SECTION 02224

REMOVAL, PRESERVATION, AND REUSE OF HISTORIC ELEMENTS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies removal, preservation, and reuse of historic elements as indicated on the Project Definition Plans, including, but not limited to, the following:
1. Historic Steel Elements: Steel bents cut from the existing historic viaduct at Lechmere, for reinstallation in their existing location after the new viaduct has been constructed. Work includes cutting out portions of the existing structure so that the new viaduct structure can pass over it. Historic Steel Elements shall be stored in a safe, secure and enclosed area provided by the DB Entity.
 2. Historic Concrete Elements: Concrete demolition work for the bridge seat and on the parapet of the historic Lechmere Viaduct, the demolition the Homans building (See Section 7.1), which are to be removed, labeled, protected and stored at the Somerville DPW, Pier 13.
- B. Related Work:
1. Section 03300 – CAST IN PLACE CONCRETE
- C. Historical Conservator: The DB Entity will engage a Historical Conservator that meets the National Park Service's (NPS) standards set forth at 36 CFR Part 61 regarding qualifications for preservation/conservation professionals at http://www.nps.gov/history/local-law/gis/html/table_of_contents.html. The Historical Conservator will meet the NPS professional standards and have demonstrated experience performing conservation work within the guidelines of the American Institute for Conservation Code of Ethics and Guidelines for Practice at https://www.nps.gov/training/tel/Guides/HPS1022_AIC_Code_of_Ethics.pdf. The MBTA will review and approve the qualification requirements for the DB Entity's proposed Historical Conservator. The duties of the DB Entity's Historical Conservator will include, but not be limited to the following:
1. Approving proposed methods for removal, preservation and handling.
 2. Documenting existing conditions by still photographs (Article 1.2.D) and preparing a report to be submitted to the MBTA prior to beginning the Work of this Section.
 3. The review of submittals described in this section.
 4. The review of specialist qualifications.
 5. On site review of the work described in Part 3 – EXECUTION of this specification section.
 6. Coordinate with the MBTA and other members of the project team.

1.2 SUBMITTALS

- A. Removal Specialist: Qualifications of the proposed qualified Historical Conservator and Historic Metalwork, Masonry, Concrete and Steel Removal and Dismantling, and Refinishing Specialist's for review by MBTA.
- B. Shop Drawings: Fabrication and installation details for historic elements to be reinstalled for review by MBTA. Include structural analysis data signed and sealed by the qualified professional engineer licensed in the Commonwealth of Massachusetts responsible for their preparation
 - 1. Include plans, elevations, sections, and details of connections.
 - 2. Show anchorage and accessory items.
 - 3. Provide information and specifications for cutting, paint removal/stabilization, coatings, and finishes of historic steel sections.
 - 4. Provide copies of all information to the Historical Conservator to review and coordinate with the MBTA.
- C. Construction schedule for Historic Elements: Submit a construction schedule to the MBTA for review and acceptance. Include detailed sequence of Historic Element work with start and end dates, coordinated with the MBTA's continuing operations and with any other related work planned by the MBTA or in progress at other locations that is likely to be affected by the Work of this Project.
- D. Preconstruction Documentation: Prepared by or in coordination with the Historical Conservator, showing pre-existing conditions of adjoining construction, including finish surfaces, that might be misconstrued as damage caused by the DB Entity's historic element operations. Documentation shall include a record of measurements, materials, and construction details of the Historic Elements.
- E. Construction approach for Historic Elements: Submit procedures for the scope of this Section to demonstrate the means, methods and materials to ensure that the following guidelines are applied:
 - 1. Retain as much existing material as possible.
 - 2. Use additional material or structure to reinforce, strengthen, prop, tie, and support existing material or structure.
 - 3. Record existing work before each procedure (preconstruction) and during the course of the Work with digital documentation such as video recordings and still photographs.
 - 4. If missing features are indicated to be repaired or replaced by the Historical Conservator or the MBTA, the DB Entity shall provide features whose designs are based on accurate duplications of the existing structure rather than on conjectural designs.
 - 5. Where the Work requires existing features to be removed or dismantled, perform these operations without damage to the material itself, to adjacent materials, or to the substrate.
 - 6. Exposed concrete surfaces resulting from the cutting of the historic concrete Lechmere Viaduct shall be treated to protect from environmental degradation.
- F. Structural Procedures Report: The DB Entity shall engage a professional engineer, licensed to stamp and seal drawings in the Commonwealth of Massachusetts, to survey existing conditions of the scope

of Work and to evaluate demolition and reconstruction impacts on the existing structure based on the DB Entity's means and methods. The evaluation shall be submitted as a Structural Procedures Report and shall include, but not be limited to, the following.

1. Adherence to notes specified on the Project Definition Plans.
 2. Requirements for the structural integrity of the system during construction activities.
 3. Protection of the structure to remain against any and all damage.
 4. Recommendations against compromising the structural integrity and capacity of the system.
 5. Requirements for temporary supports, bracing, shoring and underpinning.
- G. Cleaning and Protection: Submit for review cleaning materials product data sheets, application means, methods and environmental condition requirements and disposal procedures.

1.3 QUALITY ASSURANCE

- A. Historical Conservator: The DB Entity shall engage the services of a qualified Historical Conservator who shall work cooperatively with the MBTA. The DB Entity shall make all task related information available to the Historical Conservator and shall make all arrangements necessary for site visits.
1. The Historical Conservator shall visit the Project site daily when work of this Section is in progress. The Historical Conservator shall not be changed or replaced during the term of the Work on the historic Viaduct structure except for a cause judged by the MBTA to be beyond the control of the Historical Conservator specialist or firm.
- B. Removal and Refinishing: Removal, dismantling and refinishing work shall be performed by a qualified Historic Metalwork Specialist or Historic Masonry and Concrete Removal and Dismantling specialist, as appropriate, with the following qualifications:
1. Experience in historic metal or concrete removal work as partial demolition of a historic building or historic landmark structure in the last two years. Qualifications shall be submitted for review by the Historical Conservator and the MBTA.
 2. Two letters of reference for previous experience, completed by previous facility owners and submitted to the Historical Conservator and the MBTA.
- C. Historic Element Preconstruction Conference: The Historical Conservator and the MBTA shall be present at this meeting. Review methods and procedures related to historic element including, but not limited to, the following:
1. Review and finalize the construction schedule for Historic Elements; verify availability of materials, equipment, and facilities needed to continue the Work and avoid delays.
 2. Review qualifications of personnel assigned to the Work and their duties.
 3. Review material application, work sequencing, tolerances, and required clearances.
 4. Review areas where existing historic construction is to remain and requires protection.

PART 2 - PRODUCTS

Not Used

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Preparation for Removal and Dismantling: Examine all Historic Elements construction items to be removed or dismantled in order to determine best methods for safely and effectively performing removal and dismantling work. Examine adjacent work to determine what protective measures will be necessary. Make explorations, probes, and inquiries as necessary to determine the condition of all construction to be removed or dismantled and location of utilities and utility services to remain that may be hidden by construction that is to be removed or dismantled.
1. Verify that affected utilities have been disconnected and capped.
 2. Inventory and record the condition of items to be removed and dismantled for reinstallation or salvage.
 3. Before removal or dismantling of existing Historical Elements that will be reproduced or duplicated in final Work, make a permanent record of measurements, materials, and construction details that will be required to make exact reproductions of these elements.

3.2 HISTORIC REMOVAL AND DISMANTLING EQUIPMENT

- A. Removal Equipment: Use only hand-held tools except as follows or unless otherwise approved by the Historical Conservator, on a case-by-case basis:
1. Light jackhammers are allowed
 2. Large air hammers are not permitted.
- B. Dismantling Equipment: Use manual, hand-held tools, except as follows or otherwise approved by the Historical Conservator, on a case-by-case basis:
1. Hand-held power tools and cutting torches are permitted only as submitted for review and following approval by the Historical Conservator. All such tools must be adjustable so as to penetrate or cut only the thickness of material being removed.
 2. Pry bars more than 18" long and hammers weighing more than 2 lbs. are not permitted for dismantling work.
- C. Cleaning Equipment: Use only passive, non-chemical cleaning methods for cleaning concrete surfaces unless otherwise approved by the Historical Conservator.

3.3 GENERAL PROTECTION

- A. Ensure that the Historical Conservator is on-site and on duty when Historic Element Work begins and throughout the progress of the Work.
- B. Protect persons, motor vehicles, adjacent surfaces, the work-site in general, plants, and surrounding buildings from harm resulting from historic element procedures.
 - 1. Use only proven protection methods, appropriate to each area, material and surface being protected.
 - 2. Contain dust and debris generated by removal and dismantling work on historic Viaduct and prevent it from reaching the public and adjacent or nearby surfaces.
 - 3. Provide shoring, bracing, and supports as necessary.
 - 4. Protect the site and abutters from debris due to demolition activities.
- C. Temporary Protection of Historic Materials: Protect existing historic materials with temporary protections and construction. Do not deface or remove existing materials outside the limits shown for removal and dismantling. Do not attach temporary protection elements to historic surfaces except as where indicated to be part of the construction approach for Historic Elements and as approved by the Historical Conservator.

3.4 HISTORIC REMOVAL AND DISMANTLING

- A. Ensure that Historic Metalwork or Historic Masonry and Concrete Removal and Dismantling Specialist's field supervisors are present when removal and dismantling work begins and at all times during the performance of this work. The Historical Conservator shall be present at all times that this work is underway and shall observe the progress of Work. Historical Conservator shall offer comments and recommendations regarding the performance of this Work prior to its initiation and during its performance.
- B. Perform Work according to the detailed sequence of shop drawings, the Construction approach for Historic Elements and other accepted submittals.
- C. Use water-mist sprinkling and other wet methods to control dust only with adequate, accepted procedures and equipment that ensure that such water will not create a hazard or adversely affect other building areas or materials.
- D. Keep equipment that is not permitted for historic removal or dismantling work away from the vicinity where such work is being performed.
- E. Protect historic surfaces from damage by tools and machinery. Support each Historic Element as it becomes loosened to prevent stress and damage to the historic surfaces. Dismantle anchorages.

3.5 STORAGE AND PROTECTION

- A. Storage and Protection: When taken from their existing locations, catalog and store Historic Elements within a weathertight enclosure where they are protected from wetting by rain, snow, condensation, or ground water, and from freezing temperatures.

1. Identify each item with a non-permanent mark to document its original location. Indicate original location of each item on plans, elevations, sections, and/or photographs by annotating the documents with these identifying marks.
2. Secure stored materials to protect from theft and vandalism.

3.6 REINSTALLATION

- A. Comply with recommendations of the Historical Conservator and the MBTA. Install materials in accordance with accepted submittals.

END OF SECTION

SECTION 02450

SECONDARY CONTAINMENT SYSTEMS - GEOSYNTHETIC BARRIER

PART 1- GENERAL

1.1 DESCRIPTION OF WORK

- A. Design, furnish and install a prefabricated and complete geosynthetic barrier oil containment system including all accessory materials including excavation of soil materials, installation of backfill to form a secondary containment system around oil-filled electrical equipment.
- B. The DB Entity shall propose a suitable secondary oil containment system to be placed under/around each oil filled transformer. The system shall comprise of a buried geosynthetic barrier that will allow the passage of rain water but impede the flow of oil.
- C. DB Entity shall size the containment system meeting the necessary oil containment requirements, i.e. volume of oil, based on the specifics at each site and shall propose the required crushed stone to meet the necessary void ratio as recommended by the manufacturer. It is expected that one containment area will be constructed at each traction power substation and that the containment area will encompass all the transformers at that location.
- D. Geosynthetic barriers typically installed as a "Passive" secondary containment measure also used in "Active Containment" situations to impede or block the flow of oil from reaching drainage structures or waterways.
- E. Excavation and backfilling shall be performed to prevent damage to adjacent properties, buildings, structures, utilities, underground piping, electric cable, cable trays, grounding systems, and other facilities.

1.2 RELATED SECTIONS

- A. Section 02300- EARTHWORK
- B. Section 02240- DEWATERING

1.3 APPLICABLE CODES, STANDARDS AND REFERENCES

- A. IEEE Std 980-1994 R2001 (The Institute of Electrical and Electronics Engineers) Guide for Containment and Control of Oil Spills in Substations.
- B. Code of Federal Regulations (CFR) 40 CFR Protection of the Environment; PART 112- Oil Pollution Prevention.
- C. AASHTO No. 57 (American Association of State Highway and Transportation Officials)

1.4 QUALITY ASSURANCE

- A. Design geosynthetic barrier under direct supervision of a Professional Engineer experienced in the design of such Work and to accommodate site conditions.
- B. Excavations shall comply with the local Building Code and published standards.
- C. Manufacturer shall be company(s) specializing in manufacturing geosynthetic barrier systems with minimum three years of documented experience.
- D. Installer shall be company(s) specializing in installation of geosynthetic barrier or similar systems with minimum three years of documented experience.
- E. Engage the services of a trained manufacturer's representative to be on Project site during geosynthetic barrier installation.

1.5 SUBMITTALS

- A. See Sections 2.7 and 2.8
- B. Submit qualification and experience record for designers.
- C. Product Data: Provide containment system dimensions & materials (including geotextile fabric, barriers, partition barriers, etc.); describe components within assembly and anchorage of fasteners.
- D. Design drawings for each location, including, if necessary, the method of installing the fabric around pipes or conduits and at perimeter supports.
- E. Design Data: Provide physical characteristics and engineering calculations and identify dimensional requirements/limitations.
- F. Shop Drawings: Indicate geosynthetic barrier dimensions, affected related Work and details including overlap at joints.
- G. Samples: Submit two samples 6 by 6 inches in size illustrating barrier materials.
- H. Warranty: Submit manufacturer warranty and ensure forms have been completed in MBTA's name and registered with manufacturer.

1.6 DELIVERY, STORAGE AND PROTECTION

- A. Handle products of this section in accordance with manufacturer's requirements.
- B. Protect geosynthetic barrier materials during transport and on Project site storage prior to installation.

1.7 WARRANTY

- A. Provide manufacturer warranty against failure of barrier material when installed properly including provision for replacement of failed units.

- B. Warranty shall be in effect for the Service Life of installed product.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Geosynthetic barrier shall be designed to prevent flow of hydrocarbons from a site by becoming an impervious barrier in the event of an oil release and allow unrestricted water flow during normal rainfall or snow melt events.
- B. Barrier shall be suitable to be laid horizontally at the bottom of the containment area.
- C. Materials to adjoin to adjacent concrete walls shall be proposed. Refer to the Design Documents for details.

2.2 PERFORMANCE

- A. The geosynthetic barrier shall have a hydrocarbon flow rate: 0 gpm.
- B. The secondary containment system must be able to contain 110% of the oil volume in the equipment or have a freeboard of 3.5” for 100% of oil volume, whichever yields the largest storage volume.
- C. Geosynthetic barrier must be able to flow a minimum of 3 GPM per square foot of material with one foot of head pressure
- D. Shall meet Spill Prevention Control and Countermeasures (SPCC) requirements in accordance with 40 CFR 112.

2.3 FABRICATION

- A. Fabricate components with minimum clearances around perimeter of assembly, yet enabling installation and dynamic movement of perimeter seal.
- B. Accurately fit and secure joints and corners. Make joints flush.
- C. Prepare components to receive anchor devices.
- D. Arrange fasteners and attachments to conceal from view.

2.4 MATERIAL FOR COVER

- A. Gradation requirements shall be determined in accordance with AASHTO No. 57.
- B. For fills categorized as "crushed stone" or equivalent clean stone comply with the following:

Coarse Aggregate

Sieve Size		AASHTO No. 57 (percent passing)
50 mm	2 inch	-
37.5 mm	1.5 inch	100 min
25 mm	1 inch	95 - 100
19.0 mm	0.75 inch	-
12.5 mm	0.5 inch	25 - 60
9.5 mm	0.375 inch	-
4.75 mm	No. 4	10 max
2.36 mm	No. 8	5 max
1.18 mm	No. 16	-

PART 3 – EXECUTION

3.1 EXAMINATION

- A. Verify dimensions, tolerances, and method of attachment.
- B. Verify that anchorage devices have been properly installed and located.

3.2 INSTALLATION

- A. Avoid damage wherever excavation is being done. The width of such excavation shall not exceed the width necessary for the proper prosecution of the work.
- B. Install geosynthetic barrier in accordance with manufacturer's instructions.
- C. Overlap and splice barrier sections, as necessary, according to the shop drawings and the manufacturer's recommendations.
- D. Barrier should not be cut or trimmed without the approval of the manufacturer or their representative.
- E. Attach to grade to permit sufficient adjustment to accommodate construction tolerances and other irregularities allowing expeditious progress of the work.
- F. Comply with site MBTA and operator's safety practices particularly in close proximity to active electrical equipment.
- G. Stage the work in accordance with the manufacturer's recommendations.

3.3 FIELD QUALITY CONTROL

- A. Verify barrier is firmly attached to supports before placing cover material.

3.4 CLEANING AND PROTECTION

- A. Remove any protective material.
- B. Repair minor damage to surfaces to the satisfaction of the manufacturer prior to cover material being installed.
- C. Protect barrier during installation of cover material.

END OF SECTION

SECTION 02850

LIGHT RAIL TRACK CONSTRUCTION

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This section specifies Ballasted Transit Track Construction on the Project.
- B. Ballasted transit track construction shall include:
 - 1. Constructing new ballasted transit track.
 - 2. Placing and compacting ballast.
 - 3. Placing and compacting subballast.
 - 4. Placing and aligning wood ties.
 - 5. Thermal adjustment of existing Continuous Welded Rail (CWR).
 - 6. Aligning and clamping rail.
 - 7. Installing welded rail joints.
 - 8. Initial tamping, gauging, lining and surfacing track.
 - 9. Testing and corrections/adjustments to completed track.
 - 10. Other operations as specified.

1.2 RELATED WORK SPECIFIED ELSEWHERE

- A. Delivery, unloading and handling of 115 RE rail and procedures for creating CWR strings is in Section 02851 - RAILROAD RUNNING RAIL.
- B. Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
- C. Section 02854 – TRACK SURFACING AND ALIGNMENT.
- D. Turnout procurement and installation is in Section 02855 – SPECIAL TRACKWORK.
- E. Section 02865 – TRACK APPURTENANCES.
- F. Section 02867 – RESTRAINING RAILS.
- G. Section 02877 – THERMITE WELDING.

1.3 GENERAL DESCRIPTION OF NEW TRACK CONSTRUCTION

- A. New Green Line Track, for mainline and yard lead tracks, shall be new 115 RE head hardened rail, electric flash butt welded rail on 7" x 9" x 8' 6" treated timber ties with resilient fastener tie plates, spring clips and screw spikes. New yard track shall be jointed.
 - 1. Head hardened rail shall be used for all new track.
 - 2. Curves less than 1,000 feet radius shall require restraining rail.
 - 3. Electric flash butt welds may be by a fixed plant or by an in-track mobile unit as specified in Section 02851 – RAILROAD RUNNING RAIL.
 - 4. The use of thermite welds shall be limited to locations where electric flash butt welding is not possible and as permitted by the MBTA.

1.4 APPLICABLE STANDARDS

- A. The following Codes, Regulations, Reference Standards and Specifications apply to work included in this Section:
 - 1. MBTA Track Maintenance Standards.
 - 2. MBTA Book of Standard Trackwork Drawings
 - 3. American Railway Engineering and Maintenance of Way Association, AREMA:
 - a. Manual for Railway Engineering
 - b. Portfolio of Trackwork Plans

1.5 SUBMITTALS

- A. Submit a prepared CPM Construction Plan in accordance with Section 2.7. The CPM Construction Plan shall include descriptions of the following:
 - 1. Construction sequences
 - 2. Construction activities including but not limited to:
 - a. Rail distribution and installation
 - b. Track removal
 - c. timber crosstie unloading and installation
 - d. ballast distribution
 - e. surface and alignment
 - f. thermal adjustment of CWR
 - g. final ultrasonic inspection and rail grinding

- h. turnout installation
- 3. Production Equipment
- B. Submit identity and location of licensed incinerator and land fill facilities proposed for crosstie and switch timber disposal.
- C. Submit a detailed trackwork installation plan.

1.6 QUALITY CONTROL

A. Tolerances From Design

- 1. Final established gauge, cross level, superelevation, vertical and horizontal alignment of tracks are indicated on Design Documents, and shall be within tolerances from design specified below:
 - a. Horizontal Track Alignment:
 - Maximum permissible variation from design shall not exceed
 - Plus or minus 1/2"

 - Rate of change of permissible variation from design shall not exceed
 - Plus or minus 3/16" middle ordinate to a 31' chord on curves, and 1/16" middle ordinate to a 31' chord on tangent
 - b. Vertical Track Profile:
 - Maximum permissible variation from design shall not exceed
 - Plus or minus 1/2" .

 - Rate of change of permissible variation shall not exceed
 - Plus or minus 1/16" middle ordinate to a 31' chord
 - c. Track Centers:
 - Maximum permissible variation from design not to exceed
 - Plus 1/2", minus zero
 - d. Cross Level:
 - Maximum permissible variation from design at any point
 - Plus or minus 1/16"
 - e. Gauge variation: +/- 1/16"

2. No tolerances from design shall be allowed at locations where vertical and horizontal clearances are restricted by the MBTA and Contract Documents such as platforms, abutments, and overhead bridges.
- B. Welds, in track after final acceptance will be warranted by the DB Entity as specified in Section 02851 – RAILROAD RUNNING RAIL

PART 2 – PRODUCTS

Not Used.

PART 3 - EXECUTION

3.1 TRACK CONSTRUCTION

- A. Construct ballasted transit track construction as shown on the Design Documents.

3.2 SUBGRADE PREPARATION IN NEW TRACKBED LOCATIONS

- A. Remove existing track structure and fouled ballast.
- B. Smooth and compact subgrade areas, with cross slope as shown on the Design Documents, to receive subballast.

3.3 PLACEMENT OF NEW SUBBALLAST

- A. Subballast shall be distributed over subgrade unless otherwise specified on the Design Documents.
- B. Distribute and compact eight inch layers of subballast, uniformly over the finished subgrade.
- C. Deliver subballast at a rate no faster than can be satisfactorily incorporated into the work, maintaining a proper interval of operations, and at such times as to permit proper inspection by the MBTA.
- D. To the extent practicable, unload subballast in position for use with a minimum of redistribution and dressing.
- E. Self-spreading vehicles may be used as accepted by the MBTA. When subballast is initially spread by a self-spreading vehicle, a power grader may be used to assist spreading operations.
- F. Thoroughly compact subballast until material is firmly interlocked and surface is true and unyielding.
- G. Top surface of initial layers of subballast shall be smooth, flat and uniformly compacted prior to distributing ballast.
- H. Refer to Section 02857 – SUBBALLAST for material requirements.

3.4 PLACEMENT OF INITIAL BALLAST

- A. Ballast shall not be distributed until the subgrade and the subballast has been completed and accepted as specified above.

- B. Distribute and compact 4" layers of ballast, not to exceed an 8" total, uniformly over the finished subgrade or subballast, prior to tie distribution.
- C. Deliver ballast at a rate no faster than can be satisfactorily incorporated into the work, maintaining a proper interval of operations, and at such times as to permit proper inspection by the MBTA.
- D. To the extent practicable, unload ballast in position for use with a minimum of redistribution and dressing.
- E. Self-spreading vehicles may be used as accepted by the MBTA. When stone is initially spread by a self-spreading vehicle, a power grader may be used to assist spreading operations.
- F. Thoroughly compact ballast until stones are firmly interlocked and surface is true and unyielding.
- G. Top surface of initial layers of ballast shall be smooth, flat and uniformly compacted prior to distributing ties.

3.5 DISTRIBUTING AND SPACING TIMBER CROSS TIES

- A. General
 - 1. Carefully distribute and properly space ties on initial layer of ballast. Space ties at design spacing as follows on center, or as shown on the Design Documents.
 - a. Mainline tie spacing 24".
 - b. Grade Crossing tie spacing 18".
 - c. Turnout tie spacing varies, see Design Documents.
 - 2. Handle ties in a manner to avoid breaking and bruising. Do not throw ties from cars or trucks onto rails or rocks.
 - 3. Place timber so that ties heartwood is down. Place all ties so that the bottom surface of the tie shall have full bearing against the initial layer of ballast.
 - 4. Place ties normal to center line of track.
 - 5. Properly space and align ties prior to rail installation.
 - 6. In placing or spacing treated ties, handle only with tongs or suitable devices. Do not use bars, chisels, forks, mauls, picks, punches, shovels, or sledges for moving ties or placing them in position beneath rails.
 - 7. Avoid unnecessary handling, redistribution, and reloading of ties. To extent practical, distribute ties in proper position for use without further handling.
- B. Remove ties damaged as result of improper handling by the DB Entity and rejected by the MBTA and replace with undamaged ties at no additional cost to the MBTA.

3.6 TIE PLATES - RESILIENT

- A. Install tie plates under each running rail on timber crossties.
- B. Tie Plates shall be new resilient fastener tie plates in accordance with MBTA Maintenance of Way Division, Book of Standard Trackwork, or as shown on Design Documents.
- C. Prior to installation of tie plates, clean contact surfaces to allow proper bearing of tie plate on tie and rail on tie plate.
- D. Locate centerline of tie plates on 8' 6" ties such that the line side of the tie is 18.64" from outer edge of base of rail with 115 RE rail. Tie plate shall be centered on the crosstie under rail.
- E. Locate tie plates on longitudinal centerline of each tie and place square to centerline of rail so that outside shaller of plate bears fully against rail base. Place plate with the downward cant toward center of track.
- F. Secure rail on line end of ties to tie, in proper relation to tie end, before securing opposite rail.
- G. Use line rail as reference in securing opposite rail to proper gauge.
- H. Tie Boring
 - 1. Field bore crossties and switch timber before fastening tie plates.
 - 2. Holes in crossties shall be 3/4" diameter. If other fasteners are used, as per manufacturers recommendations.
 - 3. Location and number of holes shall conform to location and number of screw spikes. Boring of holes in excess of number required will not be permitted.
 - 4. Do not bore holes entirely through tie.
 - 5. After drilling, brush drill chips from top surface of tie.
 - 6. Immediately treat bored hole with pentachlorophenol oil or creosote.
 - 7. Prior to locating position of holes to be bored for second rail to be placed on any tie or timber, position tie laterally so that field side base of first rail is in contact with shaller of plate. Any tolerance between rail base width and plate seat width shall be on gauge side of rail. Position other plate similarly to ensure retention of gauge established.

3.7 RESILIENT RAIL FASTENER SYSTEM

- A. Rail clips shall be installed according to the manufacturer instructions.
- B. Rail clips shall be installed from the right-hand side of the tie plate, facing the rail, with the open end of the clip at the base of the rail.
- C. Rail clips shall be driven until there is approximately 3/8" gap between the edge of the tie plate and the inner edge of the rear arch of the clip.

3.8 SCREW SPIKES

- A. Start and drive screw spikes vertically and aligned with rail.
- B. Screw spikes shall be set and driven in accordance with manufacturer's recommendations and specifications.
- C. Straightening screw spikes shall not be permitted. Screw spikes bent during driving shall be withdrawn and a replacement spike shall be driven.
- D. Number of screw spikes used per tie shall conform to the MBTA Book of Standard Trackwork.
- E. Avoid removal of screw spikes once driven. When necessary, pull spikes and plug hole using treated tie plug.
- F. Under no circumstances shall gauge be adjusted by striking lags, spikes, or plate edge after it is fixed to tie.
- G. Seat rail properly between tie plate shallers, with outside base of rail tight against outside plate shaller.

3.9 INSTALLATION OF CONTINUOUS WELDED RAIL (CWR)

- A. Install and temporarily joint CWR as specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION. Lay and joint to produce zero thermal stress in the rail.
- B. Install rail in such a manner that damage to ties or OTM is avoided, and ties are not dislodged from their proper position.
- C. Install temporary six holes, 36” joints using 4 bolts prior to surfacing and aligning track. Leave end holes blank (not drilled).
- D. The track shall be brought to within 1 inch of final line and grade in accordance with Article 3.10 of this Section and the CWR strings shall have their lengths adjusted for zero thermal stress temperature, be vibrated to relieve internal rail stress, and be fully clipped in accordance with Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.

3.10 RAIL CLIPPING

- A. Clip CWR as specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
- B. Final clipping of rail, in ballasted track, shall be done when rail is at its zero thermal stress temperature, and has been vibrated to relieve internal rail stress.
- C. Final rail clipping, in ballasted track, shall not proceed until track has been sufficiently ballasted to prevent tie or track movement due to thermal expansion or contraction in rails and until track has been initially raised, tamped, aligned, and destressed.
- D. Install clips as specified by manufacturer.

1. Use modified clips at temporary bolted joint and insulated joint locations.
- E. Install two clips per tie per plate.
1. Install clips on each plate in an opposite direction and in a consistent pattern.
- F. Clips shall not be overdriven.

3.11 TIE PLUGS

- A. Install treated tie plugs in holes where spikes have been pulled from ties.
- B. Drive plugs into tie to refusal and cut plug flush with top of tie, using an adze, before installing tie plate.

3.12 RAIL ALIGNMENT

- A. General
1. Construct track conforming to alignment and profile data shown on Design Documents.
 2. Alignment is based on centerline of track equidistant between gauge sides of running rails.
 3. For tangent track, profile refers to top of rail in final position. For curved track, profile refers to top of low (inner rail) in final position.

3.13 INSULATED JOINTS – POLY

- A. Insulated joints in accordance to Section 02865 – TRACK APPURTENANCES.
- B. Install 115 RE poly insulated joints at locations shown on Design Documents.
- C. Install insulated joints during installation of 115 RE rail.
- D. Insulated joints shall be installed as suspended joints.
- E. Accurately space and drill holes for bolting of rail in accordance with requirements of the current AREMA Manual for Railway Engineering, Specifications for Steel Rails and MBTA Book of Standard Trackwork. Drill holes with an approved rail drill.
- F. Drill cylindrical holes of specified diameter for the size bolt required through and perpendicular to web of rail.
- G. Use a template, as a drilling guide, to locate holes both vertically from bottom of rail and horizontally from rail end. In no case shall a joint bar be used for this purpose.
- H. Remove all rough edges from holes.

3.14 SURFACING AND ALIGNING

- A. Surface and Align track in accordance with Section 02854 – TRACK SURFACING AND ALIGNMENT.

END OF SECTION

SECTION 02851

RAILROAD RUNNING RAIL

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the manufacture and shipping of head hardened 132 and 115 RE rail, electric flash butt welding of rail into continuous welded rail (CWR) strings and delivery and distribution of CWR strings within Project limits.
- B. The work consists of:
1. Arranging for the shipment of 132 and 115 RE head hardened rail from the rail manufacturer to the Project area.
 2. Electric flash butt welding rail into CWR strings by means of either a fixed plant or a portable, in-track mobile welding unit.
 3. Delivery and proper distribution of CWR strings within project limits.
- C. Related work specified elsewhere:
1. Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION – Procedures for installation, thermal adjustment and maintenance of CWR.
 2. Section 02856 – COMMUTER RAIL TRACK CONSTRUCTION – Overall track construction procedures.
 3. Section 02877 – THERMITE WELDING – Requirements for thermite welding where required.
- D. Project Conditions and General Requirements for CWR fabrication:
1. There will be new 115 RE CWR along the entire length of the transit line. New rail for the commuter line will consist of 132 RE CWR. Electric flash butt welds may be made by either a fixed or semi portable plant and the welded strings moved by approved methods to the installation site, or; the new rail may be placed in track as jointed rail with end holes blank and temporarily secured with four track bolts in 36 inch joint bars. Electric flash butt welds can then be made in-track using an approved, mobile electric flash butt welding unit.
 2. The DB Entity shall plan the work to minimize the number of thermite welds in completed track.
 3. Where new 132 RE rail is to be joined to 115 RE rail, compromise thermite welds shall be used. as specified in Section 02877 – THERMITE WELDING.
 4. Use head hardened rail for all new track on the transit line and commuter line.

1.2 SUBMITTALS

- A. Submit certification from the rail manufacturer that rail furnished meets the physical requirements of the current AREMA Manual.
- B. Prepare a list of all welded rail strings, their location, required length, and if they contain bonded insulated joint plug rails and their location in the string.
- C. Submit welding plant or mobile unit company name.
- D. Prior to production welding, submit proper certification that each shop weld will be warranted by the DB Entity against workmanship or alignment defects.
- E. Submit the identity and qualifications of the certified independent testing laboratory that will perform sample weld inspection and testing. Include qualifications of nondestructive examination specialist performing the radiographic tests.
- F. Prior to commencement of production welding, submit certification that each sample weld has passed required tests and inspections.
- G. Prior to production welding submit schedule for the welding of rail.
- H. Submit daily during periods of production welding, the following:
 - 1. Log of inspections and tests made using form included as Figure 2 of this Section.
 - 2. Number of acceptable welds made.
 - 3. Number of rail strings completed and number and length of each string and type of rail in each string.
- I. Upon the completion of welding CWR strings, submit recorder charts and a record documenting the production of each string of CWR. Included shall be string number; string length; heat number of each piece of rail in the string; number of welds in the string; and number of any weld which had been cut out and re-welded. Use form included as Figure 3 of this Section.
- J. All submittals will be reviewed for general conformance with the intent of the Contract Documents. This review will not relieve the DB Entity of final responsibility for the means, methods, procedures and sequences to be utilized.
- K. Submit a description of the method for pre-curving rail.

1.3 QUALITY CONTROL

A. General

1. Production welds, in track after final acceptance, will be warranted by the DB Entity for one full year.
2. Perform sample and production electric flash butt weld inspection and testing at no additional cost to the MBTA.
3. Sample weld inspection and testing shall be performed by the approved certified independent testing company or laboratory. The MBTA may audit operations to ensure that inspections and tests are being performed in accordance with accepted procedures and in compliance with these Mandatory Specifications.
4. Sample and production welds made in head hardened rail shall be air quenched.
5. Sample and production welds shall have full penetration and complete fusion with no evidence of surface or internal fissures, cracks, porosity or slag type defects.
6. To be accepted, each weld shall fulfill the requirements of the Mandatory Specifications.

B. Electric Flash Butt Weld Qualification, Inspection and Testing

1. Prior to commencement of welding, each welding machine and operator shall be qualified based on sample welds passing the tests specified in this Article 1.3.B of this Section.
 - a. Each welding machine and operator shall make three sample welds using standard and head hardened rail. Three sample welds each of 132 RE standard rail to 132 RE head hardened rail, 132 RE head hardened rail to 132 RE head hardened rail, 115 RE standard rail to 115 RE head hardened rail, 115 RE head hardened rail to 115 RE head hardened rail shall be a set and every set shall be inspected and tested.
 - b. Assign each sample weld a number and mark each weld with that number and type of rail using a permanent marking device.
 - c. Submit with each sample weld for inspection and testing, a record of the following signed by the welding supervision:
 - Sample Weld number.
 - Welding machine identification.
 - Welding machine operator.
 - Brand, rolling date, heat number, and type of rail used on each side of the weldment.
 - Date welded.
 - d. The sample weld shall join two pieces of rail each a minimum of 30" or minimum required by testing agency. Rail pieces to be used for the sample welds shall be cut from 132 RE

rail and 115 RE rail received for this project. Each rail also shall be coded for identification and comparison with the record submitted.

2. Test each set of 3 sample welds as follows:
 - a. Perform Radiographic Tests as specified in Article 1.3.B.3 of this Section on all sample welds.
 - b. Perform Slow Bend Test specified in Article 1.3.B.5 of this Section on one sample weld.
 - c. Perform Hardness Test specified in Article 1.3.B.6 of this Section on one sample weld.
3. Radiographic Testing
 - a. Inspect sample shop welds radiographically in accordance with ASTM E142, ASTM E94, and these Mandatory Specifications for the purpose of detecting flaws in shop welds.
 - b. Radiograph each sample weld on head, web and each side of rail base.
 - c. Identify each radiographic film with Contract number, weldment number, inspection agency, and view. Submit statement of certification with each film to the MBTA, giving comment on any irregularities found in the weld, and whether the weld passes or fails.
 - d. The acceptance criteria for this test shall be full penetration and complete fusion with no evidence of surface or internal fissures or cracks.
 - e. Nondestructive inspection of metal welds by radiographic use of nuclear by-product materials shall be in accordance with United States Nuclear Regulatory Commission Rules and Regulations, Title 10, Atomic Energy, Part 20, Standard for Protection Against Radiation.
 - f. Transportation, handling and storage of hazardous materials used in radiographic inspection of welds shall be performed only by or under the supervision of a technician operating under a proper license.
5. Slow Bend Test
 - a. Subject second sample weld which has passed Radiographic Tests specified in Article 1.3.B.3 of this Section to the Slow Bend Test described in the Proceedings of the AREMA, Chapter 4.
 - b. The acceptance criteria for this test shall be a minimum deflection of one inch with minimum 120,000 pounds per square inch modulus of rupture for standard carbon rail and 0.75" deflection with minimum 125,000 pounds per square inch modulus of rupture for head hardened rail.
6. Hardness Test
 - a. Longitudinally cut a cross section of third sample weld of each type of rail passing Radiographic Tests specified in Article 1.3.B.3 of this Section for a maximum distance of one foot each side of the weld and test by the Brinell Hardness or Rockwell C Hardness Test.

- b. No weld shall have hardness values greater than 400 BHN or 43 Rc. Test welded zone as specified in AREMA. The minimum Brinell Hardness number of parent metal is published at 310 for standard rail and 370 for head hardened rail.
 - c. For a weld to be acceptable the weld material and heat affected zone of each rail, not more than 6 inches from weld center line, shall meet the minimum hardness above for standard or head hardened rail. Hardness within the weld shall be within plus or minus 30 BHN points or plus or minus 5 Rc of parent rails head hardness except at decarburized centerline and at the spherodized edge of the heat affected zone.
 - d. Inspect macroetched section for compliance with shop weld requirements of full penetration, complete fusion, and internal defects specified herein.
- 7. Approval of welding process, welding machine, and operator will depend upon sample welds satisfying the specified requirements. Shall any sample weld fail to satisfy specified requirements, then the welding process, welding machine or both shall be altered or adjusted to produce an acceptable weld and the tests shall be repeated. Any change required to correct sample weld failure, or any change of procedure, equipment or personnel shall require additional submittals as specified in Article 1.2 of this Section.
 - 8. Satisfactorily complete qualification testing specified herein, prior to production welding.

C. Production Welding – Inspection and Testing

- 1. During production welding, test and inspect welds as specified herein to ensure compliance of each shop weld with requirements of these Mandatory Specifications.
- 2. Magnaflux Testing
 - a. Inspect welds by the dry powder magnetic particle method in accordance with ASTM E109.
 - b. Cut out welds giving fault indication in magnetic particle inspection and re-weld rails in accordance with these shop welding specifications.
- 3. Physical Inspection
 - a. Inspect welds with a three-foot certified straightedge similar to a No. 270 Starrett, along the centerline of top of rail and 5/8 inch below top of rail on gauge side of the rail head.
 - b. With straightedge centered over weld the gap between straightedge and rail shall not exceed AREMA requirements of Chapter 4 for surface misalignment tolerance and gauge misalignment tolerance. The relevant data from AREMA for surface alignment is shown as Figure 1 of this Section.
 - c. Cut out welds not meeting these straightness tolerances and re-weld rails in accordance with these shop welding specifications.
 - d. Shop Weld Machine Performance
 - (1) During preparation of sample welds and during production welding, attach a chart recorder, with certified calibration to each welding machine to record platen

movement and current impulses during welding. Chart recorder shall be calibrated at least daily.

- (2) The weld will be rejected if the record indicates a performance which is not in conformance with standards submitted and accepted under Article 1.2.C of this Section.

4. Rejected Welds

The removal and replacement of welds cut out due to not passing a Magnaflux test or a physical inspection or due to improper welding machine function shall be done at the DB Entity's expense.

PART 2 - PRODUCTS

2.1 MATERIALS TO BE FURNISHED BY THE DB ENTITY

- A. The DB Entity shall furnish 80' lengths of 132RE and 115RE section rail to the Project Area. Rail shall be head hardened, high strength rail meeting the requirements of the AREMA Manual Chapter 4, and MBTA Material Specification No. 9633-A. If rail is to be welded using a fixed plant, furnish rail with blank ends. If rail is to be welded in-track after temporarily joining with joint bars, furnish rail with end holes blank and two holes for placing two bolts on each rail end to a 36' joint bar.
- B. Pre-curving of transit rail.
 1. Prior to performing pre-curving, submit shop drawings to show compliance with the requirements below.
 - a. Rail used for curves having a horizontal centerline radius less than 400' shall be pre-curved from beginning (TS or PC) to end of curve (ST or PT).
 - b. Uniformly curve rail, such that the deviation of the interior mid-ordinate offset from the theoretical offset is within the tolerances for straight rail using the appropriate chord distance required by the track construction specification.
 - c. Pre-curved rail shall be identified with painted identity numbering per accepted shop drawing code at end of each rail. As a minimum the identification shall include track number, curve number, and inside or outside rail on curve and sequential number indicating position of rail in curve. Curve points on rails falling at the beginning or ends of curves shall be clearly marked.

PART 3 - EXECUTION

3.1 DELIVERY, STORAGE, AND HANDLING

- A. Rail
 1. Prior to welding, handle rails in accordance with these Mandatory Specifications:

- a. During unloading and handling, rail shall be lifted using a minimum of a two point hitch to avoid causing horizontal set in the rail.
 - b. Rails to be stockpiled by type and length with heads up, separating full length rails from short rails.
 - c. First layer of rail in stockpile shall be on a firm foundation to prevent contact with ground and to protect rails from damage.
 - d. Rails shall be separated in tiers by wood separators at a minimum of five points per 80' rail. Stock used as separators between tiers of rail shall be oak or other hardwoods that will sustain the weight of the rails without crushing.
 - e. Stockpile rails so that brands are all on the same side to reduce handling of rail to the welding machine or placing in track.
2. The DB Entity is responsible for the unloading of rails from the manufacturer. The DB Entity is responsible for the subsequent handling, shipping, storage, loading, unloading, and security of rail relative to the welding and distribution of CWR strings. The DB Entity is responsible for scheduling associated with the movement, welding, delivery, and distribution of rail.

3.2 FABRICATION

A. Continuous Welded Rail

1. General
 - a. Provide continuous welded rail for running rail within work limits as indicated on Design Documents.
 - b. Electric flash butt weld rail in accordance with the current AREMA Specifications for Fabrication of Continuous Welded Rail, Chapter 4, except as modified herein.
 - c. Weld rails with brand of each rail on same side of rail. All CWR strings shall have the brand on the same side throughout the Contract.
 - d. Make all welds by the electric flash butt welding process.
 - e. Straightening of welds shall be performed in a manner which minimizes the bending of rail.
 - f. Incomplete welds or welds that fail to pass inspections per Article 1.3 of this Section shall be cut out using a rail saw and the rails re-welded. The section cut out of rail shall include heat affected zone of each rail. Use of cutting torch or other heat dependent device to cut out defective weld shall not be permitted.
2. Continuous Welded Rail String Lengths
 - a. The maximum CWR string shall be 1,440' in length. The DB Entity shall create a schedule of required strings, their location, and length. Do not weld any length of rail less than 18 feet into a CWR string.

- b. Using a permanent marker, in the web of head hardened rail, clearly mark string number on first rail in a CWR string and string number and length of string, in feet, on the last rail in the string. Use Nissen metal marker as manufactured by J. P. Nissen, Jr., Co. or approved equivalent.
- d. Head hardened rail shall be marked using the color orange.
- e. If it is necessary to drill a hole in the first rail of a CWR string for handling purposes the hole shall be drilled as the second hole per MBTA Standard Plan 1302 except hole diameter to be reduced to 1 3/16" in diameter. If rail is damaged at hole location, the damaged end shall be cut off at DB Entity's expense.

3.3 DISTRIBUTION OF CONTINUOUS WELDED RAIL (CWR) FROM A FIXED PLANT

A. General

- 1. Only load continuous welded rail strings onto rail cars, or other suitable transporting equipment, specially equipped to handle CWR.
- 2. Handling, loading, transporting, and unloading of continuous welded rail shall be in accordance with the current AREMA Manual and Contract Documents.

B. Distribution

- 1. Distribute CWR strings within project limits where required.
 - a. Ends of CWR strings shall be offset and blocked to prevent buckling and the standard overlap shall be 2'.
 - b. Rails shall not be run out over crossings, or across side track side of turnouts but shall be laid on either side of crossings, and side tracks unless otherwise directed by the MBTA.
 - c. Rail strings shall be set on crossties removed from existing track at minimum 100' intervals, one-tier high.
 - d. Rail strings shall be moved to the approved locations by equipment designed to handle CWR without causing damage to the rail, existing or newly constructed track. Dragging of welded strings is prohibited.

C. Rail Installation shall be as specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION

3.4 HANDLING 80 FOOT RAILS FOR WELDING IN TRACK WITH A MOBILE WELDING UNIT

- A. Rail Distribution: Distribute rails along ROW adjacent to installation sites using approved rail handling equipment and methods.
- B. Rail Installation shall be as specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION

END OF SECTION

SECTION 02853

CONTINUOUS WELDED RAIL INSTALLATION

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies requirements for installation of continuous welded rail (CWR) where required within Project limits and includes thermal adjustment of rail to neutral rail temperature, rail clipping, rail grinding, and final ultrasonic testing of rail.
- B. Installation of welded rail shall follow installation of crossties as specified in Section 02856 – COMMUTER RAIL TRACK CONSTRUCTION and in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION and thermal adjustment shall follow initial surfacing and alignment. Work shall also include installing bonded insulated joint-plug rails.
- C. Related work specified elsewhere:
 - 1. Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
 - 2. Section 02851 – RAILROAD RUNNING RAIL.

1.2 DB ENTITY RESPONSIBILITIES RELATED TO WORKING WITHIN IN-SERVICE CWR TRACK

- A. In general, these Mandatory Specifications address the installation of welded rail, thermally adjusting to neutral temperature as if the track is being built as new track, not under existing rail traffic. Since part of the trackwork on this Project is within an active commuter rail/freight line, there are many additional requirements and measures to prevent track buckling and the significant dangers inherent from improper procedures. At all times during trackwork on this Project, the DB Entity shall be familiar with and strictly adhere to the Policy on Track Buckling Countermeasures attached to the end of this Section as Attachment B.

1.3 SUBMITTALS

- A. Submit descriptions of equipment and the proposed procedure for rail grinding, prior to initiation of rail grinding. The MBTA Rail Grinding Specifications are applicable to this work; a copy has been included at the end of this Section as Attachment A.
- B. Submit a description of on-track equipment and procedures for final ultrasonic rail and weld testing in installed track, prior to initiation of testing program.
- C. Submit certified final ultrasonic rail test results.

- D. Submit complete record of rail adjustment information on form MBTA Rail Clipping/Anchoring Record included as Attachment C.
- E. All submittals will be reviewed for general conformance with the intent of the Contract Documents. This review will not relieve the DB Entity of final responsibility for the means, methods, procedures and sequences to be utilized.

1.4 QUALITY CONTROL

A. General

1. Perform final rail ultrasonic testing after rail grinding.
2. Ultrasonic testing shall be performed using on- track rail detector car.
3. Rail detector car shall be capable of detecting defects in rail, joints, shop welds, and field welds.
4. Inspection procedure shall include providing a permanent record, on tape or film, of rail tested and defects detected, showing type and location of each defect.

PART 2 - PRODUCTS

2.1 MATERIALS TO BE FURNISHED BY THE DB ENTITY

- A. Provide temporary new or approved relay 132 RE six hole toeless joint bars. This material shall conform to the dimension requirements for 132 RE rail, Standard Plan No. 1322, and shall be in conformance with the attached MS No.9227 in Attachment C.
- B. Provide temporary new or approved relay 115 RE six hole toeless joint bars. This material shall conform to the dimensional requirements for 115 RE rail, Standard Plan No. 320, and shall be in conformance with the attached MS No.9227 in Attachment C.
- C. Provide temporary new track bolt, nut and washer assemblies. Bolts shall be 1 1/8 inch x 5 3/4 inch and conform to the dimensional requirements for the temporary 132 RE joint bar, 115 RE joint bar, and be in conformance with MS No. 9227 in Attachment C and Standard Plan No. 1332.
- D. Electric flash butt welds as specified in Section 02851 – RAILROAD RUNNING RAIL.
- E. Thermite welds as specified in Section 02877 – THERMITE WELDING.

PART 3 - EXECUTION

3.1 WELDED RAIL INSTALLATION USING CWR STRINGS FROM A FIXED PLANT

A. General

1. Installation of CWR strings in track shall follow crosstie distribution and proper spacing of crossties.

2. Prior to start of CWR installation, the DB Entity shall participate in a conference chaired by the MBTA, including other attendees designated by the MBTA, to establish parameters for rail adjustment including the MBTA's requirements for record keeping. DB Entity shall be fully prepared to discuss methods and equipment for adjusting CWR.
 3. DB Entity shall de-stress rail by vibration and thermal adjustment after track has been brought to within one inch of final line and grade through initial surfacing and aligning. De-stressing of track shall be completed prior to final surfacing and aligning.
 4. Field cuts in CWR shall be made only after receiving the acceptance of the MBTA. Designate locations of field cuts by track designation, station of cut end of rail string, and right or left rail determined by facing in the direction of increasing stationing.
 5. Lay CWR so that shop welds in opposite strings are staggered at least ten feet.
 6. CWR strings installed in tracks with rail traffic shall be thermally adjusted as soon as possible after installation.
- B. Handle, and move as necessary, CWR in such a manner and by use of such equipment that will prevent bumping or striking of rail and will avoid damaging or excessively bending the CWR. Lay CWR in a manner which will prevent damage to rail, ties, fasteners, and structures. Do not drop rail. Use rollers to facilitate movement and placement and to reduce risk of damage to ties, fasteners and track appurtenances. Procedures to be in conformance with the AREMA Manual.

C. Cutting and Drilling of Rails

1. CWR strings may have a hole burned or drilled in each end to facilitate handling which shall be cut out prior to welding into track. Cut rail a minimum of 9" back of burned hole and 1" back of drilled hole using a rail saw.
2. Cut rails square and clean using a rail saw.
3. Do not cut rails for the installation of a bolted joint within 30" of a shop weld in the same rail string or opposing rail.
4. Accurately space and drill holes for bolting of rail in accordance with requirements of the current AREMA Manual for Railway Engineering, Specifications for Steel Rails, and MBTA Standard Plan Nos. 1300 and 1302. Drill holes with an approved rail drill. For temporary 132 RE joints and 115 RE joints, drill two holes only, leaving first hole space blank.
5. Drill cylindrical holes of specified diameter for the size bolt required through and perpendicular to web of rail.
6. Use a template, as a drilling guide, to locate holes both vertically from bottom of rail and horizontally from rail end. In no case shall a joint bar be used for this purpose.
7. Remove all rough edges from holes.
8. Cut out rail segments containing holes that are rejected by the MBTA.

9. Install 6 holes, 36" joints using 4 bolts per joint for temporary installations prior to initial surfacing per Section 02854 – TRACK SURFACING AND ALIGNMENT.

3.2 WELDED RAIL INSTALLATION USING STICK RAIL WELDED IN TRACK

A. General Procedures

1. Install new 132RE and 115RE 80' rails on new resilient fastener tie plates. In cases where new rail is laid on existing ties, all spike holes in existing ties shall have new tie plugs inserted.
2. Lay rails so that joints in opposite rails are staggered at least 10'.
3. Rails shall be temporarily joined with four track bolts per 36" joint bars secured by four bolts per joint.
4. When approved mobile electric flash butt welding unit is on track all joint bars shall be removed and rails welded.
5. Adjust rails to rail neutral temperature and clip per applicable requirements of Articles 3.3 and 3.4 of this Section.
6. The rail gap created at the end of a string by flash butt welding strings of rail in track shall be closed by cutting in a plug rail not less than 18' long in tangent or 21' long in curves and welding the plug.

3.3 THERMAL ADJUSTMENT OF CWRSTRINGS

A. General

1. Thermal adjustment shall follow initial surface and alignment to the tolerances as specified in Section 02854 – TRACK SURFACING AND ALIGNMENT.
2. Rail temperature shall be taken after track has been initially surfaced and lined just prior to rail adjustment. The temperature reading shall be used in computation of rail adjustment.
3. Determine rail temperature by an AREMA standard rail thermometer as specified in the current AREMA Manual for Railway Engineering.
4. Determine temperature of rail by placing rail thermometer on shaded side of rail base next to web and leaving it there for not less than five minutes and until no change in its reading is detected.
5. During adjustment of rail constantly monitor and record rail temperature readings of CWR on the Rail Clipping Record/Anchoring form in Attachment C of this Section.

B. Rail Movement and Rail End Gap

1. During thermal adjustment, determine the gap or rail movement between CWR strings and between CWR and bolted rail by the equation:

$$G = (t - T) LK + Q$$

Where:

G = Rail gap (inches)

t = Zero Thermal Stress temperature of 95 degrees Fahrenheit

T = Actual rail temperature at time of laying (degrees Fahrenheit)

L = Length of CWR being laid (feet)

K = Coefficient of thermal expansion for rail steel (0.000078 inches per foot per degree Fahrenheit)

Q = Rail gap as required by respective manufacturer of field weld kit and bonded standard joint. For bolted standard joint Q = 0.125", and for insulated joints Q equals the end post thickness. Q shall be 0.125 if field weld is not expected to be completed prior to operation of the first train over newly installed rail.

2. Take care not to damage rail ends during rail laying, ballasting, and other operations requiring passage of on-track equipment over rail joints. Install plug rail if rail ends are damaged.

C. Temporary Fastening of Rail for Use of On-Track Construction Equipment

1. Prior to placing equipment on newly laid rail, secure rail, allowing for proper gauge, surface, and alignment, in a manner that will prevent damage to CWR, rail fastening assemblies, ties, and other material.
2. Move equipment over partially secured track in such a manner as to prevent damage to structures and trackwork materials.
3. Prior to surfacing, fully clip all ties to allow for track raise and alignment.
4. Remove fastenings to adjust rail to its zero thermal stress length.

3.4 RAIL CLIPPING (ANCHORING)

A. General

Install rail clipping devices as specified herein and in accordance with manufacturer's recommendations.

3.5 RAIL FASTENING

- A. Rail fastening shall be with resilient fasteners. Install rail clips in accordance with the manufacturer's requirements exercising care in not overdriving clips to exceed the deflection limit.
- B. Rail fastening (clipping) shall commence immediately after the rail has achieved the rail neutral temperature and immediately following the rail heater if that method is used to achieve rail neutral temperature.

3.6 RAIL ALIGNMENT

A. General

- 1. Construct track conforming to alignment and profile data shown on Design Documents.
- 2. Alignment is based on centerline of track equidistant between the gauge sides of running rails.
- 3. For tangent track, profile refers to top of rail in the final position. For curved track, profile refers to top of low or inner rail of the curve in the final position.

B. Track Gauge

Measure track gauge between points 5/8" below top of rail and from inside face to inside face of running rails for Commuter Rail, 7/16" for LRT track. Measure track gauge at right angles to alignment of track.

C. Track Cant

- 1. Construct track with a 1:40 toward inclination of rails with respect to top of rail plane, except for track within limits of turnouts.
- 2. Track within turnouts where special turnout plates are used and through frog and guard rails shall be constructed without cant.

3.7 BONDED INSULATED JOINT PLUG RAILS

- A. Work shall include proper handling and placement of bonded insulated joint plug rails.
- B. Install plug rails at required locations within CWR as shown on Design Documents.
- C. The stagger of insulated joints shall not exceed 60", nor be less than 24".
- D. Install insulated joint plug rails while installing CWR. Saw cut CWR strings where required and pull string ahead to continue rail laying.
- E. Insulated joint plug rails shall be installed as suspended joints and crossties shall be re-spaced as necessary to meet this requirement.
- F. Insulated joints shall be clipped with modified "e" clips as shown on the MBTA Standard Plans and shall include a modified insulator in concrete crosstie construction.

- A. Joints created by installation of insulated joint plug rails shall be electric flash butt welded per Section 02856 – COMMUTER RAIL TRACK CONSTRUCTION.

3.2 RAIL GRINDING

- A. Rail grinding shall follow this order.
 - 1. Completion of track to specified tolerances
 - 2. Field welds
 - 3. Rail grinding
 - 4. Final ultrasonic testing
 - 5. Final acceptance
- B. Grind top and gauge side of running rail head only.
- C. Rail metal removed shall be as specified in Rail Grinding Specifications included as Attachment A.
- D. Make number of passes necessary to remove rust, mill scale, surface irregularities and as specified in 3.D, of the Rail Grinding Specification.
- E. After grinding operation, visually and randomly check the rail with a feeler gauge and a straight edge. If surface irregularities in rail head exceed 0.003” in a length of 6”, notify the MBTA and make a determination if additional passes of rail grinders are to be made.

3.3 FINAL ULTRASONIC TESTING

- A. Final ultrasonic testing shall be as specified in Article 1.4 of this Section and performed prior to final inspection and within one week following rail grinding operations. Trackwork, field welds, and rail grinding shall be completed prior to final ultrasonic testing.
- B. DB Entity shall remove and replace defective welds found by ultrasonic testing immediately following test or as otherwise directed by the MBTA. Defective welds shall be removed and replaced with a minimum 18-foot rail in tangent or 21-foot rail in curves and two field welds at DB Entity expense.
- C. After defect is corrected, DB Entity shall have replacement field welds ultrasonically tested.
- D. Rails found to be defective by ultrasonic testing shall be replaced by the DB Entity.

RAIL GRINDING SPECIFICATIONS FOR RAIL SERVICE
MASSACHUSETTS BAY TRANSPORTATION MBTA

I. Grinding Equipment Specifications.

Grinding equipment to be used on the Rail Service of the MBTA shall use conventional rotating grinding motors (3600 rpm) with a 10" O.D. grinding stone. The stone to be used shall leave an acceptable level of finish on the rail. No gouging of the rail is to be permitted. Significant blueing of the rail by the grinding equipment will be avoided.

Adequate spark guards and water sprays are required to minimize the danger of fires. The grinding equipment shall accommodate sufficient water to permit grinding for a full day under MBTA conditions.

The minimum range of motor adjustment shall be 24 Degrees Gauge to 15 Degrees Field. Motors shall be capable of adjustment (either manual or automatic) within this range so as to achieve the desired MBTA rail pattern(s). Minimum motor size is 15 Hp.

The grinding train shall be capable of grinding between 1.5 and 2.5 mph and shall remove .0008" of metal from the ball of the rail per pass for every 100 Hp available. Thus a 1500 Hp train shall remove .012 inch metal per pass. This metal removal shall be on the ball of the rail, away from any defects. (Metal removal at defects will vary according to defect type). The minimum metal removal for the grinding equipment, per pass, is 0.012". Metal removal measurements for verification will be made using a telebrineller or other suitable measurement device.

Since significant grinding of engine burns or low (battered) weld is expected, the grinding train shall have a "long wave" type feature.

The grinding equipment shall possess stacle clearance capability, to lift motors for switches, frogs, road crossings at its normal grinding, speed. It also shall be capable of grinding only one rail (as required).

II. Rail Grinding Specifications.

Rail grinding on the MBTA is to be carried out for two reasons; maintenance of rail profile and removal of rail surface defects.

Prior to the arrival of the grinding equipment a detailed inspection of the track to be ground will be carried out by railroad and DB Entity personnel.

The following specifications and standards are to be applied to rail grinding on the MBTA.

1. Rail Condition Inspection.

Prior to the arrival of the grinding equipment, DB Entity and railroad personnel will evaluate the condition of the rail in order to effectively plan for the utilization of the equipment, determine the sections to be ground and the number of passes required, and to avoid unnecessary delay. For planning and estimating purposes, it will be assumed that the grinding train utilization will be 60% (i.e. 40% of the time there will be railroad or travel delays.)

DB Entity and railroad supervisory personnel will have available appropriate measurement tools to include profilometer, telebrineller, and straight edge with either taper gage, dial indicator or depth micrometer for monitoring the performance of the grinding equipment.

2. Rail Profile Standards

In the area of rail profile standards, two major areas of activity are addressed: Rail Profile and Rail Flow.

A. Rail Profile

The desired rail profile for the Commuter Rail Service of the MBTA is a profile with a 10" top radius (as shown in Figure 1). Degradation of the railhead from this desired profile (by flattening) shall be monitored through the taking of rail profiles (using a profilometer) or using a "flatness™ gage.

When the profile degrades so that a measurable gap of 2/32 to 3/32 (corresponding to about a 30" radius) is seen when overlaying the desired profile onto the actual profile, then the rail shall be ground to restore the desired rail profile. (This gap is to be at or near the center of the rail head, to evaluate the rail "flatness". If the profile has a radius smaller than 10", the profile is acceptable providing it conforms to the remainder of the profile and lip standards.)

The final profile after grinding shall conform to the profile shown in Figure 1.

Conventional rail grinding equipment (see Rail Grinding Equipment section of this Specification) will be used on the MBTA for both profiling as well as correcting rail head surface defects. If no significant lip is present, a contour type pattern is to be used to restore the rail profile, with a motor distribution of 18 degrees gage to 15 degrees field. This profile shall have the following distribution.

20% of motors between 14 and 18 degrees gage 20% of motors between 5 and 10 degrees gage
15 % of motors between 1/2 and 4 degrees gage 20% of motors between 1 and 3 degrees field
20% of motors between 6 and 9 degrees field 5% motors at 15 degrees field.

B. Rail Flow

Plastic flow or lip will be ground if it results in a degradation of the profile pattern (field) or is excessive (gage). Plastic flow or lip on the gauge side of the rail head shall not exceed 3/16 to 1/4". When such a lip is present it shall be ground. This will be carried out using the conventional contour pattern presented above, but with approximately 10% of the grinding motors shifted to angles between 18 and 24 degrees to the gage. Using this pattern, both areas with and without lip can be ground, without having to continuously change grinding patterns. (Note: this pattern can also be used to grind the rail surface defects, without having to continuously change grinding patterns.)

Plastic flow to the field side of the rail head is a secondary problem on the MBTA. It shall be ground only in those cases where it significantly distorts the desired rail profile. It shall also be ground (or the rail remove) when it is 1/2" or larger in size. Grinding of field side flow will require an additional 5% of the motors shifted to 15 degrees filed.

3. Rail Surface Conditions

The following standards are defined for rail surface conditions on the Commuter Rail Service of the MBTA, These specifications are for corrugations, weld conditions and other rail surface conditions to include engine burns and new rail. This specification addresses only those conditions where grinding is required for maintenance of the rail surface. The list below presents a set of definitions for these rail surface conditions and defects.

A. Corrugations

For rail corrugation, rail grinding will be performed when 80% of the corrugations are .012 to .015" in depth or greater. The minimum length for grinding one section is 3 to 4 rail lengths (120 to 160'), unless the area has a large distribution of corrugations, and a rail grinder is already scheduled to be in the vicinity, in which case any section over one rail length shall be ground. Depth of corrugations after grinding shall be less than 0.005" for 80% of the corrugations. Corrugation depth measurements shall be verified with a parallel straight edge and dial indicator (or depth micrometer).

Rail shall not be ground when corrugation depths exceed 0.060" over 50% of the measured corrugations or if they are isolated, i.e. not near any site scheduled for grinding, and have corrugation depths greater than .050".

The pattern used by MBTA to grind, including the profile pattern(s) discussed in rail profiles (above) shall have grinding motors located in the range of -5 to +5 degrees, to remove rail corrugations. This can be incorporated as part of the contour pattern, if profile grinding is also being carried out. If profile grinding is not required, then additional motors may be used at the top of the railhead to eliminate the corrugations. The profile used shall not result in a flattening of the railhead.

B. Weld Irregularities or Defects

For rail weld irregularities, the following standards are defined:
High welds shall be ground when 25% of the welds are higher than .015 inches. Alternately, high welds can be ground when new rail ground within 20 MGT of installation. After grinding, 80% of the high welds shall be less than .005".

Low welds shall be ground when 25% of the welds are more than .025". After grinding, 80% of the welds shall be less than .010".

Low welds deeper than .040" shall not be ground, but shall be welded or replaced. Depths of welds will be verified using straight edge and taper gage or other suitable measurement equipment.

The pattern used to grind low welds shall have grinding motors located in the range of +/- 15 degrees. This can be incorporated as part of the contour pattern, if profile grinding is also being carried out.

C. Engine Burns.

The grinding of engine burns shall be carried out only if there is significant grouping or clustering of the engine burns. Individual engine burns shall be welded or replaced. Engine burns shall be ground when 50% of the defects are deeper than .020 to .025". Grinding shall take place when there are groups or clusters of defects. After grinding, 80% of the engine burns shall be less than .010" in depth.

Isolated engine burns or groups of engine burns deeper than 0.040" shall not be ground, but shall be welded. If the burn is deeper than 1/8", the rail shall be replaced. Engine burn depth shall be measured using straight edge and dial indicator (or depth micrometer).

The pattern used to grind engine burns shall have grinding motors located between ± 12 degrees. This can be incorporated as part of the contour pattern, if profile grinding is also being carried out.

D. New Rail.

New rail will be ground with one pass of a conventional grinding train with 20 MGT of installation of the rail. A second pass will be ground only if required to remove high welds or other rail surface defects. The pattern used shall be the contour pattern recommended under Rail Profile above.

- I. Introduction
- II. Track Work Methods and Criteria
- III. Record of Disturbance of Main Track CWR Territory
- IV. Protection and Corrective Action Requirements
- V. Glossary
- VI. Instructions for Preparation of the Report of Disturbed Track
- VII. Instruction for Report of Track Movement due to Surfacing
- VIII. Summary Report of Track Disturbance

PART I. Introduction

Buckled track has always been a major concern in the railroad industry. Incidents within the industry of buckled track and derailments due to buckled track have been steadily growing since the introduction of CWR. Industry wide in the United States, FRA reports, under Cause Code 115 (Buckled Track), railroads are experiencing over 100 derailments per year.

Amtrak and the MBTA, by the nature of their operations cannot tolerate risk of buckled track. Buckled track is, in reality, not a cause but is rather the result of some deficiency in the track structure or track maintenance procedures. This means that a properly constructed and maintained piece of track will not buckle from thermal loading during normal seasonal variations of temperature. There shall be something else present for buckling to occur such as misalignment, substandard ballast section, loss of neutral temperature, rail anchor deficiency, etc.

Current research has shown that the critical parameters or conditions influencing track buckling are:

1. Track Lateral Resistance.
2. Track Longitudinal Resistance.
3. Track Curvature.
4. Initial Alignment Deviation.
5. Rail Neutral Temperature.
6. Dynamic Train Loading.

As can be seen above, the operations of the Track Department in its construction and maintenance activities, have complete control over the first five critical items and substantial influence on the sixth item. If track buckling is to be prevented all six items shall be controlled and maintained within standards. Also, effective protective measures shall be applied when conditions are present which take any of the critical items into a danger zone.

Ensuring that track will not buckle depends on the knowledge of buckling causes and safe temperature values and on the ability to detect and/or prevent buckling conditions. In this light, the following is a brief description of the relationship of various Maintenance of Way activities to the critical items influencing track buckling, with the possible result if executed outside of established standards.

Lateral Restraint

<u>Operation</u>		<u>Temperature Condition</u>	<u>Potential Result*</u>
Undercutting)	Above Neutral Temperature	Potential buckling immediately or shortly after operation
Surfacing)		
Cribbing)		
Tie Renewal)		
)	Below Neutral Temperature	Contributes by allowing track movement in curve territory, thereby lowering neutral temperature with potential for buckling next hot season.
)		
)		
)		
)		
)		

Longitudinal Restraint

<u>Operation</u>		<u>Temperature Condition</u>	<u>Potential Result*</u>
Undercutting)	Above Neutral Temperature	Allows longitudinal track movement, thereby altering the neutral temperature producing a potential for immediate buckling at fixed objects or the potential for buckling the following hot season.
Surfacing)		
Cribbing)		
Tie Renewal)		
Anchor/Clip Removal and Application)		
)		
)	Below Neutral Temperature	Allows movement in curve territory producing potential for buckling in following hot season.
)		
)		
)		

* If not executed within prescribed limits.

1. Track Curvature

Curved track is more prone to buckle than tangent track, and as curvature is increased the temperature at which a track will buckle is decreased.

2. Initial Alignment Deviation

Although alignment deviation is a condition rather than a work function, we shall be sensitive to the fact that alignment deviation significantly reduces the temperature increase at which a track will buckle. As an example, a deviation increase from 1" to 1 1/2" will reduce the buckling temperature by as much as 40°F.

3. Rail Neutral Temperature

Shifts in rail neutral temperature are hard to detect and measure. Shifts of 30 °F. to 40°F. for the established neutral temperature for a territory can be critical and lead directly to buckling. In addition to the items described under lateral and longitudinal restraint, other factors influencing rail neutral temperature variations are:

1. Cold rail installation. (Improper Practice)
2. Inadequate rail temperature control or adjustment when replacing rail in maintenance work or field welding.
3. Inadequacy of rail anchors/clips and crib ballast.
4. Lateral shifts in curves through lining operations or track movements.
5. Skeletonizing track for any reason.
6. Inadequate ballast section.

All of the above items, if improperly executed or allowed to exist in a deficient condition, will cause a downward shift in the neutral rail temperature and produce a potential for buckled track.

4. Dynamic Train Loading

In a recent FRA study of 85 derailments due to buckled track, in 90% of the cases the first derailed car was the 10th or greater car in the train. This indicates that the buckling occurs under the train, thereby leading to the conclusion that train loading of the track structure plays a role in the buckling of track. There are a number of ways in which the dynamic train loads influence track buckling.

- a. Train induced uplift of the track structure can cause a large reduction in buckling temperature.
- b. High L/V ratios accelerate the growth of initial misalignments.
- c. Braking and traction forces typically produce an additional 10 tons of compressive force in the track.

Since the above items are sensitive to the geometric condition of the track and the application of slow orders, we shall recognize them when planning and executing track work and the effects on buckling potential.

As can be seen from the previous discussion, all Maintenance of Way track operations are related to the potential for track buckling. Some are more obvious than others. This policy establishes procedures and controls to minimize the possibility of Maintenance of Way track operations adversely affecting the track structure to produce a potential for buckling.

PART II. Track Work Methods and Criteria

To establish and maintain a neutral temperature in CWR territory that will prevent the potential of buckled track, the following work methods and restrictions will be adhered to, in addition to instructions presently contained in the MBTA's MW1.

1. Installing CWR

All CWR (Rail greater than 78' in length) will be installed at temperature between 90°F. and 110°F. inclusive, unless it is specifically accepted by the MBTA. This approval will be specific by track number and milepost location. When the temperature of CWR is below 90°F at the time of installation, the rail shall be expanded to a length which will produce an equivalent neutral temperature between 90°F and 110°F over the entire length inclusive, by use of an approved heating device. The required expansion will be calculated, executed and recorded in accordance with Section 119.5 and 119.6 of Part II of the current MW1. To assure uniform expansion the rail shall be vibrated by an approved rail vibrator. When making emergency adjustments of CWR the tie plates and rail can be tapped lightly along the entire length in lieu of a rail vibrator. For concrete tie territory one fully clipped concrete tie will be considered the same as one (1) wood tie box anchored for purposes of complying with the requirements of Section 119.6 of the MW1.

Any exemption granted by the MBTA will be in written format and remedial and/or protective action will be specified as part of the exemption.

2. Installing Rail Plugs in CWR Territory

When it is necessary to install rail plugs in CWR territory due to replacement of defective rails, field welding, insulated joint failures, etc., an approved heating device shall be used to assure the amount of rail installed is equal to or less than the length of rail removed. Hydraulic expander use is limited to restraining CWR while making field weld or assist their joining of CWR strings in cold weather. If in emergency requirements of this section cannot be met, the Foreman in charge shall accurately complete the information required in Part 111 of this procedure under "Report of Rail Cut in Main CWR Track", and report to his Roadmaster the reason he could not comply with requirements of this section. In addition, the foreman shall take the protective action described in Section 8 of this part.

3. Field Welding Without Rail Plug Installation

When field welding a single joint between CWR strings which have been temperature adjusted and whose rail temperature is less than the neutral temperatures, the necessary gap for welding will not be developed by allowing the rail to contract. The following method will be used:

- a. After re oval of the joint bar, remove with an approved rail saw 1" of rail to provide the required welding gap. Torch cutting of rail is prohibited.
Apply a hydraulic expander to return the rail ends to a 1" gap and while holding this position, proceed to make the weld in accordance with existing procedures.
- c. Upon completion of weld restore anchors or clips in each direction to effective positions as required, before removal of the hydraulic expander.

4. Undercutting; Out of Face Surfacing and Lining; Out of Pace Tie Renewal

(REVISED 10/30/87)

The above operations will not be performed at rail temperatures of less than 30°F.

In emergency situations the MBTA may grant permission upon request of the DB Entity to perform this work at less than 30°F, but the authorization will be specific by track number and milepost location. It will be issued in written form and remedial and/or protective action will be specified as part of the exemption.

5. Panel Turnout or Panel Track Installation in CWR Territory

When installing panel turnouts in CWR territory at less than 90°F rail temperature it is essential that there is no net addition of rail to the track upon completion of the panel installation. To insure this, the following procedure will be used:

- a. Measure the total length of rail in the panels to be installed and the rail temperature at time of measurement.
- b. Calculate the equivalent length of rail in the panels to be installed at 90°F in accordance with Section 119.5 of Part II of the MW1.
- c. Measure on each rail the calculated lengths. If a turnout is being installed, locate the Starting Point to assure the Point of Frog is in the proper location.
- d. Cut the rails according to the measurements made above, and remove the existing track.
- e. Upon installation of the last panel, do not cut rail to fit, but by of an approved heating device or hydraulic rail expander, expand the CWR string being connected to meet the rail of the last panel installed.
- f. During expansion, vibrate or tap the rail and plates to assure uniform expansion.
- g. Upon completion, assure that anchors and/or clips on the CWR in both directions have full bearing and add additional anchors as necessary to comply with Section 213.120(d) of Part I of the MW1.

If, in emergency, the requirement of this section cannot be met, the Foreman in charge shall accurately complete the information required in Part 3 of the procedure under "Rail Cut in Main CWR Track" and report to his Roadmaster the reason he could not comply with the requirements of this section. In addition, the Foreman shall take the protective action described in Section 8 of his part.

6. Cut and Throw of Track

When existing CWR track is cut and thrown at less than 90°F. rail temperature, it will be considered to have lost its temperature adjusted condition and will have to be adjusted in accordance with Section 1 of this part, Installing CWR.

7. Curve Realignment (Out-of-Face)

When curves are realigned out-of-face in excess of the following amounts:

- | | | |
|--------------------|---|---------------------|
| Curves Under 2° |) | 2" to the Outside. |
| |) | 1" to the Inside. |
| Curves 2° and Over |) | 2" to the Outside. |
| |) | 1/2" to the Inside. |

They will be considered to have lost their temperature adjustment and will have to be adjusted in accordance with Section 1 of this part, Installing CWR. Out-of-face curve realignment is defined as shifting a curve consistently in one direction at all throw points. The normal balancing of throws done during high speed surfacing operations does not constitute out-of-face curve realignment.

8. Protective Action

When any of the requirements of this part are not met, a 30 MPH speed restriction will be applied until the requirements of this part are met.

PART III. RECORD OF DISTURBANCE OF MAIN TRACK IN CWR TERRITORY PURPOSE

To maintain a record of any disturbance of main track in CWR territory which can cause a downward shift in the neutral temperature of continuous welded rail. This downward shift of neutral temperature can occur when any of the following operations are conducted below the established neutral temperature:

1. Undercutting.
2. Out-of-face tie replacement.
3. High speed surfacing.
4. Field welding.
- *5. Rail replacement.
6. Anchor removal or clip removal (more than 8 ties per 39' section of rail).
7. Cribbing operations {in excess of 8 cribs per 39' section of rail}.
- *8. Panel track installation.
- *9. Panel turnout installation.
10. Cutting and throwing of track.

*When current destressing procedures are not complied with and rail adjusted to 90°F or above.

IMPLEMENTATION

For purposes of implementation of this procedure, any of the above operations conducted in a manner not in compliance with Part II of this policy, whether under a granted exception or emergency condition, will fall under the Scope of this Part, and following report will be completed.

REPORT OF TRACK DISTURBANCE

When any of the above operations are not conducted in accordance with Part II of this Policy, a "Report of Track Disturbance" will be made by the Foreman in charge. Part A of this form will be completed for all work listed above when the requirements of Part II are not met. Part B will be completed whenever CWR in main track is cut or broken for any reason and the requirements of Part II are not met. The "Report of Track Disturbance Form" with instructions is attached as Appendix A. When this report is completed by the Foreman, Copy A will be forward to the Track Roadmaster with Copy B to be retained by the Foreman for his record.

REPORT OF TRACK MOVEMENT DUE TO SURFACING:

During out of face surfacing operations, the neutral temperature can be adversely affected on curved track by lining to the inside of a curve, on line drift caused by reduced longitudinal resistance of the track structure, and train traffic.

For track receiving out-of-face surfacing, a "Report of Track Movement Due to Surfacing" will be made for each curve worked. This report will be required in addition to the Report of Track Disturbance. This report will be completed by the DB Entity on whose territory the work is being performed. The "Report of Track Movement Due to Surfacing" form with instructions is attached to this procedure as

Appendix B. When this report is completed by the DB Entity, Copy A will be forwarded to the MBTA and Copy B will be retained for his record.

WEEKLY SUMMARY REPORT OF TRACK DISTURBANCE

On a weekly basis, the DB Entity will submit to the MBTA, a "Summary Report of Track Disturbance", attached to this procedure as Appendix C. This report will be reviewed by the MBTA, and the DB Entity will propose correction action at locations identified requiring corrective action.

PART IV. Protective and Corrective Action

1. Annual Inspection

Annually, a walking inspection of all main track will be conducted. This inspection will be made by the MBTA in the company of the DB Entity. The inspection will concentrate on compliance with standards in the following areas:

1. Anchor Pattern
2. Anchor Position
3. Ballast Section
4. Evidence of longitudinal rail movement, particularly at fixed locations, such as turnouts and grade crossings.

The MBTA will, upon completion of the inspection, submit a report of the inspection which identifies track inspected by number and milepost limits, the name of the individuals inspecting, date inspected, and any exceptions found, with protective and corrective action identified.

2. Special Inspection in Hot Weather

When the air temperature is 90 °F or above, all main tracks shall be inspected by qualified Track Inspectors, hired by the DB Entity, in accordance with currently established inspection procedures, outlined in the MBTA's MW-1. The Track Inspector shall make out an individual report for this inspection, and submit it to the MBTA. The DB Entity will log the inspection in his Summary of Special Inspections.

During this inspection, the Track Inspector shall be particularly alert for wavy track, longitudinal rail movement, kinked joints in compression and evidence of lateral track movement. He shall also be aware that the following conditions increase the possibility of buckling:

- a) Recent worked track
- b) Mud spots
- c) Existing deformations in line and surface
- d) Fixed facilities (i.e., turnouts, road crossings, bridges, etc.)
- e) Sub-standard ballast section
- f) Sub-standard anchor pattern

If any track is identified as having any conditions which indicate the possibility of buckling, immediate protective action shall be taken in the form of a slow order or removal from service, depending on severity.

3. Protection of Sub-standard Condition

If a Sub-standard Condition is found to exist, the following minimum protective action will be taken when the air temperature is expected to exceed 80°F:

- a) Substandard Anchor Pattern, or Ineffective Anchors Reduce speed over the affected track to 30 MPH
- b) Substandard Ballast Condition
Reduce speed over the affected track to 30 MPH
- c) Missing clips on concrete tie track.
If both clips are missing on each side of a rail on one tie at a rate of more than four (4) ties per 39' of rail, reduce speed to 30 MPH over the affected track.

4. Protective Slow Order after Surfacing, Undercutting and Out of Face Tie Renewal

A 30 MPH protective slow order will be applied after out-of-face surfacing, undercutting or tie renewal for a period of 24 hours and a minimum of 12 trains over the affected track.

After 24 hours and prior to removal of the slow order, the involved supervisor will verify by conversation with the Chief Dispatcher that the required 12 trains have passed over the track. He will also make a walking inspection over the work area prior to removal of the slow order to determine that there are no deficiencies in the track structure that will prevent the safe passage of trains at scheduled speed.

For existing concrete tie track, which has had out-of-face surfacing and has been treated with the dynamic track stabilizer, or with a crib and shaller compactor with all compacting components fully operational and for a minimum 6-second cycle, the slow release policy will be as follows;

- a) First train 30 MPH over the area. The MDZ in travel configuration may run over its own work at a speed not exceeding 30 MPH and this passage will meet the requirements of "first train 30 MPH over the area."
- b) Walking inspection by the involved supervisor to assure no deficiencies (i.e. misalignments, ballast section, anchoring, etc.) exist which would adversely affect the safe passage of train.
- c) 60 MPH speed restriction for a 24 hour period and the passage of 12 trains for track treated with a Crib & Shaller Compactor or 80 MPH speed restriction for a 24 hour period and the passage of 12 trains for track treated with a Dynamic Track Stabilizer.
- d) After "c" above, the track may be returned to normal speed.

Spot surfacing operations will be protected as follows:

When the air temperature is not expected to exceed 70°F and rail temperature is not expected to exceed the anchoring temperature of record for a 24 hour period after work, the following spot surfacing operations may be conducted with the protection prescribed below:

- Spot Surface & Line 0' to 40' No protection required
- Spot Surface & Line 41' to 200' 60 MPH S.O. for 24 hrs & 12 Trains

The involved supervisor will make a ground inspection of the work area prior to returning the track to scheduled speed to determine that no deficiencies exist in the track structure that will prevent the safe passage of trains at scheduled speed (i.e., full ballast section, proper anchoring, etc.).

If, in fact, the air temperature exceeds 70 °F in the 24 hour period following work and until 1 or 2 trains have passed, then a 30 MPH speed restriction shall be immediately applied.

5. General Speed Restriction and Suspension of Work

(REVISED 04/25/85)

During periods of extreme heat, when air temperatures are 95°F or above during a 24 hour period, a general speed restriction of 80 MPH will be placed in effect over the affected territory for the period that the air temperature is 95°F or above. The general speed restriction will be placed and removed by the MBTA, specifying the territory over which the restriction is to be applied.

In addition, the following work will be suspended when air temperatures are expected to be 95°F or above during a 24 hour period:

- a) High Speed Surfacing
- b) Smoothing (From 11:00 AM to 8:00 PM)
- c) Tie Renewal (Except under a continuous track outage)

6. Working Under a Continuous Track Outage

When undercutting, renewing ties out-of-face, and other work which disturbs the ballast is in progress under a continuous track outage, and it is expected that the air temperature will be 95° or above at the time track is returned to service, the 30 MPH speed restriction will remain in effect until seven (7) days of traffic is accumulated or until the period of high heat ends. The 30 MPH speed restriction, if required after the initial 24 hour period, will be in effect during the period of the day that the air temperature is 95°F or above.

7. Protection of Work Areas far Latent Effect

In addition to the above, track which has been worked within seven (7) days prior to the onset of high heat will be reduced to the Protection Slow Order speed required under Section 4 of this part until seven (7) days of traffic has been accumulated, or the period of high heat ends. The speed restriction, if required after the initial 24 hour period, will be in effect during the period of the day that the air temperature at 95°F or above.

V.GLOSSARY

Braking Force - The longitudinal force induced into the rail as a result of brake application of a train.

Buckling Temperature Increase - The amount that the temperature of the rails of a track shall be increased over the neutral temperature for a track to buckle.

Continuous Welded Rail (CWR) - Rail in excess of 78' in length.

Dynamic Train Loading - Forces which are imparted to the track structure during the passing of a train due to wheel action and vehicle response.

L/V Ratio - The relationship of lateral force on the rail to the vertical force on the rail which is produced by the wheel of a train.

Lateral Resistance - The ability of the track structure to remain in position under the influence of in service forces which are generated in a plane perpendicular to the line of the rail. Lateral resistance is a product of interaction of the ballast with the sides, bottom, and end face of the tie.

Longitudinal Resistance - The ability of the track structure to remain in position under the influence of in service forces which are generated in a plane which is parallel to the line of the rail. Longitudinal resistance is a product of the interaction of the ballast, the tie body, rail anchor bearing, and rail anchor rail grip.

Neutral Temperature - The rail temperature at which there is no internal stress in the rail, either tensile or compressive.

Out of Face Tie Removal - Tie replacement at a rate of more than four (4) ties per 39' rail.

Out of Face Surfacing and Lining - Surfacing and/or lining a continuous piece of track in excess of 500 feet.

Safe Temperature Increase - The amount that the temperature of the rails of a track may be increased over neutral temperature without buckling, considering the influence of lateral geometric imperfections, and lateral resistance.

Smoothing - Spot surfacing where no more than five (5) consecutive ties are disturbed from the tie bed.

Thermal Loading - The compressive forces generated in the rail due to its temperature being increased above its neutral temperature.

Track Breathing - The changing of the neutral temperature of CWR as a result of the natural cycle of seasonal temperature and the effect of the dynamic loading due to train operations.

Track Buckling - The sudden formation of large lateral misalignments caused by high compressive forces, in the presence of some other influencing factors.

Traction Force - The longitudinal force induced into the rail as a result of tractive effort of the locomotive and the rolling of the wheels of allequipment

VI. INSTRUCTIONS FOR PREPARATION OF THE REPORT OF DISTURBED TRACK

A report of disturbed track will be made out as required by Part II of the Policy on Track Buckling Countermeasures. The report will be completed by the Foreman in charge of the work as follows:

Part A - This part will be completed in its entirety any time track is worked and a report is necessary as outlined in the policy.

Part B - This part will be completed any time main track CWR is cut or broken for any reason.

The distance over which rail movement occurred will be measured as follow

1. Prior to cutting the rail or removing bolts from a joint and using yellow marking crayon, make a mark on the base of the rail and tie plate. These marks will be made on every twentieth tie for 900' in each direction.
2. After the rail is cut or the joint is brokers, inspect the marks and identify the last mark showing movement in each direction from the work.
3. Measure the total distance between the marks identified in No. 2 above and record on the form.
4. In the event of a rail weld or joint service failure, the movement shall be estimated by inspecting in each direction for anchor movement. After identifying the last anchors showing movement, measure and record the distance between the anchors identified.

RAIL ANCHORING/CLIPPING RECORD

JOINT BARS & FASTENINGS

MATERIAL AND MANUFACTURE

Standard joint bar material and manufacture shall be in accordance with AREA Manual for Railway Engineering, Chapter 4, Part 2 - Specifications for "Quenched Carbon-Steel Joint Bars and Forged Compromise Joint Bars."

Track bolts and nuts material and manufacture shall be in accordance with AREA Manual, Chapter 4, Part 2, "Specifications for Heat-Treated Carbon-Steel Track Bolts and Carbon-Steel Nuts."

1. Prior to shipment entire bolt thread shall be coated with an approved oil or grease to protect threads.
2. Bolt and nut shall be assembled by turning nut onto bolt at least 2 threads.

Lockwashers material and manufacture shall be in accordance with AREA Manual, Chapter 4, Part 2, "Specifications for Spring Washers."

DESIGN

Joint bars shall be in accordance with MBTA Standard Plans for 115 lb. and 132 lb. rail as specified in the order. All other rail section joint bars shall conform to AREA Manual, Chapter 4, Part 1 with length and punching as specified in the order.

Compromise joints shall be in accordance with MBTA Standard Plans for rail sizes as specified in the order.

Track bolts shall be rolled, button-head, elliptic-neck bolts with wrench fit thread and shall be provided with standard square nuts all per AREA Manual Chapter 4, Part 1. Bolt diameter and length shall be as specified in the order.

Lock washer diameter shall be as specified in the order and washer configuration shall conform to requirements of ANSI, B27.1, for "Extra Heavy Duty Helical Spring Lock Washers."

INSPECTION

Inspection and testing shall be in conformance with the inspection procedures outlined in AREA Manual, Chapter 4, part 2.

Prior to shipment, the manufacturer or supplier shall submit certified inspection and test reports.

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9227

JOINT BARS & FASTENINGS

Joints, bolts and nuts, and lock washers are subject to inspection at delivery and are at suppliers risk until accepted by the Authority.

DELIVERY

Joints shall be wired into pairs, palletized and strapped for shipment.

Bolts and nuts shall be packed in sealed kegs with a maximum of 200 pounds per keg. Kegs shall be palletized and wrapped or strapped for shipment.

Lock washers shall be packed in steel pails or kegs with a maximum of 200 pounds per container.

Material rejected because of non-conformance with this specification will be returned at supplier's expense.

SECTION 02854

TRACK SURFACING AND ALIGNMENT

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This section specifies general procedures for curve modifications in existing track which include track throws and changes in superelevation.
- B. Also included are the following:
 - 1. Initial and final surfacing and aligning of tracks and turnouts.
 - 2. Ballast compaction.
 - 3. Curve and superelevation modifications in existing track.
 - 4. Installation of superelevation tags.
 - 5. Resurfacing and aligning of track and turnouts.
- C. The DB Entity shall perform the above work in accordance with applicable recommended practices set forth in the current AREMA Manual for Railway Engineering and as specified herein.

1.2 SUBMITTALS

- A. Submit name and location of proposed ballast supplier and laboratory test results confirming that ballast furnished meets the requirements of Section 02858 – BALLAST.
- B. Submit the type and specifications of equipment to be used in placing, compacting, and tamping ballast, aligning track and turnouts.
- C. Submit charts as specified from tamper/liner for all curves.
- D. All submittals will be reviewed for general conformance with the intent of the Contract Documents. This review will not relieve the DB Entity of final responsibility for the means, methods, procedures and sequences to be utilized.

1.3 HANDLING

- A. Superelevation Tags
 - 1. Shipping
 - a. Tags shall be grouped by markings and wired together; nails shall be in boxes.
 - 2. Delivery
 - a. To be accepted, the superelevation tags delivered to the DB Entity shall conform to these Mandatory Specifications in all respects. Material rejected for non-compliance with these Mandatory Specifications will be returned to the supplier wholly at the supplier's expense.

1.4 QUALITY CONTROL

A. Tolerances

1. Tolerances, cross level, superelevation, and horizontal and vertical alignment of ballasted track shall be as specified herein. Deviation from the cross level, superelevation, horizontal alignment and vertical alignment shall not exceed the tolerances specified in Part 3 of this Section.

PART 2 - PRODUCTS

2.1 MATERIALS TO BE FURNISHED BY THE DB ENTITY

A. Ballast

1. Provide new stone ballast in conformance with the MBTA Specification in Section 02858 – BALLAST.

B. Superelevation Tags

1. New superelevation tags, to mark the superelevation on curved track, shall be stainless steel 22 gauge, American Iron and Steel Institute Type 302 with unpolished finish No. 4. The tags shall be stamped with embossed gothic figures and fraction. Fractions to be as shown on attached MS No. 9254 – Superelevation Tags.
2. Fluted galvanized nails.
3. Epoxy or construction adhesive accepted by the MBTA.

PART 3 - EXECUTION

3.1 CONSTRUCTION TOLERANCES

- #### A. Final surface, aligning, and gauge of track shall be within the following tolerances.

TRACK SURFACE, ALIGNMENT, AND GAUGE TOLERANCES

Deviation from uniform profile on either rail at the mid-ordinate of a 62' chord shall not exceed – 1/4"

Deviations from zero cross level at any point on tangent or from designated elevation on curves or spirals shall not exceed – 1/8"

The difference in cross level between any two points less than 62' apart on tangents or curves shall not exceed – 1/8"

Deviation from uniform alignment between any two points less than 62' apart on tangent and curved track shall not exceed – 1/4"

Deviation from 4' 8 1/2" track gauge shall not exceed – 1/16"

B. Runoff – Vertical Alignment

1. The runoff at the end of a raise into a hold point in track, such as at the Project limits location, shall not exceed ¼” in 62’ of track unless otherwise accepted by the MBTA.

3.2 SURFACING AND ALIGNING NEW TRACK

A. Ballasting

1. Following assembly of track, unload ballast in tie cribs and shallers of track structure.
2. Unload ballast in quantities which will fill tie cribs and provide an adequate amount of ballast for the initial track raise with sufficient surplus to continue to hold track after initial raise.
3. Prior to dumping ballast in track, ties shall be properly spaced as specified and shall be square with rails.
4. DB Entity shall re-space and straighten ties as required before stone is distributed.
5. The DB Entity shall use a ballast regulator machine to distribute the stone ballast in sufficient quantity for tamping the track and for restoring the ballast section.
6. The DB Entity shall avoid pulling sod, vegetation, and other foreign material onto the track structure or shallers for purpose of tamping or dressing the ballast section. Any sod, vegetation or foreign matter inadvertently pulled in shall be removed by the DB Entity prior to tamping.
7. Clean the track way area of all debris and standing water prior to placing of ballast. Do not place ballast on frozen subgrade or subballast.
8. Deliver ballast at a rate no faster than can be satisfactorily incorporated into the work.
9. To the extent practicable, unload ballast in position for use with a minimum of redistribution and dressing.

B. Tamping

1. Tamp ballast with 16 tool, squeeze-vibratory type, power tamping equipment. Control of power tamper shall ensure maximum compaction of ballast uniformly along track. The MBTA will determine tamping variables, including rate of advance, number of passes, number of insertions per tie (if more than two are required), length and number of blades, and frequency of vibration. Tamping tools shall be replaced when the working surface is worn more than 30% of its original surface area. Procedures and equipment shall be as approved. To allow for proper insertion depth below bottom of crossties, the tamping tools shall be adjusted to compensate for concrete/timber crosstie size difference.
2. Tamp ballast thoroughly under both sides of tie from a point 15” inside rails to ends of tie.
3. For each tie, tamp simultaneously inside and outside both running rails on both sides of tie. Minimum tamping insertions will be two.
4. Immediately following each tamping lift, cribs and shallers shall be compacted by a machine specifically designed for this purpose. Crib and shaller compaction machine shall be as approved.

5. The DB Entity shall remove 5 ties per mile, at locations selected by the MBTA, in order that the MBTA may inspect ballast compaction beneath ties. If compaction does not meet requirements of these Mandatory Specifications, additional ties shall be pulled at the MBTA's direction to discover limits of inadequate tamping. Areas of inadequate tamping shall be retamped at no additional cost to the MBTA.
6. Tamping on snow covered or frozen ballast will not be permitted.

C. Initial Surfacing and Aligning

1. Surface and align track and turnouts to achieve horizontal and vertical alignment as specified.
2. Initial surfacing and aligning shall be performed to bring track geometry to within one inch of final profile and to within one inch of final alignment, prior to thermal adjustment of rail.
3. Surface and align track by methods which will prevent undue bending of rail, straining of joints, or damaging of rail fastening assemblies.
4. Surface and align track only after cribs are filled with ballast.
5. The amount of any track lift shall neither exceed three inches nor endanger horizontal and vertical stability of tracks.
6. Perform as many raising and surfacing passes of three inches or less as needed to bring track surface to within one inch of final design elevation as shown on Design Documents.
7. Initially line track to within one inch of final alignment.
8. Restore ties pulled loose during surfacing to full bearing against rail and properly secure them.
9. Remove and replace with new ties and fasteners any ties or fasteners damaged during surfacing operations at no additional expense to the MBTA.

D. Final Surfacing and Aligning

1. Final surfacing and aligning of track and turnouts shall be completed after track has been initially surfaced and aligned, thermally adjusted, clipped and field welded.
2. Final surfacing and aligning shall be performed on all track and turnouts within project limits.
3. Final surfacing and aligning shall be required to bring the track and turnouts to final grade and alignment and to comply with surface and superelevation tolerances specified and shall consist of a lift of one inch maximum unless otherwise directed by the MBTA.
4. During final track raise, line track to final alignment. Track liner employed shall be a fully automatic model capable of determining existing curve data, computing new values for optimum curve value, and lining track to the new values without disturbing track surface. Machine shall be capable of producing a tape or graph showing existing and proposed values and this tape shall be reviewed and accepted by the MBTA prior to final lining. Tape shall become the property of the MBTA.

E. Ballast Compaction and Ballast Dressing

1. Concurrent with both initial and final surfacing and aligning of all tracks and turnouts, consolidate cribs and shallers and dress ballast to conform to ballast section shown on accepted Drawings.
2. Compact ballast shallers and cribs, after each surfacing raise, using a track machine specifically designed for that purpose. Machine shall compact cribs and shallers continuously by applying a combination of pressure and vibration. Ballast compaction shall be completed prior to any train operation.
3. After final surfacing and alignment of track is completed, consolidate cribs and shallers and dress ballast to conform to ballast section shown on MBTA Standard Plans. Top of ballast shall be one inch below base of rail.
4. Subbase outside toe of slope of ballast that has been fouled or disturbed by DB Entity's operations shall be properly sloped as shown on MBTA Standard Plans.
5. Upon completion of final surfacing and aligning produce as-built chart form tamper or liner and submit to the MBTA.

3.3 CURVE RE-ALIGNMENTS AND ADJUSTMENTS IN EXISTING TRACK

- A. All work within existing CWR track shall be governed by the Track Buckling Countermeasure requirements, Attachment B of Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
- B. Before realigning existing curves where throws exceed either 2" outward or ½" inward, both rails at the end of curve away from the start of realignment shall be cut in two places and twelve feet of rail removed.
- C. After realignment, surfacing and adjusting superelevation, thermal adjust rail in disturbed track and anchor rail as prescribed in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
- D. Cut plug rails not less than 18 feet long and thermite weld into gap created prior to curve re-alignment. Make additional cut in parent rail if gap is less than 18'.

3.4 FINAL TRACK INSPECTIONS

- A. Final horizontal and vertical alignment, gauge, superelevation and cross level shall be within the tolerances specified. In order to determine the acceptability of finished track, the DB Entity together with the MBTA shall conduct a final inspection to establish that track construction is within tolerances specified herein.
- B. Track deviations disclosed by inspection, which exceed tolerances specified herein, shall be corrected by the DB Entity at no additional cost to the MBTA. Reinspections shall be made by the DB Entity and MBTA to ensure that corrections have been made.
- C. Final inspection will include testing by an MBTA furnished track geometry test car capable of testing gauge, cross level, left and right rail profiles, track alignment, twist, warp and superelevation. Test car is capable of measuring the parameters specified above with sufficient accuracy to establish that the track construction is within the specified tolerances.
- D. Notify the MBTA one month in advance regarding the request for the scheduling of final track inspections.

- E. The DB Entity shall correct track deviations, as disclosed by final inspection, at no additional cost to the MBTA.
- F. The DB Entity shall participate in any retesting, required as a result of corrections to work, at no additional cost to the MBTA. Cost of MBTA supplied geometry car and crew, required for retesting, shall be borne by the DB Entity and will not exceed \$1,000.00 per retest.

3.5 SUPERELEVATION TAGS

- A. Use superelevation tags to mark the zero beginning and full elevation points of superelevation and to mark ¼” increments of elevation between zero and full points of superelevation.
- B. Attach tags stamped with superelevation in 1/4” increments from zero superelevation to maximum superelevation for each curve to ties at points approximately one foot inside base of high rail. All numerals shall be ½” in height.
- C. Place tag with numbers parallel to length of tie to be read when facing in direction of increasing elevation except place tag which indicates full elevation parallel with rail to be read from track centerline when facing high rail.
- D. Attach tag to tie using 2 nails per tag on timber ties.

3.6 RESURFACING AND ALIGNMENT

- A. Approximately 3 to 6 months after the completion of all trackwork and prior to Contract Substantial Completion, at a time agreed to by the MBTA, the DB Entity shall resurface and realign all trackwork performed by the DB Entity, as required to restore the track surface, superelevation and line to the originally intended design condition per the Design Documents.
- B. This work shall be performed only on weekends, unless otherwise directed by the MBTA. Track outages for this work shall be requested at least one month in advance of the work. Such request will be subject to MBTA acceptance.
- C. Resurfacing and alignment shall be defined as a smoothing operation to correct deviations from tolerances specified herein whereby all crossties and switch timber are tamped and rack raises are held to less than one inch unless track settlement dictates otherwise.
- D. Existing ballast shall be used. Additional ballast, if required, shall be furnished and installed by the DB Entity.
- E. During this resurfacing and alignment operation, ballast shallers and cribs shall be consolidated and the ballast dressed to conform to the ballast section shown on the Design Documents.
- F. Following completion of track resurfacing and aligning an MBTA furnished geometry car will measure track parameters. Deviations disclosed by this test, which exceed tolerances specified herein, shall be corrected by the DB Entity at no additional cost to the MBTA. Re-inspections shall be made by the DB Entity and MBTA to ensure that corrections have been made.

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9254

SUPERELEVATION TAG

MATERIALS

Superelevation tags shall be 22 gage stainless steel, AISI Type 302 with unpolished finish No. 4.

Nails shall be fluted, galvanized steel nails.

DESIGN

Superelevation tag shall be $1\frac{1}{2}$ inches x $3\frac{1}{2}$ inches as shown:

Tags shall be stamped with embossed gothic figures and fractions specified in the order.

All numerals shall be 1/2 inch in height.

Nails shall be 1/8 inch x $1\frac{1}{2}$ inch with flat head. Supply 3 nails for each tag ordered.

SHIPMENT

Tags shall be grouped by markings and wired together; nails shall be in boxes or kegs depending on quantity ordered.

DELIVERY

To be accepted, superelevation tags and nails shall conform to this specification. Tags and nails are subject to inspection at time of delivery and are at supplier's risk until acceptance. Tags and nails rejected because of non-compliance with this specification will be returned at supplier's expense.

APPROVED:

END OF SECTION

SECTION 02855

SPECIAL TRACKWORK

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the furnishing and installation of special trackwork and includes:
 - 1. Furnishing, receiving, unloading, inventorying, stockpiling, securing and distributing new special trackwork metals and treated hardwood switch timber.
 - 2. Installation of special trackwork on a prepared subgrade.

1.2 RELATED SECTIONS

- A. Tolerances, gauge, cross level, superelevation, and horizontal and vertical alignment of turnouts shall be as specified herein and in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION, and Section 02854 – TRACK SURFACING AND ALIGNMENT.
- B. Section 02858 – BALLAST.
- C. Section 02857 – SUBBALLAST.
- D. Section 02851 – RAILROAD RUNNING RAIL.
- E. Section 02865 – TRACK APPURTENANCES.
- F. Section 02871 – TIMBER CROSS TIES.

1.3 HANDLING AND STORAGE

- A. Handle special trackwork materials in a manner that will prevent damage during stockpiling and installation operations.
- B. Transporting and handling of new switch timber shall be as specified for new crossties in Sections 02871 – TIMBER CROSS TIES.
- C. All efforts shall be made to prevent damage to the components by handling. Proper lifting points shall be indicated on all material.
- D. Rail shall be handled with proper devices. The use of chains is prohibited.
- E. Materials stored onsite will be cleaned and protected with a suitable anti-rust protection designed to protect for a minimum of 3 years outside storage.

1.4 REFERENCES

- A. American Railway Engineering and Maintenance of Way Association (AREMA), Manual for Railway Engineering and Portfolio of Trackwork Plans
- B. American Society for Testing and Materials (ASTM)
- C. American Welding Society (AWS)
- D. American Society for Nondestructive Testing (ASNT)
- E. MBTA Maintenance of Way Division Green Line Light Rail Transit Track Maintenance and Safety Standards (LRTMSS)
- F. MBTA Maintenance of Way Division – Book of Standard Trackwork Plans
- G. Transit Cooperative Research Program (TCRP) Report 155: Track Design Handbook for Light Rail Transit, 2nd Edition

1.5 SUBMITTALS

- A. Complete shop drawings will be furnished to the MBTA a minimum of 60 days prior to inspection. Complete erection drawings will be furnished 30 days prior to shipment.
- B. All drawings shall be 22” x 34”. Index to all shop drawings shall be provided. All drawing dimensions and text will be in the English system. A 3” x 5” blank area will be left above the title block for the approval stamp.
- C. All drawings become the property of the MBTA for the purposes of future replacement. The suppliers for complete components, spare parts, and components shall be an accepted MBTA supplier.
- D. Prior to commencing work, submit detailed working drawings and proposed installation procedures of turnouts to the MBTA. Include procedures for handling and installing rail, switches, and frogs.

1.6 QUALITY ASSURANCE AND CONTROL

- A. A qualified independent testing laboratory accepted by the MBTA shall perform all special trackwork inspection and testing. The selected laboratory shall employ the proper equipment and qualified testing personnel for the special trackwork testing and inspection described in these Mandatory Specifications. Special trackwork testing and inspection equipment and personnel shall be subject to acceptance by the MBTA. The MBTA shall monitor the operations at the special trackwork plant to ensure that the inspections and tests are being performed in accordance with accepted procedures and in compliance with these Mandatory Specifications.
- B. Personnel performing nondestructive testing shall be qualified and certified in accordance with ASNT-TC-1A. Only persons certified for NDT Level I and working under a NDT Level II person or persons certified for NDT Level II may perform nondestructive testing.
- C. Testing equipment shall be in good operating condition, of adequate capacity and range, and accurately calibrated. Testing equipment calibration shall be certified and traceable to national standards such as the National Institute of Standards and Technology.

D. Test Program Plan

1. A test program plan shall be prepared identifying the approach for accomplishing each of the specified inspections and tests. The test plan shall include the test sequencing.
2. Equipment specifications and calibration methods for all testing equipment used to perform testing and inspection shall be included in the test program plan. The plan shall indicate the calibration certificates that will be submitted with the test reports.
3. Identity and qualifications of personnel who will perform testing and inspection shall be included in the test program plan. Also include certification records for personnel who will perform nondestructive testing.
4. The test plan shall include the name and location of the testing facility, qualifications of the testing facility, a description of the testing facilities, and a layout of the test equipment that will permit the efficient performance of the testing.
5. The plan shall include the proposed format for reporting test data.
6. The plan shall include the proposed schedule for testing procedure submittals.
7. The test program shall address welding and bonded insulated joint testing separately. The test program plan shall also address qualifications testing and production testing separately.
8. The test program shall include all geometry measurements of individual components and assemble units.
9. After approval of the test program plan, obtain the approval of any proposed changes from the MBTA, in writing, prior to implementing the change.

E. Test Reports

1. Test results shall be submitted in bound units for each special trackwork unit. The test results submittal shall not be submitted until complete.
2. No special trackwork shall be shipped until all components meet all of the quality requirements herein.
3. A report of test results of each test shall be submitted that includes test name, identification of test sample, test procedure references, test equipment identification, test personnel, time and date of test, specified requirements, actual test results, nonconforming items if any, and interpretation of results. The format for the test report shall be arranged so that the data is presented in an orderly manner.
4. Standard computer generated test reports may be used. Such reports shall be supplemented, as required, to provide all information and test and inspection results required by these Mandatory Specifications.
5. Copies of calibration certificates shall be submitted with the initial test reports. If test equipment is recalibrated while work is being performed, calibration certificates shall be submitted for the recalibrated test equipment with the test reports of the first tests performed after recalibration.

- F. The MBTA retains the right to witness all tests and shall be notified not less than 7 days in advance of dates.
- G. The performance of the independent testing is entirely the responsibility of the DB Entity. Any substandard conditions discovered after independent testing and inspection shall be repaired or replaced at no additional cost to the MBTA.

1.7 WELDING

- A. Welders and welding operators shall be qualified in accordance with AWS D15.2, Weld Kit Manufacturer's Welder Certification, or other standard accepted by the MBTA.
- B. Miscellaneous rolled, forged, or cast steel accessory components may be welded provided the carbon content does not exceed 0.40 % and provided a 200 degree F minimum preheat is used for any material with a carbon content greater than 0.30 %. Welding procedure specifications shall be qualified in accordance with AWS B2.1, AWS D1.1, or other standard acceptable to the MBTA.

PART 2 - PRODUCTS

2.1 MATERIALS TO BE FURNISHED BY THE DESIGN BUILDER

- A. Transit Rail Special Trackwork shall consist of 115RE rail (welded in the mainline and jointed in the yard), resilient fasteners, switch points, house tops (switch point protectors), restraining rails, guard rails, frogs, insulated joints, joint bars, switch plates, rods, braces, and associated material as follows:
 - 1. Ballast per Section 02858
 - 2. Subballast per Section 02857
 - 3. Rail per Section 02851
 - 4. Track appurtenances per Section 02865
 - 5. Timber Switch Ties per Section 02871
 - 6. Headblocks shall meet the requirements of MBTA Material Specification 9260.
 - 7. Frogs:
 - a. Frogs for normal operations use shall be flange-bearing type.
 - b. Frogs for emergency operation crossovers shall be jump frog type.
 - c. Manufacture frogs from high strength rail and manganese steel castings.
 - 8. All switch parts shall conform to the MBTA fully guarded, double switch point, curved split switch design with uniform risers.
 - 9. Switch Stands for yard track switches (non-interlocked) shall be Racor model 22P painted orange or approved equal. Switch stands shall be furnished with reflectorized aluminum targets (green for normal position or red for reverse).
 - 10. Switch point cover guard (housetop) shall be manganese steel compatible with switchpoint design.

11. Switch rods shall be vertical insulated type.
12. Special trackwork shall be identified with markings in accordance with AREMA specifications for Special Trackwork. Shop marks, match marks, and identification tags shall be as follows:
 - a. Shop marks shall designate the number of the portion, the connecting trackwork part, the trackwork piece or the miscellaneous material identity; all corresponding to marks indicated on the manufacturer's shop drawings.
 - b. Match marks shall designate adjoining trackwork parts, trackwork pieces, and miscellaneous material at all joints and at their intended locations. The match marks shall correspond with the markings indicated on the manufacturer's shop drawings.
 - c. Shop marks and match marks shall be applied by means of paint markers of different color contrast, capable of being distinguished from one another. All marks shall be clear and legible to permit proper assembly in the field.
 - d. Identification tags shall indicate the following information:
 - (1) The portion, part, and piece numbers.
 - (2) The manufacturer's name or initials.
 - (3) The designation "right hand" or "left hand".
 - (4) The description (abbreviation will be acceptable).
 - (5) The length and number of frog.
 - e. Identification tags shall be stainless steel in accordance with ASTM A176.
 - f. Identification tags and markings shall be of sufficient size to permit in-track identification. The marking letters and numerals shall be at least 3/8" in height.
 - g. Identification tags and markings shall be located such that they will be visible after installation in track and shall be secured to a reinforcing bar or to a web of a rail at the bar or web centerline by means of at least two steel drive rivets.
13. Special Trackwork Fabrication
 - a. Special trackwork shall be accurately fabricated to fit all abutting portions, associated connecting trackwork parts, associated trackwork pieces, and miscellaneous materials.
 - b. Manufacture and workmanship shall be done in accordance with the AREMA Specifications for Special Trackwork.
 - c. Grinding, planing, and drilling of holes shall be done to achieve true alignment and accurate fit at all points. Burrs shall be removed, edges shall be rounded smooth and surfaces shall be free from defects such as nicks, fins, and sharp resistant angles.
 - d. Rails shall be sawed square to their center lines and machined, ground, and beveled smooth to produce the required guage, flangeway, and profile.
 - f. Separator, filler, and heel blocks shall be removed when they are in interference with the proper fit of the separator, filler, and heel blocks.

- g. Countersunk rivets shall fill the countersink completely and the surface shall be ground flush.

PART 3 - EXECUTION

3.1 TURNOUT INSTALLATION

A. General

1. Special trackwork shall be installed over a prepared subgrade in accordance with the MBTA Standard Plans.
2. Special trackwork shall have a complete set of new timbers installed in accordance with MBTA Standard Plans and accepted drawings.
3. Special trackwork components shall be installed in accordance with the manufacturer's shop drawings and AREMA Specifications for Special Trackwork.

3.2 SWITCH TIMBER

- A. All timber in designated special trackwork shall be installed.
- B. Switch plates shall be fully fastened with screw spikes as specified herein.
- C. Plates in turnouts, except self-aligning plates at frogs, shall be fastened using four (4) screw spikes. Screw spikes shall be installed at each corner of plate. Self-aligning plates shall be installed using two screw spikes per plate.

3.3 RAIL FASTENING

- A. Rail fastening except at guard rails shall be with resilient fasteners. Clips shall not be overdriven.
- B. Rail braces shall be properly adjusted to maintain stock rails rigidly in proper position.
- C. Tie Boring
 1. Field bore switch timber before installing screw spikes.
 2. Holes shall be 3/4" diameter and 6 inches deep for 15/16" screw spikes.
 3. Location and number of holes shall conform to location and number of screw spikes. Boring of holes in excess of number required will not be permitted.
 4. Do not bore holes entirely through timbers.
 5. After drilling, brush the drill chips from the top surface of tie.
 6. Prior to locating position of holes to be bored for the second rail of a pair to be placed on any timber, position timber laterally so that field side base of first rail is in contact with shaller of plate and tolerance between rail base width and plate seat width is on the gauge side of rail. Position the other plate similarly to ensure retention of gauge established.

D. Tie Plates

1. Locate and secure special and resilient tie plates as shown on Standard Plans and Design Documents and as specified in this Section.

E. Cutting and Drilling of Rails

1. Cut and drill rails in conformance with these Mandatory Specifications and as specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.

F. Screw Spiking

1. Screw spikes shall be started vertically square and installed by turning with a power wrench. Screw spikes are not to be driven by use of a hammer. Screw spikes shall be seated squarely against top of plate.

G. Tolerances

1. Rail will be spiked to a track gauge of 4' 8 1/2" plus or minus 1/16".
2. Tie spacing shall be as shown on the accepted drawings and the MBTA Standard Plans. Switch tie spacing shall have a tolerance of plus or minus 1/2" except that ties under switch plates and frog plates shall have a tolerance of plus or minus 1/4".
3. Switch points in the normal position shall be square to the straight stock. Tolerance shall be within 1/4" plus or minus.

H. Rail Anchoring/Clipping

1. Clip rails on both side of every tie throughout turnout units except switch rails and stock rails adjacent to switch rails.

3.4 THERMITE WELDS

- A. Thermite weld all joints in the turnout limits except insulated joints as indicated on MBTA Standard Plans and accepted drawings per Section 02877 – THERMITE WELDING.
- B. Thermite weld all joints within 400' from both ends of all turnouts.

3.5 STANDARD JOINTS

- A. Standard joints, supplied with the special trackwork, shall be installed at the locations shown on the Design Documents. Installation shall be in accordance with the AREMA Specification for Special Trackwork.
- B. Clean and coat rail surfaces, to be covered by joint bars, with an approved oil or grease to prevent corrosion.
- C. Tighten bolts starting at the center of the joint and working toward each end of joint. Tighten bolts during initial installation within the range of 20,000 to 25,000 pounds. For subsequent tightening, bring bolts to a range of 15,000 to 20,000 pounds.

3.6 INSULATED JOINTS

- A. Insulated joints, supplied by the DB Entity, shall be installed at the locations shown on the Design Documents. Installation shall be in accordance with the AREMA Specification for Special Trackwork and manufacturers recommendations for installation.

3.7 BALLASTED TURNOUT CONSTRUCTION

- A. A minimum of 12” of ballast shall be provided under base of switch timber for entire length of turnout.
- B. Uniformly distribute and compact an initial layer of ballast as specified in Section 02854 – TRACK SURFACING AND ALIGNMENT, over the finished subgrade prior to switch timber distribution. The first ballast layer shall not exceed four inches.
- C. Initial and final surfacing and aligning shall be as specified in Section 02854 – TRACK SURFACING AND ALIGNMENT. After accomplishing final grade, re-tamp all ties within the turnout limits a second time without raising the track. Surface, alignment, compaction, ballast dressing, and stone ballast shall conform to all requirements as specified in Section 02854 – TRACK SURFACING AND ALIGNMENT except that two separate passes with approved compactor equipment shall be required through the entire turnout limits including the transition tie areas on both ends of the turnouts and on both tracks.
- D. Establish final top of ballast elevation one inch below base of rail throughout turnouts, except in cribs between point of switch and heel of switch where the ballast level shall be 3 inches below base of rail. Provide additional clearance to switch rods to allow for unrestricted movement of switch rods.
- E. Ballast compaction during all lifts shall be as specified in Section 02854 – TRACK SURFACING AND ALIGNMENT.
- F. In areas of Special Trackwork where standard rail mounted power tamping and compacting equipment cannot be used, use hand held power tamping and compacting equipment.

3.8 FINAL SURFACE AND LINE

- A. Special Trackwork shall be brought to final line and grade as shown on Design Documents and as specified in Section 02854 – TRACK SURFACING AND ALIGNMENT.
- B. Bring Special Trackwork to final line and grade by a final surface life of not more than 1” and final horizontal adjustment of not more than 1”.

- C. Compact ballast after final surfacing and lining as specified in Section 02854 – TRACK SURFACING AND ALIGNMENT.

3.9 LUBRICATION AND ADJUSTMENT

- A. Lubricate sliding surfaces on switch assemblies. Switch plates, under side of switch point, and points of contact on base of stock rail by the switch point shall be wire brushed to remove rust and foreign matter before applying graphite lubricant. Apply graphite lubricant in accordance with manufacturer's recommendation.
- B. Prior to final acceptance, make mechanical adjustments to moveable parts of switch assemblies to ensure that turnouts units are in acceptable operating condition.

END OF SECTION

SECTION 02856

COMMUTER RAIL TRACK CONSTRUCTION

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This section specifies general requirements for new commuter track construction including, but not limited to the following:
1. Constructing new ballasted commuter track.
 2. Placing and compacting ballast.
 3. Placing and compacting subballast.
 4. Placing and aligning wood ties.
 5. Placing and aligning concrete ties.
 6. Thermal adjustment of existing Continuous Welded Rail (CWR).
 7. Aligning and clamping rail.
 8. Installing welded rail joints.
 9. Initial tamping, gauging, lining and surfacing track.
 10. Testing and corrections/adjustments to completed track.
 11. Other operations as specified.

1.2 RELATED WORK SPECIFIED ELSEWHERE

- A. Delivery, unloading and handling of 132 RE rail and procedures for creating CWR strings is in Section 02851 – RAILROAD RUNNING RAIL.
- B. Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
- C. Section 02854 – TRACK SURFACING AND ALIGNMENT.
- D. Turnout procurement and installation is in Section 02855 – SPECIAL TRACKWORK.
- E. Section 02857 – SUBBALLAST.
- F. Section 02858 – BALLAST.
- G. Section 02865 – TRACK APPURTENANCES.
- H. Section 02877 – THERMITE WELDING.

- I. Section 02879 – SIDE TRACK CONSTRUCTION FOR COMMUTER RAIL SYSTEMS.
- J. Removal of existing track, turnouts and disposal of salvaging of materials is in Section 02852 – TRACKWAY DEMOLITION AND SALVAGE.

1.3 GENERAL DESCRIPTION OF NEW TRACK CONSTRUCTION

- A. New Commuter Rail Track shall be new 132 RE head hardened rail electric flash butt welded rail on 7” x 9” x 8’ 6” treated timber ties with resilient fastener tie plates, spring clips and screw spikes.
 - 1. Head hardened rail shall be used for all new track.
 - 2. Electric flash butt welds shall be by a fixed plant or by an on-track mobile unit as specified in Section 02851 – RAILROAD RUNNING RAIL.
 - 3. The use of thermite welds shall be limited to locations where electric flash butt welding is not possible and as permitted by the MBTA.

1.4 APPLICABLE STANDARDS:

- A. The following Codes, Regulations, Reference Standards and Specifications apply to work included in this Section:
 - 1. MBTA Commuter Rail Design Standards Manual.
 - 2. MBTA Book of Standard Plans Track and Roadway
 - 3. MBTA MW-1 Track Standards
 - 4. American Railway Engineering and Maintenance of Way Association, AREMA:
 - a. Manual for Railway Engineering
 - b. Portfolio of Trackwork Plans

1.5 DB ENTITY RESPONSIBILITIES RELATED TO WORKING WITHIN IN-SERVICE CWR TRACK

- A. In general, these Mandatory Specifications address the installation of welded rail, thermally adjusting and mainline track construction as new track, not under existing rail traffic. On this Project, most trackwork is within an active commuter rail/freight line. Consequently, there are many additional requirements and measures to prevent track buckling and the significant dangers inherent from improper procedures. At all times during trackwork on this Project, the DB Entity shall be familiar with and strictly adhere to the track buckling countermeasures attached to Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION as Attachment B, Track Buckling Countermeasures.

1.6 SUBMITTALS

- A. Submit a prepared CPM Construction Plan in accordance with Volume 2, Section 2.5. The CPM Construction Plan shall include descriptions of the following:
 - 1. Construction sequences
 - 2. Construction activities including but not limited to:
 - a. rail distribution and installation
 - b. track removal
 - c. timber crosstie unloading and installation
 - d. ballast distribution
 - e. surface and alignment
 - f. thermal adjustment of CWR
 - g. final ultrasonic inspection and rail grinding
 - h. turnout installation
 - 3. Production Equipment
- B. Submit identity and location of licensed incinerator and land fill facilities proposed for crosstie and switch timber disposal.
- C. Submit detailed trackwork installation plan.
- D. All submittals will be reviewed for general conformance with the intent of the Contract Documents. This review will not relieve the DB Entity of final responsibility for the means, methods, procedures and sequences to be utilized.

1.1 QUALITY CONTROL

- A. Tolerances From Design
 - 1. Final established gauge, cross level, superelevation, vertical and horizontal alignment of tracks are indicated on accepted drawings, and shall be within tolerances from design specified below:
 - a. Horizontal Track Alignment:
Maximum permissible variation from design shall not exceed plus or minus ½”

Rate of change of permissible variation from design shall not exceed plus or minus 3/16" middle ordinate to a 31-foot chord on curves, and 1/16" middle ordinate to a 31-foot chord on tangent

- b. Vertical Track Profile:
Maximum permissible variation from design shall not exceed plus, or minus 1/2".

Rate of change of permissible variation shall not exceed plus, or minus 1/16" middle ordinate to a 31-foot chord

- c. Track Centers:
Maximum permissible variation from design not to exceed plus 1/2", minus zero
- d. Cross Level:
Maximum permissible variation from design at any point plus, or minus 1/16"
- e. Gauge variation: Plus or minus 1/16"

- 2. No tolerances from design shall be allowed at locations where vertical and horizontal clearances are restricted by the MBTA, Standard Plans, and Design Documents such as platforms, abutments, and overhead bridges.

- 3. Tie Spacing. Space ties shall be as follows:

- a. Tie spacing for timber crossties shall be in accordance with Standard Plan 1104.
- b. Within grade crossings, tie spacing shall be 18".
- c. Crosstie spacing at transition locations shall be in accordance with Standard Plan 1108.
- d. In single track the line side of ties will be the field side when facing in an easterly direction. In double track segments the line side will be the field side of both tracks.

- B. Welds, in track after Contract Final Acceptance will be warranted by the DB Entity as specified in Section 02851 – RAILROAD RUNNING RAIL.

PART 2 - PRODUCTS

2.1 TRACK MATERIALS

- A. All materials used in ballasted commuter rail track construction shall be as specified herein and in the relevant sections referenced in Part 1.2 above.

PART 3 - EXECUTION

3.1 GENERAL – NEW TRACK CONSTRUCTION

- A. Following track removal and preparation of subgrade and subballast to the lines and grades on the accepted drawings, construct ballasted track in accordance with these Mandatory Specifications, Standard Plans and Design Documents.
- B. Track removal at ballasted and open deck bridges will be in accordance with these Mandatory Specifications.

3.2 SUBGRADE PREPARATION IN NEW TRACKBED LOCATIONS

- A. Remove existing track structure and fouled ballast and subballast as indicated on the Design Documents.
- B. Smooth and compact subgrade areas, with cross slope as shown on the MBTA Standard Plans, to receive subballast.

3.3 PLACEMENT OF NEW SUBBALLAST

- A. See Section 02857 – SUBBALLAST for further details.
- B. Subballast shall be distributed over subgrade unless otherwise specified in Design Documents.
- C. Distribute and compact eight inch layers of subballast, uniformly over the finished subgrade.
- D. Deliver subballast at a rate no faster than can be satisfactorily incorporated into the work, maintaining a proper interval of operations, and at such times as to permit proper inspection by the MBTA.
- E. Unload subballast in position for use with a minimum of redistribution and dressing.
- F. Self-spreading vehicles may be used as accepted by the MBTA. When subballast is initially spread by self-spreading vehicle, a power grader may be used to assist spreading operations.
- G. Thoroughly compact subballast.
- H. Top surface of initial layers of subballast shall be smooth, flat and uniformly compacted prior to distributing ballast.

3.4 PLACING INITIAL LAYERS OF BALLAST

- A. See Section 02858 – BALLAST for more information.
- B. Ballast shall not be distributed until the subgrade, and where applicable, subballast has been completed and accepted as specified above.
- C. Clean track way area of debris and standing water prior to placing ballast. Do not place ballast on frozen subgrade or frozen subballast.
- D. Distribute and compact four inch layers of ballast, not to exceed an eight inch total, uniformly over the finished subgrade or subballast, prior to tie distribution.

- E. Deliver ballast at a rate no faster than can be satisfactorily incorporated into the work, maintaining a proper interval of operations, and at such times as to permit proper inspection by the MBTA.
- F. To extent practicable, unload ballast in position for use with a minimum of redistribution and dressing.
- G. Self-spreading vehicles may be used as accepted by the MBTA. When stone is initially spread by self-spreading vehicle a power grader may be used to assist spreading operations.
- H. Shape ballast to a true section conforming to the ballast section shown on Standard Plans and Design Documents.
- I. Thoroughly compact each ballast layer until stones are firmly interlocked and surface is true and unyielding.
 - 1. Compact by rolling using either a self-propelled, three-wheel, or two axle roller of such weight that will provide compression under the rear wheels of not less than 350 pounds per linear inch of tread; or using a two or three-wheel tandem roller having a weight per inch of drive roll of not less than 350 pound, and every part of the surface receiving compression from the drive wheels.
 - 2. Compact by vibration using vibratory compactors of either the roller or pad type. Dynamic force for either type shall not be less than 20,000 pounds and the frequency range shall be 1100 to 1500 vpm. Use machines equipped with a governor which can be set and locked to control rate of impulse. Provide a tachometer or other suitable device for accurately checking the frequency of vibration during the compacting operation.
- J. Top surface of initial layers of ballast shall be smooth, flat and uniformly compacted prior to distributing ties.

3.4 DISTRIBUTING AND SPACING TIES

- A. General
 - 1. Carefully distribute and properly space ties on initial layer of ballast. Space ties at design spacing as follows on center, or as shown on the MBTA Standard Plans.
 - a. Mainline timber tie spacing 19 ½”.
 - b. Mainline concrete tie spacing 24”.
 - c. Grade Crossing tie spacing 18”.
 - d. Turnout tie spacing varies see MBTA Standard Plans.
 - 2. Handle treated timber ties in a manner to avoid breaking and bruising. Do not throw ties from cars or trucks onto rails or rocks.

3. Place timber so that ties heartwood is down. Place all ties so that the bottom surface of the tie shall have full bearing against the initial layer of ballast.
4. Lift and support concrete ties during storage, transportation, and placing, in such a manner to prevent chipping, spalling, cracking, and other damage. In no case shall ties be dropped to the roadbed.
5. Place all ties normal to center line of track.
6. Properly space and align all ties prior to rail installation.
7. In placing or spacing treated ties, handle only with tongs or suitable devices. Do not use bars, chisels, forks, mauls, picks, punches, shovels, or sledges for moving ties or placing them in position beneath rails.
8. Avoid unnecessary handling, redistribution, and reloading of all ties. Distribute ties in proper position for use without further handling.
9. Remove any tie damaged as result of improper handling by the DB Entity and rejected by the MBTA and replace with undamaged ties at no additional cost to the MBTA.

3.5 INSTALLATION OF CONTINUOUS WELDED RAIL (CWR)

- A. Install and flash butt weld CWR as specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION. Lay and flash butt weld CWR to produce zero thermal stress in the rail.
- B. Install rail in such a manner that damage to ties or OTM is avoided, and ties are not dislodged from their proper position.
 - A. Install temporary six hole, 36” joints using 4 bolts prior to surfacing and aligning track.
 - B. Before flash butt welding CWR strings, the track shall be brought to within one inch of final line and grade in accordance with Section 02854 – TRACK SURFACING AND ALIGNMENT and the CWR strings shall have their lengths adjusted for zero thermal stress temperature, be vibrated to relieve internal rail stress, and be fully clipped in accordance with Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
- C. Install permanent insulated joint plug rails at locations shown on Design Documents during the installation of CWR.
- D. Install permanent insulated joint plug rails so that actual joint location will be a suspended joint.

3.5 TIE PLATES - RESILIENT

- A. Timber crossties shall have tie plates installed under each rail.
- B. Prior to installation of tie plates, clean contact surfaces to allow proper bearing of tie plate on tie and rail on tie plate.
- C. Locate tie plates on 8’ 6” ties such that the line side of the tie is 18 ¼” from outer edge of base of rail with 132 RE rail. Tie plate shall be centered on the crosstie under rail.

- D. Locate tie plates on longitudinal centerline of each tie and place square to centerline of rail so that outside shaller of plate bears fully against rail base. Place plate with the downward cant toward center of track.
- E. Secure rail on line end of ties to tie-in proper relation to tie end, before securing opposite rail.
- F. Use line rail as reference in securing opposite rail to proper gauge.
- G. Tie Boring
 - 1. Field bore crossties and switch timber before fastening tie plates.
 - 2. Holes in crossties shall be 5/8" diameter and 6" deep for 15/16" screw spikes.
 - 3. Location and number of holes shall conform to location and number of screw spikes. Boring of holes in excess of number required will not be permitted.
 - 4. Do not bore holes entirely through tie.
 - 5. After drilling, brush drill chips from top surface of tie.
 - 6. Prior to locating position of holes to be bored for second rail to be placed on any tie or timber, position tie laterally so that field side base of first rail is in contact with shaller of plate. Any tolerance between rail base width and plate seat width shall be on gauge side of rail. Position other plate similarly to ensure retention of gauge established.

3.6 SCREW SPIKES

- A. Start and install screw spikes vertically and square with rail. Install spikes straight.
- B. Screw spikes shall be set and driven in accordance with manufacturer's recommendations and specifications.
- C. Straightening screw spikes will not be permitted.
- D. Number of screw spikes used per tie shall conform to the MBTA Standard Plans.
- E. Avoid removal of screw spikes once driven. When necessary, pull spikes and plug hole using treated tie plug.
- F. Under no circumstances shall gauge be adjusted by striking lags, spikes, or plate edge after it is fixed to tie.
- G. Seat rail properly between tie plate shallers. With outside base of rail tight against outside plate shaller.

3.7 TIE PLUGS

- A. Install treated tie plugs in holes where spikes have been pulled from timber ties.
- B. Drive plugs into tie to refusal and cut plug flush with top of tie, using an adze, before installing tie plate.

3.8 RAIL CLIPPING

- A. Clip CWR as specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
- B. Final clipping of rail, in ballasted track, shall be done when rail is at its zero thermal stress temperature, and has been vibrated to relieve internal rail stress.
- C. Final rail clipping, in ballasted track, shall not proceed until track has been sufficiently ballasted to prevent tie or track movement due to thermal expansion or contraction in rails and until track has been initially raised, tamped, aligned, and de-stressed.
- D. Install clips as specified by manufacturer and as shown on the MBTA Standard Plans.
- E. Install two clips per tie per rail.
- F. Clips shall not be overdriven.

3.9 ELECTRIC FLASH BUTT WELDING

- A. Electric flash butt welding and testing will be as specified in Section 02851 – RAILROAD RUNNING RAIL and the following;
 - 1. Welds in head hardened rail will be air quenched.
 - 2. Removal of rail anchoring shall not exceed 200' in both directions when making a weld.

3.6 RAIL ALIGNMENT

- A. General
 - 1. Construct track conforming to alignment and profile data shown on Design Documents.
 - 2. Alignment is based on centerline of track equidistant between gauge sides of running rails.
 - 3. For tangent track, profile refers to top of rail in final position. For curved track, profile refers to top of low or inner rail in final position.

3.7 INSULATED JOINTS – POLY

- A. Insulated joints shall be in accordance with Section 02865 – TRACK APPURTENANCES.
- B. Install 132 RE poly insulated joints at locations shown on the Design Documents.
- C. Install insulated joints during installation of 132 RE rail.
- D. Insulated joints shall be installed as suspended joints.
- E. Accurately space and drill holes for bolting of rail in accordance with requirements of the current AREMA Manual for Railway Engineering, Specifications for Steel Rails and STANDARD PLAN 1302. Drill holes with an approved rail drill.

- F. Drill cylindrical holes of specified diameter for the size bolt required through and perpendicular to web of rail.
- G. Use a template, as a drilling guide, to locate holes both vertically from bottom of rail and horizontally from rail end. In no case shall a joint bar be used for this purpose.
- H. Remove all rough edges from holes.

3.8 SURFACING AND ALIGNING

- A. Surface and align track as specified in Section 02854 – SURFACING AND ALIGNING TRACK.

END OF SECTION

SECTION 02857

SUBBALLAST

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the type of fine crushed stone to be used for the subballast layer beneath the ballast layer for both the Light Rail Tracks and Commuter Rail Tracks.

1.2 SUBMITTALS

- A. The following submittals shall be submitted to the MBTA for review and approval prior to procuring any material or performing any work required under this Section:
 - 1. Submit name and location of proposed supplier.
 - 2. Submit gradation reports of representative samples of the material furnished together with certification that the material meets the requirements of this specification.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Subballast shall be crushed stone or granulated, expanded or air-cooled slag with an average hardness of 5.5 minimum on Moh's Scale of Hardness.
- B. Subballast shall be composed of clean, hard, uncoated particles free from lumps of clay, shale and other objectionable materials.
- C. Subject to meeting the requirements established in 2.1.A, 2.1.B, and 2.2, et seq., subballast currently placed within the MBTA right-of-way and used as subballast may be reused as subballast within the limits of the Project.
- D. Subject to meeting the requirements established in 2.1.A, 2.1.B, and 2.2, et seq., ballast currently placed within the MBTA right-of-way may be reused as subballast within the limits of the Project.

2.2 GRADATION

Gradation shall be in accordance with ASTM C136 and C117 as follows:

Sieve Size	% Passing by Weight
1 inch	100
3/8 inch	50 to 85
No. 4	35 to 65
No. 10	25 to 50
No. 40	15 to 25
No. 200	4 to 10

The fraction passing the No. 200 sieve shall be less than two-thirds of the fraction passing the No. 40 sieve.

1. Soft Particles – ASTM C235 – 5% of sample weight maximum.
2. Clay lumps and Friable Particles – ASTM C142 – 0.5% maximum.
3. Wear ASTM C131 – 20% maximum.
4. Absorption – ASTM C127 – 0.5% maximum.

Crushing of subballast and ballast proposed for use as subballast shall not be required except the supplier may, at their option, elect to crush any oversize particles present in the deposit as an alternative to screening.

2.3 PRODUCTION

- A. Notify the MBTA, at least 30 days prior to delivery, of the source and location of the source of materials to be used, in order that approval test may be conducted.
- B. Use only the one approved material to complete order. Do not change source of material unless new source and material is accepted, in writing, by the MBTA.
- C. Subballast shall be handled during all stages of production and delivery in a manner that will provide all uniform product and will prevent contamination or segregation.
- D. To satisfy the requirements of this specification, subballast may be screened, crushed, washed or otherwise processed to produce a uniform acceptable product.
- E. Blending of materials to improve quality of product shall not be permitted.

2.4 HANDLING

A. Shipping

Load subballast only into rail cars or trucks which are in good order, tight enough to prevent leakage, waste of material and clean and free from rubbish or any other substance which would foul the subballast material.

B. Handling

1. Handle prepared subballast at production plant, during shipment and at work site so that it is kept clean and free from segregation.
2. Do not make repeated passes of equipment over the same level in stockpile area.

C. If oil-stained ballast or subballast removed from the right-of-way is to be stored off-site prior to reuse, the following precautions are recommended:

1. Place ballast on poly sheeting to minimize the potential for oil from stone to contact underlying surface.

2. Utilize hay bales or similar to create a berm surrounding the stockpile area; drape poly sheeting base over bales.
3. Cover ballast with poly sheeting when not being handled to minimize the potential for rain to cause the oil to be released from the stockpiled stone.

2.5 DELIVERY

The stone subballast delivered to the DB Entity shall conform to these Mandatory Specifications in all respects. Material rejected for non-compliance with these Mandatory Specifications will be returned wholly at the DB Entity's expense.

PART 3 – EXECUTION

Not Used.

END OF SECTION

SECTION 02858

BALLAST

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the coarse, angular crushed stone to be used to create the ballast layer for both the Light Rail Tracks and the Commuter Rail Tracks.
- B. Ballast shall conform to AREMA size No. 4 per AREMA Chapter 1, Part 2, as modified by these Mandatory Specifications.

PART 2 - PRODUCTS

2.1 MATERIAL

Ballast shall be crushed, quarried, washed stone conforming to the current AREMA Specification Chapter 1, Part 2 and the following:

Ballast Requirements:

- 1. Deleterious Substances. The amount of deleterious substances present in prepared ballast shall not exceed the following limits, when using test methods specified herein.

	% By Weight	Method of Test
Soft and Friable Pieces	3.0	ASTM C235
Material Finer than No. 200 Sieve	0.5	ASTM C117
Clay Lumps	0.5	ASTM C142

- 2. ASTM C235 method of test for scratch hardness of coarse aggregate particles.
- 3. ASTM C117 test method for materials finer than No. 200 sieve in mineral aggregate be washing.
- 4. ASTM C142 test method covers the approximate determination of clay lumps and friable particles in aggregate.
- 5. Flat or elongated particles having a length equal to or greater than five times the average thickness of the particle shall not exceed five % by weight of the total when visually inspected.
- 6. Water absorption shall not exceed 0.4 pounds per cubic foot when tested in accordance with ASTM C127.
- 7. Percentage of wear, when tested in the Los Angeles abrasion machine in accordance with ASTM C535, grading No. 2, shall not exceed 18%.

8. Soundness of the prepared ballast shall be such that when tested in the sodium sulphate soundness test in accordance with ASTM C88, weighted average loss shall not exceed 1.5% after 10 cycles of test.
9. Cementing value of the ballast shall not exceed an average value of 320 pounds per square inch for five specimens when tested in accordance with the Logan Walter Page Method (U.S. Department of Agriculture, Bulletin No. 347, 1916, Pg. 15) except as modified as follows:
 - a. A sufficient amount of pea size pieces of the rock, amounting to about 500 grams (1.1 pounds) is revolved in Los Angeles Abrasion Cylinder with three cast iron balls 4.76 cm. (1.875 inch) diameter and weighting approximately 0.43 kilograms (0.95 pounds) at the rate of 30 and 33 revolutions per minute, and the stiff dough at room temperature resulting from about 500 grams (17.64 oz.) of dust screened through a 100 mesh sieve, mixed with sufficient water, thoroughly kneaded for five minutes, allowed to stand in an air tight container for two hours, is molded into cylindrical briquettes 2.54 cm. (1 inch) diameter by 2.54 cm. (1 inch) in height under a pressure of 132 kgs. Per sq. cm. (1877.5 pounds per square inch), after which they are dried for 20 hours in air at room temperature, 4 hours in a hot air bath at a temperature of 100 degrees C (212 degrees F), then cooled for 20 minutes in a desiccator and immediately tested in a compression testing machine for static crushing strength, the bearing heads being suspended by pivots to secure uniform distribution of load, which is applied at 600 pounds per minute, approximately.
10. Determine ballast weight per cubic foot in accordance with ASTM C29.
11. Ballast samples shall be obtained in accordance with ASTM D75.

2.2 HANDLING

A. Shipping

- a. Load ballast only into rail cars or trucks which are in good order, tight enough to prevent leakage and waste of material, and clean and free from rubbish or any substance which would foul the ballast.

B. Handling

- a. Handle prepared ballast at production plant, during shipment, and at work site so that it is kept clean and free from segregation.
- b. Do not make repeated passes of equipment over the same level in stock pile area.

C. Reuse of Previously Accepted Ballast

- a. Subject to 2.4.C, if oil-stained ballast is to be stored off-site prior to reuse, the following precautions are recommended:
 1. Place ballast on poly sheeting to minimize the potential for oil from stone to contact underlying surface.
 2. Utilize hay bales or similar to create a berm surrounding the stockpile area; drape poly sheeting base over bales.

3. Cover ballast with poly sheeting when not being handled to minimize the potential for rain to cause the oil to be released from the stockpiled stone.

2.3 DELIVERY

Stone ballast shall conform to these Mandatory Specifications in all respects. Stone ballast is subject to inspection at delivery and is at the supplier's risk until acceptance. Stone ballast rejected for non-compliance with this specification will be returned at the DB Entity's expense.

2.4 QUALITY CONTROL

A. Ballast Production Site Testing

1. Notify the MBTA of proposed source and location of crushed stone ballast. The independent testing company hired by the DB Entity shall obtain samples of proposed material and test them for conformance to classification, quality, and grading requirements specified in Article 2.1. Samples of ballast for testing shall be taken from each 500 tons of prepared ballast. Sample shall be representative and shall weigh not less than 150 pounds.
2. The DB Entity will notify the MBTA of test results. Failure of ballast to meet these requirements will mean rejection of ballast quarry.
3. Ballast material will be accepted in writing by the MBTA prior to commencing work site delivery.
4. If, during ballast installation, source of ballast changes, the independent testing company hired by the DB Entity will perform tests at new production site in accordance with these Mandatory Specifications. Ballast shall have the same or higher classification, quality, and grading as former ballast used. Work site delivery shall not commence until the MBTA has accepted, in writing, the new ballast source.

B. Ballast Job-Site Testing

1. Periodically during progress of track work, the independent testing company hired by the DB Entity will test samples of the ballast obtained from in-place locations designated by the DB Entity to insure a uniform quality of ballast.
2. If ballast in-place does not conform to Article 2.1 in this section, the DB Entity will notify the MBTA and further loading of ballast will be halted until fault has been corrected. DB Entity shall dispose of all defective material without cost to the MBTA.
3. The MBTA reserves the right to reject any load of ballast arriving at work site for unloading that does not conform to this specification. The load shall be disposed of without cost to the MBTA.

C. Reuse of Previously Accepted Ballast and Placed Ballast

Subject to meeting the requirements of 2.1, et seq., and 2.3, ballast currently placed within the MBTA right-of-way may be reused as ballast within the limits of the Project.

PART 3 - EXECUTION

Not Used.

END OF SECTION

SECTION 02859

SHOP TRACK CONSTRUCTION

PART 1 - GENERAL

1.1 DESCRIPTION

- A. Description: Requirements for the construction of new shop track systems within the Vehicle and Maintenance Storage Facility (VMF) shop building including embedded shop track and exterior embedded apron shop track areas; pedestal track in the VMF shop building pit track areas and direct fixation type tracks in the wash track areas to line, surface, and grade and as specified herein. Comply with Section 02850 - LIGHT RAIL TRACK CONSTRUCTION, and this Section.
1. Embedded Shop Track and Exterior Apron Tracks:
 - a. Requirements for installing rail to be embedded using rail boot and support leveling beams.
 - b. Requirements for providing reinforced Portland cement concrete floor and apron slabs with appropriate expansion joint material and joint sealants for the shop building in accordance with the Contract Documents.
 - c. Requirements for providing track that exhibits the proper electrical grounding properties as specified herein.
 - d. Requirements for performing required testing for the grounding of rail.
 - e. Requirements for providing other incidentals and ancillary work required for completing an acceptable facility for the operation of passenger vehicles.
 2. Pedestal Shop Track:
 - a. Requirements for installing rail to the VMF shop building shop floor pedestal beams, using cap plate with welding and additional hardware, as required.
 - b. Requirements for providing track that exhibits the proper electrical grounding properties as specified herein.
 - c. Requirements for performing required testing for the grounding of rail.
 - d. Requirements for performing visual and ultrasonic inspection of the plate welds and adjacent metal after plate cooling.
 - e. Requirements for providing other incidentals and ancillary work required for completing an acceptable facility for the operation of LRT vehicles.
 3. Direct Fixation Wash Track:
 - a. Requirements for providing reinforced Portland cement concrete for track slab with appropriate expansion joint material and joint sealants.

- b. Requirements for constructing direct fixation track with single fastener concrete plinths for wash track.
- c. Requirements for providing track that exhibits the proper electrical insulating properties as specified herein.
- d. Requirements for performing required testing of insulated rail.
- e. Requirements for providing other incidentals and ancillary work required for completing an acceptable facility for the operation of LRT vehicles.

B. Section includes:

1. Track alignment, profile, and geometry.
2. Embedded shop track construction.
3. Laying continuous welded 115RE rail in rail boot.
4. Pedestal shop track construction.
5. Direct fixation wash track construction.
6. Distributing continuous welded rail.
7. Rail gap.
8. Rail temperature.
9. Rail installation.
10. Bonded insulated joints.
11. Traction electrification and signal bonding.
12. Tolerances.
13. Field quality control.

C. Related work specified elsewhere

1. Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
2. Section 02851 – RAILROAD RUNNING RAIL.
3. Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
4. Section 02854 – TRACK SURFACING AND ALIGNMENT.
5. Section 02857 – SUBBALLAST.
6. Section 02858 – BALLAST.

7. Section 02862 – GRADE CROSSINGS.
8. Section 02865 – TRACK APPURTENANCES.
9. Section 02867 – RESTRAINING RAILS.
10. Section 02877 – THERMITE WELDING.
11. Section 03300 – CAST-IN-PLACE CONCRETE
12. Section 03410 – PLANT PRECAST STRUCTURAL CONCRETE
13. Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION
14. Section 16829 – INSULATED JOINTS FOR THE LIGHT RAIL SIGNAL SYSTEM

1.2 APPLICABLE STANDARDS

- A. The following Codes, Regulations, Reference Standards and Specifications apply to work included in this Section:
 1. MBTA Track Maintenance Standards.
 2. MBTA Book of Standard Trackwork Drawings
 3. American Railway Engineering and Maintenance of Way Association, AREMA:
 - a. Manual for Railway Engineering.
 - b. Portfolio of Trackwork Plans.

1.3 SUBMITTALS

- A. General: Submittal procedures for all submittals, including but not limited to shop drawings, product data, samples, shall comply with Section 2.7 “Design Submittal Review Management” and Section 2.8“Construction Submittal Requirements”.
- B. Relevant submittals as required under Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
- C. Embedded Shop Track:
 1. Work Plan in accordance with applicable Articles in Part 3 herein.
 2. Product Data: Submittals as required by Related Sections.
 3. Shop Drawings:
 - a. Shop and apron track structural drawings.
 - b. Leveling beams.
 - c. Trackwork grounding within the shop.

4. Certified Test Reports:
 - a. Electrical grounding test results.
 5. Instructions and Procedures:
 - a. Procedures for securing encased CWR 115 RE rail.
 - b. Detailed procedure for achieving uniform longitudinal rail stress in embedded track.
 - c. Procedures for forming and finishing flangeways on the gauge side of the rail.
 - d. Welding procedures for AWS D1.4 Welding Reinforcing Steel.
 6. Submit welder qualifications and certifications.
- D. Pedestal Shop Track:
1. Work Plan in accordance with salient Articles in Part 3 herein.
 2. Product Data: Submittals as required by Related Sections.
 3. Shop Drawings:
 - a. Shop pedestal track structural drawings.
 - b. Trackwork insulation within the shop.
 4. Certified Test Reports:
 - a. Rail weld inspection reports.
 5. Instructions and Procedures:
 - a. Procedures for securing 115 RE rail.
 - b. Detailed procedure for achieving uniform longitudinal rail stress in pedestal track.
- E. Wash Tracks:
1. Work Plan in accordance with applicable Articles in Part 3 herein.
 2. Product Data: Submittals as required by Related Sections.
 3. Shop Drawings:
 - a. Shop wash track structural drawings.
 - b. Other materials as specified herein.
 4. Certified Test Reports:
 - a. Electrical insulating test results as specified herein.

5. Instructions and Procedures:
 - a. Procedures for securing CWR 115 RE rail in accordance with Article 3.09 herein.
 - b. Detailed procedure for achieving uniform longitudinal rail stress in wash track.

1.4 QUALITY CONTROL

- A. General: Refer to the Design-Builder Quality Assurance Plan for Quality Assurance requirements and procedures.
- B. Comply with Section 02850 – LIGHT RAIL TRACK CONSTRUCTION requirements for quality in trackwork construction.

1.5 DELIVERY, STORAGE, AND HANDLING

- B. Comply with the requirements of Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.

PART 2-PRODUCTS

2.1 TRACK MATERIALS AND EQUIPMENT

- A. Furnish all materials and equipment required to construct the trackwork, including, but not limited to, the following:
 1. Rail welding materials and equipment:
 - a. Provide welding materials and equipment for welding rail by both the electric (flash butt) method as specified in Section 02851 – RAILROAD RUNNING RAIL, and the thermite weld method as specified in Section 02877 – THERMITE WELDING. Provide submittals as required in these sections.
 2. Concrete slab work, underlying subbase materials, and associated earthwork shall comply with indicated requirements.
- B. Embedded Shop Track:
 1. Concrete:
 - a. Provide 4,000-psi strength concrete mix for the slabs in accordance with the requirements of Section 03300 – CAST-IN-PLACE CONCRETE.
 - b. Submit structural floor shop drawings for the shop and apron track construction and show details for drainage structures and electrical boxes.
 2. Steel Reinforcement Bars:
 - a. Provide Grade 60, uncoated, pre-formed steel reinforcement bars.

- b. Provide electrical continuity throughout all steel reinforcing bar mats to comply with corrosion control requirements by either welding the reinforcing bar connections or by other means.
 - c. Provide expansion joints and construction joints in reinforced concrete.
3. Insulating Rubber Rail Boot: As shown on the Design Documents and the following requirements:
- a. Elastomeric rubber boot and cuff extrusions shall be pre-formed to fit 115RE rail and 115RE tee rail with attached restraining rail as shown on the Design Documents. Rubber rail boot shall be a continuous extruded elastomeric material with a minimum length of 230 feet. Elastomeric rubber extrusion and cuff material shall be manufactured from Santoprene 121-73 W 175 Thermoplastic Rubber or approved equal.
 - b. Rail boot for use with embedded rail shall not be the same product as that used with at-grade crossings specified in Section 02862 – GRADE CROSSINGS. The two products have different purposes and physical dimensions and are not interchangeable.
 - c. Test Requirements: Submit certification from a testing laboratory that the material to be installed in track will pass the tests listed below. Test reports indicating acceptable material shall be received by the MBTA prior to shipment of material to the job site.
 - 1) Volume Resistivity:
 - a) Test Method: In accordance with ASTM D257, at 50% relative humidity and 77 degrees Fahrenheit resistivity shall be measured for a dry specimen and then for the same specimen after 7 days immersion in a 3% NaCl solution. The specimen from the latter test shall only be wiped dry prior to testing and no more than 1 hour shall elapse between removal from immersion and performing the test.
 - b) Acceptance Criterion: 1×10^{12} ohm-cm minimum.
 - 2) Tensile Strength Test:
 - a) Test Method: In accordance with ASTM D412.
 - b) Acceptance Criterion: 1,200 psi minimum.
 - 3) Chemical Resistance:
 - a) Test Method: In accordance with ASTM D471, oil swell, IRM 903.
 - b) Acceptance Criterion: plus 60% by weight maximum.
 - 4) Absorption of Moisture:
 - a) Test Method: In accordance with ASTM D570.
 - b) Acceptance Criterion: Less than 0.45% water absorption by weight.

- 5) Durometer Hardness Test:
 - a) Test Method: In accordance with ASTM D2240, report for cured specimens and specimens aged 24 hours at 75 degrees Fahrenheit.
 - b) Acceptance Criterion: Shore hardness A: 65 to 75.
- d. Service History: Submit certification and documentation from the manufacturer that the installed product will withstand:
 - 1) AASHTO HS25-44 loading in an urban environment for a minimum of 5 years with no failure. Failure shall be defined as the product not capable of carrying a vehicle or pedestrian in a smooth and safe manner from pavement to rail, requiring replacement or repair of the product.
 - 2) The pressure and abrasion of heavy bus and truck traffic with studded tires or chains, and shall provide a non-skid surface for a minimum of 5 years with no failure.
 - 3) The strength of the adhesive used to join adjacent sections when it is at least 70 % of the cohesive strength of the elastomeric rubber extrusion insert.
- 4. Fiber Expansion Joint Materials: As specified in Section 07920 – JOINT SEALANTS.
- 5. Joint Sealing Materials for Shop Floor and Track Slabs: As specified in Section 07920 – JOINT SEALANTS.
- 6. Aggregate base course: In accordance with Section 02509 – PAVEMENT BASE COURSES.
- C. Pedestal Shop Track:
 - 1. Provide pedestal cap plate, crane rail clip to suit 115RE rail base, 1-inch diameter-8 UNC square head anchor bolt, plain washer, spring lockwasher and hexagon nut.
 - a. Pedestal and base of pedestal hardware are considered part of building construction and shall comply with indicated requirements.
- D. All additional materials to complete the various track installations.
 - 1. Provide all other materials incidental to the construction of the track types that are necessary to provide a complete and acceptable track installation providing the function, appearance, and electrical requirements specified.

2.2 EQUIPMENT

- A. Comply with the equipment requirements specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.

PART 3 - EXECUTION

3.1 TRACK ALIGNMENT, PROFILE, AND GEOMETRY

- A. Construct the track types to the alignment and profile and within the tolerances specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.

3.2 EMBEDDED SHOP TRACK CONSTRUCTION

- A. Construct embedded shop and apron track in accordance with the requirements of Section 02850 – LIGHT RAIL TRACK CONSTRUCTION, and where applicable AREMA Manual for Railway Engineering, Volume 1, Chapter 5, Part 4 , except as modified herein.
- B. Work Plan: Prior to beginning the Work specified in this Section, submit a detailed work plan with supporting drawings describing the installation procedures and showing the details required for the Work.
- C. Sub-Grade Preparation:
 - 1. Prepare the sub-grade in accordance with Section 02300 - EARTHWORK.
- D. Interior Embedded Shop Track and Exterior Apron Track Construction:
 - 1. Fully assemble steel leveling beams and rails, rail boot and other track appurtenances in accordance with the requirements indicated in these Mandatory Specifications, the accepted Track Work Plan, the accepted shop drawings, the assembly drawings and instructions from fabricators and suppliers, and other directives as appropriate. Install embedded track in the shop interior floor to standard 4' 8-1/2" track gauge.
 - 2. Form skeleton track on the leveling beams to required surface, line and gauge prior to placement of floor and apron concrete. Secure the rail in position at the proper track gauge and top of rail elevation to suit the floor height using a leveling beam with two hexagonal bolt and nut leveling screws. Space steel leveling beam in track a distance of 7.5 to 10' apart and as required to hold the horizontal and vertical alignment before concrete is placed.
 - 3. Use slotted bolt holes in the leveling beam channels to allow lateral adjustment of the rail to set the proper track gauge.
 - 4. Prior to the concrete pour, the rails in embedded track rails shall be grounded to the shop electrical substation.

3.3 LAYING CONTINUOUS WELDED 115RE RAIL IN RAIL BOOT

- A. Prepare 115RE CWR string lengths in accordance with the accepted Shop Rail Layout Plan developed as part of the Track Work Plan.
- B. De-stressing Rail in Embedded Shop Track:
 - 1. The zero thermal stress (neutral) temperate for un-booted rail at final closure and fastening is 90 to 110 degrees Fahrenheit.
 - a. To establish an approximate rail temperature for encased booted rail, prepare a temperature rail approximately 6' long encased in rail boot with a slot cut out to place a thermometer against the rail base.

- b. Submit a detailed procedure for achieving uniform longitudinal rail stress in embedded track for the controlled stress temperature as specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.

C. Booting and Securing Continuous Welded 115RE Rail in Track:

1. Use a complete rail encapsulation methodology (rail boot) on standard embedded trackwork to obtain the required steel rail/concrete interface protection.
2. Install the rail boot to the rail butting the rail boot sections with joining cuffs and the following:
 - a. Exercise care during the handling of the boot spools or lengths, installation, movement of the rail, installation of the track slab reinforcement, and reinforcement welding operations so that the rail boot will not be damaged.
 - b. Install the rail boot only on clean rail free of dirt and debris.
 1. Inspect the inside of the rail boot to ensure that no rocks, dirt, or other construction debris has fallen into the boot, which could cause damage.
 - c. Install the boot to minimize the number of butting joints required in any length of shop track and outside the designated walkway areas of the shop floor. Butting joints shall preferably be factory cut ends and shall be assembled and retained tight to within 1/8 inch. When necessary to cut rail boot, it shall be cut clean and square in accordance with manufacturer's recommendations.
 - d. Hold the rail boot in place using non-conductive tape laid over the rail head in accordance with the manufacturer's recommendations. The use of tie-wire or metallic hangers against the rail boot is strictly prohibited.
3. Lay, clamp, and fasten 115RE CWR in the insulating rubber boot in accordance with the following procedure:
 - a. Place CWR on leveling beams in accordance with accepted work plan procedures and associated working drawings.
 - b. Determine the rail temperature by using a calibrated rail temperature measuring device placed on the shaded side of the base of the temperature rail, and record and submit to the MBTA the rail temperature and other information specified hereinafter for the time the continuous welded rail track was being fastened:
 1. Location by station, track designation, and left or right rail as determined by facing in the direction of increased stationing.
 2. Date and time.
 3. Rail weight and section, mill brand, year and month rolled, and heat number of the end rails in each CWR string.
 4. Length of CWR string in feet.

5. Air temperature, rail temperature taken on the rail base, and approximate weather conditions.
 6. Adjustment applied specifying type and end movement.
 7. Wire or metallic hangers against the rail boot is strictly prohibited.
- c. Secure the encased rail to the leveling beams during appropriate weather conditions to achieve rail temperatures noted and minimize the chances of solar heat gain expanding the rail during the concrete pour.
 - d. If alignment of the track or rail is necessary after installation of the boot, minimize concentrated force on the boot surface as follows:
 1. Use wood blocks or other means to distribute the force of contact.
 2. Shift the leveling beams if necessary, taking care to not damage the rail boot by applying pressure to it.
 3. Adjusting the rail by using lining bars or similar tools directly against the boot is prohibited.
 - e. Both prior to placing concrete and within 30 minutes of placing the concrete for embedded shop track, take a track alignment condition survey to confirm alignment both vertically and horizontally.
 - f. Take periodic survey checks during concrete placement to confirm that the track has not shifted due to thermal expansion or construction activities.
 - g. Shall track shift under thermal expansion or due to concrete placement, cease placing all concrete. Take corrective actions to realign the track, including the removal of concrete or other methods satisfactory to the MBTA, prior to recommencement of embedded shop track construction.
 - h. Finish concrete surfaces within shop area:
 1. Form and finish flangeways adjacent to the gauge side of the rails to the dimensions shown on the accepted drawings. Concrete surface on the field side of the rails shall be depressed ¼” below the top of rail running surface for a distance of 5” beyond the gauge side of the rail.
4. Final Connections to Adjoining Ballasted Track:
 - a. To minimize the chances of pushing the rail longitudinally through the rail boot, provide final closure between embedded shop track and adjoining ballasted yard track rails only after shop track construction is complete, including any intermediate segments of pedestal or direct fixation track.
 - b. Final connection between embedded shop track and adjoining ballasted track shall occur at rail joint locations in the ballasted track area adjacent to the shop apron track. Join the CWR strings (yard and shop) by the joint installation at the appropriate neutral rail laying temperature in both rails.

3.4 PEDESTAL SHOP TRACK CONSTRUCTION

- A. Construct interior pedestal shop track in accordance with the requirements of Section 02850 – LIGHT RAIL TRACK CONSTRUCTION, and where applicable AREMA Manual for Railway Engineering, Volume 1, Chapter 5. Part 4, except as modified herein.
- B. Work Plan: Prior to beginning the Work specified in this Section, prepare a detailed work plan with supporting drawings describing the installation procedures and showing the details required for the Work.
- C. Install pit track for shop interior pedestal track areas by bolting 115RE rail to a pre-welded plate positioned on the “I Beam” vertical pedestals laterally spaced to provide standard 4’ 8-1/2” track gauge and the vertical height to suit the pit track rail elevation.
 - 1. Pedestal trestle construction: Comply with applicable portions of referenced Sections in these Mandatory Specifications as listed in Article 1.1C herein.
 - 2. String the rail in place over the pedestal top plates, position rail to horizontal and vertical track alignment, and track gauge, bolting the rails in place.
 - 3. The pit track rails shall be grounded to the shop electrical system.

3.5 DIRECT FIXATION WASH TRACK CONSTRUCTION

- A. Construct wash track in accordance with the accepted drawings, the requirements of Section 02850 – LIGHT RAIL TRACK CONSTRUCTION, except as modified herein.
- B. Work Plan: Prior to beginning the Work specified in this Section, prepare a detailed work plan with supporting working drawings describing the installation procedures and showing the details required for the Work.
- C. Installation procedure:
 - 1. Placement of extra-length anchor bolt inserts in the base concrete by epoxy grout installation method.
 - 2. Placement of plinth and pad concrete with skeleton track.
 - a. Construct the base slab located beneath wash and inspection tracks in accordance with indicated requirements and the following:
 - 1. Prior to placing concrete confirm both vertical and horizontal alignment.
 - 2. Correct all defects in the aggregate base course material prior to placement of the concrete track slab.
 - 3. Place the concrete track slab in accordance with Section 03300 – CAST-IN-PLACE CONCRETE.
 - 4. Provide electrical continuity throughout all steel reinforcing bar mats to comply with corrosion control requirements by either welding the reinforcing bar

connections or by other means. Perform electrical tests after concrete is placed as specified herein.

5. Install the single track slab sections in one pour.
 6. Locate the top surface of the concrete slab at the base of plinth elevation.
- b. Construct skeleton track on the cured concrete slab and mark locations of fastener anchor bolt holes.
 1. Mark anchor bolt locations using direct fixation fastener with anchor bolt adjustment centered on serrated adjustment section.
 - c. Drill hole diameter and depth to suit special elongated anchor insert and roughen sides of drilled hole for epoxy grout connection.
 - d. Roughen surface of track slab in areas to be covered by plinth concrete.
 - e. Clean area of laitance and debris.
 - f. Reset skeleton track to final alignment and grade to set anchor inserts in drilled holes to proper elevation at top of plinth or pads. Install inserts to protrude above track slab. Inspect the anchor insert epoxy coating before installation; apply approved epoxy paint to areas with damaged coating, if necessary.
 - g. Use top down skeleton track with suspended fasteners with temporary bolted clip/clamps to accurately locate the inserts in the parent slab, and positively secure the anchor inserts against displacement during epoxy grout installation into the concrete track slab.
 - h. Install and position anchor inserts to be flush with the top of the eventual concrete plinth or pad surface to plus 0" or minus 1/8". Provide anchor inserts that are free of loose scale, grease, or other foreign matter.
 - i. Check track alignment and grade prior to placing epoxy grout to permanently secure anchor inserts. Loosen track assembly at fastener rail base once epoxy grout has reach transfer load strength.
 - j. Place plinth and pad formwork to proper height and alignment for track installation.
 - k. Place plinth pad concrete.
 1. Finish the direct fixation fastener bearing seat area, which is the concrete surface area covered by the direct fixation fastener insulating shim, with a uniform steel-troweled cement mortar finish to provide a smooth and uniform bearing surface capable of supporting 100% of the direct fixation fastener.
 2. Construct abbreviated direct fixation fastener concrete track pads and plinths in conformance with the requirements of Section 03300 – CAST-IN-PLACE CONCRETE.

3.6 DISTRIBUTING CONTINUOUS WELDED RAIL

- A. Distribute continuously welded rail in accordance with the requirements specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.

3.7 RAIL TEMPERATURE

- A. The zero thermal stress temperature at final closure and fastening for CWR pedestal track and direct fixation track is as noted in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION except that tracks which are constructed within erected buildings and will therefore always be in the shade shall be fastened at a temperature between 90 and 110 degrees Fahrenheit.

3.8 RAIL INSTALLATION

- A. Lay, clamp, fasten, and weld CWR in pedestal track and direct fixation track according to the procedure specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
- B. Install running rail and pre-curved rail in accordance with Section 02851 – RAILROAD RUNNING RAIL.

3.9 BONDED INSULATED JOINTS

- A. Locate bonded insulated rail joints within ballasted track if required.
 - 1. Coordinate construction so that embedded track through the apron areas is complete prior to construction of adjoining ballasted track under Section 02858 – BALLAST.
 - 2. Locate bonded insulated joints centered in the joints between adjacent crossties.
 - 3. Install and test bonded insulated joints in accordance with Section 16829 – INSULATED JOINTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

3.10 TOLERANCES

- A. Conform to the track construction tolerances and concrete finish tolerances specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.

3.11 FIELD QUALITY CONTROL

- A. Incomplete or inadequate quality control documentation will be sufficient grounds for rejection of installed materials.
- B. Final Alignment and Track Inspections:
 - 1. Inspect track construction to verify that the final horizontal and vertical alignment, track gauge, and cross level are within the tolerances specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
- C. Electrical Trackwork Testing:
 - 1. As the Work on the embedded pedestal and direct fixation track sections proceed, perform rail grounding integrity, and rail-to-rail and rail-to-ground electrical resistance tests along the track.

Testing shall be in accordance with Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION.

2. Use the same independent corrosion control firm that will perform the electrical trackwork isolation testing on ballasted track construction outside of the shop building.
3. Testing shall demonstrate that the rails within the shop building and the adjoining aprons, pedestal track, wash tracks and inspection tracks are grounded.

D. Anchor Bolt Insert Tests:

1. During the construction period, intermittently conduct the restrained pull-out test, unrestrained pull-out test, and torsion test as described below on 30 % of the grouted inserts.
 - a. Randomly select inserts, unless otherwise directed by the MBTA.
 - b. Notify the MBTA 24 hours in advance of the location and time of insert testing.
2. Test Methods and Acceptance Criteria: Perform restrained and unrestrained pull-out tests and torsion tests.

END OF SECTION

SECTION 02862

GRADE CROSSINGS

PART 1 - GENERAL

1.1 DESCRIPTION

- A. The work specified in this Section shall include the design and construction of rubber rail seal and grade crossing panels as indicated on the accepted drawings, including both at-grade and aerial viaduct pedestrian track crossings and panels placed between the rail and edge of station platform.

1.2 SUBMITTALS

- A. Shop Drawings
 - 1. Detailed description of construction procedures for the specific type of grade crossing to be installed.
 - 2. Product data for crossing materials.

PART 2 - PRODUCTS

2.1 GRADE CROSSINGS, GENERAL

- 1. Commuter rail grade crossings shall be designed in accordance with MBTA Commuter Rail Book of Standard Plans Dwg Nos. 3100, 3106, and 3108.
- 2. Transit rail grade crossings shall be designed in accordance with MBTA MOW Book of Standard Plans Dwg Nos. 145 and 155.
- 3. Design crossings with full depth rubber panels on the commuter line and transit line for at-grade and aerial viaduct pedestrian crossings.
- 4. Design removable full depth rubber panels for use on the field side of the rail along the edge of station platform at all low-level transit passenger stations.
- 5. Design grade crossings with surface of rubber rail seal and bituminous concrete on the commuter line and transit line at the following locations:
 - a. ROW Hi-rail access pads (multiple locations)
 - b. 3rd Avenue grade crossing
- 6. Modular full-depth rubber and elastomeric rail seal products shall be fabricated by a qualified manufacturer regularly engaged in the production of such items for commuter and transit rail applications.
- 7. Crossing material shall be insulator type design to retard stray current. Crossing module material shall provide volume bulk resistivity of 1×10^7 ohm-cm according to ASTM D257.

8. Rubber Rail Seals:
 - a. Crossing material shall be an elastomeric type, designed and manufactured of 100% virgin rubber and having the ability to interface with a bituminous surface. All rubber materials shall meet ASTM Specification D-2000, M4A712, B35, C32, EA14, G21, and Z1 thru Z6.
 - b. Crossing material shall be capable of being installed and secured using the approved rail fastener system on timber ties using 132 RE or 115 RE rail sections.

PART 3 – EXECUTION

3.1 GRADE CROSSING CONSTRUCTION

1. Crossing placement shall be coordinated with insulated joint locations.
2. Installation of rubber crossing material shall be in accordance with manufacturer's recommendations and MBTA Standard Drawings.

END OF SECTION

SECTION 02865

TRACK APPURTENANCES

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section describes the requirements for furnishing and installing miscellaneous track appurtenances which may be required.

1.2 APPLICABLE STANDARDS

- A. The following Codes, Regulations, Reference Standards and Specifications apply to work included in this Section:

1. American Railway Engineering and Maintenance of Way Association (AREMA):
 - a. Manual for Railway Engineering.
 - b. Portfolio of Trackwork Plans.
2. MBTA Book of Standard Trackwork Plans
3. American Society of Mechanical Engineers (ASME):
 - a. ASME B1.1 Unified Inch Screw Threads (UN and UNR Tread Form)
 - b. ASME B1.3 Screw Thread Gaging Systems for Applicability: Inch and Metric Screw Threads
 - c. ASME B.18.2.1 Square, Hex, Heavy Hex, and Askew Bolts and Hex, Heavy Hex, Hex Flange and Lag Screws
4. ASTM International (ASTM)
 - a. ASTM A36 Carbon Structural Steel
 - b. ASTM A123 Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
 - c. ASTM A325 Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength
 - d. ASTM D257 Test Methods for DC Resistance or Conductance of Insulating Material Tensile Strength
 - e. ASTM D395 Test Methods for Rubber Property – Compression Set
 - f. ASTM D412 Test Methods for Vulcanized Rubber and Thermoplastic Elastomers - Tension
 - g. ASTM D471 Test Methods for Rubber Property – Effect of Liquids

- h. ASTM D570 Test Methods for Water Absorption of Plastics
 - i. ASTM D573 Test Methods for Rubber – Deterioration in an Air Oven
 - j. ASTM D1002 Test Methods for Apparent Shear Strength of Single Lap Joint Adhesively Bonded Metal Loading (Metal to Metal)
 - k. ASTM D1149 Test Methods for Rubber Deterioration – Surface Ozone Cracking in a Chamber Ozone Controlled Environment
 - l. ASTM D2137 Test Methods for Rubber Property – Brittleness Point of Flexible Polymers and Coated Fabrics
 - m. ASTM D2240 Test Methods for Rubber Property – Durometer Hardness
5. National Electrical Manufacturers Associates (NEMA):
- a. NEMA Standard L1

1.3 RELATED WORK

- A. Other specification sections that relate to the work include, but are not limited to, the following:
 - 1. Section 02886 – BALLAST MATS
 - 2. Section 03300 – CAST-IN-PLACE CONCRETE

1.4 QUALITY ASSURANCE

- A. Prior to the procurement of any material or the commencement of any work, obtain certified reports from the manufacturers or from laboratories accepted by the MBTA indicating the critical properties of all track appurtenances, as specified.
- B. Inspection
 - 1. The MBTA shall have free entry to the track appurtenance manufacturing facilities at all times while the work under this Section is in progress.
 - 2. The MBTA shall be provided with all proper facilities and testing equipment to ensure that the track appurtenances being furnished to the MBTA are as specified.

1.5 SUBMITTALS

- A. The following submittals shall be made to the MBTA for review prior to procuring any material or performing any work required under this Section:
 - 1. Submit name, manufacturer’s catalog cuts and specifications.
 - 2. Submit certified manufacturers’ test reports or test reports from a laboratory accepted by the MBTA establishing the critical properties of each track appurtenance to the satisfaction of the MBTA.

3. Submit shop drawings detailing the manufacture and recommended installation procedures for the rail bond system.
- B. All submittals will be reviewed for general conformance with the intent of the Contract Documents. This review will not relieve the DB Entity of final responsibility for the means, methods, procedures and sequences to be utilized.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Bumping Posts for Transit Line

1. Bumping posts for LRT (Green Line) track shall be Type WA as manufactured by the Western-Cullen-Hayes, Inc. or equivalent, meeting the requirements specified herein.
2. A complete bumping post assembly shall consist of a steel bumping post equipped with a shock absorbent head of multiple-spring and shockbed design.
3. All components used in the manufacture of bumping posts shall conform to the dimensional requirements of Section 115 RE rail unless specified otherwise. Bumping posts shall be designed for severe service conditions. Assembly shall be symmetrical about the centerline of track
4. Bumping posts shall be designed to be bolted to the running rails. No part of the assembly shall extend more than two inches below the rail base. Bumping post components shall clear the vehicle regardless of its position. Bumping post to vehicle clearances shall be based on vehicle coupler swing radius, swing angle and coupler size.
5. Dimensions shown on MBTA MOW Standard Plan No. 925 are based on prevailing train designs in use at the time of Plan preparation (June 2001). Different vehicle designs may require dimensional modifications to bumping post design. The DB Entity is responsible for determining the suitability of bumping post design to prevailing car design upon receipt of car data from the MBTA. Identify on submittals the vehicle design used for design of bumping posts.
6. Bumping post heads shall engage the vehicle anti-climber. Heads shall be shock absorbent design, such as the Hayco Shock-Free head manufactured by the Western-Cullen-Hayes, Inc. or equivalent.

B. Hydraulic Bumping Posts for Transit Line

1. Where specified in accepted drawings hydraulic bumping posts are required. Hydraulic bumping post – An energy absorbing and automatic resetting bumping post capable of withstanding a six mph impact from trains weighing 385 tons without damage to the vehicle or the bumping post. Provide Track Mounted Hydraulic Transit Bumper meeting these criteria as manufactured by Western-Cullen-Hayes, Inc. model WH, or approved equal.
2. Bumping posts shall be bolted to the running rails and shall not require anchoring to cross ties. No part of the assembly shall extend more than two inches below the rail base.
3. The hydraulic bumping post shall be provided for use with transit vehicles. The striking face shall engage the transit vehicle's anti-climber. Bumping post components shall clear the transit

vehicle coupler regardless of its position. Clearances shall be based on the coupler swing radius, swing angle, and size of coupler indicated.

C. Joint Bars and Associated Hardware

1. Standard joint bar assembly to consist of two toeless, headfree bars of the rail section and length indicated, track bolts, nuts and washers in quantity as dictated by the specified joint bar length. All material and processes shall be in accordance with the current AREMA manual for Railway Engineering, Chapter 4, Part 3 – Specifications for Quenched Carbon Steel Joint Bars.
2. Track bolts and nuts material and manufacture shall be in accordance with the current AREMA Manual, Chapter 4, Part 3 – Specifications for Heat-Treated Carbon Steel Track Bolts and Carbon Steel Nuts.
 - a. Prior to shipment, entire bolt thread shall be coated with an appropriate oil or grease to protect the threads during shipment and storage.
 - b. Bolt and nut shall be assembled for shipment by turning the nut onto the bolt at least two threads.
3. Lockwasher material and manufacture shall be in accordance with the current AREMA Manual, Chapter 4, Part 3 – Specifications for Spring Washers.
4. Joint bars for transit lines shall be in accordance with Plan No. 320 in the MBTA M.O.W. Division Book of Standard Trackwork Plans. Joint bars for commuter line shall be in accordance with MBTA Standard Plan No. 1320 for 115 LB RE rail or Standard Plan No. 1322 for 132 LB RE rail. Varying lengths of bars and different rail sections may be specified by any particular order. Length and bar punching will be indicated in the order.
5. Compromise joint bars for transit lines shall be in accordance with Plan No. 350 in the MBTA M.O.W. Division Book of Standard Trackwork Plans for the rail sizes as specified in the order. Compromise joint bars for commuter lines shall be in accordance with MBTA Standard Plan No. 1328.
6. Track bolts shall be rolled, button-head, elliptic neck bolts with wrench fit thread and shall be provided with standard square nuts all per the current AREMA Manual Chapter 4, Part 3. Bolt diameter and length shall be as specified in the order.
7. Lock washer diameter shall be as specified in the order and washer configuration shall conform to requirements of ANSI, B27.1, for Extra Heavy Duty Helical Spring Lock Washers.

D. Cut Track Spike

1. Refer to MS No. 9212 in this section.

E. Split Switch Derails

1. Refer to MS No. 9215 in this section.

F. Insulated Bonded Joint Plug Rail

1. Refer to MS No. 9221 in this section (See paragraph 3.8.B of this Section).

G. Insulated Joint Kit

1. Refer to MS No. 9224 in this section (See paragraph 3.9.B of this Section).

H. Resilient Fastener

1. Refer to MS No. 9245 in this section.

I. Screw Spikes

1. Refer to MS No. 9246 in this section.

J. Tie Plate Resilient Fastener

1. Refer to MS No. 9269 in this section.

K. Tie Plug – Treated

1. Refer to MS No. 9275 in this section.

L. Restraining Rail Lubricators

1. Where specified by the accepted drawings, a single track restraining rail lubrication system shall be installed. A single track restraining rail lubricator systems meeting these criteria as manufactured by SKF-Lincoln Industrial Corp. or approved equal.
2. The single track restraining rail lubrication system shall include a metallic weather resistant cabinet with durable powder coated finish housing the pump, controller, power supply and reservoir with 200 lbs. grease capacity. When not installed on above grade structures, the metallic cabinet shall be placed on a concrete leveling pad.
3. The single track restraining rail lubrication system shall have an oversized 24 Volt DC solar panel to charge battery cells and shall be designed to be theft resistant.
4. A grease pump shall be installed which provides low flow (7 cubic inches/minute) at high pressure (4,000 psig) and is able to pump an equal amount of grease to each applicator bar at a distance of up to 200 feet from the reservoir.
5. The system shall include two restraining rail applicator bar assemblies. The assembly shall consist of a valve divider block to distribute grease evenly to ports on the assembly bars.
6. The system shall have a non-contacting wheel sensor, controller with wheel counter and adjustment dials to allow precision grease pumping on time (in seconds) per cycle (specified number of axle count) basis.

PART 3 – EXECUTION

3.1 BUMPING POSTS

- A. Prior to fabrication, the manufacturer shall submit shop drawings showing details of materials, manufacturing procedures and tolerances for review and acceptance. Identify on shop drawings the vehicle design used for design of bumping posts.

- B. Bumping Posts shall conform to these Mandatory Specifications in all respects. Bumping posts rejected for non-compliance with these Mandatory Specifications will be returned at the DB Entity's expense.
- C. Installation of bumping posts shall be in conformance with MBTA Standard Plan No. 3010, the manufacturer's recommendations and specifications.

3.2 JOINT BARS AND ASSOCIATED HARDWARE

- A. Inspection and testing shall be in conformance with the inspection procedures outlined in the current AREMA Manual, Chapter 4, Part 3.
- B. Prior to shipment, the manufacturer or supplier shall submit certified inspection and test reports as required.
- C. Joints shall be wired into matched pairs, palletized and strapped for shipment.
- D. Bolts and nuts shall be packed in sealed kegs with a maximum of 200 lbs. per keg. Kegs shall be palletized and wrapped or strapped for shipment.
- E. Lock washers shall be packed in steel pails or kegs with a maximum of 200 lbs. per container.
- F. To be accepted, all material specified herein shall conform to these Mandatory Specifications in every respect. Material is at the supplier's risk until accepted at the specified delivery site by an authorized representative of the MBTA. Material rejected for non-compliance with these Mandatory Specifications will be returned to the supplier wholly at the supplier's expense.

3.5 CUT TRACK SPIKE

- A. Refer to MS No. 9212 in this Section.

3.6 SPLIT SWITCH DERAILS

- A. Refer to MS No. 9215 in this Section.
- B. Installation of split switch derails shall be according to the manufacturer's recommendations, MBTA Standard Plan No. 3006, and as specified in
 - 1. Section 02854 – TRACK SURFACING AND ALIGNMENT
 - 2. Section 02855 – SPECIAL TRACKWORK

3.7 INSULATED BONDED JOINT PLUG RAIL

- A. Refer to MS No. 9221 in this Section.
- B. End posts in insulated joints; both plug rails and bolted poly, shall be 3/8" thick rather than 3/16" as indicated on attached MS sheets to improve insulator reliability.

3.8 INSULATED JOINT KIT

- A. Refer to MS No. 9224 in this Section.

- B. End posts in insulated joints; both plug rails and bolted poly, shall be 3/8” thick rather than 3/16” as indicated on attached MS sheets to improve insulator reliability.
- C. Installation of insulated joints shall be as specified in
 - 1. Sections 02850 – LIGHT RAIL TRACK CONSTRUCTION
 - 2. Sections 02856 – COMMUTER RAIL TRACK CONSTRUCTION
 - 3. Sections 02879 – SIDE TRACK CONSTRUCTION FOR COMMUTER RAIL SYSTEMS

3.9 RESILIENT FASTENER

- A. Refer to MS No. 9245 in this Section.

3.10 SCREW SPIKES

- A. Refer to MS No. 9246 in this Section.

3.11 TIE PLATE RESILIENT FASTENER

- A. Refer to MS No. 9269 in this Section.

3.12 TIE PLUG – TREATED

- A. Refer to MS No. 9275 in this Section.

3.13 COMPROMISE JOINTS

- A. Installation of compromise joints at the siding locations shown on the Design Documents shall be according to the manufacturer’s recommendations, MBTA Standard Plan 1328, and as specified in
 - 1. Sections 02879 – SIDE TRACK CONSTRUCTION FOR COMMUTER RAIL SYSTEMS

3.14 RESTRAINING RAIL LUBRICATORS

- A. Installation of restraining rail lubricators at the restraining rail locations shown on the Design Documents shall be according to the manufacturer’s recommendations.
- B. At-grade installations shall have a 6’x 7’ leveling pad installed beneath the metallic weather resistant cabinet.
- C. All metallic weather resistant cabinets and associated equipment shall be clear of the light rail vehicle’s clearance envelope.

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9212

CUT TRACK SPIKE

MATERIALS

Cut track spikes shall conform to material and workmanship specifications of the AREA Manual for Railroad Engineering, Chapter 5, Part 2 - "Specifications for Soft-Steel Track Spikes".

DESIGN

Cut track spikes shall be in accordance with MBTA Book of Standard Plans.

INSPECTION

Inspection shall be in accordance with the inspection procedures outlined in AREA Manual Chapter 5, Part 2.

SHIPMENT

All cut track spikes shall be packed in sealed-top kegs or other suitable container, with a maximum of 200 pounds of non-defective cut track spikes per container.

DELIVERY

To be accepted, the cut track spikes offered shall conform to this specification in all respects. All spikes are subject to inspection at delivery and are at the supplier's risk until acceptance. All spikes rejected for non-compliance with this specification will be returned at the supplier's expense.

CUT TRACK SPIKE PAGE 1 OF 1

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9215

DERAIL - SPLIT SWITCH

MATERIALS

Materials shall conform to AREA-Portfolio of Trackwork Plans - Plan No. 100-89 "Specification for Special Trackwork".

DESIGN

Split switch derail shall be a 16'-6" switch point complete with 39 foot undercut stock rail, switch plates, rail braces, solid heel block, operating rod and support bracket, connecting rod, and switch stand in accordance with MBTA Standard Plans 3006 and 3007. Derail shall be for right or left hand as specified in the order.

Switch point and stock rail shall be manufactured from heat treated rail per MBTA Material Specification No. 9233 titled "Rail - High Strength Running".

MANUFACTURE

Split switch derail shall include, but not be limited to, the following components in accordance with MBTA Standard Plans specified by plan number.

- 16'-6" Switch Point
- Heel Block Assembly
- 39'-0" Undercut Stock Rail
- Adjustable Brace Plates
- Switch Rail Stop
- Adjustable Rocker Clip
- Switch Rod
- Turnout Plates
- Rail Braces
- New Century Switch Stand
- Operating Rod Support Bracket
- Screw Spikes

SHIPMENT

Switch point and stock rail shall be blocked and banded together; switch rods shall be banded together; plates, braces and switch stands shall be palletized and wrapped or banded for shipment. All shall be marked to identify them as a unit.

INSPECTION

The manufacturer shall be responsible for all tests and inspections necessary to ensure that the split switch derail conform to this specification and the MBTA Standard Plans referenced herein.

DELIVERY

To be accepted switch point derail must conform to this specification in all respects. Switch point derail is subject to inspection at time of delivery and is at supplier's risk until accepted by the Authority. Switch point derail rejected for non-compliance with this specification will be returned at supplier's expense.

DERAIL - SPLIT SWITCH PAGE 2 OF 2

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9221

INSULATED BONDED JOINT PLUG RAIL

MATERIALS

Insulated joints shall be in conformance with AREA Manual for Railway Engineering, Chapter 4, Part 2, "Specification for Quenched Carbon-Steel Joint Bars".

Rail shall be No. 1, fully heat-treated, high strength steel rail with no "A" rails. Rail shall conform to MBTA Material Specification No. 9233 titled "Rail - High Strength Running".

DESIGN

The joint bars shall be 36 inch, full-face contact design, conforming to the rail section specified and shall consist of joint bars, end posts, bushings, bolts, nuts, washers and insulated polyplate tie plates (when specified on the order), as manufactured by Portec or equivalent.

Joint bars shall conform to rail size specified in the order.

MANUFACTURE

Rail shall be two pieces, with lengths as specified on the order, jointed to form a plug rail. Web of rail where joint is to be bonded shall be ground free of brandings to provide a full contact fit.

Joint Bars - Joint bars to be smooth and straight with all burrs removed. The inside face of the joint bars shall have all insulating material pre-bonded and shall be free of stamping or branding. The fabrication tolerances shall be as follows:

Fishing Height - Plus or minus 1/64 inch
Straightness - Plus or minus 1/32 inch in 36 inches
Length - Plus or minus 1/8 inch

Joint bars shall be designed so that when fully assembled and bonded to rail 3/4 of an inch of rail base, on each side of the rail, shall be exposed to allow application of rail fasteners.

Insulation - Insulation materials shall be of high pressure, laminated design, impervious to oil, grease and water. The material shall have electrical resistance characteristics equal to or greater than fiber insulation meeting the requirements of the AAR Manual, Part 116, Signal Section Specification 216-46.

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9221

INSULATED BONDED JOINT PLUG RAIL

End posts shall be manufactured to fit ball, web, and base and shall be 3/16 inch thick and shall project 1/4 inch plus to 1/16 inch minus below the base of rail.

Fasteners - Insulated bonded joints shall be bolted together with six high strength 1 inch bolts. The bolts shall be in conformance with ASTM Specification A490 having Class 2A and 2B thread fit. The fastener provided must provide a positive means for maintaining the tension in the bolts by a lock-nut complying with Industrial Fastener Institute Standard IFI-100 and IFI-101, or approved equivalent. Flat washers, if required, shall be hardened A-325 or A-490 quenched and tempered carbon steel.

Adhesive - The adhesive shall have a shelf life of at least one year when stored in a protected, weather tight location at reasonable storage temperatures, and shall withstand the requirements of the prescribed mechanical testing.

TESTING

The manufacturer shall perform and certify in writing prior to shipment, that three assembled joints, representative of the joints offered, have successfully passed the following tests:

Rolling Load Test
Longitudinal Compressive Strength

Rolling Load Test - The rail joint shall be mounted on a 33 inch stroke rolling load test machine, supported on 36 inch centers, with the joint centered between the supports. Apply a 44,400 pound wheel load on the rail for 2,000,000 cycles and measure and record to the nearest 0.001 inch the deflection of the rail at the centerline of the joint. The deflection at the ends of the joint shall also be measured at every 500,000 cycles. The wheel path shall travel from a point 6 inches from the center of the joint to a point 9 inches outside the opposite end of the joint. Total range of deflection of the joint shall not exceed 0.065 inches during the test and the joint shall show no evidence of failure by bending. The electrical resistance test shall then be performed and the test results shall be within the acceptance criteria specified.

The Longitudinal Compression Test shall then be performed on the test specimens and the results shall be within the acceptance criteria specified.

INSULATED BONDED JOINT PLUG RAIL PAGE 2 OF 4

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9221

INSULATED BONDED JOINT PLUG RAIL

Longitudinal Compression Test - The assembled joint shall be sawn in half where the rails are joined together in a manner which will prevent over-heating and damage to the epoxy bond. The cut shall be perpendicular to the center line of the top of rail.

A fixture or device shall be used so that the reaction at the sawn ends occurs only on the face of the joint bars when a load is applied to the centroid of the rail at the opposite end. The load shall be applied in increments of 25,000 pounds, maintaining each load increment until the deflection of the rail stops before increasing the load. The load shall be increased to 650,000 pounds and a record of loading and differential movement of the rail, measured to 0.001 inch shall be measured for each increment. The joint shall show no indication of slippage prior to reaching a compressive load of 650,000 pounds and the movement shall be less than 1/8 inch in any direction. The relative position of the rail and joint bar shall be within 1/32 inch of its original value when the load is removed.

The manufacturer shall perform and certify in writing, prior to shipment, that each assembled INSULATED BONDED JOINT PLUG RAIL, in the order, has successfully passed the following Electrical Resistance Test.

Electrical Resistance Test - A rail joint shall be assembled in accordance with manufacturer's recommendations and supported on non-conducting material. With 500 volts dc applied to the rail across the bonded insulated joint for a duration of three minutes, the current flow through the joint should be measured to the nearest 0.1 micro ampere. The minimum acceptable resistance for the test shall be 10 megohms. With 50 volts ac applied to the rail across the bonded insulated joint for a duration of three minutes, the impedance shall be measured with an accuracy of plus or minus 2 degrees. This test shall be repeated three times, once with a frequency in the range from 10Hz to 100Hz, again with a frequency in the range from 200Hz to 1000Hz and again in the range from 2000Hz to 10KHz. The minimum acceptable impedance for any of these tests shall be 10,000 ohms.

FABRICATION

All insulated bonded joint plug rails shall be fully shop assembled prior to shipment.

Insulated bonded joint plug rails shall be in accordance with MBTA Standard Plan to lengths as specified in the order.

SUBMITTALS

Prior to shipment, the manufacturer shall submit shop drawing showing materials and fabrication tolerances.

Prior to shipment, the manufacturer shall submit certified test results for tests described under testing.

All submittals shall be made to the Chief Engineering Officer, or his designee, for review.

DELIVERY

To be accepted, insulated bonded joint plug rails shall conform to this specification in all respects. Insulated bonded joint plug rails are subject to inspection at delivery and are at the supplier's risk until acceptance. Insulated bonded joint plug rails rejected for non-compliance with this specification will be returned at the supplier's expense.

INSULATED JOINT KIT

MATERIALS

Insulated joint bars shall be manufactured to conform to AREA Manual for Railway Engineering, Chapter 4, Part 2, "Specifications for Quenched Carbon-Steel Joint Bars".

DESIGN

Insulated joint shall be 36 inch, 6 hole, short toe, full face design, conforming to the configuration of the rail section ordered, bars shall be insulated with a polymeric material.

Joint shall consist of joint bars, bolts, nuts and washers, end posts, and bushings packaged as a unit.

Joint shall conform to rail size specified in the order.

End posts shall be 3/16 inch thick and shall project 1/4 inch plus to 1/16 inch minus below the base of the rail.

SUBMITTAL

Prior to fabrication, the manufacturer shall submit shop drawings showing details of materials, manufacturing procedures, and tolerances to the Chief Engineering Officer, or his designee, for review.

Upon completion of the testing, submit certified results in writing including statement that joints have passed the test and are approved.

MANUFACTURE

Joint bars shall be smooth and straight with all burrs removed. The bars shall be short toe type so that when the joint is completely assembled 3/4 of an inch of rail base, on both sides of the rail, shall be exposed to allow application of rail fasteners. The face of the joint bar shall be free of stamping or branding. Boring of bolt holes shall be for 1 1/8 inch bolts spaced as shown on MBTA STANDARD PLAN for rail section ordered.

INSULATED JOINT KIT PAGE 1 OF 3

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9224

INSULATED JOINT KIT

Insulation shall be a uniform, single pour, polymeric insulation material, equivalent to that manufactured by Portec, Inc. Joint insulation, end post and bushing insulation material shall be impervious to oil, grease and water, and shall have electrical resistance characteristics equal to or greater than fiber insulation meeting the requirements of the AAR Signal Manual Part 14.5.1. Insulated joints shall be highly resistant to abrading, cracking, cutting, spalling and fatigue failure under impact loads, and shall exhibit deflection characteristics comparable to standard steel rail joints.

Fasteners - insulated joint kits shall be supplied with six high strength 1 1/8 inch bolts. The bolts shall be in conformance with ASTM Specification A490 having Class 2A and 2B thread fit. The fastener provided must provide a positive means for maintaining the tension in the bolts by a lock-nut complying with Industrial Fastener Institute Standard IFI-100 and IFI-101, or approved equivalent. Flat washers, if required shall be hardened A325 or A490 quenched and tempered carbon steel.

RESILIENT FASTENER

MATERIAL

Resilient fastener shall be manufactured from high quality spring steel bar stock.

DESIGN & MANUFACTURE

Resilient fastener shall be designed and manufactured to fit MBTA Standard Resilient Fastener Tie Plate for rail weight as specified in the order.

Resilient fastener shall be designed to resist rail longitudinal forces by exerting downward pressure on the base of the rail by spring action.

Resilient fastener shall be designed to be installed by driving with hand tools or applied mechanically by an on-track machine.

Resilient fastener shall be designed so that application pressure shall be by driving parallel to length of rail to avoid possible damage to rail base by scoring.

Resilient fastener shall have a minimum hold down force of 2750 pounds for each fastener.

Minimum static longitudinal slip per complete rail fastener assembly with two resilient fasteners in place shall be 5500 pounds.

Resilient fastener shall be designed to be installed and removed by one man using readily available track tools or by commercially available equipment and shall be capable of removal and reapplication without appreciable loss of hold down force.

TESTING

Representative samples from each run of resilient fasteners shall be tested and certified that they meet this specification in all respects.

SUBMITTAL

Submit results of testing and certification that resilient fasteners meet or exceed this specification.

SCREW SPIKES

MATERIALS

Screw spikes shall be hot forged from medium carbon steel conforming with ASTM designation A-66.

DESIGNS

Screw spikes shall be in accordance with MBTA Book of Standard Plans.

Screw spikes shall be either 7/8 inch by 5 3/4 inches measured under the head or 15/16 inch by 6 inches measured under the head as specified on the order.

Screw spikes shall be manufactured to comply with ASTM A-66 to meet the following physical requirements.

Tensile Strength - Minimum psi 60,000
Yield Point - psi 0.5 tensile strength
Elongation - 18 percent in 2 inches
Heads shall be "S" style

INSPECTION

Inspection shall be in accordance with the inspection procedures outlined in AREA Manual.

SHIPMENT

Screw spikes shall be packed in sealed-top kegs or other suitable containers, with a maximum of 200 pounds of non-defective lags per container.

DELIVERY

To be accepted, screw spikes offered shall conform to this specification in all respects. Screw spikes are subject to inspection at delivery and are at supplier's risk until acceptance. Screw spikes rejected for non-compliance with this specification will be returned at supplier's expense.

TIE-PLUG - TREATED

MATERIAL

Tie plug shall be manufactured from sound, seasoned, straight grained wood, free from knots and other defects in compliance with AREA Manual, Chapter 5, Part 1, Section 7 - "Specifications for Tie Plugs".

DESIGN

The plugs shall be manufactured in two varieties, both for 5/8 inch spikes, notched and unnotched. The variety shall be specified in the material order and shall be sized as follows:

Notched tie plugs shall be in sticks of five plugs per stick. Tie plugs shall be 5/8 inch by 5/8 inch x 4½ inches.

Unnotched tie plugs shall be in sticks 5/8 inch by 5/8 inch x 22½ inches long.

TREATMENT

Tie plugs shall be treated with a 60/40 creosote and petroleum solution with retention of 8 pounds per cubic foot in accordance with AREA Manual, Chapter 3, Part 6.

SHIPMENT

Treated tie plugs shall be bundled 100 sticks per bundle, palletized, and strapped for shipment.

DELIVERY

To be accepted, treated tie plugs shall conform to this specification in all respects. Treated tie plugs are subject to inspection at delivery and are at supplier's risk until acceptance. Treated tie plugs rejected for non-compliance with this specification will be returned at supplier's expense.

TIE PLUG - TREATED PAGE 1 OF 1

END OF SECTION

SECTION 02867

RESTRAINING RAILS

PART 1 - GENERAL

1.1 DESCRIPTION

- A. Work under this Section covers furnishing all labor, materials, and equipment for the manufacture, testing, fabricating, shipping and installation of 132RE restraining rail and all associated hardware as required to provide a complete restraining rail installation for the Project.
- B. Definitions: Terminology used in this Section is consistent with definitions and glossaries contained in the American Railway Engineering and Maintenance of Way Association's Manual for Railway Engineering and Portfolio to Trackwork Plans.
- C. Related Work Specified Elsewhere:
 - 1. Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
 - 2. Section 02851 – RAILROAD RUNNING RAIL.

1.2 REFERENCES

- A. Restraining Rail MBTA MOW Standard plan no's. 305, 330, 335, 370.
- B. The following Codes, Regulations, Reference Standards and Specifications apply to the Work. Where the DB Entity substitutes a foreign standard for a United States standard, or a United States standard for foreign standard, he shall provide a written comparison with sufficient explanatory text and data to prove to the satisfaction of the MBTA that the requirements of the referenced standard and this Section will be achieved.
- C. Standards
 - 1. The American Railway Engineering and Maintenance of Way Association Manual for Railway Engineering (AREMA Manual), Chapter 4.
 - 2. American Society for Testing and Materials (ASTM):

ASTMA27	Standard Specification for Steel Castings, Carbon, for Standard Application
ASTMA36	Standard Specification for Structural Steel
ASTMA123	Standard Specification for Zinc (Hot-Dip Galvanized) Castings on Iron and Steel Products
ASTMA325	Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength

ASTMA536	Standard Specification for Ductile Iron Castings
ASTMA563	Standard Specification for Carbon and Alloy Steel Nuts
ASTMF436	Standard Specification for Hardened Steel Washers
ASTME10	Standard Method of Brinell Hardness for Metallic Materials

1.3 SUBMITTALS

- A. Submit a list of proposed suppliers for all components prior to procurement. Subsequent changes in proposed suppliers shall be submitted as they occur.
- B. Submit the following to the MBTA for review at least 30 days before the anticipated rolling dates:
 - 1. The date scheduled for the rail production, inspection, shipment and final delivery.
 - 2. A detailed description of the steel metallurgy.
 - 3. Lengths in which the rail section will be provided.
 - 4. A description of the method and verification testing to achieve the required rail hardness.
 - 5. A detailed description of other components used in the restraining rail assemblies including but not limited to shims, bolts, washers, and nuts.
 - 6. Shop drawings showing rail layouts, end details, joint and separator block details and locations, and details of rail fastening assembly.
 - 7. A description of pre-curving procedures.
- C. Provide test records, including mechanical properties tests, hardness measurements, ultrasonic test records and all other required test documentation, for review during any in-plant inspection and formal submittal to the MBTA.
- D. All submittals will be reviewed for general conformance with the intent of the contract documents. This review will not relieve the DB Entity of final responsibility for the means, methods, procedures and sequences to be utilized.

1.4 QUALITY CONTROL

- A. Develop and maintain a quality control program regulating methods, procedures, and processes to ensure compliance with standards of quality required by the Contract Documents.
- B. Records of all inspection work by the DB Entity shall be kept complete and available to the MBTA during the performance of the contract.
- C. Rail fastening system quality assurance records shall remain available from the supplier for a minimum of 7 years.

D. Inspection and Testing:

1. The products and material incorporated into the work will be subject to inspection by the Independent Testing Agency hired by the DB Entity, at the DB Entity's and Subcontractor's facilities, place of manufacture, the shipping point, and at the shipping destination. The inspection frequency will be reviewed by the MBTA.
2. Whether or not the MBTA inspects or tests any materials, the DB Entity will not be relieved from any responsibility regarding defects or other failures to meet the requirements in the Contract Documents, or will such inspection or testing be considered as a guarantee of acceptance of any material which may be delivered later.
3. Perform all tests and analyses specified in Chapter 4, Part 2, of the AREMA Manual and submit the results in accordance with this Section.
4. Have the manufacturer furnish all the rail inspection results required to complete.
5. Perform all rail tests and inspections at the mill prior to shipment. Assume full responsibility for all testing indicated. Give the MBTA and the Independent Testing Agency hired by the DB Entity sufficient notice when testing in any form is proposed so to witness the tests. Provide the MBTA and the Independent Testing Agency hired by the DB Entity free entry at all times to the manufacturer's mill to inspect and processing and testing of rail while work on this Project is being performed. Perform all tests specified herein at no additional cost to the MBTA. Testing shall be performed by a NIST certified testing facility, either in-house or using a certified independent testing firm.
6. Hardness tests shall be conducted in accordance with ASTM A370, Brinell Hardness. Shall the manufacturer perform the testing by another method for his own convenience, the results shall be converted to Brinell Hardness in accordance with the tables in ASTM E10. Hardness testing by methods established for rail hardness; i.e., Rockwell, Brinell, or Vickers, shall be used.

1.5 DELIVERY, HANDLING AND STORAGE

- A. Restraining rail shall be stacked and banded for shipment. Package small loose plates, bolts, washers and nuts in secure shipping boxes and kegs.
- B. Lift restraining rail at multiple points, with the rail weight evenly distributed to each lift point. Handle carefully to avoid damage.
- C. Load restraining rail with adequate wood strips between the tiers of rail to prevent damage in transit.

PART 2 - PRODUCTS

2.1 RESTRAINING RAIL

- A. The restraining rail configuration shall be that shown in the MBTA standard plans.
 1. Tolerance shall be +/- 0.020" for width of section from back to guarding face.
 2. All other tolerances shall be +/- 0.040".

B. Metallurgy and Physical Properties

1. The chemical composition shall be in accordance with one of the following:
 - a. AREMA Manual, Chapter 4, Part 2.
2. Alloying to improve rail hardness shall not exceed the chemical limits allowed in AREMA Manual, Chapter 4.
3. The rail shall be head hardened and have a minimum Brinell Hardness Number (BHN) of 370 in accordance with Chapter 4 of the AREMA Manual.

C. Section Lengths

1. The standard length shall be 80', unless otherwise requested.
2. The minimum length between an insulated and standard joint shall be 15'.
3. The minimum length adjacent to an end section shall be 15'.

D. Fabrication

1. Restraining rails shall be fabricated with a sheared base as shown on MBTA MOW Standard Dwg. No. 305.
2. Restraining rail ends shall be drilled for joint application as shown on the Design Documents and MBTA standard plans.
3. Restraining rails shall be drilled every 23" for installation of separator block assemblies.

2.2 RESTRAINING RAIL ASSEMBLIES

A. General:

1. The rail fastening system shall be produced by an ISO 9001 certified manufacturer with a minimum of 25 years of documented experience in design and manufacturing.
2. The supplier shall be the original designer of the product and shall have a minimum of 25 years of experience in the design, manufacture, and supply of resilient rail fastening systems.
3. The rail fastening system shall be suitable for installation and extraction with hand tools and automated machinery.
4. Adjustment of the rail head gap shall be possible by the installation of different insulator post thicknesses.

B. Separator Blocks: Cast ductile iron, grade 65-45-12 per ASTM A536.

C. Shims: Steel per ASTM A36.

D. Separator Bolts: 1 3/8" diameter square head, Type 3, per ASTM A325.

E. Cast Baseplate: Cast ductile iron, grade 80-55-06, per ASTM A536.

- F. Rail Clips:
 - 1. Nominal rail clip clamping force shall be a minimum of 2,750 lbs.
- G. Rail Clip shall be manufactured from alloy spring steel with a surface hardness of HRC 44 to HRC 48. Marks caused by forming tools shall be smooth and free of burrs.
- H. Screw Spikes: Provide per Section 02865 – TRACK APPURTENANCES and the MBTA standard plans.

2.3 JOINT BARS

- A. Joint bars and associated hardware shall be as noted in Section 02865 – TRACK APPURTENANCES.

2.4 SPARE PARTS

- A. Provide as spare parts, two standard lengths of Restraining Rail and ten assemblies including clips and baseplates.
- B. Deliver spare parts to a location designated by the MBTA.

PART 3 - EXECUTION

3.1 GENERAL

- A. An installation plan specific to Restraining Rail Installation Locations shall be developed prior to fabrication of restraining rail.
- B. The restraining rail lengths shall be pre-cut to length for the curve. Rail less than or equal to 400-foot radius shall be pre-curved. Rails shall be pre-curved in accordance with the requirements of Section 02851 – RAILROAD RUNNING RAIL.
- C. Track having a centerline radius equal to or less than 1000' shall have restraining rail added to the gauge side of the inside rail.
- D. Track having a centerline radius equal to or less than 100' shall have restraining rail added to both sides.
- E. End flares for the beginning pieces of restraining rail shall be milled in the shop before delivery to the site. Fabrication of end flares in the field is prohibited.
- F. Install insulated restraining rail joints to correspond to running rail insulated joints.
- G. Restraining rail assembly shall be installed in accordance with manufacturer's instructions.
- H. Identification Marking
 - 1. Each piece of restraining rail shall be marked to indicate its proposed installed location.
 - 2. Marks shall be in at least two locations on each piece, widely separated, located on the top to be visible after installation.

- I. Install joint and separator block bolts and nuts to a tension of 20,000 to 25,000 pounds using a track wrench or power torque wrench. Retighten all bolts to a tension of 15,000 to 25,000 pounds prior to acceptance of restraining rail installation.
- J. Flangeway shall be 1 5/8”.

END OF SECTION

SECTION 02871

TIMBER CROSS TIES

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section includes specifications for the manufacture, treatment, inspection and shipment of new timber cross-ties.
- B. Related work specified elsewhere:
 - 1. Volume 2 Technical Provisions Exhibit 2I “Additional Project Requirements”
 - 2. Section 02850 – LIGHT RAIL TRACK CONSTRUCTION
 - 3. Section 02856 – COMMUTER RAIL TRACK CONSTRUCTION
 - 4. Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION

1.2 QUALITY CONTROL

- A. The following codes, regulations, reference standards and specification apply to work included in this Section:
 - 1. American Railway Engineering and Maintenance of Way Association (AREMA), Manual for Railway Engineering.
 - 2. American Wood Preservers Association, AWPA
- B. The MBTA shall have free entry at all times to the facilities to observe the milling, treating, and loading of ties. This observation, if made, will be general in nature and will not alter the fact that acceptance/rejection of the product will be made upon delivery.
- C. DB Entity shall require the manufacturer to perform tests and inspections as specified in Chapter 30 of the current AREMA Manual and as required herein. Prior to shipment, DB Entity shall provide written verification of the manufacturer's performance of the specified tests and inspections along with a manufacturer's certification that the ties provided comply with these Mandatory Specifications. Ties will not be accepted without the manufacturer's certificate and verifications.
- D. Tie inspection and testing shall be made at the treating facility prior to shipment.
- E. To be accepted ties shall meet the requirements of the AREMA Manual Chapter 30 and these Specifications.
- F. Ties will not be accepted until unloaded at the job site and are at DB Entity's risk until accepted. Material not in compliance with these Mandatory Specifications shall be removed and replaced with acceptable ties at no additional cost to the MBTA.

1.3 SUBMITTALS

- A. Submittals will be reviewed for general conformance with these Mandatory Specifications. This review will not relieve the DB Entity of final responsibility for the quality of the material furnished.

- B. Prior to shipment, the DB Entity shall submit certified inspection and test reports as specified herein.
- C. Submit proposed shipping schedule for crossties.

PART 2 - PRODUCTS

2.1 WOOD SPECIES

- A. Crossties shall be new, creosote treated with a minimum of 90 % oak and the balance shall be hardwoods of the following species: Beech, Birches Hard, Cherries and Maples.

2.2 ANTI-SPLITTING NAIL PLATES

- A. Anti-Splitting Nail Plates shall be manufactured from a minimum of 18 gage galvanized steel conforming to ASTM A446 Grade 4, and the galvanizing conforming to ASTM A525. End plate shall have teeth not less than 3/8” in length and of sufficient sharpness to fully penetrate oak ties. Plate shall be fabricated so that teeth twist vertically to provide better grip in tie. Plates shall be 6” by 7” accordance with MBTA RRO Standard Dwg. No. 1106.

2.3 GENERAL QUALITY

- A. Ties shall conform to MBTA RRO Standard MS 9209 – CROSS TIE – TREATED attached in this Section.
- B. Ties shall be manufactured from sound, live timber and shall be free from any defects that may impair strength or durability as further described in this section. Every effort shall be made to get the felled timber to mill and milled timber to treatment facility for seasoning as quickly as possible, to avoid wood fiber infection.
- C. All ties shall be straight, well sawn on four sides, cut square at the ends, have top and bottom parallel and have bark completely removed. A tie will be considered straight when a straight line along the top, from the middle of one end to the middle of the other end, is entirely within the tie and when a straight line along a side, from the middle of one end to the middle of the other end, is everywhere more than 2” from the top and bottom of the tie. The top and bottom will be considered parallel when any difference in the thickness at the sides and ends is less than or equal to 1/2”. Ties shall be free from the following defects:

- 1. Decay - Ties that show decay of any nature and ties that show strain from being left in the log too long will be rejected. "Blue stain" is not decay and is permissible in any wood.
- 2. Holes - Ties will be rejected if a large hole, or numerous holes with the net effect of a large hole, is present. A large hole is one exceeding 1/2” in

diameter and 3 inches deep within the Rail Bearing Area (RBA), or more than one-fourth the width of the surface on which it appears and 3” deep outside the RBA. The RBA is the area of the tie between 20” and 40” from its middle.

3. Knots - Ties with a large knot, or numerous knots with the net effect of a large knot within the RBA will be rejected. A large knot is one whose average diameter is greater than one-fourth the width of the surface on which it appears.
4. Shake - Shake greater than one-third the width of the tie will be cause for rejection of the tie.
5. Split - A tie will be rejected if a split exceeds 5 inches long or 1/2” wide.
6. Slanting Grain - A tie will be rejected if a slant in grain more than 1:15 is present, except in the case of woods with interlocking grain.
7. Wane - Excessive wane will be cause for rejection of the tie.

D. Anti-Splitting End Plates shall be applied to both ends of every tie prior to seasoning.

E. Crosstie Dimensions

1. Crossties shall be AREMA 7-inch grade and shall be 7” by 9” in cross section with a maximum of 1” of wane in the RBA. A maximum of 20 % of the 7” grade ties may be 7” by 8” in cross section with no wane in the RBA. The length shall be 8’ 6”. Longer ties will be used at turnouts and grade crossings per Design Documents.
2. The lengths and thickness specified are minimum dimensions. Ties over one inch wider, thicker or longer, at any point, then the specified dimensions will be rejected.

F. Brand top of each tie with year treated, MBTA, and identity of the treating facility as specified in the AREMA Manual, Chapter 30. The branding shall appear on the tie so that when properly installed in track with the branded side up, the heartside of the tie shall face down. In lieu of top branding, the required information may be included on the anti-splitting end plate. Submit details of branded end plate for acceptance.

2.4 INSPECTION, SEASONING AND TREATMENT

A. Inspection

1. Green ties will be inspected at the time of delivery to seasoning area. Dry ties will be subject to inspection after seasoning and before treatment.
2. Inspector will make a close examination of the top, bottom, sides and ends of each tie. Each tie will be graded independently without regard for the grading of the others in the same lot.
3. Ties are subject to inspection at delivery.
4. Anti-splitting plates that are found to be loose or not firmly against the end of the tie will be cause for rejection of the tie.

B. Seasoning

1. Cross ties shall be air seasoned prior to treatment. Ties shall be stacked for seasoning in accordance with AREMA Manual, Chapter 30, Part 3. Seasoning shall continue for at least 12 months and no more than 18 months.
2. In the absence of air seasoned cross ties, the Boulton drying process may be used. If the Boulton process is used, conditioning shall continue until moisture removal rate indicates a % moisture retained equal to a 12 month air dried cross tie, but not less than 45 % by weight.
3. A minimum of 20 borer cores per treatment charge shall be taken of seasoned ties to determine that adequate drying has taken place.
4. The borer cores shall be taken mid-way between the ends and mid-way between the top and bottom faces of the tie. Three 3-inch borer cores shall be taken to determined moisture content.

C. Treatment

1. Prior to treatment, anti-splitting plates shall be checked by the treating facility to ensure that plates are firmly imbedded in the tie. If plates are found to be loose or not flush against the end of the tie, plate shall be firmly pressed against the tie before treatment begins.
2. Cross tie treatment shall be to retention of seven pounds or to refusal of 60/40 creosote coal tar solution per cubic foot of timber in accordance with the AREMA Manual, Chapter 30, Part 3, Sections 6 and 7.
3. A minimum of 20 borings shall be taken per charge after treatment to determine proper penetration.

PART 3 - EXECUTION

3.1 GENERAL

- A. DB Entity shall furnish all cross ties as required to perform the track work as indicated in the Design Documents.

3.2 END PLATING

- A. Each tie shall be end plated on both ends. End plates shall be machine applied so that the nail teeth side of the plate is flush with the end surface of the tie.

3.3 MACHINING CROSS TIES

- A. General: Machining of wood cross ties shall be completed before seasoning and shall be completed before treatment.

3.4 DELIVERY

- A. Handle ties during all phases of processing and loading so as not to cause damage to the material.

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9209

CROSSTIE - TREATED

MATERIALS

Crossties shall be manufactured such that a minimum of 90% of the order is from Group A and the remainder of the order is from Group D below:

- Group A - All Oaks
- Group D - Beech, Birch, Cherries, Hard Maples

Anti-splitting end plates shall be galvanized steel plate in accordance with MBTA Standard Plan.

DESIGN

Crossties shall be 8 feet 6 inches in length and shall be 7 inches by 9 inches in cross section with a maximum of 1 inch of wane allowed in the rail bearing areas. A maximum of 30 percent of the order may be 7 inches by 8 inches in cross section with no wane allowed in the rail bearing areas.

The lengths and thicknesses specified are minimum dimensions. Ties over one inch wider or thicker, or over three inches longer, at any point, than the dimensions specified above, will be rejected.

Anti-splitting end plates shall be 6 inches by 7 inches and shall be installed in accordance with MBTA Standard Plan.

Anti-splitting end plates shall be embossed with letters and figures a minimum of one-half inch in height. Embossing shall include the following:

Authorities identification - MBTA
Last two digit of year treated - 93
Producer's name or symbol-XXCo.

Finished identifying brand shall appear as:

MBTA-93-XXCo.

and shall be positioned along the top of the plate on the 7 inch side.

MANUFACTURE

Crossties shall be manufactured from sound, live timber and must be free from any defects that may impair their strength or durability as crossties as further described in this section. Every effort

APPROVED:

should be made to get the felled timber to mill and milled timber to treatment facility for seasoning as quickly as possible, to avoid wood fiber infection.

All ties shall be straight, well sawn on four sides, cut square at the ends, have top and bottom parallel and have bark completely removed. A tie will be considered straight when a straight line along the top, from the middle of one end to the middle of the other end, is entirely within the tie and when a straight line along a side, from the middle of one end to the middle of the other end, is everywhere more than 2 inches from the top and bottom of the tie. The top and bottom will be considered parallel when any difference in the thickness at the sides and ends is less than or equal to 1/2 inch. Crossties shall be free from the following defects:

1. Decay - Ties that show decay of any nature and ties that show stain from being left in the log too long will be rejected. "Blue stain" is not decay and is permissible in any wood.
 2. Holes - Ties will be rejected if a large hole, or numerous holes with the net effect of a large hole, is present. A large hole is one exceeding 1/2 inch in diameter and 3 inches deep within the RBA*, or more than one-fourth the width of the surface on which it appears and 3 inches deep outside the RBA*.
 3. Knots - Ties with a large knot, or numerous knots with the net effect of a large knot within the RBA* will be rejected. A large knot is one whose average diameter is greater than one-fourth the width of the surface on which it appears.
- *RBA - Rail Bearing Area - the area of the tie between 20 inches and 40 inches from its middle.
4. Shake - Shake greater than one-third the width of the tie will be cause for rejection of the tie.
 5. Split - A tie will be rejected if a split exceeds 5 inches long or 1/2 inch wide.
 6. Slanting Grain - A tie will be rejected if a slant in grain in excess of 1:15 is present, except in the case of woods with interlocking grain.

CROSSTIE - TREATED

7. Wane - Excessive wane will be cause for rejection of the tie.

INSPECTION

Green ties will be inspected at the time of delivery to seasoning area. Dry ties will be subject to inspection after seasoning and before treatment.

Inspector will make a close examination of the top, bottom, sides and ends of each tie. Each tie will be graded independently without regard for the grading of the others in the same lot. Ties covered with ice, or too muddied for ready examination, will be rejected. The responsibility and expense for the inspection described above will be borne by the manufacturer.

When conditions warrant, in the judgment of the Chief Engineering Officer or his designee, ties will be inspected at other points, and all ties are subject to inspection at delivery.

Anti-splitting plates that are found to be loose or not firmly against the end of the tie will be cause for rejection of the tie.

SEASONING

Crossties shall be air seasoned prior to treatment. Ties shall be stacked for seasoning in accordance with AREA Specifications, Chapter 3, Part 5, Section 6. Seasoning shall continue for at least 12 months and no more than 18 months.

In the absence of air seasoned crossties, the Vapor or Boulton drying process may be used with the permission of the Chief Engineering Officer, or his designee. If the Vapor or Boulton process is used, conditioning should continue until moisture removal rate indicates a percent moisture retained equal to a 12 month air dried cross tie, but not less than 45 percent by weight.

Sufficient borer cores shall be taken of seasoned ties to determine that adequate drying has taken place so that ties may be satisfactorily penetrated with preservative.

Prior to seasoning, all crossties shall have anti-splitting devices applied at each end of the tie.

TREATMENT

Prior to treatment anti-splitting plates must be checked to ensure that plates are firmly imbedded in the tie. If plates are found to be loose or not flush against the end of the tie, plate shall be firmly pressed against the tie before treatment begins.

Crosstie treatment shall be to retention of seven pounds or to refusal of 60/40 creosote and petroleum per cubic foot of timber in accordance with the latest AREA Manual, Chapter 3, Parts 7, 8, & 9.

Sufficient number of borings shall be taken after treatment to determine proper penetration.

SUBMITTALS

Prior to shipment, the manufacturer shall submit certified inspection and test reports to the Chief Engineering Officer, or his designee, for review.

SHIPMENT

Ties shall be bundled in groups of 24 pieces, in a configuration of four rows of 6 on edge with two 2 inch by 0.05 inch heavy duty steel bands with two seals per band. Wood dunnage shall be placed on the bottom of the transportation vehicle and between tiers to facilitate unloading operations.

DELIVERY

To be accepted, the ties offered shall conform to this specification in all respects and are at the supplier's risk until acceptance at the specified delivery site. Ties which are rejected for non-compliance with this specification will be returned at the supplier's expense.

END OF SECTION

SECTION 02872

PRECAST CONCRETE CROSS TIES

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the furnishings and installation of precast concrete ties to replace any existing precast concrete cross ties on the New Hampshire Mainline that may be determined unsuitable for continued use.

1.2 SUBMITTALS

- A. Submittals will be reviewed for general conformance with these Mandatory Specifications. This review will not relieve the DB Entity of final responsibility for the quality of the material furnished.
 - 1. Submit proposed shipping schedule for crossties.
 - 2. Submit product data together with certification that the material meets the requirements of this specification.
 - 3. Name and location of proposed supplier.

PART 2-PRODUCTS

2.1 MATERIALS TO BE FURNISHED BY DB ENTITY

A. Concrete Ties

- 1. If concrete tie is not suitable, replace existing concrete tie.
- 2. Monoblock design type reinforced concrete design in accordance with longitudinal and cross-sectional configuration indicated in MBTA Standard RRO Dwg no. 1120.
- 3. Include inserts for fastenings to secure running rails in all concrete ties.

2.2 FABRICATION

A. Concrete Ties

- 1. Conform to the material and testing requirements of AREMA Chapter 30 Specifications of Concrete Ties (and Fastenings).

PART 3 -EXECUTION

3.1 HANDLING

- A. Handle ties during all phases of processing and loading so as not to cause damage to the material.
- B. Further information on placement of concrete ties is covered in Section 02856 – COMMUTER RAIL TRACK CONSTRUCTION.
- C. Replace defective concrete ties with new concrete ties.

END OF SECTION

SECTION 02877

THERMITE WELDING

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section includes specifications for thermite welds within turnout limits as shown on the Standard Plans and for closure welds within track where permitted by these Mandatory Specifications and the MBTA.

1.2 LIMITATIONS ON USE OF THERMITE WELDS

- A. The DB Entity shall plan and schedule the work to minimize the use of thermite welds. In general, thermite welds shall be allowed only within special trackwork, at closure welds when installing new CWR strings in existing track, when welding in plug rails at curve adjustments when a mobile welding unit is not available, and for closure welds near grade crossing installations.
- B. Compromise thermite welds shall be allowed to join 132 RE rail to existing 115 RE rail currently in track. At these locations, the DB Entity shall determine if the length of 115 RE rail being joined to 132 RE rail is less than 200', resulting in a short "island" of the smaller section. In such case, provide additional new 132 RE rail, eliminating two compromise welds over a short distance. 115RE rail "Island" track structure will need to be lowered to accommodate taller 132 RE rail.

1.3 SUBMITTALS

- A. Submittals will be reviewed for general conformance with the intent of the Contract Documents. This review will not relieve the DB Entity of final responsibility for the means, methods, procedures and sequences to be utilized.
- B. Submittals shall be legible and reproducible.
- C. Prior to initiation of thermite welding, submit detailed specifications showing proposed quick-preheat, self-tapping thermite weld kit and method and procedure for thermite welding. Specifications submitted shall comply with these Mandatory Specifications and those of weld kit manufacturer.
- D. Submit qualification certification for each supervisor and field welder who will perform work on this Contract. Weld supervisors and welders shall be required, upon request of the MBTA, to submit their qualification certificate throughout the duration of the project.
- E. Submit name of independent testing agency and certification that testing laboratory and persons who shall perform ultrasonic testing of field welds have previously tested a minimum of 250 welds.
- F. Submit documentation that sample thermite welds have been tested and that welds meet or exceed requirements of this section.
- G. Submit certified ultrasonic inspection results for field welds.

1.4 QUALITY CONTROL

The thermite welding process can only be successful if it is carried out by thoroughly trained and well-disciplined personnel. It will be the responsibility of the DB Entity to organize and coordinate all preparation and training activities for its personnel, including participation by welding kit supplier as required. DB Entity is also responsible for documenting the preparation and training activities for submittal to the MBTA. Cost of all preparation and training activity shall be included in the contract line item for field welding.

A. General

1. The DB Entity shall perform sample weld testing and inspection at no additional cost to the MBTA.
2. Sample weld testing and inspection shall be performed by an accepted certified independent testing laboratory. The MBTA may audit operations to ensure that inspection and tests are being performed in accordance with accepted procedures and in compliance with these specifications.
3. To be accepted, sample welds shall fulfill the requirements of these Mandatory Specifications.

B. Field Weld Qualification Inspection and Testing

1. Prior to field welding, welds and each welding crew shall be qualified as specified below. Welding crews shall prepare, in accordance with method and procedure for thermite field welding, submitted and approved under Article 1.3 of this Section, at least three samples of each type of thermite weld; high strength rail welded to high strength rail, high strength rail welded to standard rail, and standard rail welded to standard rail. Each welding crew shall perform at least one of each type of sample weld. Sample welds shall join two pieces of commuter line 132 RE rail a minimum of 30” or longer as required by testing laboratory. Sample will also be provided of 115 RE rail for transit line.
2. Test three sample welds from each type of rail as follows:
 - a. Perform Radiographic Test on all sample welds from each type of rail.
 - b. Perform Slow Bend Test specified in this Section on second sample weld from each type of rail.
 - c. Perform Hardness Test specified in this Section on third sample weld from each type of rail.
 - d. Perform Manual Ultrasonic Test specified in this Section on all sample welds
3. Radiographic Testing
 - a. Inspect welds radiographically in accordance with ASTM E142, ASTM E94, and these Mandatory Specifications for purpose of detecting flaws in field welds.

- b. Radiographic tests shall detect flaws in welds with sufficient detail to establish weld's ability to meet the requirements specified herein.
 - c. Radiograph four areas of each weld, head, web, and each side of base.
 - d. Identify each radiographic film with Contract Number, sample number, rail identity, date, welder identity, inspection agency, and view.
 - e. The acceptance criteria for this test shall indicate full penetration and complete fusion with no evidence of surface or internal fissures or cracks.
 - f. Nondestructive inspection of metal welds by radiographic use of nuclear by- product materials shall be in accordance with United States Nuclear Regulatory Commission Rules and Regulations, Title 10, Atomic Energy, Part 20, Standard for Protection Against Radiation.
 - g. Transportation, handling, and storage of hazardous materials used in radiographic inspection of welds shall be performed only by, or under supervision of, a person of proven experience and ability operating under a proper license.
4. Slow Bend Test
- a. Subject a second sample weld from each type of rail which has passed Radiographic Test to the Slow Bend Test described in the Proceedings of the AREMA Manual, Chapter 4.
 - b. Acceptance criteria for this test shall be minimum deflection of $\frac{3}{4}$ " and 100,000 pounds per square inch modulus of rupture.
5. Hardness Test
- a. A third sample weld of each type of rail passing the Radiographic Test shall be longitudinally sectioned for a distance of one foot either side of weld, microetched, and tested by the Rockwell Hardness test using a 150 kg diamond sphero-conical penetrator. Test results shall be converted to Brinell Hardness Numbers.
 - b. Rail shall be tested for hardness on sectioned face on both sides of weld, at $\frac{1}{2}$ " increments on three lines until the hardness is that of parent metal. One test line will be at center of head, second at center of web and third at center of base. Parent metal hardness shall be reached not more than 6 inches from weld center line or weld shall fail this test. The minimum Brinell number of parent metal is published as 300 for standard rail and 341 for high strength rail.
 - c. Inspect microetched section for compliance with field weld requirements of full penetration, complete fusion, and internal defects specified herein.
6. Manual Ultrasonic Testing
- a. Inspect sample welds ultrasonically in accordance with recommendations of the Nov, 23-30, 1983 Proceedings of Association of American Railroads entitled "Railroad Rail

Welding" Pages 191-205.

- b. Acceptance criteria for this test shall be as specified in Article 1.4.E.4 of this Section.
7. Approval of weld kit, welding process, and welding crews will depend upon all sample welds satisfying the specified requirements. Shall any sample weld fail to satisfy the specified requirements, the welding process, the welding crew, or both, will not be qualified for the work.
8. Employ a supervisor for each welding crew, who has been trained and certified for performing thermite field welding by manufacturer supplying weld kits. Shall supervisor of welding crew be replaced during the Work, welding crew shall be re-qualified under the new supervisor.
9. Prior to performing welds in specified work, satisfactorily qualify welds and welding crew as specified herein.
10. If DB Entity changes supplier of welding kits, or welders during the job, repeat all above sample weld testing.

C. Preparation and Training for Field Welding

1. Prior to making sample welds and prior to field welding, the DB Entity shall coordinate with the welding kit manufacturer the following at no additional cost to the MBTA.
 - a. Provide a detailed list of tools, equipment, and supplies required to make field welds. Copies shall be delivered to the MBTA and shall be kept on the job site with welders at all times.
 - b. Provide a detailed procedure for making field welds, consistent with MBTA's requirements. Field welds shall be made with approved kits. If there are different types of welds in the Contract, for example; different sizes or types of rail and compromise joints, a procedure shall be provided for each. Copies of procedures shall be delivered to the MBTA and shall be kept on job site with welders at all times.
 - c. Organize and conduct training course for welders. The MBTA may also participate in course. Course shall include "hands on" experience for all students. An outline or other material describing course shall be submitted to the MBTA for review and acceptance. Course work shall include the different type welds called for in Contract. All welders will participate in course, even if they have taken it for a previous job. Qualified welders will receive a dated Certification Card, signed by a Supplier Representative, accepted by the MBTA, which shall be available for inspection at any time.
 - d. Organize and conduct refresher training courses for welders every six months. The MBTA may participate in these courses as well. Record shall be kept by DB Entity and the MBTA indicating that their personnel have taken part in refresher courses. Welder's Certification Card shall be updated to reflect same.
 - e. Make random inspections of the welding work in progress, at least every three months, to insure that proper tools, equipment, and supplies are being used, and that their procedures are being followed.

- f. The welding kit manufacturer shall be on call to assist the DB Entity and the MBTA in case any unusual problems arise in the field. Supplier shall be prepared to provide for laboratory testing needed to solve a problem, and shall have the capability of tracking their kit materials backward through the chain of production.

2. Responsibilities of the DB Entity

- a. Coordinate welder training program described above, including provision of documentation required by the MBTA to describe course, and verify that DB Entity's personnel have successfully completed course work.

D. Field Weld Record

1. DB Entity shall provide the MBTA with a complete and up-to-date record of all welds, welders, and welding kits. This record shall be submitted on the accepted MBTA standard form which includes, but is not limited to, the following information for each weld.

- a. Weld number, location by track designation and station, date and time weld made
- b. Rail identification including section, heat number, date rolled and rail hardness. Different weld kits based on hardness.
- c. Kit manufacturer and identity of each mold and portion
- d. Weather conditions, air and rail temperature
- e. Rail gap
- f. Name of welder and DB Entity's foreman

2. A copy of accepted MBTA form Figure 02877-3 has been made part of this Section.

E. Field Weld In-Track Testing

1. During field welding, hand test and inspect all field welds as specified herein to ensure compliance of welds to requirements of these Mandatory Specifications.
 - a. Thermite welds shall be visually and dimensionally inspected as soon as weld has been completed regardless of whether track has been designated as "in revenue service" or "out of revenue service."
 - b. Manual ultrasonic testing of thermite welds in track designated as "in revenue service" shall be completed within 24 hours of weld completion.
 - c. Manual ultrasonic testing of thermite welds in track designated as "out of revenue service" shall be completed within 30 days from date of welding but in all cases prior to the resumption of train operations.
 - d. It shall be the responsibility of the DB Entity to follow above criteria and ensure that

all welds are properly inspected and tested at no additional cost to the MBTA.

2. Manual Ultrasonic Testing

- a. Inspect all field welds ultrasonically in accordance with recommendations of the Nov. 29-30,1983 Proceedings of Association of American Railroads entitled "Railroad Rail Welding" pages 191 -205. Weld quality shall meet requirements of this Section.
- b. For each field weld, complete and submit the MBTA Ultrasonic Test Report attached to the rear of this Section as Figure 02877 –2.

3. Test Procedures – Ultrasonic

- a. Testing organization shall submit to the MBTA detailed test procedure and description of test equipment including calibration blocks that will be utilized in testing process. Calibration process shall be able to permit detection of any defect including the size, type, and location. Test procedure and equipment shall include, but not be limited to the following:

Calibration:

- o Calibrate when starting work and at least every hour.
- o Recalibrate if there is a change in probes or cables.
- o Use I.I.W. Type 1 and Type B-1 steel test blocks for calibration. A rail with drilled holes may be used in addition. If a rail is used, a duplicate shall be provided to the MBTA.

Web Test:

- o Use two 45 degree probes placed on top of rail in pitch-catch configuration.
- o Scan from top to bottom of weld with both probes.
- o Scan top and bottom edges of weld with a single probe.
- o Scan from both sides of weld.

Head Test:

- o Use two 45 degree probes placed on sides of the rail head in pitch-catch configuration.
- o Scan across weld with both probes angling them up and down to cover entire cross-section of weld.
- o Scan each vertical edge of weld with a single probe.
- o Scan from both sides of weld.

Base Test:

- o Use a 70 degree probe, place probe on top of base far enough back from center of weld so that beam is following the "3/4 W" path.
- o Move toward and away from weld, angling probe from side to side.
- o Scan both sides of base and from both sides of weld.

- b. Test crew shall fully document their findings, on accepted MBTA standard form. This form shall include, but is not limited to, identification of: test equipment used, calibration, weld number and location, members of test crew, date and time of test, description of defects, and recommendation to accept or reject weld. The MBTA accepted form Figure 02877-2 has been made a part of this Section.
4. Acceptance Criteria – Ultrasonic
- a. No defect in the weld of any size will be accepted in the head, web or base of rail.
 - b. MBTA Materials Testing Lab may perform random manual ultrasonic tests of field welds. The MBTA is currently using equipment supplied by Krautkramer, and personnel who have been trained with this equipment.
5. Physical Inspection
- a. DB Entity shall visually and dimensionally inspect each field weld to determine conformance with alignment and finishing tolerances specified herein.
 - b. When weld is made and molds and risers removed weld shall be checked for obvious failures such as an incomplete weld.
 - c. Once weld has been ground and weld temperature is less than 200 degrees F, physical inspections shall be made to verify acceptance criteria.
6. Acceptance Criteria – Physical
- a. There shall be no visible voids, ratholes, nicks or gouges in surfaces which have been ground.
 - b. Weld collar in web zone and base of rail shall not be ground except to remove notches created by upset conditions. Sharp protrusions and gouges shall be blended into rail and weld collar contour to eliminate possible stress risers.
 - c. Combined vertical offset and crown camber at top of rail, at rail temperature of 200 degree F or less, shall not exceed 0.060 inches, measured as shown on Figure 02877-1. NO DIP CAMBER will be allowed.
 - d. Combined horizontal offset and horizontal kink camber at side of rail head, at rail temperature of 200 degree F or less, shall not exceed 0.060 inch, as shown on Figure 02877-1.
 - e. A finished deviation of not more than plus 0.010" or minus 0.00" from parent section of rail head surface shall be allowed.
 - f. If field weld, because of certain field conditions, is located within 4 ½" of a rail support, the sides and bottom of the rail base shall be within plus 0.012" or minus 0.00" of parent section.
 - g. Weld straightness tolerances shall be as shown on attached Figure 02877-1.

7. Defective Welds

Defective welds shall be cut out and replaced with a 19' 6" section of new rail in tangent or 21' in curves, welded in place, at no additional cost to the MBTA.

8. Final Ultrasonic Testing

Final ultrasonic testing shall be performed by an on track detector car as specified in Section 02853 – CWRINSTALLATION.

PART 2 - PRODUCTS

2.1 MATERIAL TO BE FURNISHED BY THE DB ENTITY

- A. Furnish complete thermite weld kits conforming to attached MS No. 9266 and this Section.

PART 3 - EXECUTION

3.1 THERMITE WELDING

A. General

1. Thermite field welds shall be made to join rails within turnout limits as shown on the Standard Plans and as specified in Article 1.2 of this Section.
2. Ends of rails to be welded shall be saw cut. Torch cutting of rails will not be allowed.
3. Do not locate field welds within the following locations in standard track work:
 - a. Within 8' of the center of any bonded or insulated joint.
 - b. Within 14' of a field weld in the same rail.
 - c. Within 4' of a plant weld in the same rail.
 - d. Within 10' of the centerline of any joint (except bonded insulated joints)
 - e. Within 2' of a thermite weld in the opposite rail.
 - f. Within 6" of any hole drilled in rail.
 - g. Within 9" of a weld which has been cut out.
 - h. On or within 4 ½" of a tie plate or concrete tie rail seat.
 - i. Within a grade crossing.
4. In the case of special trackwork (turnouts and rail crossings) some exceptions to above will be allowed, with acceptance of the MBTA.

5. If plug rails are required to meet requirements shown above, or to replace a defective weld, minimum length of plug rail is 18' in tangent and 21' in curves.
6. Thermite welding process generates extremely high temperature (up to 5000° F) accompanied by flames, sparks, hot molten metal, and slag. Extreme caution shall be observed by welders and others in the vicinity. The following precautions shall be observed.
 - a. During welding process, prevent hot molten metal and slag from contacting water, snow, or ice as an explosion could occur.
 - b. Properly dispose of hot slag, slag pans, top and side risers, or other hot scrap. Be sure that this material is not left where it could be stepped on, causing serious injury.
 - c. Wear welding goggles or safety glasses and other safety equipment as appropriate.
 - d. During and after welding, avoid burning or damaging rail pads, ties and timbers, or setting fire to wayside areas. A fire extinguisher shall be required at weld site (2 1/2 gallon water type extinguisher).
 - e. Keep welding tanks, hoses, and other flammables a safe distance from the weld site.
 - f. Do not make field welds on open deck bridges or timber structures.
 - g. Unused thermite material shall be kept in an approved secure, dry, weather tight location, consistent with applicable fire regulations so that it will not be accessible to unauthorized persons.
 - h. When welding rails in track on lines in service, be sure that rail fastenings, anchors or clips, pads, and insulators, are properly installed prior to restoration of service.

B. Weld Quality

1. Weld quality shall be as specified in Article 1.4 of this Section.

C. Welding Requirements

1. Use approved kits that are self-tapping and require minimum preheating.
2. Saw-cut rail ends at right angles to rail. Clean the surface of rail for a length of approximately six inches from each end, free of all grease, dirt, loose oxide, scale and moisture. Remove burrs and lipped metal which would interfere with the proper fit of molds.
3. At time of field welding, rails shall be aligned to produce a weld which, with respect to alignment, shall be in accordance with Article 1.4.E.6 of this Section.
 - a. Proper rail end alignment shall be achieved by use of an approved alignment device designed and manufactured for this purpose. In no case will use of track jacks or track spikes be allowed for rail end alignment.
 - b. Striking of rail with blunt tools, such as a maul, is prohibited.

- c. DB Entity shall assure that rail ends are secured against longitudinal, vertical, lateral or twisting movement during and immediately after the welding process. Rail puller/expanders shall be used to prevent movement. Rail clips or anchors shall be installed if there is a chance of longitudinal movement.
 - d. At time of field welding, rail gap shall be as specified by manufacturer of the weld kit.
4. The following restrictions limit when field welds can be made, and specify special procedures required under certain environmental conditions.
- a. It is important that weld is not subjected to a sudden strain by-releasing hydraulic pressure too quickly. The rail puller/expander shall be left in place until rail has cooled to below 500 degrees F. Any movement of rail before weld has cooled to at least 500 degrees F. may result in failure of weld.
 - b. Hydraulic rail puller/expander shall not be used to establish proper rail end gap.
 - c. When welding rail in track on lines in service, allow sufficient time to complete weld so that surface finish, and temperature of welded joint will permit safe operation of scheduled trains without delay to service. Temperature of welded joint shall be 200 degrees F or less before rail traffic is allowed to pass over weld.
 - d. Thermite field welds shall be made in accordance with and shall not deviate from manufacturer's recommendations and AREMA Chapter 4. Short cuts in recommended pre-heating process are prohibited.
5. Trim and grind weld to meet the following requirements and as otherwise specified by manufacturer:
- a. Finish weld to the tolerances specified in Article 1.4 of this Section.
 - b. A rail shear, specifically designed for the purpose, shall be utilized to remove weld upset. Use of a saw, cutting torch or other hand held devices is prohibited.
 - c. Rail profile grinder specifically designed for the purpose, shall be utilized to finish grind top and sides of weld. Use of hand held grinder is prohibited.

As specified in Article 1.4.E.6.b of this Section, weld collar in the web zone and base of rail shall not be ground except to remove notches created by upset

and weld collar contour to eliminate possible stress risers. Remove, by grinding, defects visible to the unaided eye. If removal by grinding cannot be accomplished without damaging rail, remove the weld. Take precautions to avoid excessive pressure during grinding of weld in order to prevent overheating of rail surface.

- d. Finish grinding shall be done only when weld temperature is less than 200 degrees F.
- e. Overheating rail when grinding shall be avoided. Since weld has cooled to below 200 degrees F. prior to grinding, the temperature rise due to grinding shall not exceed this level.
- f. Finish rail grinding on top and sides of weld shall be completed prior to operation of trains over weld.

D. Weld Identification

- 1. Mark weld identification on field side of rail using a permanent metal marker as manufactured by J.P. Nissen, Jr. Co., or approved equivalent and record required information in conformance with Article 1.4.D.

E. Weld Cleanup

- 1. Clean up and remove waste material such as paper and plastic containers, scraps of metal, slag, and molds.

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9266

THERMITE WELD KIT

MATERIAL

Thermite weld kits shall contain a mixture of aluminum and iron oxide, which when ignited, produces a filler metal to fuse the rail ends together, by heat produced by the thermite reaction. Each weld kit shall also contain all molds, luting material and thimble required to complete one weld.

DESIGN

Thermite weld kits shall be self-tapping crucible type requiring minimum pre-heating as manufactured by Calorite, Inc., or approved equivalent.

QUALITY ASSURANCE

The manufacturer shall maintain comprehensive continuously operated quality control procedures to ensure that each weld kit supplied is free of flaws or defects in materials and manufacture.

TESTING

The manufacturer shall perform and certify in writing prior to shipment, that representative weld kits have successfully passed the following tests:

1. Prepare, in accordance with manufacturer's recommended procedures, three sample thermite welds on the proposed rail section and type. Rail to be supplied by the weld manufacturer.
2. Test all welds radiographically in accordance with ASTM Designation E142 "Controlling Quality of Radiographic Testing". At least four areas shall be radiographed (head, web and each side of base) with sufficient detail to detect flaws to establish the ability of the weld to meet the requirement specified herein.

Each weld shall have full penetration and complete fusion with no evidence of surface or internal fissures. Porosity or slag type defects will be tolerated provided the radiograph shows:

- a. The largest defect does not exceed 1/8 inch in any dimension.
- b. The total area of all defects does not exceed 0.060 square inches.

THERMITE WELD KIT PAGE 1 OF 2

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9266

THERMITE WELD KIT

- c. The sum of the greatest dimension of defects in a line shall not exceed 3/8 inch.

Non-destructive testing of welds by radiographic use of nuclear by-product material shall be conducted by a laboratory licensed by the U.S. Nuclear Regulatory Commission.

3. Subject all test welds to the Slow Bend Test as described in the Proceedings of the AREA, Volume 68. The acceptable criteria for this test shall be a minimum deflection of one inch and 100,000 pounds per square inch modulus of rupture.

SUBMITTALS

The manufacturer shall submit detailed description of Quality Assurance program used in the manufacture and handling of all weld kit components.

The manufacturer shall submit certification that the Quality Assurance program was in place and was applied to all welds kits supplied in the order.

The manufacturer shall submit certification that representative samples of the weld kits provided meet the test requirements as described herein.

The manufacturer shall provide complete detailed instructions for welding procedures including preparation, preheating and crucible tapping.

SHIPMENT

Thermite weld materials shall be shipped in kit form with each kit containing all necessary materials to complete one thermite weld. Packaging shall be water-proof to resist damage to molds and thermite charge.

DELIVERY

To be accepted, thermite weld kits offered shall conform to this specification in all respects. Thermite weld kits are subject to inspection at delivery and are at the supplier's risk until acceptance. Thermite weld kits rejected for non compliance with this specification will be returned at the supplier's expense.

SECTION 02879

SIDE TRACK CONSTRUCTION FOR COMMUTER RAIL SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies new and relay sidetrack construction and tie-ins to existing track sidings.
- B. Work under this Section is at the following locations and generally includes but is not limited to the following:
 - 1. Milepost 1.8, Somerville – reconstruction of Yard 10 tracks west and east of Washington Street Bridge.
- C. Work under this Section includes both new and relay rail sections and tie-ins to existing track, all of varying rail sections. DB Entity shall provide joint bars as required at each location for a complete installation. Provide transition section not less than 18' long where weight differences between rail sections exceed 20 pound per yard.

1.2 SUBMITTALS

- A. Submit CPM Construction Plan as specified in Section 02856 – COMMUTER RAIL TRACK CONSTRUCTION Article 1.6. The CPM shall include the coordination plan developed by the DB Entity together with the operating railroad and the industry located on active sidings.
- B. Submit identity and location of licensed incinerator and land fill facilities proposed for crosstie and switch timber disposal.
- C. All submittals will be reviewed for general conformance with the intent of the Contract Documents. This review will not relieve the DB Entity of final responsibility for the means, methods, procedures, and sequences to be utilized.

1.3 QUALITY CONTROL

- A. Tolerance from Design
 - 1. Final established gauge, cross level, super-elevation, and vertical and horizontal alignment of tracks shall be as indicated on accepted drawings, and shall be within tolerances from design specified below.
 - a. Horizontal Track Alignment
Maximum permissible variation from design shall not exceed plus or minus ½”

Rate of change of permissible variation from design shall not exceed plus or minus 3/16”. Middle ordinate to a 31' chord on curves, and 0.0052' middle ordinate to a 31' chord on tangent
 - b. Vertical Track

Profile Maximum permissible variation from design shall not exceed plus or minus 1/16" middle ordinate to a 31' chord

c. Track Centers

Maximum permissible variation from design shall not exceed plus ½", minus zero

d. Cross Level

Maximum permissible variation from design at any point plus or minus 1/16"

e. Gauge Variation

None

2. No tolerances from design shall be allowed at locations where vertical and horizontal clearances are restricted by the MBTA, Standard Plans, and Design Documents such as platforms, abutments, and overhead bridges.
3. Tie spacing in new track siding shall be 19 ½".
4. Joint bars in new side tracks shall be new 36", six hole joint bars for the rail section furnished complete with six bolt assemblies per joint.
5. Joint bars in existing track to be rehabilitated shall match existing units and be sized for the rail in place. Furnish additional fit relay joint bars and new bolt assemblies for all joints replaced and where rails are replaced with salvaged material.
6. If salvaged relay rail is of different rail section, provide compromise joint bars to match rail sections.

1.4 DELIVERY AND HANDLING

- A. Handle all materials in a manner which will prevent damage during loading, transporting, unloading and distributing.

PART 2 - PRODUCTS

2.1 MATERIALS TO BE FURNISHED BY THE DB ENTITY

- A. New 132 RE and 115 RE rail as specified in Section 02851 – RAILROAD RUNNING RAIL.
- B. New 7" x 9" x 8'-6" treated timber cross ties as specified in Section 02871 – TIMBER CROSS TIES.
- C. New 132 RE and 115 RE 6 hole, joint bars with 6 bolt assemblies as specified in Section 02865 – TRACK APPURTENANCES.
- D. New 132 RE and 115RE 6 hole, steel poly type insulated joints as specified in Section 02865 – TRACK APPURTENANCES.

- E. Compromise joint bars, as specified in Section 02865 – TRACK APPURTENANCES.
- F. New cut track spikes, as specified in Section 02865 – TRACK APPURTENANCES.
- G. New tie plugs as specified in Section 02865 – TRACK APPURTENANCES.
- H. Stone ballast as specified in Section 02858 – BALLAST.
- I. Tie Plate Standard – MS 9272 attached and as specified in Section 02865 – TRACK APPURTENANCES.

PART 3 - EXECUTION

3.1 GENERAL

- A. Following track removal and preparation of subgrade to the lines and grades on the accepted drawings, construct ballasted sidetracks, in accordance with these Mandatory Specifications, Standard Plans, and Design Documents to the zero inch raise or hold point.
- B. Replace existing defective cross ties on track prior to raising the track to the proposed profile as directed by the MBTA.

3.2 TRACK REMOVAL

- A. Prior to track construction the existing sidetrack and any turnouts shall be dismantled and removed to the limits shown on the Design Documents.
- B. Turnout metals, excluding spikes, lags, track bolts, nuts and washers, shall be salvaged and either reused as required for track rehabilitation or returned to the MBTA.
- C. Rail, joint bars, and tie plates shall be salvaged and either used for track rehabilitation or returned to the MBTA.
- D. Track bolts, nuts, washers, spikes, anchors, and lags shall become the property of the DB Entity and shall be disposed of off of the MBTA's property.
- E. Track and turnout dismantling shall be done using equipment and procedures that will not damage salvaged material or make it unfit for future use. If a torch is used to remove bolts from joints, care shall be taken so as not to damage joint bars.
- F. Salvaged rail and other track components not used in rehabilitation shall be delivered to a designated MBTA material yard within 50 miles of the Project. Materials shall be separated, not mixed together, by class, type, and weight and stockpiled as directed by yard personnel.
- G. Crosstie and switch timber disposal shall be as specified in Section 02852 – TRACKWAY DEMOLITION AND SALVAGE.

3.3 SUBGRADE PREPARATION IN NEW TRACKBED LOCATIONS

- A. Existing track structure, fouled ballast, and subballast removal shall be as specified in Section 02852 – TRACKWAY DEMOLITION AND SALVAGE.

- B. Smooth and compact subgrade areas, with cross slope as shown on the Design Documents, to receive subballast.

3.4 PLACEMENT OF NEW SUBBALLAST

- A. Subballast shall be distributed over subgrade unless otherwise specified in Design Documents.
- B. Distribute and compact eight inch layers of subballast, uniformly over the finished subgrade.
- C. Deliver subballast at a rate no faster than can be satisfactorily incorporated into the work, maintaining a proper interval of operations, and at such times as to permit proper inspection by the MBTA.
- D. To extent practicable, unload subballast in position for use with a minimum of redistribution and dressing.
- E. Self-spreading vehicles may be used as accepted by the MBTA. When subballast is initially spread by self-spreading vehicle, a power grader may be used to assist spreading operations.
- F. Thoroughly compact subballast until material is firmly interlocked and surface is true and unyielding.
- G. Top surface of initial layers of subballast shall be smooth, flat and uniformly compacted prior to distributing ballast.

3.5 PLACING INITIAL LAYERS OF BALLAST

- A. Ballast shall not be distributed until the subgrade and where applicable subballast has been completed and accepted as specified above. Clean track way area of debris and standing water prior to placing ballast. Do not place ballast on frozen subgrade or frozen subballast.
- B. Distribute and compact four inch layers of ballast, not to exceed an eight inch total, uniformly over the finished subgrade or sub-ballast, prior to tie distribution.
- C. Deliver ballast at a rate no faster than can be satisfactorily incorporated into the work, maintaining a proper interval of operations, and at such times as to permit proper inspection by the MBTA.
- D. To extent practicable, unload ballast in position for use with a minimum of redistribution and dressing.
- E. Self-spreading vehicles may be used as accepted by the MBTA. When stone is initially spread by self-spreading vehicle a power grader may be used to assist spreading operations.
- F. Shape ballast to a true section conforming to the ballast section shown on Standard Plans and Design Documents.
- G. Thoroughly compact each ballast layer until stones are firmly interlocked and surface is true and unyielding. Compact each lift with not less than four passes of a roller or a vibratory compactor subject to the following requirements:

1. Compact by rolling using either a self-propelled, three-wheel, or two axle roller of such weight that will provide compression under the rear wheels of not less than 350 pounds per linear inch of tread; or using a two or three-wheel tandem roller having a weight per inch of drive roll of not less than 350 pound, and every part of the surface receiving compression from the drive wheels.
 2. Compact by vibration using vibratory compactors of either the roller or pad type. Dynamic force for either type shall not be less than 20,000 pounds and the frequency range shall be 1100 to 1500 vpm. Use machines equipped with a governor which can be set and locked to control rate of impulse. Provide a tachometer or other suitable device for accurately checking the frequency of vibration during the compacting operation.
- H. Top surface of initial layers of ballast shall be smooth, flat and uniformly compacted prior to distributing ties.

3.6 DISTRIBUTING AND SPACING TIES

A. General

1. Carefully distribute and properly space ties on initial layer of ballast. Space ties at design spacing of 19 ½" on center and as further specified in Article 1.3.
2. Place timber ties so that heartwood is down.
3. Handle treated ties in a manner to avoid breaking and bruising. Do not throw ties from cars or trucks onto rails or rocks.
4. Place ties normal to center line of track.
5. Properly space and align ties prior to rail installation.
6. In placing or spacing treated ties, handle only with tongs or suitable devices. Do not use bars, chisels, forks, mauls, picks, punches, shovels, or sledges for moving ties or placing them in position beneath rails.
7. Avoid unnecessary handling, redistribution, and reloading of ties. To extent practical, distribute ties in proper position for use without further handling.
8. Remove ties damaged as result of improper handling by the DB Entity and rejected by the MBTA and replace with undamaged ties at no additional cost to the MBTA.

3.7 RAIL INSTALLATION

- A. Install new 132 RE or 115 RE rail as jointed rail once beyond long timbers of turnouts connecting to main line.
- B. Lay rail in such a manner that damage to ties or other materials is avoided and ties are not dislodged from their proper position.

3.8 INSULATED JOINTS - POLY

- A. Install 132 RE poly insulated joints at locations shown on the Design Documents.

- B. Install insulated joints during installation of 132 RE rail.
- C. Insulated joints will be installed as suspended joints.
- D. Accurately space and drill holes for bolting of rail in accordance with requirements of the current AREMA Manual for Railway Engineering, Specifications for Steel Rails, Chapter 4, Part 1 and STANDARD PLAN 1302. Drill holes with an approved rail drill.
- E. Drill cylindrical holes of specified diameter for the size bolt required through and perpendicular to the web of rail.
- F. Use a template as a drilling guide to locate holes both vertically from bottom of rail and horizontally from rail end. In no case shall a joint bar be used for this purpose.
- G. Remove all rough edges from holes.

3.9 TIE PLATES - RESILIENT AND STANDARD

- A. Timber crossties shall have resilient tie plates installed under each 132 RE rail and standard double shaller canted plates under all secondhand and existing rail.
- B. Prior to installation of tie plates, clean contact surfaces to allow proper bearing of tie plate on tie and rail on tie plate.
- C. Locate tie plates on 8' 6" ties so that the line side of tie is 18 ½" from outer edge of base of rail. Tie plate shall be centered on the crosstie under rail.
- D. Locate tie plates on longitudinal centerline of each tie and place square to centerline of rail so that outside shaller of plate bears fully against rail base. Place plate with the downward cant toward center of track.
- E. Secure rail on line end of ties to tie, in proper relation to tie end, before securing opposite rail.
- F. Use line rail as reference in securing opposite rail to proper gauge.
- G. Tie Boring
 - 1. Field bore crossties and switch timber before fastening tie plates.
 - 2. Holes in crossties shall be 9/16" diameter and 6" deep for lock spikes and ½" diameter, 6" deep for cut spikes.
 - 3. Boring of holes in excess of number required will not be permitted.
 - 4. Do not bore holes entirely through tie.
 - 5. After drilling, brush drill chips from top surface of tie.
 - 6. Prior to locating position of holes to be bored for second rail to be placed on any tie or timber, position tie laterally so that field side base of first rail is in contact with shaller of plate and any tolerance between rail base width and plate seat width is on gauge side of rail. Position other plate similarly to ensure retention of gauge established.

3.10 SCREW SPIKES AND CUT SPIKES

- A. Start and drive spikes vertically and square with rail. Drive spikes straight.
- B. Spikes shall be driven in accordance with manufacturer's recommendations and specifications.
- C. Straightening spikes will not be permitted. Spikes bent during driving shall be withdrawn and replacement spike driven.
- D. Number of spikes used per tie shall conform to the MBTA Standard Plans.
- E. Avoid removal of spikes once driven. When necessary, pull spikes and plug hole using treated tie plugs.
- F. Under no circumstances shall gauge be adjusted by striking spikes, or plate edge after it is fixed to tie.
- G. Seat rail properly between tie plate shallers with outside base of rail tight against outside plate shaller.

3.11 JOINTED RAIL

- A. General
 - 1. Jointed rail shall be installed following the proper spacing of crossties, on double shaller canted tieplates, properly secured with spikes.
 - 2. Rails shall be laid one at a time, the rail ends brought squarely together and bolted.
 - 3. Rail joints in track will be staggered. The joints of one line of rails shall be opposite the middle of the rails in the other line, with a permissible variance of 18" either side of center.
 - 4. Rails shall be cut squarely and cleanly by means of a rail or abrasive disk saw. Cutting rails or burning holes in rails by means of a heat dependent device is prohibited.
 - a. Holes for bolting cut rails shall be drilled by an approved type of rail drill and with use of a template. Under no circumstances shall new holes be drilled between two existing holes.
- B. Compromise Joints
 - 1. Install compromise joints at the locations where rail section changes.
 - 2. The DB Entity is responsible for determining the proper size of the compromise joints which shall not exceed a 20 pound weight difference.
 - 3. Prior to the joint bar application, the DB Entity shall clean and coat the rail ends within the joint bar area, including webs, fishing surfaces, bolt holes and inside surfaces with an approved oil or grease as specified in AREMA Specification, Chapter 5, Part 5.
 - 4. The joint bars shall be positioned on the rail, bolts inserted and washers and nut applied by hand.
 - 5. The bars shall be in a vertical (uncocked) position as one of the center bolts is tightened.

6. All bolts shall be completely tightened when the rail is laid to a tension range of 20,000 to 25,000 pounds per bolt and in the proper sequence to properly seat the rail joint, beginning at the center and working in both directions toward the end. To assure that the joint bars maintain their vertical position the toes of the bars shall be tapped with a maul as the bolts are tightened.
7. After the rail has been laid, all bolts shall be tightened again.

C. Rail

1. If the compromise joint cross ties are not spaced properly at a joint location, the cross ties shall be re-spaced to properly support the joint bars as a suspended joint.
2. Tie plates shall be applied so the outside shaller is in contact with the rail base or a joint bar for the full length of the shaller. The tie plate shall be centered on the tie and the shaller shall not be under the rail base and shall be placed to cant the rail inward.
3. Mismatches on tread and gauge side of rail head will not be allowed and the DB Entity shall be required to properly build up rail ends to conform with adjacent rail to the satisfaction of the MBTA. Removal of mismatch by grinding rail head is prohibited.

3.12 TIE PLUGS

- A. Install treated tie plugs in holes where spikes have been pulled from ties.
- B. Drive plugs into tie to refusal and cut plug flush with top of tie, using an adze, before installing tie plate.

3.13 SURFACING AND ALIGNING

- A. Surface and align track as specified in Section 02854 – TRACK SURFACING AND ALIGNMENT.

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
COMMUTER RAIL MATERIAL SPECIFICATION NO. 9272

TIE PLATE - STANDARD

MATERIALS

New standard tie plate shall conform to AREA Manual For Railway Engineering, Chapter 5, Part 1 - "Specification For Low-Carbon Steel Tie Plates"

MANUFACTURE

Each new standard tie plate shall have AREA B-6 punching, 1:40 cant and shall be in accordance with MBTA Standard Plans.

Material order shall specify plan number required.

INSPECTION

Standard tie plates are subject to inspection at delivery for compliance with these specifications.

SHIPMENT

Standard tie plates shall be handled and shipped in accordance with currently accepted practices and as specified in the order.

DELIVERY

To be accepted, standard tie plates offered shall conform to this specification in all respects. Standard tie plates are subject to inspection at delivery and are at the supplier's risk until acceptance. Standard tie plates rejected for non-compliance with this specification will be returned at the supplier's expense.

BALLAST MATS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies furnishing and installation of a vibration mitigating ballast mat where indicated on the Design Documents, complete with all necessary components in conformity with manufacturer's specifications, and to the lines and grades shown on the Design Documents.

1.2 REFERENCE STANDARDS

- A. Tensile Strength and Elongation at Break: ISO-37(2011) Rubber, Vulcanized or Thermoplastic – Determination of Tensile Stress-Strain properties; ASTM D4632 – Standard Test Method for Grab Breaking Load Elongation of Geotextiles.
- B. CBR Puncture Strength: ASTM D6241 Standard Test Method for Static Puncture Strength of Geotextiles and Geotextile-related Products Using a 50-MM Probe.
- C. Compression Set: ISO-815-1(2008) Rubber, Vulcanized or Thermoplastic – Determination of Compression Set – Part 1: At Ambient or Elevated Temperatures.

1.3 SUBMITTALS

- A. Design:
 - 1. Submit drawings showing the limits of ballast mat installation in plan and cross section.
- B. Construction:
 - 1. Submit complete details of the ballast mat and appurtenant materials, including shop drawings and a detailed procedure for the storage, handling, transport, installation, and protection of the ballast mat (including procedures and equipment to be used for distribution, grading and compaction of initial layer of ballast) to the MBTA for review and acceptance.
 - 2. Submit complete details of the ballast mat performance qualification test, consistent with procedures described in Article 2.2 herein.
 - 3. Provide name and qualifications of proposed test consultants and/or lab as described in Paragraph 1.4(B).

1.4 QUALITY CONTROL

- A. A representative of the manufacturer of the ballast mat shall be present on the Project site(s) at least two days prior to the commencement of ballast mat installation and shall remain on the site(s) to supervise the ballast mat installation work for the duration of the installation or for a period of at least one week, as deemed necessary by the MBTA to ensure proper installation.
- B. Provide test results conducted by a recognized independent consultant and/or test lab that the performance specifications of the ballast mat to be installed on this Project is as specified herein and is compatible with substrates track system and rolling stock to be used on this Project.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Ballast mat shall be designed to provide reduction of ground or structure-borne vibrations, and the impact on structures and of the crushing of ballast.
- B. The upper surface of the mat shall be textured to permit ballast to nest for track bed stability and be designed for protection against attack by contaminants that may filter through ballast over time. The subsurface shall contain fabric reinforcement for strength and load distribution. The underside shall provide for subsurface drainage under the mat.

2.2 QUALIFICATION TEST

- A. Ballast mat material shall display minimum required performance characteristics for reducing measured vibration levels when tested (in-situ) for similar track installations and similar rolling stock, as specified below:

- 1. Insertion Loss Performance Requirement:

Measured ballast mat insertion loss will meet or exceed the following one-third octave band values, as measured using test procedures listed below.

1/3 Octave Band Center Frequency (Hz)	Insertion Loss (dB)
50	0
63	3.4
80	4.8
100	7.6
125	8.8
160	9.2
200	7.6
250	0.4
315	-0.9
400	0

- 2. Track Type and Rolling Stock Requirement:

Qualification testing shall be conducted (if possible) on a tangent and at-grade track installation (not on curves, in tunnels, or on bridges). Track type shall be continuously welded rail, with wood ties, with 12" minimum bottom ballast. Rolling stock used for test shall include a minimum 36.88-ton axle load locomotive.

- 3. Qualification Test Requirements, Ballast Mat Insertion Loss:

- a. Insertion loss is a measure of the difference in train-induced vibrations with and without the ballast mat installed.

- b. Measurements shall be made along a stretch of track where the soil conditions are substantially the same for the treated and untreated sections. A minimum of two vibration sensors shall be used, one next to the treated section and one next to an adjacent untreated section. In order to minimize flanking from the end of the ballast mat, the sensors shall be located approximately 200' from the treated/untreated junction (400 feet apart). Vibration data shall be recorded simultaneously at the two sites. The sensors shall be approximately 25' from the track centerline.
- c. Vibration spectra shall be measured for the same train passing each site, at the same speed. Vibration spectra shall be measured in one- third octave bands from 5 Hz to 500 Hz. Vibration spectra shall be measured using a "peak-hold" or "band-maximum" type average. Data from multiple passes shall be averaged using an energy averaging technique.
- d. Train speed shall be between 30 mph and 50 mph and shall be measured by both the cab recorder and by some other method such as GPS. Multiple train speeds are required. The measurements shall be made with rolling stock similar to that used on MBTA commuter rail lines, in particular with a 36.88-ton axle load locomotive.

2.3 BALLAST MAT PROPERTIES

A. Ballast mat material shall satisfy the following requirements:

- 1. Capacity: an axle load of 36.88 tons; speeds up to 70 mph.
- 2. Dimensions:
 - a. Width no less than 48" not including joint overlaps.
 - b. Thickness no greater than 2 inches.
- 3. Fabric:
 - a. Tensile strength $\geq 1,150$ lb/inch
 - b. Elongation at break ≥ 10 %
 - c. CBR- Puncture Resistance ≥ 725 lbf
- 4. Elastomer Properties:
 - a. Tensile strength ≥ 58 psi
 - b. Elongation at break ≥ 40 %
 - c. Compression Set < 4 %
- 5. Dynamics: dynamic to static stiffness ratio (related to a preload of 8.5 psi), $K_d = 1.3 (+0.1/-free)$.
- 6. Temperature Range: standard quality is suitable for service where ballast mat temperatures range between (-) 4 degrees F and (+) 158 degrees F.

- B. The material used for the sealing of ballast mat joints shall be an integral extension of the top surface of the mat or a separate material having strength characteristics equal to those of the top layer of the ballast mat and be accepted by the MBTA.

PART 3 – EXECUTION

3.1 INSTALLATION

- A. Installation shall be in accordance with:
 - 1. Manufacturer's guidelines
 - 2. Limits shown on accepted drawings.

END OF SECTION

SECTION 03300

CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items:
1. Cast-in-place concrete, including formwork, reinforcement, concrete materials, mixture design, placement procedures and finishes for the following applications:
 - a. Footings, mat foundations, grade beams
 - b. Pile caps: Including but not limited to caps for drilled shafts, mini-piles, driven piles and other deep foundation types
 - c. Slabs: Including but not limited to, slabs-on-grade, suspended slabs, slab on steel deck, approach slabs, topping slabs, and other slab types
 - d. Concrete toppings
 - e. Building frame members
 - f. Walls: Including but not limited to building walls, retaining walls, foundation walls, parapet walls, safety walls and other wall types
 - g. Cutting and patching of mechanical and electrical penetrations through cast-in-place concrete
 - h. Pedestrian Viaducts and Bridges:
 1. Abutments and abutment caps
 2. Piers and pier caps
 3. Deck slabs and parapet walls, curbs and haunches
 4. Approach slabs
 5. Footings
 6. Parapet walls
 - i. Viaduct Structures and Washington Street Bridge:
 1. Abutments and abutment caps
 2. Piers and pier caps
 3. Deck slabs
 4. Equipment platform slabs
 5. Approach slabs
 6. Approach retaining walls
 7. Drilled shafts
 8. Driven pile and drilled mini pile caps

- j. Storm drain manholes, structures, and headwalls
 - k. Sidewalks, curbs, gutters, and ramps
 - l. Foundations for fence posts
 - m. Foundations for bollards, benches, bicycle racks, and other miscellaneous site items
 - n. Footing for traffic signal structures
 - o. Concrete pavement structure at bus station
 - p. Underpasses at Walnut Street, Medford Street and School Street
 - q. Miscellaneous cast-in-place concrete item of varying types including but not limited to: ramps, service pits, sump pits, elevator and escalator pits, stairs and landings, pans, steps, concrete encasements, pole supports, corbels, haunches and other miscellaneous elements
2. Cast-in-place concrete with Integral Crystalline Waterproofing Admixture System: Furnish all materials, services, application instructions, testing guidelines, quality control requirements and supervision necessary for the supply and installation of crystalline integral waterproofing admixture in concrete. Add the crystalline waterproofing admixture to the concrete mixture at the time of batching. Design, batch, place, finish and cure concrete in accordance with the guidelines set out by the American Concrete Institute and the recommendations of the manufacturer written instructions
- B. Related Work: The following items are not included in this Section and shall be performed under the designated Sections:
- 1. Section 03301 –CAST-IN-PLACE CONCRETE FOR ROADWAY BRIDGES.
 - 2. Section 09900 – PAINTING
 - 3. Section 16125 – CATENARY POLES
 - 4. Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION
 - 5. Section 16807 – CONCRETE AND OTHER FOUNDATIONS FOR THE LIGHT RAIL SIGNAL SYSTEM

1.2 DEFINITIONS

- A. Cementitious Materials: Portland cement alone or in combination with one or more of the following: blended hydraulic cement, fly ash and other pozzolans and ground granulated blast-furnace slag; subject to compliance with requirements.
- B. Mass Concrete requirements apply to the cast-in-place retaining wall, slabs, cap beams, bridge abutments and viaduct structures.
 - 1. Concrete slabs, footings, cap beams, bridge abutment, viaducts structures and other structures with thickness greater than three feet (3'-0") are considered mass concrete.
 - 2. Mass concrete also includes concrete placements of other dimensions where measures must be taken to mitigate cracking caused by heat of hydration.
- C. Lightweight Concrete as required by design shall consist of lightweight aggregate conforming to ASTM C330. Lightweight concrete shall achieve a 28-day oven-dry maximum unit weight of 110 pounds per cubic foot.

1.3 SUBMITTALS

- A. Product Data: Submit data for each type of product indicated, including but not limited to reinforcement, forming accessories, admixtures, patching compounds, waterstops, joint systems, curing compounds.
1. Include descriptive data, catalog cuts, laboratory test reports and any other information necessary to show acceptable materials and confirm Contract compliance.
- B. Design Mixtures: For each concrete mixture, submit proposed mix proportions and test results confirming mix meets requirements stated below. Submit alternate design mixtures when characteristics of materials, project conditions, weather, test results, or other circumstances warrant adjustments.
1. Indicate amounts of mixing water to be withheld for later addition at Project site.
 2. Indicate amount of fly ash or slag in the mix minimum of 25% of fly ash or slag is required in conformance with Volume 2 Technical Provisions Exhibit 2I.
 3. For mass concrete placements, submit a Temperature Control Plan. The temperature control plan shall follow the procedures outlined in Section 207 of the ACI Manual of Concrete Practice to formulate, implement, administer and monitor a temperature control plan, making adjustments as necessary to ensure compliance with the Contract Documents.
 4. As a minimum the Temperature Control Plan shall include the following:
 - a. Concrete mix design
 - b. Duration and method of curing
 - c. Procedures to control concrete temperatures at the time of placement
 - d. Methods of controlling temperature differentials
 - e. Temperature sensor types and locations
 - f. Temperature monitoring and recording system
 - g. Field measures to ensure conformance the maximum concrete temperature and temperature differential requirements
 - h. Methods for crack control
- C. Steel Reinforcement Shop Drawings: Submit steel reinforcement placing shop drawings that detail fabrication, bending, and placement. Include bar sizes, lengths, material, grade, bar schedules, stirrup spacing, bent bar diagrams, bar arrangement, splices and laps, mechanical connections, tie spacing, hoop spacing, and supports for concrete reinforcement.
1. Indicate coordination requirements for reinforcement locations with requirements of structural steel, steel joists and steel deck.
 2. Comply with ACI, "Manual of Standard Practice for Detailing Reinforced Concrete Structures".
- D. Formwork Shop Drawings: Prepared by or under the supervision of a qualified professional engineer licensed in the Commonwealth of Massachusetts detailing fabrication, assembly, and support of formwork
1. Submit complete and accurate shop drawings as required to adequately illustrate and control finished work. Show all dimensions, kind, type, quality of all material, applicable specification

references, and all information as may be necessary to detail finished construction of work covered.

2. Shoring and Reshoring: Indicate proposed schedule and sequence of formwork removal, shoring removal, and installing and removing reshoring. Submit camber and shoring calculations.
3. Blockouts for Architectural Joint Systems: Indicate blockouts and coordination with architectural joint systems.

E. Concrete Placement: Submit the following:

1. Written Cold-Weather Placement Plan: The Cold-Weather Placement Plan shall include detailed procedures to protect concrete during cold weather placements. Submit the Cold-Weather Placement Plan prior to concrete placement. The plan shall include:
 - a. Instructions for placing and protecting all concrete elements including but not limited to slabs on grade, walls, columns and elevated slabs
 - b. Provisions for monitoring the concrete temperature during placement, curing and immediately after protection is removed
 - c. Curing procedures to prevent undesirable drying of fresh concrete
 - d. Delivery coordination of redi-mix concrete trucks to avoid delays in concrete delivery
2. Written Hot-Weather Placement Plan: The Hot-Weather Placement Plan shall include detailed procedures to protect concrete during hot weather concrete placements. Submit the Hot-Weather Placement Plan prior to concrete placement. The plan shall include:
 - a. Instructions for placing and protecting all concrete elements to prevent rapid drying due to high temperature, low relative humidity and/or high wind velocity
 - b. The concrete producer's proposed methods of preventing the concrete from exceeding the maximum allowable temperature upon delivery
 - c. Detailed description for the use of chilled water, cooled aggregate, substitution of shaved ice in batching concrete or combination of methods
 - d. Detailed curing procedures including instructions to prevent drying-shrinkage cracking due to rapid loss of moisture as well as thermal cracking due to rapid temperature drop after placement
 - e. Delivery coordination of redi-mix concrete trucks to avoid delays in concrete delivery
3. Written Mass Concrete Placement Plan
4. Written lightweight Concrete Placement Plan, describing equipment and procedures to be used in the placement of the concrete and methods for consolidation

F. Reinforcement Placement: Comply with CRSI-WCRSI "Placing Reinforcing Bars"

- G. Material Test Reports: For the following, submit a test report from a qualified testing agency, indicating compliance with requirements:
1. Aggregate Soundness Test Reports (ASTM C88).
 2. Aggregate Staining Test Reports (ASTMC641).
 3. Preliminary Design Mix reports (ACI 301).
 4. Air Entrainment Test Reports (ASTM C260).

- H. Material Certificates: For each of the following, submit material certification signed by manufacturers:
1. Cementitious materials
 2. Lightweight Aggregate
 3. Admixtures
 4. Form materials and form-release agents
 5. Steel reinforcement and accessories
 6. Fiber reinforcement
 7. Waterstops
 8. Curing compounds
 9. Floor and slab treatments
 10. Bonding agents
 11. Adhesives
 12. Vapor Barriers/ Retarders
 13. Semirigid joint filler
 14. Joint-filler strips
 15. Repair materials
- I. Submit floor surface flatness and levelness measurements to determine compliance with specified tolerances and requirements for applied finishes and materials, except as noted for slope to drains.
- J. Submit for review and approval the name and qualifications of the proposed Independent Inspection and Testing Agency.
- K. Submit field quality-control test and inspection reports.
- L. Submit Minutes of pre-installation conference.
- M. Samples: Provide 3 samples, minimum 36" round by 3" thick, for the MBTA's evaluation of appearance and workmanship for each location type. If samples are not accepted, provide additional rounds of samples until approval is received.
- N. In-Place Mock-Ups: Using materials and mixes from approved samples, provide separate 10' x 10' mock-ups for each location type. Comply with procedural requirements for in-place mock-ups specified in Volume 2 Technical Provisions Exhibit 2I, including scheduling, shop drawings, photographs.
1. Submit proposed location of in-place mock-ups to the MBTA for review.
 2. Remove and replace rejected mock-ups until accepted by the MBTA.

1.4 QUALITY CONTROL /QUALITY ASSURANCE

- A. Manufacturer Qualifications: Furnish concrete from a plant experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment. Select a plant that has recently furnished specified concrete for a large

- project, or furnish evidence of plant's capacity to produce and deliver concrete conforming to specified requirements at required rate and has laboratory capability to develop acceptable concrete mix designs and to control quality of concrete production, in accordance with a preapproved quality control plan.
- B. The DB Entity's selected Independent Testing Agency is required to perform all Testing and Inspection Services, Concrete Plant Inspection and Field Control and record keeping.
- C. The minimum number of test cylinders to be made for each class of concrete and for each placement shall be four for each 50 cubic yards or less and minimum of four extra cylinders for each additional 100 cubic yards or fraction thereof. When additional sets of test cylinders are required beyond the normal seven and twenty-eight day tests, each set shall consist of a minimum of two test cylinders. For Lightweight Concrete an additional three test cylinders are required in addition to those indicated above. Use the additional cylinders to help verify the final dry unit weight of the as placed mix.
- D. Independent Testing Agency Qualifications: An independent agency, acceptable to the MBTA, qualified according to ASTM C 1077 and ASTM E 329 for testing indicated, as documented according to ASTM E 548.
1. Personnel conducting field tests are required be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-01 or an equivalent certification program.
 2. Personnel performing laboratory tests are required be ACI-certified Concrete Strength Testing Technician and Concrete Laboratory Testing Technician - Grade I. Testing Agency laboratory supervisor is required to be an ACI-certified Concrete Laboratory Testing Technician - Grade II.
- E. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant, obtain aggregate from one source, and obtain admixtures through one source from a single manufacturer.
- F. Welding: Qualify procedures and personnel according to AWS D1.4, "Structural Welding Code-- Reinforcing Steel".
- G. ACI Publications: Comply with the following unless modified by requirements in the Contract Documents:
1. ACI 116R "Cement and Concrete Terminology"
 2. ACI 207.1 "Guide to Mass Concrete"
 3. ACI 211.1 "Selecting Proportions for Normal, Heavyweight, and Mass Concrete"
 4. ACI 211.2 "Recommended Practice for Selecting Proportions for Structural Lightweight Concrete"
 5. ACI 214 "Recommended Practice for Evaluation of Compression Test Results of Field Concrete"
 6. ACI 117 "Specifications for Tolerances for Concrete Construction and Materials"
 7. ACI 301 "Specifications for Structural Concrete for Buildings"
 8. ACI 304 "Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete"
 9. ACI 304.2R "Placing Concrete by Pumping Methods"
 10. ACI 304.5R "Batching, Mixing, and Job Control of Lightweight Concrete"

11. ACI 305 “Hot Weather Concreting”
12. ACI 306 “Cold Weather Concreting”
13. ACI 309 “Consolidation of Concrete”
14. ACI 311 “Recommended Practice for Concrete Inspection”
15. ACI 315 “Manual of Standard Practice for Detailing Reinforced Concrete Structures”
16. ACI 318 “Building Code Requirements for Reinforced Concrete”
17. ACI 347 “Recommended Practice for Concrete Formwork”
18. ASTM C31 “Making and Curing Concrete Test Specimens in the Field”
19. ASTM C33 “Concrete Aggregates”
20. ASTM C39 “Compressive Strength of Cylindrical Concrete Specimens”
21. ASTM C40 “Organic Impurities in Fine Aggregates for Concrete”
22. ASTM C87 “Effect of Organic Impurities in Fine Aggregate on Strength of Mortar”
23. ASTM C88 “Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate”
24. ASTM C94 “Ready-Mixed Concrete”
25. ASTM C136 “Sieve Analysis of Fine and Coarse Aggregates”
26. ASTM C138 “Density (Unit Weight), Yield, and Air Content (Gravimetric) of Concrete”
27. ASTM C143 “Slump of Hydraulic Cement Concrete”
28. ASTM C150 “Portland Cement”
29. ASTM C157 “Length Change of Hardened Hydraulic Cement Mortar and Concrete”
30. ASTM C173 “Air Content of Freshly Mixed Concrete by the Volumetric Method”

H. Construction Tolerances: Allowable deviations from as-designed or indicated dimensions and elevations - Do not allow adjacent units to have cumulative deviations:

1. Footings and Pile Caps
 - a. Misplacement and eccentricity, as measured from centroid of footing: Two percent of footing width in direction of misplacement but not more than two inches
 - b. Elevation of top: $\pm 1/4$ "
 - c. Other footing/cap dimensions: $- 1/4$ "
2. Concrete Substrate Surfaces
 - a. Slab to receive dry shake aggregate topping - Adjust to accommodate finished surface tolerances
 - b. Variation of other substrate surfaces from indicated elevation: $\pm 1/4$ "
3. Variations in thickness of finished monolithic slabs: $\pm 1/4$ "
4. Top of track slab (invert concrete) finish course: $\pm 1/4$ "
5. Horizontal distance from centerline of track to edge of station platform: $+ 1/8$ ", $- 1/4$ "
6. Concrete walkway dimensions: $\pm 1/4$ ".
7. Horizontal distance from edge of walkway to centerline of track: $+ \text{zero}$, $- 1/4$ "

8. Tops of slabs not otherwise specified: +/- 1/4"
 9. Variation from a 10' straightedge placed in all directions on horizontal and inclined surfaces: 1/4"
 10. Top elevation of columns, piers and walls: +/- 1/4"
 11. Flatness of wall and column surfaces in 10' in all directions: +/- 1/4"
 12. Out-of-plumb of columns, piers, walls, centerlines of elevator shafts, and joints not exposed to view in public areas of finished structure: 1/4" in 10'; do not exceed one inch total.
 13. Out-of-plumb of columns, piers, walls, vertical joints and grooves, openings for doors, windows, louvers, and other lines exposed to view in public areas of finished structure: 1/4" in 10'; do not exceed 1/2" total.
 14. Clearance between door, window and louver frames - Not less than 1/4" nor more than 3/8".
 15. Level and grades of exposed lintels, sills, parapets, horizontal grooves and other conspicuous lines: 1/4" in 20'; do not exceed 1/2" in entire line.
 16. Level and grade of slab soffits, ceilings, beam soffits and arises: 1/4" in any 10' length; 3/8" in any 20' length; do not exceed 3/4" for entire surface
 17. Cross Sectional dimensions of columns and beams and thickness of slabs: + 1/4", - 1/8".
 18. Elevation of bottom of slabs on grade: + zero, - has no minimum.
 19. Thickness of walls and pilasters: + 1/2", - 1/4"
 20. Position of linear building lines and distance from centerlines of columns, walls and partitions: 1/2"
 21. Rise of steps: +/- 1/16" in consecutive steps; do not exceed +/- 1/8" in total flight
 22. Tread of steps: +/- 1/8" in consecutive steps; do not exceed +/- 1/4" in total flight
 23. Size and location of sleeves and floor openings: +/- 1/4"
 24. Difference between diagonal dimensions of rectangular opening - Not more than two percent of sum of diagonal dimensions
 25. Escalator and elevator Sections - As required to fit approved equipment, determined by coordination with equipment subcontractor and actual measurements of equipment taken by DB Entity
 26. Horizontal distance form centerline of track to face of exterior concrete wall zero to plus one inch
 27. Fill Concrete: 1/4" of required elevation with variation in slope or plane not to exceed 1/4" in ten feet
- I. Concrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design concrete mixtures.
- J. Pre-installation Conference: Conduct conference at Project site to address the following:
1. Before submitting design mixtures, review concrete design mixture and examine procedures for ensuring quality of concrete materials. Require representatives of each entity directly concerned with cast-in-place concrete to attend, including the following:
 - a. DB Entity's superintendent
 - b. Independent testing agency responsible for concrete design mixtures
 - c. Ready-mix concrete manufacturer
 - d. Concrete subcontractor

2. Review special inspection and testing and inspecting agency procedures for field quality control, concrete finishes and finishing, cold- and hot-weather concreting procedures, curing procedures, construction contraction and isolation joints, and joint-filler strips, semirigid joint fillers, forms and form removal limitations, shoring and reshoring procedures, vapor barrier/retarder installation, anchor rod and anchorage device installation tolerances, steel reinforcement installation, floor and slab flatness and levelness measurement, concrete repair procedures, and concrete protection
- K. Where the language in any of the documents referred to herein is in the form of a recommendation or suggestion, such recommendations or suggestions shall be deemed to be mandatory under this Contract.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Steel Reinforcement: Deliver, store, and handle steel reinforcement to prevent bending and damage. Avoid damaging coatings on steel reinforcement.
- B. Waterstops: Store waterstops under cover to protect from moisture, sunlight, dirt, oil, and other contaminants

PART 2 - PRODUCTS

2.1 CONCRETE MATERIALS

- A. Cement: Shall be American-made Portland Cement, free from water-soluble salts or alkalis which may cause efflorescence on exposed surfaces. Portland Cement shall be Type II, ASTM C 150 except as noted for Mass Concrete. Sulfate-resistant cement shall be Type V. Use only one brand of cement for each type of concrete throughout project. DB Entity shall be responsible for whatever steps are necessary to insure that no visual variations in color shall result in exposed concrete and shall place on order and secure in advance a sufficient quantity of this (these) cement(s) to complete concrete work specified herein.
 1. Fly Ash: ASTM C 618, Type F 15-35%
 2. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120, 25-50%
 3. A minimum of 25% of fly ash or slag is required in conformance with Volume 2 Technical Provisions Exhibit 2I Additional Project Requirements.

Maximum water/cement ratio shall conform to the following requirements:

1. All slabs that can be used as a walking surface; 0.40
2. All Stations safety walls/grade beams; 0.40
3. All walls, grade beams, beams, columns, roofs; 0.43
4. All drilled shafts for retaining walls; 0.43
5. All drilled shafts and foundation elements, columns, pier cap beams, approach structure walls, deck slabs and parapet walls for viaduct structure; 0.40

- B. Normal Weight Fine Aggregate: Shall be washed, inert, natural sand conforming to ASTM C 33 and the following additional requirements:

<u>Sieve</u>	<u>Percent Passing</u>
#4	95-100 (typical)
#16	50-85
#50	5-30
#100	0-10
Fineness Modulus	2.80 (Plus/Minus 0.20)
Organic	Plate 2 maximum
Silt	2.0 percent maximum
Mortar Strength	100 percent minimum compression ratio
Soundness	15 percent maximum loss, magnesium sulfate, five cycles

- C. Normal Weight Coarse Aggregate: Shall be well graded crushed stone or washed gravel conforming to ASTM C 33 and the following additional requirements:

Designated Size (inches)	3	2	1-1/2	1	3/4	1/2	3/8
F.M. (+/-0.20)	7.95	7.45	7.20	6.95	6.70	6.10	5.80
Organic	Plate 1 maximum						
Silt	1.0 percent maximum						
Soundness	5 percent maximum loss, magnesium sulfate, five cycles						

- D. Lightweight Aggregates: Expanded Shale, Clay, or Slate lightweight aggregate produced by the rotary kiln method, shall conform to ASTM C 330.
- E. Maximum designated sizes for normal weight coarse aggregate used in concrete sections shall conform to the requirements of ACI 211.1, except that sizes shall also be chosen in conjunction with required clearances and methods of placement.
- F. Concrete Fill for Steel Stair and Landing Pans: Composed of 1:2:2 mix with three-eighths inch maximum size normal weight aggregate and shall be placed with a 0" to 1" slump.
- G. Water: From approved source, potable, clean and free from oils, acids, alkali, organic matter and other deleterious material and complying with the requirements of ASTM C 94.
- H. Admixtures:
1. Water-reducing agent conforming to ASTM C494 Type A:
 - a. "WRDA" - W.R. Grace & Co.
 - b. "PDA25" - Protex Industries, Inc.
 - c. "Pozzolith 344H" - Master Builder's Co.
 - d. Or approved equivalent
 - e. Note: Water-reducing agent shall be by same manufacturer as air-entraining agent.
 2. Air-entraining agent conforming to ASTM C260:

- a. "DAREX AEA" - W.R. Grace & Co.
 - b. "PROTEX AEA" - Protex Industries
 - c. "MB-VR" or "MB-AE" - Master Builder's Co.
 - d. Or approved equivalent
3. Superplasticizer: High-range water-reducer conforming to ASTM C 494 / C 494M, Type A or Type F. ASTM C1017 Type I plasticizing selected to best meet application.
- a. "ADVA CAST 575" – W.R. Grace & Co.
 - b. "PLASTIFLOW R" – Nox-crete
 - c. "MasterGlenium 3400" – BASF US (Master Builders Solutions)
4. Corrosion inhibitor: Calcium Nitrite with a typical dosage rate of 3 gallons per cubic yard. For viaduct elements located within the detention pond use a dosage rate of 5 gallons per cubic yard. Calcium nitrite mix designs shall take into account the effect on concrete set times. Corrosion inhibitors shall be used on areas exposed to deicing salts, such as platforms, as called out in the DB Entity's accepted Shop Drawings

2.2 CONCRETE MIXTURES

- A. Design, on the basis of trial mixes and strength curves specified below, mixes for each type and strength of concrete. The Testing Agency shall verify that the proposed mix designs conform to all specification requirements.
- B. Furnish sufficient materials for concrete mix design not less than five weeks before use. Duplicate small samples plainly and neatly labeled with source, where proposed to be used, date, and name of collector shall be provided and presented to Testing Agency for permanent reference.
- C. Design concrete mixes in accordance with "Method 1" of ACI 301, and the requirements of this Section. All concrete is normal weight unless specifically designated otherwise; air-dry weight not to exceed 150 lbs. per cubic foot.
- D. Furnish Lightweight concrete in accordance with ACI 211.2 and the requirements of this section. Design Lightweight concrete mix to produce a 28-day oven-dry unit weight not to exceed 110 pound per cubic foot, plus or minus 2 percent. Mix lightweight coarse aggregate along with normal weight or lightweight fine aggregate, as required to obtain the unit weight indicated.
- E. All structural concrete shall be normal weight and have a minimum 28-day compressive strength of 4,000 psi and a maximum 28-day compressive strength of 6,000 psi. Deck slabs supporting railroad/light rail loads shall have a minimum 28-day compressive strength of 4,500 psi. The DB Entity may propose the use of higher strength concretes when feasible and as accepted by the MBTA.
- F. Exterior concrete shall contain air-entraining admixture when tested to ASTM C 231 at the point of discharge from the truck mixer:

<u>Aggregate Size</u>	<u>Air Content, %</u>
1-1/2 in.	4.5 - 7.5
3/4 in.	5.0 - 8.0
3/8 in.	6.0 - 9.0

Design Lightweight concrete mix to contain an Air Content between 3 and 4 percent as tested to ASTM C 231. Tremie concrete to contain an Air Content of 4 +/-1.5 percent.

- G. Furnish concrete to have the following slump, unless noted otherwise, when tested to ASTM C 143 at the point of discharge from the truck mixer:

<u>Condition</u>	<u>Slump, inches</u>
With Water-Reducing Agent	4-1/2 – 7
With High-Range W/R Agent	7-9
Without Water-Reducing Agent	2 - 5

- H. Design concrete mixes for slabs, including slabs on grade, to have a mid-range water reducer and have a maximum slump of 6”.
- I. The approved superplasticizer shall be used in all concrete walls.
- J. Design mix of concrete to be used in work shall correspond to following test strengths (TABLE A) obtained in laboratory trial mixtures.

TABLE A

Minimum Strength of Lab Trial Mixes (psi)

Design Trial Mix	Strength 7-days	Strength 28-days
4,000	3,400	5,200
5,000	4,200	6,200
6,000	5,100	7,500

- K. Exposed concrete: Provide corrosion admixture, such as DCI as manufactured by Grace Products, added to the mix design at a rate as indicated in Article 2.1-H.4 at locations noted below:
1. Slabs and concrete in contact with water
 2. Viaduct drilled shafts, columns, pile and shaft caps, and pier cap beams
- L. Mass Concrete: Provide cement complying with AASHTO M85 Type II, provided the specified temperature limitations are met. However, the DB Entity is allowed the option of using Type IV low heat cement in lieu of Type II.

2.3 FORM MATERIALS

- A. Construct formwork to shapes, lines, and dimensions required, plumb and straight, secured and braced sufficiently rigid to prevent deformation under load, and sufficiently tight to prevent leakage, all in conformance with ACI Standard 347, “Recommended Practice for Concrete Formwork”.
- B. Formwork for exterior concrete exposed to public view shall be high-density plastic overlaid plywood, 3/4” minimum thickness; for concealed concrete shall be “Plyform” plywood, 5/8” minimum thickness.

1. Chamfer Strips: At architectural concrete as required by design, use half-inch PVC radius former by BoMetals, Inc. At all other locations, use three quarter-inch, 45 degree poplar wood strips, nailed six inches on center, and installed in inside corners of all forms.
- C. Form Ties and Spreaders: Superior-ties by Superior Concrete Accessories, Inc.; or Sure-Grip Ties by Dayton Sure-Grip and Shore Co. Wire ties shall not be used. Ties for foundation walls shall be snap-ties or type specified above with removal cones and shall incorporate water seal washer. Ties shall be arranged in a symmetrical manner.
1. Provide units that shall not leave any metal closer than 1-1/2" to finished exposed surface.
 2. Provide tie that, when removed, shall not leave holes larger than 1-inch diameter in concrete surface, tie shall not be used for columns or exterior fascias.
- D. Form Release Agent: Crete-Lease 880-VOC-Xtra or Non-staining and non-emulsifiable type, or equal accepted by MBTA. Form release agent shall be biodegradable and shall not impart any stain to concrete nor interfere with adherence of any material to be applied to concrete surfaces.
- E. Form Liners: Units of face design, texture, arrangement, and configuration indicated. Furnish with manufacturer's recommended liquid-release agent that shall not bond with, stain, or adversely affect cast-in-place concrete surfaces and shall not impair subsequent surface or joint treatments of cast-in-place concrete.
1. Available Manufacturer: Available product by manufacture that may be incorporated into the Work include, but are not limited to, the following:
 - a. Greenstreak Group, Inc. or approved equal.
- F. Form-Facing Panels for Exposed-Aggregate Finishes: Steel, glass-fiber-reinforced plastic, or other approved non-absorptive panel materials that shall provide continuous, true, and smooth architectural concrete surfaces. Furnish in largest practicable sizes to minimize number of joints.
- G. Pan-Type Forms: Glass-fiber-reinforced plastic or formed steel, stiffened to resist plastic concrete loads without detrimental deformation.

2.4 REINFORCEMENT AND ACCESSORIES

- A. Reinforcing Steel Bars: Reinforcing bars shall be newly rolled billet steel conforming to ASTM A 615 Grade 60. Bars shall be bent cold.
1. All reinforcing bars shall be epoxy-coated, in accordance with ASTM D 3963, with the following exceptions:
 - a. Retaining walls reinforcing bars, other than viaduct approach structure retaining walls, shall be uncoated
 - b. Pile caps reinforcing bars, other than viaduct structure pile caps and drilled shaft caps, shall be uncoated
 - c. Reinforcing bars for mitigation of Stray Currents requirements per Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION shall be uncoated.
- B. Reinforcing Steel Bars for Welding: Shall be newly rolled billet steel conforming to ASTM A706 Grade 60, uncoated. Bars shall be bent cold.
1. Reinforcing bars for mitigation of Stray Currents requirements per Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION.

- C. Welded Wire Fabric: Shall conform to ASTM A 185 for interior concrete and ASTM A884, Class A for exterior concrete.
- D. Reinforcement Accessories: Shall conform to Product Standard PS7-766, National Bureau of Standards, Department of Commerce, Class C, as produced by Superior Concrete Accessories, Inc.; Dayton Sure-Grip Co.; or R.K.L. Building Specialties Co., Inc. Reinforcement accessories shall include spacers, chairs, ties, slab bolsters, clips, chair bars, and other devices for properly assembling, placing, spacing, supporting, and fastening reinforcement. Tie wire shall be galvanized, epoxy coated or stainless wire of sufficient strength for intended purpose, but not less than No. 18 gage. Metal supports shall be of such type as not to penetrate surface of formwork and show through surface of concrete. Provide epoxy coated supports for epoxy coated reinforcing steel. Accessories touching interior formed surfaces exposed to view shall have not less than 1/8" of plastic between metal and concrete surface. Plastic tips shall extend not less than 1/2" up on metal legs. Individual and continuous slab bolsters and chairs shall be of type to suit various conditions encountered and shall be capable of supporting 300 pound load without damage or permanent distortion.
- E. Mechanical Reinforcing Bar Splicers (Couplers): The completed splice, utilizing couplers, Dowel Bar Splicer and Dowel-In shall meet or exceed 125 percent of the yield of the reinforcing bars being spliced. Provide temporary plastic plugs in splicers, which shall be exposed for extended periods

2.5 MISCELLANEOUS MATERIALS

- A. Grout: Non-Shrink, Non-Metallic Grout: factory pre-mixed grout product complying with U.S. Army Corps of Engineers Handbook CRD-C-62 1. Ready-to-use aggregate product requiring only addition of water at job site such as "Embeco Pre-mixed Grout" by Master Builder's; "Vibro-Foil Ready-Mixed" by W.R. Grace & Co.; or "Ferrolith G" by Sonneborn Building Products, Inc. Grout shall be easily workable and shall have no drying shrinkage at any age. Compressive strength of grout (2" x 2" cubes) shall not be less than 5000 psi at 7 days, and 7500 psi at 28 days.
- B. Waterstops: Extruded virgin PVC containing no scrap or reclaimed material or pigment. Provide cross section as indicated, uniform along the length of the waterstop and symmetrical transversely so that the thickness at any given distance from either edge of the waterstop shall be uniform. The finished waterstop shall meet the requirements specified below for the average of five samples tested in each case. Report standard deviations of values in addition to averages. Condition and test samples in atmosphere of 73 (plus or minus 3) degrees F and 50 (plus or minus 10) percent relative humidity, except where other test conditions are specified.
 1. Tensile strength, per ASTM D 638. Die IV-: 2000 psi, minimum
 2. Ultimate elongation, per ASTM D 638. Die IV: 350 percent, minimum
 3. Tear resistance, per ASTM D 624. Die B: 350 pounds per inch of thickness, minimum
 4. Stiffness in flexure, samples reduced to 1/8-inch thickness, per ASTM D 747. 1/4" span: 600 psi. minimum
 5. Low temperature brittleness samples reduced to 1/8-inch thickness, per ASTM D 746: no cracking, chipping, or sign of failure at minus 35 degrees F
 6. Accelerated Extraction, samples reduced to 1/8-inch thickness, per Corps of Engineers CRDC-572: tensile strength, per ASTM D 412. Die C 1750 psi. minimum; ultimate elongation, per ASTM D 412. Die C: 300 percent, minimum.
 7. Effect of Alkali, samples reduced to 1/8-inch thickness, per Corps of Engineers CRDC-572: Change in weight. 7 days: minus 0.10 to plus 0.25 percent; Change in weight. 30 days minus

0.10 to plus 0 25 percent; Change in hardness. 7 days. per ASTM D 2240. Shore A-2: plus or minus 5 points; Change in thickness. 30 days: plus or minus 1.0 percent.

8. Tensile strength of samples taken across site-made and factory-made splices, per ASTM D 638 Die I \1000 psi. minimum
- C. Waterstop Grout: Where indicated on the drawings, provide continuous Waterstop Grout (Internal or External type as recommend by the manufacturer) and Waterstop Treatment system as manufactured by Kryton International Inc. or equal product accepted by the MBTA.
- D. Vapor Barrier/Retarder: Vapor Retarder: Minimum 15 mil polyethylene.
- E. Membrane Curing Compound: ASTM C 309, Type 1. Product used shall be shown to be compatible with the later application of coatings. Curing compound shall not be used on any floor slab scheduled to receive an adhered floor finish.
- F. Membrane Curing Compound for Architectural Concrete: Liquid membrane curing compound complying with AASHTO M148, Type 1D, except Type 2 if required to control temperature of mass concrete and hot weather concrete.
- G. Sheet Curing Materials: Waterproof paper (regular or white), polyethylene film (clear or opaque white), and white burlap-polyethylene sheet complying with AASHTO M171.
- H. Chemical Hardener: All exposed concrete floor slabs shall be hardened with three applications of fluosilicate chemical hardener followed by two applications of clear acrylic concrete sealer by Sonneborn Division, ChemRex Inc. "Lapidolith"; or equal products by W.R. Meadows Co. and Concrete Service Material Company or other manufacturers.
- I. Penetrating Sealer: Monomeric alkyalkoxy silane sealer which has demonstrated penetrability into dry low permeability concrete to a minimum of 1/4". Sealer shall have 20 to 25 percent solids when used on walls, and 40 to 50 percent solids when used on floors.
- J. Epoxy Bonding Compound: ASTM C881, Type V for load bearing applications, Grade 1 Class A (if placement temperature is below 40F); Class B (if placement temperature is above 60F). Provide Grade 1 or 2 for horizontal surfaces and Grade 3 for vertical surfaces.
- K. Epoxy Membrane Curing Compound/Concrete Sealer: The two- component, epoxy resin system shall act as a dual purpose material: A membrane compound for curing alone, plus a penetrating sealer. It shall provide protection for concrete exposed to de-icing salts, commercial acids and alkalis, gasoline, diesel fuel, and oil, and exposure to freeze/thaw cycles and to vehicular traffic. The epoxy resin compound shall be furnished in two components for combining immediately prior to use in accordance with the manufacturer's written instructions as specified herein. The components of the epoxy resin system shall conform to the following requirements.
 1. Component A: Poly (2 hydroxypropylene, P'p, isopropylidenephenolate) condensed with 1 chlorepropoxirane such that the ox content is 4% in aralkyl and hydroxylated solvents. Component B: The amido amine condensate of the Diels Alder adduct of polyunsaturated acids dissolved in suitable solvents. Ratio of components (A to B): 1:1 by volume.
 2. Properties of Mixed Material:
 - a. Viscosity: 75 to 125 cP's at 75°F
 - b. Pot Life: 8 hours minimum at 75°F

- c. Minimum Solids Content: 40 to 44% by weight
 - d. Recoat Time: 24 hours maximum
 - e. Dry Film Thickness: 2 to 3 mils per coat
 - f. Color: Clear, White tint, gray tint
3. Properties of Cured Material:
- a. The cured system shall exhibit no evidence of amine blushing or sweating which may inhibit bond of subsequent coats.
 - b. When tested according to ASTM D 968, specimens of coating cured for 14 days at 75°F shall exhibit an abrasion coefficient of at least 30 liters per mil.
 - c. When tested according to ASTM D 522, a 2 mil dry film thickness specimen cured for 14 days at 75° shall exceed 12% elongation when tested on the 1/4" mandrel.
 - d. Specimens cured for 14 days at 75°F and immersed for 48 hours shall exhibit less than 1% water absorption by weight.
 - e. Water Retentivity shall not exceed 0.055 grams per square centimeter when tested according to ASTM C 156.
- L. Compressible Filler: Closed Cell Foam Filler per MassDOT "Supplemental Specifications to the 1988 English Standard Specifications for Highways and Bridges and the 1995 Metric Standard Specifications for Highways and Bridges"

PART 3 - EXECUTION

3.1 INSPECTION

- A. Examine all work prepared by others to receive work of this Section. Commencement of work shall be construed as complete acceptance of preparatory work by others.
 - 1. Hold Point-A pre-placement inspection shall be performed by the DB Entity prior to placing concrete to assure that placement prerequisites have been accomplished.

3.2 HANDLING, STORAGE, AND PROTECTION OF MATERIALS

- A. Handle and store materials separately in such manner as to prevent intrusion of foreign matter, segregation, or deterioration. Do not use foreign materials or those containing ice. Remove improper and rejected materials immediately from point of use. Cover materials, including steel reinforcement and accessories, during construction period. Stockpile concrete constituents properly to assure uniformity throughout project.

3.3 ERECTION OF FORMWORK, SHORING AND RESHORING

- A. Set and maintain formwork to insure complete concrete work within tolerance limits listed in ACI 347 latest edition, "Recommended Practice for Concrete Formwork", and with following additional requirements:
 - 1. Maximum variations from plumb:

- a. In surfaces of columns, walls and beams:
 - 1. In any 10' of length: 1/4"
 - 2. Maximum for entire length: 1/2"
 - 2. Maximum variations from established position in plan required by design:
 - a. Column: 1/2"
 - b. Walls: 3/4"
 - 3. Variations in cross-sectional dimensions of columns and beams and in thickness of slabs and walls.
 - a. Minus: 1/8"
 - b. Plus: 1/4"
- B. Before form materials can be re-used, surfaces that shall be in contact with freshly cast concrete shall be thoroughly cleaned, damaged areas repaired and projecting nails withdrawn, as required in accordance with ACI 301 to return forms to acceptable surface condition. Re-use of form material shall be subject to acceptance by MBTA.
- C. Construct formwork so concrete members and structures are of size, shape, alignment, elevation, and position indicated, within tolerance limits of Article 1.4-I.

3.4 PLACING OF REINFORCEMENT

- A. Reinforcement shall be placed in accordance with requirements of CRSI 93, "Recommended Practice for Placing Reinforcing Bars" and CRSI 93, "Recommended Practice for Placing Bar Supports" and with further requirements below.
- B. Reinforcement shall be accurately placed as required by design and shall be firmly secured in position by wire ties, chairs, spacers, and hangers, each of type accepted by MBTA.
- C. Bending, welding or cutting reinforcement in field in any manner, is prohibited, unless specific approval for each case is given by MBTA.
- D. Reinforcement shall be continuous through construction joints unless otherwise required by design.
- E. Reinforcement shall be spliced only in accordance with requirements of the design. Splices of reinforcement at points of maximum stress shall generally be avoided. Welded wire fabric shall lap six inches or one space plus two inches whichever is larger, and shall be wired together.
- F. Hold Point - Before concrete is cast, check all reinforcement after it is placed to insure that reinforcement conforms requirements of the design and accepted Design Documents. The MBTA shall be notified at least 36 hours prior to concrete placement and given opportunity to inspect completed reinforcement and formwork before concrete placement. Prior acceptance of shop drawings shall in no way limit MBTA's right to demand modifications or additions to reinforcement or accessories.

3.5 JOINTS

- A. Construction and control joints required by design are mandatory and shall not be omitted.

- B. Joints not required by design shall be placed to least impair strength of structure and shall be subject to acceptance of MBTA.
- C. Waterstops:
1. Protect waterstop from oil, dirt, concrete spatter, and damage, and leave clean to receive concrete forms. Exercise care during installation of waterstop to eliminate all possibilities that may cause leakage. Ensure reinforcing bars and slip dowels shall not interfere with positioning of waterstop during Installation.
 2. Install waterstops in accordance with manufacturer's recommendations and as indicated. Hold waterstops rigidly in place by extending through slots in keyways, by spilt bulkheads, by tying to reinforcing bars, or by such other adequate methods as are necessary to insure proper support and embedment during the concreting process. Secure waterstop between the last rib and the end of the waterstop when tying to reinforcing rods. Tie waterstop to reinforcing bars every 12 inches.
 3. Install waterstop so that half of the ribs of the waterstop material are embedded in the concrete on each side of the joint. When installed in an expansion joint, exercise care in pouring so that the closed hollow center-bulb remains in the gap between the first and second pour, to allow for maximum elongation with minimum stress on the portion of the waterstop embedded in the concrete.
 4. Install expansion joint material and a sealant in the joint, as indicated, to prevent foreign matter from accumulating in the joint area. When a sealant is used place a separator between the sealant and the waterstop to insure that both the waterstop and sealant best perform their respective functions.
 5. Sweep horizontal joints prior to pour to insure that foreign matter does not interfere with direct contact between the waterstop and concrete.
 6. Systematically and thoroughly vibrate concrete around waterstop to avoid honeycombs and voids in the concrete and to insure complete contact of waterstop to concrete.
 7. For the second pour on horizontal sections, secure waterstops to forms and/or reinforcing bars to prevent excessive movement of the waterstop and to provide positive insurance against honeycombing or voids. Use a thicker waterstop, 3/8" or 1/2", for heavy pour or larger aggregate.
 8. Where using split-ribbed waterstop spread open the split leg of the waterstop and nail it to the bulkhead between the last two ribs. Upon completion of the first pour and removal of the bulkhead, join the split leg together every 12" with hog rings and position it for the second pour.
 9. PVC waterstop may be butt-spliced on the job with an electrical splicing iron or a hot air welding gun and vinyl welding rod in accordance with the manufacturer's instructions.
 10. Do not drive nails through center of waterstop. Do not lap waterstop, splice joints. Do not embed center bulb in concrete. Position it in the center of the joint to insure freedom of movement. Do not secure waterstop except between the last rib and the end of the waterstop when tying to the reinforcing rod to hold in place for the pour. Where using split-ribbed waterstop, do not nail split legs to bulkhead adjacent to bulb.
- D. Integral Waterproofing System (Crystalline Admixture, Waterstop Grout and Waterstop Treatment):
1. The Waterstop System, consisting of Waterstop Grout and Waterstop Treatment, shall be installed in all non-moving construction joints and shrinkage control joints, according to the applicable manufacturer written instructions of Waterstop System.

2. All pipe penetrations shall be treated as per the crystalline admixture manufacturer's recommendations.
3. After completion of pour, all tie-holes shall be treated as per the admixture manufacturer's recommendations. Application Instruction 5.31 — Waterproofing Tie Holes and Concrete Defects.
4. Follow the manufacturer's recommendations for storage and handling.

3.6 INSTALLATION OF EMBEDDED ITEMS

- A. Conform to requirements of ACI 318, paragraph 6.3, "Conduits and Pipes Embedded in Concrete", and as specified below.
- B. Install galvanized steel sleeves, galvanized embedded wall plates and similar items, furnished by other trades, at locations shown on the drawings.
- C. Anchor bolts for column baseplates shall be galvanized and installed with templates provided.
 1. Vertical alignment shall be maintained within one-sixteenth inches of the elevations shown on the Contract Drawings.
 2. Horizontal alignment shall be maintained within one-eighth inches of the locations shown on the Contract Drawings.
 3. Verify depth of embedment and bolt projection prior to placement of concrete.
 4. Inspection shall be performed by a surveyor licensed in the Commonwealth of Massachusetts. Certify compliance with shop drawings.
- D. Temperature Sensors for Mass Concrete
 1. Install temperature sensors for each mass concrete placement as outlined in the Temperature Control Plan specified in Article 1.3B.3 of this Section.
 2. Furnish to the MBTA 8 1/2 x 11" record sketches showing dimensional temperature sensor locations in plan and section.

3.7 MIXING, CONSISTENCY, AND DELIVERY OF CONCRETE

- A. Concrete shall be ready-mixed, produced by plant acceptable to MBTA. Hand or site mixing shall not be done. Constituents, including admixtures except certain corrosion inhibitors and superplasticizers, shall be batched at central batch plant. Admixtures shall be premixed in solution form and dispensed as recommended by manufacturer.
- B. Central plant and rolling stock equipment and methods shall conform to Truck Mixer and Agitator Standard of Truck Mixer Manufacturer's Bureau of National Ready-Mixed Concrete Association, and Contract Documents. Consistency of concrete at time of deposit shall be as per Article 2.2.
- C. Ready mixed concrete shall be transported to site in watertight agitator or mixer trucks loaded not in excess of rated capacities. Discharge at site shall be within one and one-half hours after cement was first introduced into mix. Discard concrete not discharged within one and one-half hours and dispose of legally. Concrete with a temperature greater than 80 degrees F shall require the implementation of Hot Weather Placement Plan (per ACI 305). Central mixed concrete shall be plant mixed a minimum of five minutes. Agitation shall begin immediately after premixed concrete is placed in truck and shall

continue without interruption until discharged. Transit mixed concrete shall be mixed at mixing speed for at least ten minutes immediately after charging truck followed by agitation without interruption until discharged. Concrete shall be furnished by a single plant unless accepted by the MBTA in writing.

- D. Retempering of concrete which has partially hardened, that is, mixing with or without additional cement, aggregates, or water, shall not be permitted.
- E. The DB Entity shall determine the infield delivered un-cured fresh unit weight of all Lightweight concrete prior to placement and compare this value to that determined from the trail mix results. If infield un-cured fresh unit weight is not within plus or minus 2 percent of the trail mix results the concrete shall be rejected and not used in construction.

3.8 PLACING CONCRETE

- A. No concrete shall be placed until forms, reinforcing steel, pipes, conduits, sleeves, hangers, anchors, inserts, reglets, and other work required to be built into the concrete have been properly installed. Do not schedule concrete placements without prior acceptance of the MBTA.
- B. Remove water and foreign matter from forms and excavations and, except in freezing weather or as otherwise directed, thoroughly wet wood forms just prior to placing concrete. Place no concrete on frozen soil and provide adequate protection against frost action during freezing weather.
- C. Before placing concrete, verify that subgrade preparation, installation of formwork, reinforcement, and embedded items is complete, and that required inspections have been performed. Concrete placement shall not proceed until the required inspection has verified the work related to subgrade preparation, formwork, reinforcing, embedded items, and other related work has been performed satisfactorily.
- D. To secure full bond at construction joints, surfaces of concrete already placed, including vertical and inclined surfaces, shall be thoroughly cleaned of foreign materials and laitance. Provide standard shear key-way or roughen surface to ¼" minimum amplitude with suitable tools such as chipping hammers or bush-hammer, and re-cleaned by stream of water or compressed air. Alternatively for horizontal construction joints above grade, the DB Entity may use the natural roughness at top of pour within forms provided wall surface are patched to the satisfaction of the MBTA.
- E. Do not place concrete having slump outside of allowable slump range.
- F. Do not add water to concrete during delivery, at Project site, or during placement, unless accepted in writing by the MBTA. Only water withheld at the batching plant shall be added at the Project site upon the acceptance of the MBTA. No other water may be added.
- G. Do not add water to concrete after adding high-range water-reducing admixtures to mix.
- H. Transport concrete from mixer to place of final deposit as rapidly as practical by methods which prevent separation of ingredients and displacement of reinforcement, and which avoid rehandling. Deposit no partially hardened concrete. When concrete is conveyed by chutes, equipment shall be of such size and U-shaped design as to insure continuous flow in chute. Flat (coal) chutes shall not be employed. Chutes shall be of metal or metal lined and different portions shall have approximately same slope. Slope shall not be less than 25 degrees nor more than 45 degrees from horizontal and shall be such as to prevent segregation of ingredients. Discharge end of chute shall be provided with baffle plate or spout to prevent segregation. If discharge end of chute is more than five feet above

surface of concrete in forms, spout shall be used, and lower and maintained as near surface of deposit as practicable. When operation is intermittent, chute shall discharge into hopper. Chute shall be thoroughly cleaned before and after each run and debris and any water used shall be discharged outside forms. Concrete shall not be allowed to flow horizontally over distances exceeding five feet.

- I. Concrete shall be placed in such manner as to prevent segregation, and accumulations of hardened concrete on forms or reinforcement above mass of concrete being placed. To achieve this end, suitable hoppers, spouts with restricted outlets and tremies shall be used as required.
- J. During and immediately after depositing, concrete shall be thoroughly compacted by means of internal type mechanical vibrators or other tools, or by spading to produce required quality of finish. Vibration shall be done by experienced operators under close supervision and shall be carried on only enough to produce homogeneity and optimum consolidation without permitting segregation of constituents or "pumping" of air. Vibrators used for normal weight concrete shall operate at speed at not less than 7,000 vpm and be of suitable capacity. Do not use vibrators to move concrete. Vibration shall be supplemented by proper wooden spade puddling to remove included bubbles and honeycomb adjacent to visible surfaces. At least one active vibrator shall be on hand for every 10 cubic yards of concrete placed per hour, plus one spare vibrator in addition to the active vibrators. Vibrators shall be operable and on site prior to starting placement.
- K. Vertical lifts shall not exceed 18"es. Vibrate completely through successive lifts to avoid pour lines. Vibrate first lift thoroughly until top of lift glistens to avoid stone pockets, honeycomb, and segregation.
- L. Concrete shall be deposited continuously, and in layers of such thickness that no concrete shall be deposited on concrete which has hardened sufficiently to cause formation of seams and planes of weakness within section. If section cannot be placed continuously between planned construction joints, as specified, field joint and additional reinforcement shall be introduced so as to preserve structural continuity. MBTA shall be notified in any such case.
- M. Deposit and consolidate concrete for floors, slabs, and toppings in a continuous operation, within limits of construction joints, until placement of a panel or section is complete.
 - 1. Consolidate concrete during placement operations so concrete is thoroughly worked around reinforcement and other embedded items and into corners.
 - 2. Maintain reinforcement in position on chairs during concrete placement.
 - 3. Screed slab surfaces with a straightedge and strike off to correct elevations. Place concrete at mid-span of beams and girders prior to placement at the member supports. The slab thicknesses are theoretical minimum thicknesses, which shall be maintained.
 - 4. Slope surfaces uniformly to drains where required.
 - 5. Begin initial floating to form a uniform and open-textured surface plane, free of humps or hollows, before excess moisture or bleed water appears on the surface. Do not further disturb slab surfaces before starting finishing operations.
- N. Cold joints, particularly in exposed concrete, including "honeycomb", are unacceptable. If they occur in concrete surfaces exposed to view, MBTA shall require that entire section in which blemish occurs be removed and replaced with new materials at DB Entity's expense.
- O. When placing exposed concrete walls or columns, strike corners of forms rapidly and repeatedly from outside along full height while depositing concrete and vibrating.

- P. Chutes, hoppers, spouts, adjacent work, etc. shall be thoroughly cleaned before and after each run and water and debris shall be discharged outside form.

3.9 HOT WEATHER CONCRETE PLACEMENT

- A. The DB Entity shall be adequately prepared to protect the concrete from the adverse influence of hot weather before the placement of any concrete may begin. Placement of concrete when the air temperature exceeds 80° F, particularly when the work is exposed to direct sunlight, shall be done taking special precautions to avoid cracking of the concrete from rapid drying or setting. The concrete shall be placed in accordance with ACI 305, "Hot Weather Concreting" when hot-weather conditions exist.
- B. Cool ingredients before mixing to maintain concrete temperature below 90° F at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated into the total amount of mixing water.
- C. Cover steel reinforcement with water-soaked burlap so steel temperature shall not exceed ambient air temperature immediately before embedding in concrete.
- D. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. The temperature of the forms shall not exceed 100° F. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.
- E. If requested by the DB Entity, deemed advisable by the Testing Agency, and accepted by the MBTA, a retardant may be used to delay the initial set of the concrete.
- F. Concrete shall be placed at a sufficient rate that cold joints are not formed by the rapid set of concrete.
- G. Moist curing shall be applied as soon as possible after placement to inhibit the development of shrinkage cracks due to the rapid drying of the surface.
- H. The specified requirements for curing shall be strictly adhered to.
- I. When high temperatures, low humidity and dry winds create conditions which may produce plastic cracking (when the rate of evaporation exceeds 2 lbs. per sf. per hr.), the evaporation retarder specified may be required to be applied by spray one or more times during the finishing operation. Placing under these conditions should be reviewed by the Testing Agency prior to placing any concrete.

3.10 COLD WEATHER CONCRETE PLACEMENT

- A. The DB Entity shall be adequately prepared to protect the concrete from the adverse influence of cold weather before the placement of any concrete may begin. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures. The concrete shall be placed in accordance with ACI 306, "Cold Weather Concreting" when cold-weather conditions exist.
- B. When the average daily temperature falls below 50° F, special precautions shall be taken to assure adequate strength gain of the concrete.
- C. When air temperature has fallen to or is expected to fall below 40° F, uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50°F and not more

than 80° F at point of placement. The forms shall be prewarmed to at least 40° F to prevent the rapid cooling of the concrete by their contact, and shall be free of all ice and snow.

- D. When heated materials are being used the water shall be combined with the aggregate in the mixer and the resulting temperature shall be below 90° F before cement is added to the mix.
- E. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
- F. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators, unless otherwise specified and approved in mix designs.
- G. After placement all concrete shall be maintained at a temperature of 50° F for at least seven days. If high early strength concrete is used, this time requirement may be reduced to three days.
- H. All concrete shall be protected by the use of heated enclosures, which must be sufficiently strong and wind proof and within which adequate heaters are properly distributed to maintain all concrete at the required temperatures. Heaters shall not be allowed to locally heat or dry the concrete. Adequate fire precautions shall be maintained and sufficient ventilation shall be provided to dissipate the building of carbon dioxide or other gases detrimental to the development of strength and hardness at the exposed surface(s).
- I. Only the specified non-corrosive, non-chloride accelerator may be used. Calcium chloride, thiocyanates, or admixtures containing more than 0.05% chloride ions are not permitted.

3.11 MASS CONCRETE PLACEMENT

- A. Mass Concrete shall be placed in accordance with ACI 207.1 “Guide to Mass Concrete”.
 - 1. Temperature of concrete at time of placement is limited to a maximum of 85 degrees F.
 - 2. A combination of the mix design, components in the mix, methods of pre-cooling and post-cooling, if employed, and surface insulation, if used, shall limit the maximum concrete temperature and also the maximum temperature differential between any point in the interior of the concrete element and any surface of the concrete element, thereby preventing cracking.
 - 3. During the period following placing the concrete, the temperature differential between interior and surface shall be limited to a maximum of 35 degrees F unless an analysis submitted under the Temperature Control Plan, required under Article 1.3.B.3 of this Section demonstrates through calculation that the element is sufficiently reinforced to prevent crack widths in excess of 0.012”es.
 - 4. The maximum allowable temperature (peak heat of hydration) in any portion of the mass concrete shall not exceed 165 degrees F.
 - 5. Mix designs shall achieve the required design strength without unnecessary increase in cement content. Such mix designs may result in slower strength gain than normal and are thus allowed to fall below the required strength test results at 28 Days provided the full strength is reached by 56 Days, and slab spans are not subjected to superimposed loads before the full strength is reached. No individual strength test result shall be below 3200 psi at 28 Days.
 - 6. Pre-cooling may be used to prevent excessive heat build-up caused by heat of hydration. Acceptable means include use of chilled water; providing some mixing water in the form of chipped, shaved, or flaked ice; cooling the aggregate; and cooling the mix with liquid nitrogen.

prior to placing. Ice shall be completely melted in the mix prior to concrete arrival at the jobsite.

7. Post-cooling is acceptable if feasible within the parameters of the construction schedule. Piping within the concrete shall be non-corrosive, non-conductive, non-metallic, and the system shall be submitted for review of the MBTA.
8. Regardless of methods used, install temperature sensing devices within the concrete in each placement as specified in Article 3.6D of this Section. The devices shall operate in the range of 32 degrees F to 212 degrees F with an accuracy of ± 2 degrees F. The temperatures shall be recorded automatically by the DB Entity. Transmit to MBTA daily.
9. Provide adequate concrete delivery and suitable equipment to accomplish mass placements without segregation, and without formation of cold joints.
10. If the 165 degree F maximum allowable temperature or the allowable differential temperature has been exceeded, take immediate action to retard further temperature increases or further growth of the temperature differential.
11. The MBTA may, at its sole discretion, direct that the concrete that has exceeded the temperature limits defined above be removed or otherwise mitigated at no additional cost to the MBTA.

3.12 LIGHTWEIGHT CONCRETE PLACEMENT

1. Lightweight Concrete shall be placed in accordance with the recommendations of ACI 304R and ACI 304.5R "Batching, Mixing, and Job Control of Lightweight Concrete".

3.13 MISCELLANEOUS CONCRETE ITEMS

- A. Filling In: Fill in holes and openings left in concrete structures, unless otherwise required by design, after work of other trades is in place. Mix, place, and cure concrete, as specified, to blend with in-place construction. Provide other miscellaneous concrete filling indicated or required to complete Work.
- B. Curbs: Provide monolithic finish to curbs by stripping forms while concrete is still green and by steel-troweling surfaces to a hard, dense finish with corners, intersections, and terminations slightly rounded.
- C. Equipment Bases and Foundations: Provide machine and equipment bases and foundations. Set anchor bolts for machines and equipment at correct elevations, complying with diagrams or templates of manufacturer furnishing machines and Equipment.
- D. Steel Pan Stairs: Provide concrete fill for steel pan stair treads, landings, and associated items. Cast-in inserts and accessories as required by design. Screeds, tamps, and provide slip-resistant aggregate finish.

3.14 FINISHING OF UNFORMED CONCRETE SURFACES

- A. General: Comply with ACI 302.1R recommendations for screeding, restraightening, and finishing operations for concrete surfaces. Do not wet concrete surfaces.
- B. Scratch Finish: While still plastic, texture concrete surface that has been screened and bull-floated or darbied. Use stiff brushes, brooms, or rakes to produce a profile amplitude of 1/4" in 1 direction.

1. Revise locations of scratch finish in subparagraph below to suit Project.
 2. Apply scratch finish to surfaces to receive mortar setting beds for bonded cementitious floor finishes.
- C. Float Finish: Consolidate surface with power-driven floats or by hand floating if area is small or inaccessible to power driven floats. Restraighten, cut down high spots, and fill low spots. Repeat float passes and re-straightening until surface is left with a uniform, smooth, granular texture.
1. Revise locations of float finish in subparagraph below to suit Project.
 2. Apply float finish to surfaces to receive trowel finish and where concrete flatwork is to receive waterproofing membranes or setting beds for finished materials.
- D. Trowel Finish: After applying float finish, apply first troweling and consolidate concrete by hand or power-driven trowel. Continue troweling passes and restraighten until surface is free of trowel marks and uniform in texture and appearance. Grind smooth any surface defects that would telegraph through applied coatings or floor coverings.
1. Revise locations of trowel finish in first subparagraph below to suit Project.
 2. Apply a trowel finish to all concrete surfaces unless noted otherwise.
 3. Finish surfaces to the following tolerances, according to ASTM E 1155, for a randomly trafficked floor surface:
 - a. Revise surface plane tolerances to suit Project. See Evaluations for description of F-number system. ACI 301 suggests that all residential floors and nonresidential floors less than 10,000 sq. ft. (929 sq. m) be measured by straightedge method and that other nonresidential floors be measured by F-number system.
 - b. Select floor flatness and levelness values required for Project from four subparagraphs below, or revise values to suit type of floor. ACI 302.1R suggests values in first subparagraph be used for carpeted slabs; those in second and third, for thin floor coverings; and those in fourth, for very flat floors for high-speed forklifts, air pallets, and ice and roller rinks.
 - c. Specified overall values of flatness, F(F) 35; and of levelness, F(L) 25; with minimum local values of flatness, F(F) 27; and of levelness, F(L) 20; for slabs-on-grade.
 4. Retain straightedge method in subparagraph below if deleting F-number system above.
 5. Finish and measure surface so gap at any point between concrete surface and an unleveled, freestanding, 10' long straightedge resting on 2 high spots and placed anywhere on the surface does not exceed 1/4".
- E. Broom Finish: Apply a broom finish to exterior concrete platforms, steps, and ramps, and elsewhere as indicated.
1. Immediately after float finishing, slightly roughen trafficked surface by brooming with fiber-bristle broom perpendicular to main traffic route. Coordinate required final finish with MBTA before application.
- F. Slip-Resistive Finish: Before final floating, apply slip-resistive aluminum granule finish where indicated and to concrete stair treads, platforms, and ramps. Apply according to manufacturer's written instructions and as follows:

1. Uniformly spread 25 lb/100 sq. ft. of dampened slip-resistive aluminum granules over surface in 1 or 2 applications. Tamp aggregate flush with surface, but do not force below surface.
2. After broadcasting and tamping, apply float finish.
3. After curing, lightly work surface with a steel wire brush or an abrasive stone and water to expose slip-resistive aluminum granules.

3.15 REPAIRING OF UNFORMED CONCRETE SURFACES

- A. Repairs of concrete surfaces are not allowed below 40 degrees F without proper preheating of materials and substrate. Concrete repairs below 40 degrees F shall be allowed only if the repair material temperatures are maintained per manufacturer's recommendations and if the substrate is tented and pre-conditioned to 40 degrees F and rising.
- B. Tops of slabs and walls shall be repaired by using either same material as originally cast or by use of dry-pack material, as accepted by MBTA. Areas affected shall be chipped back square and to depth of one inch minimum. Hole shall then be moistened with water for a minimum of two hours, followed by brush coat of 1/16 inch thick cement paste. Immediately plug hole with concrete, or with dry pack material consisting of 1:1.5 mixture of cement and concrete sand mixed slightly damp to touch. Hammer dry-pack into hole until dense, and excess paste appears on surface. Finish patch flush and to same texture as surrounding concrete. For large repairs employ 1-1-2 mixture of cement, concrete sand and pea gravel at same dry-pack consistency.

3.16 CURING, SEALING AND PROTECTION

- A. When concrete is placed at or below ambient air temperatures of 40 degrees F. or whenever in opinion of MBTA, such or lower temperatures are likely to occur within 48 hours after placement of concrete, cold weather concreting procedures, according to ACI 306 and as specified herein, shall be followed. To this end, entire area affected shall be protected by adequate housing or covering, and heating. No salt, chemicals or other foreign materials shall be used in the mix to lower freezing point of concrete.
- B. Protect concrete work against injury from heat, cold, and defacement of any nature during construction operations.
- C. Concrete shall be treated and protected immediately after concreting or cement finishing is completed, to provide continuous moist curing above 50 degrees F. for at least seven days, regardless of ambient air temperatures.
- D. Curing compounds shall not be permitted for slab and beams.
- E. Keep permanent temperature record showing date and outside temperature for concreting operations. Thermometer readings shall be taken at start of work in morning, at noon, and again late in afternoon. Locations of concrete placed during such periods shall likewise be recorded, in such manner as to show any effect temperatures may have had on construction. Copies of temperature record shall be distributed daily to MBTA.
- F. Epoxy Curing Compounds/Hardener:
 1. Apply the first coat of epoxy to the plastic concrete as soon as the bleed water has totally disappeared. This application shall serve a dual function: a membrane curing compound which

shall retain 95% or more of the mixing water in the concrete for a minimum of seven days; and the first coat of a two-coat system to seal and protect the concrete.

2. After a minimum curing period of 30 days and before the structure is opened to general use, wash the concrete with cleaning and degreasing chemical solution applied in accordance with the manufacturer's instructions and as specified herein.
 3. Prepare the cleaning solution in accordance with the manufacturer's instructions. Dampen concrete surface with water. Apply the prepared solution over the area to be cleaned using a soft fibered but densely filled brush. Allow the solution to remain on the surface for 3 to 5 minutes. Reapply the cleaning solution and scrub vigorously. Rinse with fresh water applied at a pressure of 400-800 psi and a volume of water per minute 5 - 10 gallons. Protect all non-masonry surfaces.
 4. Allow concrete to dry a minimum of 24 hours and a maximum of 48 hours before application of the second coat of epoxy.
 5. Pour equal quantities of Components 'A' and 'B' into a clean container. Mix thoroughly with a low speed electric drill equipped with a steel paddle. Keep individual components and mixed compound covered when material is not being used.
 6. Application: Apply mixed epoxy compound in a uniform coat at the rate of approximately 200 sq. ft. per gallon. Mixed material may be sprayed with any equipment capable of spraying epoxy compounds, or it may be applied with a deep nap lamb's wool roller.
 7. Protect surface against vehicular and pedestrian traffic during curing period (24 hours at 75°F).
 8. Final Coat - Broom Finish and Wood Float Finish: Concrete is totally sealed against contaminants and resists the attack of de-icing chemicals. It may be applied at any time after the concrete has cured a minimum of 30 days and before the structure is opened to general use. Apply the epoxy compound by spray or roller at the rate of 275 to 325 sq. ft. per gallon being careful to avoid puddles or uneven application. The concrete shall exhibit a uniform gloss indicating it is totally sealed. Any areas that are dull or flat are not totally sealed. Any areas that are dull or flat are not totally sealed and shall be given a third coat.
 9. Final Coat - Steel Trowel Finish Concrete: Apply the second and final coat at any time after the concrete has cured a minimum of 30 days and before the structure is opened to general use. Apply mixed epoxy compound in a uniform coat at a rate not to exceed 200 sq. ft. per gallon. While the epoxy compound is still liquid, drop fine sand meeting the gradation requirements of ASTM C-109, vertically into the epoxy at a uniform rate of one lb. per sq. ft. Make sure entire epoxy surface is thoroughly covered. After epoxy has hardened so that it cannot be dented with a screwdriver, remove excess sand.
- G. Concrete Sealer: Apply to bridge copings, beam sets, parapets, vehicle barriers, boatwalls portal flank walls and other concrete surfaces as required. Apply in accordance with manufacturer's instructions and the following:
1. Application of the sealer shall not alter the surface texture and shall be compatible with the use of surface finish coatings and caulking. Surface shall dry to a tack-free condition in 4 hours or less.
 2. Preparation process shall not cause any undue damage to the concrete surface, remove or alter the existing surface finish, or expose the coarse aggregate of the concrete.
 3. Concrete sealer shall be used as supplied by the manufacturer and not altered in any way. Apply onto concrete surfaces at manufacturer's recommended rate of coverage.

4. Prevent the concrete sealer from coming in contact with open joints that have not yet been filled with joint sealant, so as to prevent any loss of bond of the joint sealant.

3.17 REMOVAL OF FORMWORK, SHORING AND RESHORING

- A. DB Entity shall be responsible for proper removal of formwork, shoring, and reshoring.
- B. Forms shall be removed only after concrete has attained sufficient strength to support its own weight, construction loads to be placed thereon and lateral loads, without damage to structure or excessive deflection.
- C. Forms and falsework shall not be removed unless the concrete has attained the minimum percentage compressive strength as listed in the following table:

<u>Structural Member</u>	<u>Minimum Percent of Design Strength (f'c)</u>
1. Invert Slabs; Slabs and Beams on Grade	25
2. Free Standing Walls, Columns and Piers	40
3. Retaining Walls	50
4. Soffits of Beams, Slabs and Girders Less Than 20' Span	80
5. Stairs	80
6. Soffits of Beams, Slabs and Girders Greater Than 20' Span	90
7. Cantilevered Beams, Slabs and Girders	90

- D. Acceptance for form removal shall be based on field-cured concrete cylinders tested by the MBTA Lab.
- E. Clean and repair surfaces of forms to be reused in the Work. Do not use split, frayed, delaminated, or otherwise damaged form-facing material. Apply new form-release agent.
- F. When forms are reused, clean surfaces, remove fins and laitance, and tighten to close joints. Align and secure joints to avoid offsets. Do not use patched forms for architectural concrete surfaces.
- G. Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where stripping may damage cast-in-place surfaces. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical. Kerf wood rustications, keyways, reglets, recesses, and the like, for easy removal.
 1. Seal form joints and penetrations at form ties with form joint tape or form joint sealant to prevent cement paste leakage with eased edge on internal corners.
 2. Do not use rust-stained steel form-facing material.

3.18 REPAIRING AND FINISHING OF FORMED CONCRETE SURFACES

- A. In accordance with the provisions of ACI 301, Chapter 10, all concrete shall have "smooth form finish".

- B. Intent of this Specification is to require forms, mixtures of concrete, and workmanship so that concrete surfaces shall require no patching, except for plugging of tie holes. However, where patching is acceptable to MBTA, procedure described below shall be followed.
- C. Defective concrete and honeycombed areas shall not be patched unless examined and acceptance is given by MBTA. If such acceptance is received by DB Entity, areas involved shall be chipped down square and at least one inch deep to sound concrete by means of cold chisels or pneumatic chipping hammers. If honeycomb exists around reinforcement, chip to provide clear space at least three-quarter inch wide all around steel to afford proper ultimate bond thereto. For areas less than one and one-half inches deep, patch shall be made in same manner as described above for filling unformed concrete surfaces, care being exercised to use crumbly-dry (nontrowelable) mixtures and to avoid sagging. Thicker repairs shall require build-up in successive days, each layer being applied as described. To aid strength and bonding of multiple layer repairs, non-shrink, non-metallic aggregate shall be used as an additive to the mixture in proportions as follows:

Materials	Volumes (proportions)	Weights (proportions)
Cement	1.0	1.0
Non-Metallic Aggregate	0.15	0.25
Sand	1.5	1.55

For very heavy (generally, formed) patches, pea gravel may be added to mixture and proportions modified as follows:

Materials	Volumes (proportions)	Weights (proportions)
Cement	1.0	1.0
Non-Metallic Aggregate	0.2	0.33
Sand	1.0	1.0
Pea Gravel	1.5	1.55

- D. After hardening, rub lightly as described above for form tie holes.
1. Mortar for patching shall be same mix as above except aggregate shall pass a No. 14 sieve.
 2. For all concrete to receive "smooth" finish, remove formwork fins and clean entire surface of grease, form oil, laitance, dust, and other foreign matter.
 3. "Smooth" finish shall consist of having all fins removed, joint marks smoothed off, blemishes removed, and surfaces left smooth and unmarred.
 4. Begin finishing operations as soon as practicable after removal of forms, continue with curing operations after finishing is completed. After concrete has been well cured, carefully inspect surfaces. Remove any fins, rough spots, streaks, hardened mortar or grout and other foreign material. Patch defects with finishing mortar as specified above, to satisfaction of MBTA.
- E. Patches which become crazed, cracked, or sound hollow upon tapping shall be removed and re-placed with new material at DB Entity's expense.

3.19 CLEANING

- A. Concrete surfaces shall be cleaned of objectionable stains as determined by the MBTA. Materials containing acid in any form or methods which shall damage "skin" of concrete surfaces shall not be employed, except where otherwise specified.

END OF SECTION

SECTION 03301

CAST IN PLACE CONCRETE FOR ROADWAY BRIDGES

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving the following items:
1. Cast-in-place concrete, including formwork, reinforcement, concrete materials, mixture design, placement procedures, and finishes for the roadway bridges and underpasses in the following applications:
 - a. Footings and drilled shaft caps.
 - b. Foundation walls and wingwalls.
 - c. End diaphragms.
 - d. Approach slabs.
 - e. Deck slabs and sidewalks.
 - f. Underpasses (walls, roof slab, base slab)
 - g. Cutting and patching of mechanical and electrical penetrations through cast-in-place concrete.
 - h. Other bridge elements as shown on the Contract Documents.
- B. Related Work:
1. Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION.
- C. For Cast-In-Place HP Cement Concrete Deck requirements, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 901, and the following:
1. At least 30 calendar days prior to the proposed start of placing the concrete bridge deck, the DB Entity shall submit to the MBTA for acceptance, a submittal (herein called the Placement and Curing Plan) specifying the method of concrete conveyance, placement, type and number of finishing machines and work bridges, rate of pour, estimated time of completion, screed and rail erection plan, sequence of concrete pours, and the concrete curing procedure. The Placement and Curing Plan shall take into consideration weather conditions. It shall also include details and a complete description of equipment to be used in the handling, placement, finishing and curing the concrete including the number and type of personnel who will be engaged in the operation. The personnel shall consist exclusively of persons with the experience and skill appropriate to their working assignment. acceptance of this plan will not relieve the DB Entity of the responsibility for the satisfactory performance of his/her methods and equipment. The Placement and Curing Plan shall include, but not be limited to, the following:
 - a. Proof of the following minimum operator qualifications for the bridge deck finishing machine(s):

1. Five years' experience operating machines of similar type and manufacturer as that proposed.
 2. Proof of no less than five bridge decks of similar size, placed using a machine of the same manufacturer as that proposed.
 3. Or as a substitute for a. and b., a representative of the manufacturer of the bridge deck finishing machine shall be present on the site a minimum of 24 hours in advance of the proposed deck placement to approve the setup of the machine and rail system, and the representative shall be present for the entire duration of the placement of the deck concrete using the bridge deck finishing machine.
- b. Provisions for consolidation of cement concrete. At least one vibrator shall be in service per each 30 cubic yards per hour of cement concrete placed with at least 2 vibrators in service at all times.
 - c. Curing method. At least two workers shall continuously place wet burlap curing materials from a dedicated work bridge from the start of the deck placement until the deck is completely covered with wet burlap.
 - d. When cold weather is reasonably expected during the 14 day wet curing period, or has occurred within 7 days of anticipated concrete placement, the DB Entity shall include detailed procedures for the production, transporting, placing, provisions for enclosures, protecting, curing, and temperature monitoring of concrete during cold weather, including a plan of heating devices, types and locations around structure.
 - e. Method of monitoring temperature of hardened concrete. The method of monitoring concrete temperatures shall be submitted regardless of whether cold weather is expected during the 14 day wet cure period.
 - f. Letter certifying that the fogging equipment attached to the finishing machine produces atomized water droplets with an average droplet diameter of 0.003 inches (76 μm) or less that are uniformly distributed at a rate of at least 0.10 gallons/square foot/hour.
 - g. Backup systems as required.
2. Before concrete placement operations begin, the DB Entity shall make all necessary arrangements and have all materials on hand for curing and protecting the concrete deck. Concrete placement shall not proceed until all necessary steps have been taken to insure adequate compliance with these Mandatory Specifications and that completion of the operation can be accomplished within the required scheduled time. The DB Entity shall allow sufficient time for inspection. The DB Entity shall review all aspects of the proposed deck slab concrete placement, as documented in the approved Placement and Curing Plan, including, but not limited to, the following:
 - a. Equipment proposed for use and for back-up
 - b. Planned workforce and assigned tasks of each designated position, based on experience and expertise
 - c. Proposed construction techniques
 - d. Safety considerations
 - e. Concrete mix design

- f. Admixtures and performance data; dosage rates shall be as approved
- g. Proposed placement rate, provisions for adverse weather, curing and loading schedules
- h. Curing Practices to be employed as well as the workforce designated to the curing process
- i. Delivery / conveyance equipment, including deck finishing machine setup and operation
- j. Traffic control

3. No concrete shall be placed until the environmental conditions are deemed favorable and satisfactory means to mitigate adverse environmental conditions exist. Favorable environmental conditions are defined as an expected weather forecast suitable for concrete placement during the entire placement duration with an evaporation rate not to exceed 0.15 lbs./ft²/hr, or suitable equipment and appropriate actions are taken to limit the evaporation rate of the exposed concrete surface to less than 0.15 lb/ft²/hr and acceptable curing temperatures are expected for the duration of the curing period.

The DB Entity shall provide any necessary means to mitigate adverse weather conditions and curing temperatures. Failure to maintain acceptable environmental conditions will result in the concrete placement being stopped and a bulkhead put in place. Concrete temperature will be taken from the same sample used for slump and air content tests. These measurements will be taken prior to commencement of concrete placement. If, in the MBTA's opinion, significant changes occur in atmospheric conditions, additional atmospheric measurements and calculations by the DB Entity will be required. The DB Entity will supply all instruments necessary to make the required calculations, will perform the tests, and will document the results on the attached "Bridge Deck Placement Environment" table which shall be submitted to the MBTA.

A trial placement of at least 3 cubic yards using the approved HP Cement Concrete mix design shall be required a minimum of two weeks before the intended date of the deck slab placement. The DB Entity shall demonstrate proper mix design, batching, placement, finishing and curing of the HP Cement Concrete deck slab. The trial placement shall simulate the actual job conditions in all respects including plant conditions, transit equipment, travel conditions, admixtures, forming, placement equipment, and personnel.

If there are problems, the MBTA may require the DB Entity to conduct more trial batches and trial placements. Removal of the trial placement concrete from the job site is the responsibility of the DB Entity.

In addition to the requirements contained herein, all weather and concrete temperature requirements contained in Subsection 901.64 of the MassDOT Standard Specifications shall be satisfied. Cement concrete for bridge decks shall not be placed when the ambient air temperature exceeds 85°F or is expected to exceed 85°F during the placement of the deck. When placing concrete, the DB Entity must provide suitable equipment and take appropriate actions to limit the evaporation rate of the exposed concrete surface to less than 0.15 lb/ft²/hr. The deck surface evaporation rate shall be determined in accordance with the paper "Plastic Cracking of Concrete" by Delmar Bloem for the National Ready Mixed Concrete Association and published in ACI 305R-89. and all data contained in the Bridge Deck Placement Environment table below shall be determined by the DB Entity

prior to and after casting the bridge deck. To maintain the deck surface evaporation rate below 0.15 lb/ft²/hr the DB Entity shall take one or more of the following actions:

- a. Misting the surface of the concrete with pressurized equipment attached to the finishing machine until the curing cover is applied. The water mist shall be distributed at a rate of at least 0.10 gallons/square foot/hour. For example, on a deck that is 30 feet wide, the system must be able to apply at least 3.0 gallons of water per linear foot per hour. The fog spray must be produced from nozzles that produce an atomized fog mist that will maintain a sheen of moisture on the concrete surface without ponding. The atomized water droplets shall have an average droplet diameter of 0.003” or less. The area of coverage from each nozzle shall overlap all adjacent coverage areas by at least 12”. Water that drips from the nozzles shall not be allowed to fall onto the concrete that is being cured.
- b. Reduce the temperature of the concrete.
- c. Reschedule the placement until such time as the environmental conditions are acceptable, such as at night or during early morning hours.

4. Cement Concrete crack sealing requirements defined herein are for the repair and sealing of cast-in-place cement concrete to prevent water infiltration to the steel reinforcement bars. The width of cracks shall be determined using a width indicating comparator card made of clear plastic with lines of specified width on the cards. The crack width comparator cards shall be held on concrete surfaces to allow the widths of any concrete cracks to be determined by direct visual comparison of the crack width with the widths of the lines marked on the card surface. These cracks are assumed to be non-moving and to have been caused by inadequate control of shrinkage or temperature

stresses during curing. Cracks that are of structural concern shall be repaired by other methods determined by the DB Entity.

All required crack sealing and crack repairs shall be performed by the DB Entity without additional compensation. The DB Entity shall be required to seal cracks even if the environmental conditions during placement and curing satisfied specification requirements.

Cracks shall be sealed after construction movement is substantially stable and before waterproofing, pavement, or other construction covers the cracked surface. Crack sealing materials shall be applied by skilled applicators under a supervisor with proven successful experience in applications with similar scope of work. Crack sealing materials shall be applied when the concrete and the ambient air temperatures are above 40°F. If a heated enclosure is used to accomplish this, the heating units shall be properly vented to the outside of the enclosure to prevent products of combustion from exhausting within the enclosure.

Before containers of sealing materials are opened, the labels shall be checked and the label information shall be documented. If multi-component systems are used, mixing shall be completed prior to application. Manufacturer's instructions shall be followed. An initial crack sealing application demonstration shall be satisfactorily made before the application is continued.

Before sealing, the concrete must be clean, sound, and free of contaminants and surface moisture. Any curing compounds, sealers, oils, greases, coatings, or other impregnations shall be removed by sandblasting. Once any concrete surface contaminants are removed, the concrete shall be swept clean and blown off using oil free compressed air immediately prior to applying the sealer.

Methacrylate crack sealing shall be performed in accordance with the manufacturer's instructions within the allowable ambient temperature range. The cracks shall be v-notched to a minimum depth of 1/2" and shall be cleaned with compressed air. The notch shall then be inspected to confirm that the crack was intercepted. If the crack was not intercepted, the notch shall be expanded to intercept the crack and shall then be re-cleaned with compressed air. Methacrylate shall then be poured into the crack. The crack shall then be observed for seepage of methacrylate and shall be refilled as necessary to ensure the crack is completely filled. If large quantities of methacrylate are used and the crack is not getting filled, the crack should be filled with pre-bagged dried silica sand filler and the crack shall then be re-filled with methacrylate.

Methacrylate crack sealer shall consist of a high molecular weight low viscosity methacrylate monomer that when catalyzed will produce a crack-healer/penetrating-sealer that is a rapid-curing, modified-methacrylate resin. The methacrylate material shall, as a minimum, provide the following as applied properties:

Property	Value	Test
Viscosity	< 25 cps	ASTM D2393

Bond Strength	> 1500 psi	ASTM C882
Tensile Elongation	> 3%	ASTM D638

In addition, the methacrylate material shall demonstrate full penetration of concrete cracks in mock-up testing. Mock-up testing shall consist of preparing the deck surface, applying the methacrylate sealer, and removing cores to evaluate the depth and quality of methacrylate sealer penetration. Successful methacrylate penetration of the concrete cracks shall be demonstrated visually in nominal 3” deep cores that intersect crack widths in the 7 to 20 mil width range. The cores shall be sliced longitudinally, perpendicular to the crack, and examined in an AASHTO accredited laboratory using ultraviolet light in order to fluoresce the methacrylate to determine the methacrylate penetration depth (the deepest point to which the methacrylate reached) and the sealer-filled crack depth (the depth to which the crack was filled wall-to-wall). The results of mock-up testing shall be documented in a report prepared by the AASHTO accredited laboratory.

Epoxy injection crack sealing shall be performed in accordance with the manufacturer’s instructions within the allowable ambient temperature range. Epoxy-Resin for Cement Concrete Crack Injection shall conform to AASHTO M235, Type IV, Grade I. The cracks shall be cleaned with compressed air. Surface mounted injection ports shall then be installed over the centers of the cracks. The spacing of these ports shall be contingent upon the material and the injection equipment chosen. Socket porting shall be allowed provided that a hollow drill bit and vacuum system is used to prevent debris from entering the cracks. Surface ports shall be mounted with rapid setting epoxy material. The crack widths shall be noted during port installation. After the ports are installed, the crack surfaces shall be sealed with high modulus, 100% solids, moisture tolerant epoxy paste adhesive. This material shall be capped with fine sand before it is cured. After the capping material has cured, the cracks shall be injected with an epoxy resin compound. The injection pressure used to seal the cracks shall be based upon a number of factors including crack width, crack depth, and the epoxy material used. Injection shall be accomplished using a metered system. The system shall be equipped with a pressure gauge accurate for the pressures anticipated for this work. Injection shall start at the widest point of the crack and shall continue until the narrowest portions of the crack have been filled. Injection shall continue until refusal. If epoxy is observed at adjacent ports, the adjacent port shall be capped and injection shall continue until refusal occurs. Once refusal occurs, injection shall continue at the next wet port until refusal is reached.

Silane Crack Sealer shall consist of a clear, breathable, high-performance, 100 percent solids by weight Silane sealer for protecting new and existing concrete surfaces. It must penetrate deeply, sealing out water, chloride ions, and acids, and prevent damage from freeze/thaw cycles. Silane Crack Sealer material shall provide, as a minimum, the following as applied properties:

Property	Value	Test
Water Weight Gain at 250 ft ² /gal	88 percent reduction	NCHRP 244 Series II-Cube test
Absorbed Chloride at 250 ft ² /gal	89 percent reduction	NCHRP 244 Series II-Cube test

Absorbed Chloride at 250 ft ² /gal	94 percent reduction	NCHRP 244 Series IV - Northern Climate
---	----------------------	--

The type of Cement Concrete crack sealing required shall be determined as a function of the surface type and maximum crack width as follows:

- a. Bridge decks, either with membrane waterproofing and hot mix asphalt wearing surface or left exposed, and other non-overhead surfaces sloped less than or equal to 15%:
 1. Cracks less than 0.006" wide shall be ignored
 2. Cracks greater than or equal to 0.006" wide and less than 0.012" wide shall be sealed with an approved methacrylate
 3. Cracks greater than or equal to 0.012" wide shall be sealed using either epoxy injection or methacrylate with a sand filler
 - b. Overhead surfaces, vertical surfaces, and non-overhead surfaces sloped greater than 15%:
 1. Cracks less than 0.006" wide shall be ignored
 2. Cracks greater than or equal to 0.006" wide and less than 0.016" wide shall be sealed with an approved silane sealer
 3. Cracks greater than or equal to 0.016" wide shall be sealed using epoxy injection
- D. For all other Roadway Bridge Cast-in-Place Concrete requirements regarding General Information, Products, and Execution, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 901, amended as follows:
1. For Roadway Bridge Cast-in-Place Concrete submittal requirements, including, but not limited to, shop drawings, working drawings, Requests For Information, Non Conformance and testing reports, see Volume 2.
 2. The DB Entity is responsible for all sampling and testing as outlined in their approved Quality Management Plan and Testing Plan. The DB Entity is also responsible for all costs related to the sampling, testing and related work.

PART 2 – PRODUCTS

2.1 ACCEPTANCE SAMPLING AND DOCUMENTATION REQUIREMENTS

- A. The following samples and documents must be submitted to the Program Manager per MassDOT Research and Materials assurance requirements:
 1. For Cement Concrete
 - a. Sampling Frequency: A minimum of one test per 100 (sublot) CY or fraction thereof for each pour of each class, minimum one test a day.
 2. For Rebar

- a. Sampling Frequency: One for each grade and size from each source with heat number.

PART 3 – EXECUTION

Not used.

END OF SECTION

SECTION 05122

STRUCTURAL STEEL FOR RAIL STRUCTURES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Structural steel for all Viaduct Structures.
 - 2. Structural steel for the Washington Street Rail Bridge.
- B. Items to Be Furnished Only: Furnish the following items for installation by the designated Sections:
 - 1. Section 03300 - CAST-IN-PLACE CONCRETE: Lintels, sleeves, anchors, inserts, embedded wall plates, loose leveling plates, and similar items.
- C. Related Work: See Volume 2 for other technical provisions.
 - 1. SUSTAINABILITY REQUIREMENTS - Volume 2 Technical Provisions Exhibit 2I "Additional Project Requirements".

1.2 DEFINITIONS

- A. Structural steel: Elements of structural-steel frame, as classified by AISC's "Code of Standard Practice for Steel Buildings and Bridges", that support design loads.
- B. Fracture Critical Members: A steel member in tension, or with a tension element, whose failure would probably cause a portion of the bridge or the entire bridge to collapse.

1.3 PERFORMANCE REQUIREMENTS

- A. Connections: Provide details of all connections to withstand loads determined by analysis of required load combinations.
 - 1. Connections shall be designed in accordance with the AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO), Standard Specifications for Highway Bridges, 17th Edition, Section 10.
 - 2. Connections shall be fully detailed or designed by the DB Entity or the DB Entity's subcontractor/fabricator for the design of the Viaduct Structures and or Washington Street Rail Bridge. The DB Entity shall provide all loads on the final Design Documents for the Fabricator's use in design of the final connections. The Fabricator shall utilize the services of a qualified professional engineer Registered in the Commonwealth of Massachusetts, to prepare structural analysis data for structural-steel connections.

1.4 SUBMITTALS

- A. Product data: For each type of product indicated.

- B. Erection Procedure and Erection drawings, see requirements within Article 3.3 Erection below.
- C. Shop drawings: Show fabrication of structural-steel components.
 - 1. Include details of cuts, connections, splices, camber, holes, and other pertinent data.
 - 2. Include embedment drawings.
 - 3. Indicate welds by standard American Welding Society (AWS) symbols, distinguishing between shop and field welds, and show size, length, and type of each weld.
 - 4. Indicate type, size, and length of bolts, distinguishing between shop and field bolts. Identify pre-tensioned and slip-critical high-strength bolted connections.
 - 5. For structural-steel connections indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer Registered in the Commonwealth of Massachusetts, responsible for their preparation.
- D. Welding Certificates: Certificate from AWS indicating certification in type of welding required for each welder and welding operator.
- E. Welding Records and Data:
 - 1. Before welding, submit the procedure which will be used for qualifying welders and welding procedures. For procedures other than those pre-qualified in accordance with AWS D1.1 and AWS D1.5, submit a copy of procedure qualification test records.
 - 2. Submit certified copy of qualification test records for each welder, welding operator, and tacker who will be employed in the work.
 - 3. Where field welding is permitted, submit descriptive data for field welding equipment.
 - 4. Submit all NDE records (radiographs, ultrasonic, magnetic particle) and visual inspection reports upon completion or when otherwise requested by the MBTA.
- F. Qualification Data: For installer, fabricator, DB Entity or fabricator professional engineer, testing agency, welding inspectors, NDE inspectors and galvanizer. Submit prior to starting work.
- G. Mill Test Reports: Signed by manufacturers certifying that the following products comply with requirements:
 - 1. Structural steel including chemical and physical properties.
 - 2. Bolts, nuts, and washers including mechanical properties and chemical analysis.
 - 3. Direct-tension indicators.
 - 4. Tension-control, high-strength bolt-nut-washer assemblies.
 - 5. Shear stud connectors.
 - 6. Shop primers and finished paint systems.
 - 7. Nonshrink grout.

1.5 QUALITY ASSURANCE

- A. Fabricator qualifications: A qualified fabricator who participates in the AISC Quality Certification Program and is certified for: Major Steel Bridges (CBR).

- B. Galvanizer qualifications: Engage the services of a qualified galvanizer who has demonstrated a minimum of five years' experience in the successful application of galvanized coatings specified in this Section in the facility where the work is to be performed and who will apply the coatings within the same facility.
- C. Installer qualifications: A qualified installer with previous experience in installing structural steel.
- D. Welding: Qualify procedures and personnel according to AWS D1.1 "Structural Welding Code -Steel" and AWS D1.5 " Bridge Welding Code".
- E. Comply with applicable provisions of the following specifications and documents:
 - 1. AASHTO "Standard Specification for Highway Bridges, 17th Edition"
 - 2. American Railway Engineering and Maintenance-of-way Association (AREMA), "Manual for Railway Engineering"
 - 3. AISC's "Code of Standard Practice for Steel Buildings and Bridges"
 - 4. AISC's "Seismic Provisions for Structural Steel Buildings" and "Supplement No. 2"
 - 5. AISC's "Specification for Structural Steel Buildings"
 - 6. AISC's "Specification for the Design of Steel Hollow Structural Sections"
 - 7. AISC's "Specification for Allowable Stress Design of Single-Angle Members" and "Specification for Load and Resistance Factor Design of Single-Angle Members"
 - 8. RCSC's "Specification for Structural Joints Using High-Strength Bolts"
- F. Tests and Inspection
 - 1. The DB Entity shall test and inspect all high-strength bolted connections and welded connections and prepare test reports for submission to the MBTA. Specialty tests shall be performed by an independent testing laboratory accepted by the MBTA. Costs of specialty tests shall be borne by the DB Entity. Test reports shall be submitted to the MBTA for review and acceptance.
 - 2. The MBTA reserves the right to inspect high-strength bolted connections and weld connections. The DB Entity shall provide access to places where structural steel work is being fabricated or erected so that required inspection and testing can be accomplished. Costs for providing access shall be borne by the DB Entity. At times, inspection may require moving or handling of steel to permit proper inspection, costs for handling and moving steel shall be borne by the DB Entity. Notify the MBTA not less than 48 hours prior to start of fabrication.
 - 3. The MBTA may inspect structural steel at the plant before shipment; the MBTA reserves the right, at any time before final acceptance, to reject material not complying with specified requirements.
 - 4. Correct deficiencies in structural steel work that inspections and laboratory test reports have indicated to be not in compliance with requirements at the DB Entity 's expense. Perform additional tests, at DB Entity's expense, as may be necessary to reconfirm any non-compliance of the original work, and as may be necessary to show compliance of corrected work.
 - 5. For Fracture Critical Members, acceptable Charpy V-Notch (CVN) tests shall be performed as required by ASTM A673, Temperature Zone 2.

6. Specialty Tests: Nondestructive examination of welds in accordance with provisions of AWS D1.1 and AWS D1.5 and ASTM Standards noted shall be made in accordance with the following schedule:
 - a. Radiographic Examination of Welds, per ASTM E94 and E142:
 - 1) Field, complete joint penetration groove welds:
 - a) 10%, of all complete joint penetration groove welds.
 - 2) Shop, complete joint penetration groove welds:
 - a) 10%, of all complete joint penetration groove welds.
 - b. Ultrasonic Examination, per ASTM E164: Complete joint penetration groove butt welds not accessible for radiographic examination shall be subjected to ultrasonic testing. The extent shall be the same as noted for radiographic examination. Ultrasonic examination shall be made 48 to 72 hours after welding at locations on weldments or welded joints subject to high restraint as indicated in order to check for lamellar tearing. The exact location of the areas to be inspected shall be determined with the MBTA at the time of fabrication. This examination shall be made according to the following schedule unless conditions of tearing require a greater number of tests, as directed:
 - 1) 100%, for all welds.
 - c. Magnetic Particle Examination, per ASTM E709, field and shop:
 - 1) 1 out of 5 (20%) of complete joint penetration groove welds of tee and corner joints.
 - 2) 1 out of 10 (10%) of partial joint penetration groove and fillet welds.
 - d. Penetrant Examination, per ASTM E165: Shall be used for detecting discontinuities that are open to the surface use as appropriate. 100% for all welds.
 7. Visual Examination: All welds, whether otherwise examined or not, shall be visually examined and faulty joints shall be marked for correction.
 8. When any testing, examination, or inspection reveals faulty welds, all joints of the same type shall be checked at the expense of the DB Entity, until the integrity of the weld is assured before resuming examination.
 9. After faulty welds have been corrected or repaired, they shall each be re-examined at the expense of the DB Entity, in the manner specified for the original joint.
 10. It is intended that inspections shall be performed to permit an orderly flow of completed material from the shop. Work with the MBTA to establish a schedule that will permit this.
 11. Test result information shall be forwarded to the MBTA immediately after test results are available stating the acceptance or rejection of fabricated pieces in order that the repairs and re-inspection may be made as soon as possible.
- G. Pre-Installation Conference: DB Entity shall schedule a meeting to be attended by DB Entity, MBTA, fabricator, erector and galvanizer. Agenda shall include the following: Project schedule, source for each fabrication, coordination between fabricator and galvanizer and adjacent Work, finish of surfaces, application of coatings, submittals, and approvals.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Store materials to permit easy access for inspection and identification. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers. Protect steel members and packaged materials from erosion and deterioration.

1. Store fasteners in a protected place. Clean and re-lubricate bolts and nuts that become dry or rusty before use.
2. Do not store materials on a structure in a manner that might cause distortion, damage, or overload to members or supporting structures. Repair or replace damaged materials or structures as directed by the MBTA.

1.7 COORDINATION

- A. Furnish anchorage items to be embedded in or attached to other construction without delaying the Work. Provide setting diagrams, sheet metal templates, instructions, and directions for installation.

PART 2 - PRODUCTS

2.1 STRUCTURAL STEEL MATERIALS

- A. ASTM A709, Grade 50
- B. ASTM A709, Grade 50W
- C. ASTM A709, Grade 50 Fracture Critical
- D. Welding Electrodes: Comply with AWS requirements.

2.2 BOLTS, CONNECTORS, AND ANCHORS

- A. High-Strength Bolts, Nuts, and Washers for Non-Weathering steels: ASTM F3125, Grade A325, Type 1, heavy hex steel structural bolts; ASTM A563 Grade DH heavy hex carbon-steel nuts; and ASTM F436 hardened carbon-steel washers.
 1. Finish: Hot-dip zinc coating, ASTM A153, Class C.
- B. High-Strength Bolts, Nuts, and Washers for weathering steels: ASTM F3125, Grade A325 Type 3.
- C. Tension-Control, High-Strength Bolt-Nut-Washer Assemblies: ASTM F3125, Grade F1852, Type 1, steel structural bolts with splined ends; ASTM A563 heavy hex carbon-steel nuts; and ASTM F436 hardened carbon-steel washers. Finish, mechanically deposited zinc coating, ASTM B695, Class 50.
- D. Shear Connectors: ASTM A 108, Grades 1015 through 1020, headed-stud type, cold-finished carbon steel; AWS D1.1 and AWS D1.5, Type B.
- E. Anchor Rods and or Anchor Bolts: ASTM F1554, Grade 55 minimum, hot-dip zinc coating, ASTM A123 and A153, Class C.
- F. Threaded Rods: ASTM A193, grade as required by design, hot-dip zinc coating, ASTM A153, Class C.
- G. Eye Bolts and Nuts: ASTM A108, Grade 1030, cold-finished carbon steel.
- H. Sleeve Nuts: ASTM A108, Grade 1018, cold-finished carbon steel.

2.3 MISCELLANEOUS MATERIALS

- A. Galvanizing Repair Paint: Coatings meeting requirements of ASTM A780.
- B. Nonmetallic, Shrinkage-Resistant Grout: ASTM C1107, factory-packaged, nonmetallic aggregate grout, noncorrosive, nonstaining, mixed with water to consistency suitable for application and a 30-minute working time.

2.4 FABRICATION

- A. Structural Steel: Fabricate and assemble in shop to greatest extent possible. Fabricate according to AASHTO Standard Specification, 17th Edition Division II, Section 11, AREMA Chapter 15 Part 3, AISC's "Code of Standard Practice for Steel Buildings and Bridges".
 - 1. Camber structural-steel members where indicated.
 - 2. Identify high-strength structural steel according to ASTM A6/A6M and maintain markings until structural steel has been erected.
 - 3. Mark and match-mark materials for field assembly.
 - 4. Complete structural-steel assemblies, including welding of units, before starting shop-priming and painting operations.
- B. Thermal Cutting: Perform thermal cutting by machine to greatest extent possible. Plane thermally cut edges to be welded to comply with requirements in AWS D1.1 and AWS D1.5.
- C. Bolt Holes: Cut, drill, or punch standard bolt holes perpendicular to metal surfaces.
- D. Finishing: Accurately finish ends of columns and other members transmitting bearing loads.
- E. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1 and AWS D1.5 and manufacturer's written instructions.
- F. Holes: Provide holes required for securing other work to structural steel and for passage of other work through steel framing members.
 - 1. Cut, drill, or punch holes perpendicular to steel surfaces. Do not thermally cut bolt holes or enlarge holes by burning.
 - 2. Base-Plate Holes: Cut, drill, mechanically thermal cut, or punch holes perpendicular to steel surfaces.
 - 3. Weld threaded nuts to framing and other specialty items indicated to receive other work.

2.5 SHOP CONNECTIONS

- A. High-Strength Bolts: Shop install high-strength bolts according to RCSC's "Specification for Structural Joints Using High-Strength Bolts" for type of bolt and type of joint specified.
- B. Weld Connections: Components requiring fabrication will be made in accordance with ANSI/AASHTO/AWS Bridge Welding Code D1.5. Comply with procedure specifications, tolerances, appearance and quality of welds and for methods used in correcting welding work. Complete welds in accordance with the design requirements.

1. Remove backing bars or runoff tabs, back gouge, re-weld, and grind steel smooth.
2. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances of AISC's "Code of Standard Practice for Steel Buildings and Bridges" for mill material.
3. Insufficient welds shall be rejected and corrected until required profiles are met.
4. Verify that weld sizes, fabrication sequence, and equipment used for exposed structural steel will limit distortions to allowable tolerances. Prevent weld show-through on exposed steel surfaces.
 - a. Grind butt welds flush.
 - b. Grind or fill exposed fillet welds to smooth profile. Dress exposed welds.
5. No skip welds will be permitted for steel connections to be coated.

2.6 STEEL PAINTS AND FINISHES

- A. Where required by the Contract Documents, structural steel for rail structures shall be fully shop painted. All paint coats shall conform to the requirements of MassDOT approved materials for New and 100% Bare Existing Steel for Bridges, per Northeast Protective Coating Committee (NEPCOAT) product list. Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for The Society for Protective Coatings (SSPC) surface preparation specifications and environmental exposure conditions of installed metal fabrications:
 1. Exteriors (SSPC Zone 1B) and Items Indicated to Receive Zinc-Rich Primer: SSPC-SP 10/NACE No. 2, "Near White Metal Blast Cleaning"
 2. Apply coating to uncoated surfaces of metal fabrications, except those with galvanized finishes not indicated to be painted, and those to be field welded, or embedded in concrete or masonry, unless otherwise indicated. Extend priming of partially embedded members to a depth of 2 inches within the embedment.
 3. Comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel" for shop painting.
 4. Comply with SSPC-PA 2, "Measurement of Dry Coating Thickness with Magnetic Gages"
- B. Zinc-Rich Primer: Urethane zinc rich primer compatible with topcoat specified in Section 09900. Provide primer with a VOC content of 340 g/L (2.8 lb/gal.) or less per OTC ozone standards. Provide Tnemec Series 394 or Ameron 5105 or equal by DuPont or Carboline for exposed steel to be fireproofed, or Tnemec Series 901K97 Series or 90-97 or Ameron 68HS or equal by DuPont or Carboline for exposed steel to be finish painted at 3.0 mils DFT.
- C. Primer for Exposed Steel to Receive Multi-Coat Shop-Applied Coating: Tnemec Series 901K97 or 90-97 urethane zinc rich primer at 3.0 to 3.5 mils DFT, topcoated in shop with Tnemec Series V73 Endura-Shield, or use Ameron Series 68HS Primer at 3.0 to 5.0 mils DFT topcoated in shop with Ameron's Amercoat 450H, or use or equal primers and finish coats from DuPont or Carboline.
- D. Galvanizing: For steel to be galvanized, provide coating for iron and steel fabrications applied by the hot-dip process. Comply with ASTM A 123 for fabricated products and ASTM A 153 for hardware. Provide thickness of galvanizing specified in referenced standards. The galvanizing bath shall contain high grade zinc and other earthly materials. Fill vent holes and grind smooth after galvanizing.
- E. Hot-Dip Galvanizing and Factory-Applied Primer for Steel: Galvanized surfaces to be painted, provide hot-dip galvanizing and factory-applied prime coat, certified OTC/VOC compliant less than 2.8 lbs/gal.

and conforming to EPA and Commonwealth of Massachusetts requirements. Apply primer within 12 hours after galvanizing at the galvanizer's plant in a controlled environment meeting applicable environmental regulations and as recommended by the primer coating manufacturer. Blast cleaning of the surface is unacceptable for surface preparation. Primer shall have a minimum two year re-coat window for application of finish coat. Coatings shall meet or exceed the following performance criteria:

1. Abrasion: ASTM D 4060, CS17 Wheel, 1,000 gram load.
2. Adhesion: ASTM D 3359, Method B, 5 mm crosshatch.
3. Humidity Resistance: ASTM D 4585.
4. Salt Spray (Fog): ASTM B 117.

F. Hot-Dip Galvanizing and Factory-Applied Urethane Primer and Finish for Steel: Galvanized surfaces to be painted, provide factory-applied architectural coating over primed hot-dip galvanized steel matching approved samples.

1. Primer coat shall be factory-applied polyamide epoxy primer. Apply primer within 12 hours after galvanizing at the galvanizer's plant in a controlled environment meeting applicable environmental regulations and as recommended by the primer coating manufacturer.
2. Finish coat shall be factory-applied color-pigmented architectural finish. Apply finish coating at the galvanizer's plant, in a controlled environment meeting applicable environmental regulations and as recommended by the finish coating manufacturer.
3. Coatings shall be certified OTC/VOC compliant and conform to applicable regulations and EPA standards.
4. Apply the galvanizing, primer, and coating within the same facility and provide single-source responsibility for galvanizing, priming, and finish coating.
5. Blast cleaning of the galvanized surface is not acceptable.
6. Primer shall meet or exceed the following performance criteria:
 - a. Abrasion: ASTM D 4060, CS17 Wheel, 1,000 gram load.
 - b. Adhesion: ASTM D 3359, Method B, 5 mm crosshatch.
 - c. Humidity Resistance: ASTM D 4585.
 - d. Salt Spray (Fog): ASTM B 117.
7. Finish coat shall meet or exceed the following performance criteria:
 - a. Abrasion: ASTM D 4060, CS17 Wheel, 1,000 gram load.
 - b. Adhesion: ASTM D 3359, Method B, 5 mm crosshatch.
 - c. Graffiti Resistance: After drying for seven days, no staining from acrylic, epoxy, epoxy-ester and alkyd spray paints, ballpoint pen, crayons, magic marker, black shoe polish and lipstick.
 - d. Weathering: ASTM D 1014, 45 degrees facing south.
 - e. Surface Burning Characteristics: ASTM E 84
 - f. QUV: ASTM G53, ES-40 bulbs, 4 hours light, 4 hours dark.
 - g. Salt Spray (Fog): ASTM B 117.
8. Clearcoat over finish coat shall meet or exceed the following performance criteria:

- a. Abrasion: ASTM D 4060, CS17 Wheel, 1,000 gram load.
- b. Adhesion: ASTM D 3359, Method B, 5 mm crosshatch.
- c. Graffiti Resistance: After drying for seven days, no staining from acrylic, epoxy, epoxy-ester and alkyd spray paints, ballpoint pen, crayons, magic marker, black shoe polish and lipstick.
- d. Weathering: ASTM D 1014, 45 degrees facing south; and ASTM D 4141C EMMAQUANTW.
- e. QUV: ASTM G53, ES-40 bulbs, 4 hours light, 4 hours dark.
- f. Salt Spray (Fog): ASTM B 117.
- g. Flexibility: ASTM D 522, Method B, cylindrical mandrel.
- h. Hardness: ASTM D 3363 (Pencil).

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify elevations of concrete- and masonry-bearing surfaces and locations of anchor rods and or bolts, bearing plates, and other embedments, with steel erector present, for compliance with design requirements. Elevations shall be verified by a surveyor licensed in the Commonwealth of Massachusetts.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Provide temporary shores, braces, and other supports during erection to keep structural steel secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads. Remove temporary supports when permanent structural steel, connections, and bracing are in place, unless otherwise required by design. Do not remove temporary shoring supporting composite deck construction until cast-in-place concrete has attained its design compressive strength.

3.3 ERECTION

- A. DB Entity shall submit an erection procedure. The submitted method of erection is subject to review, comment, and acceptance by the MBTA. The method shall be submitted with a detailed procedure which includes drawings and calculations sufficient to enable the MBTA to determine the adequacy of the proposed method. The method and all submissions shall be prepared under the supervision of a professional engineer, registered in the Commonwealth of Massachusetts, engaged by the DB Entity, who is familiar with these Mandatory Specifications, AASHTO, the work, and experienced in this technical field. All submitted sheets shall be stamped by the DB Entity. As a minimum the following information shall be included in the submittal:
 - 1. Plan showing the location of all roadways, utilities, railroad tracks and other appurtenances in areas of erection.
 - 2. The location of cranes, both horizontally and vertically, and their operating radii.

3. Lifting equipment information including rating data. Information shall include counter weights to be used and boom capability. The manufacturer's rated capacity of the crane and of all lifting and connecting devices shall be adequate for 125% of the total pick load including spreaders and other material except that in the areas within the potential influence area of the crane where railroad, vehicular or pedestrian traffic has access, the rated capacity shall be adequate for 150% of the total pick load. The limits of the potential crane influence area shall be taken as circular areas with radii matching the boom length and radius points located at the boom pivot point. Crane capacity rating charts and the rated capacity of all lifting and connecting devices shall be clearly shown in the submittal. The 125% or 150% factors of safety are to be used in addition to any factors of safety used by the manufacturer to calculate the rated capacity.
4. The type, size and arrangements of slings, shackles or other lifting and connecting devices including relative technical data.
5. The order of lifts, repositioning of equipment and counterweights, and location and method of attaching deadmen.
6. Methods and materials for temporary structures or the strengthening or bracing of a member(s) (either temporarily or permanently) for erection purposes.
7. Analysis of stresses shall be investigated at each stage of erection and the impact on construction of deck systems. Stresses shall take into consideration the non-composite nature of the girders when placing the concrete for the decks, in addition to other temporary construction loads from form work, personal, equipment. Allowance for wind pressure shall be included in the analysis of stresses based on the table below.

Height of Members Above Ground Feet	Wind Pressure Pounds per square foot
15	21.0
30	25.5
50	28.0

8. Curved girders and straight girders shall be stabilized with falsework, temporary braces, or holding cranes until a sufficient number of adjacent girders are erected with all diaphragms and cross frames connected to provide necessary lateral stability. The falsework and temporary braces shall provide for proper camber and alignment and shall be properly designed, constructed, and maintained for the loads that will be imposed upon it. Care shall be taken in the use of falsework and other temporary supports to ensure that the temporary elevation of structural steel provided by the falsework is consistent with the deflections that will occur as the structure is completed.
 9. In instances where falsework is required as part of the erection procedure, it shall be properly designed, constructed, and maintained for the loads that it will bear. Plans for falsework along with necessary engineering data shall be submitted to the MBTA for review, comment, and acceptance.
- B. Erection Drawings: Erection drawings shall show bolting or welding procedures necessary to complete erection. Procedures shall include sequence and method of connecting main members and secondary members. For stringer and girder spans, the following minimum information shall be included in the notes, modified as necessary to conform to design and erection requirements for each structure:
1. Splices and field connections of main stress carrying members shall be made with a minimum of 50% of the holes filled with approved high strength bolts and erection pins before the external

- support system is released. At least one-half of this percentage shall be bolts, tightened to specification requirements. The bolts and pins shall be installed uniformly throughout the connection except that erection pins shall be used in the extreme corners of all main connections.
2. Members to be assembled on the ground before erection shall be blocked to their proper "no load profile" and 100% of the approved high strength bolts shall be installed and tightened to specification requirements before erecting the member.
 3. All diaphragms and cross frames shall be installed between stringer lines as the work progresses.
 4. Dimensions indicated at expansion joints and similar construction shall be determined for a temperature of 50°F. Proper adjustments shall be made when the structure is placed at any other temperature.
 5. After the erection of beams and girders has been completed, expansion bearing sole plates shall be re-aligned so that they will be centered at 50°F.
- C. Set structural steel accurately in locations and to elevations indicated and according to AISC's "Code of Standard Practice for Steel Buildings and Bridges".
- D. Base and Bearing Plates: Clean concrete- and masonry-bearing surfaces of bond-reducing materials, and roughen surfaces prior to setting base and bearing plates. Clean bottom surface of base and bearing plates.
1. Set base and bearing plates for structural members on wedges, shims, or setting nuts as required.
 2. Weld plate washers to top of base plate.
 3. Snug-tighten or pre-tension anchor rods as applicable after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of base or bearing plate before packing with grout.
 4. Where indicated promptly pack grout solidly between bearing surfaces and base or bearing plates so no voids remain. Neatly finish exposed surfaces; protect grout and allow to cure. Comply with manufacturer's written installation instructions for shrinkage-resistant grouts.
- E. Maintain erection tolerances of structural steel within AASHTO, AREMA and AISC's "Code of Standard Practice for Steel Buildings and Bridges", in the event of conflict between the referenced documents, the more stringent condition shall apply.
- F. Align and adjust various members forming part of complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact with members. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
1. Level and plumb individual members of structure.
 2. Make allowances for difference between temperature at time of erection and mean temperature when structure is completed and in service.
- G. Splice members only where indicated.
- H. Do not use thermal cutting during erection unless accepted by MBTA. Finish thermally cut sections within smoothness limits in AWS D1.1 and AWS D1.5.

- I. Do not enlarge unfair holes in members by burning or using drift pins. Obtain written acceptance from MBTA prior to reaming holes that are required to be enlarged to admit bolts.
- J. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1 and AWS D1.5 and manufacturer's written instructions.

3.4 FIELD CONNECTIONS

- A. High-Strength Bolts: Install high-strength bolts according to RCSC's "Specification for Structural Joints Using High-Strength Bolts" for type of bolt and type of joint indicated on the Drawings.
- B. Weld Connections: Comply with AWS D1.1 and AWS D1.5 for welding procedure specifications, tolerances, appearance, and quality of welds and for methods used in correcting welding work.
 - 1. Comply with AISC's "Code of Standard Practice for Steel Buildings and Bridges" for bearing, adequacy of temporary connections, alignment, and removal of paint on surfaces adjacent to field welds.
 - 2. Remove backing bars or runoff tabs, back gouge, and grind steel smooth.
 - 3. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances of AASHTO, AREMA and AISC's "Code of Standard Practice for Steel Buildings and Bridges" for mill material. In the event of conflict between the referenced documents, the more stringent tolerance condition shall apply.

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: The DB Entity will engage a qualified independent testing and inspecting agency to inspect field welds and high-strength bolted connections.
- B. Bolted Connections: Bolted connections will be inspected according to RCSC's "Specification for Structural Joints Using High-Strength Bolts". When using bolted connections prime with "slip critical class B" primer as specified in this Section. All surfaces of bolted or bearing connections may be primed. When welding, hold back primer a minimum of 2" each side of weld.
- C. Welded Connections: Field welds will be visually inspected according to AWS D1.1 and AWS D1.5. In addition to visual inspection, specialty tests will be performed in accordance with AWS D1.1 and AWS D1.5 and at the frequency stated in Article 1.5.F.
- D. In addition to visual inspection, test and inspect field-welded shear connectors according to requirements in AWS D1.1 and AWS D1.5 for stud welding and as follows:
 - 1. Perform bend tests if visual inspections reveal either a less-than- continuous 360-degree flash or welding repairs to any shear connector.
 - 2. Conduct tests on additional shear connectors if weld fracture occurs on shear connectors already tested, according to requirements in AWS D1.1 and AWS D1.5.
- E. Correct deficiencies in Work that test reports and inspections indicate do not comply with the requirement of the Contract Documents.

3.6 REPAIRS AND PROTECTION

- A. Repair damaged galvanized coatings on galvanized items with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.
- B. Touchup Painting: After installation, promptly clean, prepare, and prime or reprime field connections, rust spots, and abraded surfaces of painted joists and accessories, bearing plates, and abutting structural steel.
 - 1. Clean and prepare surfaces by SSPC-SP 3 power-tool cleaning.
 - 2. Apply a compatible coating of same type as shop coating used on adjacent surfaces.

END OF SECTION

SECTION 07160

CRYSTALLINE WATERPROOFING

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes crystalline waterproofing for application with concrete.
- B. Related Sections:
 - 1. Section 03300 - CAST IN PLACE CONCRETE.
 - 2. Section 07920 - JOINT SEALANTS.

1.2 PERFORMANCE REQUIREMENTS

- A. The DB Entity shall provide waterproofing that prevents passage of water under hydrostatic pressure and complies with physical requirements specified as demonstrated by testing performed by independent testing agency of manufacturer's current waterproofing formulation.

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated. Include material descriptions and installation instructions for crystalline waterproofing. Indicate material interactions with substrate, accessories, or adjacent materials that could impair the performance of either item.
- B. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience.
- C. Product Certificates: For waterproofing, patching, and plugging materials, from manufacturer.
- D. Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified independent testing agency, for crystalline waterproofing.
- E. Field quality-control reports.

1.4 QUALITY ASSURANCE

- A. Qualification of Installer: A qualified installer who is authorized, approved, or licensed to install waterproofing manufacturer's products; and who is eligible to receive waterproofing warranty specified.
- B. Preinstallation Conference: Review requirements for waterproofing, including surface preparation specified under other Sections, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

1.5 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with application only when existing and forecasted weather conditions permit crystalline waterproofing to be performed according to manufacturer's written instructions.
- B. Proceed with waterproofing work only after pipe sleeves, vents, curbs, inserts, drains, and other projections through the substrate to be waterproofed have been completed. Proceed only after substrate defects, including honeycombs, voids, and cracks, have been repaired to provide a sound substrate free of forming materials, including reveal inserts.
- C. Ambient Conditions: Proceed with waterproofing work only if temperature is maintained at 40 deg F (4.4 deg C) or above during work and cure period, and space is well ventilated and kept free of water.

1.6 WARRANTY

- A. Submit written warranty signed by manufacturer and Installer agreeing to repair or replace waterproofing, sheet flashings, and other components of waterproofing system that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 WATERPROOFING MATERIALS

- A. Crystalline Waterproofing: Prepackaged, blend of portland cement, specially treated sand, and active chemicals that, when mixed with water and applied, penetrates into concrete and concrete unit masonry and reacts chemically with the byproducts of cement hydration in the presence of water to develop crystalline growth within substrate capillaries to produce an impervious, dense, waterproof substrate; that has VOC content complying with limits of authorities having jurisdiction; with properties meeting or exceeding the criteria specified below.
 - 1. Available Products: Subject to compliance with requirements, provide one of the following:
 - a. Xypex Chemical Corporation; Xypex
 - b. AQUAFIN, Inc.; AQUAFIN-1C.
 - c. Vandex USA LLC; Vandex Super/Super White.
 - d. Or approved equal.
 - 2. Water Permeability: Maximum zero for water at 30 feet when tested according to CE CRD- C 48.
 - 3. Compressive Strength: Minimum 4000 psi at 28 days when tested according to ASTM C 109/C 109M.
- B. Crystalline Waterproofing Additive: Crystalline type that chemically controls and permanently fixes a non-soluble crystalline structure throughout the capillary voids of the concrete which causes the concrete to become sealed against the penetration of liquids and protects the concrete from deterioration due to harsh environmental conditions.

1. Available Products: Subject to compliance with requirements, provide one of the following:
 - a. Kryton International Inc.
 1. Krystol Internal Membrane (KIM)
 2. Krystol Waterstop Grout
 - b. Xypex Chemical Corporation
 1. Xypex Admix C-500 or Xypex Admix C-1000.

2.2 ACCESSORY MATERIALS

- A. Patching Compound: Factory-premixed cementitious repair mortar, crack filler, or sealant recommended by waterproofing manufacturer for filling and patching tie holes, honeycombs, reveals, and other imperfections; compatible with substrate and other materials indicated; and VOC content complying with limits of authorities having jurisdiction.
- B. Plugging Compound: Factory-premixed cementitious compound with hydrophobic properties and recommended by waterproofing manufacturer; resistant to water and moisture but vapor permeable for all standard applications (vertical, overhead, and horizontal surfaces not exposed to vehicular traffic); compatible with substrate and other materials indicated; and VOC content complying with limits of authorities having jurisdiction.
- C. Portland Cement: The DB Entity shall use ASTM C 150, Type I.
- D. Sand: The DB Entity shall use ASTM C 144.
- E. Water: The DB Entity shall use potable water.

2.3 MIXES

- A. Crystalline Waterproofing: Add prepackaged dry ingredients to water according to manufacturer's written instructions. Mix together with mechanical mixer or by hand to required consistency.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. The DB Entity shall examine substrates, areas, and conditions, with applicator present, for suitable conditions where waterproofing is to be applied.
- B. Proceed with application only after unsatisfactory conditions have been corrected.
- C. Notify Architect of Record in writing of active leaks or defects that would affect system performance.

3.2 PREPARATION

- A. Protect other work from damage caused by cleaning, preparation, and application of waterproofing.
- B. Provide temporary enclosure to ensure adequate ambient temperatures and ventilation conditions for application.

- C. Do not allow waterproofing, patching, and plugging materials to enter reveals or annular spaces intended for resilient sealants or gaskets, such as joint spaces between pipes and pipe sleeves.
- D. Stop active water leaks with plugging compound according to waterproofing manufacturer's written instructions.
- E. Repair damaged or unsatisfactory substrate with patching compound according to manufacturer's written instructions.
 - 1. At holes and cracks in substrate, remove loosened chips and cut reveal with sides perpendicular to surface, not tapered, and approximately 1 inch deep. Fill reveal with patching compound flush with surface.
- F. Surface Preparation: Comply with waterproofing manufacturer's written instructions to remove efflorescence, chalk, dust, dirt, mortar spatter, grease, oils, paint, curing compounds, and form-release agents to ensure that waterproofing bonds to surfaces.
 - 1. Clean concrete surfaces according to ASTM D 4258.
 - 2. Concrete Joints: Clean reveals according to waterproofing manufacturer's written instructions.

3.3 APPLICATION

- A. General: Comply with waterproofing manufacturer's written instructions for application and curing.
 - 1. Saturate surface with water for several hours prior to application and maintain damp condition until applying waterproofing. Remove standing water.
 - 2. Apply waterproofing to surfaces indicated on Design Documents.
 - 3. Number of Coats: Number required for specified water permeability.
 - 4. Application Method: Brush or spray. Apply to ensure that each coat fills voids and is in full contact with substrate or previous coat.
 - 5. Dampen surface between coats.
- B. Final Coat Finish: Smooth.
- C. Waterproofing admixture shall be added to concrete mix at time of batching.
- D. Curing: Moist-cure waterproofing for three days immediately after final coat has set, followed by air drying, unless otherwise recommended in writing by manufacturer.

3.4 FIELD QUALITY CONTROL

- A. After installation and prior to covering waterproofing system, arrange for system manufacturer's technical personnel to inspect waterproofing installation and submit report to Engineer of Record.

END OF SECTION

SECTION 08331

OVERHEAD COILING DOORS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Manually-operated and electrically-operated insulated service doors.
 - 2. Electrically-operated fire-rated, automatic-closing overhead coiling doors.
 - 3. Electrically-operated non-insulated overhead coiling doors.
 - 4. Electrically-operated high-speed insulated overhead coiling doors.
 - 5. Electrically-operated high-speed non-insulated vinyl overhead coiling doors (at car wash area).

- B. Related Work:
 - 1. Volume 2 Technical Provisions Exhibit 2I, Additional Project Requirements.
 - 2. Section 08711 - DOOR HARDWARE; lock cylinders and keying.
 - 3. Section 09900 - PAINTING; field-applied paint finish.
 - 4. Division 16 of Exhibit 2A.1 - ELECTRICAL; electrical service and connections for powered operators and accessories.

1.2 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Provide overhead coiling doors capable of withstanding the effects of gravity loads and the following loads and stresses without evidencing permanent deformation of door components:
 - 1. Wind Load: Uniform pressure (velocity pressure) required by Code but not less than 20 lbf/sq. ft. acting inward and outward.

- B. Springs: 100,000 cycle springs.

1.3 SUBMITTALS

- A. Product Data: For each type and size of overhead coiling door and accessory. Include the following:
 - 1. Summary of forces and loads on walls and jambs.

- B. Shop Drawings: For special components and installations not dimensioned or detailed in manufacturer's product data.

- C. Qualification Data: For Installer.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for both installation and maintenance of units required for this Project.
- B. Source Limitations: Obtain overhead coiling doors through one source from a single manufacturer.
 - 1. Obtain operators and controls from overhead coiling door manufacturer.
- C. Fire-Test-Response Characteristics: Provide assemblies complying with NFPA 80 that are identical to door and frame assemblies tested for fire-test-response characteristics per UL 10b and NFPA 252, and that are listed and labeled for fire ratings indicated by UL, FMG, ITS, or another testing and inspecting agency acceptable to authorities having jurisdiction.
 - 1. Required Fire Rating for Unit at Employee Lounge/Lower Lobby Wall: 1 hour.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100.
- E. Engineering Design: Engineering and structural analysis, as well as any necessary calculations shall be prepared under the supervision of, and signed and sealed by, a qualified professional engineer licensed in the Commonwealth of Massachusetts. Engineer shall have minimum 5 years experience performing work of similar scope and complexity. These calculations shall include gravity, wind and seismic loading. The internal structure, dimensions and specifications for all items shall be indicated in the DB Entity's shop drawings.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, Overhead Door Company, Raynor, Wayne-Dalton, Cornell and Rytek. Basis-of design models and performance as indicated below and on the Drawings:
 - 1. Insulated Coiling Doors: Insulated (R-9.3) 22 gauge galvanized steel insulated slats, 35 cycles per 24 hours; finished both sides; 12' per second open with window slot.
 - 2. Insulated Coiling Doors: Insulated (R-8) 22 gauge galvanized steel insulated slats, 10 cycles per 24 hours; finished both sides; 12' per second open with window slot.
 - 3. Non-Insulated Coiling Doors: Standard speed door, 10 cycles per day.
 - 4. High-Speed Coiling Doors: Interior high speed rubber or vinyl coiling door with 35 cycles per 24 hours (suitable for use in a car wash area); Spiral LH Door by Rytec Corporation.
 - 5. Fire-Rated Doors: Cornell Model ERD11 with M100 FireGard Tube Motor Operated System.

2.2 DOOR CURTAIN MATERIALS AND CONSTRUCTION

- A. Door Curtains: Fabricate overhead coiling door curtain of interlocking slats, designed to withstand wind loading indicated, in a continuous length for width of door without splices. Unless otherwise indicated, provide slats of thickness and mechanical properties recommended by door manufacturer for performance, size, and type of door indicated, and as follows:

1. Steel Door Curtain Slats: Zinc-coated (galvanized), cold-rolled structural steel (SS) sheet; complying with ASTM A 653/A 653M, G90 (Z275) coating designation.
 - a. Minimum Base-Metal (Uncoated) Thickness: 0.0209”.
 - b. Flat profile slats.
 2. Insulation at Exterior Units: Fill slat with manufacturer's standard rigid cellular polystyrene or polyurethane-foam-type thermal insulation complying with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, according to ASTM E 84. Enclose insulation completely within metal slat faces.
 3. Inside Curtain Slat Face: To match material of outside metal curtain slat.
- B. Endlocks and Windlocks for Service Doors: Malleable-iron casings galvanized after fabrication, secured to curtain slats with galvanized rivets or high-strength nylon. Provide locks on not less than alternate curtain slats for curtain alignment and resistance against lateral movement.
- C. Bottom Bar for Service Doors: Consisting of 2 angles, each not less than 1-1/2” by 1-1/2” by 1/8” thick; galvanized, stainless-steel, or aluminum extrusions to suit type of curtain slats.
- D. Curtain Jamb Guides for Service Doors: Fabricate curtain jamb guides of steel angles or channels and angles, with sufficient depth and strength to retain curtain, to allow curtain to operate smoothly, and to withstand loading. Build up units with not less than 3/16” (thick galvanized steel sections complying with ASTM A 36/A 36M and ASTM A 123/A 123M. Slot bolt holes for guide adjustment. Provide removable stops on guides to prevent overtravel of curtain, and a continuous bar for holding windlocks.

2.3 HOODS AND ACCESSORIES

- A. Hood: Form to act as weatherseal and entirely enclose coiled curtain and operating mechanism at opening head. Contour to fit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Provide closed ends for surface-mounted hoods and provide fascia for any portion of between-jamb mounting projecting beyond wall face. Provide intermediate support brackets as required to prevent sagging.
1. Fabricate hoods for steel doors of minimum 0.028” thick, hot-dip galvanized steel sheet with G90 zinc coating, complying with ASTM A 653/A 653M.
 2. Include automatic drop baffle to guard against passage of smoke or flame.
- B. Smoke Seals at Fire-Rated Unit: Combination smoke seal/sensing unit at bottom bar, replaceable UL listed nylon pile smoke seals sealing against fascia side of curtain at guides and head.
- C. Battery Back-Up System for Motor Operator at Fire-Rated Units: To provide 4 hours of door open holding time in the event of a power failure; powers local detectors and warning appliances. Allows for programming open/close obstruction cycling should the sensing edge encounter a stationary obstruction in the opening during AC power, alarm signal closing.
- D. Detector at Fire-Rated Units: UL listed photoelectric smoke/heat detector.
- E. Automatic Closing and Speed Governor Mechanism: Activation by central alarm system, local smoke and heat detectors or power outage greater than 4 hours with use of F-BBU back up device. Motor operator shall close door upon signal from central alarm system or local smoke and heat detectors or power outage. Closing speed not more than 9 inches per second. Reset Procedure; operation of control

station after alarm is cleared and/or power is restored; resetting of spring tension or mechanical dropouts shall not be required.

- F. Weatherseals at Exterior Units: Provide replaceable, adjustable, continuous, compressible weather-stripping gaskets fitted to bottom and top of exterior doors, unless otherwise indicated. At door head, use 1/8-inch-thick, replaceable, continuous sheet secured to inside of hood.
 - 1. Provide motor-operated doors with combination bottom weatherseal and sensor edge.
 - 2. In addition, provide replaceable, adjustable, continuous, flexible, 1/8" thick seals of flexible vinyl, rubber, or neoprene at door jambs for a weathertight installation.
- G. Fabricate locking device assembly with manufacturer's standard assembly which is compatible with project high-security lock cylinders and keyways installed under Section 08711 – DOOR HARDWARE.
- H. If door unit is power operated, provide safety interlock switch to disengage power supply when door is locked.
- I. Provide automatic-closing device that is inoperative during normal door operations, with governor unit complying with requirements of NFPA 80 and with an easily tested and reset release mechanism, and designed to be activated by building fire alarm and detection system and door-holder-release devices.

2.4 COUNTERBALANCING MECHANISM

- A. General: Counterbalance doors by means of adjustable-tension, steel helical torsion spring mounted around a steel shaft and contained in a spring barrel connected to door curtain with barrel rings. Use grease-sealed bearings or self-lubricating graphite bearings for rotating members.
- B. Counterbalance Barrel: Fabricate spring barrel of hot-formed, structural-quality, welded or seamless carbon-steel pipe, of sufficient diameter and wall thickness to support rolled-up curtain without distortion of slats and to limit barrel deflection to not more than 0.03 in./ft. (2.5 mm/m) of span under full load.
- C. Provide spring balance of one or more oil-tempered, heat-treated steel helical torsion springs. Size springs to counterbalance weight of curtain, with uniform adjustment accessible from outside barrel. Provide cast-steel barrel plugs to secure ends of springs to barrel and shaft.
- D. Fabricate torsion rod for counterbalance shaft of cold-rolled steel, sized to hold fixed spring ends and carry torsional load.
- E. Brackets: Provide mounting brackets of manufacturer's standard design, either cast iron or cold-rolled steel plate.

2.5 MANUAL DOOR OPERATOR

- A. General: Equip door with manual door operator by door manufacturer.
- B. Push-up Operation: Design counterbalance mechanisms so required lift or pull for door operation does not exceed 25-lbf.

2.6 ELECTRIC DOOR OPERATORS

- A. General: Provide electric door operator assembly of size and capacity recommended and provided by door manufacturer for door specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, solenoid-operated brake, clutch, remote-control stations, control devices, integral gearing for locking door, and accessories required for proper operation.
- B. Comply with NFPA 70.
- C. Disconnect Device: Provide hand-operated disconnect or mechanism for automatically engaging chain and sprocket operator and releasing brake for emergency manual operation while disconnecting motor without affecting timing of limit switch. Mount disconnect and operator so they are accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.
- D. Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
- E. Provide control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6, with NFPA 70 Class 2 control circuit, maximum 24-V, ac or dc.
- F. Door-Operator Type: Provide wall-, hood-, or bracket-mounted, jackshaft-type door operator unit consisting of electric motor, drive, and chain and sprocket secondary drive.
- G. Electric Motors: Provide high-starting torque, reversible, continuous-duty, Class A insulated, electric motors complying with NEMA MG 1; with overload protection; sized to start, accelerate, and operate door in either direction from any position, at not less than 2/3 fps and not more than 1 fps, without exceeding nameplate ratings or service factor.
 - 1. Type: Polyphase, medium-induction type.
 - 2. Service Factor: According to NEMA MG 1, unless otherwise indicated.
 - 3. Coordinate wiring requirements and electrical characteristics of motors with building electrical system.
- H. Remote-Control Station: Provide momentary-contact, three-button control station with push-button controls labeled "Open," "Close," and "Stop."
 - 1. Provide interior units, full-guarded, surface-mounted, heavy-duty type, with general-purpose NEMA ICS 6, Type 1 enclosure.
- I. Obstruction Detection Device: Provide each motorized door with indicated external automatic safety sensor capable of protecting full width of door opening. Activation of sensor immediately stops and reverses downward door travel.
- J. Limit Switches: Provide adjustable switches, interlocked with motor controls and set to automatically stop door at fully opened and fully closed positions.
- K. Provide electric operators with ADA-compliant audible alarm and visual indicator lights.
- L. Radio Control: Provide radio control system consisting of the following:
 - 1. Three-channel universal coaxial receiver to open, close, and stop door, one per operator.
 - 2. Multifunction remote control.

3. Remote antenna mounting kit.

2.7 FINISHES

- A. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved samples and are assembled or installed to minimize contrast.
- B. Powder-Coat Finish: Manufacturer's standard powder-coat finish consisting of primer and topcoat according to coating manufacturer's written instructions for cleaning, pretreatment, application, thermosetting, and minimum dry film thickness.
 1. Color and Gloss: As selected by DB Entity from manufacturer's full range.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Install coiling doors and operating equipment complete with necessary hardware, jamb and head molding strips, anchors, inserts, hangers, and equipment supports.
 1. Install fire-rated doors to comply with NFPA 80.
 2. Test fire-rated unit to demonstrate proper operation. Adjust until proper operation is achieved.

3.2 ADJUSTING

- A. Lubricate bearings and sliding parts; adjust doors to operate easily, free of warp, twist, or distortion and with weathertight fit around entire perimeter.

3.3 STARTUP SERVICES

- A. Engage a factory-authorized service representative to perform startup service.
 1. Complete installation and startup checks according to manufacturer's written instructions.
 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - a. Test door closing when activated by detector or alarm-connected fire-release system. Reset door-closing mechanism after successful test.

3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train the Authority's maintenance personnel to adjust, operate, and maintain overhead coiling doors.

END OF SECTION

SECTION 08711

DOOR HARDWARE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies hardware for all operable doors for the purposes of coordination. This Section includes the following items.
1. Commercial door hardware.
 2. Hardware for doors specified in other Sections as listed below.
 3. Electrified door hardware.
 4. Electronic access control system (EACS) hardware
- B. Items to be Furnished Only: Furnish the following items for installation by others.
1. Lock cylinders and cores: Medico high security lock cylinders and non-removable cores with restricted keyways particular to the MBTA.
 - a. The Medico cylinders are Medico DR keyway M3.
 - b. These cylinders are additional to the cylinders and construction cores to be furnished and installed in each lock set as specified in Part 3 of this Section.
- C. Related Work - It shall be the DB Entity's option to assign the furnishing and installation of hardware for doors specified in Other Sections to the appropriate Subcontractor. Other Sections include, but are not limited to:
1. Volume 2 Technical Provisions for requirements for metal gates and station closure elements.
 2. Section 08331 – OVERHEAD COILING DOORS; lock cylinders and cores
 3. Section 16702– ELECTRONIC ACCESS CONTROL SYSTEM; card readers, audio/visual alarms, security terminal cabinets
- D. Related Work – Items Not Included: The following items are not included in this Section and will be performed under the designated Sections:
1. Division 16 of Exhibit 2A.1 – ELECTRICAL; power for electrified door hardware and interface with building control and security systems.
- E. Integration of EACS Work: The installation of electronic access control system (EACS) hardware requires coordination between trades. It shall be the DB Entity's option to assign the furnishing and installation of EACS hardware and components to the appropriate Subcontractor.

1.2 SUBMITTALS

- A. Product Data: Include installation details, material descriptions, dimensions of individual components and profiles, and finishes.
- B. Shop Drawings: Details of electrified door hardware, indicating the following:
 - 1. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring. Include the following:
 - a. System schematic.
 - b. Point-to-point wiring diagram.
 - c. Riser diagram.
 - d. Elevation of each door.
 - 2. Detail interface between electrified door hardware and fire alarm access control and building control and security systems.
- C. Door Hardware Schedule: Prepared by or under the supervision of supplier, detailing fabrication and assembly of door hardware, as well as procedures and diagrams. Coordinate the final Door Hardware Schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of door hardware.
 - 1. Format: Comply with scheduling sequence and vertical format in DHI's "Sequence and Format for the Hardware Schedule."
 - 2. Organization: Organize the Door Hardware Schedule into door hardware sets indicating complete designations of every item required for each door or opening.
 - 3. Content: Include the following information:
 - a. Type, style, function, size, label, hand, and finish of each door hardware item. Note that the correct hand of the door
 - b. Manufacturer of each item.
 - c. Fastenings and other pertinent information.
 - d. Location of each door hardware set, cross-referenced to Drawings, both on floor plans and in door and frame schedule.
 - e. Explanation of abbreviations, symbols, and codes contained in schedule.
 - f. Mounting locations for door hardware.
 - g. Door and frame sizes and materials.
 - h. Description of each electrified door hardware function, including location, sequence of operation, and interface with other building control systems.
 - 1) Sequence of Operation: Include description of component functions that occur in the following situations: authorized person wants to enter; authorized person wants to exit; unauthorized person wants to enter; unauthorized person wants to exit.
 - i. Note that correct hand of door hardware is the responsibility of the hardware supplier.

4. Submittal Sequence: Submit the final Door Hardware Schedule at earliest possible date, particularly where approval of the Door Hardware Schedule must precede fabrication of other work that is critical in the Project construction schedule. Include Product Data, Samples, Shop Drawings of other work affected by door hardware, and other information essential to the coordinated review of the Door Hardware Schedule.
- D. Keying Schedule: Prepared by or under the supervision of supplier, detailing the Engineer's final keying instructions for locks. Include schematic keying diagram and index each key set to unique door designations.
 - E. Product Certificates: Signed by manufacturers of electrified door hardware certifying that products furnished comply with requirements.
 1. Certify that door hardware approved for use on types and sizes of labeled fire doors complies with listed fire door assemblies.
 - F. Qualification Data: For firms and persons specified in Part 1 "Quality Assurance" Article.
 1. Include lists of completed projects with project names and addresses of architects and Authorities, and other information specified.
 - G. Maintenance Data: Include maintenance manuals for each type of door hardware.
 - H. Warranties: Special warranties specified in this Section.
 - I. Closeout:
 1. Submit RECORD COPY of hardware schedule and product cuts, as indicated. Submission to contain contact information for Supplier and the DB Entity.
 2. Submit Manufacturers' warranties as listed below.
 - J. Proprietary Products: The MBTA has established the following as proprietary manufacturers of the specified items:
 1. All cylinders shall be Medico DR Keyway M3 high security lock cylinders with non-removable cores particular to the MBTA.

1.3 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who has completed door hardware similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- B. Supplier Qualifications: Door hardware supplier with warehousing facilities in Project's vicinity and who is or employs a qualified Architectural Hardware Consultant, available during the course of the Work to consult with the DB Entity about door hardware and keying.
 1. Electrified Door Hardware Supplier Qualifications: An experienced door hardware supplier who has completed projects with electrified door hardware similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful in-service performance, and who is acceptable to manufacturer of primary materials.

- a. Engineering Responsibility: Prepare data for electrified door hardware, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.
 2. Scheduling Responsibility: Preparation of door hardware and keying schedules.
- C. Architectural Hardware Consultant Qualifications: A person who is currently certified by the Door and Hardware Institute as an Architectural Hardware Consultant and who is experienced in providing consulting services for door hardware installations that are comparable in material, design, and extent to that indicated for this Project.
1. Electrified Door Hardware Qualifications: Experienced in providing consulting services for electrified door hardware installations.
- D. Source Limitations: Obtain each type and variety of door hardware from a single manufacturer, unless otherwise indicated.
1. Provide electrified door hardware from same manufacturer as mechanical door hardware, unless otherwise indicated. Manufacturers that are listed to perform electrical modifications, by a testing and inspecting agency acceptable to authorities having jurisdiction, are acceptable.
- E. Regulatory Requirements: Comply with provisions of the following:
1. Where indicated to comply with accessibility requirements, comply with Massachusetts Architectural Access Board and the Americans with Disabilities Act (ADA), "Accessibility Guidelines for Buildings and Facilities (ADAAG)," as follows:
 - a. Handles, Pulls, Latches, Locks, and other Operating Devices: Shape that is easy to grasp with one hand and does not require tight grasping, tight pinching, or twisting of the wrist.
 - b. Door Closers: Comply with the following maximum opening-force requirements indicated:
 - 1) Interior Hinged Doors: 5 lbf applied perpendicular to door.
 - 2) Sliding or Folding Doors: 5 lbf applied parallel to door at latch.
 - 3) Fire Doors: Minimum opening force allowable by authorities having jurisdiction.
 - c. Thresholds: Not more than ½" high. Bevel raised thresholds with a slope of not more than 1:2.
 2. NFPA 101: Comply with the following for means of egress doors:
 - a. Latches, Locks, and Exit Devices: Not more than 15 lbf to release the latch. Locks shall not require the use of a key, tool, or special knowledge for operation.
 - b. Delayed-Egress Locks: Lock releases within 15 seconds after applying a force not more than 15 lbf for not more than 3 seconds.
 - c. Door Closers: Not more than 30 lbf to set door in motion and not more than 15 lbf (67 N) to open door to minimum required width.
 - d. Thresholds: Not more than ½" high.
 3. Electrified Door Hardware: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.

- F. Fire-Rated Door Assemblies: Provide door hardware for assemblies complying with NFPA 80(2007) that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to NFPA 252.
 - 1. Test Pressure: Test at atmospheric pressure.
- G. Field Measurement: The DB Entity shall verify all dimensions in the field, including, but not limited to, door and frame opening dimensions and wall thickness dimensions.
- H. Keying Conference: Incorporate keying conference decisions into final keying schedule after reviewing door hardware keying system including, but not limited to, the following:
 - 1. Function of building, flow of traffic, purpose of each area, degree of security required, and plans for future expansion.
 - 2. Preliminary key system schematic diagram.
 - 3. Requirements for key control system.
 - 4. Address for delivery of keys.
- I. Pre-installation Conference: Review methods and procedures related to electrified door hardware including, but not limited to, the following:
 - 1. Inspect and discuss electrical roughing-in and other preparatory work performed by other trades.
 - 2. Review sequence of operation for each type of electrified door hardware.
 - 3. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
 - 4. Review required testing, inspecting, and certifying procedures.

1.4 MARKING AND PACKING

- A. Door hardware shall arrive at the site in its original packaging. All packages shall be legibly labeled indicating manufacturer's numbers, types, sizes and hardware schedule reference number. All hardware shall be wrapped in paper and shall be packed in the same package as all screws, bolts and fasteners necessary for proper installation.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Inventory door hardware on receipt and provide secure lock-up for door hardware delivered to Project site. Do not store electronic access control hardware, software or accessories at Project site without prior authorization.
- B. Tag each item or package separately with identification related to the final Door Hardware Schedule, and include basic installation instructions with each item or package.
- C. Deliver permanent keys, cylinders, cores and related accessories directly to the MBTA via registered mail or overnight package service. Instructions for delivery to the MBTA shall be established at the "Keying Conference".

1.6 COORDINATION

- A. Coordinate layout and installation of recessed pivots and closers with floor construction. Cast anchoring inserts into concrete. Concrete, reinforcement, and formwork requirements are specified in Section 03300 - CAST-IN-PLACE CONCRETE.
- B. Templates: Obtain and distribute to the parties involved templates for doors, frames, and other work specified to be factory prepared for installing door hardware. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing door hardware to comply with indicated requirements.
- C. Electrical System Roughing-in: Coordinate layout and installation of electrified door hardware with connections to power supplies, fire alarm system and detection devices, access control and building control system.

1.7 WARRANTY

- A. General Warranty: Special warranties specified in this Article shall not deprive the Authority of other rights the Authority may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the DB Entity under requirements of the Contract Documents.
- B. Special Warranty: Written warranty, executed by manufacturer agreeing to repair or replace components of door hardware that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, the following:
 - 1. Structural failures including excessive deflection, cracking, or breakage.
 - 2. Faulty operation of operators and door hardware.
 - 3. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
- C. Warranty Period: Three years from date of Contract Substantial Completion, unless otherwise indicated.
- D. Warranty Period for Manual Closers: Ten years from date of Contract Substantial Completion.

1.8 SPECIAL REQUIREMENTS

- A. Hardware Supplier shall determine conditions and materials for all doors and frames for the proper application of hardware.
- B. Hardware Supplier shall be responsible for the accuracy of the quantities, sizes, finish and proper hardware to be furnished, whether specifically mentioned or not.
- C. All lever trim for door locks to hazardous areas such as mechanical rooms shall have a tactile surface to comply requirements of the third-party involved.
- D. Tools for maintenance: All tools shall be packed with hardware items shall be saved and turned over to the MBTA upon completion of the work.
- E. Lock fronts, flush bolt faces and strikes shall be beveled in accordance with manufacturer's standards.

1.9 ATTIC STOCK

- A. Provide a minimum of one additional unit of each specified product item. Where the quantity of any specified item numbers more than 10, provide one additional unit for each additional 10 items specified.

1.10 MAINTENANCE SERVICE

- A. Maintenance Tools and Instructions: Furnish a complete set of specialized tools and maintenance instructions as needed for the MBTA’s continued adjustment, maintenance, and removal and replacement of door hardware.

1.11 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties with all agents whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS PREFERRED DOOR HARDWARE

- A. The MBTA has identified a number of specific door hardware items for which they have a preferred manufacturer.

Item	Preferred Manufacturer	Acceptable Manufacturers
Locksets & Deadlocks	Schlage (SCH), Sargent(SAR), Yale (YA)	As listed below
Electric Strikes	HES	As listed below
Cylinders & Keying	Medico (MED)	None
Exit Devices & Mullions	Von Duprin (VON)	As listed below
Door Closers	LCN	As listed below
Automatic Operators	RECORD (REC)	As listed below

2.2 SCHEDULED DOOR HARDWARE

- A. Scheduled and acceptable manufacturers must provide all the functions and features of the specified product or it will not be approved.

	Scheduled Manufacturer	Acceptable Manufacturers
Hinges (at typical doors)	Ives (IVE)	McKinney, Hager, Stanley
Continuous Hinges (at high-frequency doors)	SELECT (SEL)	McKinney, Stanley
Locksets & Deadlocks	Schlage (SCH)	Sargent, Yale
Electric Strikes	HES	Folger Adams, Von Duprin

Electromagnetic Locks	Schlage (SCH)	
Keypad Locks	Schlage (SCH)	Campus Standard
Cylinders & Keying	Medico (MED)	None
Exit Devices & Mullions	Von Duprin (VON)	Sargent, Yale
Door Closers	LCN (LCN)	Sargent,
Automatic Operators	RECORD (REC)	LCN, Stanley
Push & Pull Plates & Bars	Ives (IVE)	Rockwood, Burns
Flush Bolts & Coordinators	Ives (IVE)	Rockwood, Burns
Protection Plates	Ives (IVE)	Rockwood, Burns
Stops & Holders	Ives (IVE)	Rockwood, Burns
Overhead Stops	Glynn-Johnson (GLY)	Sargent, Rixson
Silencers	Ives (IVE)	Rockwood, Burns
Thresholds, Weatherstrip & Door Bottoms	National Guard (NGP)	Pemko, Reese
Door Position Switches	GE Sentrol (GE)	

- B. Hand of Door: Drawings show direction of slide, swing, or hand of each door leaf. Furnish each item of hardware for proper installation and operation of door movement as shown.
- C. Where the hardware specified is not adaptable to the finished shape or size of the members requiring hardware, furnish suitable types having the same operation and quality as the type specified, subject to the MBTA's acceptance.

2.3 MATERIALS

A. Fasteners

1. Provide hardware manufactured to conform to published templates, generally prepared for machine screw installation.
2. Furnish non-corrosive screws for installation with each hardware item. Finish exposed (exposed under any condition) screws to match hardware finish, or, if exposed in surfaces of other work, to match finish of this other work as closely as possible including "prepared for paint" surfaces to receive painted finish.
3. Provide concealed fasteners for hardware units that are exposed when door is closed except to the extent that no standard units of type specified are available with concealed fasteners. Do not use thru-bolts for installation where bolt head or nut on opposite face is exposed in other work unless their use is the only means of reinforcing the work adequately to fasten the hardware securely.
4. All hardware shall be installed with the fasteners provided by the hardware manufacturer.
5. Self-taping screws shall not be used to install hardware, except at continuous hinges.

B. Mortise Hinges

1. Material – Stainless steel (32D)
2. Design – 3-knuckle or 5-knuckle
3. Mortise hinges shall be of the same design

4. Bearings – ball bearing or concealed bearing
5. The width of hinges shall be 4 1/2" or as required for clearance.
6. Hinge Pins: Except as otherwise indicated, provide hinge pins as follows:
 - a. Steel Hinges: Steel pins
 - b. Non-Ferrous Hinges: Stainless steel pins
 - c. Out-Swinging Exterior Doors: Non-removable pins
 - d. Interior Doors: Non-rising pins
 - e. Electronic Access Control System (EACS) Doors: Non-removable pins
7. The following is a guide for hinge type required for this specification:
 - a. 1 3/4" thick doors up to and including 3'-0" wide:
Exterior: standard weight, 4 1/2" high
Interior: standard weight, 4 1/2" high
 - b. 1 3/4" thick doors over 3'-0" wide:
Exterior: heavy weight, 5" high
Interior: heavy weight, 5" high
8. Provide heavy weight HW hinges where indicated
9. Provide 3 hinges per door leaf for doors 90 inches or less in height, and one additional hinge for each 30 inches of additional door height.
10. Hinges meeting this specification: Ives 3BB1, 3BB1HW; 5BB1, 5BB1HW. McKinney TA 314, TA386HW; TA2314, T4A3386; Hager BB1191, BB1168; Stanley CB191, CB199; CB1960, CB1961.

C. Continuous Hinges

1. Concealed type geared heavy duty continuous hinges at high-frequency portals (unless otherwise noted). Material/Finish – clear aluminum
 - a. Preferred Manufacturer: SELECT – SL-11HD
 - b. Acceptable Manufacturers:
McKinney MCK-12 HD
Stanley 661 HD.
2. Continuous hinges at exterior gates shall be heavy duty 12 gauge stainless steel pin & barrel full mortise type, capable of carrying doors up to 600 pounds.
 - a. Products meeting this specification: Stanley 651, or equal
 - b. Continuous hinges at gates shall be installed with drilled and tapped fasteners.
3. Provide bearings at each hinge knuckle for quiet, smooth, self-lubricating operation.

4. Hinges shall be capable of supporting door weights up to 600 pounds, and shall be successfully tested for 1,500,000 cycles.
5. Install hinges with fasteners supplied by manufacturer. Hole pattern shall be symmetrically patterned.
6. Where indicated, provide hinge leaf cutouts to accommodate electric power transfers.

D. Flush Bolts

1. Automatic and manual flush bolts shall have forged bronze faceplates with extruded brass levers and with wrought brass guides and strikes. Doors up to 7'-6" in height shall have 12" steel or brass rods. Manual flush bolts for doors over 7'-6" in height shall be increased by 6" for each additional 6" of door height. Provide dust-proof strikes where scheduled.

E. Coordinators

1. Where pairs of doors are equipped with automatic flush bolts, an astragal, or other hardware that requires synchronized closing of the doors, provide a bar-type coordinating device, surface applied to the underside of the stop at the frame head.
2. Finish of the coordinator to be prime coat to receive the same finish paint as the door frame.
3. Provide a filler bar of the correct length for the unit to span the entire width of the opening, and appropriate brackets for parallel arm door closers and surface vertical rod exit device strikes. Factory-prep coordinators for vertical rod devices if required.

F. Mortise Locks

1. Mortise locks shall be certified as ANSI A156.13, Grade 1 Operational, Grade 1 Security, and shall be manufactured from heavy gauge steel, containing components of steel with a zinc dichromate plating for corrosion resistance. Lock case shall be multi-function and field reversible for handing without opening the case.
2. Locks are to have a standard 2 3/4" backset with a full 3/4" throw 2-piece stainless steel mechanical anti-friction latchbolt. Deadbolt shall be a full 1" throw, constructed of stainless steel.
3. Lever trim shall be solid brass, bronze, or stainless steel, cast or forged in the design specified, with wrought roses and external lever spring cages. Levers shall be thru-bolted to assure proper alignment, and shall have a 2-piece spindle. Lever trim on the secure side of doors serving rooms considered by the authority having jurisdiction to be hazardous shall have a tactile warning. Lever design shall be Schlage 07 or similar.
4. Locks meeting this specification: Schlage L9000 series, Sargent 8200 series, Yale 8800 series.

G. Keypad Locks

1. Locksets shall be mortise type with 3-piece, beveled, stainless steel latchbolts with 3/4" throw and equipped with an anti-friction latch.
2. Chassis shall accommodate ANSI standard mortise lock prep with a 2 3/4" nominal backset for 1 3/4" doors.
3. Locksets shall be provided from the factory with appropriate handing.
4. Levers shall operate independently of each other. Lock shall use patented clutch mechanism to deter vandalism and maximize durability. Disablement of secured levers shall not permit

latchbolt retraction from secure side, but shall allow egress. Lever trim on the secure side of doors serving rooms considered by the authority having jurisdiction to be hazardous, or where noted on the door schedule, shall be knurled to provide a tactile warning. Lever style to be Schlage 07.

5. Provide key cylinder for emergency key override, with Everest/Primus core.
6. Electrical operation shall be battery operated, capable of 80,000 operating cycles using four AA alkaline batteries. Lock shall be resistant to radio frequency and electrostatic discharge.
7. Outside escutcheon shall have keypad and iButton reader.
8. Visual red and green LED indicators shall indicate activation, operational systems status, system error conditions and low power conditions.
9. Locks meeting this specification: Schlage/Locknetics CM5596.

H. Exit Devices

1. Exit devices shall be touchpad type, fabricated of brass, bronze, stainless steel, or aluminum, plated to the standard architectural finishes to match the balance of the door hardware.
2. All exit devices shall incorporate a fluid damper or other device which eliminates noise associated with exit device operation. Touchpad shall extend a minimum of one half of the door width. End-cap will have two-point attachment to door. Touch-pad shall match exit device finish, and shall be stainless steel for US26, US26D, US28, US32, and US32D finishes. Only compression springs will be used in devices, latches, and outside trims or controls.
3. All devices to incorporate a security deadlatching feature.
4. Provide roller strikes for all rim and surface mounted vertical rod devices, ASA strikes for mortise devices, and manufacturer's standard strikes for concealed vertical rod devices.
5. Mechanism case shall sit flush on the face of all flush doors, or spacers shall be furnished to fill gaps behind devices. Where glass trim or molding projects off the face of the door, provide glass bead kits.
6. All non-fire-rated exit devices shall have cylinder dogging.
7. Where lever handles are specified as outside trim for exit devices, provide heavy duty lever trims with forged or cast escutcheon plates. Provide vandal-resistant levers that will travel to a 90-degree down position when more than 35 pounds of torque are applied, and which can easily be re-set. Lever styling will match the lever style of the locksets.
8. Exit devices shall be UL listed panic exit hardware. All exit devices for fire rated openings shall be UL labeled fire exit hardware.
9. Provide electrical options as scheduled.
10. All exit devices shall be supplied for cylinder dogging. Provide cylinder housings and cores for dogging function.
11. Exit devices meeting this specification for steel doors: Von Duprin 98 series, Sargent 80 series with dead latching, Yale 7100 Series.
12. Exit devices meeting this specification for aluminum doors: Von Duprin 33A series, Sargent 8500 series, Yale 7200 series.

I. Door Closers

1. Door closers shall have fully hydraulic, full rack and pinion action with a high strength cast iron or cast aluminum cylinder. Cylinder body shall be 1 1/2" in diameter, and double heat-treated pinion shall be 11/16" in diameter.
 2. Hydraulic fluid shall be of a type requiring no seasonal closer adjustment for temperatures ranging from 120 degrees F to -30 degrees F. Fluid shall be fireproof and shall pass the requirements of the UL10C "positive pressure" fire test.
 3. Spring power shall be continuously adjustable over the full range of closer sizes, and allow for reduced opening force for the physically handicapped. Hydraulic regulation shall be by tamper-proof, non-critical valves. Closers shall have separate adjustment for latch speed, general speed, and backcheck.
 4. Closers shall have solid forged steel main arms (and forged forearms for parallel arm closers).
 5. Closers shall not incorporate a pressure relief valve.
 6. All closers shall have metal covers.
 7. Closer cylinders, arms, and metal covers shall have a powder coating finish which has been certified to exceed 100 hours salt spray testing by an independent testing laboratory used by BHMA for ANSI certification. For metal components that can't be powder coated, a special rust inhibiting finish (SRI) must be used.
 8. Door closers shall be mounted on the least public side of the door.
 9. Door closers meeting this specification: LCN 4010/4110 series, Norton 7500/PR7560 (standard screws).
- J. Push Plates: 8" wide x 16" high x .050" thick. Where door stile does not allow 8" wide plates, 4" wide plates may be used.
- K. Door Pulls & Push Bars: Solid bar stock, diameter and length as scheduled. Push bars shall be of sufficient length to span from center to center of each stile.
1. Where Long Door Pulls are indicated provide 1-1/4" diameter offset pulls with smooth gripping surface and flat ends. Provide center bracket for pulls over 72" center-to-center (CTC) of top and bottom bracket.
 - a. Long door pulls meeting this specification: Burns VP4251, Ives 92641, Rockwood RM3311
- L. Protection Plates: Provide kick plates as scheduled, with 4 beveled edges. Furnish with machine or wood screws, finished to match plates. Plates shall be 8" high x 2" LWOD on single doors, 1" LWOD on pairs of doors.
- M. Door Stops and Holders
1. It shall be the responsibility of the hardware supplier to provide door stops for all doors in accordance with the following requirements:
 - a. Wall stops shall be used wherever possible.
 - b. Where wall stops cannot be used, provide dome type floor stops of the proper height.
 - c. At any opening where a wall or floor stop cannot be used, a heavy duty overhead stop must be used.

- N. Thresholds and Weatherstrip: Furnish as scheduled and per architectural details. Match finish of other items as closely as possible. Provide only those units where resilient or flexible seal strip is easily replaceable and readily available.
- O. Silencers: "Push-in" type silencers for each hollow metal or wood frame, 3 for each single frame, 2 for each pair frame. Omit where gasketing is scheduled.
- P. Automatic Operators:
1. Automatic Operators shall be heavy duty low energy surface mounted automatic swing door operators consisting of aluminum housing, electro-mechanical motor, operator assembly, swing arm, electronic control, wire harnesses, signage and push plate control devices.
 2. Units shall comply with the following:
 - a. Current ANSI A156.19 for Power Assist and Low Energy Power Operated Doors. Automatic operators shall comply with opening force and time to close standards required to be accessible to the disabled.
 3. Provide single and dual operators for doors swinging in the same direction, as specified.
 4. The operators shall be non-handed. Opening Force shall be adjustable.
 5. Electronic controls: Microprocessor controlled unit shall control the operation and switching of the swing power operator. The microprocessor control shall provide low voltage power supply for all means of actuation.
 6. Door opening: The door connecting hardware shall accommodate up to a 12" reveal and opening angles to 120 degrees.
 7. Normal Open: The operator shall serve as a manual door closer in the direction of swing with or without electrical power. Full closing force shall be provided when the power operation cycle ends.
 8. Power Open: When an opening signal is received by the control unit, the door shall be opened at the operator-adjusted opening speed. Before the door is fully open at back check, it shall slow automatically to low speed. The motor shall stop with the selected door opening.
 9. External Control: A three position switch shall be mounted in the end cover of the housing, along with a "fault warning" LED. The switch shall be marked ON/OFF/HOLD OPEN. The LED shall flash if the microprocessor detects a fault of any kind.
 - a. Provide the capability for the three position switch to be remotely located.
 10. Power Close: Closing shall be provided by means of a spring and motor. When the hold open time has elapsed, the operator will close the door automatically, using spring force and motor. The door will slow to low speed at latch catch before it reaches the fully closed position. The door is kept closed by spring power or extended closing force by the motor.
 11. Power Assist: Operator can be adjusted to lower the forces when used manually. Power assist will be active only when applied while pushing or pulling the door and will allow the door to close when an opening force is no longer applied to the door.
 12. Electronic dampening: Operator shall include standard electric dampening system which automatically counteracts additional forces applied to the door during the opening or closing cycle by reducing door speed.

13. Stack Pressure Feature: The electronic control allows for increases of forces to overcome stack pressure issues. The control automatically compensates for lower manual push forces when the door is used in manual mode. The door must comply with ANSI A156.19, when using this feature.
14. Lock Engage Circuit: Not used.
15. Push Plate Control Devices: Provide hard wired push plate switches. Switches shall be remotely mounted on stanchions.
16. Signage: Provide signage in accordance with ANSI/BHMA A156.19.
17. Locate power unit and exhaust away from door to minimize noise and vibration in pedestrian areas. Provide two low voltage 18 gauge stranded wires from automatic operator to activation devices (50 ft max).
18. All power operator systems shall include the following features and functions:
 - a. Provisions for separate conduits to carry high and low voltage wiring in compliance with the National Electric Code, section 725-31.
 - b. When an obstruction or resistance to the opening swing is encountered, the operator will continue attempting to open the door. If the obstruction or resistance remains, the operator will pause the door again.
 - c. The operator will be designed to prevent damage to the mechanism if the system is actuated while the door is latched or if the door is forced closed during the opening cycle.
 - d. Power consumption must be less than or equal to the following: Nominal power 67 watts, Nominal current .08A at 120VAC. Peak power consumption 2.9A. standby .02A with
 - e. Power consumption of 13watts.
 - f. Electric motor shall be equipped with built-in thermal overload protection.
19. Provisions in the control box or module shall provide control (inputs and outputs) for: electric strike delay, auxiliary contacts, sequential operation, fire alarm systems, actuators, swing side sensors, and stop side sensors.
20. Operators at Electronic Access Control System(EACS) doors:
 - a. The EACS shall be interconnected through the push plate control device so that a valid card transaction is required to enable the push plate control device to send a signal to the operator to open the door.
21. Provide safety sensors exterior and interior of automatic operating doors.
22. All exposed aluminum surfaces shall be clear anodized.
23. Preferred Manufacturer: Record 8200 Series
24. Acceptable manufacturers: LCN 9550 Series, Stanley Magic-Swing

Q. Electric Strikes

1. Provide electric strikes of configurations and with trim appropriate for the supplied lock sets and exit devices.
2. Standard Electric Strikes: Heavy duty mortise lock electric strikes conforming to ANSI/BHMA A156.31, Grade 1, UL listed for both Burglary Resistance and for use on fire rated door assemblies. Stainless steel construction with dual interlocking plunger design tested to exceed 3000 lbs. of static strength and 350 ft-lbs. of dynamic strength. Strikes tested for a minimum 1

million operating cycles. Provide strikes with 12 or 24 VDC capability and supplied standard as fail-secure unless otherwise specified. Provide faceplates appropriate for the operating hardware.

- a. Preferred Manufacturer: HES - 1006 Series
 - b. Acceptable Manufacturers:
Folger Adams (FO) – 310 Series
Von Duprin (VON) - 6000 Series.
 - c. Electric strikes shall be fail-secure unless otherwise noted.
3. Surface Mounted Rim Electric Strikes: Surface mounted rim exit device electric strikes conforming to ANSI/BHMA A156.31, Grade 1, and UL Listed for both Burglary Resistance and for use on fire rated door assemblies. Construction includes internally mounted solenoid with two heavy-duty, stainless steel locking mechanisms operating independently to provide tamper resistance. Strikes tested for a minimum of 500,000 operating cycles. Provide strikes with 12 or 24 VDC capability supplied standard as fail-secure unless otherwise specified.
- a. Preferred Manufacturer: HES - 9500/9600 Series.
 - b. Acceptable Manufactures:
Folger Adams (FO) – 310-4
Von Duprin (VON) - 6100 Series
 - c. Electric strikes shall be fail-secure unless otherwise noted.
 - d. Provide a Surface Mount Box accessory at door pairs with an active and an inactive leaf.
4. Hurricane and Tornado Resistance Compliance: Electric strikes to be U.L. listed for windstorm components where applicable. Provide the appropriate hurricane or tornado resistant products that have been independent third party tested, certified, and labeled to meet state and local windstorm building codes applicable to project.
5. Provide electric strikes with in-line power controller and surge suppressor by the same manufacturer as the strike with combined products having unlimited lifetime warranty.
6. Voltage shall be 24VDC.

R. Electromagnetic Gate Locks

1. Electromagnetic gate locks shall have magnetic bond sensors and gate status monitors.
2. Voltage – 24 volts
3. Electromagnetic gate lock to have compression fitting at cable connection and 24inch wire leads.
4. Finish shall be heavy-duty plating – nickel finish
5. Provide mounting brackets to accommodate frame mounting and misalignments
6. Acceptable manufacturers: Schlage M490G; or equal.

S. Miscellaneous

1. Silencers: "Push-in" type silencers for each hollow metal or wood frame, 3 for each single frame, 2 for each pair frame. Omit where gasketing is scheduled.
2. Electric Power Transfers (EPT): Provide Von Duprin EPT-10, or equal

3. Door Cords: Provide Von Duprin DL-18, or equal
4. Power Supplies and Transformers:
 - a. Provide power supplies and transformers appropriate for hardware requiring low voltage power.
 - b. Provide cabinets with key lock covers for power supplies and transformers.
5. Removable mullions. Provide keyed removable mullions (designated KR MULLION) where indicated in hardware sets. Provide appropriate model for adjacent door hardware. Preferred Manufacturer: Von Duprin models 1654, 4954, 9954.

T. Door Position Switches

1. Door Position Switches shall be by the same manufacturer.
2. Unless otherwise noted, door position switches shall be Steel Door Contacts, GE-Sentrol 1078C, or equal.
 - a. At doors with recessed channels at head, provide Rare Earth Magnets, GE-Sentrol 1840, or equal.
3. At grout-filled masonry frames and aluminum curtain wall or storefront frames, door position switches shall be Balance Magnetic Switches, GE-Sentrol 2702A, or equal. Provide brackets of shapes and sizes for installation and adjustment.
4. At overhead coiling doors, door position switches shall be wide gap Balanced Magnetic Switches, GE-Sentrol 2707AU, or equal. Provide brackets of shapes and sizes for installation and adjustment.

2.4 FINISHES

- A. With the exception of all items listed below, the finish of all hardware shall be US26D - satin chrome or US32D - satin stainless steel.
- B. Exceptions are as follows:
 1. Door Closers - aluminum powder coat finish.
 2. Coordinators - prime painted.
 3. Thresholds - mill finish aluminum.
 4. Weatherstrip & Sweeps - clear anodized aluminum.
 5. Silencers - grey.

2.5 KEYING

- A. All locks and cylinders shall be construction master keyed and master keyed per the Authority's instructions, to existing key system.
- B. All locks and cylinders, except cylinders for keypad locks will be interchangeable core type.
- C. Provide 3 keys per lock, 6 construction master keys, and a total of 6 master keys for each group.

- D. All master keys shall be delivered directly to the Authority by the hardware supplier, who shall obtain a receipt for delivery of same.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine doors and frames, with Installer present, for compliance with requirements for installation tolerances, labeled fire door assembly construction, wall and floor construction, and other conditions affecting performance.
- B. Examine roughing-in for electrical power systems to verify actual locations of wiring connections before electrified door hardware installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Steel Doors and Frames: Comply with DHI A115 series.
- B. Surface-Applied Door Hardware: Drill and tap doors and frames according to SDI 107.
- C. Wood Doors: Comply with DHI A115-W series.

3.3 INSTALLATION

- A. Mounting Heights: Mount door hardware units at heights indicated in following applicable publications, unless specifically indicated or required to comply with governing regulations:
 - 1. Standard Steel Doors and Frames: DHI's "Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames."
 - 2. Custom Steel Doors and Frames: DHI's "Recommended Locations for Builders' Hardware for Custom Steel Doors and Frames."
- B. Install each door hardware item to comply with manufacturer's written instructions. Where cutting and fitting are required to install door hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation of surface protective trim units with finishing work specified in Division 9 Sections of Exhibit 2A.1. Do not install surface-mounted items until finishes have been completed on substrates involved.
 - 1. Set units level, plumb, and true to line and location. Adjust and reinforce attachment substrates as necessary for proper installation and operation.
 - 2. Drill and countersink units that are not factory prepared for anchorage fasteners. Space fasteners and anchors according to industry standards.
- C. Key Control System: Place keys on markers and hooks in key control system cabinet, as determined by final keying schedule.

- D. **Boxed Power Supplies:** Locate power supplies as indicated or, if not indicated, above accessible ceilings. Verify location with Engineer.
 - 1. **Configuration:** Provide the least number of power supplies required to adequately serve doors with electrified door hardware.
- E. **Thresholds:** Set thresholds for exterior and acoustical doors in full bed of sealant.
 - 1. Thresholds shall be full width of door opening.

3.4 SPECIAL INSTRUCTIONS

- A. **General**
 - 1. Prior to installation, the DB Entity is to test each electrified finish hardware device to verify that it is in working order, and ready for installation.
 - 2. Electrified hardware is to be installed with wiring concealed within door and/or door frame.
 - 3. Install construction cores in all locking hardware at time of installation. Replace construction cores with permanent cores when directed by the MBTA.
 - 4. The DB Entity shall retain responsibility for hardware installation until final acceptance. This includes control of hardware during and through the wiring of electrified devices. Coordinate installation of electrified door hardware with electrical trades.
 - 5. Provide a person on-site when access control door is brought on-line to accommodate replacement of mal-functioning hardware components.

3.5 ADJUSTING

- A. **Initial Adjustment:** Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended. Adjust door control devices to compensate for final operation of heating and ventilating equipment and to comply with referenced accessibility requirements.
 - 1. **Spring Hinges:** Adjust to achieve positive latching when door is allowed to close freely from an open position of 30 degrees.
 - 2. **Electric Strikes:** Adjust horizontal and vertical alignment of keeper to properly engage lock bolt.
 - 3. **Door Closers:** Adjust sweep period so that, from an open position of 70 degrees, the door takes at least 3 seconds to move to a point 3 inches from the latch, measured to the leading edge of the door.
- B. **Six-Month Adjustment:** Six months after date of Contract Substantial Completion, Installer shall perform the following:
 - 1. Examine and readjust each item of door hardware as necessary to ensure function of doors, door hardware, and electrified door hardware.
 - 2. Consult with and instruct the MBTA's personnel on recommended maintenance procedures.

3. Replace door hardware items that have deteriorated or failed due to faulty design, materials, or installation of door hardware units.

3.6 CLEANING AND PROTECTION

- A. Clean adjacent surfaces soiled by door hardware installation.
- B. Clean operating items as necessary to restore proper function and finish.
- C. Provide final protection and maintain conditions that ensure door hardware is without damage or deterioration at time of Contract Substantial Completion.

3.7 HARDWARE SCHEDULE

- A. Provide hardware for each door to comply with requirements of Section “Door Hardware,” hardware set numbers indicated in door schedule, and in the following schedule of hardware sets.
- B. It is indicated that the following schedule includes complete items or finish hardware necessary to complete the work. If a discrepancy is found in the schedule, such as a missing item, improper hardware for a frame, door or fire codes, the preamble will be the deciding document.
- C. Abbreviations:
 - CR – card reader
 - EACS – electronic access control system
 - PR - pair
 - SGL – singleRefer to paragraphs 2.1 & 2.2 for manufacturer abbreviations used in this schedule

END OF SECTION

SECTION 09360

MODULAR TACTILE SURFACES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies modular tactile surface sheet tile and filled pavers at station platforms.
- B. Related Work:
 - 1. Volume 2 Technical Provisions Exhibit 2I, Additional Project Requirements.
 - 2. Section 03300 - CAST-IN-PLACE CONCRETE: Concrete substrate.
 - 3. Section 09300 - TILE: Tile adjacent to modular tiles.

1.2 SUBMITTALS

- A. Shop drawings: Include complete layout and fabrication details, composite structure, dimensions of tiled areas, and affected adjacent areas. Provide large scale plan details of the tiles at the curves, including fastener locations.
- B. Product Data: Manufacturer's catalog cuts, material specifications, installation and maintenance instructions, and other data pertinent to the work of this Section.
- C. Samples: One full-size sample of the type, size, pattern, and color of tile required, and five six by six inch samples for MBTA records.
- D. Material Certification: Manufacturer's certification that all products meet specified requirements, as verified by a certified independent testing agency. Submit certified test reports for all tests shown in Article 2.02 B, indicating for each test whether or not the tile passes or fails the passing criteria. Test report shall be current and shall not predate the notice to proceed date of this contract by more than two years.
- E. Installer Certification: Manufacturer's approval of installer if other than manufacturer, and detailed work history with the product proposed for installation.
- F. Extra Materials: After completion of the work, furnish a minimum of ten percent of the total amount of tile furnished, from the same manufactured lot as materials furnished for work of this Section, in sealed, protective packaging marked with Contract number, lot number and identification contents. Store in a location designated by the DB Entity.

1.3 QUALITY ASSURANCE

- A. **Manufacturer:** A company specializing in the manufacture of modular tactile surface tiles as used in transit systems for guidance of the sight impaired. Product must have been installed at other locations with successful records of performance and product durability.
- B. **Installer:** Manufacturer-approved installer with documented experience in work similar to that of this Section. The Installer must be accepted by the MBTA before installation of the tile may begin.
- C. **First Time Suppliers and Installers:** For first time installers and suppliers of tactile tile to the MBTA, a meeting with representatives of the MBTA, the DB Entity, Surface Preparation subcontractor, Manufacturer, and Installer in attendance is mandatory. The agenda shall include the review and clarification of the specification, installation procedures, quality control, inspection and acceptance criteria and installation schedules. In no case will installation be allowed to commence until this meeting is held.
- D. **Hold Point - Mock-Up:** After approval of materials, erect an eight foot long tile mock-up using specified materials, per Volume 2 Technical Provisions Exhibit 2I, Additional Project Requirements.
 - 1. Assign the same construction crew to both the mock-up and the permanent work.
 - 2. If not accepted, remove and replace mock-up at no additional cost to the MBTA. Repeat procedure until approval is granted.
 - 3. Accepted mock-up shall serve as the quality standard for appearance, tolerances, and workmanship.
 - 4. Accepted mock-up may be incorporated in the permanent work, with the following certification.
 - 5. Protect and maintain accepted mock-up in accepted condition throughout the construction period. When no longer required, remove and dispose of offsite, if not incorporated into the permanent work.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials and products in unopened, factory labeled packages. Store and handle in strict compliance with manufacturer's instructions and recommendations. Store under cover and protect from all damage and pilferage

1.5 WARRANTY

- A. **Warranty:** In addition to the requirements of the General Conditions, furnish a warranty jointly executed by the tile manufacturer and the installer. Warrant the work executed in this Section for a period of five years against failure of tile material, workmanship, and installation for the work performed under the supervision of the manufacturer of the tile. The Warranty shall include breakage, deformation, fading, chalking of finishes, loosening of tiles, and mechanical fasteners, which are used for securing the tiles to the platform.

PART 2 - PRODUCTS

2.1 MODULAR TACTILE SURFACE TILE

- A. Accessibility Requirements: The modular tactile tile surface system shall differ from adjoining surfaces in resiliency or sound-on-cane contact as set forth by the latest requirements of the Americans with Disabilities (ADA) and the Massachusetts Architectural Access Board (AAB). Such reference is intended to establish quality and performance characteristics and meet the legal definition of the law.
- B. Modular Tile: Provide fiberglass polymer platform edge surfaces with custom sheet size as indicated on Drawings. Provide 1/8" minimum to 3/16" maximum thicknesses of the non-domed surface. The tactile tile shall be fabricated with a solid dome and solid body. Tile shall have a truncated dome design in patterns conforming to Americans with Disabilities Act Architectural Guidelines (ADAAG) requirements. Tiles shall have integral safety yellow color throughout the entire thickness of material.
1. Modular Tactile Surface at Curb Ramps: 24" wide, 1-1/2" thick polymer-concrete- filled fiberglass tile, maximum slope of 8 percent, in contrasting color with curb. Unit shall be flush with roadway and be able to withstand AASHTO H-20 truck loading.
- C. Performance Requirements: Tiles shall be chemically test certified to resist corrosion by sand, salt, and salt substitutes and resist color change and be resistant to ultraviolet rays. Tiles shall exhibit the following properties, and be tested using the corresponding test method, and meet the respective passing criteria, as follows:
1. Property: Water Absorption.
 - a. Test Method: ASTM D570 - Standard Test Method for Water Absorption of Plastics.
 - b. Passing Criteria: No greater absorption than 0.35% of weight increase due to saturation.
 2. Property: Compressive Strength.
 - a. Test Method: ASTM D 695 - Standard Test Method for Compressive Properties of Rigid Plastics.
 - b. Passing Criteria: 13000 psi average compressive strength.
 3. Property: Slip Resistance.
 - a. Test Method: ASTM C1028 - Standard Test Method for Determining the Static Coefficient of Friction of Ceramic Tile and Other Like Surfaces by the Horizontal Dynamometer Pull-Meter Method.
 - b. Passing Criteria: Minimum coefficient of friction of 0.80 with Neolite under wet and dry conditions.
 4. Property: Impact Resistance.
 - a. Test Method: ASTM D 5420 - Standard Test Method for Impact Resistance of Flat, Rigid Plastic Specimen by Means of a Striker Impacted by a Falling eight Gardner Impact).
 - b. Passing Criteria: No cracks at ambient temperature.

5. Property: Accelerated Weathering.
 - a. Test Method: ASTM G 26 - Standard Practice for Operating Light-Exposure Apparatus (Xenon-Arc Type) With and Without Water for Exposure of Nonmetallic Materials.
 - b. Passing Criteria: No deterioration, fading, or chalking of tile surface after 500 hrs. of exposure.
6. Property: Fire Resistance.
 - a. Test Method: ASTM E 136 - Standard Method for Behavior of Materials in a Vertical Tube Furnace at 750 degrees C.
 - b. Passing Criteria: Material shall conform to the contained criteria to be considered noncombustible.
7. Property: Flexural Strength.
 - a. Test Method: ASTM D 790 - Standard Test Method for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
 - b. Passing Criteria: 15,000 psi average flexural strength.
8. Property: Stain and Chemical Resistance.
 - a. Test Method: ASTM D 543 - Standard Practices for Evaluating the Resistance of Plastics to Chemical Reagents.
 - b. Passing Criteria: No staining or dissolution of the material.

2.2 FASTENING SYSTEM

- A. Fasteners: The fastener system shall consist of stainless steel masonry nails anchored into predrilled holes in the concrete platform sections, meeting the following requirements:
 1. Nails: Supply stainless steel nails, oval head tamperproof, 1/8" diameter by 2" long. The head of the screw shall be powder coating finished to match the color of the tile or covered with a cap to match the tile finish. Nails shall be hammer driven into the concrete and shall be removable with the use of a special tool for the tamperproof head.
 2. Number: The number of fasteners used shall be as required to completely fasten the tile to the platform substrate, but in no case will less than 10 fasteners be installed in a 2' by 4' modular unit. Fasteners shall not be installed in the body of the tactile material.
 3. Adhesive: Urethane Adhesive as recommended by manufacturer of anchors, conforming to manufacture's installation instructions.

PART 3 - EXECUTION

3.1 INSPECTION OF SURFACES

- A. Carefully inspect substrates for conditions affecting application and performance of the work of this Section. Report defects in writing to MTBA. Do not proceed with tactile tile installation work until unsatisfactory conditions have been corrected.

- A. Beginning work shall constitute acceptance of its conditions and any defects in tactile tile installation work resulting from such accepted surfaces shall be corrected without further expense to the Authority.

3.2 PREPARATION

- A. Coordinate tile installation, working with prior and subsequent work of other trades.
- B. Ensure that concrete substrate is smooth, clean, cured and trowel finished or scarified, free from curing compounds or surface coatings. The tactile tile shall be installed on poured in place concrete, retractable edge units, or precast concrete units and not on leveling compounds or fillers.
- C. The platform surface shall be scarified or depressed during forming, except for 2' wide platform edge units, and preparation shall depend on the thickness of the modular tile/ The surface preparation shall also be as recommended by the manufacturer for installation of that particular product so the body of the tile is to be recessed flush with the finished platform surface so that only the domes project above the top of the finished surface.
- D. If applicable, any slurry or concrete dust produced by the scarifying procedure and/or drilling for mechanical anchors shall be vacuumed from the platform during the preparation process to prevent the slurry from cementing the ballast or fouling the track drains. The DB Entity shall provide protection as required to prevent any residue from entering the ballast area.
- E. If applicable, electrical or signal cables under the platform edges or mounted on the support walls shall be protected, as required, using polyethylene or similar waterproof material.

3.3 INSTALLATION

- A. Install tile in accordance with manufacturer's recommendations and as indicated on the Design Documents. Install anchors and adhesive in accordance with manufacturer's recommendations.
- B. Hold Point - The tiles shall be dry-fit prior to installation to ensure proper installation.
- C. At the platform radius, tiles shall be installed with the platform edge tangent to the radius with the ends trimmed to provide a joint tangent to the curve and square to adjoining tiles. Domes cut in the trimming shall be beveled and polished to match the finish of the tile.
- D. Apply sealant only at expansion joints in accordance with Section 07920 - JOINT SEALANTS.
- E. Fasteners, as required by the platform conditions, shall be used to fully fasten the tile to the platform to provide complete contact between the tile and the platform.

3.4 PROTECTION

- A. During construction and prior to opening the platform edge for public use, cover all tactile surfaces with an appropriate covering material, temporarily secured in place, to protect it from damage from construction activity. Remove covering when protection is no longer needed and dispose of it off-site in a manner conforming to all appropriate laws and regulations.

- B. Prohibit construction vehicle traffic from riding on newly tiled surfaces. Do not place or store construction equipment or tools directly on tiled surfaces.
- C. Provide snow removal as required using equipment that will not damage tile.

END OF SECTION

SECTION 09671

FLUID APPLIED DI-ELECTRIC EPOXY FLOOR TOPPING

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This section specifies furnishing and installing dielectric epoxy topping on the floor under and around the rectifier and dc switchgear and on all the exposed vertical walls of the floor openings.
- B. An area at minimum 6' from the DC switchgear and rectifier equipment shall require the installation of an epoxy insulated floor. Areas in between equipment requiring installation of epoxy floor shall be filled in to expand the area of coverage.

1.2 RELATED SPECIFICATIONS

- A. Section 16311 –TRACTION POWER ELECTRICAL EQUIPMENT

1.3 SUBMITTALS

- A. Submit a layout drawing showing the proposed epoxy floor area to be provided for acceptance by the MBTA.
- B. Submit the proposed method of epoxy floor insulated anchors to be used with the DC switchgear and rectifiers. Note the requirement that the anchors shall withstand the 40kV level required by the insulated floor.
- C. Submit the qualifications of the installers of similar flooring systems. Provide the experience list of the proposed installer demonstrating installation of similar system. Where possible, demonstrate that the installation personnel have completed training courses provided the material supplier to ensure product installation is professional and manufacturer's requirements and performance.
- D. Submit technical data and test data indicating conformance to the mechanical, dielectric, and water absorption properties specified herein. Tests shall represent the composition and thickness of the proposed topping.
- E. Submit manufacturer's application and installation procedures including the following:
 - 1. Surface preparation.
 - 2. Temperature, humidity and other environment condition prior to, during and after installation.
 - 3. Drying and curing requirements of concrete subsurface and each layer of topping.
 - 4. Method and rate of application including the minimum and maximum thickness of each layer.
 - 5. The submittal of manufacturer's application and installation procedure shall be site specific for each Substation site.

- F. Submit three (3) 12 inch square samples of epoxy floor topping on concrete paving blocks. Show installation proposed for the project.
- G. Submit the proposed test procedure to be used to prove the epoxy floor meets the specified values at the specified locations. The test procedure should include test equipment, test values, test locations (shown on a substation layout plan), pass/fail criteria, test record sheets and should address each stage of installation and testing. Testing should include the floor and the equipment anchors. The DB Entity shall consider the proposed test method within the testing procedure submittal, such that testing of the equipment anchors can be achieved at the specified value in 2.2.A without risk of damaging the equipment.

1.4 JOB SITE CONDITIONS

- A. Provide positive ventilation and conform to volatile organic content regulations.
- B. Apply topping only when substrate temperature is 55°F minimum and rising, 90°F maximum. Do not apply if humidity is greater than 90% or if the substrate temperature is 5°F above dew point of the work area.

PART 2 - PRODUCTS

2.1 GENERAL

- A. The topping shall be dielectric, non-porous, seamless, 100% solid (no solvent resin and hardener) two component epoxy with silica added.

2.2 PERFORMANCE REQUIREMENTS

- A. Dielectric strength: 40,000 VDC minimum when tested per ASTM D-149 for 60 seconds without physical breakdown of epoxy.
- B. Insulation resistance: 10,000 megaohms at 2500 VDC.
- C. Water absorption: 0.8% maximum when tested per ASTM D-570.
- D. Hardness: Shore “D” hardness 75 minimum at 7 days.
- E. Durability: Ability to withstand steel-wheeled fork-lift traffic.

2.3 THICKNESS AND APPLICATION

- A. The topping shall be a trowel applied self-leveling system consisting of the following:
 - 1. A prime coat of neat epoxy of minimum 1/8” thickness.
 - 2. Apply thoroughly mixed epoxy mortar in proper thickness of 1/2”, unless otherwise indicated or directed by the MBTA.
 - 3. Non-slip shake applied prior to hardening of the epoxy topping.
 - 4. A final seal coat of neat epoxy.

2.4 ACCEPTABLE BRAND NAMES

- A. Any brand name and manufacturer that meet the specified performance requirement is acceptable.

Subject to the conformance of the requirements the following provide 100% solid epoxy topping systems:

1. Amazite: As manufactured by Halamite Inc., 28 Alhambra Road, Warwick, RI 02887 (800/272- 7752).
2. Duraltek: As distributed by Tamms Industries, 7405 Production Drive, Mentor, OH 44060 (800/21-TAMMS).
3. Dex-O-Tex Cheminert: As manufactured by Crossfields Products Corporation, 3000E Harcourt Street, Compton. (213/509-2016).

2.5 MOISTURE CONTENT

- A. Sand, shake material and all other constituents shall be dry.

PART 3 – EXECUTION

3.1 PREPARATION OF CONCRETE FLOOR SUBSTRATE

- A. Fill floor cracks by injecting epoxy grout under pressure.
- B. Evaluate levelness of floor with a straightedge. Grind highpoints. Patch floor imperfections.
- C. Cure floor slab and concrete filing and patching for 28 days minimum. Perform the “Visqueen Test” (ASTM D-4263), as necessary, to evaluate the moisture level of concrete.
- D. Saw cut 1/2" deep at all termination edges to insure adhesion of topping.
- E. Chip and roughen concrete floor to prepare substrate surface, removal of concrete shall not exceed a depth of 3/4". Adopt dust control measures during chipping and saw cutting to prevent dust infiltration into energized electrical equipment.
- F. No acid etching or solvent cleaning or sand blasting is permitted.
- G. Inspect the surface and correct unsatisfactory conditions. Starting of work by the applicator shall be construed as the applicator’s acceptance of the substrate.
- H. DB Entity shall verify the substrate floor has been prepared in a manner which will facilitate installation of a flat and level dielectric floor; unsatisfactory conditions shall be corrected. Starting of work by the applicator shall be construed as the applicator’s acceptance of the substrate.

3.2 TOPPING - GENERAL

- A. Apply in accordance with manufacturer’s instructions.
- B. Clean surface with industrial vacuum immediately prior to application of topping.

- C. Start topping work after MBTA's inspection of the substrate surface.
- D. Apply in a seamless manner to insure no holidays through cold joints.
- E. Top surface of the insulated floor shall be grouted with a finish coat insulated epoxy topping to smooth up and fill to give a smooth hard, easy to clean top surface.
- F. The top surface of the insulated floor shall mate flush with the top surface the concrete floor. All evaluation readings to be within a plane 1/16" above and a plane 1/16" or below an imaginary "perfectly level" zero reference plane.

3.3 PROTECTION

- A. After curing and before foot traffic commences, cover all finished surfaces with 1 inch thick construction grade plywood. Seal joints and edges with duct tape.

3.4 CLEANUP

- A. Clean all drips and spills, using care not to scratch or otherwise damage finished surfaces. Mask all termination edges.

3.5 TESTING

- A. DB Entity shall test the floor and the insulated anchors to assure that the dielectric strength is as specified. Dielectric strength to be achieved for the floor and the anchors is specified in 2.02.A above. Testing shall be completed in accordance with the accepted test procedure. The "Copper Plate Method" is the accepted method of testing the epoxy floor. The plate should cover at least 144 sq. inches of floor, comprised of 1/4" copper with an integrated test lead. The positive lead of the hi-pot shall be connected to the plate while the negative lead is connected to building ground. The use of liquid/void filling liquid for the testing will not be acceptable unless accepted by the MBTA.
- B. The testing shall be performed by an independent testing laboratory acceptable to MBTA.
- C. Tests shall be conducted after topping installation of each phase and prior to the installation of equipment for that phase. DB Entity shall propose the test locations. The DB Entity shall perform a test per every 4sqft of floor installed.
- D. After installation of all electrical equipment, DB Entity shall retest the entire area for dielectric strength. Testing at a minimum, shall be completed at the following locations. Test voltage shall be the di-electric strength identified in 2.02.A above.
 - 1. All equipment anchors – DB Entity may propose testing prior to equipment installation, subject to acceptance by the MBTA.
 - 2. At two locations at the rear of each DC switchgear cubicle. Test locations shall be 12" and 24" from the edge of the equipment.
 - 3. At three locations in front of each DC switchgear cubicle. Test locations shall be 12", 24" and 36" from the edge of the equipment.
 - 4. At two locations at each end of the DC switchgear, approximately 2' from the edge of the equipment.

5. Two on each side of each rectifier approximately 2' from the edge of the equipment.
 6. One test per every 4sqft of installed epoxy floor outside of the areas identified above.
- E. The areas which do not meet the dielectric strength specified shall be repaired and re-tested at no additional cost.
- F. Any areas which exhibit cracks or chipping shall be repaired and retested at no additional cost.

END OF SECTION

SECTION 09900

PAINTING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
1. Field painting of exposed interior items and surfaces.
 2. Field painting of exposed exterior items and surfaces.
 3. Surface preparation for painting.
 4. Painted signage: Level ID markers on concrete columns, refer to Division 10.

1.2 DEFINITIONS AND EXTENT

- A. General: Standard coating terms defined in ASTM D 16 apply to this Section.
1. Flat refers to a lusterless or matte finish with a gloss range below 15 when measured at an 85-degree meter.
 2. Eggshell refers to low-sheen finish with a gloss range between 20 and 35 when measured at a 60-degree meter.
 3. Semi-gloss refers to medium-sheen finish with a gloss range between 35 and 70 when measured at a 60-degree meter.
 4. Full gloss refers to high-sheen finish with a gloss range more than 70 when measured at a 60-degree meter.
- B. This Section includes surface preparation and field painting of exposed exterior and interior items and surfaces.
1. Surface preparation, priming, and finish coats specified in this Section are in addition to shop priming and surface treatment specified in other Sections.
- C. Paint exposed surfaces, except where these Mandatory Specifications indicate that the surface or material is not to be painted or is to remain natural. If an item or a surface is not specifically mentioned, paint the item or surface the same as similar adjacent materials or surfaces. If a color of finish is not indicated, DB Entity will select from standard colors and finishes available.
1. Painting includes field painting of exposed bare and covered pipes and ducts (including color coding), hangers, exposed steel and iron supports, and surfaces of mechanical and electrical equipment that do not have a factory-applied final finish.
- D. Do not paint prefinished items, concealed surfaces, finished metal surfaces, operating parts, and labels.
1. Prefinished items include, but are not limited to the following factory-finished components:

- a. Elevator entrance doors and frames.
 - b. Elevator equipment.
 - c. Finished mechanical and electrical equipment.
 - d. Light fixtures.
2. Concealed surfaces include walls or ceilings in the following generally inaccessible spaces:
- a. Foundation spaces.
 - b. Furred areas.
 - c. Ceiling plenums.
 - d. Pipe spaces.
 - e. Duct shafts.
3. Finished metal surfaces include the following:
- a. Anodized aluminum.
 - b. Stainless steel.
 - c. Chromium plate.
 - d. Copper and copper alloys.
 - e. Bronze and brass.
4. Operating parts include moving parts of operating equipment and the following:
- a. Valve and damper operators.
 - b. Linkages.
 - c. Sensing devices.
 - d. Motor and fan shafts.
5. Labels: Do not paint over UL, FMG, or other code-required labels or equipment name, identification, performance rating, or nomenclature plates.

1.3 SUBMITTALS

- A. Product Data: For each paint system indicated, include block fillers and primers.
1. Material List: An inclusive list of required coating materials. Indicate each material and cross-reference specific coating, finish system, and application. Identify each material by manufacturer's catalog number and general classification.
 2. Manufacturer's Information: Manufacturer's technical information, including label analysis and instructions for handling, storing, and applying each coating material.
 3. If the product submitted is an equal to those listed, provide detailed comparison in at least five (5) material properties against each of the products listed.
- B. Samples for Verification: For each color and material to be applied, with texture to simulate actual conditions, on representative Samples of the actual substrate.
1. Provide stepped Samples, defining each separate coat, including block fillers and primers. Use representative colors when preparing Samples for review. Resubmit until required sheen, color, and texture are achieved.

2. Provide a list of materials and applications for each coat of each Sample. Label each Sample for location and application.
 3. Submit two 8" by 12" samples for each type of finish coating for MBTA's review of color and texture only.
- C. Qualification Data: For Applicator.

1.4 QUALITY ASSURANCE

- A. Applicator Qualifications: A firm or individual experienced in applying paints and coatings similar in material, design, and extent to those indicated for this Project, whose work has resulted in applications with a record of successful in-service performance.
- B. Source Limitations: Obtain block fillers and primers for each coating system from the same manufacturer as the finish coats.
- C. Mockups: Provide a full-coat benchmark finish sample for each type of coating and substrate required. Comply with procedures specified in Painting and Decorating Contractors of America PDCA P5. Duplicate finish of accepted sample Submittals.
1. DB Entity will select one room or surface to represent surfaces and conditions for application of each type of coating and substrate.
 - a. Wall Surfaces: Provide samples on at least 100 sq. ft.
 - b. Small Areas and Items: DB Entity will designate items or areas required.
 2. Apply benchmark samples, according to requirements for the completed Work, after permanent lighting and other environmental services have been activated. Provide required sheen, color, and texture on each surface.
 - a. After finishes are accepted, DB Entity will use the room or surface to evaluate coating systems of a similar nature.
 3. Final approval of colors will be from benchmark samples.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to Project site in manufacturer's original, unopened packages and containers bearing manufacturer's name and label and the following information:
1. Product name or title of material.
 2. Product description (generic classification or binder type).
 3. Manufacturer's stock number and date of manufacture.
 4. Contents by volume, for pigment and vehicle constituents.
 5. Thinning instructions.
 6. Application instructions.
 7. Color name and number.
 8. VOC content.

- B. Store materials not in use in tightly covered containers in a well-ventilated area at a minimum ambient temperature of 45 deg F and a maximum ambient temperature of 95 deg F. Maintain storage containers in a clean condition, free of foreign materials and residue.
 - 1. Protect from freezing. Keep storage area neat and orderly. Remove oily rags and waste daily.

1.6 PROJECT CONDITIONS

- A. Apply waterborne paints only when temperatures of surfaces to be painted and surrounding air are between 50 and 90 deg F.
- B. Apply solvent-thinned paints only when temperatures of surfaces to be painted and surrounding air are between 45 and 95 deg F.
- C. Do not apply paint in snow, rain, fog, or mist; or when relative humidity exceeds 85 percent; or at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.
 - 1. Painting may continue during inclement weather if surfaces and areas to be painted are enclosed and heated within temperature limits specified by manufacturer during application and drying periods.

1.7 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by all interested parties whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 PAINT MATERIALS, GENERAL

- A. Material Compatibility: Provide block fillers, primers, and finish-coat materials that are compatible with one another and with the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.
- B. Material Quality: Provide manufacturer's best-quality paint material of the various coating types specified that are factory formulated and recommended by manufacturer for application indicated. Paint-material containers not displaying manufacturer's product identification will not be acceptable.
 - 1. Proprietary Names: Use of manufacturer's proprietary product names to designate colors or materials is not intended to imply that products named are required to be used to the exclusion of equivalent products of other manufacturers. Furnish manufacturer's material data and certificates of performance for proposed substitutions.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Applicator present, for compliance with requirements for paint application.
 - 1. Proceed with paint application only after unsatisfactory conditions have been corrected and surfaces receiving paint are thoroughly dry.
 - 2. Start of painting will be construed as Applicator's acceptance of surfaces and conditions within a particular area.
- B. Coordination of Work: Review other Sections in which primers are provided to ensure compatibility of the total system for various substrates. On request, furnish information on characteristics of finish materials to ensure use of compatible primers.

3.2 PREPARATION

- A. General: Remove hardware and hardware accessories, plates, machined surfaces, lighting fixtures, and similar items already installed that are not to be painted. If removal is impractical or impossible because of size or weight of the item, provide surface-applied protection before surface preparation and painting.
 - 1. After completing painting operations in each space or area, reinstall items removed using workers skilled in the trades involved.
- B. Cleaning: Before applying paint or other surface treatments, clean substrates of substances that could impair bond of the various coatings. Remove oil and grease before cleaning.
 - 1. Schedule cleaning and painting so dust and other contaminants from the cleaning process will not fall on wet, newly painted surfaces.
- C. Surface Preparation: Clean and prepare surfaces to be painted according to manufacturer's written instructions for each particular substrate condition and as specified.
 - 1. Provide barrier coats or tie-coats over incompatible primers or remove and reprime.
 - 2. Cementitious Materials: Prepare concrete, concrete unit masonry, cement plaster, and mineral-fiber-reinforced cement panel surfaces to be painted. Remove efflorescence, chalk, dust, dirt, grease, oils, and release agents. Roughen as required to remove glaze. If hardeners or sealers have been used to improve curing, use mechanical methods of surface preparation to remove.
 - a. Use abrasive blast-cleaning methods if recommended by paint manufacturer.
 - b. Determine pH of surfaces using pH indicating papers and distilled water and perform moisture vapor transmission testing for concrete floors in accordance with ASTM F 1869 and moisture tests on concrete walls in accordance with ASTM D 4263, Standard Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method. For masonry walls, use a moisture meter approved by the coating manufacturer. Follow the selected and approved coating manufacturers recommendations for acceptable pH values, moisture vapor transmission values (in lbs. of moisture per 24 hours per 1,000 SF), and moisture meter values (for masonry). If these values are not acceptable, do not paint surfaces until

- moisture levels are acceptable or additional surface preparation has been performed and the pH values measured are acceptable.
- c. Clean concrete floors to be painted with shot blast equipment in accordance with SSPC-SP13 Surface Preparation of Concrete. Reference (ICRI CSP 3-5).
3. Wood: Clean surfaces of dirt, oil, and other foreign substances with scrapers, mineral spirits, and sandpaper, as required. Sand surfaces exposed to view smooth and dust off.
 - a. Scrape and clean small, dry, seasoned knots, and apply a thin coat of white shellac or other recommended knot sealer before applying primer. After priming, fill holes and imperfections in finish surfaces with putty or plastic wood filler. Sand smooth when dried.
 - b. Prime, stain, or seal wood to be painted immediately on delivery. Prime edges, ends, faces, undersides, and back sides of wood, including cabinets, counters, cases, and paneling.
 - c. If transparent finish is required, backprime with spar varnish.
 - d. Backprime paneling on interior partitions where masonry, plaster, or other wet wall construction occurs on back side.
 - e. Seal tops, bottoms, and cutouts of unprimed wood doors with a heavy coat of varnish or sealer immediately on delivery.
 4. Ferrous Metals: Clean ungalvanized ferrous-metal surfaces that have not been shop coated; remove oil, grease, dirt, loose mill scale, and other foreign substances. Use solvent or mechanical cleaning methods that comply with The Society for Protective Coatings' (SSPC) recommendations.
 - a. Exterior Exposed Steel surfaces shall be cleaned in accordance with SSPC-SP 6/NACE No. 3 Commercial Blast Cleaning. Abrasive blast cleaned surfaces shall exhibit a uniform, angular profile of 1.5-3.0 mils. Cleaned surfaces shall be primed within 8 hours of cleaning and prior to any surface rusting.
 - b. Interior Exposed Steel in humid environments shall be cleaned in accordance with SSPC-SP 6/NACE No. 3 Commercial Blast Cleaning. Abrasive blast cleaned surfaces shall exhibit a uniform, angular profile of 1.5-3.0 mils. Cleaned surfaces shall be primed within 8 hours of cleaning and prior to any surface rusting.
 - c. Interior Exposed Steel in dry environments shall be cleaned in accordance with SSPC-SP2 or SP3 Hand or Power Tool Cleaning.
 5. Galvanized Surfaces: Shall be cleaned in accordance with SSPC-SP16 Brush of Blast Cleaning of Galvanized Steel and Non-Ferrous Metals to achieve a minimum 1 mil anchor profile. (Including but not limited to Structural and Miscellaneous Metals, Galvanized Metal Deck, etc.)
- D. Material Preparation: Mix and prepare paint materials according to manufacturer's written instructions.
1. Maintain containers used in mixing and applying paint in a clean condition, free of foreign materials and residue.

2. Stir material before application to produce a mixture of uniform density. Stir as required during application. Do not stir surface film into material. If necessary, remove surface film and strain material before using.
 3. Use only thinners approved by paint manufacturer and only within recommended limits.
- E. Tinting: Tint each undercoat a lighter shade to simplify identification of each coat when multiple coats of same material are applied. Tint undercoats to match the color of the finish coat, but provide sufficient differences in shade of undercoats to distinguish each separate coat.

3.3 APPLICATION

- A. General: Apply paint according to manufacturer's written instructions. Use applicators and techniques best suited for substrate and type of material being applied.
1. Paint colors, surface treatments, and finishes are indicated in the paint schedules.
 2. Do not paint over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to formation of a durable paint film.
 3. Provide finish coats that are compatible with primers used.
 4. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, grilles, convector covers, covers for finned-tube radiation, and similar components are in place. Extend coatings in these areas, as required, to maintain system integrity and provide desired protection.
 5. Paint surfaces behind movable equipment and furniture the same as similar exposed surfaces. Before final installation of equipment, paint surfaces behind permanently fixed equipment or furniture with prime coat only.
 6. Paint interior surfaces of ducts with a flat, nonspecular black paint where visible through registers or grilles.
 7. Paint back sides of access panels and removable or hinged covers to match exposed surfaces.
 8. Finish exterior doors on tops, bottoms, and side edges the same as exterior faces.
 9. Sand lightly between each succeeding enamel or varnish coat.
- B. Scheduling Painting: Apply first coat to surfaces that have been cleaned, pretreated, or otherwise prepared for painting as soon as practicable after preparation and before subsequent surface deterioration.
1. The number of coats and film thickness required are the same regardless of application method. Do not apply succeeding coats until previous coat has cured as recommended by manufacturer. If sanding is required to produce a smooth, even surface according to manufacturer's written instructions, sand between applications.
 2. Omit primer over metal surfaces that have been shop primed and touchup painted.

3. If undercoats, stains, or other conditions show through final coat of paint, apply additional coats until paint film is of uniform finish, color, and appearance. Give special attention to ensure that edges, corners, crevices, welds, and exposed fasteners receive a dry film thickness equivalent to that of flat surfaces.
 4. Allow sufficient time between successive coats to permit proper drying. Do not recoat surfaces until paint has dried to where it feels firm, and does not deform or feel sticky under moderate thumb pressure, and until application of another coat of paint does not cause undercoat to lift or lose adhesion.
- C. Application Procedures: Apply paints and coatings by brush, roller, spray, or other applicators according to manufacturer's written instructions.
1. Brushes: Use brushes best suited for type of material applied. Use brush of appropriate size for surface or item being painted.
 2. Rollers: Use rollers of carpet, velvet-back, or high-pile sheep's wool as recommended by manufacturer for material and texture required.
 3. Spray Equipment: Use airless spray equipment with orifice size as recommended by manufacturer for material and texture required.
- D. Minimum Coating Thickness: Apply paint materials no thinner than manufacturer's recommended spreading rate to achieve dry film thickness indicated. Provide total dry film thickness of the entire system as recommended by manufacturer.
- E. Mechanical and Electrical Work: Painting of mechanical and electrical work is limited to items exposed in equipment rooms and occupied spaces.
- F. Mechanical items to be painted include, but are not limited to, the following:
1. Uninsulated metal piping.
 2. Uninsulated plastic piping.
 3. Pipe hangers and supports.
 4. Tanks that do not have factory-applied final finishes.
 5. Visible portions of internal surfaces of metal ducts, without liner, behind air inlets and outlets.
 6. Duct, equipment, and pipe insulation having "all-service jacket" or other paintable jacket material.
 7. Mechanical equipment that is indicated to have a factory-primed finish for field painting.
- G. Electrical items to be painted include, but are not limited to, the following:
1. Switchgear.
 2. Panelboards.
 3. Electrical equipment that is indicated to have a factory-primed finish for field painting.
- H. Block Fillers: Apply block fillers to concrete masonry block at a rate to ensure complete coverage with pores filled.
- I. Prime Coats: Before applying finish coats, apply a prime coat, as recommended by manufacturer, to material that is required to be painted or finished and that has not been prime coated by others. Recoat primed and sealed surfaces where evidence of suction spots or unsealed areas in first coat appears, to ensure a finish coat with no burn-through or other defects due to insufficient sealing.

- J. Pigmented (Opaque) Finishes: Completely cover surfaces as necessary to provide a smooth, opaque surface of uniform finish, color, appearance, and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections will not be acceptable.
- K. Transparent (Clear) Finishes: Use multiple coats to produce a glass-smooth surface film of even luster. Provide a finish free of laps, runs, cloudiness, color irregularity, brush marks, orange peel, nail holes, or other surface imperfections.
 - 1. Provide satin finish for final coats.
- L. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint work not complying with requirements.

3.4 CLEANING

- A. Cleanup: At the end of each workday, remove empty cans, rags, rubbish, and other discarded paint materials from Project site.
 - 1. After completing painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping without scratching or damaging adjacent finished surfaces.
- B. Cleaning of Galvanized Ductwork, Conduit and Similar Items: Prepare surfaces of galvanized items in accordance with SSPC-SP 16 (The Society for Protective Coatings) – Brush-Off Blast Cleaning of Coated and Uncoated Galvanized Steel, Stainless Steels and Non-ferrous Metals.

3.5 PROTECTION

- A. Protect work of other trades, whether being painted or not, against damage from painting. Correct damage by cleaning, repairing or replacing, and repainting.
- B. Provide "Wet Paint" signs to protect newly painted finishes. After completing painting operations, remove temporary protective wrappings provided by others to protect their work.
 - 1. After work of other trades is complete, touch up and restore damaged or defaced painted surfaces. Comply with procedures specified in Painting and Decorating Contractors of America PDCA P1.

3.6 PAINT SCHEDULE

- A. Schedule: Provide products and number of coats specified. Use of manufacturer's proprietary product names to designate colors, materials, generic class, standard of quality and performance criteria and is not intended to imply that products named are required to be used to the exclusion of equivalent performing products of other manufacturers.
- B. Exterior Paint Schedule:
 - 1. Exterior Masonry and Concrete to be Painted:
 - One Coat
 - 1. Tnemec Series 156 Enviro-Crete at 6.0 to 10 mils DFT
 - 2. PPG PMC Amercoat 147 at 6.0 to 10.0 mils
 - 3. RD Coatings – RD Elasto-Flex at 6.0 to 10 mils DFT

- One Coat
1. Tnemec Series 156 Enviro-Crete at 8 to 10 mils DFT
 2. PPG PMC Amercoat 147 at 6.0 to 10.0 mils DFT
 3. RD Coatings – RD Elasto-Flex at 6.0 to 10 mils DFT
2. Exterior Concrete and Masonry in Right of Way:
- Two Coats
1. TextureDot Smooth by ChemMasters or equal by Tnemec or PPG AMC; application rate of 125-150 square feet per gallon. Complies with ASTM C309, Type 2, Class B and ASTM C1315 Class B for curing/sealing efficiency.
3. Exterior Ferrous Metals: (Railings, Polyurethane System) (Surface Preparation: SSPC-SP6)
- One Coat
1. Tnemec 90-1K97 at 3 mils DFT; shop applied under other Sections; use for touch up
 2. PPG PMC 68 at 3 mils DFT; shop applied under other Sections; use for touch up
 3. International Interzinc 315 at 2.0 to 3.0 mils DFT
- One Coat
1. Tnemec N69 Hi-Build Epoxoline II at 3.0 mils DFT
 2. PPG PMC Amerlock 400 Hi-Build Epoxy at 3.0 to 5.0 mils DFT
 3. International Intergard 475 HS at 4.0 to 8.0 mils DF
- One Coat
1. Tnemec 1075 Endura-Shield at 3.0 mils DFT
 2. PPG PMC Amerlock 400 Hi-Build Epoxy at 3.0 to 5.0 mils DFT
 3. International Interthane 990 HS at 2.0 to 3.0 mils DFT
4. Exterior Galvanized Metal: Refer to specification section 05041 – Hot Dip Galvanizing for shop finished galvanized metal. Paint system below is for galvanized and shop-primed steel items that is not hot-dip galvanized. Surface Preparation SSPC-SP7 Brush-Off Blast.
- One Coat
1. Tnemec 66HS Hi-Build Epoxoline at 3.0 mils DFT
 2. PPG PMC Amerlock 400 Hi-Build Epoxy at 4.0-5.0 mils DFT
 3. International Intergard 475 HS at 5.0 to 10.0 mils DFT
- One Coat
1. Tnemec 1080 /1081 Endurashield at 3.0 – 4.0 mils DFT
 2. PPG PMC AmerShield VOC at 2.0 to 3.0 mils DFT
 3. International Water Borne Urethane at 3.0 to 4.0 mils DFT
5. Yellow Pavement Marking Paint.
- One Coat
1. S-W Pro-Park Waterborne Traffic Marking Paint Latex Flat
 2. Moore Super Spec HP Latex Flat
 3. PPG Olympic Latex Flat
6. Exterior Existing Prepainted Painted Steel, for Overcoat Painted Finish:
- a. Surface Preparation: Water Blast 5000 psi and SSPC-SP3 Power Tool Clean.
 - b. One Coat:
 - 1) Tnemec 394 Omnithane at 3.0 to 3.5 mils DFT.
 - 2) PPG PMC Amerlock 400 Hi-Build Epoxy at 3.0 to 4.0 mils DFT.
 - 3) RD Coatings Elasto Metal at 3.0 mils DFT.

- c. And One Coat:
 - 1) Tnemec 66HS Hi-Build Epoxoline at 3.0 to 5.0 mils DFT.
 - 2) PPG PMC Amerlock 400 at 3.0 to 4.0 mils DFT.
 - 3) RD Coatings Elasto Metal at 7.0 mils DFT.
- d. And One Coat:
 - 1) Tnemec 1080 /1081 Endurashield at 3.0 – 4.0 mils DFT.
 - 2) PPG PMC AmerShield VOC at 2.0 to 3.0 mils DFT.
 - 3) International Water Borne Urethane at 3.0 to 4.0 mils DFT.

C. Interior Paint Schedule for Standard Performance Coatings:

1. Interior Gypsum Wallboard for Latex Eggshell Finish:

- One Coat
- 1. Moore Ecospec Interior Latex Primer Sealer (231)
 - 2. Duron Genesis Latex Primer
 - 3. S-W Health Spec Latex Wall Primer
 - 4. PPG Pure Performance Latex Primer

- Two Coats
- 1. Moore Pristine Ecospec Interior Latex Eggshell (223)
 - 2. Duron Genesis Latex Eggshell
 - 3. S-W Health Spec Latex Eggshell
 - 4. PPG Pure Performance Latex Eggshell

2. Interior Finish Carpentry for Latex Semi-Gloss Paint Finish (softwoods, paint grade hardwoods, MDO, and hardwood veneers):

- One Coat
- 1. Moore Eco Spec WB Interior Latex Primer (372)
 - 2. Duron Genesis Latex Primer
 - 3. PPG Pure Performance Latex Primer

- And Two Coats
- 1. Moore Eco Spec WB Interior Latex Semi-Gloss (376)
 - 2. Duron Genesis Latex Semi-Gloss
 - 3. PPG Pure Performance Latex Semi-Gloss

D. Interior Paint Schedule for High Performance Coatings:

1. Interior Concrete Ceiling Surfaces for Acrylic – Semi-Gloss Finish for Garage Ceilings:

- One Coat
- 1. Tnemec 27WB Typoxy at 4.0-6.0 mils DFT
 - PPG PMC Amerlock Sealer at 1.0 mils DFT
 - International Intercryl 520 at 3.0 mils DFT

- Two Coats
- 1. Tnemec 1028/1029 Tufcryl at 2.0 to 3.0 mils DFT per coat min.
 - 2. PPG PMC Amercoat 220 at 3.0 mils DFT
 - 3. International Intercryl 530 at 3.0 mils DFT

2. Interior Concrete Block, Epoxy/Urethane Coating:
(Surface Preparation: Cured, clean and dry, free of surface contaminants)

One Coat 1. Tnemec 130 Envirofil at 100 sq/ft/gal
PPG PMC Amercoat 965 at 100 sq/ft/gal

One Coat 1. Tnemec 27WB Typoxy at 6.0 8.0 mils DFT
PPG PMC Amercoat 133 at 6-8 mils DFT

One Coat: 1. Tnemec 1080 /1081 Endurashield at 3.0 – 4.0 mils DFT
PPG PMC AmerShield VOC at 2.0 to 3.0 mils DFT

3. Interior Concrete Walls Exposed to View, Urethane Coating:
(Surface Preparation: Cured, clean and dry, free of surface contaminants)

One Coat 1. Tnemec 27WB Typoxy at 3.0- 4.0 mils DFT
2. PPG PMC Amercoat 133 at 6-8 mils DFT

One Coat 1. Tnemec 27WB Typoxy at 6.0 to 8.0 mils DFT
2. PPG PMC Amercoat 133 at 6-8 mils DFT

One Coat 1. Tnemec 1080 / 1081 Endura-Shield WB at 3.0 to 3.5 mils DFT
2. PPG PMC AmerShield VOC at 2.0 to 3.0 mils DFT

4. Interior Concrete Walls Exposed to View, Epoxy Coating for Non-Immersion Service:
(Surface preparation- Cured, clean, dry and free of contaminants)

One Coat 1. Tnemec 27WB Typoxy at 3.0- 4.0 mils DFT
2. PPG PMC Amercoat 133 at 6-8 mils DFT

One Coat 1. Tnemec 27WB Typoxy at 6.0 to 8.0 mils DFT
2. PPG PMC Amercoat 133 at 6-8 mils DFT

One Coat 1. Tnemec 1080 / 1081 Endura-Shield WB at 3.0 to 3.5 mils DFT
2. PPG PMC AmerShield VOC at 2.0 to 3.0 mils DFT

5. Interior Metals, Epoxy (Not specified to receive other coating systems/not shop finished/intended to be painted):

One Coat 1. Approved primer, in shop under other Sections (where specified). If not shop primed, provide primer recommended by finish coating manufacturer

One Coat 1. Tnemec 27WB Typoxy at 2.0 to 3.0 mils DFT
2. PPG PMC Amerlock 400 at 2.0 to 4.0 mils DFT
3. International Interseal 670 HS at 3.0 mils DFT

One Coat 1. Tnemec 1081 EnduraShield WB at 2.0 to 3.0 mils DFT
2. PPG PMC Amerlock 400 at 2.0 to 4.0 mils DFT
3. International Intercryl 530 at 3.0 to 4.0 mils DFT

6. Interior Steel, Joists, Ductwork, Conduit and Similar Items Not Galvanized:

One Coat 1. Tnemec Series 115 WB Unibond at 2.5 to 3 mils DFT
2. PPG PMC Amercoat 220 Acrylic Series at 3.0 mils DFT
3. RD Muracryl at 2.5 to 3.0 mils DFT

7. Interior Galvanized Metal: Refer to specification section 05041 – Hot Dip Galvanizing for shop finished galvanized metal. Paint system below is for galvanized and shop-primed steel items that are not hot-dip galvanized. Surface Preparation SSPC-SP7 Brush-Off Blast.
- One Coat
1. Tnemec 66HS Hi-Build Epoxoline at 3.0 mils DFT
 2. PPG PMC Amerlock 400 Hi-Build Epoxy at 4.0-5.0 mils DFT
 3. International Intergard 475 HS at 5.0 to 10.0 mils DFT
- One Coat
1. Tnemec 1080 /1081 Endurashield at 3.0 – 4.0 mils DFT
 2. PPG PMC AmerShield VOC at 2.0 to 3.0 mils DFT
 3. International Intergard 475 HS at 5.0 to 10.0 mils DFT
8. Mechanical and Electrical Work; Paint all exposed items that are located on surfaces that are to be painted only except factory finished items with factory-applied baked enamel finishes which occur in mechanical rooms or areas, and excepting chrome or nickel plating, stainless steel, and aluminum other than mill finished. Paint all exposed ductwork and inner portion of all ductwork: Same as specified for other interior metals, hereinabove. Note: Do not paint exposed mechanical and electrical work inside of garage that are installed on unpainted surfaces.

END OF SECTION

SECTION 10100

DISPLAY CASES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies all display cases as indicated on the Design Documents and specified herein.
- B. Transportation: Deliver all display cases and related elements, including mounting hardware, to the job site.
- C. Temporary: Provide fabrication, erection, and removal of any and all temporary safety barricades, temporary holding, retaining or storage structures necessary as described herein.

1.2 PERFORMANCE REQUIREMENTS

- A. Design Criteria: Design, fabricate, and install display cases to withstand normal exposure to weather, temperature variation, wind loads and building movement; provide units resistant to vandalism and theft.
- B. Field Measurements: Check actual locations of construction - to which metal fabrications must fit - by accurate field measurements before fabrication; show recorded measurements on final shop drawings.
- C. Thermal Movements: Allow for thermal movement resulting from the following maximum change (range) in ambient temperature in engineering, fabricating, and installing cases to prevent buckling, opening of joints, over stressing of components and connections, and other detrimental effects. Base engineering calculation on actual surface temperatures of materials due to both solar heat gain and nighttime sky heat loss.
 - 1. Temperature Change (Range): 0 - 180 deg F ambient, material surfaces.
- D. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.3 SUBMITTALS

- A. All submittals shall be provided to the MBTA for review.
- B. Product Data: Manufacturer's product data, any limitations and recommendations for each material used, installation instructions, and manufacturer's certification (stating that materials comply with requirements) for the MBTA's review and acceptance.
 - 1. Include material details for each display case specified.

- C. Shop drawings: Submit shop drawings showing layout, profiles, and product components, including dimensions, anchorage, all details, plans and sections required to indicate all conditions. Provide shop drawings for review by the MBTA.
- D. Samples for Approval: Submit suppliers standard color chart for selection purposes and selected colors to the MBTA for verification.

1.4 QUALITY ASSURANCE

- A. Reference Standards: The work shall conform to the codes and standards of the following regulatory Agencies and Authorities as further cited herein:
 - 1. ADAAG: Americans with Disabilities Act Accessibility Guidelines
 - 2. ANSI: American National Standards Institute.
 - 3. ASTM: American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103 as published in "Compilation of ASTM Standards in Building Codes".
 - 4. MAAB: Massachusetts Architectural Access Board.
- B. Source: Obtain all products in this section from a single supplier.
- C. Qualifications: The approved manufacturer shall have a minimum of 5 years of successful experience with similar work, and shall have a reputation for doing satisfactory work on time.
- D. Engineering: The DB Entity is responsible for the proper engineering of all items. The internal structure, dimensions and specifications for all items shall be indicated in the DB Entity's shop drawings. The DB Entity to engineer display cases to proper level to withstand their environment.
- E. Coordination: The work in this Section shall be completely coordinated with the work of other Sections. Verify dimensions and work of other trades that adjoin materials of this Section before the installation of items herein specified. Cooperate with such trades to assure the steady progress of all work under this Contract.
- F. Project Meetings: Subcontractors are required to attend project meetings at the Project site.
- G. Certification: Submit manufacturer's certification that materials furnished comply with requirements specified.
- H. Maintenance Instructions: Submit manufacturer's printed instructions for maintenance of each display case installed to the MBTA, including precautions for use of cleaning materials.
- I. Warranty:
 - 1. Submit a written Manufacturer's warranty for MBTA acceptance, signed by the manufacturer, agreeing to repair or replace display cases that fail due to defects in material or workmanship during the specified warranty period.
 - 2. Warranty Period: 1 Year Limited

1.5 DELIVERY, STORAGE AND HANDLING

- A. Installer: Installer specialized and experienced in work similar to that required for this project shall perform Installation.
- B. Deliver work under this Section to the site in ample time to avoid delay in job progress and at such times as to permit proper coordination of the various parts.
- C. Installation of this work shall be scheduled to occur near time of Contract Substantial Completion.

1.6 PROJECT CONDITIONS

- A. Inspection of Site: The DB Entity shall visit the site of the proposed work and become fully acquainted with existing conditions, and fully informed as to the facilities involved and the difficulties and restrictions attending the requirements of the Contract Documents, prior to submitting a price quotation.
- B. Substrates: Proceed with work of this Section only when substrate construction and penetration work have been completed.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturers products must meet or exceed the specifications approved for use on the Project. Provide products of one of the following vendors or approved equal:
 - 1. Access Display Group
 - 2. SwingFrame
 - 3. Outdoor Display Cases

2.2 MATERIALS

- A. Materials
 - 1. Aluminum Extrusions: Meeting ASTM B221, alloy 6063-T6.
 - 2. Aluminum Panels: Meeting ASTM B209, minimum 0.032" thick.

2.3 FABRICATION

- A. General:
 - 1. Comply with requirements indicated for materials, thickness, finishes, colors, designs, shapes, sizes and details of construction.

2. Welded Connections: Comply with AWS standards for recommended practices in shop welding. Provide welds behind finished surfaces with distortion or discoloration of exposed side. Clear exposed welded surfaces of welding flux and dress on exposed and contact surfaces.
 3. Mill joints to a tight, hairline fit.
 4. Pre-assemble display cases in the shop. No visible fasteners.
 5. Form panels to required size and shape. Comply with requirements indicated for design, dimensions, finish, color and details of construction.
 6. Display cases to be fabricated based on dimensions as shown on Design Documents.
 7. Coordinated dimensions and attachment methods to produce display panels with closely fitting joints. Align edges and surfaces with one another in the relationship indicated.
 8. Increase metal thickness or reinforce with concealed stiffeners or backing materials as required to produce surfaces without distortion, buckles, warp or other surface deformations.
 - a. Fabricate frame from extruded aluminum. Corners to have hairline miters and be braced by means of internal aluminum angels. If welding is necessary, none should be visible. Frames shall have a continuous back-up member behind door.
 - b. Venting: Provide venting as recommended by the manufacturer to prevent condensation.
- B. Display Case Construction:
1. Casing: Aluminum extrusion mitered and reinforced with locking corner brackets.
 2. Exterior Backing: 0.032" weather resistant aluminum with silicone sealant.
 3. Interior Backing: 1/32" cork laminated to 7/16" fiberboard.
 4. Weep Holes: on bottom.
 5. Lock: security cam lock.
- C. Finishes:
1. Aluminum with anodized finish: Black.
 2. Aluminum with a satin polyurethane coating. Faces shall be smooth, free of scratches, blemishes or other imperfections.
- D. Door Profile:
1. Hinged aluminum extruded door, mitered and assembled with concealed corner angles, 1/4" shatter resistant acrylic window, and cam lock.
- E. Background:
1. Vinyl (grey) over Cork/Fiberboard.
- F. Mounting:
1. Sign Frame Mounting: Mount display case to sign frame structure through case sides.
 - a. Maintain a minimum 3/16" open joint to allow for venting.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The DB Entity shall examine substrates, supports, and conditions under which this Work is to be performed, and notify the MBTA in writing of conditions detrimental to the proper completion of the Work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means DB Entity accepts substrates and conditions.
- B. Notification Point: MBTA will be given 72 hour notice to perform field inspection at the start of installation. If work does not meet project requirements, the DB Entity must remove and replace deficient work.

3.2 INSTALLATION/APPLICATION/ERECTION

- A. Strictly comply with accepted shop drawings and manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this Section.
- B. Install work plumb, level, and in true plane and alignment and at heights indicated in accordance with manufacturer's recommendations.
- C. Install products at heights to conform to Americans with Disabilities Act Accessibility Guidelines (ADAAG) and applicable local amendments and regulations.
- D. Follow manufacturer's instructions for storage and handling of units before installation.
- E. Protect adjacent or adjoining surfaces and work from damage during installation in this Section.
- F. Work shall be designed and anchored so that work will not be distorted nor the fasteners overstressed from expansion and contraction of metal or other materials as applicable.

3.3 CLEANING AND PROTECTION

- A. Touch-up damaged finishes and eliminate any evidence of repair. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully repaired or cleaned.
- B. Provide temporary protection to ensure work is delivered without damage or deterioration at time of final acceptance. Remove protections and reclean as necessary immediately before final acceptance.
- C. Manufacturer shall provide Authority with information on cleaning and maintenance recommendations for all display cases.
- D. Names, stamps and decals of manufacturers, installers or maintainers of display cases shall not be visible in the finished work.

END OF SECTION

SECTION 10400

FIXED SIGNAGE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies all fixed signage as indicated on the Design Documents and specified herein. The work of this section includes, but is not limited to, the fabrication and installation of the following:
1. Station Identification and Wayfinding signs as indicated – porcelain enamel on steel
 2. Maps – Line, RTL, Neighborhood, Bus Neighborhood– porcelain enamel on steel
 3. Historic Interpretive Murals – porcelain enamel on steel
 4. Regulatory, Informational signage - Aluminum
 5. Sign frames and mounting accessories as indicated and required
- B. Custom software to be used by the MBTA for generating all custom sign content as digital files. No other method of creating graphic files or content is permitted.
- C. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
1. Section 09900 – PAINTING
 2. Section 10100 – DISPLAY CASES
 3. Section 10401 – METAL SIGN FRAMES
 4. Section 10426 – TACTILE /BRAILLE SIGNAGE
 5. Division 16 of Exhibit 2A.1 – ELECTRICAL - “Exit” signs; and “Variable Message Signs”
- D. Transportation: Deliver all signs and related elements, including frames and mounting hardware, to the job site.
- E. Temporary: Provide fabrication, erection, and removal of any and all temporary safety barricades, temporary holding, and retaining or storage structures necessary as described herein.
- F. Permits: Obtain permits required by Authority Having Jurisdiction for installation of signs and frames.
- G. Coordination between the DB Entity and MBTA on signage requires Pre-Design meeting: DB Entity required meeting with MBTA to discuss signage specs, process, and signage guidelines.
- H. Pre-Construction meeting: The DB Entity and signage/frame sub (same source for porcelain enamel signage and framing to ensure quality.) required to meet with MBTA to discuss signage specs and schedules.
- I. FIXED SIGNAGE SUBMITTAL PROCESS SUMMARY (Details found in 1.2 Submittals)
1. Submittals must include a dated transmittal form and be provided to MBTA

2. Pre-Construction meeting with MBTA, the DB Entity, and sign/framing fabricator:
 - a. Review scope for signage and frames, submittal process, schedule, expected fabrication lead times, overall fabrication process and critical path to completion.

1.2 SUBMITTALS

- A. All submittals shall be provided to both the MBTA for review.
- B. Product Data: Manufacturer's product data, any limitations and recommendations for each material used, installation instructions, and manufacturer's certification (stating that materials comply with requirements) shall be provided to the MBTA for review and acceptance.
- C. Shop Drawings: Submit shop drawings for fabrication and installation of each sign assembly. This includes, but is not limited to; sign frames and associated sign panel drawings, plans and elevations, sign content elevations, and large-scale details of each sign frame and sign panel showing all required mounting holes, slots, clips, flanges, and other integral fastener components and accessory items. Provide date stamped digital copies of shop drawings for review by the MBTA.
- D. Sign Schedules: Submit complete sign schedule for each sign. Use same designations as indicated on the Design Documents. Notify the MBTA, in writing, of any size variances from the construction documents so that adjustments can be made to the final sign fabrication files.
- E. Samples for Approval: Sample Submittals are in addition to quantities shown in sign schedule. They are record project samples to be kept on file at the MBTA.
 1. Samples and Proofs: To be provided to the MBTA within 30 business days from the MBTA's submittal of digital artwork. All samples and proofs must be produced by the fabricator and submitted to the MBTA by the DB Entity for acceptance.
 2. Fabricator proofs:
 - a. For each sign assembly/content type listed on the signage schedule, provide digital proofs on all files and full size paper proofs on selected files as determined by the MBTA; the DB Entity shall request graphic artwork from the MBTA.
 - b. Submit 3" x 4" samples of each color on all signage substrates specified.
 - c. For art and mural panels (if indicated), provide full size paper proofs; the DB Entity shall request graphic artwork from the MBTA.
 3. For porcelain enamel signage, art panels, and murals provide 15" x 15" sample with flanges on all four sides of the sample (area of sign determined by MBTA). Samples and proofs will be resubmitted until they meet quality standards outlined in the next section.
 4. Provide samples and proofs to the MBTA at no extra charge.
 5. acceptance is required from the MBTA for all samples and proofs prior to final signage production.
 6. Mock-ups: Provide a full-size mock-up in place of each type of sign, for locations, to verify selections made under sample submittals and to demonstrate aesthetic effects and quality of

materials and execution. Build mock-ups to comply with the specified requirements, using materials indicated for final unit of Work.

- a. If the MBTA determines mock-ups do not comply with requirements, provide new corrected sign(s) until mockups are accepted.
- b. Accepted mock-ups may become part of the completed work if undisturbed at time of Contract Substantial Completion.

1.3 SUPPLIED GRAPHICS

- A. Digital Graphics files: The MBTA will prepare and supply all digital sign content to the DB Entity.
 1. Elevation drawings of all signs at $\frac{1}{2}'' = 1'$ scale will be provided in raster format for the DB Entity use in preparing shop drawings.
 2. Full size sign layouts will be provided in vector format for direct fabrication from digital files.
 3. The DB Entity is responsible for verifying that each sign frame and sign panel is coordinated with the dimensions and content of supplied digital sign files, and for fabricating and installing all signs based on the MBTA's supplied graphic layouts of signs, historic interpretive panels and associated panels.
- B. Formats: Digital files are provided in vector format (.EPS) for use in final fabrication of signs, and in raster format (.PNG) at $\frac{1}{2}'' = 1'$ scale for insertion in to shop drawings. Vector graphics do not contain editable fonts. Any typographic editing must be done by the MBTA and returned to the DB Entity.
- C. Colors: Match all spot colors using the Pantone Matching System (PMS) or as per file designation in the digital files and in compliance with the standard colors as identified in the MBTA Signage Guidelines. Color samples, PMS color swatches, and proofs are to be provided to the MBTA at no extra charge. Standard PMS Colors by Line:

<u>Line</u>	<u>PMS Color</u>
Blue Line	293 C
Green Line	348 C
Orange Line	152 C
Red Line	485 C
Silver Line	430 C
Commuter Rail (purple)	249 C
Amtrak (brand color)	302 C
Bus (Yellow)	1235 C
Commuter Boat	3135 C

- D. Mural Panels: The DB entity shall request the final digital artwork for the mural panels from the MBTA. The DB Entity shall be responsible for the fabrication of the artwork, adhering to industry standards of quality and procedures. When one image spans several panels, either a larger sized porcelain panel will be required or margins shall be minimized to reduce white seams.
 1. The DB Entity to provide name of sign, art, and mural manufacturer.

2. Resolution of final sign output by fabricator must be in vector format (not raster format) with a minimum resolution of 150- 300 LPI. Final output shall match EPS digital files for accurate layout, smoothness of contours and letter forms, and evenness of colors.
3. Fabricator must provide written documentation of their capabilities/specs to the MBTA to show resolution output capability of equipment - line screens (LPI).

1.4 PERFORMANCE REQUIREMENTS

1. Design Criteria: Design, fabricate, and install sign items to withstand normal exposure to weather, temperature variation, wind loads and building movement; provide units resistant to vandalism and theft.
2. Field Measurements: Check actual locations of construction - to which metal fabrications must fit - by accurate field measurements before fabrication; show recorded measurements on final shop drawings.
3. The drawings indicate minimum dimensions and thicknesses for components. Where performance requirements necessitate thickness of material to be increased or additional reinforcing to be added such revisions shall be made without changing the visible profiles of inlay elements. Where changes cannot be made without changing visible profiles they shall be made only with acceptance by the MBTA.
4. Thermal Movements: Allow for thermal movement resulting from the following maximum change (range) in ambient temperature in engineering, fabricating, and installing signs to prevent buckling, opening of joints, over stressing of components and connections, and other detrimental effects. Base engineering calculation on actual surface temperatures of materials due to both solar heat gain and nighttime sky heat loss.
 - a. Temperature Change (Range): 0 - 180 deg F ambient, material surfaces.
5. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.5 QUALITY ASSURANCE

- A. MBTA Reference Standards: Comply with the MBTA Signage Guidelines V 03.2015.
- B. Reference Standards: The work shall conform to the codes and standards of the following regulatory Agencies and Authorities as further cited herein:
 1. ADAAG: Americans with Disabilities Act Accessibility Guidelines
 2. ANSI: American National Standards Institute.
 3. ASTM: American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103 as published in "Compilation of ASTM Standards in Building Codes".
 4. MAAB: Massachusetts Architectural Access Board.
 5. PEI: Porcelain Enamel Institute, Inc., 1900 L Street N.W., Washington, DC, 20036 – “Specifications for Architectural Porcelain Enamel,” PEI-1001 (S-100); and “Standard Tests for Special Properties and Classifications.”

6. Structural Code:
 - a. Mass Building Code
 - b. AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaries and Traffic Signals
- C. Source: For each material type required for the work in this Section, provide Single-Source Responsibility. This local Single-Source supplier will control coordination and installation of Frames and Fixed Signage. For each separate type of sign required, obtain signs from a single manufacturer. Inform the MBTA of single-source supplier prior to submission of artwork.
- D. Accessibility: The ADAAG and the MAAB regulations are pertinent to the design and installation of items covered under the work of this Section. When guidelines conflict, the guideline giving greater access shall be applicable.
- E. Signage and Frame Coordinator Qualifications: The approved signage and frame coordinator for the manufacturing, delivery, and installation of porcelain enamel shall have a minimum of 5 years of successful experience with porcelain enamel signage and frame work, and shall have a reputation for doing satisfactory work on time.
- F. Welding Standards: Comply with applicable provisions of the American Welding Society AWS D1.1 "Structural Welding Code".
 1. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
- G. Coating Applicator Qualifications: must be experienced in successfully applying specified coatings of the type indicated to specified materials, and equipped with the following:
 1. Application equipment required to apply a uniform coating as recommended by the coatings manufacturer.
- H. Engineering and structural analysis for signs, as well as necessary calculations, shall be prepared under the supervision of, and signed and sealed. These calculations shall include gravity, wind, and seismic loading. The internal structure, dimensions and specifications for all items shall be indicated in the Contract Documents, and shall be indicated in the DB Entity's shop drawings. Signs shall be designed to withstand surrounding environmental conditions.
- I. Coordination: The work in this section shall be completely coordinated with the work of other sections. Verify dimensions and work of other trades that adjoin materials of this section before the installation of items herein specified. Cooperate with such trades to assure the steady progress of all work under this contract.
- J. Project Meetings: The signage subcontractor and related subcontractors shall be required to attend project meetings at the project site when required by the DB Entity and MBTA.
- K. Certification: Submit manufacturer's certification that materials furnished comply with requirements specified.

- L. Maintenance Instructions: Submit manufacturer's printed instructions for maintenance of each sign installed to the MBTA, including precautions for use of cleaning materials and solvents for paint removal, which could damage surfaces.
- M. Warranty:
 - 1. Submit a written manufacturer's warranty for MBTA acceptance, signed by the manufacturer, agreeing to repair or replace panels that fail during the specified warranty period. Failures include, but are not limited to, the following:
 - a. Coating degradation.
 - b. Chipping, chalking, fogging or discoloration.
 - c. Fading.
 - d. Structural failure.
 - e. Delamination of applied graphics.
 - f. Delaminating or degradation of applied anti-graffiti coatings.
 - 2. Warranty Period:
 - a. Porcelain Steel Enamel – 10 years
 - b. Aluminum – 7 years
 - 3. The manufacturer's warranty is in addition to, and not a limitation of, other rights the MBTA may have under the contract documents.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver and store work under this section in a manner to prevent the cracking or stress of components, and to prevent mechanical damage or damage from the elements.
 - 1. Porcelain Enamel Signs: Store units at building site, under cover. Place units on minimum 4" high wood blocking. Do not use non-ventilating plastic or canvas shelters that could create humidity chambers. If package becomes wet, remove carton and crating immediately. Provide 1/4" spaces between stacked units to promote air circulation.
- B. Deliver work under this section to site in ample time to avoid delay in job progress and at such times as to permit proper coordination of the various parts.
- C. Installation of this work shall be scheduled to occur near time of Contract Substantial Completion.
- D. Handle signs carefully to prevent breakage, surface abrasion, denting, soiling, and other defects. Comply with the manufacturer's written handling instructions for unloading components subject to damage. Inspect sign components for damage on delivery.
 - 1. Do not install damaged sign components.
 - 2. Repair minor damage to signs, provided the finished repair is equal in all respects to the original work and is accepted by MBTA; otherwise, remove and replace damaged sign components.

1.7 PROJECT CONDITIONS

- A. Inspection of Site: The DB Entity shall visit the site of the proposed work and become fully acquainted with existing conditions, and to become fully informed as to the facilities involved and the difficulties and restrictions attending the performance of the contract, prior to submitting a price quotation.
- B. Substrates: Proceed with work of this section only when substrate construction and penetration work have been completed.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Porcelain Enamel on Steel Signs:
 - 1. Acceptable Porcelain Enamel Sign Manufacturers: Provide products of one of the following manufacturers or approved equal if they meet the requirements of these specifications:
 - a. Winsor Fireform Porcelain, Inc., Tumwater, WA
 - b. Cherokee Porcelain Enamel Corp., Knoxville, TN
 - c. KVO Industries, Inc., Santa Rosa, CA
 - 2. Metal Preparation/Cleaning:
 - a. All panels shall be degreased by immersion in an approved degreasing fluid. The panels shall then be rinsed in a heated water bath.
 - b. After the first rinse, panels shall be immersed in a caustic solution sufficient to provide an "etched" surface capable of good porcelain adherence. The panels shall then be rinsed.
 - c. After the third rinse, the chemical action shall be neutralized in a soda ash solution then dried rapidly.
 - 3. Porcelain Enameling:
 - a. A porcelain enamel ground coat shall be applied to all areas of each unit, including backside and flanges, by spraying methods recognized by the Porcelain Enamel Institute. At least one additional separately fired cover-coating shall be applied to the face side and flanges of each unit. For corrosion protection and flatness, one additional coating shall be applied to the backside of each panel.
 - b. Apply digitally supplied sign content graphics by silkscreen process; each color shall be fired separately and shall be uniform and even.
 - 4. Finish and Background Color Control
 - a. Color to match approved samples based on MBTA standard colors.
 - b. Continuity of coating: Visual inspection of each unit shall reveal no visible breaks, gas bubbles, scumming, hairlines, stress lines or surface defects in the cover coat.

- c. Check color at each application of enamel with a Hunter Lab D-25 P.C. color difference meter. Produce colors within the limits established during processing of submittals.
 - d. The color and finish shall match a color sample previously submitted to and accepted by the MBTA.
 - 5. Ground and Overcoat Thickness
 - a. Ground and overcoat thickness shall be applied in accordance with PEI recommendations to a thickness range between 0.004 to 0.020", as required by the manufacturer to suit the intended use.
 - 6. Firing
 - a. Panels shall be fired in a continuous furnace (not a batch-type furnace) at a temperature between 1450 - 1600 degrees Fahrenheit to fuse the porcelain enamel to the metal, expel any volatile matter, and ensure color uniformity.
 - b. After firing, every panel is submitted to a visual inspection for color consistency against the control panel as accepted by the MBTA.
 - 7. Glasses
 - a. Glasses used in the screening process shall be acid resistant and opaque. The glasses shall be corrosion proof, UV proof, wind proof, and vandal resistant. All screen glass must be milled to a 400 mesh particle size or smaller.
 - 8. Mural Panels
 - a. When one image spans several panels either a larger sized porcelain panel will be required or margins shall be minimized to reduce white seams.
- B. Aluminum Signs
- 1. Acceptable Aluminum Sign Manufacturers: Provide products from manufacturers if they meet the requirements of the specifications following.
 - 2. Aluminum Grade: Alloy 6063-T5 aluminum sheet. Thicknesses as indicated on the sign schedule
 - a. Surfaces constructed to remain flat under installed conditions within a tolerance of plus or minus 1/16" (1.5 mm) measured diagonally from corner to corner. Increase metal thickness or reinforce with concealed stiffeners or backing materials as required to produce surfaces without distortion, buckles, warp, or other surface deformations.
 - b. Unframed Single Sheet Panels: Provide unframed single sheet sign panels with edges mechanically and smoothly finished. The thickness of the aluminum sheeting shall be as shown on the plans or in these specifications.
 - c. Aluminum panels shall be free of buckles, warps, dents, cockles, burrs, and any other defects resulting from fabrication processes.
 - d. All possible fabrication including shearing, cutting and punching of holes shall be completed prior to pretreatment of the sheeting.

3. Coordinate dimensions and attachment methods to produce message panels with closely fitting joints. Align edges and surfaces with one another in the relationship indicated.
4. Continuously weld joints and seams unless other methods are indicated; grind, fill, and dress welds to produce smooth, flush, exposed surfaces with welds invisible after final finishing.
5. Provide concealed sealing of joints to exclude water and provide corrosion protection, exclude sealing of joints where drainage of moisture will be inhibited - do not seal weep holes. Seal joints with specified sealers. For exposed sealers, provide color to match finish. Provide joint sealers tested for adhesion and compatibility with specified materials and finishes.
6. Mounting Method: Provide members with pins of length shown; for installation, weld to base plates or mechanically fasten where shown unless otherwise indicated. Provide turned pins and other anchorage provisions to resist vandalism and theft.
7. Silk screening imaging: Screen-printed graphics shall be produced directly from full-sized digital vector files, provided to the DB Entity as final approved graphics. Graphic files shall utilize digitally-prepared screens and shall be printed in accordance with accepted industry standards. No hand-cut screens will be accepted. All screen-printing shall be executed in such a manner that all edges and corners of letterforms are true and clean. Letterforms, color areas, or lines with rounded positive or negative corners, built-up edges, bleeding, spattering, etc. will not be accepted. All inks shall be applied evenly without pinholes, scratches, orange peeling, etc. All silk screening processes shall be accepted by the MBTA prior to fabrication.
8. Finishes:
 - a. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations relative to applying and designating finishes.
 - b. The front and back surfaces of all aluminum panels shall be cleaned, deoxidized, and coated with a light, tightly adherent chromate conversion coating free of any powdery residue.
 - c. Shop finish individual components prior to mechanical assembly.
 - d. Color to match approved samples based on MBTA standard colors.
 - e. Shop Painting of Panel Faces:
 - 1) Abrasive brush blasting preparation (SSPC-SP7) to a 100-mesh sandpaper texture.
 - 2) Finish Coats: Provide intermediate and finish coats of "Imron Elite" polyurethane enamel or approved equal to achieve the colors and matte finish selected by the MBTA.
9. Anti-graffiti coating
 - a. For signs scheduled to receive anti-graffiti coating, provide a high-durability, "permanent type" quality, matte finish, non-yellowing, and suitable for painted aluminum surfaces, as manufactured by one of the following companies, or approved equal:
 - 1) Monopole, Monochem Permashield Premium
 - 2) Dumond CPU 647 Graffiti Barrier Coat
 - 3) Adsil Microguard AD00

- b. Apply anti-graffiti coatings in strict accordance with manufacturer's instructions
- c. Warranty: 10 years

C. Hardware and Frames

1. Supply sign frames and hardware as indicated on the drawings.
2. Structural steel materials, details and workmanship shall conform to the specifications of the latest edition of the A.I.S.C. Specifications for the Design, Fabrication, and Erection of Structural Steel Buildings. ASTM standards:
 - a. Extruded Bars and Shapes: ASTM B 221 (ASTM B 221M), 6063-T6.
 - b. Plate and Sheet: ASTM B 209 (ASTM B 209M), 6061-T6.
 - c. Die and Hand Forging: ASTM B 247 (ASTM B 247M), 6061-T6.
 - d. Castings: ASTM B 26/B 26M, A356-T6.
3. Anchors and Inserts: Use non-ferrous metal or hot-dipped galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. High strength bolts other than anchor bolts, nuts and washers shall conform to ASTM-A325. Use toothed steel or lead expansion bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into concrete or masonry work.
4. Tamper resistant fasteners to be stainless steel, 3/8" dia. button head Phillips socket pinhead.
5. Threaded studs shall be low carbon mild steel with a minimum yield strength of 50,000 PSI.
6. All hardware shall be as indicated on Design Documents: 316 stainless steel, or galvanized per ASTM-A153 requirements.
7. Where mechanical fasteners and hardware are required, they shall be of adequate thickness, length and construction to properly secure the sign unit. Any visible portion of any mounting device shall be finished to match adjacent sign surface, unless otherwise specified.
8. Non-metallic Washers: Provide rigid neoprene separators between fasteners and non-compatible materials being joined.
9. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of metal to be welded, complying with applicable AS specifications, and as required for color match, strength, and compatibility in the fabricated items.
10. Galvanizing Repair Paint: High zinc dust content paint for re-galvanizing welds in galvanized steel, with dry film containing not less than 94 percent zinc dust by weight, complying with DOD- P-21035 or SSPC-Paint 20.
11. Backing Materials: 1/2" cement board backing, for locations requiring non-combustible assemblies - Hardibacker 500 Board or equal. Where combustible materials are allowed, backing may be 1/2" APA Graded, Exterior Grade A-C Plywood and Marine Grade Plywood, as indicated on the drawings.

D. Adhesives:

1. Where adhesive mounting techniques are specified, the DB Entity shall use adhesives specifically designed for compatibility with the base materials and the desired adhesive strength. All adhesives shall be tested on site. All adhesives shall be indicated in the shop drawings.
2. Surfaces on which signage is to be installed using adhesive shall be free of grease, oil, or any other residue.
3. Foam tape shall be 1/32" thick, high-density open cell double coated polyurethane foam tape for applications indicated as manufactured by the 3M Co. or approved equal.
4. Very high bond (VHB) tape shall be double coated acrylic foam tape.

E. Sealant:

1. For joints indicated in the drawings, provide silicone sealant that meets or exceeds the industry specifications TT-S-230C Class A, ASTM C 920, Class 50, Type S, Grade NS as manufactured by one of the following companies, or approved equal:
 - a. Tremco, Spectrem 1
 - b. Pecora, 864NST
2. Install in strict accordance with manufacturer's instructions.
3. Surface Preparation: prepare joints in accordance with ASTM C 1193 and manufacturer's instructions. For good adhesion, the joint interface must be sound, clean and dry. Clean joint surfaces to remove dirt, dust, oils, wax, paints, and other contamination capable of affecting primer and sealant bond.
4. Joint-Sealant Backing:
 - a. General: provide sealant backings of material and type that are non-staining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.
 - b. Elastomeric Tubing Sealant Backings: neoprene, butyl, EPDM, or silicone tubing complying with ASTM D 1056, nonabsorbent to water and gas, and capable of remaining resilient at temperatures down to minus 26 degrees F. Provide products with low compression set and of size and shape to provide a secondary seal, to control sealant depth, and to otherwise contribute to optimum sealant performance.
 - c. Bond-Breaker Tape: polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surface at back of joint where such adhesion would result in sealant failure. Provide self-adhesive tape where applicable.
5. Color: match to frame color as closely as possible – use dark sealant with dark-colored frames and light sealant with light-colored (or galvanized) frames.

2.2 FABRICATION

A. Porcelain Enamel Signs:

1. ASTM A424. Porcelain sign panels shall be #16 gauge prime vitreous enameling steel finished with non-fading class A or AA acid resisting Architectural porcelain enamel in color specified, fused to the metal at temperatures between 1450 F to 1600 F. Porcelain enamel sign panels shall be of the best commercial quality and their forms shall be flat, straight, and true. Finish shall be non-reflective matte. Base metal shall receive a ground coat on all surfaces and successive face coats as required on the front and on all flanges. Silkscreened color shall be applied to face surface only. Exercise extreme care in all handling and stacking of porcelain work to avoid chipping. Graphics shall be of high resolution as per specifications.
2. Fabricate from pan-formed porcelain enameled steel plate with flat-flanged edges. All forming shall be mechanical and done in advance of welding.
3. Precisely form work to sizes, shapes, and profiles indicated on accepted shop drawings. Fabricate work with uniform joints that are not visible. Work to be truly straight, plumb, level and square with smooth flat surfaces and sharp corners
4. All welds shall be clean, sound and solid, free from defects and gas bubbles, and ground and sanded smooth to 3/16" to match the 3/16" radii of the mechanical break. They shall be done using a hand oxyacetylene fusion technique with no additions of foreign metals.
5. All necessary holes and cutouts shall be drilled or punched and welded in advance of enameling, with edges sufficiently ground to hold a porcelain coating.
6. Fabricate laminated sandwich construction, consisting of front sheet of porcelain enameled steel plate, on a 1/2 in. thick Marine Grade plywood core, with a layer of galvanized steel backing.

B. Aluminum Signs

1. Coordinate dimensions and attachment methods to produce message panels with closely fitting joints. Align edges and surfaces with one another in the relationship indicated.
2. Continuously weld joints and seams, unless other methods are indicated; grind, fill, and dress welds to produce smooth, flush, exposed surfaces with welds invisible after final finishing.
3. Provide concealed sealing of joints to exclude water and provide corrosion protection, exclude sealing of joints where drainage of moisture will be inhibited, and do not seal weep holes. Seal joints with specified sealers, and for exposed sealers, provide color to match finish. Provide joint sealers tested for adhesion and compatibility with specified materials and finishes.
4. Mounting Method: Provide members with pins of length shown for installation weld to base plates or mechanically fasten where shown unless otherwise indicated. Provide turned pins and other anchorage provisions to resist vandalism and theft.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The DB Entity shall examine substrates, supports, and conditions under which this work is to be performed, and notify the MBTA, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means DB Entity accepts substrates and conditions.
- B. Notification Point: The MBTA will be given notice to perform field inspection at the start of installation of signage. If work does not meet project requirements, the DB Entity must remove and replace deficient work.

3.2 INSTALLATION/APPLICATION/ERECTION

- A. Strictly comply with accepted shop drawings and manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this section.
- B. Install work plumb, level, and in true plane and alignment. Provide signs and graphics where shown or scheduled using mounting methods indicated.
- C. Protect adjacent or adjoining surfaces and work from damage during installation in this section.
- D. Work shall be designed and anchored so that work will not be distorted nor the fasteners overstressed from expansion and contraction of metal or other materials as applicable.

3.3 TOLERANCES

- A. The following installed tolerances are allowable variations from locations and dimensions indicated by the contract document and shall not be added to allowable tolerances indicated for other work:
 - 1. Allowable Variation from True Plumb, Level and Line: Plus or minus 1/32" from true position for signage smaller than 24" by 24" in size; plus or minus 1/16" from true position for signage 24" by 24" in size and larger.
 - 2. Allowable Variation from True Plane of Adjacent Surfaces: Plus or minus 1/16".

3.4 CLEANING AND PROTECTION

- A. Adjust work to present the best possible appearance. Touch-up damaged finishes and eliminate any evidence of repair. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully repaired or cleaned.
- B. Provide temporary protection to ensure work is delivered without damage or deterioration at time of final acceptance. Remove protections and reclean as necessary immediately before final acceptance.

- C. Manufacturer shall provide MBTA with information on cleaning and maintenance recommendations for all signs.
- D. Names, stamps and decals of manufacturers, installers or maintainers of signs shall not be visible in the finished work.

END OF SECTION

SECTION 10401

METAL SIGN FRAMES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Station Identification and Wayfinding signs as indicated – porcelain enamel on steel
 - 2. Maps – Line, RTL, Neighborhood, Bus Neighborhood maps – porcelain enamel on steel
 - 3. Historic Interpretive Murals – porcelain enamel on steel
 - 4. Sign frames and mounting accessories as indicated and required
- B. Related Work:
 - 1. Section 09900 – PAINTING.
 - 2. Section 10100 – DISPLAY CASES.
 - 3. Section 10400 – FIXED SIGNAGE.
 - 4. Section 10426 – TACTILE /BRAILLE SIGNAGE.
 - 5. Section 10428 – MBTA LOGO LOLLIPOP SIGN.
 - 6. Division 16 of Exhibit 2A.1 – ELECTRICAL - “Exit” signs; and “Variable Message Signs”.
- C. Transportation: Deliver all sign frames and mounting hardware, to the job site.
- D. Temporary: Provide fabrication, erection, and removal of any and all temporary safety barricades, temporary holding, retaining or storage structures necessary as described herein
- E. Permits: Obtain permits required by Authority Having Jurisdiction for installation of signs and frames.

1.2 PERFORMANCE REQUIREMENTS

- A. Performance Requirements for Fixed Signage Metal Frame Work.
 - 1. Design Criteria: Design, fabricate, and install sign frame items to withstand normal exposure to weather, temperature variation, wind loads and building movement; provide units resistant to vandalism and theft.
 - 2. Field Measurements: Check actual locations of construction - to which metal fabrications must fit - by accurate field measurements before fabrication; show recorded measurements on final shop drawings.

3. The drawings indicate minimum dimensions and thicknesses for components. Where performance requirements necessitate thickness of material to be increased or additional reinforcing to be added such revisions shall be made without changing the visible profiles of inlay elements. Where changes cannot be made without changing visible profiles they shall be made only with acceptance by the MBTA.
4. Thermal Movements: Allow for thermal movement resulting from the following maximum change (range) in ambient temperature in engineering, fabricating, and installing signs to prevent buckling, opening of joints, over-stressing of components and connections, and other detrimental effects. Base engineering calculation on actual surface temperatures of materials due to both solar heat gain and nighttime sky heat loss.
 - a. Temperature Change (Range): 0 - 180 deg F ambient, material surfaces.
5. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials. Insulating materials shall not be visible to public view in final configuration.

1.3 SUBMITTALS

- A. All submittals shall be provided to the MBTA for review; disposition and documentation management.
- B. Product Data: Manufacturer's product data, any limitations and recommendations for each material used, installation instructions, and manufacturer's certification (stating that materials comply with requirements) shall be submitted to the MBTA for review and acceptance.
- C. Engineering and structural analysis for metal sign and frame work, as well as necessary calculations, shall be prepared under the supervision of, and signed and sealed by, the Engineer of Record. These calculations shall include gravity, wind, and seismic loading. The internal structure, dimensions and specifications for all items shall be indicated in the Design Documents, and shall be indicated in the subcontractor's shop drawings. Signs shall be designed to a proper level to withstand abuses of their environment.
- D. Shop Drawings: Submit shop drawings for fabrication and installation of each sign assembly, including, but not limited to: sign frames and associated sign panels drawings, plans and elevations; sign content elevation (from SIGNmaker™ 1/2"=1'-0" elevation export file); and large-scale details of each sign frame and sign panel showing all required mounting holes, slots, clips, flanges, and other integral fastener components and accessory items. Shop drawings must be provided within 30 days of receiving signage plan and 1/2"=1'-0" elevation export file from MBTA. After action, provide copies of shop drawings on which action has been taken to the MBTA.
- E. Frame Field Measurements: Provide measurements of frame openings to MBTA. Final graphics export will be based on field verified sizes.
- F. Mock-ups: Provide mock-ups in place of each frame type including; suspending, spanning, surface mounted, and freestanding for locations as determined by the MBTA, to verify selections made under sample submittals and to demonstrate aesthetic effects and quality of materials and execution. Build mock-ups to comply with the specified requirements, using materials indicated for final unit of Work. If required, mock up shall include both welded and mechanical connections. Welded connections shall

be done in the shop, and not visible in final configuration as accepted by Engineer of Record, MBTA Capital Delivery Department, and MBTA Sign Shop. Mechanically attach signage in field.

1. If the MBTA determine mockups do not comply with requirements, provide new corrected frames until mockups are accepted.
 2. Accepted mock-ups may become part of the completed Work if undisturbed at time of Substantial Completion.
- G. Installer: Installer shall be trained or certified by the manufacturer to perform work. Manufacturer shall certify installer as acceptable for terms of warranty.
- H. Certificates: Welder and weld procedure qualifications.
- I. Weld inspection reports.

1.4 QUALITY ASSURANCE

- A. MBTA Reference Standards: Comply with the MBTA Signage Guidelines V 03.2015.
- B. Reference Standards: The work shall conform to the codes and standards of the following regulatory Agencies and Authorities as further cited herein:
1. ADAAG: Americans with Disabilities Act Accessibility Guidelines
 2. ANSI: American National Standards Institute.
 3. ASTM: American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103 as published in "Compilation of ASTM Standards in Building Codes".
 4. MAAB: Massachusetts Architectural Access Board.
 5. AWS D1.1, Structural Welding Code – Steel
 6. AWS D1.2, Structural Welding Code – Aluminum
 7. AWS D1.1, Structural Welding Code – Sheet Steel
 8. AWS D1.1, Structural Welding Code – Stainless Steel
- C. Source: For each type of material required for the work of this section, provide Single-Source Responsibility. This local Single-Source supplier will control coordination and installation of Frames and Fixed Signage.
- D. Installer Qualifications: Installation of sign frames specified in this section shall be performed by the fabricator. Fabricator Qualifications: The approved fabricator shall have a minimum of 5 years of successful experience with metal frame work, and shall have a reputation for doing satisfactory work on time and shall have recently successfully completed similar work.
- E. Galvanizer Qualifications: Engage the services of a qualified galvanizer who has demonstrated a minimum of five years experience in the successful application of galvanized coatings.

- F. Welding Standards: Comply with applicable provisions of the American Welding Society AWS D1.1 "Structural Welding Code".
 - 1. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
- G. Coordination: The work in this section shall be completely coordinated with the work of other sections. Verify dimensions and work of other trades that adjoin materials of this section before the installation of items herein specified. Cooperate with such trades to assure the steady progress of all Work under this Project.
- H. Project Meetings: The signage subcontractor and related subcontractors shall be required to attend project meetings at the Project site when required by the DB Entity and MBTA Capital Delivery Department.
- I. Certification: Submit manufacturer's certification that materials furnished comply with requirements specified.
- J. Inspection: Except as otherwise specified, only visual inspection of welds, materials, workmanship, finished products, and installation.
- K. Maintenance Instructions: Submit manufacturer's printed instructions for maintenance of each frame installed to the MBTA, including precautions for use of cleaning materials and solvents for paint removal, which could damage surfaces.
- L. Warranty:
 - 1. Submit a written Manufacturer's warranty for MBTA acceptance, signed by the manufacturer, agreeing to repair or replace panels that fail during the specified warranty period. Warranty begins at substantial completion. Failures include, but are not limited to, the following: Coating degradation or structural failure.
 - 2. Warranty Period: Steel Frames – 30 years; Aluminum – 10 years.
 - 3. The Manufacturer's warranty is in addition to, and not a limitation of, other rights the MBTA may have under the Project.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Deliver and store work under this Section in a manner to prevent the cracking or stress of components, and to prevent mechanical damage or damage from the elements.
- B. Deliver and store frames in wooded crates surrounded by sufficient packing material to ensure products will not be damaged.
- C. Deliver work under this Section to Site in ample time to avoid delay in job progress and at such times as to permit proper coordination of the various parts, but minimize on-site storage.

1.6 PROJECT CONDITIONS

- A. Inspection of Site: The DB Entity shall visit the site of the proposed work and become fully acquainted with existing conditions, and to become fully informed as to the facilities involved and the difficulties and restrictions attending the performance of the Project, prior to submitting a price quotation.
- B. Substrates: Proceed with work of this Section only when substrate construction and penetration work have been completed.

1.7 SEQUENCING AND SCHEDULING

- A. General approach: signs will not be fabricated until sign frames have been fabricated to the satisfaction of the DB Entity and the Engineer of Record; sign frames and frameless signs housed within architectural and/or structural spaces will not be fabricated until those spaces have been created, and shop drawings reflect their actual dimensions.
- B. Pre-Construction Conference: the DB Entity shall attend a pre-construction conference with MBTA, sign frame fabricator, and sign fabricator. The agenda will include: signage scope of work, schedule, including expected lead times, submittal process and the critical path to completion. Discuss minimum clearances of signs, based on the anticipated thickness of finish galvanization, paint, and construction tolerances. Included in this discussion is the workflow below, which includes related work in Fixed Signage Mandatory Specification Section 10400:
 - 1. MBTA shall provide 1/2" scale png sign files for use by the sign installer, and a field measurement schedule in Excel format, requiring field measurements of all locations where the signage frame is housed within architectural and/or structural elements upon request from the DB Entity.
 - 2. MBTA will determine which signs and frames will be mocked up.
 - 3. The DB Entity shall provide Porcelain Enamel color samples (See Fixed Signage Specification 10400), a completed field measurement schedule in Excel format (1.3.F), and frame shop drawings, stamped by the Engineer of Record (1.3.C, 1.3.D)

Mockups (may run concurrently with 4-7)

- a. MBTA shall provide: Full scale digital .eps files with revised measurements to the DB Entity (See Fixed Signage Specification Mandatory 10400) at the request of the DB Entity at the request of the DB Entity.
- b. The DB Entity issues: Full sized digital and paper proofs of sign elevations using .eps files (See Fixed Signage Specification 10400).
- c. Upon acceptance, the DB Entity shall issue a notice to proceed on fabrication of sign and sign frame mock-ups.
- d. Upon satisfaction with mock-ups, the DB Entity shall issue a notice to proceed with fabrication of sign frames for locations not dependent upon construction of structural and architectural elements.

4. Upon construction of the structural and architectural elements that will house sign frames and frameless signs, the subcontractor shall revise the shop drawings and field measurement schedule if indicated, and submit to DB Entity for acceptance.
5. Upon satisfaction, MBTA shall provide: Full scale digital .eps files with revised measurements to the DB Entity (See Fixed Signage Mandatory Specification 10400) at the request of the DB Entity.
6. The DB Entity issues: Full sized digital proofs and paper proofs of sign elevations using .eps files (See Fixed Signage Specification Mandatory 10400)
7. Upon acceptance of digital and paper proofs, and assuming satisfaction with mock-ups, MBTA shall issue a notice to proceed with fabrication of sign frames and all associated mounting elements, and with those signs not requiring sign frames.
8. Fabrication of signs requiring sign frames (See Fixed Signage Mandatory Specification 10400) shall not proceed until the sign frames have been fabricated, and have been accepted by MBTA for conformance with shop drawings, including size, fit, and quality of fabrication and finish. At no time is the DB Entity to alter digital artwork provided by MBTA to fit frames. Delivery of approved frames shall occur a minimum of 180 days prior to anticipated date of Contract Substantial Completion, to allow adequate time for fabrication and delivery of porcelain enamel sign panels.

PART 2 - PRODUCTS

2.1 MATERIALS AND PRODUCTS

- A. Structural steel materials, details and workmanship shall conform to the specifications of the latest edition of the A.I.S.C. Specifications for the Design, Fabrication, and Erection of Structural Steel Buildings. ASTM standards:
 1. Extruded Bars and Shapes: ASTM B 221 (ASTM B 221M), 6063-T6.
 2. Plate and Sheet: ASTM B 209 (ASTM B 209M), 6061-T6.
 3. Die and Hand Forging: ASTM B 247 (ASTM B 247M), 6061-T6.
 4. Castings: ASTM B 26/B 26M, A356-T6.
- B. Anchors and Inserts: Use non-ferrous metal or hot-dipped galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. High strength bolts other than anchor bolts, nuts and washers shall conform to ASTM-A325. Use toothed steel or lead expansion bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into concrete or masonry work.
- C. Tamper Resistant Fasteners: shall be stainless steel, 3/8" dia. button head Phillips socket pinhead.
- D. Threaded Studs: shall be low carbon mild steel with minimum yield strength of 50,000 PSI.

- E. All hardware shall be as indicated on drawings: 316 stainless steel, or galvanized per ASTM-A153 requirements.
- F. Where mechanical fasteners and hardware are required, they shall be of adequate thickness, length, and constructed to properly secure the sign unit. Any visible portion of any mounting device shall be finished to match adjacent sign frame surface, unless otherwise specified.
- G. Non-metallic Washers: Provide rigid neoprene separators between fasteners and non-compatible materials being joined.
- H. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of metal to be welded, complying with applicable AS specifications, and as required for color match, strength, and compatibility in the fabricated items.
- I. Galvanizing Repair Paint: High zinc dust content paint for re-galvanizing welds in galvanized steel, with dry film containing not less than 94 percent zinc dust by weight, complying with DOD- P-21035 or SSPC-Paint 20.
- J. Separate dissimilar metals.

2.2 FABRICATION

- A. Assemble items in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limits. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- B. Fabricate work to be truly straight, plumb, level, and square.
- C. Work Exposed to View: Take special care in choosing materials that are smooth and free of blemishes such as pits, roller marks, trade names, scale and roughness. Fabricate work with uniform, hairline tight joints. Form welded joints and seams continuously and grind flush and smooth to be invisible after painting. For exposed fasteners, use hex head bolts or Phillips head machine screws, or acorn head screws and bolts as indicated.
- D. Welded Connections: Perform welding to comply with AWS for recommended practices, using method appropriate for metal and finish indicated. Grind exposed welds flush and smooth to blend with adjoining finish metal surfaces. Maintain open joint clearances as indicated in drawings.
- E. Cut, drill, and tap as indicated to receive finish hardware, screws, and similar items metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1mm), unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- F. Fabricate seams and other connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water accumulates.
- G. Provide frames complying with A-F to hot-dip galvanizer, notify MBTA for inspection prior to hot-dip galvanizing.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The DB Entity shall examine substrates, supports, and conditions under which this work is to be performed, and notify the MBTA in writing of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means Installer accepts substrates and conditions.
- B. Notification Point: The MBTA shall be given 72 hour notice to perform field inspection at the start of installation of signage. If work does not meet project requirements, the DB Entity must remove and replace deficient work.

3.2 INSTALLATION/APPLICATION/ERECTION

- A. Strictly comply with accepted shop drawings and manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this section.
- B. Install work plumb, level, and in true plane and alignment using mounting methods indicated.
- C. Protect adjacent or adjoining surfaces and work from damage during installation in this section.
- D. Work shall be designed and anchored so that work will not be distorted nor the fasteners overstressed from expansion and contraction of metal or other materials as applicable.
- E. No field welding of sign frames. Field welding of attachments shall be allowed as required and accepted by MBTA. Welds shall not be visible in final configuration.

3.3 TOLERANCES

- A. The following installed tolerances are allowable variations from locations and dimensions indicated by the DB Entity and shall not be added to allowable tolerances indicated for other work:
 - 1. Allowable Variation from True Plumb, Level and Line: Plus or minus 1/32 inch from true position for signage smaller than 24 by 24 inches in size; plus or minus 1/16 inch from true position for signage 24 by 24 inches in size and larger.
 - 2. Allowable Variation from True Plane of Adjacent Surfaces: Plus or minus 1/16 inch.

3.4 CLEANING AND PROTECTION

- A. Adjust work to present the best possible appearance. Touch-up damaged finishes and eliminate any evidence of repair. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully repaired or cleaned. MBTA shall be final authority on acceptance of repaired work.

- B. Provide temporary protection to ensure work is delivered without damage or deterioration at time of final acceptance. Remove protections and re-clean as necessary immediately before final acceptance.
- C. Touch-up Painting: Immediately after erecting, clean bolted connections and abraded areas.
- D. The DB Entity shall provide Authority with information on cleaning and maintenance recommendations for all signs from the manufacturer.
- E. Names, stamps and decals of manufacturers, installers or maintainers of signs shall not be visible in the finished work. All assembly markings shall not be visible in the finished work.

END OF SECTION

SECTION 10424

SPECIALTY SIGNAGE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This section specifies specialty signage.
- B. Related Work:
 - 1. Section 10400 – FIXED SIGNAGE.
 - 2. Section 10401, METAL SIGN FRAMES.
 - 3. Section 10426, TACTILE/BRAILLE SIGNAGE.
 - 4. Section 10428 – MBTA LOGO LOLLIPOP SIGN.
- C. Provide all signs and graphics required by authorities having jurisdiction even if not otherwise indicated in the Contract Documents. Fire sprinkler room identification shall comply with Fire Department requirements.
- D. Permits: Obtain permits required by Authority Having Jurisdiction for installation of signs.

1.2 SUBMITTALS

- A. Product Data: Submit manufacturer's product data, installation instructions, use limitations and recommendations for each material used. Provide manufacturer's certification stating that materials comply with requirements.
- B. Shop Drawings: Provide large scale shop drawings for fabrication and installation of each sign type including mounting. Provide large scale layouts of sign wording, spacing, type size and style. Provide plans, elevations, and details of anchorage, connections and accessory items. Provide installation templates for work installed by others.
- C. Templates: Submit full size templates or film positives for all messages and graphics for all Sign Types. Outline drawings of letterforms will not be accepted as templates.
- D. Sign Schedules: Submit complete sign schedule for each sign. Use same designation as on the Shop Drawings.
- E. Samples for Approval: Sample submittals are in addition to quantities shown in sign schedule. Record project samples to be kept on file.
 - 1. For each typestyle specified submit full samples of all alphabets, including numbers and punctuation, on 11 inch by 17 inch photostats and samples of standard letter spacing and word spacing (at min. of 3/4 inch cap height) for approval prior to fabrication.
 - 2. Submit artwork of all symbols and logos to be used on 11 inch by 17 inch photostats for approval prior to fabrication.
 - 3. Submit samples of colors on all substrates specified for each sign type.

1.3 QUALITY ASSURANCE

- A. MBTA Reference Standard: Comply with the MBTA, Guidelines and Standards, Part V, Graphics, Revised Fall 1990 with 1995 Supplement. A copy can be viewed or supplied on request to the MBTA Design Department, 12th Floor, 100 Summer Street, Boston, MA 617-222-5044.
- B. Reference Standards: The Work shall conform to the codes and standards of the following agencies as further cited herein:
 - 1. ADAAG: Americans with Disabilities Act Accessibility Guidelines
 - 2. ANSI: American National Standards Institute.
 - 3. ASTM: American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103 as published in "Compilation of ASTM Standards in Building Codes".
 - 4. MAAB: Massachusetts Architectural Access Board.
- C. Source: For each type of material required for the work of this section, provide primary materials which are the products of one manufacturer. Provide secondary materials which are acceptable to the manufacturers of the primary materials.
- D. Accessibility: The ADAAG and the MAAB regulations are pertinent to the design and installation of items covered under the work of this Section. When guidelines conflict, the guideline giving greater access shall be applicable.
- E. Qualifications: The approved manufacturer shall have a minimum of 5 years of successful experience with work of similar and complexity, and within schedule.
- F. Engineering Delegated Design: Engineering and structural analysis, as well as any necessary calculations shall be prepared under the supervision of, and signed and sealed by, a qualified Professional Engineer licensed in the Commonwealth of Massachusetts. Professional Engineer shall have minimum 5 years experience performing work of similar scope and complexity. These calculations shall include gravity, wind and seismic loading. The internal structure, dimensions and specifications for all items shall be indicated in the subcontractor's shop drawings. Sign subcontractor to engineer signs to proper level to withstand abuses of their environment.
- G. Coordination: The Work in this section shall be completely coordinated with the work of other sections. Verify dimensions and work of other trades that adjoin materials of this section before the installation of items herein specified. Cooperate with such trades to assure the steady progress of all Work under this Project.
- H. Hold Points - Mockups: Provide one full size mock-up in place of each type of signage.
 - 1. If mockups do not comply with requirements, provide new identification device until mockups are accepted.
 - 2. Accepted mockups may become part of the completed Work if undisturbed at time of Contract Substantial Completion.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver and store work under this section in a manner to prevent cracking or stress of components and to prevent mechanical damage or damage by the elements.

- B. Deliver work under this section to Site in ample time to avoid delay in job progress and at such times as to permit proper coordination of the various parts.
- C. Delay installation of this work until near time of opening for revenue service.

1.5 PROJECT CONDITIONS

- A. Substrates: Proceed with work of this Section only when substrate construction and penetration work have been completed.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Specialty Sign Manufacturers: Provide products of one of the following manufacturers if they meet or exceed the requirements of these specifications:
 - 1. Andco Industries Corp.
 - 2. A.R.K. Ramos Manufacturing Company, Inc.
 - 3. Best Manufacturing Co.
 - 4. Gemini, Inc.
 - 5. Lake Shore Markers.
 - 6. Metal Arts, Division of L & H Manufacturing Co.
 - 7. OMC Industries, Inc.
 - 8. The Southwell Company.

2.2 MATERIALS

- A. Steel
 - 1. Structural steel materials, details and workmanship shall conform to the specifications of the latest edition of the A.I.S.C. Specifications for the Design, Fabrication, and Erection of Structural Steel Buildings.
 - 2. Steel posts shall be Schedule 40 pipe, 2 inch internal diameter, ASTM A120 Standard Weight. The bottom of each post shall be deformed to provide for anti-rotation.
- B. Aluminum: Alloy 6063-T5, urethane finish.
- C. Plywood: APA Graded, Exterior Grade A-C Plywood and Marine Grade Plywood, as required.
- D. Bronze
 - 1. Cast bronze buttons shall be solid silicon bronze, sand cast from pre-alloyed ingots with no scrap permitted, with an applied wax finish. Original of buttons shall be sculpted from reproductions of the artifacts as indicated in the drawings. Bronze shall be cast in sizes

and thicknesses as shown on drawings. Sand sides to a smooth finish.

2. Original buttons shall be sculpted in clay from reproductions of the artifacts as indicated in the drawings.
 3. Sculptor shall be pre-qualified for the work indicated through submission of one complete, full scale, BT-5 sculpted clay button. If approved, the button may be used for casting production.
 4. Sculpting work to be provided by qualified sculpture studio.
- E. Plastic Laminate: Provide high pressure laminate engraving stock, with face and core plies in contrasting colors, in finishes and color combinations from manufacturer's full range.
- F. Cast Acrylic Sheet: Provide cast (not extruded or continuous cast) methyl methacrylate monomer plastic sheet, in sizes and thicknesses indicated, with a minimum flexural strength of 16,000 psi when tested according to ASTM D 790, with a minimum allowable continuous service temperature of 176 deg F, and of the following general types:
1. Transparent Sheet: Where sheet material is indicated as "clear," provide colorless sheet in matte finish, with light Transmittance of 92 percent, when tested according to the requirements of ASTM D 1003.
 2. White Translucent Sheet: Where sheet material is indicated as "white," provide white translucent sheet of density required to produce uniform brightness and minimum halation effects.
 3. Opaque Sheet: Where sheet material is indicated as "opaque," provide colored opaque acrylic sheet in colors and finishes.
- G. Hardware
1. Tamper resistant fasteners to be stainless steel, 3/8" dia. button head Phillips socket pinhead.
 2. High strength bolts other than anchor bolts, nuts and washers shall conform to ASTM A325.
 3. Threaded studs shall be low carbon mild steel with a minimum yield strength of 50,000 PSI.
 4. All hardware shall be galvanized per ASTM-A153 requirements.
 5. Where mechanical fasteners and hardware are required, shall be of adequate thickness, length and construction to properly secure the sign unit. Any visible portion of any mounting device shall be finished to match adjacent sign surface, unless otherwise specified.
 6. Metal fasteners and hardware in contact with dissimilar metals shall have a protective coating or neoprene shields to prevent electrolytic action.
- H. Adhesives
1. Where adhesive mounting techniques are specified, the subcontractor shall use adhesives specifically designed for compatibility with the base materials and the desired adhesive strength. All adhesives shall be tested on site. All adhesives shall be indicated in the shop drawings.

2. Surfaces on which signage is to be installed using adhesive shall be free of grease, oil, or any other residue.
3. Foam tape shall be 1/32" thick, high density open cell double coated polyurethane foam tape.
4. Very high bond (VHB) tape shall be double coated acrylic foam tape.
5. Provide necessary amounts of clear silicone sealant or grout for use in pin mounting.

I. Silk Screening

1. Screen printed text and symbols shall utilize photographically prepared screens and shall be printed in accordance with accepted industry standards. No hand-cut screens will be accepted. All screen printing shall be executed in such a manner that all edges and corners of letterforms are true and clean. Letterforms, color areas, or lines with rounded positive or negative corners, built-up edges, bleeding, spattering, etc. will not be accepted. All photoscreens shall be prepared from typesetter's reproduction of the text specified, or camera ready artwork. All artwork and typesetting shall be no less than 50% of actual specified size. All inks shall be applied evenly without pinholes, scratches, orange peeling, etc.

J. Typesetting

1. All typeset messages shall be prepared on a computer. Letterforms shall match the samples shown in the drawings. Output for photographic reproduction shall be 2400 dots per inch. No typesetter's proofs shall be enlarged more than three times for use as graphics.
2. Typical type and symbol layout for each sign type is indicated on the Drawings. All type shall be placed according to the dimensions shown on the drawings.

2.3 FABRICATION

A. Acrylic or Plastic Laminate Panel Signs: Fabricate as follows:

1. Construction: Backplate, 1/8 in. acrylic or plastic laminate.
2. Raised Letter Construction: 1/32 in. routed letters permanently mounted to surface of plate.
3. Border Style: None (straight).
4. Background Texture: Smooth.
5. Edges: Eased.
6. Fasteners: Flexible self-adhesive.
7. Corners: Square.
8. Braille: Provide raised Grade 2 Braille on each sign, as required.

B. Acrylic Letterform Signs: Fabricate as follows:

1. Construction: 6 in. high, 1/2 in. deep acrylic.
2. Projection: 1 in.
3. Color: Integral black letters.

- C. Fabricate work to be truly straight, plumb, level and square with smooth flat surfaces and sharp corners, except where indicated otherwise.
- D. Precisely form work to sizes, shapes, and profiles indicated on accepted shop drawings.
- E. Fabricate work with uniform joints that are not visible.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The DB Entity shall examine substrates, supports, and conditions under which this work is to be performed and notify the MBTA, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means DB Entity accepts substrates and conditions.
- B. Notification Point - Work shall be subject to inspection and acceptance by the MBTA in the shop or field at any reasonable time. Provide at least 72 hours notice for inspection of complete fabricated signs before delivery.

3.2 INSTALLATION/APPLICATION/ERECTION

- A. All locations where signs are to be installed new must be field measured. This must be documented and sent to the MBTA prior to final digital artwork submittal and fabrication of signage.
- B. Strictly comply with accepted shop drawings and manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this Section.
- C. Install work plumb, level, in true plane and alignment. Provide signs and graphics where shown or scheduled using mounting methods indicated.
- D. Protect adjacent or adjoining surfaces and work from damage during installation in this Section.
- E. Work shall be designed and anchored so that work will not be distorted nor the fasteners overstressed from expansion and contraction of metal or other materials as applicable.
- F. Acrylic Letterform Sign Installation: Install cut letterform type signage mounted on canopy fascia in accordance with accepted shop drawings.
- G. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials. Insulating materials shall not be visible to public view in final configuration.

3.3 TOLERANCES

- A. The following allowable installed tolerances are allowable variations from locations and dimensions indicated by the Volume 2 and shall not be added to allowable tolerances indicated for

other Work:

1. Allowable Variation from True Plumb, Level and Line: Plus or minus 1/16 inch from true position for signage smaller than 24 by 24 inches in size; plus or minus 1/8 inch from true position for signage 24 by 24 inches in size and larger.
2. Allowable Variation from True Plane of Adjacent Surfaces: Plus or minus 1/16 inch.

3.4 CLEANING AND PROTECTION

- A. Adjust work to present the best possible appearance. Touch-up damaged finishes and repair damage to eliminate evidence of repair. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully repaired or cleaned. MBTA shall be final authority on acceptance of repaired work.
- B. Provide temporary protection to ensure work being without damage or deterioration at time of final acceptance. Remove protections and reclean as necessary immediately before final acceptance.
- C. The DB Entity shall provide Authority with information on cleaning and maintenance recommendations for all signs from the manufacturer.
- D. Names, stamps and decals of manufacturers, installers or maintainers of signs shall not be visible in the finished work. All assembly markings shall not be visible in the finished work.

END OF SECTION

SECTION 10426

TACTILE-BRAILLE SIGNAGE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies all ADA-required tactile/Braille signage as indicated on the Drawings and specified herein.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 10100 – DISPLAY CASES
 - 2. Section 10400 – FIXED SIGNAGE
 - 3. Section 10401 – METAL SIGN FRAMES
 - 4. Division 16 – ELECTRICAL - “Exit” signs; and “Variable Message Signs”.
- C. Permits: Obtain permits as required by Local Authorities for installation of signs.

1.2 SUBMITTALS

- A. Product Data: Manufacturer's product data, any limitations and recommendations for each material used, installation instructions, and manufacturer’s certification (stating that materials comply with requirements) for the Engineer of Record’s and MBTA’s review and acceptance.
- B. acceptance Drawings: Provide dimensioned shop drawings of each individual sign, based on .eps files supplied by the MBTA, along with a complete sign schedule utilizing the same designations as indicated on the MBTA’s drawings. The shop drawings must represent exactly what will be etched on each sign. No fabrication shall take place without acceptance of the shop drawings by the Engineer of Record and MBTA.
- C. Provide four copies of shop drawings for action by the Engineer of Record and MBTA.
- D. Samples for Approval:
 - 1. Provide one full-size, complete sample of a representative sign, etched, painted and finished, for acceptance by the Engineer of Record and MBTA.
 - 2. ADA compliance: the DB Entity shall complete the attached “ADA Tactile/Braille Metrics Check list” to assure that all metrics of sample sign are in compliance with ADA defined metrics.
 - 3. Approval of sample sign is required from the MBTA prior to final signage production.
 - 4. Sample will be resubmitted, if necessary, until it meets quality standards.

5. Once approved, the sample sign will be forwarded to the project site for installation (completed sample sign to be provided to the Designer of Record and MBTA at no extra charge).

1.3 QUALITY ASSURANCE

- A. Reference Standards: The Work shall conform to the codes and standards of the following regulatory Agencies and Authorities as further cited herein:
 1. ADA: Americans with Disabilities Act 2010 Standards
 2. ANSI: American National Standards Institute.
 3. ASTM: American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103 as published in "Compilation of ASTM Standards in Building Codes".
 4. MAAB: Massachusetts Architectural Access Board.
- B. Performance Requirements
 1. Painted Sign Finish shall comply with the following performance requirements:
 - a. Weatherability: When tested in accordance with ASTM G 53, after 500 hours in Weatherometer (equivalent to approximately 3 years exterior exposure):
 - b. Gloss retention not less than 88.0 determined in accordance with ASTM D 523 at a 60 degree angle.
 - c. Color shall not change more than 1.68 units determined in accordance with STM D 2244 and measured with a Hunter Colorimeter, Model D25.
 2. Durability: Sign finish shall not effect after repeated use of cleaners such as Graffiti Remover #1120 manufactured by Organics Corp., Lodi, NJ.
- C. Source: For each type of material required for the work of this section, provide Single-Source Responsibility.
- D. Accessibility: The ADA 2010 Standards and the MAAB regulations are pertinent to the design and installation of items covered under the work of this Section. When guidelines conflict, the guideline giving greater access shall be applicable.
- E. Qualifications: The approved manufacturer shall have a minimum of 5 years of successful experience with similar work, and shall have a reputation for doing satisfactory work on time.
- F. Coordination: The work in this Section shall be completely coordinated with the Work of other Sections. Verify dimensions and work of other trades that adjoin materials of this Section before the installation of items herein specified. Cooperate with such trades to assure the steady progress of all Work under this Project.
- G. Certification: Submit manufacturer's certification that materials furnished comply with requirements specified.
- H. Maintenance Instructions: Submit manufacturer's instructions for maintenance of tactile/Braille sign to the MBTA, including precautions for use of cleaning materials and solvents.

I. Warranty:

1. Submit a written Manufacturer's warranty for MBTA acceptance, signed by the manufacturer, agreeing to repair or replace panels that fail during the specified warranty period. Failures include, but are not limited to, the following:
 - a. Coating degradation.
 - b. Chipping, chalking, fogging or discoloration.
 - c. Fading.
2. Warranty Period: 1 year from product ship date.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver and store work under this Section in a manner to prevent the cracking or stress of components, and to prevent mechanical damage or damage from the elements.
- B. Deliver work under this Section to Site in ample time to avoid delay in job progress and at such times as to permit proper coordination of the various parts.
- C. Installation of this work shall be scheduled to occur near time of Substantial Completion.
- D. Inspect sign components for damage on delivery.
 1. Do not install damaged signs. Replace any damaged signs with new signs.

1.5 PROJECT CONDITIONS

- A. Substrates: Proceed with Work of this Section only when substrate construction and penetration work have been completed.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Zinc Signs
 1. 0.125" one-piece zinc plate, utilizing chemical etch process to produce raised characters in compliance with ADA and supplied graphics. Chamfer or ease all sides and corners to remove sharp edges.
 2. Acceptable Manufacturers: the following is a partial list of zinc signage manufacturers:
 - a. Vivid Manufacturing
 - b. Dixie Graphics
 - c. Kroy Sign Systems

- d. Etchcraft Incorporated
- e. Advance Corporation
- f. ADA Signs
- g. ASI
- h. ASE Manufacturing

B. Attachments

1. Mechanical:

- a. Threaded inserts appropriate to substrate material – 4 per sign
- b. Tamper resistant, ¼” diameter stainless steel Flat Head Phillips Pin-Head screws. Screws shall seat into countersunk holes such that when fully tightened the screw head is flush with sign background surface. Paint screws to match background paint color of sign
- c. Non-metallic Washers: Provide rigid neoprene separators between fasteners and non-compatible materials being joined.

2. Adhesive:

- a. Where adhesive mounting techniques are specified, very high bond (VHB) tape specifically designed for compatibility with the base materials and the desired adhesive strength shall be used. All adhesives shall be tested on site. All adhesives shall be indicated in the shop drawings.
- b. Very high bond (VHB) tape shall be double coated acrylic foam tape as manufactured by the 3M Co., or approved equal.
- c. Surfaces on which signage is to be installed using adhesive shall be free of grease, oil, or any other residue.

2.2 Fabrication

A. Zinc Signs:

- 1. Etching: Signs reverse-etched to create all tactile text, lines, arrows, and braille glyphs raised 1/32” high. Braille glyphs shall be standard rounded grade 2 Braille as rendered in the EPS files. Cross section angle of raised characters shall not exceed 45 degrees. Text and Braille shall be finished to provide smooth, non-pointed edges. Background surface shall be smooth texture.
- 2. Finishes:
 - a. Background - Mathews baked-on acrylic polyurethane enamel paint with eggshell/matte finish. Custom color shall be: Black.
 - b. Foreground - (tactile lettering only) brushed natural zinc with U.V. resistant clear urethane topcoat.
 - c. Predrilled holes: Provide four ¼” counter sunk mounting holes, centered 3/8” from edges, only in corners of signs scheduled to be screw attached. All other signs to be provided without mounting holes.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Prior to installation, the DB Entity shall examine substrates, supports, and conditions under which this work is to be performed, and notify the MBTA in writing of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means DB Entity accepts substrates and conditions.
- B. Notification Point: MBTA will be given 72 hour notice to perform field inspection prior to the start of signage installation. The MBTA shall conduct a detailed inspection of all tactile/Braille signs to be installed prior to installation to assure compliance with the supplied drawings. A formal signoff by the MBTA must be executed prior to commencement of any installation. If work does not meet project requirements, the DB Entity must replace deficient work.

3.2 INSTALLATION/APPLICATION/ERECTION

- A. All locations where signs are to be installed new or retrofitted to existing frames must be field measured by the DB Entity. This must be documented and sent to the Engineer of Record and MBTA prior to final digital artwork submittal and fabrication of signage.
- B. Strictly comply with accepted shop drawings and manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this Section.
- C. Install work plumb, level, and in true plane and alignment. Provide signs and graphics where shown or scheduled using mounting methods indicated.
- D. Protect adjacent or adjoining surfaces and work from damage during installation in this Section.
- E. Work shall be designed and anchored so that work will not be distorted nor the fasteners overstressed from expansion and contraction of metal or other materials as applicable.
- F. The tactile/Braille signs are small in size and shall be installed plumb and square. In the event that an adjacent material, such as a doorframe, is slightly out of plumb, the DB Entity shall install the tactile/Braille sign parallel so as to minimize the visual conflict.

3.3 CLEANING AND PROTECTION

- A. Adjust work to present the best possible appearance. Touch-up damaged finishes and eliminate any evidence of repair. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully repaired or cleaned.
- B. Provide temporary protection to ensure work is delivered without damage or deterioration at time of final acceptance. Remove protections and reclean as necessary immediately before final acceptance.
- C. The DB Entity shall provide the Authority with information on cleaning and maintenance recommendations for all signs from the Manufacturer.

- D. Names, stamps and decals of manufacturers, installers or maintainers of signs shall not be visible in the finished work.

3.4 ADA Compliance Checklist

- A. Tactile/Braille signs must comply with the dimensional requirements of ADA 703.3 (2010). The following legend graphically illustrates each ADA 703.3 metric.
- B. Once a mockup has been fabricated, and prior to submission for acceptance, the fabricator must complete the following check list to assure that the sample product is in complete compliance with ADA metrics. Completed checklist must be submitted with sample sign for approval. Samples submitted without a completed checklist will be rejected.
- C. Tactile metrics legend

D. ADA 703.2 and 703.3 Compliance Checklist

ADA 703.2 – Raised Characters						
Legend Symbol	ADA Reference	Description	ADA Values	ADA Values for 5/8" Text	Check by Contractor	Check by Designer
H5	703.2.1 Depth	Depth of character above background	$\geq 1/32"$ (0.8 mm)	-		
-	703.2.2 Case	All Uppercase	Y/N	-		
-	703.2.3 Style	Sans serif, not italic, oblique, script, highly decorative, or of unusual forms	Y/N	-		
W1	703.2.4 Character Proportions	Width of uppercase "O" relative to height of uppercase "I" (H2)	$0.55 \leq W1/H2 \leq 1.1$	Min: 0.344" Max: 0.743"		
H2	703.2.5 Character Height	Height of uppercase "I"	$0.625" \leq H2 \leq 2"$ $16 \text{ mm} \leq H2 \leq 51 \text{ mm}$	0.625"		
W2	703.2.6 Stroke Thickness	Width of uppercase "I" relative to height of uppercase "I" (H2)	$W2/H2 \leq 0.15$	$\leq 0.094"$

H3	703.3.2 Position	Distance from Braille to tactile characters, raised borders, and decorative elements.	$\geq 0.375"$ (9.5 mm)			

END OF SECTION

SECTION 10428

MBTA LOGO “LOLLIPOP” SIGN

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the MBTA logo sign as indicated on the DB Entity’s accepted shop drawings and specified herein. All modes of transport requiring a logo sign will use this specification to maintain consistency of appearance.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 09900 – PAINTING
 - 2. Section 10401 – METAL SIGN FRAMES
 - 3. Division 16 - ELECTRICAL; Signs.
- C. Permits: Obtain permits required by Authority Having Jurisdiction for installation of signs.

1.2 GRAPHICS

- A. MBTA logo dimensions can be found in MBTA 2013 Logo Sign Guidelines and must be followed to ensure consistency. MBTA logo graphics can also be provided by MBTA upon request.

1.3 PERFORMANCE REQUIREMENTS

- 1. Design Criteria: Design, fabricate, and install sign items to withstand normal exposure to weather, temperature variation, wind loads and building movement; provide units resistant to vandalism and theft.
- 2. Field Measurements: Check actual locations of construction - to which metal fabrications must fit - by accurate field measurements before fabrication; show recorded measurements on final DB Entity’s accepted shop drawings prior to fabrication
- 3. Thermal Movements: Allow for thermal movement resulting from the following maximum change (range) in ambient temperature in engineering, fabricating, and installing signs to prevent buckling, opening of joints, over stressing of components and connections, and other detrimental effects. Base engineering calculation on actual surface temperatures of materials due to both solar heat gain and nighttime sky heat loss.
 - a. Temperature Change (Range): 0 - 180 deg F ambient, material surfaces.
- 4. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.4 SUBMITTALS

- A. All submittals shall be provided to the MBTA.
- B. Product Data: Manufacturer's product data, any limitations and recommendations for each material used, installation instructions, and manufacturer's certification (stating that materials comply with requirements) for the MBTA's review and acceptance.
- C. DB Entity's accepted shop drawings: Provide shop drawings for fabrication and installation of logo sign including mounting. Provide plans, elevations, and details of anchorage, connections and accessory items. Provide installation templates for work installed by others. Provide four copies of shop drawings for action by the MBTA. After action, provide two copies of shop drawings on which action has been taken for MBTA's records.
- D. Sign Schedules: Submit complete Sign Schedule for logo sign. Use same designation as on the DB Entity's accepted shop drawings.
- E. Samples for Approval: Sample Submittals are in addition to quantities shown in sign schedule. They are record project samples to be kept on file.
 - 1. Paper Proofs: Provide proofs for logo sign including half-size elevation sample of the entire logo sign.
 - 2. Submit 3" x 4" samples of polycarbonate lens material in white and black colors.
 - 3. Acceptance of all proofs is required from the MBTA prior to final sign production.
 - 4. Color samples and paper proofs will be resubmitted until they meet quality standards outlined in the next section.
 - 5. Provide samples and proofs to the MBTA at no extra charge.

1.5 QUALITY ASSURANCE

- A. MBTA Reference Standard: Comply with the MBTA Logo Sign Guidelines.
- B. Reference Standards: The work shall conform to the codes and standards of the following agencies as further cited herein:
 - 1. ADAAG: Americans with Disabilities Act Accessibility Guidelines
 - 2. ANSI: American National Standards Institute
 - 3. ASTM: American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103 as published in "Compilation of ASTM Standards in Building Codes"
 - 4. MAAB: Massachusetts Architectural Access Board
 - 5. Structural Code:
 - a. Latest edition of the Massachusetts State Building Code
 - b. AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaries and Traffic Signals

- c. Latest edition of NFPA 70 National Electrical code
- C. The Lollipop Sign shall be certified as UL listed and have affixed to the sign the UL Certification Listing Mark and all required markings.
- D. Accessibility: The ADAAG and the MAAB regulations are pertinent to the design and installation of items covered under the work of this Section. When guidelines conflict, the guideline giving greater access shall be applicable, however written acceptance must be obtained by the MBTA Capital.
- E. Qualifications: The approved manufacturer shall have minimum of 5 years of successful experience with similar work, shall have a reputation for doing satisfactory work on time.
- F. Welding Standards: Comply with applicable provisions of the American Welding Society AWS D1.1 "Structural Welding Code."
 - 1. Certify that welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
- G. Coating Applicator Qualifications: must be experienced in successfully applying specified coatings of the type indicated to specified materials, and equipped with the following:
 - 1. Application equipment required to apply a uniform coating as recommended by the coatings manufacturer.
- H. Engineering: Design, engineering and structural analysis for the Lollipop Sign and supports, as well as necessary calculations, shall be prepared under the supervision of, and signed and sealed by, the Engineer of Record. These calculations shall include gravity, wind, and seismic loading. The internal structure, dimensions and specifications for all items shall be indicated in the DB Entity's accepted shop drawings, and shall be indicated in the drawings. The Engineer of Record shall engineer signs to a proper level to withstand abuses of their environment.
- I. Coordination: The work in this Section shall be completely coordinated with the work of other Sections. Verify dimensions and work of other trades that adjoin materials of this Section before the installation of items herein specified. Cooperate with such trades to assure the steady progress of all work under this Contract.
- J. Hold Points: Completed logo sign shall be available for inspection for two weeks prior to installation, with notification given to the MBTA. If MBTA determines sign does not comply with requirements, provide new logo sign until it is accepted.
- K. Project Meetings: The signage subcontractor and related subcontractors shall be required to attend project meetings at the Project site when required by the MBTA.
- L. Certification: Submit manufacturer's certification that materials furnished comply with requirements specified.
- M. Maintenance Instructions: Submit manufacturer's printed instructions for maintenance of each sign installed to the MBTA, including precautions for use of cleaning materials and solvents for paint removal, which could damage surfaces.
- N. Warranty:

1. Submit a written Manufacturer's warranty for the MBTA acceptance, signed by the manufacturer, agreeing to repair or replace lenses that fail during specified warranty period. Failures include, but not limited to, the following:
 - a. Coating degradation
 - b. Chipping, chalking, fogging or discoloration.
 - c. Fading.
 - d. Structural failure.
 - e. Delamination of applied graphics.
 - f. Delaminating or degradation of applied anti-graffiti coatings.
2. The manufacturer's warranty is in addition to, and not a limitation of, other rights the MBTA may have under the Contract Documents.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver and store work under this Section in a manner to prevent cracking or stress of components and to prevent mechanical damage or damage by the elements.
- B. Deliver work under this Section to Site in ample time to avoid delay in job progress and at such times as to permit proper coordination of the various parts.
- C. Installation of this work shall wait until near time of revenue service.
- D. Handle signs carefully to prevent breakage, surface abrasion, denting, soiling, and other defects. Comply with the manufacturer's written handling instructions for unloading components subject to damage. Inspect sign components for damage on delivery.
 1. Do not install damaged sign components.
 2. Repair minor damage to signs, provided the finished repair is equal in all respects to the original work and is accepted by MBTA in writing; otherwise, remove and replace damaged sign components as directed and without exception.

1.7 PROJECT CONDITIONS

- A. Inspection of Site: The DB Entity shall visit the site of the proposed work and become fully acquainted with existing conditions, and to become fully informed as to the facilities involved and the difficulties and restrictions attending the performance of the Project, prior to submitting a price quotation.
- B. Substrates: Proceed with work of this Section only when substrate construction and penetration work have been completed.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Logo “Lollipop” Sign: Each sign will be shop fabricated by the DB Entity off-site and delivered and installed at the locations as shown on the DB Entity’s accepted shop drawings.
- B. Lens: The lens shall be Solar Grade, vacuum-formed, UV resistant, high-impact polycarbonate convex sheets with 2 ½” bow. The polycarbonate shall be ¼” in thickness. The lens shall be white with a black “T” on the surface on both exterior sides. The black “T” logo shall be embossed such that it protrudes .375” out from the white background.
- C. Structural Steel:
1. The sign’s post shall be a schedule 80 steel pipe, with an outer diameter of 3.5” and an inner diameter of 2.90”. The pipe will be welded to steel gusset plate and steel base plate.
 2. The frame shall be a C4 x 5.4 steel rolled channels with ¼” weep holes, and opening wide enough for the pipe. The channel will be bent and welded to form a circle with the flange on the outside.
 3. The sign frame and support shall be shop painted steel.
- D. Sign Connections:
1. Logo sign attached and or supported as shown on the MBTA’s Green Line Extension Station Signage Components, including supports and connections.
 2. Continuously weld joints and seams unless other methods are indicated; grind, fill, and dress welds to produce smooth, flush, exposed surfaces with welds invisible after final finishing.
 3. Logo sign pipe will be secured in Portland cement concrete or bituminous concrete sidewalks or other rigid surfaces and shall be in accordance with the DB Entity’s accepted shop drawings. Any leveling of the sign baseplate to the concrete sub-base should be filled with a pourable cementitious, non-shrink grout.
 4. The polycarbonate lens will be mechanically fastened to the frame with two half-circle angle long leg in aluminum ring frame, for each sign face.
 5. Neoprene sponge between channel ring frame and lens shall conform to ASTM D1056, Type 2, Class C, Grade 2.
 6. The steel pipe will connect to the circular channel ring frame by sliding the pipe through hole cut at base of the channel ring. Two steel angle clips welded to the interior of the channel ring at the top and two at the bottom will be mechanically fastened to the pipe.
 7. All hardware shall be as indicated on DB Entity’s accepted shop drawings.
- D. Hardware:
1. Anchors and Inserts: Use non-ferrous metal or hot-dipped galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. High strength bolts other than anchor bolts, nuts and washers shall conform to ASTM A325.
 2. Tamper resistant fasteners to be stainless steel, 3/8" dia. button head Phillips socket pinhead.

3. Threaded studs shall be low carbon mild steel with a minimum yield strength of 50,000 PSI.
 4. All hardware shall be as indicated on DB Entity's accepted shop drawings: 316 stainless steel, or galvanized per ASTM-A153 requirements.
 5. Where mechanical fasteners and hardware are required, they shall be of adequate thickness, length and construction to properly secure the sign.
 6. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of metal to be welded, complying with applicable AS specifications, and as required for color match, strength, and compatibility in the fabricated items.
 7. Galvanizing Repair Paint: High zinc dust content paint for re-galvanizing welds in galvanized steel, with dry film containing not less than 94 percent zinc dust by weight, complying with DOD- P-21035 or SSPC-Paint 20.
- E. Coatings: The logo sign frame, post, and anchors shall all receive the Exterior Ferrous Metal, Urethane system as specified in section 09900. Finish will be color semi-gloss black.
- F. Electrical:
1. Electrical wire shall be #10 and be a 3 wire system.
 2. Conduit shall be rigid galvanized steel.
 3. Twelve Light-Emitting Diode (LED) shall be 5000K. Power supply shall be 277volt or 120volt, depending on site conditions, damp rated. The LEDs will be tacked to two 3" wide steel sheet metal channels placed in the inside of the steel channel ring to either side of the pipe. These two channels will be bent with flanges out (opposite of channel ring frame bend), so that the wiring will fit between the steel sheet metal channel and the channel ring frame. See DB Entity's accepted shop drawings for clarification.

2.2 FABRICATION

- A. Precisely form work to sizes, shapes, and profiles indicated on DB Entity's accepted shop drawings.
- B. Any material defects or damage due to shipment will be repaired or replaced by the supplier.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The DB Entity shall examine substrates, supports, and conditions under which this work is to be performed and notify the MBTA, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means DB Entity accepts substrates and conditions.

- B. Notification Point: The MBTA will be given 72 hour notice to perform field inspection at the start of installation of signage. If work does not meet project requirements, the DB Entity must remove and replace deficient work.

3.2 INSTALLATION/APPLICATION/ERECTION

- A. Strictly comply with DB Entity's accepted shop drawings and manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this Section.
- B. Install LED lighting in accordance with manufacturer's instructions.
- C. Install sign plumb, level, in true plane and alignment. Provide logo sign where shown or scheduled using mounting methods indicated.
- D. Protect adjacent or adjoining surfaces and work from damage during installation in this Section.
- E. Work shall be designed and anchored so that work will not be distorted nor the fasteners overstressed from expansion and contraction of metal or other materials as applicable.
- F. Verify all electrical wiring and connections are secure and protected.

3.3 TOLERANCES

- A. The following allowable installed tolerances are allowable variations from locations and dimensions indicated by the Contract Documents and shall not be added to allowable tolerances indicated for other work:
 - 1. Allowable Variation from True Plumb, Level and Line: Plus or minus 1/16 inch from true position for signage smaller than 24 by 24 inches in size; plus or minus 1/8 inch from true position for signage 24 by 24 inches in size and larger.
 - 2. Allowable Variation from True Plane of Adjacent Surfaces: Plus or minus 1/16 inch.

3.4 CLEANING AND PROTECTION

- A. Adjust work to present the best possible appearance. Touch-up damaged finishes and eliminate any evidence of repair. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully repaired or cleaned.
- B. Provide temporary protection to ensure work being without damage or deterioration at time of final acceptance. Remove protections and reclean as necessary immediately before final acceptance.
- C. The DB Entity shall provide Authority with information on cleaning and maintenance recommendations for logo sign from the manufacturer.
- D. Names, stamps and decals of manufacturers, installers or maintainers of signs shall not be visible in the finished work.

END OF SECTION

SECTION 10440

SITE SIGNAGE

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

- A. This Section specifies furnishing and installing aluminum signs on galvanized steel posts and furnishing and installing other types of site signage indicated herein.

1.2 DESCRIPTION OF WORK

- A. Work Included: Provide labor, materials and equipment necessary to complete the Work of this Section, including the following:
 - 1. Trailblazer signs, handicapped parking signs, parking space assignment signs, directional signs, safety signs, and other types of site signage.
- B. Related Work: The following items are not included in this Section and are specified under the designated Sections:
 - 1. Section 03300 – CAST-IN-PLACE CONCRETE
 - 2. Section 10400 – FIXED SIGNAGE
 - 3. Section 10424 – SPECIALTY SIGNAGE
 - 4. Section 10426 – TACTILE/BRAILLE SIGNAGE
 - 5. Section 10428 – MBTA LOGO “LOLLIPOP” SIGN
 - 6. Section 16742 – VARIABLE MESSAGE SIGN SYSTEM

1.3 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, and dimensions of individual signs.
- B. Shop Drawings: Include plans, elevations, and large-scale sections of typical members and other components. Show mounting methods, grounds, mounting heights, layout, spacing, reinforcement, accessories, and installation details.
 - 1. Take measurements in the field and verify all dimensions before submitting shop drawings or samples.
 - 2. Provide message list for each sign, including large-scale details of wording, lettering, and artwork.
 - 3. Where provisions must be made for attaching other materials to work included under this Section or where provisions must be made for assembly and installation in the field, the required cut outs and attachments shall be provided in the shop. All such items shall be indicated on the shop drawings.

- C. Samples for Verification: For each type of sign, include the following Samples to verify color selected:
 - 1. Panel Signs: Full-size Samples of each type of sign required.
 - 2. Approved samples will not be returned for installation into Project.
 - 3. The MBTA may inspect all material and workmanship at any time during the progress of the work and shall have the right to reject all material and workmanship that does not conform to the Specifications or that is not considered of adequate quality in terms of accuracy of registration, color, or coverage.
 - 4. List manufacturer and name for each type and color of paint used.
- D. Maintenance Data: For all signage, cleaning and maintenance requirements to be included in maintenance manuals.

1.4 COLOR SAMPLES

- A. Colors shall be pure, non-fading pigments, mildew-proof, sun proof, finely ground in approved medium. Colors used shall be submitted on the respective material surfaces. The "Commuter Rail" purple paint color shall match Dupont Imron 1976.

1.5 QUALITY ASSURANCE

- A. Source Limitations: Obtain each sign type through one source from a single manufacturer.
- B. Regulatory Requirements: Comply with the Massachusetts Architectural Access Board, Americans with Disabilities Act (ADA), and with code provisions as adopted by authorities having jurisdiction.
- C. Deliver and store work in a manner to prevent cracking, chipping, or stress of components and to prevent mechanical damage or damage by the elements. Damaged items shall be removed and replaced as directed.

1.6 PROJECT CONDITIONS

- A. Field Measurements: Where sizes of signs are determined by dimensions of surfaces on which they are installed, verify dimensions by field measurement before fabrication and indicate measurements on shop drawings.

1.7 COORDINATION

- A. For signs supported by or anchored to permanent construction, advise installers of anchorage devices about specific requirements for placement of anchorage devices and similar items to be used for attaching signs.

PART 2 - PRODUCTS

2.1 COORDINATION

- A. General: Provide signs that comply with requirements indicated for materials, thicknesses,

finishes, colors, designs, shapes, sizes, and details of construction as indicated. Produce smooth panel sign surfaces constructed to remain flat under installed conditions within tolerance of plus or minus 1/16 inch measured diagonally. Provide the following:

1. Code-Required Signs for Certificate of Occupancy:
 - a. Type: Photopolymer on acrylic or printed acrylic / aluminum as applicable.
 - b. Color: Selected from manufacturer's standard colors including dark blue.
 - c. Edge: Square cut.
 - d. Corner: Square cut.
 - e. Type Size - Room #: 1-1/4 in. high.
 - f. Type Size - Room Name: 5/8 in. high.
 - g. Typeface: Gill Sans.
2. Exterior Signs:
 - a. Type – Entrance: Fabricated monolithic aluminum sign with stencil cut graphics and non- illuminated.
 - b. Type – Directional: Fabricated aluminum sign, 3 inches deep, double post and panel.
 - c. Raised-Copy Thickness: Not less than 1/32 inch.
 - d. Changeable Message Inserts: Where indicated, fabricate signs to allow insertion of changeable messages in form of transparent covers with paper inserts printed by MBTA.

2.2 ACCESSORIES

- A. Glass Mounting: Blank panel same size as sign mounted to reverse side of glass.
- B. Anchors and Inserts: Provide nonferrous-metal or hot-dip galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. Use toothed steel or lead expansion-bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into concrete or masonry work.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Examine substrates, areas, and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. Verify that items provided under other sections of Work are sized and located to accommodate signs.
- C. Examine supporting members to ensure that surfaces are at elevations indicated or required to comply with authorities having jurisdiction and are free from dirt and other deleterious matter.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General: Locate signs and accessories where indicated, using mounting methods of types described and in compliance with manufacturer's written instructions.
 - 1. Install signs level, plumb, and at heights indicated, with sign surfaces free from distortion and other defects in appearance.
 - 2. Interior Wall Signs: Install signs on walls adjacent to latch side of door where applicable. Where not indicated or possible, such as double doors, install signs on nearest adjacent walls. Locate to allow approach within 3 inches of sign without encountering protruding objects or standing within swing of door.

3.3 CLEANING AND PROTECTION

- A. After installation, clean soiled sign surfaces according to manufacturer's written instructions. Protect signs from damage until acceptance by MBTA.

END OF SECTION

SECTION 10606

BICYCLE STORAGE RACKS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies bicycle storage racks.
 - 1. Storage and handling requirements and recommendations.
- B. Shop Drawings: Manufacturing details for each bicycle rack.

1.2 SUBMITTALS

- A. Product Data: Manufacturer's data sheets on each product to be used, including preparation instructions and recommendations.
- B. Samples for Verification: For each finish product specified, two samples, minimum size 6 inches (150 mm) square representing actual product, color, and patterns.

1.3 QUALITY ASSURANCE

- A. Manufacturer Qualifications: A firm experienced in manufacturing bicycle racks similar to those required for this project and with a record of successful in-service performance.
- B. Installers Qualifications: An experienced installer who has completed installation of bicycle racks similar in material, design, and extent to that indicated for this project and whose work has resulted in construction with a record of successful in-service performance.
- C. Source Limitations: Obtain each color, finish, shape and type of bicycle rack from a single source with resources to provide components of consistent quality in appearance and physical properties.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Store products in manufacturer's unopened packaging until ready for installation.
- B. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.5 PROJECT CONDITIONS

- A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

PART 2 - PRODUCTS

2.1 BICYCLE STORAGE RACKS

- A. Basis-of-Design Product: Dero Bike Racks; Dero Decker, Modular 2-Tiered or an approved equal.

1. Construction: 11 gauge (0.06 inch) (1.52 mm) steel for corner pieces and cross braces.
2. Capacity: DD-SS-8; 8 bike capacity, 17 inch (432 mm) spacing.
3. Upper Bike Stalls: 3/8 inch (9.5 mm) mounting hardware.
4. Lower Bike Stalls: 1/4 inch (6.4 mm) mounting hardware.
5. Square Beams: 6 inch (152 mm) and 2 inch (51 mm), 0.1875 inch (4.763 mm) thick.
6. Mounting Brackets: 0.1793 inches (7 gauge) (4.554 mm) thick.
7. Base Plates and Locking Flange: 0.25 inches (6.35 mm) thick.
8. Roller Cart Sides: 0.1196 inches (11 gauge) (3.038 mm) thick.
9. Tubes: 1.25 inches (31.7 mm) diameter, 0.625 inches (15.9 mm) diameter, 0.0598 inches (16 gauge) (1.519 mm) thick.
10. Wheel Tray: 0.0598 inches (16 gauge) (1.519 mm) thick.
11. Second Level Bike Positions: Assisted lift.
12. Finish: Hot dipped galvanized coating.

2.2 MATERIALS

- A. Steel Tube: ASTM A 513, electric welded steel tubing.
- B. Steel Pipe: ASTM A 500B, steel pipe.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Do not begin installation until substrates have been properly prepared.

3.2 INSTALLATION

- A. Install bike storage racks in accordance with manufacturer's instructions.
- B. Install level, plumb, and true.

3.3 PROTECTION

- A. Protect installed bike racks until completion of Project.
- B. Touch-up, repair or replace damaged products before Contract Substantial Completion.

END OF SECTION

SECTION 11140

VEHICLE SERVICE EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- B. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the DB Entity shall be provided at no additional cost to the Agency and shall be as approved by the Contracting Officer.
- C. Furnish and install the equipment items listed below by their identifier:
 - 1. Pallet, Spill Containment (EQ ID: 1234)
 - 2. Pump, air piston, 3:1 ratio (Waste Oil) (EQ ID: 7530)
 - 3. Receiver, used oil, 25 gallons (EQ ID: 7706)
 - 4. Hoist, truck repair, 15,000 lbs, above-slab (EQ ID 9443)
- D. The work specified in this Section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in Article 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The DB Entity shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 3 - Concrete
 - 2. Division 15 - Mechanical
 - 3. Division 16 – Electrical

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.

- B. Operations and Maintenance Manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years' experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Follow the requirements specified in Volume 2 Technical Provisions.
- B. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the DB Entity.
- C. Substitution Approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided in accordance with Volume 2 Technical Provisions. Acceptance will be based on the technical requirements herein as determined by the MBTA.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with Volume 1 Contract Terms and Conditions.

PART 2 – PRODUCTS

2.1 PALLET, SPILL CONTAINMENT (EQ ID: 1234)

A. Manufacturer's Reference

1. Prime Manufacturer: Specifications are based on products identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Eagle Manufacturing, Wellsburg, West Virginia, (304) 737-3171
 - 1) Model: 1640
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions.

B. General Description

1. Spill containment pallet for up to 4 drums.

C. Capacities/Capabilities

1. Capacity: 132 gal.
2. Provide a drain connection.
3. Provide forklift able design to allow use of a forklift or pallet jack to move the pallet.
4. Provide load capacity of 8,000 lbs.
5. Dimensions: 52.5" wide x 51" length x 13 ¾" height.
6. Meet EPA requirements for secondary spill containment of hazardous materials (40 CFR 264.175)

2.2 PUMP, AIR-POWERED, OILS, MEDIUM PRESSURE (EQ ID: 7530)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on furniture identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Graco, Minneapolis, MN, (612) 623-6000
 - 1) Model: LD Series 3:1 #24G579

2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions, furniture produced by other manufacturers, including the following, may be considered as equal:

- a. Flowserve, Irving, TX, (800) 728-6989
- b. Parker Autoclave Engineers, Erie, PA, (814) 860-5700

B. Capacities/Dimensions:

1. Ratio: 3:1
2. Mounting: Bung Mount
3. Output per cycle: 142 cc
4. Output at 75 CPM: 2.5 gpm (25.3 lpm)
5. Motor size: 4.25" effective diameter
6. Maximum fluid pressure: 450 psi
7. Air Input Pressure Range: 20-150 psi
8. Air Inlet size: ¼" inch
9. Pump Inlet size: 1" inch npt(f)
10. Pump outlet size: ½" inch npt(f)

C. Features/Performance/Construction:

1. Provide electronic controls for pump diagnostics, material usage tracking, and pump runaway protection.

2.3 RECEIVER, WASTE OIL, 25 GALLONS (EQ ID: 7706)

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Graco, Incorporated, Minneapolis, MN (612) 623-6000
 - 1) Model: 248866
2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions, equipment produced by other manufacturers, including the following, may be considered as equal:
 - a. The Aro Corporation, Bryan, OH (419) 636-4242
 - b. Lincoln, A Pentair Company, St. Louis, MO (314) 679-4200

B. Capacities/Dimensions:

1. Capacity: 25 gallons
2. Dimensions:
3. Length: 24 inches
4. Width: 24 inches
5. Height: 45 to 72 inches
6. Dry weight: 54 pounds
7. Fluid inlet/inspection port size: 3 inch (76 millimeter) buttress
8. Fluid outlet fitting size: 3/4 inch NPT
9. Collection funnel size: 22 x 24 inches

C. Features/Performance/Construction:

1. Unit shall be constructed of heavy duty, durable UV-stabilized polymer.
2. The unit shall include a gravity feed drain valve and a quick disconnect method of suction-evacuation from the top of the unit.
3. The unit shall be mounted on semi-pneumatic, synthetic rubber wheels and polyurethane front casters.
4. The unit shall contain a funnel assembly capable of extending to 72 inches.
5. The unit shall be dent, rust, and corrosion resistant.

D. Finish: UV-stabilized polymer complete with necessary markings to readily identify contents.

2.4 HOIST, TRUCK REPAIR, 15,000 LBS, ABOVE-SLAB

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. American Solving Inc., Brook Park, OH (440-234-7373)
 - 1) Model: Heavy Capacity Mobile Scissor Lift Table
2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions, equipment produced by other manufacturers, including the following, may be considered as equal:
 - a. Duff-Norton, Charlotte, NC (704) 588-4610

B. Capacities/Dimensions:

1. Capacity: 15,000 lbs

2. Dimensions: Capable of securely holding all types of trucks to be used on the Type 7, 8, and 9 light rail vehicles.

C. Features/Performance/Construction:

1. Provide two rails onto which to lower a light rail vehicle truck.
2. Provide continuously variable height adjustment. The lowest setting shall allow the rails to rest on the floor. The highest height shall place the top of rail at least six (6) feet above finished floor.
3. Provide pushbutton controls for raising and lowering of the table.
4. The table shall not lower in the event of power failure.
5. Provide end stops on the support rails to prevent rolling of the truck. End stop positions shall be adjustable if needed to secure trucks of different dimensions.
6. The truck repair hoist is to remain completely stationary while loaded with a truck.

D. Finish:

1. Provide yellow safety markings.
2. Paint equipment in manufacturer's standard color.

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Install equipment in accordance with the plans, shop drawings, and manufacturer's instructions:
 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 3. Anchorage: Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- B. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.

END OF SECTION

SECTION 11161

MISCELLANEOUS STATION EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies mobile wheelchair lifts, Stryker Evacuation Chairs and dock bumpers.

1.2 QUALITY ASSURANCE

- A. Provide where indicated on the DB Entity's accepted Shop Drawings such equipment as specified hereinafter complete and ready for operation. Provide necessary accessories, items of equipment, plumbing, mechanical, electrical, and structural items, whether specified or not in order to provide properly installed and functional equipment.
- B. Equipment as selected by the MBTA is suitable for installation in the space allocated on the DB Entity's accepted Shop Drawings and operation on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the DB Entity must be provided by the DB Entity at no additional cost to the MBTA and shall require the MBTA's prior acceptance.
- C. In all cases where a device or part of the equipment is referred to in the singular number, it is intended that such reference shall apply to as many such devices as are required to complete the installation.
- D. When two or more similar items of equipment are required, they shall be products of a single manufacturer.
- E. Permits and Tests: Obtain necessary permits from local authorities having jurisdiction, make application and file drawings if required for such permits, and pay for such permits. Obtain acceptance by governing authorities and by the MBTA and pay all costs connected therewith. Obtain MBTA's acceptance prior to contacting or submitting documents to governing authorities. Obtain and file with the MBTA written evidence that above requirements have been met.
- F. Applicable Codes:
 - 1. Unless otherwise directed by the MBTA, work shall conform to Federal, State, and Local governing rules, regulations, and ordinances, including OSHA and NFPA requirements, as applicable, and shall pass inspection by the authorities having jurisdiction.
 - 2. Provide materials and labor above and beyond those required by these Specifications in order to meet these requirements and to obtain approvals of inspections and tests.
- G. Certification:
 - 1. Furnish certificates stating that materials and workmanship comply with the applicable code requirements.
 - 2. Before final acceptance, furnish certificates of the authorities having jurisdiction.

H. Quality Control Program:

1. Submit to the MBTA for acceptance a quality control program that meets the requirements of ANSI ZI.8 specifications of general requirements for quality control program explaining the quality control procedures to be utilized for the manufacture, fabrication, and installation of equipment. Include details of the methods and procedures to be used to regulate the production of the equipment to assure compliance with the specified standards of quality. In addition, include complete information on the proposed methods of testing and inspection and identify the authorized representatives performing this work and their duties.
2. During the course of the work, the MBTA will monitor the Quality Control Program to verify compliance. Work undertaken, including the ordering and purchase of materials and supplies for the work, prior to acceptance of the Quality Control Program shall be at the DB Entity's risk.

I. Warranty:

1. Lift Warranty: 2 year warrantee from date of invoice.
2. Provide the manufacturer's standard warranty or a minimum of one year warranty whichever is greater which starts on the date of formal final acceptance of the facility or the separate equipment.

1.3 SUBMITTALS

- A. Submit the following in accordance Project requirements and as specified in by Equipment Specifications.
1. Shop Drawings.
 2. Product data.
 3. Installation instructions.
- B. Sequence of Review for Alternate Equipment Selection: When a proposed piece of equipment is of different manufacture than that specified, comply with the following procedures:
1. Tentative Review of Alternate Equipment: Before submittal of shop drawings, submit to the MBTA for review, drawings, specifications, and lists of alternate equipment to be incorporated in the work. This list shall include catalog numbers, cuts, and such other descriptive data as may be required to assure compliance with these Specifications. No consideration will be given to partial lists submitted from time to time. Approval of alternate equipment will be tentative subject to submission of complete shop drawings indicating compliance with the Contract Documents.
 2. Final Review of Alternate Equipment: After receiving tentative approval of alternate equipment lists submit shop drawings, product data and installation instructions for final approval.
- C. Shop Drawings: Shop drawings shall consist of the following as applicable:
1. Layout drawings showing equipment layout, elevations, conduit runs, utility layout and hook-ups, and all required dimensions.
 2. Fabrication drawings, including bill of materials.
 3. Detail drawings.

4. Foundation structural support drawings including anchor bolt plan and elevation.
 5. Utility connection plan.
 6. Electrical control diagram.
 7. Electrical wiring diagram.
 8. Electrical equipment layout, with all motors, limit switches, solenoid valves, disconnect switches, control panels, etc. located and labeled.
 9. Pumping systems including routing, sizing, valves, lubricators, regulators, pumps, nozzles, etc. fully noted and scheduled.
- D. Product Data: Manufacturer's literature including catalog cuts, pamphlets, descriptive literature, equipment specifications, performance and test data, and brochures which adequately describe the piece of equipment or product.
- E. Installation Instructions: Manufacturer's recommended installation instructions and manufacturer's installation drawings.
- F. Operations and Maintenance Manuals: Submit manuals for each equipment item.
- G. Provide the MBTA with specialized test equipment and tools necessary to maintain equipment components and sub-assemblies. Provide one set of maintenance equipment and tools with the final O&M Manuals for each piece of equipment.
- H. Guarantee spare parts availability for a period of ten years. Include guarantee in O&M Manual.

1.4 OPERATIONS AND MAINTENANCE MANUALS

- A. Submit operations and maintenance manuals for each machinery and equipment item as follows:
1. One copy of sample format and outline of contents in draft form with the equipment shop drawings.
 2. One copy of complete manual in final form on equipment delivery date.
 3. Five copies of approved manual after the equipment is installed and ready to test.
- B. Prepare manuals using the following materials:
1. Loose leaf, on 60-pound, three hole punched paper.
 2. Holes reinforced with plastic cloth.
 3. Page size, 8-1/2 inches by 11 inches.
 4. Foldout diagrams and illustrations.
 5. Reproducible by dry-copy xerography method.
 6. Oil-, moisture- and wear-resistant plastic covers.

C. General Requirements for Manuals:

1. Manuals furnished may be manufacturer's standard publications in regard to size and binding provided they comply with specified requirements relative to quantity and quality of information and data.
2. Bind manuals within hard or flexible covers. Make illustrations clear, and printed matter, including dimensions and lettering on drawings, easily legible. If reduced drawings are incorporated into manuals, heavy-up original lines and letter as necessary to retain their legibility after reduction. Larger drawings may be folded into manuals to page size.
3. Clearly identify each manual through the front cover with at least the following information:
(*description of manual)
(description of equipment or systems)
MBTA
GLX
(Name of the DB Entity)
accepted by: (MBTA Signature) Date

D. Format Manuals as Follows:

1. Title page: Include the name and function of the equipment, manufacturer's identification number, and the Project Specifications number and title.
2. Table of contents, in numerical order listing all sections and subsection titles of the O&M Manual with reference to the page on which each starts-and a list of included diagrams and drawings.
3. Index, in alphabetical order.
4. Frontispiece: Recognition illustration of the equipment described in the O&M Manual.
5. Manufacturer's literature describing each piece of equipment, including major assemblies and subassemblies, and giving manufacturer's model number and drawing number.
6. Operation instructions including step-by-step preparation for starting, operation, shutdown and draining and emergency requirements.
7. Control diagrams, as-installed by the manufacturer.
8. Sequence of operation by the control manufacturer.
9. Wiring diagrams, as-installed and color codes, of electrical motor controllers, connections and interlock connections.
10. Diagrammatic location, function and tag numbers of each valve.
11. Maintenance instructions: Include step-by-step procedures for inspection, operation checks, cleaning, lubrication, adjustments, repair, overhaul, disassembly, and reassembly of the equipment for proper operation of the equipment. Include list of special tools which are required for maintenance with the maintenance information.
12. Possible breakdowns and repairs.
13. Manufacturer's parts list of all functional components, control diagrams and wiring diagrams, giving manufacturer's model number and manufacturer's part number.

14. "Long-Lead-Time' spare parts list for all spare parts not readily available on the open market or for which it is anticipated ordering and delivery time will exceed 10 days.
15. List of nearest local suppliers of all equipment parts.
16. Lubrication schedule indicating type and frequency of lubrication.
17. Manufacturer's warranty and guarantee data.
18. Spare parts data as follows:
 - a. Complete list of parts and supplies, with current unit prices and sources of supply.
 - b. List of parts and supplies that are either normally furnished at no extra cost with purchase of equipment, or specified herein to be furnished as part of Contract.
 - c. List of additional items recommended by manufacturer to assure efficient operation for period of 120 days.
19. Appendix: Include safety precautions, a glossary, and, if available at time of submittal, copies of test reports, and other relevant material not specified to be submitted.
20. Delete information on material or equipment not used in the work from the O&M Manual.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Equipment and components shall be suitably packed or crated to prevent damaged in transit or during handling. Items shall be carefully stored at the site as required in a manner to avoid misalignment or distortion, and shall be adequately protected against damage by weather or other cause.
- B. Special precautions shall be taken to prevent damage to electrical components such as motors, controls and conductors.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Material and equipment particulars and requirements as specified in manufacturer's standard installation procedures.
- B. Mobile Wheelchair Lift:
 1. Basis of Design: The Mobile Lift TX from Adaptive Engineering Inc. or approved equal.
 2. Lift must be ADA compliant and can quickly be stored in a designated storage location.
 3. Lift Criteria:
 - a. Typical lifting time: 20 seconds to max. lifting height
 - b. Max. lifting height: 60" (1.52m)
 - c. Crank force: 5 lbs. to lift 150 lbs.; 11 lbs to lift 300 lbs.
 - d. Capacity: 600 lbs. (275 kg)
 - e. Lift weight: 289 lbs. (135 kg)
 - f. Lift height: 66" (1.76m)
 - g. Lift width: 37.5" (.95m)

- h. Length: 72" (1.83m)
- i. Platform size: 34" x 56" (.86m x 1.42m)
- j. Bridge Ramp: 20"L x 28"W (.51m x .71m)

C. Shop Paint:

- 1. Shop prime paint: Rust inhibitor paint containing at least 50 percent rust inhibitor pigments.
- 2. Shop finish paint: Manufacturer's standard finish coat system.

D. Motors:

- 1. Provide motors of sufficient capacity to operate the given equipment under all conditions of operation without loading beyond the nameplate current or power.
- 2. In no case are motors offered to be less than the horsepower specified except when it can be demonstrated that because the efficiency of the driven equipment is greater than that specified and lesser horsepower will suffice.
- 3. Motors for periodic usage designed as standard efficiency, all other motors designed as high efficiency, each bearing the UL label and constructed to standards of NEMA, IEEE, ANSI, and AFBMA.
- 4. Provide motors designed for operation on the electrical service characteristics indicated on the DB Entity's accepted Shop Drawings.
- 5. Design motors to operate in an ambient temperature of 40 degrees C in continuous operation (unless otherwise specified) with a service factor of 1.15.
- 6. Motors designed for outdoor service or corrosive atmosphere service shall have the motor windings protected by U.S. Motors Everseal Solid-Cast Encapsulation, Westinghouse Life-Guard Encapsulation, or approved equal.
- 7. Motors rate on horsepower or greater shall have a full-load power factor of 85 percent or higher. Motors rated 20 horsepower and over shall be designed for reduced voltage starting.
- 8. Provide motors of totally enclosed type unless otherwise specified.
- 9. Provide vertical motors with thrust bearings adequate for axial loading to which they can be subjected in operation.
- 10. Bearings for motors one-half horsepower and larger shall be rated for 20-year life under AFBMA Standards.

E. Equipment Anchors: Provide anchors for equipment requiring such. Size anchors for embedding in concrete and expansion anchors as recommended by equipment manufacturers. When recommendations are not provided, size anchors in the largest diameter that will pass through the bolt heads in equipment bases. Anchor lengths as indicated on the DB Entity's accepted Shop Drawings or as recommended by equipment manufacturer.

- 1. Expansion Anchors: Conforming to Federal Specification FF-S-325, Group II, Type 4, Class I Stainless Steel; such as Hilti Kwik-Bolt, Phillips Red Head Wedge-Anchor and Molly Parabolt, or approved equal.
- 2. Steel Anchor Bolts: Shapes as indicated or as recommended by equipment manufacturer, ASTM A 307 with galvanized finish.

- F. Dock Bumpers: provide heavy duty dock bumpers for loading dock areas.
 - 1. Dock Bumper basis of design: Grainger Dock Bumper Model 5W823 or approved equal
 - 2. Bumper Shape: Rectangular
 - 3. Overall Dimensions: 10 ¾"W x 10"H x 4 ½"D
 - 4. Bumper Material: Rubber

2.2 MATERIALS

- A. Stairway Evacuation Chairs: Provide manufacturer's standard completely assembled units, minimum 300 pound capacity, wall mounted on brackets. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, the following:
 - 1. Evacu-Trac CD7 by Garaventa.
 - 2. Evac+Chair by Evac+Chair Corp.
 - 3. Model 49 Sirocco Stair Chair by Ferno.
 - 4. Evacuation Chair Model 6253 by Stryker.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Installation particulars and requirements are as specified in manufacturer's standard installation procedures.
- B. Shop Painting: Paint equipment with one coat of approved shop primer and manufacturer's standard finish coat system. Indicate brand and type of paint on shop drawings. Colors shall be accepted by the MBTA.
- C. Electrical Requirements:
 - 1. Power supply for equipment is designed as 480V, 3-phase, 60Hz unless otherwise specified.
 - 2. Provide transformers for equipment as required to step down the specified supply voltage to provide lower voltage for controls and accessories and to provide voltage compatible with equipment as required.
 - 3. Provide wiring and conduit for a complete installation and proper operation of all equipment and accessories. Provide electrical service devices (disconnect switches) complying with the requirements of Division 16; Electrical. As work of this Section, install these electrical service devices, perform wiring (including conduit installation) and make connections between these electrical service devices and equipment specified in the various Sections referenced in Related Work Specified Elsewhere. Size wiring and conduits for the loads and voltages indicated on the DB Entity's accepted Shop Drawings. Wiring and conduit type shall be in accordance with the requirements of the National Electrical Code for the individual equipment location except where more stringent requirements are specified in Division 16. In no case shall maximum current carried exceed that specified by the National Electrical Code for type of conductor used.
 - 4. Provide disconnect switches (fused and non-fused as required), motor starters and start-stop control stations for all equipment subject to the following conditions:

- a. Provide above stated electrical devices consistent with NEC and equipment design requirements, as well as the electrical power circuit design for each piece of equipment.
 - b. Provide the type of electrical device based on the requirements of the proceeding paragraph and the electrical characteristics of the Project electrical design.
 - c. Sizing of the above state electrical devices is the responsibility of the DB Entity based on the information supplied by equipment manufacturers and is subject to the MBTA's review.
5. Provide control devices necessary for proper operation and locate to permit efficient operation of the equipment, and where possible group in a factory fabricated NEMA approved control panel complying with the requirements of Division 16; Electrical.
 6. Identify switches, lights and control functions with legend plates. Construct the plates of polyvinyl chloride materials of laminated multiple construction, and rout engraved with appropriate legends. Submit the size of letters, colors and legend for review. Mount legend plates on the equipment in an approved manner. No decals will be accepted.

D. Mechanical Requirements:

1. Piped services for equipment are specified as work of Division 15; Mechanical and are terminated near the piece of equipment in a shut-off means. As part of the work off this Section, extend these piped services to the equipment and make the associated connections.
2. Provide piping, fittings, valves connections, etc. of a type and size as recommended by the equipment manufacturer that will properly interface with the piped services provided under Division 15; Mechanical.
3. Provide gas piping and connections in accordance with the requirements of the American Gas Association for Stationary and vibration producing equipment.

E. General Installation Requirements:

1. Furnish common and skilled labor, tools, rigging equipment, scaffolding, shims, dowels, and other materials necessary to make complete installation of equipment specified and indicated in the Contract Documents.
2. Conduct loading, transportation, unloading, and storage of products such that they are kept clean and free from -damage. Bear transportation costs. Mark and tag equipment with equipment item numbers.
3. Perform work in an acceptable manner and install materials and equipment as recommended by the manufacturers and in accordance with specified codes and standards.
4. Repair or replace materials and equipment marred or damaged in any way, shape, or form to the satisfaction of the MBTA at no additional cost to the MBTA.
5. Be responsible for safety and protection from loss or damage of equipment received until work is complete. Provide secured areas for equipment that will not be installed as soon as it arrives on Site.
6. Reassemble equipment items which were dismantled for shipment or moving. Assemble items which are delivered knocked down, or disassembled.
7. Provide grout, shim material and miscellaneous steel necessary for brackets, anchors or supports required in installation of equipment.
8. Perform field machining that might be required to fit equipment together or to install equipment.

9. Lubricate apparatus before start-up.
 10. Field check for clearance and interferences before fabrication or installation and relocate material and equipment furnished as required to eliminate interferences.
 11. Details listed in these Specifications are given for a better understanding of the Work and do not place limitation on the amount of work to be done nor do they relieve the DB Entity of additional work that may be required for a complete installation.
- F. Setting and Alignment of Equipment:
1. Set and align equipment in accordance with manufacturer's recommendation, conformed shop drawings and applicable standards of trade practice.
 2. Set equipment plumb and level. Demonstrate adequate leveling of installed equipment.
 3. Retighten bolted connections after installation.
- G. Equipment Foundations:
1. Provide anchor bolts where required to mount equipment. Coordinate with other trades to insure the proper installation of the anchor bolts.
 2. Provide concrete pads and grout pads as required to stabilize equipment base to concrete slab and foundations where indicated and where recommended by the manufacturer. Grouting requirements and grout material shall be in accordance with the recommendations of the manufacturer.
 3. Grout under base plates after they have been set, aligned and leveled.
 4. Provide hard rubber shimming and dampening pads as recommended by the manufacturer for leveling of equipment and dampening of equipment vibration transmission.
- H. Cleaning and Protection:
1. Clean fabrication assemblies and equipment items thoroughly before and after operating and testing.
 2. Protect equipment from damage, deterioration, paint or coating spills or spots, corrosion, or harm from any source.
- I. Motors and Drives:
1. Check motors and drives for correct rotation and alignment before placing equipment into operation.
 2. Disconnect couplings and realign before placing into service or testing.
 3. Adjust belt drives and replace worn belts.
- J. Field Painting:
1. Field painting equipment, including touch-up painting is included as work under this Section. Normally, equipment shall be factory finished as previously specified.
 2. Touch-up or repaint to match original finishes, factory finished or painted equipment and materials which are scratched or marred during shipment or installation.

3.2 TRAINING PROGRAM

- A. At least 30 days prior to schedule delivery of equipment, submit to the MBTA, a detailed outline of the proposed training program for the MBTA's personnel. Include such information as the duration of the program, material and literature to be utilized, topics covered, and any material and equipment required to be provided by the MBTA. The MBTA will provide transit vehicles and transit vehicle components required for the training program.
- B. Include familiarization with equipment operation and performance and detailed instruction in operation and maintenance of the equipment including "hands-on" training.
- C. The program shall be provided for the following as a minimum: MBTA - 8 hours; Operating personnel - 40 hours; Maintenance Personnel - 48 hours.
- D. Include each piece of equipment's operation and maintenance manual as a basic text for instruction. Organize the program to permit the MBTA to develop, within its own organization, the capability to continue the education of its personnel in the proper operation, maintenance, and repair of the equipment. Assume no prior knowledge, on the part of the MBTA personnel, of the equipment.
- E. Conduct the training program prior to final equipment testing and acceptance. Notify the MBTA of the proposed training period at least 14 days prior to commencement of the training program. The MBTA will provide the exact number of MBTA personnel who will attend 7 days prior to the start of the program.
- F. Conduct the training program on Site, on the pieces of equipment supplied as part of this Contract.

3.3 EQUIPMENT TESTING AND CHECK-OUT

- A. Submit acceptance testing program for work performed under this Section to the MBTA for review and approval 45 days prior to the start of testing. Design the program to show that the work performed, or equipment installed, under this Section will perform as intended. Perform all tests to written test procedures that have been reviewed and accepted by the MBTA. The test procedures will include the following:
 - 1. Item tested and date of test.
 - 2. Acceptance criteria.
 - 3. Measuring and test equipment used and calibration data.
 - 4. Result of the test.
 - 5. Signature of person performing the test.
- B. Provide a qualified manufacturer's representative to supervise testing by the DB Entity, including those personnel of the contract operator required in providing vehicles and components, in the presence of the MBTA, to ensure proper operation of equipment.
- C. Before Final Acceptance, test the equipment in the presence of the MBTA to his satisfaction and to demonstrate that it is correctly connected, installed and operating properly.
- D. The MBTA will provide transit vehicles and transit vehicle components required for the testing procedures.
- E. The equipment testing shall not only demonstrate that each piece of equipment has been properly installed and connected and operates properly but shall also demonstrate that the equipment performs

the work for which it is intended. Design the equipment test so that all assemblies, subassemblies, components, auxiliary functions, and safety devices are utilized in the testing procedure at least once.

- F. Tested equipment found to be defective or inoperable to any extent shall be reported to the MBTA immediately.
- G. Repair or replace, at no additional expense to the MBTA, any operating difficulty or defective item and restore the equipment to proper operation before testing is continued.
- H. Protect equipment and surrounding areas from damage resulting from testing operations. Clean-up spills or leakage resulting from testing.
- I. Bear all expenses of all tests, including the furnishing of all necessary instruments, test weights, lubricants, hydraulic fluids, supplies, data recorders, and operating personnel.

END OF SECTION

SECTION 11500

INDUSTRIAL AND PROCESS EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of DB Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the DB Entity shall be provided at no additional cost to the MBTA and shall be as accepted by the MBTA.
- D. Furnish and install the equipment items listed below by their identifier
 - 1. Eye wash, Primary, Portable Station Kit (EQ ID: 2296)
 - 2. Vise, Combination, Swivel Base, 5" (EQ ID: 2629)
 - 3. Tank, parts cleaning (EQ ID: 3025)
 - 4. Washer, hi pressure/hot water, NG (EQ ID: 3050)
- E. The work specified in this Section shall be performed and coordinated with the work of other trades including, those listed in Article 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The DB Entity shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 3 - Concrete
 - 2. Division 15 - Mechanical
 - 3. Division 16 - Electrical

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements".
- B. Operations and Maintenance Manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years' experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Follow the requirements specified in Volume 1 Contract Terms and Conditions.
- B. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the DB Entity.
- C. Substitution Approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided in accordance with Volume 1 Contract Terms and Conditions. Acceptance will be based on the technical requirements herein as determined by the MBTA.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with Volume 1 Contract Terms and Conditions.

PART 2 – PRODUCTS

2.1 EYE WASH, PRIMARY, PORTABLE STATION KIT (EQ ID: 2296)

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Uline, Pleasant Prairie, WI, (800) 295-5510
 - 1) Model: H-1142
2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Speakman Company, New Castle, DE, (800) 537-2107
 - b. Haws Corporation, Sparks, NV, (775) 359-4712

B. Capacities/Dimensions:

1. Size: 26" x 19 ½" x 19 ½" (LxWxH)
2. Capacity: 16 gallon
3. Flow rate: 0.4 gpm over 15 minutes

C. Features/Performance/Construction

1. Featuring a FDA approved high-density green polyethylene tank easily activated by pulling the yellow activation arm down to the open position.
2. A wide-fill opening with threaded cap permits easy inspection, cleaning and filling.
3. Relocation is simple due to the easily mounted (bracket included) and light design of this 16 gallon (60.6 L) portable.

2.2 VISE, COMBINATION, SWIVEL BASE, 5" (EQ ID: 2629)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Yost Visers, Holland, MI - (616) 396-2063
 - 1) Model: 33C
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 1 Contract Terms and Conditions and Volume 2

Technical Provisions, equipment produced by other manufacturers, including the following, may be considered as equal:

- a. Ridgid Tool Co., Elyria, OH - (216) 323-5581
- b. Milwaukee Tool and Equipment Co., Milwaukee, WI - (414) 645-0200

B. Capacities/Dimensions:

1. Jaw width (nominal inches): 5"
2. Jaw opening (nominal inches): 7 ½"
3. Throat depth (nominal inches): 6"
4. Min. pipe capacity (nominal inches): 1/8"
5. Max. pipe capacity (nominal inches): 4 ½"
6. Base: Swivel

C. Features/Performance/Construction:

1. 65,000 PSI tensile ductile iron body parts.
2. Interlocking swivel base with 360 degree motion.
3. Two (2) lockdowns.
4. Hardened, replaceable steel pipe jaws.
5. Pipe jaws set back to allow for machinist's vise use.
6. Pipe jaws designed to grip pipe securely.
7. Design helps prevent pipe marring, crushing or bending.
8. Conforms to Fed. Spec. GGG-V-410B Type IV.
9. No pinch main screw handle.
10. Replaceable hardened steel flat serrated jaws.
11. Continuous rolled thread on main screw.
12. Material: Ductile Iron

2.3 TANK, PARTS CLEANING, 16-42 GALLON (EQ ID: 3025)

- A. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
1. Graymills, Inc. (877) 465-7867
Model: Clean-O-Matic Solvent Parts Washer 500-A
 2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 1 Contract Terms and Conditions and Volume 2

Technical Provisions, equipment produced by other manufacturers, including the following, may be considered as equal:

- a. Safety-Kleen Systems, Inc. (800) 323-5040
- b. Ultimate Washer, Inc. (866) 858-4982

B. Capacities/Dimensions:

1. Operating Fluid Capacity: 16-42 Gallons
2. Dimensions: 44" L x 21" W x 23 ¾" H

C. Features/Performance/Construction:

1. Unit is to be made of 16 gauge, powder-coated steel.
2. Provide the capability for three cleaning methods:
 - a. Pump for in-tank agitation.
 - b. Pistol-grip nozzle, with capability for both light spray and solid stream.
 - c. Flush hose with hand-held brush.
3. Provide capability to switch between or use all of the above cleaning methods at once.
4. Provide washable 40 mesh screen solvent filter.
5. Provide drain plug.
6. Maximum Flow Rate: 2400 GPH
7. Unit is to be mounted on casters to provide mobility.

D. Utility Requirements:

1. Motor Horsepower: 1/3 HP
2. Electrical Supply: 115V, 60 Hz, 1 Phase AC
3. Provide nearby domestic water hose bib for filling tank.

2.4 WASHER, HI PRESSURE/HOT WATER, NG (EQ ID: 3050)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. The Hotsy Corporation, Camas, WA - (360) 833-1600
 - 1) Model: 995SS
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions, equipment produced by other manufacturers, including the following, may be considered as equal:

- a. Landa, Inc., Camas, WA (360) 833-9100
- b. Alkota Cleaning Systems, Inc., Alcester, SD - (605) 934-2222

B. Capacities/Dimensions:

1. Pump motor: 460V AC, 3 phase, 5 HP
2. Operating pressure: 2,000 PSI
3. Maximum discharge capacity: 4 GPM
4. Overall dimensions:
 - a. Length: 45"
 - b. Width: 18"
 - c. Height: 48"
5. Net weight: 525 lbs.

C. Features/Performance Construction:

1. Burner: NG fired, 365,000 BTU/hr., AGA-listed gas controls, ring type with aspirating spuds, natural draft.
2. All open flames and fire rings shall be mounted at a minimum of 18" above the finished floor.
3. Heating coil: Vertically-fired; 7/8" OD, hydrostatic-pressure tested; 14,900 PSI burst-rated.
4. Water pump: Triplex water pump with positive displacement, ceramic plungers, brass manifold, and oil bath crankcase.
5. Fabrication: Welded angle iron frame shall have heavy gauge tank and cabinet.
6. Piping: Supplier shall provide piping (schedule 80) from high-pressure wash unit to each trigger gun wand for a complete and operable system.
7. The manufacturer shall supply all necessary soap system equipment including piping, fittings, distribution hose, and connections for a complete and operable soap distribution system.
8. Controls: Adjustable temperature controller, safety pressure relief valve, pressure switch, ON/OFF electric motor switch with overload protection, unloader, water heater switch, detergent valve, and automatic non-contaminating float valve.

D. Accessories:

1. Trigger gun and hose assembly (50' long hose).
2. The DB Entity supplied scabbard for trigger gun: Wall mounted; one (1) at each trigger gun location.
3. Hose reel: Hotsy No. 860204, or equivalent. One (1) at each trigger gun location.
4. Draft diverter: Hotsy No. 835526, or equivalent.
5. Remote starter: Smart box with soap solenoid and remote.
6. Replacement nozzle: 2.5 mm with quick disconnect.
7. The DB Entity supplied replacement nozzle holder: Wall mounted.

8. Powershine Plus© detergent: 55 gallon drum.
 9. Breakthrough© detergent: 55 gallon drum.
 10. Time delayed shutdown: 1 minute delay.
- E. Utility Requirements:
1. Electrical: 460V AC, 3 phase, 5 H.P.
 2. Plumbing:
 3. Water: ¾” to supply, 40 to 60 PSI, 4 GPM minimum (regulate water supply if greater than 60 PSI).
 4. Natural gas: 1 to 1 ½” NPT to supply 525,000 BTU at equipment.
 5. Stack size: 8” with draft diverter.
- F. Finish:
1. Durable enamel using the MBTA’s choice from the manufacturer’s standard colors

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Install equipment in accordance with the plans, shop drawings, and manufacturer’s instructions:
 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 3. Anchorage: Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- B. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications or designated representative using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.

- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the MBTA or designated representative for acceptance inspection.

END OF SECTION

SECTION 11520

MISCELLANEOUS SHOP EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the DB Entity shall be provided at no additional cost to the MBTA and shall be as accepted by the MBTA.
- D. Furnish and install the equipment items listed below by their identifier:
 - 1. Cart, deionized water, portable (EQ ID: 5041)
 - 2. Platform, work, portable (EQ ID: 8002)
 - 3. Platform, work, roof (EQ ID: 8005)
 - 4. Pallet Jack, 5500 lbs (EQ ID: 9815)
- E. The work specified in this Section shall be performed and coordinated with the work of other trades including, those listed in Article 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The DB Entity shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, the following:
 - 1. Division 2 - Site Work
 - 2. Division 3 - Concrete
 - 3. Division 5 - Metals
 - 4. Division 15 - Mechanical
 - 5. Division 16 - Electrical

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements".
- B. Operations and Maintenance Manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years' experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Follow the requirements specified in Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.
- B. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the DB Entity.
- C. Substitution Approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided in accordance with Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions. Acceptance will be based on the technical requirements herein as determined by MBTA.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.

PART 2 – PRODUCTS

2.1 CART, DEIONIZED WATER, PORTABLE (EQ ID: 5041)

- A. Manufacturer's Reference:
 - 1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Flow-Rite Controls, Ltd., Byron Center, MI - (616) 583-1700
 - 1) Model: BA-MS-105

2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions, equipment produced by other manufacturers, including the following, may be considered as equal:
 - a. Philadelphia Scientific, Montgomeryville, PA - (215) 616-0390
 - b. Battery Watering Technologies, Clemmons, NC - (336) 714-0448

B. Capacities/Dimensions:

1. Tank capacity: 22 gallons
2. Overall dimensions (nominal):
 - a. Width: 20"
 - b. Length: 27"
 - c. Height: 35"
3. Power supply:
 - a. A 12V sealed battery with its own on-board charger.
 - b. 110V AC Charger; 12V DC Volt Meter.

C. Features/Performance/Construction:

1. Cart shall have an onboard battery charger with voltmeter with cord to plug into a 120 VAC outlet.
2. Cart shall have a suction pump with an in-line pressure regulator to limit maximum pressure.
3. Cart shall be mounted on wheels.
4. Cart shall have a minimum 6 feet of dispensing hose with a sensor to shut off water flow when a battery cell is full.

D. Accessories:

1. Requires Flow-Rite Deionized Water Filter w/ Regulated Hose (Model No. BA-MS-341), or equivalent.
2. Removes ions and heavy metals that are present in tap water.
3. The separate bed deionizer uses an ion exchange cartridge to filter the water before it enters the battery.
4. Low pressure bypass for maintaining pressure in the event that a cartridge is not changed and becomes clogged.
5. 20' supply hose with inline strainer.
6. 110-115V AC Light (water quality indicator)

2.2 PLATFORM, WORK, PORTABLE (EQ ID: 8002)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.

a. Ladder Man, Wooster, OH - (800) 783-8887

1) Model: 40218

2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions, equipment produced by other manufacturers, including the following, may be considered as equal.

a. Cotterman Co., Crosswell, MI - (810) 673-4400

b. Gillis, Prospect Heights, IL - (877) 445-5471

B. Capacities/Dimensions:

1. Maximum capacity: 500 lbs.

2. Overall dimensions (nominal):

a. Width: 36"

b. Length: 58"

c. Platform height: 20"

3. Platform dimensions:

a. Width: 36"

b. Length: 48"

c. Weight: 102 lbs.

C. Features/Performance/Construction:

1. Extra wide work platform with ½" sure-grip rubber pad.

2. Platform shall have two (2) rear 4" rigid casters.

3. Platform shall be of heavy-duty welded steel construction.

4. Platform shall be constructed with two (2) steps with grip strut treads.

D. Accessories:

1. Each unit shall be wrapped in non-conductive material, 3M black rollstock.

E. Finish:

1. Durable enamel using the MBTA's choice from the manufacturer's standard colors

2.3 PLATFORM, WORK, ROOF (EQ ID: 8005)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Service Scaffold Co, Inc., South Fallsburg, NY - (845) 434-8888
 - 1) Model: SSC Series
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions, equipment produced by other manufacturers, including the following, may be considered as equal:
 - a. Universal Manufacturing Corp., Zelienople, PA - (800) 836-8780
 - b. Mdm Scaffolding Services, Inc., Grapevine, TX - (800) 339-2390

B. Capacities/Dimensions:

1. Maximum capacity: 500 lbs.
2. Platform dimensions:
 - a. Width: 30"
 - b. Length: 14'-0"
 - c. Height: Height of LRV + 30"
3. Stairs to platform:
 - a. Width: 2'

C. Features/Performance/Construction:

1. Equipment shall be designed to access rooftops without the use of a fall protection system.
2. Guardrails shall be included on three (3) sides of each platform.
3. Platforms shall be designed to connect together across the rooftop with gates creating a safety approved area.
4. Each platform shall include toe plates on three (3) sides.
5. Each unit shall include a stairway with handrails on both sides.
6. Treads shall include traction gripping.
7. Each platform shall have continuous rubber protective bumpers.

D. Finish:

1. Durable enamel using the MBTA's choice from the manufacturer's standard colors

2.4 PALLET JACK, 5500 LBS (EQ ID: 9815)

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Wesco Industrial Products, Inc., Lansdale, PA, (215) 699-7031
 - 1) Model: 272148
 2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Dayton, Vandalia, OH, (937) 454-7545
 - b. Lift-Rite Inc., Ontario, Canada, (905) 456-2603
- B. Capacities/Dimensions:
1. Capacity: 5,500 lbs.
 2. Overall dimensions
 - a. Fork Width: 21 inches
 - b. Fork Length: 48 inches
 - c. Weight: 157 lbs.
 3. 8 inch raised height
 4. 3 inch lowered height
 5. 6 inch wide forks
- C. Features/Performance/Construction:
1. 8" moldon polyurethane steering wheels
 2. 3" moldon polyurethane load wheels
- D. Finish: Durable enamel in manufacturer's standard color

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Install equipment in accordance with the plans, shop drawings, and manufacturer's instructions:
 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.

2. **Fitting:** Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 3. **Anchorage:** Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- B. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the MBTA or designated representative for acceptance inspection.

END OF SECTION

SECTION 11550 WHEEL TRUING MACHINE

PART 1 - GENERAL

1.1 PURPOSE

- A. This document covers the procurement of a new under floor, single axle full profile wheel truing milling machine for all Light Rail Vehicles (LRV) of the Massachusetts Bay Transportation Authority (MBTA) Green Line.
- B. This Specification outlines and provides criteria to be used in procuring a new under floor wheel truing re-profiling machine, enabling the DB Entity to furnish an end item in compliance with the requirements of this specification. The work performed by the DB Entity shall comply with all applicable standards, codes and regulations, wheel specifications, and MBTA documents, drawings, and requirements.

1.2 VARIATIONS

- A. This specification identifies the acceptable equipment configuration and functions of the wheel truing machine. Alternate manufacturer models may be proposed. In all cases the DB Entity must provide in writing sufficient technical description of the alternate unit(s) and proves it meets specification. The MBTA must have ample time and supporting documentation to review the proposed equipment meets the specification.
- B. Conflicts and recommendations shall be referred to the MBTA.

1.3 QUALITY CONTROL PROGRAM

- A. Submit to the MBTA for approval a detailed narrative explaining the quality control procedures to be utilized for the fabrication and installation of equipment. The narrative shall include details of the methods and procedures to be used to regulate the production of the equipment to assure compliance with the specified standards of quality. The narrative shall also include full information on the DB Entity's methods of testing and inspection and shall identify the DB Entity's representatives and their duties.
- B. Any work undertaken, including the ordering and purchase of materials and supplies for the Work, by the DB Entity prior to approval of the Quality Control Program shall be at the DB Entity's risk.
- C. Upon delivery of the equipment, submit certificates of compliance. Each certificate shall be signed by an authorized representative of the manufacturer stating that the equipment complies in all respects with the Contract Documents.
- D. DB Entity shall verify foundations, structures and other construction is adequate for the wheel truing machine in operation with any MBTA Green Line vehicle.

- E. Verify that the wheel truing machine will function in both, the CNC and manual controlled mode, properly with every vehicle in the MBTA Green Line rail fleet.
- F. Verify that all dimensions, foundations and utility supplies are adequate for the wheel truing machine. Verify dimensions of all vehicles that relate to fabrication of the wheel truing machine and notify the Engineer of Record of any discrepancy before fabrication and delivery of the equipment to the site.

1.4 QUALIFICATIONS

- A. The DB Entity must include a firm with a minimum of 10 years successful experience in the manufacturing and installation of under floor wheel truing milling machines for Light or Heavy Rail Vehicles. DB Entity shall provide documentation that they regularly engaged in successful design, manufacturing, and installation of wheel truing machines for low floor and centerless vehicles including those with independently rotating wheels.
- B. The manufacturer of the wheel truing machine shall provide written instructions on how their centerless wheel truing machine will true the power and unpowered bogies of the No. 7 SRC, No. 8 low floor car, and the No. 9 low floor car.
- C. The DB Entity shall provide a list of comparative installations currently in operation for a period of at least the past five years, including names and phone numbers for engineers and or technicians at other Transit Authorities using the system.
- D. The DB Entity's product support and repair department shall be capable of responding and providing on-site assistance if necessary within 48 hours of notification.
- E. Manufacturer must maintain an adequate supply of spare parts for the expected life of the equipment supplied under this contract. The manufacturer shall be able to ship parts within 24 hours of notification if the parts are not commercially available.
- F. The DB Entity's installer of the wheel truing machine shall have previous experience in the installation of wheel truing machine equipment.
- G. The equipment manufacturer shall employ of specialists who are trained and experienced in the methods and requirements necessary for the proper execution of the Work in this specification.

1.5 SUBMITTALS

- A. The DB Entity shall submit a list of a minimum of five transit properties where similar under floor wheel truing machines were installed and are currently operating successfully. A reference contact person, address and telephone number at these properties with English speaking capabilities shall be furnished. In addition, commercial literature or drawings of these models shall be furnished for illustration.

- B. The DB Entity shall submit all sub-contractor contact information and qualifications in the particular subcontracted scope of work.
- C. Preliminary installation drawings sufficiently detailed indicating required concrete foundation dimensions, equipment attachment details, required electrical and mechanical services, as well as drawings and catalog cuts indicating operation, dimensions, and all features for all equipment to be supplied, shall be submitted.
- D. Three hard copies and one electronic copy on a USB 3 drive of the following manuals and drawings shall be submitted by the DB Entity to the MBTA with all revisions to the manuals throughout the warranty period:
 - 1. Detailed Operating Instruction Manuals for the wheel truing machine system and all auxiliary equipment.
 - 2. Detailed Maintenance Instruction Manuals for the wheel truing machine system and all auxiliary equipment.
 - 3. Parts Manuals with OEM part numbers for the wheel truing machine and all auxiliary equipment.
 - 4. Site dimensions, foundation requirements and drawings for wheel truing machine system. Above and below grade electrical schematics and installation instructions. Electric power requirements with wiring diagrams and conduit runs.
 - 5. General equipment arrangement drawing(s), including outline dimensions and equipment component layout.
 - 6. Electrical control schematics.
 - 7. Hydraulic-pneumatic schematics.
 - 8. Operating and Maintenance Manuals shall be submitted for each equipment item as follows:
 - a. One electronic copy on a USB 3 drive and one hard copy of sample formats and outline of contents in draft form 30 days prior to the earliest scheduled equipment delivery to be submitted to the MBTA for approval.
 - b. Tolerances, clearances, and dimensions shall follow the system of ounces, pounds, gallons, inches, and feet, as used in the United States (metric conversions may be provided parenthetically).
 - c. One hard copy and electronic copy on a USB 3 drive of complete manual in final form on equipment delivery date.
 - d. Three copies of approved manual after the equipment is installed and ready to test.
 - e. One additional set of manuals suitable for shop environment shall be

prepared from the following materials:

- 1) Loose leaf, on 60-pound, punched paper.
 - 2) Holes reinforced with plastic cloth.
 - 3) Page size, 8-1/2 inches by 11 inches.
 - 4) Foldout diagrams and illustrations. (11 x 17 inches)
 - 5) Reproducible by dry-copy xerography method.
 - 6) Oil-, moisture and wear-resistant plastic covers.
- f. One set of as-built drawings inclusive of equipment arrangement and as-built installation. Drawing size shall be 22 X 34 inches
- g. Manuals shall include at minimum the following:
- 1) Title page: Include the name and function of the equipment, manufacturer's identification number, and the Project number, title and date.
 - 2) Table of contents, in numerical order listing each section and subsection title with reference to the page on which each starts and a list of included appendices, diagrams and drawings.
 - 3) Index, in alphabetical order.
 - 4) Manufacturer's literature describing each piece of equipment, including major assemblies and subassemblies, and giving manufacturer's model number, specifications and drawing number.
 - 5) Operation instructions including step-by-step preparation for starting, operation, shutdown, maintenance, and emergency operating requirements.
 - 6) Control Schematics and detailed diagrams as installed by the manufacturer.
 - 7) Sequence of operation by the control manufacturer.
 - 8) As-built wiring diagrams with wire color codes and numbers of all electrical wiring including motor controllers, terminal strips and interlock connections.
 - 9) Diagrammatic location, function and tag number of each hydraulic valve and control components.
 - 10) Maintenance instructions shall include step-by-step procedures for inspection, operation checks, cleaning, lubrication, adjustments,

repair, overhaul, disassembly, and reassembly of the equipment for proper operation of the equipment. Include a list of special tools that are required for maintenance with the maintenance information.

- 12) Troubleshooting flow charts shall be included for diagnosis of any major system or control, such as computer controls, hydraulic system, cutter operation, etc.
- 13) Manufacturer's parts list of all components, control diagrams and wiring diagrams, giving manufacturer's model number and manufacturer's part number.
- 14) Recommended preventive maintenance schedule for major system components including lubrication schedule indicating type and frequency of lubrication based on machine hours.
- 15) Manufacturer's warranty for a minimum of two years beyond the final acceptance and guarantee data.
- 16) "Long-Lead-Time" spare parts list for spare parts not readily available on the open market or for which it is anticipated ordering and delivery time will exceed 10 days.
- 17) List of suppliers of all commercially available equipment parts.
- 18) Spare parts data as follows: Complete list of parts and supplies, with current unit prices and sources of supply. List of additional items recommended by manufacturer to assure efficient operation for a period of two (2) years.
- 19) Appendix: Include safety precautions, a glossary, and, if available at time of submittal, copies of test reports, and other relevant material not specified to be submitted.

9. Operating Diagrams:

- a. Piping systems, electrical wiring diagrams, lubricating oil, and other diagrams necessary for operation of the equipment shall be furnished.
- b. No single diagram shall show more than one system or parts thereof.
- c. Diagrams shall be reproduced by photographic process to a size not to exceed 11 inches by 17 inches and shall be complete and legible in all respects. They shall be made on white paper and vacuum-sealed in transparent plastic material impervious to moisture and oil, and resistant to abrasion. Other formats which are equal in clarity, sharpness, durability and permanence will be considered.

10. All drawings shall be prepared in both AutoCAD and PDF format and furnished on USB 3 drive. All manuals shall be furnished on USB3 drive in a PDF format.

11. No equipment shall be delivered until manuals, schematics, and drawings have been reviewed and approved by MBTA.
12. Parts Catalog
 - a. Submit for approval three complete copies and electronic version on USB 3 drive.
 - b. Enumerate and describe every component and its related parts, including identifying numbers and commercial equivalents where applicable.
 - c. Include cut-away, exploded view or assembly drawings that clearly identify all parts of the machine.
13. Spare Parts List
 - a. Submit for approval three complete copies and electronic version on USB 3 drive.
 - b. Submit recommendations for spare parts inventory including types and quantities considered normal for routine maintenance of the equipment for three years.
 - c. Provide two sets of any specialty tools for the wheel profiling machine, required for maintenance or adjustment, packed in an appropriate steel tool box, if required.
 - d. Provide notification of any major parts or components that may become obsolete without an acceptable equivalent replacement throughout the warranty period.
 - e. Include a list of all consumables including OEM serial numbers and specifications for fluids, filters, greases, lights, cutting inserts, and other required consumables and maintenance items.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

The machine to be furnished under the contract shall be a new under floor wheel truing and re-profiling milling machine. The machine shall be designed to recondition the full profile of railroad wheels for transit vehicles; including an integrated wheel measuring system; chip collector system; chip hopper; dust collection system; calibration equipment; vehicle winching system or approved equal; hold down and adapter system for each bogie specified; and any incidental equipment, materials and special tools needed for the complete and proper installation, testing, use and maintenance of this wheel truing equipment.

- A. The machine may be designed and built in either the English or metric systems of units. Indicators, vernier scales and digital readouts shall indicate units in both English and metric. The machine shall comply with prevailing USDOT guidelines as

applicable.

- B. Equipment shall be designed, fabricated, installed and adjusted to secure the best commercially available results with respect to smooth, quiet, convenient and efficient operation, durability, economy of maintenance and operation, and the highest standards of safety.
- C. It is not the intent of the Contract Documents to detail the design and fabrication of the several parts of the equipment, but it is expected that the type, material, design, workmanship and fabrication of each and every part shall be fully adequate for the service required. The components of all electric circuits shall be of ample and proper size, design and material to avoid injurious heating and arcing, and all other objectionable effects which may reduce the efficiency of operation and economy of maintenance and upkeep.
- D. The DB Entity must provide, deliver, install and successfully test the wheel truing machine.
- E. DB Entity is required to obtain and coordinate all necessary vehicle engineering information for the No. 7 SRC, No. 8 low floor car, and the No. 9 low floor car to complete work and meet the performance characteristics herein.
- F. The machine shall be equipped with hydraulic hold-down equipment to assure the required axle load for the correct tool force. Hold-down design shall allow re-profiling wheels on the transit cars, fully assembled truck, or any single axle wheelset. The design shall include hold-down provisions appropriate for the No. 7 SRC, No. 8 low floor car, and the No. 9 low floor car.
- G. The wheel truing machine shall allow re-profiling of a train mounted truck, fully assembled truck or multiple types of single axle wheel sets for the No. 7 SRC, No. 8 low floor car, and the No. 9 low floor car.
- H. The wheel truing machine shall be capable of truing low floor bogies as a single axle wheel set that may have a rotating full length solid or hollow axle, a non-rotating stub axle, rotating stub axle, or similar design on all MBTA Green Line Vehicles.
- I. Re-profiling shall be accomplished without requiring the removal of equipment such as brake disc, actuators, HPCU's, track brake, track brake supports, or any other vehicle mounted equipment.
- J. Re-profiling must meet all Green line wheel specifications, wheel profiles, and MBTA minimum requirements for full wheel profile latest revision of MBTA drawing #51200.
- K. Wheel truing machine must be able to re-profile new wheel diameters to a condemning wheel diameters of all Green Line vehicles as listed below:

Type 7	26"-24" all trucks
Type 8	28"-26" powered truck, 26"-24" trailing truck
Type 9	25.984"-22.835" all trucks

(All diameters are measured at the wheel tape line)

- L. The machine shall be designed for truing wheel-axle sets having a back-to-back wheel gage of 54 3/16" (+1/16") and a standard track gauge of 56.5".
- M. Wheel tread hardness, when new, may range from 320 to 365BHN. Tread hardness of wheels in service may exhibit harder characteristics, especially in the area of flats spots.
- N. During the wheel truing process, the temperatures generated by machining must not exceed 230°F on all surfaces contacting the wheels' resilient rubber materials.
- O. The Wheel Truing Machine, exclusive of the consumable tooling, shall have a design life of 30 years.
- P. The system shall be designed for installation and proper operation in an indoor, transit shop environment.
- Q. The DB Entity shall provide the interface and interlocking device between the operation of wheel truing machine, winching or shunting system, and OCS (Overhead Catenary System) operation.
- R. All articles, materials, fittings, equipment and machinery incorporated in the Work shall be new, of recent manufacture, and free from defects and imperfections; shall be manufacturer's standard make; and shall be of first grade commercial/industrial quality, subject to approval of the MBTA.
 - 1. When two or more similar items of equipment are required, they shall be of the same model and type from a single manufacturer.
 - 2. All materials and equipment shall be installed as recommended by the manufacturers and in accordance with all required codes and standards.
 - 3. All factory finishes or painted equipment and materials which are scratched or marred during shipment or installation shall be repainted or touched up to match original finish.
- S. Subcontractors
 - 1. The work to be performed by any and all subcontractors as part of this contract will have sufficient documentation on their qualifications to skillfully perform the required work.
 - 2. Any subcontractor who the Authority deems to be incapable of performing their required scope of work will be dismissed and replaced by joint approval of both the Authority and supplier.

2.2 MACHINE DESIGN REQUIREMENTS

General Requirements

- A. The wheel truing machine must be of the under-floor type utilizing proven full profile milling technology, capable of simultaneously profiling both wheels of an axle set. The truing machine must be capable of re-profiling badly worn out of round and damaged wheels.
- B. The wheel truing machine will use the latest Siemens automation control software and hardware technology available to complete the wheel truing operation or MBTA approved equivalent. The automation control software and hardware must be fully supported for at least 10 years after the final acceptance date.
- C. Re-profiling operations shall be CNC/PLC controlled. Data is to be transmitted to the CNC/PLC control and be displayed on the Control Screen.
- D. The wheel truing machine must have centerless clamping and cutting capabilities along with provisions for inboard and outboard hold down devices. In board and outboard hold down devices must be of the hydraulic type or MBTA approved equal.
- E. The machine concept shall be such that the centering, driving, hold-down, and cutting forces have no negative effect on the overall accuracies. The design of the machine shall be such as to avert axle deformations during cutting operations. Axial thrusts developed during the machining processes shall be absorbed through axial wheel guides. The machine shall be designed and constructed and supported to reduce sources of vibration.
- F. The machine shall be capable of re-profiling wheel diameters from 20 inches 32 inches. No special provisions, tools or manual settings shall be required to accommodate any of these wheel sizes.
- G. Both wheels of a wheelset will be finished automatically to the diameter that is required to clean up, while removing the minimum amount of material possible.
- H. All controls for machine operation shall be at a control panel beside, yet comfortable away from, the machining area. The operator shall be able to observe the machine's cutting cycle without being exposed to any chip flow or any components underneath the vehicle.
- I. When not in use, the wheel truing machine's "Home" position (rails closed, machine down, etc.) shall ensure adequate clearance between all vehicles in the MBTA's fleet and any use of a railcar mover over the truing pit area.
- J. The wheel truing machine design shall have capabilities to true wheels with inboard and outboard wheel bearing designs.
- K. The wheel truing machine must have automated control system and fully automatic cutting and measuring programs developed for each axle wheel set in the No. 7 SRC, No. 8 low floor car, and the No. 9 low floor car MBTA Green Line Fleet.

- L. A fully integrated and automatic wheel measuring system at each axle wheel set must be included in the wheel truing system. The wheel measuring system must provide pertinent data pre and post cutting including diameter, flange width, axial run-out (back face), radial run-out, back to back, gauge, and profile conformity.
- M. A data collection system with dedicated Ethernet port or equivalent connection to MBTA network will be integrated into the wheel truing machine.
- N. Wheel truing machine will have the capabilities to true all MBTA Green Line axle wheel sets that may have a rotating full length solid or hollow axle, a non-rotating stub axle, rotating stub axle, or similar designs.
- O. The machine shall have a maximum axle load capacity of 20 tons or greater.
- P. Axle deflection during machining operations when restrained by hold-down forces not to exceed 0.020 inches.
- Q. Machine Noise level shall not exceed 80dBA at the operator's station during normal operation, except while cutting and shall be in compliance with NEMA MG 1 Section 9.6 Sound Power Level and OSHA §1910.95 when measured in accordance with OSHA §1910.95 or IEEE 85.
- R. DB Entity will provide one complete set of mechanical hold-down devices and adapters for all No. 7 SRC, No. 8 LFC, and No. 9 LFC trucks along with installation and mounting procedures. The adapters shall enable wheel truing referenced to the axial center of the wheel set. Detailed drawings for the hold down adapters will be provided along with the specifications and finite element analysis proving each hold down adaptor assembly will withstand cutting loads for the equipment's design life.
- S. A totalizing counter for recording the total number of hours of machine operation shall be provided on each machine.
- T. The minimum production rate shall provide an output of eight 28 or 26-inch diameter wheelsets per eight hour shift.
- U. The typical machining cycle, for a wheelset with 28 or 26 inch diameter wheels, being machined shall occur in no more than three passes, including the mounting of any hold down adapters, spotting of the vehicle over the machine, machine set up for cutting, and all measuring processes.
- V. Design the machine with an automatic lubricating system, or provide sealed lubrication, as applicable. For self-lubricating systems, gear oils, hydraulic fluids, greases, and any other required lubricants a one year supply of each lubrication type shall be supplied with the machine. Lubrication change schedule based on hour usage along with acceptable approved equivalent lubrication types will be provided for each applicable area.
- W. A low lubrication warning message shall show on the operators control station display when the reservoirs require filling.

X. Finished wheel set accuracy:

The DB Entity shall guarantee the following accuracies of machined wheel sets on all MBTA Green Line Vehicles:

1. Diameter parity of wheels on same axle not to exceed 0.012 inches and not to exceed 0.024 inches between axles on a single bogie.
2. The eccentricity or radial run-out on each wheel shall be 0.005 inches or less at any point on the wheel profile circumference.
3. Wheel profile machined surface finish not to exceed 200 micro-inches, RMS.
4. Limits of conformity to profiles not to exceed 0.008 inches.
5. Fully re-profiled wheels must meet all measurements and geometric tolerances associated with the latest revisions of Penn Machine drawings PM-9571, PM9572, MBTA drawings 51200, 47639, CAF M.J1.01.003, and CAF M.J2.01.003. Any conflicting measurements and or geometric tolerances must meet the stricter requirement.
6. The finished accuracies must be met when cutting all axle types listed in this specification including independently rotating stub axle, nonrotating stub axle, or similar design.
7. The machine design shall guarantee the above accuracies on all wheel axle sets without involving additional operator intervention.

Y. Drive system:

1. The wheel drive roller system will be able to support, drive, and guide each wheel during the truing operation. Drive roller system of the wheel truing machine must be of the flange driven type. Other means or contact areas for driving the wheels are not acceptable.
2. The wheel drive system shall be a roller friction type arrangement directly contacting the wheel flange. The drive motor shall transmit rotational power through a gear reduction unit. The drive rollers shall not be repositioned to complete the cutting operation.
3. Drive roller system shall be designed for compensation of inaccuracy on worn and flat wheel profiles. Provide a procedure for measuring and replacing process inclusive of pass fail criteria for measuring drive roller wear.
4. Drive rollers shall be machine-able within permissible tolerances. DB Entity shall provide drive roller drawings suitable for re-machining of the rollers.
5. The entire wheel drive system shall hydraulically swivel around a fulcrum point, resulting in lifting the vehicle wheel set off the sliding rail and move into proper cutting position.

6. Wheel truing machining operations shall be performed without lateral re-positioning of drive rollers for machining taper, tread, throat and face of flanges of wheels. The milling head shall only be positioned once per wheel set.

Z. Automatic Wheel Measurement System (Probing System):

1. Wheel truing machine electronic measuring system shall be capable but not limited to measuring wheel diameter, flange width, axial runout (back face), radial run-out, back to back, gauge, and profile conformity.
2. The wheel measuring system must have the ability to locate the wheelset and position the cutter heads to properly re-profile the wheelset during the truing process.
3. The wheel measuring system must be capable of meeting and measuring all of the accuracy requirements listed in this specification.
4. The wheel truing machine measuring system must have the measuring capabilities to deal with high back of flange wear commonly seen throughout the Green Line system.
5. The depth of cut on worn wheel profiles shall be determined by automatic measuring and positioning devices which indicate the required depth of cut to restore the wheel full profile for minimum removal of material.

AA. Milling Cutter Assembly:

1. The milling cutter assemblies shall consist of two full profile high speed milling heads, each housing multiple blades which control the wheel tread and flange contour and contain the round cutting inserts. The cutter blades shall be replaceable and the round carbide cutting inserts shall be easily indexed and/or replaced. The cutting inserts shall be of a low cost throwaway type.
2. Each milling cutter head must be of a quick change design with removable blades. The round carbide cutting inserts are to be indexable on the cutter heads without removing from the machine. A list of recommended and acceptable cutting inserts will be provided along with a six month supply.
3. The cutter blades shall be designed with a set of cutting inserts on the end of the cutter to allow for a chamfer cut at the end of the wheel tread.
4. Each cutter spindle will be independently driven by an adequately powered gear motor to complete the re-profiling process.
5. Cutting capabilities must be robust enough to removing excessive flat spot(s) that are typically seen on the Green Line system without the need to undercut by 1/16th of an inch.
6. Acceptable design depth of a single cut shall be 0.125 inch regardless of wheel condition. Sufficient axle load is required to achieve higher depths of cut.

7. Proposed wheel truing machine shall automatically stop and retract the cutter head in the event of power failure, machine malfunction, loss of power, or emergency stop application.
8. Chip guards shall be provided fitted to the cutters except in that area which it is required for the cutter to contact the wheel. The chip guards shall direct the chips to chutes that will properly convey to a disposal system. The milling process shall produce small, easily removable chips without clogging the disposal system.

BB. Sliding Rail System

3. Provide a sliding rail system over the pit and machine area. Provide the necessary rail supports in the pit area and connecting rails to the existing rails in the shop. The sliding rail system shall be hydraulic, automatically operable with a manual override and safety circuit.
4. The approach rails shall connect the machine to the rail system in the shop providing access on and off the machine. The approach rails will also aid in the alignment of the vehicle to the wheel truing machine.
5. Sliding (retractable) rails shall be hydraulically operated and bridge the opening in the machine through which the cutters contact the wheels for re-profiling. They shall be designed with an appropriate safety factor to withstand the weight of the heaviest MBTA Green Line vehicle.
6. In addition to a rail interlock system, provide at both sides of the pit warning lights which shall show red when the sliding rail is retracted (open) and green when it is extended (closed).
7. The control system safety interlocks shall not have a means of mechanical override.

CC. Mechanical Chip Collector And Conveyor System

1. Provide a chip collection system and conveyor to remove metal debris generated from the cutting process. The chip conveyor shall convey the chips to a suitable, self-dumping 1.5 cu/yd metal hopper/container, provided by the manufacturer. The chip conveyor shall convey the chips to a MBTA approved location without clogging.
2. The mechanical chip collection and conveyor system shall be integrated into the chip guard channel system to properly remove debris during the truing process without clogging or jamming.
3. The system capacity and belt speed shall be equal to, or greater than, the maximum metal removal or cut of the milling operation and be sufficient to carry the volume of chips generated by the wheel truing machine from the bottom of the pit and discharge the chips above rail level into the metal hopper provided by the manufacturer.

4. A single motor shall operate the conveyor system.
5. The controls for the chip disposal system shall be integrated into the wheel truing machine operator's control panel.
6. The conveyor machinery shall be concealed in an enclosure with removable access plates furnished at each turn in conveyor direction and at intermediate points along the conveyor as necessary for maintenance. Belt shall be hinged steel with interlocking side wings and cleats on the pans.
7. Conveyor length shall be based on chip removal from under the machine to a container location that is easily accessible by fork lift for removal. The location of the discharge end of the conveyor and the hopper are subject to the approval of MBTA. If possible and necessary, discharge end of the conveyor shall be stow-able when not in use to maximize clearance adjacent to the conveyor.
8. A chip breaker is not necessary with milling. Metal debris generated from cutting are of a size that can be discharged directly to the chip conveyor system without clogging.
9. Electrically interlock conveyor system to automatically start and stop with the machine operation. A manual on/off control for conveyor system will also be installed along with motor overload protection upon jamming.

DD. Master Machine Control Panel (MMCP)

1. The panel shall house motor starters, disconnect switches, the control circuit transformer, fuse blocks, contact blocks, and interlock necessary for the proper function and operation of the wheel truing machine equipment. Each motor shall be protected by its own circuit breaker and each magnetic motor starter must have overload ground fault protection in all three phases. The machine shall be supplied power from a single 480 Volt, 3 phase, 60 hertz source and shall provide for circuit protection from that point.
2. Control voltage shall be 120 V, 60 Hz or 24 VDC obtained from control transformer(s) furnished within the MMCP. No controls accessible to the operator shall have wiring carrying a voltage potential exceeding 120 Vac to ground.
3. Machine drive shall be by motors of sufficient capacity, provided with infinitely variable speed control. Variable speed controllers shall be mounted in the MMCP.
4. The machine shall be fully wired by the DB Entity requiring a single point of electrical connection from the building to be identified in the shop drawings.
5. The MMCP will meet the proper NEMA enclosure standards listed in this specification and be designed with an integrated climate control system.

EE. CNC Controller

1. Machine operations shall be based on Computer Numerical Control (CNC) operations and be integrated with the Programmable Logic Control (PLC)

functions. The operator control station shall be a centralized CNC operation, incorporating a screen display on which operations and sequencing of operation inclusive of help screens and operating prompts shall be shown.

2. CNC programs will have all safety interlocks listed in section 6.35 of this specification and any other required interlocks integrated into its operating system.
3. The machine operator shall confirm the wheel set data obtained by the measuring system and give a command for the next question or menu direction.
4. The CNC screen shall display images relating to machine operator communications of pre-measuring, determination of depth of cut(s), machining proposal, operational data, final wheel set parameter, post measuring, auxiliary system(s) operations, end of cutting cycle, general wheel set data, and other images determined to be necessary for proper automatic machine operation. All screen and keyboard operations shall be displayed in English.
5. Data input by the machine operator shall be checked for validity. Error input or input outside established and acceptable limits shall be rejected requiring new input via system entry.
6. Image display shall also state each wheel's flange thickness, wheel diameter, back to back, gauge, axial run-out (back face), radial run-out, profile conformity, and other features or dimension relating to operation.
7. The CNC controls shall communicate with the machine Programmable Logic Controller to provide and display diagnostic data of machine fault condition(s) leading to trouble identification.
8. Wheel tread profile(s) shall be permanently stored in the programmable memory. Loss of memory is to be protected during power failure. All backup operating and programming software will be provided to the MBTA along with procedures for re-commissioning if necessary.

FF. Automated Cutting Program

1. The control system provided shall allow the machine to determine the number of cutting passes required to true the wheelset and at what depth each pass should be taken to minimize the amount of material removal.
2. The system shall automatically feed the cutters for each pass and does so at the proper time. The wheelset pre-measure data shall be transferred automatically to the control system from the integrated automatic measuring system.
3. If possible the machine shall incorporate anti-slip controls for counteracting wheel slip when operating near the ultimate limit of high cutting forces and resulting torque.
4. When cutting is complete the cutters shall be automatically withdrawn and traversed to their set-up position. The spindle drives and drive rollers shall automatically shut-off and the machine shall remain in a safe, "idle" condition until

the operator is ready to proceed with machining the next wheelset.

5. In addition, an "Emergency Tool Retract" feature shall be provided, when actuated, shall stop both of the cutters and drive rollers and automatically lower the cutters, in case of an emergency or overload situation.

GG. PLC Controller

1. The Programmable Logic Controller (PLC) shall control the machine functions and operations.
2. PLC functions shall be connected to the CNC control operations and provide a high degree of automation and minimize operator guidance. Operator guidance features shall be included for sequence of machining steps, permissible limit values and fault indication.
3. The PLC control shall also give the proper commands for all auxiliary systems such as the chip conveyors, sliding rail assembly and approach indicators (both sides of machine).
4. PLC shall control the sequence of operation for lifting and initial positioning of wheel sets inclusive of supporting functions for hydraulic and electrical operations.

HH. Data Acquisition System (DAS)

1. The system shall include computer, user-friendly software, storage media, internal modem, wireless network connection, printer, and a work kiosk suitable for a shop environment.
2. The machine shall provide a Data Acquisition system (DAS) to record and store operator identification, vehicle, truck and wheel set identification as appropriate. Display and print out shall include but is not limited to: operator name and employee number, vehicle number, truck serial number, truck position on vehicle (A, B, or C), current vehicle mileage, axle position (1-6), reason for truing (flat spots, regular truing interval, etc.), date and time of start and completion of truing, initial diameter, flange wear, flange height, back to back wheel dimensions, final diameter, and post measuring data of finished wheel set.
3. Permanently stored data shall be transferable to the customer computer network via a category 5 network connection or approved equal.
4. The data acquisition system shall be configured for levels of management and operator password access to various levels of information.

II. Safety Interlocking

1. Design and provide an electrical interlock system to disable control power in the control panel from being applied to the machine unless the Overhead Catenary System (OCS) is de-energized.

2. Provide an interlock to prevent energizing the OCS until the machine is in the green state, and sliding rails are closed, permitting movement of a vehicle over the machine.
3. Provide emergency stops as designed by the manufacturer. Whenever an emergency stop is activated the PLC shall display a visual notification. A minimum of four mushroom style emergency stops shall strategically be placed at various work locations in the pit. The emergency stop buttons shall illuminate when the machine is activated and require pulling out to reset the machine once pushed.
4. Provide an interlock to prevent energizing the railcar mover, cable winching system, or OCS until the wheel truing machine is in the shut-down mode, and sliding rails are closed, permitting movement of a vehicle over the machine.

JJ. Electrical:

1. A single electrical service operating at 480 V/3 PH/60 HZ to be provided by the installer to the equipment. The manufacturer shall provide all other voltages required for operation of the system by transformers.
2. The machine shall be equipped with a grounding system to protect the equipment and operating personnel. Equipment grounding, structural steel grounding, and rail grounding shall be accomplished by individually connecting each item with properly sized copper conductor and a common ground bus bar in the pit area. The grounding system shall be properly wired to the ground at the MBTA power distribution panel. A similar but separate grounding system shall be provided for the control circuits. DB Entity will provide embedded ground rods if needed and comply to NEC Article 250.
3. Control panels enclosures exposed to wet conditions shall be: NEMA 4X stainless steel. Enclosures within the building: NEMA 12 type or approved equal.
4. Wiring at the machine and control panel cabinets shall comply with NFPA 70 and NFPA 79.
5. Wire chases and conduits shall be easily accessible with appropriate junction boxes for repair and replacement purposes.
6. Wire terminations, to the extent possible, shall be by lugs secured in terminal blocks with numbered terminals and color coded wires with wire markers.
7. Minimum size shall be AWG No. 12 for power circuits and AWG No. 14 for control circuits. Wire shall be copper. Wires in each of the control panels shall be color coded and tagged with a number on each end. The color and number must be marked in the wiring diagram supplied by the DB Entity. Appropriate wire sizes must meet the load required.
8. Provide each individual motor circuit with branch circuit over current protection in all phases using multiple circuit breakers.

9. Equipment shall be totally wired including all non-embedded conduits by the equipment manufacturer up to and including the main disconnect switch.
10. Use liquid tight flexible metal conduit connections to motor terminal boxes, dry type transformers, and equipment subject to movement or vibration.
11. Identify wiring by a wire tag with a number corresponding to the wiring diagram.
12. Provide transformers to step down the 480 V 3 phase supply voltage to lower required voltages and single phase for controls and accessories.
13. The maximum control voltage shall be 120 V.
14. Maximum current: Not to exceed that specified by NEC for the type of conductor.
15. Provide unfused disconnect switches, motor starters and start-stop control stations for all equipment.
16. Provide electrical switches in compliance with NEC, equipment design requirements, and the electrical power circuit design for each piece of equipment.
17. Electrical control cabinet and operator control panels shall meet the specifications for an electrical enclosure with NEMA 12/13 standards. Included in the cabinet shall be a main disconnect switch along with all fuses, motor starters, relays and terminals. All wiring for the controls and motors shall be in accordance with Division 26 requirements for use of type MTW, THWN and THHN stranded wire.
18. All motors shall be TEFC (totally enclosed, fan cooled) to provide the required operational reliability in any operating environment.

KK. Hydraulics:

1. The Hydraulic System shall be comprised of solenoid controlled hydraulic valves, flow controls, hydraulic filters for optimal performances and adequately sized oil reservoir. All valves provided to fulfill the various machine functions shall be compact mounted on a manifold sub plate for easy maintenance.
2. A hydraulic hold down system shall be provided for lightweight equipment, to increase friction force between the wheels and the drive rollers.
3. The hold down unit shall be provided for re-profiling all wheelset configurations of all Green Line Vehicles.
4. The hold down unit shall produce the appropriate forces to properly reprofile Green Line wheelsets to the required accuracies.

LL. Dust Extraction System

1. A dust collection unit shall be provided for the wheel truing machine area in accordance with NFPA 90A or similar.

2. The unit shall be of sufficient size to draw a vacuum through the piping system to the truing area to remove air borne particles generated by wheel truing.
3. Flexible hoses shall be provided as required for movement of the machine only.
4. Collected materials shall be deposited in a 3 CY capacity canister for disposal.
5. Replaceable filter media shall be provided and easily replaced.
6. The dust and fume extraction system shall be a single unit placed adjacent to the wheel truing machine pit and can be operated in automatic and manual modes. The suction pipes shall be positioned close to the working area of the tooling. Provide suction diversion valve to accommodate vacuum hose connection when wheel truing machine is not in use.

MM. Paint

1. Paint all non-stainless steel and galvanized metal component parts of the wheel truing machine, except electrical connections and machined surfaces. Prepare all surfaces to be painted as recommended by the paint manufacturer.
2. Surface Preparation: All painted surfaces shall be free of grit, oil, contaminants or other substances that could prevent proper adhesion.
3. Equipment shall be given one shop prime coat of approved rust-
4. inhibitive paint containing manufacturer's standard finish coat system suitable for a transit maintenance facility environment. All color selections must be approved by MBTA.
5. Field painting equipment, including touch-up painting, if any, is included under this Section. Normally, equipment shall be factory finished as previously specified. Where factory finishes are provided on equipment and no additional field painting is specified, all marred or damaged surfaces shall be touched up or refinished so as to leave a smooth, uniform finish at the time of final acceptance. Touch-ups shall be of the same color and type of paint as the original. Provide one gallon of matching touch up paint.

NN. Signage

1. All equipment, control panels and ancillary devices shall be clearly and distinctly identified by signage to indicate its intended use and purpose for all related operator and maintenance functions. All wording and symbols shall be in English.
2. All control, warning and instructional information shall be engraved on stainless steel metal and be riveted or screwed into conspicuous places, unless otherwise approved by the MBTA. All characters' colors shall be in contrast with the background color. All colors shall be resistant to fading from all sources including, but not be limited to, sunlight, dirt, extreme temperatures, age, ozone, oil and common cleanser.

PART 3 - EXECUTION

3.1 GENERAL TRUING PIT DESIGN AND FABRICATION REQUIREMENTS

- A. Designed truing pit location, its appurtenances, and accessories will provide proper ergonomics and sufficient clearance to accommodate the transit vehicles without damaging vehicle bodies, equipment, trucks, and other components.
- B. The DB Entity shall furnish an affidavit certifying that all materials and workmanship comply with the applicable building code requirements. Before final acceptance, the DB Entity shall furnish certificates of the agencies having jurisdiction.
- C. During the course of the work, inspections and/or audits at the DB Entity's or supplier's facilities may be conducted to ensure quality control. Construction work will be inspected by the MBTA periodically during the course of the work.
- D. The DB Entity shall be responsible for the coordination of all work performed at the site, by his own forces or by subcontractors, as required. The coordination effort shall include at a minimum, workspace allocation, wheel truing equipment layout, foundations and structures, utility connections, electrical equipment layout, piping systems, safety systems, drainage or sump pump needs, and pit exhaust or air filtration systems.
- E. The DB Entity shall provide a qualified representative at the site to supervise work related to equipment installation, subcontracting checkout and startup.
- F. Equipment and or modifications proposed by DB Entity shall be suitable for installation in the space allocated for the new wheel truing machine.
- G. The DB Entity shall visit and prepare the site prior to the installation process. The DB Entity shall perform an as-built field verification and structural analysis of the existing site to ensure that it is compatible with its proposed wheel truing machine. A copy of this report and preliminary shop drawings shall be submitted to the MBTA for review.
- H. Any modification or redesign to the building structure, pit amenities or utilities shall be provided by the DB Entity at no additional cost to the MBTA.
- I. DB Entity generated changes to the wheel truing machine, shall be the responsibility of the DB Entity.
- J. Provide heavy duty pit open grating walking surfaces, non-slip diamond plate steel stairways, handrails and supports as required for operators working in the pit. All walking surfaces shall be covered with non-slip silica grit. Wire mesh grating is not acceptable for walking surfaces.
- K. Provide additional heavy duty grating flush with the top of rail between the approach rails from the face of the pit wall to the machine.
- L. Removable sections of grating shall be provided as required to access equipment below the grating such as heaters, sump pumps and chip conveyor system.

- M. Removal, modification and re-installation of the existing running rail ground bonds and the like. All modified track work shall be straight and tangent in relationship to the original shop rails. MBTA must approve any and all track modification or installation.
- N. Installation of vehicle alignment rails will be provided to properly align vehicle to wheel truing machine cutting position.
- O. Compressed air piping shall be coordinated with building compressed air piping installation as required. DB Entity will supply any required air regulators and air filtration systems needed to properly protect wheel truing equipment and components.
- P. Design and provide all interconnecting piping sized for air flow rates as indicated.
- Q. The operator control stations shall be conveniently located in the equipment pit for one-man operation. Controls shall be within easy reach of the machine operator.
- R. The layout of the pit shall allow sufficient room for worker accessibility all around the machine.
- S. Provide appropriate task lighting. Illumination level for task lighting at work locations shall be light emitting diode (LED). Approved lighting fixtures shall be appropriately rated for the cutting environment.
- T. Supply two universal cutter alignment maintenance stations to check reassembled cutters to identify high or low cutter blades, worn cutter blades, out-of-tolerance carbide insert diameters, burrs and/or chips lodged between cutter blades and cutter body slots, etc. The alignment stations will also identify possible cutter problems upon re-assembly of the cutters. The operator shall be able to continue to operate the wheel truing machine in the automatic mode while performing these maintenance checks on the spare set of cutter assemblies.

3.2 DELIVERY, STORAGE AND HANDLING

- A. The manufacturer shall store the equipment until such time that it is required for installation in the pit within the newly constructed building.
- B. Equipment and components shall be suitably crated to prevent damage in transit or during handling. Items shall be carefully stored at the site as required in a manner to avoid misalignment or distortion, and shall be adequately protected against damage by weather or other cause.
- C. Special precautions shall be taken to prevent damage to electrical components such as motors, controls and conductors.
- D. The DB Entity shall notify the MBTA in writing of the expected delivery date and time. This notification shall be made a minimum of 15 days in advance of delivery.
- E. All materials shall be delivered to the site with their original manufacturer's markings

and identification intact. Reject materials that are damaged, improperly identified or not in conformance with reviewed shop drawings and catalog cuts. The MBTA reserves the right to also reject such materials.

3.3 INSPECTION, TESTING AND STARTUP

A. Inspection and Testing

1. In-factory testing will be performed at the manufacturer's facility. The DB Entity shall designate a representative who shall be an appropriately qualified individual, and who will coordinate the on-site installation and commissioning.
2. The in-factory inspection and test(s) shall include a visual inspection, demonstration of proper operation of all functions and equipment, running tests of electrical controls, AC breaker, transformer, all motors, and computer control.
3. Equipment shall be fully factory tested by the DB Entity prior to delivery. The MBTA will provide one of each bogie type for this purpose. Cost of insuring, loading, transporting and unloading in both directions of transport shall be borne by the DB Entity.
4. Before final acceptance, the DB Entity-furnished equipment shall be tested, in the presence of a designated MBTA engineering representative, and demonstrated to be correctly connected and installed. The DB Entity shall submit a test plan and schedule to the MBTA for approval fourteen (14) days prior to the start of the equipment test and check-out.
5. All performance requirements included in this specification shall be included in the test plan and schedule. Additionally, all recommended testing and check-out procedures of the manufacturer shall be carried out completely.
6. Equipment tests shall not only be performed to demonstrate that the equipment has been properly installed and operates properly, but also to demonstrate that the equipment performs the work as described in the contract documents.
7. Any tested equipment found to be defective or inoperable to any extent shall be reported to the MBTA.
8. Testing shall include verification of proper operation of the DAS, hydraulic system functions including a pressure test for leakage, machine accuracy and machining tolerance, along with measuring system accuracy while machining actual wheel sets. The DB Entity shall provide written documentation to the MBTA of all testing and results.
9. The DB Entity shall bear all expenses of all tests, including the furnishing of all necessary instruments, lubricant, hydraulic fluids, supplies, data recorders, operating personnel for testing.
10. The on-site test shall duplicate those test performed in-plant. Provide an Acceptance Testing Program for approval prior to testing, including:

- a. Demonstration and operation of Mechanical Chip Collector System.
- b. Demonstration of hold-down equipment adequacy for all the No. 7, No. 8, and No. 9 vehicle trucks.
- c. During the tests should the profiling machine, or the chip collection system, or any part thereof, in the determination of the MBTA fail to function properly, the DB Entity shall make modifications, adjustments or replace impaired parts as may be required for safe and proper operation, at no additional cost to the MBTA. Perform additional test deemed necessary to verify equipment is operating properly and safely after any changes.

B. Follow-up Inspection and Testing

1. The DB Entity shall provide complete follow-up inspections of the machine:
 - a. First inspection at two months after date of final acceptance of the machine. At this time a complete re-alignment and/or adjustment of all critical machine elements shall be made. All machine functions will be tested for proper operation and verified. A written report to the MBTA of all findings, maintenance and operating recommendations and any items in need of attention, shall be made.
 - b. Second inspection at six months after date of final acceptance of machine. At this time a complete re-alignment and/or adjustment of all critical machine elements shall be made. All machine functions will be tested for proper operation. A written report to the MBTA of all findings, maintenance and operating recommendations and any items in need of repair or modification shall be made.
 - c. At twelve months after date of Final acceptance of the machine. At this time all machine functions will be tested for proper operation, maintenance and operating recommendations and any items in need of repair or modification shall be made.
 - d. At eighteen months after the date of Final Acceptance of the machine. All machine functions will be tested for proper operation. A written report of all findings, maintenance and operating recommendations and any items in need of repair or modification shall be made.
 - e. A final inspection shall be conducted at twenty-four months after the date of Final Acceptance. All machine functions will be tested for proper operation of findings, maintenance and operating recommendations and any items in need of repair or modification shall be made.
2. Any necessary alterations to the machine required to provide wheel truing operation, as here-in defined, shall be made by authorized factory service personnel, provided by the DB Entity at no additional cost to the MBTA.

3.4 TRAINING

- A. All training shall be provided by a qualified representative of the DB Entity. The training plan and objectives shall be reviewed by and approved by the MBTA prior to the start of such activities.
- B. Prior to delivery, the DB Entity shall submit for review a program, which shall adequately train MBTA personnel to correctly operate, maintain and troubleshoot the equipment. The DB Entity shall be responsible for supplying all materials required for the program.
- C. The DB Entity shall provide three levels of training (operator, maintenance and computer maintenance/programming) which will ensure that MBTA personnel clearly understand the functioning of the system and become capable of taking any actions necessary for routine operation, maintenance, recalibration and repairs.
- D. A complete operators training class of minimum 80 hours duration for up to six operators and four maintenance personnel including test materials and manuals provided to the MBTA in Microsoft Word format electronically. Training shall be comprised of both classroom and hands-on training. During training, all machine functions must include classroom discussion and an opportunity for each of the individuals to perform actual machine set-up and operation.
- E. The operator training shall include but not be limited to:
 - 1. Description of the operating systems of the wheel truing machine.
 - 2. Demonstration of all standard equipment and accessories on the machine.
 - 3. Demonstration of computer system and operation procedure for wheel truing and data analysis. Sufficient hands-on training by each participant to ensure knowledge and performance competency of each operator.
- F. The maintenance training shall include, but not be limited to:
 - 1. Description of the operating systems of the wheel truing machine.
 - 2. Demonstration of all routine maintenance and preventive maintenance procedures including lubrication requirements and replacement of wear parts.
 - 3. Demonstration of all standard equipment and accessories on the machine.
 - 4. Troubleshooting common problems of the equipment and understanding the readings and operation of computer.
- G. Training shall begin after the wheel truing machine is installed and demonstrated to be working properly. The DB Entity will develop a mutually agreeable training schedule.
- H. All training shall be held at the Authorities facilities. All classes will be scheduled for weekday's single shift Monday through Friday.

- I. DB Entity shall submit one copy of the proposed training manual to the MBTA for review and approval 45 days prior to the beginning of training.
- J. The DB Entity shall provide sufficient quantities of bound training manuals at the start of the training classes for each trainee.
- K. Following completion of training, DB Entity shall furnish the following to the MBTA:
 - 1. A letter attesting to the names of persons receiving instruction and the date's instruction took place.
 - 2. Certification of completion and capability of operation for each person receiving instruction.
 - 3. Provide electronically formatted material covering the essential information contained in the training sessions.

END OF SECTION

SECTION 13000

PRE-ENGINEERED BUILDING SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Furnish and install pre-engineered building and components including the following:
 - 1. Structural steel frame
 - 2. Roof covering system including exterior roof panels, panel attachments, insulation, trim, flashings, sealants and mastics.
 - 3. Exterior wall systems including wall panels, panel attachments, insulation, trim, flashings, sealants and mastics. Reinforcing steel, masonry joint reinforcement, ties and anchors
- B. Furnish and install wall accessories including the following:
 - 1. HM doors and frames
 - 2. Windows
 - 3. Louvers
- C. Furnish and install roof accessories including the following:
 - 1. Gutters and downspouts
- D. Other specifications sections which directly relate to the work of this section include, but are not limited to the following:
 - 1. Section 03300 – Cast-in-Place Concrete
 - 2. Section 08331 – for the furnish of overhead doors to be installed under this section
 - 3. Section 09900 - Paints and Coatings: Finish painting of structural members, doors, and factory prime painted miscellaneous items.

1.2 SUBMITTALS

- A. Design data: Provide detailed design criteria in compliance with all project building code requirements and calculations prepared by a licensed Structural Engineer registered in the Commonwealth of Massachusetts. A Civil Engineer's P.E. stamp shall not be accepted as a substitute of the above requirement. Provide all column base reactions and anchor bolt configuration for design of foundations within one week of award of contract. Preliminary foundation design will be indicated on the drawings until final reactions are issued
- B. Test reports: Submit certified reports for tests required. Including providing a statement of average net-area compressive strength of masonry units in accordance with ACI 530.1 for masonry and mortar types specified herein.
- C. Shop drawings shall also include erection sequence drawings detailing all temporary structural support until the structure is stable.

- D. Anchor bolt installation drawings: Provide anchor bolt layouts with minimum bolt diameters, spacing and configuration, including anchor bolt length and details for each column base plate.
- E. Selection samples: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns
- F. Certification: Manufacturer certification that the building conforms to the Contract Documents and manufacturer's standard design procedures. The certification shall be prepared and signed by a licensed Structural Engineer registered in the Commonwealth of Massachusetts verifying compliance with all code requirements, project criteria, standards, etc.

1.3 QUALITY ASSURANCE

- A. Provide metal building frame, metal wall panels, metal roof panels, accessories and miscellaneous materials for a complete enclosure including supports for building components specified in other sections.
 - 1. Manufacturer qualifications: Not less than 5 years of experience in the actual production of specified products. Members of the Metal Building Manufacturer's Associations (MBMA) and primary manufacturer of frames, secondary steel, roof and wall sheeting and trim.
 - 2. Installer qualifications – Firm experienced in application or installation of systems similar in complexity to those required for this project, acceptable or licensed by manufacturer, 3 years of experience with systems and successfully completed not less than 5 comparable scale projects using this system
- B. Design structural systems according to professionally recognized methods and standards and legally adopted building codes and to withstand gravity and lateral loads in compliance with Contract Documents.
 - 1. Allowable deflections: Deflection/drift criteria shall follow recommendations outlined in AISC design guide 3 and MBMA serviceability recommendations and as defined below:
 - a. Maximum deflection of main framing members shall not exceed 1/240 of the span length.
 - b. Maximum deflection due to snow load in roof panels and purlins shall not exceed 1/360 of the span length.
 - c. Maximum deflection due to wind load in wall panels and girts shall not exceed 1/360 of the span length.
 - d. Lateral building deflections, or drift, at the roof level of the structure in relation to the slab on grade, shall not exceed H/240. H is the dimension from the slab on grade to the roof level.
 - 2. Metal wall panels (interior and exterior) shall not to be used as shear elements.
 - 3. Construct assembly to permit movement of components without buckling, failure of joint seals, undue stress on fasteners or other detrimental effects, when subject to temperature range of 100 degrees F (37 degrees C) in a 24-hour period.
 - 4. Design and fabricate wall and roof systems free of distortion or defects detrimental to appearance or performance. Some oil canning in rolled panels especially in the flats of the panel is normal and is not cause for rejection.

- C. Elements required for support of lights and light battens, hanging fixtures, mechanical equipment, piping, ceiling hanger wires, and all other items required to provide a complete building and not specifically indicated on the drawings
- D. Design under supervision of professional engineer licensed in the Commonwealth of Massachusetts.
- E. Roof System tested and certified to meet Factory Mutual FM Global wind classification rating FM 1-120
- F. Envelope shall include semi-rigid blanket insulation and /or rigid board insulation to meet energy code requirements.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Store products in manufacturer's unopened packaging until ready for installation
- B. Deliver to project site stacked on pallets and in undamaged condition and handle materials in strict compliance with manufacturer's instructions and recommendations. Protect from all possible damage.
- C. Cover and protect from weather.
- D. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.5 PROJECT CONDITIONS

- A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

PART 2 - PRODUCTS

2.1 STRUCTURAL STEEL FRAMING

- A. Primary framing: Rigid Frame (RF Series) solid web framing consisting of tapered or uniform depth rafters rigidly connected to uniform depth columns. Provide a clear span that supports the loads at bay spacing indicated. Steel Surface Preparation: SSPC-SP 2.
- B. Purlins: Zee-shaped; depth as required; with minimum yield strength of 60,000 psi (410 MPa); simple span or continuous span as required for design. G-30 galvanized standard material with G-90 availability. Welded members are manufacturer's standard primer.
- C. Girts: Zee- or Cee-shaped; depth as required, with minimum yield strength of 60,000 psi (410 MPa); simple span or continuous span as required for design. G-30 galvanized standard material with G-90 availability. Welded members are manufacturer's standard primer.
- D. Transbay members: Bar joist, parallel chord, secondary joists; simple span, utilizing materials, sizes and yield strength as required.

- E. Wind bracing: Portal frames, torsional bracing, diagonal bracing and/or diaphragm elements in accordance with manufacturer's standard design practices; utilizing rods, angles, and other members, with minimum yield strengths as required for design but in most cases, 50 ksi.
- F. Welding: welding procedures, operator qualifications and welding quality standards shall be in accordance with AWS D1.1 – Structural Welding Code and AWS D1.3 Structural Welding Code – Sheet Steel. Welding inspection shall be in accordance with AWS D1.1, paragraph 6.9. Welder certifications shall be supplied upon request.
- G. Finish: Provide compatible primer and top coat from same manufacturer. The DB Entity to coordinate if top coat is shop applied or field applied.

2.2 MISCELLANEOUS FRAMING

- A. Base angles: 2 inch by 3 inch by 0.060 inch (50 mm by 75 mm by 1.5 mm) galvanized steel angles, with minimum yield strength of 55 ksi (380 MPa), anchored to the floor slab or grade beam with power driven fasteners or equivalent at a maximum spacing of 4 feet (1220 mm) on center and not more than 6 inches (150 mm) from the end of any angle member. Anchors are not provided by the metal building manufacturer.
- B. Door headers and jambs: Zee- or Cee-shaped; depth as required; with minimum yield strength of 60 ksi (410 MPa).

2.3 MODIFIED BITUMINOUS ROOFING

- A. Base ply and base flashing ply: Will be one ply of approved ASTM D 6163 Type I, 80 mil SBS (Styrene-Butadiene-Styrene) rubber modified base sheet.
- B. Cold bitumen membrane inner ply adhesive: The standard bitumen will consist of a V.O.C free, non-asbestos containing cold applied adhesive
- C. Modified membrane/top flashing ply: 160 mil SBS (Styrene-Butadiene-Styrene) and SIS (Styrene-Isoprene-Styrene) rubber modified membrane incorporating recycled content and reinforced with a strong fiberglass and polyester composite scrim
- D. Surfacing: Two coats of specified coating, manufacturer approved.
- E. Insulation adhesive performance requirements: Two component, foam adhesive as recommended by insulation manufacturer and approved by FM Global indicated ratings.

2.4 METAL-FACED INSULATED WALL PANELS

- A. Wall Panels: Panel rib; 36 inch (915 mm) wide net coverage, with 1-3/16 inch (30 mm) high major ribs at 12 inches (305 mm) on center with minor ribs spaced between the major ribs. Metal panels for fabrication of wall panels shall be a factory insulated; shop assembled laminated aluminum panels for exterior walls complete with associated trim.
- B. General: Provide factory-formed and -assembled metal wall panels fabricated from two metal facing sheets and insulation core foamed in place during fabrication, and with joints between panels designed to form weathertight seals. Include accessories required for weathertight installation

1. Fire-retardant core: Noncombustible, with the following surface-burning characteristics as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
 - a. Flame-spread index: 25 or less.
 - b. Smoke-developed index: 450 or less
- C. Aluminum-faced insulated wall panels: Formed with 0.040-inch- thick, coil-coated aluminum sheet facings.
 1. Panel thickness: 3 inch (R21) and 4 inch (R30), at areas indicated on the Design Documents.
 2. Surface texture: Smooth
 3. Width: As indicated on the Design Documents.
 4. Core insulation: One of the following:
 - a. Shall be expanded polystyrene (EPS), report #NER-479, nominal density 1.0 pcf with minimum shear strength of 20 psi.
 - b. Shall be formed isocyanate, nominal density 2.0 pcf with minimum shear strength of 24 psi.
- D. Attachment system components: Formed from extruded aluminum.
 1. Include manufacturer's standard panel stiffeners, panel clips and anchor channels.

2.5 WALL ACCESSORIES

- A. Hollow metal doors and frames: Doors for panic devices: Grade 2, 1-3/4 inches (44 mm) thick minimum 18 gage (1.22 mm) steel face sheets.
 1. Type: Flush.
 2. Frames: Jamb depth, minimum 16 gauge (1.52 mm) steel; self-framing and self-flashing.
 3. U-factor: 0.090A
 4. Weather stripping: At jambs, head and sill, complying with water and air resistance requirements of SDI 115 and SDI 116.
 5. Finish: All doors and frames have a baked-on primer coating meeting ANSI A250.1 standards. Paint test for salt spray, humidity and adhesion.
- B. Window
 1. Type: Refer to drawings
 2. U-factor 0.60 and SHGC 0.80.
 3. Finish as selected by the DB Entity from the manufacturer's standard textures and colors

2.7 INSULATION

- A. Mineral fiber insulation ASTM C553, Type 2, faced with a vapor barrier having a perm rating of not more than 0.5 and with: flame spread Index not to exceed 25 flame spread when tested in accordance with UL 723 or ASTM E 84 test methods; smoke developed index: not to exceed 50 smoke development when tested in accordance with UL 723 or ASTM E 84 test methods. UL Classified.
- B. Continuous roof insulation: Mineral fiber with R value = 22.5 or provide calculations indicating roof assembly U-factor = 0.043.
- C. Continuous wall insulation: Mineral fiber with R value = 12.5 or provide calculations indicating wall assembly U-factor = 0.075.
- D. Thermal blocks: 3/4 inch thick expanded polystyrene over girts and purlins.

2.8 FABRICATION

- A. Fabricate according to manufacturer's standard practice
- B. Fabricate structural members made of welded plate sections by jointing the flanges and webs by continuous automatic submerged arc welding process. Prepare members for bolted field connection by making punched, drilled, or reamed holes in the shop. Mark all fabricated parts, either individually or by lot or group, using an identification marking corresponding to the marking shown on the shop drawings, using a method that remains visible after shop painting.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the Work. Do not proceed until unsatisfactory conditions have been corrected. Verify foundations are properly installed, to correct dimensions and within acceptable tolerances.

3.2 ERECTION OF FRAME

- A. Provide for erection and wind loads. Provide temporary bracing to maintain structure plumb and in alignment until completion of erection and installation of permanent bracing. Locate braced bays as required by manufacturer.
- B. Do not erect frames without complete installation of tie beams and anchorages.
- C. Set column base plates with non-shrink grout to full plate bearing.
- D. Do not field cut or alter structural members without written approval.
- E. After erection, prime bolts, welds, abrasions, and surfaces not primed with primer used in shop painting.

3.3 INSTALLATION OF WALL OF SYSTEM

- A. Install in compliance with manufacturer's instructions.

- B. Exercise care when cutting prefinished material to ensure cuttings do not remain on finish surface.
- C. Fasten cladding system to structural supports, aligned level and plumb.
- D. Locate end laps over supports. End lap panels according to manufacturer's recommendations. Place side laps over adjacent panel and mechanically seam or stitch fastener per erection guidelines.
- E. Use concealed fasteners.
- F. Install sealant and gaskets to prevent weather penetration.
- G. Install system free of rattles, noise due to thermal movement, and wind whistles.
- H. Install door frames, service doors, overhead doors and gutter system in compliance with manufacturer's instructions.
- I. Seal wall watertight and weathertight with sealant in compliance with building manufacturer's standard procedures.

3.4 TOLERANCES

- A. Framing members: 1/4 inch (6 mm) from level; 1/8 inch (3 mm) from plumb
- B. Racking: 1/8 inch (3 mm) from true position. Provide shoring to maintain position prior to cladding installation

3.5 FIELD QUALITY CONTROL

- A. Roof installation inspection by roof manufacturer's representative; as required as part of warranty provision.
- B. Testing by Owner: High Strength Bolted Connections: Specification for structural joints using ASTM A325 or A490 bolts, a minimum of 10% of all bolted connections and at least one bolt per connection shall be tested for proper torque in the bolts.
- C. Testing by Owner: Visual inspection of 100 percent of fillet welds and at least 20% of all fillet welds shall be tested with magnetic particles. Ultrasonic inspection of 100 percent of full penetration welds. 50 percent of partial penetration welds shall be tested with magnetic particles. Where inspection reveals defects, the extent of inspection.

3.6 CLEANING

- A. Upon completion of the work of this Section, make a thorough inspection of the installation and verify that all elements have been installed in accordance with the provisions of this Section. Make necessary adjustments.
- B. Clean surfaces as required for proper application of the specified finishes.

END OF SECTION

SECTION 13340

MODULAR STRUCTURE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work included: This section specifies the following items.
 - 1. New single story modular office (trailer) permanently installed on an engineered raised foundation.
- B. Related work:
 - 1. Section 03300 CAST IN PLACE CONCRETE for the modular structure's concrete foundation

1.2 SUBMITTALS

- A. Product data: For each type of product indicated, including but not limited:
 - 1. Kitchenette appliances, countertop and cabinet information
 - 2. Furniture by type as indicated in the drawings.
 - 3. Door and window types, including hardware
 - 4. Toilet accessories.
 - 5. System items such as thermostat, light fixtures, toilet fixtures and accessories, occupancy sensors, exit signs.
- B. Shop drawings for the following:
 - 1. Trailer layout including architectural, structural, mechanical, plumbing, fire sprinkler, fire alarm, telecommunications, audio-visual and electrical systems information.
 - 2. Exterior wall, roof and partition details
 - 3. Restroom enlarged plans including locations of toilet accessories
 - 4. Energy code compliance calculations.
- C. Samples for verification: For each type and color of the following:
 - 1. Flooring materials
 - 2. Paint color
 - 3. Casework standard finishes and stains
- D. Manufacturer's instructions: Submit manufacturer written installation instructions.
- E. Manufacturer's qualifications: Submit manufacturer documentation, including list of at least three (3) similar buildings in New England that are still in use 25 years after their initial occupancy.

1.3 QUALITY ASSURANCE

- A. Massachusetts State Building Code and by reference applicable sections of accessibility, commercial energy and fire codes.
- B. Modular Building Institute guidelines for permanent modular construction

1.4 DELIVERY, STORAGE, AND HANDLING

- A. The DB Entity shall deliver an unfurnished trailer and shall be responsible to full build-out trailer to meet specifications
- B. Provide and maintain temporary utilities for construction operations and related necessary temporary structures and remove them when they are no longer needed
- C. Pay for connections/disconnection of all temporary utilities; e.g., gas, water, power and telephone.
- D. Be responsible for ensuring that the area (fencing, buildings, grounds, etc.) around the delivered and installed trailer is returned to the state that it was in prior to the delivery and installation of the trailer
- E. Provide and maintain the following as may be required for delivery and installation of the trailer:
 - 1. All scaffolding, staging, runways and similar equipment to complete work
 - 2. Temporary rigging, rubbish chutes, ladders and similar equipment
 - 3. Barricades, lights, and similar safety precautions.

1.5 WARRANTY

- A. The DB Entity shall guarantee in writing to repair or replace any or all work, together with any other work which may be displaced, damaged or marred in so doing, that may prove defective or fail to conform to contract provisions and requirements due to defective materials and workmanship within two (2) years of the date of acceptance of the work by the MBTA. This shall be done without further expense whatsoever to the MBTA. Ordinary wear and tear and unusual abuse or neglect is accepted.

PART 2 - PRODUCTS

2.1 MODULAR TRAILER

- A. Provide one (1) new modular trailer, fully equipped and ready for occupancy.
 - 1. Occupancy: B
 - 2. Type of construction: Refer to drawings
 - 3. Wind load: 150 MPH, exposure "C"
 - 4. Roof live load: As required by code.
 - 5. Floor live load: As required by code

- B. Trailer shall be 24'-0" x 60'-0" and shall include the following provisions unless otherwise noted:
1. Moment-resisting steel frame with bolted connections or other MBTA accepted methods of construction.
 2. Exterior walls made of steel stud walls, exterior aluminum siding and interior heavy duty composite laminate surface.
 3. Interior partitions for offices, toilet area, and conference rooms, etc.
 4. Base and overhead cabinets
 5. Operable insulated windows with insect screens.
 6. Shades or venetian blinds for windows.
 7. Air conditioning and electric heating equipment capable of maintain a temperature of 70 deg.F
 8. Two-tube florescent lighting fixtures as required to provide illumination of 70-foot candles in all work areas, controlled by surface mounted toggle switches located near the entrance of each room of the trailer.
 9. Double convenience receptacles located throughout the trailer
 10. Sanitary facilities including supplying toilet tissue, paper towels and soap.
 11. Ten (10) upright full height lockers.
- C. Arrange for and comply with all necessary local permits and inspections including and incidental costs.
- D. Arrange for electrical service for the trailer and provide the necessary meter connections, fuse box and switch as required by the utility company.
- E. Modular trailer shall be installed on firm bearing ground, engineered concrete foundation and shall be "blocked-up", "leveled off", 36" off the ground with a ventilated crawlspace, enclosed around the perimeter with site installed skirting material that will match the exterior siding material of the building.
- F. Provide approved pressure treated wood steps and ramp with aluminum handrails at the entrances to the trailer.
- G. All electrical and plumbing work shall conform with state and local codes
- H. Provide 3/4" copper tubing for the water service, provided with sufficient pressure to completely expel the contents of the water closet in one operation. Provide approved electrical heating tape, as directed, together with necessary switches and thermostat for each water pipe, to prevent freezing.
- I. Provide suitable septic tank and make proper sanitary connections thereto from the trailer.
- J. Provide fire systems (smoke detectors, pull stations).
- K. Insulate all services where necessary.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine conditions, with DB Entity present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.

1. For the record, prepare written report, endorsed by DB Entity, listing conditions detrimental to performance of work.
 2. Verify that foundations are within tolerances specified.
- B. Before installation, examine rough-in and built-in construction for piping systems to verify actual locations of piping connections.
- C. Proceed with installation only after unsatisfactory conditions have been corrected

END OF SECTION

SECTION 14210

ELECTRIC TRACTION ELEVATORS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work included: This Section specifies electric traction elevators.
 - 1. Furnish lintels, sleeves, anchors, inserts, plates and similar items for elevators to concrete trade for installation.

- B. Related Work:
 - 1. Volume 2 Technical Provisions Exhibit 2I, Additional Project Requirements.
 - 2. Section 03300 – CAST-IN-PLACE CONCRETE
 - 3. Section 09900 – PAINTING
 - 4. Section 10424 – SPECIALTY SIGNAGE
 - 5. Section 10426 – TACTILE/BRAILLE SIGNAGE
 - 6. Section 16750 – ELEVATOR EMERGENCY INTERCOM SYSTEM
 - 7. Division 15 – PLUMBING, HEATING, VENTILATION AND AIR CONDITIONING
 - 8. Division 16 – ELECTRICAL

1.2 DEFINITIONS

- A. Authority having jurisdiction (AHJ): Local jurisdiction agency and/or department responsible for issuing certificates for use, testing and inspections.

- B. Beneficial use: When the elevator is placed into service, may be prior to the site being ready for public use.

- C. Burn in testing: Continuous automatic cycling of the elevators for four (4) contiguous days under fully loaded conditions. Burn in shall occur immediately following the elevator certification and prior to beneficial use, and shall be performed under normal power for three (3) days and on backup power for twenty-four (24) hours during non-revenue hours or during station shut downs. The DB Entity shall submit a continuous report for the burn in event, which shall be generated from the elevator controller program.

- D. Code: Codes, standards, publications and other references listed in Article 1.4 of this Section.

- E. Complete set: Shop drawings shall be submitted as a complete set which includes, but is not limited to, all items in Article 1.10, submittals and all other reference to submittal requirements within this specification.

- F. DB Entity: The DB Entity for the project/contract. The DB Entity is responsible for all coordination between the various trades and associated specification Sections for the elevator installation and

operation. The DB Entity is also responsible for all subcontractors to perform the work, testing and inspections as specified within this Section.

- G. Defective elevator work: Operation or control system failure, including excessive malfunctions, performances below specified ratings, excessive wear, unusual deterioration or aging of materials or finishes, unsafe conditions, the need for excessive maintenance, abnormal noise or vibration, and similar unusual, unexpected and unsatisfactory conditions.
- H. Dwell time: The period of time the elevator is at a landing while the doors open, passengers transfer and doors close.
- I. Device or a part of the equipment: References to a device or a part of the equipment applies to the number of devices or parts required to complete the installation.
- J. Elevator: A hoisting and lowering mechanism equipped with a car or platform, which moves in guide rails or racks and serves two or more landings.
- K. Elevator manufacturer/installer: The party selected under this Contract to furnish and install the elevators as a subcontractor to the DB Entity. The phrase elevator manufacturer and/or installer implies that the manufacturer is also the installer or the installer is approved by the elevator manufacturer for the installation of the elevators as specified within this Section.
- L. Elevator nomenclature: ASME/ANSI A17.1, Safety Code for Elevators and Escalators.
- M. Final acceptance: The point at which the Authority accepts the elevator project as being complete, including all submittal requirements. This may be a different point in time than substantial completion.
- N. Gearless elevator: A traction machine, without intermediate gearing, that has the traction sheave and the brake drum mounted directly on the motor shaft.
- O. Heavy-duty elevator: An elevator designed specifically for the harsh environment and duty load cycles common to transportation system usage.
- P. Installer: The responsible party who installs the elevator. The installer shall be either the elevator manufacturer or an approved licensee of the manufacturer, who has not less than five (5) years successful experience with the installation of elevators, and who is currently under contract for the maintenance of elevators in the area, and who maintains a service center within 50 miles of the project site. The elevator installer shall be licensed and strictly governed by applicable local and governmental authorities in order to perform the work.
- Q. Interim maintenance: Maintenance from the point of substantial completion, but prior to revenue service.
- R. Letter of certification: Submitted letter shall be notarized with requested compliance and signed by an officer of the manufacturer and/or Installer as specified.
- S. MSDS: Material Safety Data Sheets, as defined by Occupational Safety and Health Administration (OSHA).
- T. Notice to Proceed (NTP): The date which the elevator installer is notified to proceed with the work.
- U. OEM: Original Equipment Manufacturer.

- V. Authority: The Massachusetts Bay Transportation Authority (MBTA).
- W. Passenger elevator: An elevator used primarily to carry persons other than the operator and persons necessary for loading and unloading.
- X. Project representative: Representatives from the MBTA. Various submittals within this section require review, decisions and information from these representatives that provide resultant review status for the required submittals listed in this Section.
- Y. Revenue service: The station or facility opening date.
- Z. Substantial completion: The point at which the elevator is ready for use, whether the site is finished or not. Jurisdictional inspection usually occurs at this time.
- AA. System: Includes all elevator components, equipment and incidentals specified within this Section, unless otherwise used in context with a referenced system. The system is also inclusive of elevator components not specified in this Section but provided with the manufacturer's elevator operating system.

1.3 APPLICABLE CODES, STANDARDS, ORGANIZATIONS AND PUBLICATIONS

- A. The latest edition of codes, standards and publications shall be used for all criteria listed within this Section. In case of conflict between codes, regulation or standards, the most stringent requirement shall take precedence. In all cases, code shall be the governing factor. Elevator designs and installations shall be of the heavy-duty type and shall comply with the following:
- B. American Society of Mechanical Engineers (ASME) and the American National Standards Institute (ANSI):
 - 1. ASME/ANSI A17.1 2004 "Safety Code for Elevators and Escalators" and A17.1S-2005 with Addenda (hereafter referred to as the code)
 - 2. ASME/ANSI A17.2 2004 "Inspectors Manual for Elevators and Escalators"
 - 3. ASME/ANSI A17.5-M 1991/CAN/CSA-B44.1 "Standard for Elevator and Escalator Electrical Equipment"
 - 4. ANSI Z97.1 "American National Standard for Safety Glazing Materials Used in Buildings – Safety Performance Specifications and Methods of Test"
- C. National Fire Protection Association (NFPA):
 - 1. NFPA No. 130 "Fixed Guideway Transit and Passenger Rail Systems"
 - 2. NFPA No. 13, 70 and 72
- D. National Electric Code (NEC)
- E. Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG), 2004
- F. American Public Transit Association (APTA) machine room-less (MRL) elevator design guidelines
- G. IEEE 519 Standard Practices and Requirements for Harmonic Control in Electric Power Systems

- H. American Welding Society (AWS)
- I. American Society of Testing and Materials (ASTM)
- J. International Standards Organization, ISO 281/I, 1997 and later editions
- K. American Federation of Bearing Manufacturers Association (AFBMA), Standards 9 and 11
- L. National Electrical Manufacturers Association (NEMA)
- M. The American Insurance Association
- N. Occupational Safety and Health Act (OSHA)
- O. International Code Council / American National Standards Institute (ICC/ANSI), A117.1 2004
- P. Building Officials and Code Administrators International, Inc. (BOCA)
- Q. Massachusetts Architectural Access Board (MAAB), 521 CMR 28.00
- R. Massachusetts State Building Code, 780 CMR
- S. Massachusetts Elevator Regulations, 524 CMR
- T. MBTA Elevator Design Standard (including Appendix B and C for car operating panels, hall stations and lanterns)
- U. Boston Center for Independent Living Agreement (BCIL)
- V. Any additional requirements imposed by local agencies shall be incorporated into elevator installations.

1.4 COORDINATION REQUIREMENTS

- A. Coordination requirements shall include, but not be limited to, the following:
 1. Alterations: DB Entity shall coordinate any alterations required to accommodate elevators with the MBTA.
 2. Cab floor finish: Coordinate floor/finish at the elevator doorsill finish elevation with the required pocket for sill installation and with other appropriate subcontractors and/or trades.
 3. Door rough openings: The elevator manufacturer/installer shall coordinate with the DB Entity for the elevator's required 8" extended door jamb opening until the rails and doorframe are installed.
 4. Electrical: DB Entity shall coordinate all trades regarding the installation of CCTV, communications, smoke detectors, power and cab lighting requirements.
 5. Field measurements: DB Entity and elevator manufacturer/installer shall verify field measurements immediately after each opening is prepared for the elevator installation as indicated on the accepted elevator shop drawings and the Contract Drawings.
 6. Pit drainage: Provide a means to prevent water from accumulating in the pit for outdoor elevators and indoor elevators subject to ground water or station wash downs.
 7. Rigging plan: Installer shall supply a detailed rigging plan that is accepted by the MBTA. Rigging plans shall include, but not be limited to, path of entry/egress, imposed loading on floor surfaces

- and structures, product data of devices to be utilized in the rigging process with reference dimensions and lifting capacities. Rigging plans shall be signed and sealed by a professional engineer registered in the Commonwealth of Massachusetts.
8. Safety training: Installer shall attend appropriate safety training programs provided by the MBTA at no extra cost.
 9. As-Built Drawings: DB Entity shall provide revised shop drawings to reflect actual as-built condition including all structural, architectural, electrical, mechanical and plumbing conditions for the elevators. Submit no later than 3 weeks after the elevators receive a certificate of operation for public use.
 10. Lock cylinders:
 - a. All locks and keys shall be as per MBTA's current standard lock requirements.
 - b. DB Entity shall verify with the MBTA that the requirements for hardware have not been amended or superseded.
 - c. DB Entity shall provide the MBTA with length, finish and camming requirements of each cylinder required.
 11. Methodology: The DB Entity shall meet with the MBTA and provide a written method of installation for approval.
 12. Protection: During installations, and until elevator systems are fully operative, DB Entity shall make necessary provisions to protect systems from damage, deterioration and environmental conditions.

1.5 QUALITY ASSURANCE

- A. OEM's Qualifications: Regularly engaged for the past ten (10) years in the manufacture of major components for machine room-less (MRL) passenger elevators. As a standard of quality the elevator equipment, design and installation shall comply with the code.
- B. Installer's Qualifications: OEM's representative or authorized agent of elevator equipment OEM with minimum ten (10) years experience who is trained and approved for installation of units required for this project.
- C. Source limitations: Obtain elevators through one source from a single manufacturing plant. Buy American provisions are stipulated in the general terms and conditions of this contract.
- D. Welding: Welding shall be performed in accordance with the requirements of AWS. Welders shall produce evidence of current certification by AWS or CWB.
- E. Labeling requirements: Every elevator shall be clearly marked with rated load and speed, manufacturer serial number, and the designated MBTA's identification (EV-1, EV-2, ETC.).
- F. Application, permits, tests and inspections by regulatory agencies:
 1. Elevator manufacturer and/or installer shall obtain and pay for all permits, licenses, fees and testing inspections, and perform such tests with all required equipment and material and/or retests as may be required for acceptance and approval of each elevator by the authority having jurisdiction. The elevator manufacturer and/or installer shall complete all retesting due to improper coordination, preparation or failure of previous tests at no additional cost to the MBTA.

2. Elevator manufacturer and/or installer shall notify the MBTA and proper inspectors a minimum of four (4) Business Days in advance of the scheduled inspection to witness required testing. Supply the required personnel, equipment and materials for tests, inspections and final reviews at no additional cost to the MBTA.

1.6 DESIGN CRITERIA

- A. General: Elevators shall be designed with provisions for thermal expansion and contraction of complete elevator assemblies.
- B. Manufacturer/Installer of elevator systems shall provide system that works with the design as drawn and with performance requirements specified. Provide custom solutions where standard system does not meet requirements of DB Entity's accepted shop drawings. No added cost will be paid by the MBTA for customization required to fit within existing design.
- C. Operational Requirements:
 1. Hours of operation shall be considered as 24 hours per day, 7 days per week.
 2. Elevator components shall be designed based on the following applied duty cycle during operation:
 - a. 3 hours with 100% rated load
 - b. 6 hours with 50% rated load
 - c. 15 hours with 25% rated load
 3. Maximum dwell time per landing in these calculations shall be no more than 10 seconds.

1.7 ENVIRONMENTAL REQUIREMENTS

- A. Elevators shall be designed and constructed to operate while exposed to the natural elements of weather, including sunlight, rain, slush, snow and ice; all conditions of relative humidity while exposed to salt, de-icing chemicals, airborne dust, debris and corrosive elements; and in a dry bulb temperature range of -10 to +125 degrees Fahrenheit.
- B. Sound level: Elevators shall be designed and constructed to operate at or below a 65 decibels sound level, measured 3 feet above the elevator cab floor at any location, with the elevator operating normally, either free running or under load. For multiple elevator installations, the noise measurements shall be made with only one elevator unit in operation, but with the entire installation complete and in operating condition. An ambient level not to exceed 49 decibels shall be maintained prior to units being operated.
- C. Seismic Zone Requirements: The elevator shall be designed and constructed to comply with seismic zone 2 requirements of ASME A17.1 2004 and A17.1S 2005 regardless of edition of ASME A17.1 approved for this project. The sole exception to this requirement is where the structure has been designed for a more stringent seismic requirement.
- D. Bearings: All fixed machine and motor bearing housings shall be provided with a drilled, tapped and spot faced area in the vertical and axial axis to accommodate a transducer that a Fast Fourier Transform (FFT) analyzer requires. Permanently mount transducers on the drive bearings or where recommended

by the machine OEM and run the wires into the controller to a panel with BNC connectors on the ends to accommodate the FFT analyzer.

1. Motor limit: Rigid mount, 15 ips; flex mount, .2 ips.
2. Bearings shall be rated for an AFBMA L10 life as specified, under a fluctuating bearing load. All bearings shall have basic dynamic load ratings.

E. Fasteners:

1. Fasteners shall be compatible with materials being fastened.
2. Fasteners shall be furnished with self locking nuts or retaining rings (spring washers or toothed discs).
3. Fasteners shall be equal to, or of greater corrosion resistance than, the most corrosion resistant metals being fastened.
4. Dissimilar metals to be galvanically separated. Separating substrate shall not be visible in finished condition including through glass.

F. Ride quality:

1. All elevators shall have a maximum decibel reading of 70 decibels with the doors closed during a run in the up direction, measured 5 feet above the floor in the center of the cab.
2. All elevators shall have a maximum vibration of 30 milli-g's in the X, Y and Z axis measured with an A95 filter.

1.8 SUBMITTALS

- A. Submittals and shop drawings shall be furnished no later than 16 weeks after the DB Entity has been provided the Notice to Proceed unless otherwise directed by the MBTA.
- B. Submittals and shop drawings shall be furnished as a "complete set" for each item as required for submittal within this Section. Six (6) sets of each submittal shall be provided unless additional sets are specifically required elsewhere in the Mandatory Specifications. Incomplete sets are not acceptable.
- C. The DB Entity shall submit a letter from the elevator manufacturer indicating that the installer is approved and authorized by the manufacturer for the installation of the elevators as specified. The letter shall be signed by an officer of the manufacturer. If the manufacturer intends to install the elevators, it shall be submitted in letter form and signed by an officer of the manufacturer.
- D. Submit chart with proposed dates for the delivery and installation for each elevator. The chart shall provide the following after shop drawings have been accepted (assume a three (3) week review period by the MBTA):
 1. Weeks for fabrication time and expected delivery to site.
 2. Weeks for installation time based on consecutive installation of elevators and specify whether elevator installation shall be consecutive or simultaneous.
 3. Weeks for any other critical items.
 4. Weeks for inspection and testing and/or retesting.

- E. Product Data: Submit OEM's product data for all products and systems proposed for use. Product data shall include, but not be limited to, the following:
1. Manufacturer's catalog cuts: Fixtures, 2-Speed exhaust fan, door operator, full door height electric eye, lighting fixtures, controller, CCTV camera, sill heater, car top control station, remote intercom system for communication between remote machine rooms and the top of car, door weather stripping and interior car wall panels.
 2. Electrical characteristics and connection requirements.
 3. Expected heat dissipation of elevator equipment in machine room and control areas (BTUs/hr.) based on 60 round trip cycles per hour.
 4. Maintenance programs: Within 60 days after notice to proceed, and prior to installation, submit detailed interim and revenue service maintenance programs, showing functions to be performed and their scheduled frequency.
 5. Machine performance data sheets.
 6. Pre-acceptance test forms.
 7. All proprietary equipment shall be clearly identified in the Manufacturer's literature and manuals.
- F. Shop drawings: Provide large scale shop drawings (minimum of 3/4" = 1'-0" unless otherwise noted) for fabrication, installation and erection of all parts of the work. Provide plans for each equipment room, hoistway, and car in addition to elevations, details of anchorages, connections and accessory items. Drawings shall include, but not be limited to, the following:
1. Car guide rails, buffers and other components in the hoistway.
 2. Maximum rail bracket spacing. Rail brackets shall be located based on actual hoistway construction as shown in the DB Entity's accepted shop drawings.
 3. Maximum loads imposed on guide rails requiring load transfer to the building structure.
 4. Loads on hoisting beams.
 5. Clearances and travel of car and counterweight runby.
 6. Clear inside hoistway and pit dimensions. Location of pit and hoistway to project grids.
 7. Location and sizes of access doors, hoistway entrances and frames.
 8. Car and hall signal and operating features, including dimensioned drawings of the car control panel, position and floor indicator landing control stations, firefighter's keyed switch, access key switch, combination position indicator and hall lantern, supervisory panel, power operation intercom and other related information.
 9. Remote wiring layouts for each elevator.
 10. Refuge space on top of car and pit.
 11. Control room, machine area, pit and hoistway layout.
 12. Cab design, dimensions and layout, showing the arrangement of the elevator control panel, doors, direction indicator, intercom, and other related items. Provide reflected ceiling plan for the car locating the exhaust fan, emergency exit, lighting and other related information. Design information shall include:

- a. Details of car interior wall panels, including material type, panel sizes and thicknesses, installation and anchoring details.
 - b. Sections and details of car roof, including the relationship of the emergency exit and hatch with the exact location of the crosshead.
 - c. Detail of jack attachment to car.
13. Hoistway door and frame details.
14. Complete assembly details of machines, mountings, machine beam assemblies, dead end hitch and beam assemblies, governors, safeties, and counterweights. Provide all associated load calculations.
15. Attachment details of rails and counterweight assemblies.
- G. Samples: Submit samples of materials and products requiring color or finish selection, including but not limited to, the following:
- 1. Stainless steel: Samples shall be provided for landing control stations, door frames, doors, interior car panels, and handrails with wall connections. Samples shall be no less than 3” by 5” and shall be labeled on the unfinished side with the finish, gauge, location and elevator for which the material will be used.
 - 2. Liquid applied floor.
- H. Submit to the authority having jurisdiction elevator plans and documents according to their requirements. The DB Entity shall provide a copy of the letter of transmittal to the MBTA of all documents that were provided to the authority having jurisdiction by the elevator manufacturer/installer. When the elevator permit number is assigned for each elevator, the number shall be forwarded to the MBTA.
- I. Burn in report: Submit in accordance with Article 1.14, acceptance and Warranty. DB Entity shall submit a continuous report for the burn in event, which shall be generated from the elevator controller program.

1.9 OPERATING AND MAINTENANCE MANUALS

- A. Maintenance manuals: Prior to installation, submit four (4) complete sets of operation and maintenance manuals for acceptance. After MBTA’s acceptance and prior to beginning of acceptance testing, twelve (12) sets of the approved manuals shall be provided. Manuals shall include the following:
- 1. Complete table of contents.
 - 2. Complete instructions regarding operation and maintenance of the elevator equipment including controller safety devices and all associated equipment. Include complete illustrated, exploded views of all assemblies and a complete, illustrated exploded view for identifying all system parts.
 - 3. Complete nomenclature of replaceable parts, part numbers, current cost and warehouse location. If product source is another vendor, provide name and address of other vendor.
 - 4. Sample copies of a proposed preventive maintenance chart.
 - 5. Descriptions of safety devices.

6. Safety rules, tests and procedures, including testing of all systems and subsystems.
7. Procedures for adjusting all elevator components, including pictorials.
8. Troubleshooting techniques.
9. Detailed lubrication and cleaning schedule indicating weekly, monthly, quarterly, semiannual and annual lubrication. Include a description of each lubrication point, lubrication type and specification.
10. Control and schematic electrical wiring diagrams of controller, including wiring of safety devices to connections with remote indication and control panels for the elevator.
11. Electrical layout showing placement of lighting, light switches, receptacles, fixtures, disconnect switches and convenience outlets in control areas, machinery spaces and pits.
12. Complete detailed drawings and wiring diagram of elevator system.
13. The installer shall be required to provide certification, in writing and signed by an officer of the organization, that Authority shall be provided with copies of any and all information, correspondence, bulletins, newsletters, manuals, techniques, procedures, drawings, sketches and any other documents related to maintenance, safety, operations, design changes, modifications, retrofits, etc. which relate to any part, component, equipment, system subsystem or material and services applicable to the elevators provided.
 - a. All of the above referenced information shall be provided as it pertains to the original installation and for a period of ten (10) years after final acceptance of the elevators.
 - b. Referenced material shall be provided within 30 days of publication or internal distribution by the elevator manufacturer. The material, even if labeled "PROPRIETARY", shall be delivered to the MBTA without prejudice or delay and at no additional cost.
14. The entire manual shall also be provided in an electronic format that is acceptable to the MBTA.
15. MSDS and product data sheets shall be submitted with an index listing each product, along with application method of product, approximate quantity of product per elevator, and the component the product is applied to or associated with. Allow six (6) weeks for review of MSDS.
16. Maintenance procedure for galvanizing of glass hoistway.

1.10 TEMPORARY AND PERMANENT ELECTRICAL POWER SERVICES

- A. DB Entity shall provide and coordinate all temporary power which shall be available to the Installer at the time of installation. Permanent power shall be made available for testing. All power shall be provided at no cost to installer.
- B. Power for the elevator drive systems shall be 480 volts, 3 phase, 4 wire, 60 Hertz terminating in a disconnect switch within sight of the controller. The lift motor starting current shall not exceed 250% of the full load amperage.
- C. Power for lighting and GFCI receptacles shall be 120 volts, 3 phase, 4 wire, 60 Hertz terminating at the elevator controller location.
- D. Separate disconnect for cab lighting and wiring to cabs shall be 120 volts, 1 phase, 4 wire, 60 Hertz terminating in a disconnect switch within sight of the controller.

- E. Separate service for sill heaters and other ancillary elevator equipment shall be provided where required.

1.11 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. The DB Entity shall coordinate delivery to the site, or other storage area acceptable to the MBTA, and provide adequate secured storage acceptable to the elevator Manufacturer, Installer and the MBTA for the new elevators. Stored elevators and related equipment shall be insured as required by the DB Entity's accepted shop drawings.
- B. Deliver components with factory-installed wooden skids and lifting lugs, and pack components in factory-fabricated protective containers.
- C. Store materials in original protective packaging in a dry area protected from weather.
- D. Protect equipment and exposed finishes during transportation, storage and erection against damage and stains.
- E. Handle components carefully to avoid damage to components, enclosures and finish.
- F. Comply with the OEM's rigging instructions for unloading components and moving components to their final location for installation.

1.12 SPARE PARTS AND STOCK

- A. Spare parts: Elevator Manufacturer/Installer shall provide the following listed spare parts upon the completion of the elevator installation:
 - 1. Four (4) hoistway door rollers.
 - 2. Two (2) cab door rollers.
 - 3. Four (4) hoistway door gibs.
 - 4. Four (4) cab door gibs.
 - 5. One (1) electronic door detector.
 - 6. One (1) set of replacement lights for the elevator cab.
 - 7. One (1) box of each type of fuses.
 - 8. Two (2) complete door interlock assemblies.
 - 9. One (1) door operator motor.
 - 10. Two (2) complete pushbutton assemblies for car operating station and hall stations.
- B. Spare parts shall be delivered to location as determined by the MBTA (within 30 mile radius of project site).

1.13 ACCEPTANCE AND WARRANTY

- A. DB Entity shall submit the burn in report prior to final acceptance. The burn in report will be reviewed against the manufacturer's recommended tolerances. Failure to meet the manufacturer's tolerances shall require immediate corrective actions and a repeat of the burn in report until acceptance.
- B. The OEM shall warrant in writing that all equipment manufactured and installed under this specification, for a period of twelve (12) months from the date of final acceptance by the MBTA, be free of defects in design, materials and workmanship, under normal use and service.
- C. The warranty shall include materials and labor necessary to correct defects. Defects shall include, but not be limited to: noisy, rough or substandard operation; loose, damaged or missing parts; and fluid leaks.
- D. Warranty maintenance requirements:
 - 1. Installer shall provide twelve (12) month preventative maintenance service to coincide with the warranty period.
 - 2. Installer shall provide an interim maintenance service prior to being added into the MBTA's maintenance program.
 - 3. Interim maintenance shall start at the final equipment acceptance and at the time of issuance of the Certificate for Operation by the Commonwealth of Massachusetts Elevator Inspector. Interim maintenance shall be provided for a period of twelve (12) months.
 - 4. Interim maintenance shall include the following tasks:
 - a. Inspection of completed installation and periodic testing to maintain elevator in completely operable condition.
 - b. Operate each elevator at least monthly for a period of two (2) hours (total on-site time). Provide monthly documentation of same to the MBTA.
 - c. Provide lubrication of parts and equipment components as per OEM's recommendation. Charts shall be provided for each elevator indicating when services are provided.
 - d. Perform work without removing elevator from service during peak traffic periods between the hours of 7 a.m. to 10 a.m. and 3 p.m. to 7 p.m.
 - e. Provide 24 hour emergency service during the maintenance period consisting of prompt response (with 2 hours) to emergency request by telephone or other communication from MBTA or designated representative if an elevator is inoperable or in case of injury, entrapment or potential injury to persons.
 - f. Unlimited regular time callbacks shall be included with a required response time of one hour. Regular time will be Monday through Friday, 8 a.m. to 4:30 p.m., exclusive of holidays.
 - g. Annual clean down of the elevator and hoistway enclosure is required. Make necessary arrangements with MBTA in order to minimize any inconvenience and reduction of service.
 - 5. Reporting: Detailed monthly records of tasks performed shall include names of individuals performing the tasks, date and time performed, and other pertinent data. Installer shall be required to conform to the requirements of the MBTA's data base maintenance system.

PART 2 - PRODUCTS

2.1 ELEVATORS - GENERAL

- A. Subject to compliance with the requirements of this section: Provide manufacturer's standard or custom elevator systems as required to meet all performance requirements specified.
1. Global Tardif – 23 Model
 2. Kone, Inc. – Monospace Model
 3. Shindler Elevator Corp. – 400A
 4. Minnesota Elevator Corp.
 5. Approved Equal

2.2 ELEVATOR SCHEDULE

- A. The travel dimension provided in this specification is furnished as a quick reference for operational criteria. Dimension is approximate as indicated by the +/- symbol, and actual dimension must be verified with the Contract Documents.
- B. ELEVATOR ELEV-1 and ELEV-2

Location:	Washington St. Station
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	17'-6 1/2" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Levels 1 and 2
No. of Stops:	2
No. of Openings:	2 (front @ level 1; rear @ level 2)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Remote @ level 1
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass and steel, concrete
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy

Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Level 1 (grade)
Maintenance Term:	One year

C. ELEVATOR ELEV-3 and ELEV-4

Location	Gilman Square Station (Concourse)
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	17'-6" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Levels 1 and 2
No. of Stops:	2
No. of Openings:	2 (front @ level 1 and level 2)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Adjacent @ level 1
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass, steel, and CMU
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

D. ELEVATOR ELEV-1 and ELEV-2

Location	Lowell St. Station
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	22'-7 7/8" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Levels 1 and 2
No. of Stops:	2
No. of Openings:	2 (Front @ level 1 and level 2)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Adjacent @ level 1
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass, steel, and CMU
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

E. ELEVATOR ELEV-1 and ELEV-2

Location	Union Square. Station
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	18'-6" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Levels 1 and 2
No. of Stops:	2

No. of Openings:	2 (Front for Elev-2@ level 1 and level 2, Front for Elev-1@ level 1, Rear for Elev-1@ level2)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Adjacent @ level 1
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass, steel and concrete
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

F. ELEVATOR ELEV-1 and ELEV-2

Location	Ball Square Station (Headhouse)
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	12'-0" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Levels 1 and 2
No. of Stops:	2
No. of Openings:	2 (Front @ level 1 and Rear at level 2)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Adjacent @ level 1
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H

Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass and steel
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

G. ELEVATOR ELEV-3 and ELEV-4

Location	Ball Square Station (Concourse)
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	17'-10 3/4" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Levels 0 and 2
No. of Stops:	2
No. of Openings:	2 (Front and Rear for Elev-3 @ level 0 and 2, Front for Elev-4 @ Levels 0 and 2)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Adjacent @ level 1
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass and steel
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant

Car Direction Indicator:	features Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

H. ELEVATOR ELEV-1 and ELEV-2

Location	College Avenue Station
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	23'-3" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Levels 1, 2 and 3
No. of Stops:	3
No. of Openings:	2 for Elev 2, 2 for Elev 1, Elev 1 Level 2 Front.
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Adjacent @ level 1
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass and steel
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

I. ELEVATOR ELEV-2

Location	Lechmere Station (North Headhouse)
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	42'-7 1/2" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Level 1 and Level 3
No. of Stops:	2
No. of Openings:	2 (Front @ level 1, Rear @ Level 3)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Adjacent @ Basement
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass and steel
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

J. ELEVATOR ELEV-1

Location	Lechmere Station (North Headhouse)
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	27'-1 1/2" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Basement, Levels 1 and 3
No. of Stops:	3
No. of Openings:	2 (Front @ Basement and level 1, Rear @ Level 3)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway

Controller Location:	Adjacent @ Basement
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass, steel and concrete
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

K. ELEVATOR ELEV-3

Location	Lechmere Station (South Headhouse)
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	31'-11" +/-
Interior Car Size:	5'-0"W x 7'-2"D x 8'-0"H
Service Levels:	Basement, Levels 1 and 2
No. of Stops:	3
No. of Openings:	2 (Front @ levels 1 and 3)
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Adjacent @ Level 1
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed

Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Glass and steel
Cab Enclosure:	Stainless steel and glass, as specified
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons
Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level
Maintenance Term:	One year

L. ELEVATOR ELEV-1

Location	Transportation Building
Service:	Passenger
Capacity:	3000 lbs
Speed:	200 fpm
Travel:	Refer to the Drawings
Interior Car Size:	Refer to the Drawings
Service Levels:	Refer to the Drawings
No. of Stops:	3
No. of Openings:	3; front-back pass through as indicated
Operation:	Selective Collective
Machine Location:	Overhead within hoistway
Controller Location:	Refer to the Drawings
Machine Type:	AC gearless machine room-less
Motor:	20 HP
Power Supply:	480V, 3-Phase, 60 Hertz
Lighting/Signal Power Supply:	120V, 60 Hertz, 20A
Ancillary/Auxiliary Power Supply:	120V, 60 Hertz, 60A
Car/Hoistway Door Size:	3'-6"W x 7'-0"H
Car/Hoistway Door Type:	2-speed slide side opening
Car/Hoistway Door Operation:	Power high-speed, heavy-duty 3 fps minimum opening speed 5 fps minimum closing speed
Door Reversal Device:	Non-contact type
Hoistway Enclosure:	Stainless steel
Cab Enclosure:	Stainless steel
Cab Flooring:	Poured Epoxy
Car Operating Panel:	Type 316L stainless steel #4 finish
Car Position Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Car Direction Indicator:	Type 316L stainless steel #4 finish w/ vandal-resistant features
Hall Call Stations:	Single riser, type 316L stainless steel #4 finish w/ vandal-resistant buttons

Communication System:	Hands-free
Keyed Switch:	In hall call station to shut down elevator
Main Designated Floor:	Platform level

2.3 SPECIAL FEATURES

- A. Elevators shall be of size, arrangement and capacity as shown, and shall comply with design criteria specified in this Section and as shown on the Design Documents, and shall be in accordance with ANSI/ASME A17.1-2004 and A17.1S-2005 w/ Addenda Safety Code for Elevators, hereafter referred to as the Code.
- B. Provide all material and equipment necessary for the complete execution of all elevator work as specified in this Section and as shown on the DB Entity's accepted shop drawings.
- C. Provide hoistway guards for protecting hoistway during construction. Hoistway protection shall include high solid panels surrounding each hoistway opening at each floor.
- D. All electric equipment, conduit, fittings and wiring shall conform to the requirements of ANSI/NFPA 70 National Electric Code.
- E. Provide concrete inserts and other similar anchoring devices for installation of guide rails, machinery and other elevator components. Epoxy ceiling anchors and/or epoxy side wall anchors are not permitted.
- F. Clearance around equipment located in each elevator control room and machine area shall comply with applicable provisions of ANSI/NFPA No. 70 National Electric Code.
- G. Each elevator system shall be provided with a hands-free wireless maintenance communication system that provides for communication from within each elevator car enclosure, car top and control room.

2.4 MATERIALS

- A. Except where product conformance to specific standards is indicated on the DB Entity's accepted shop drawings and in ASME/ANSI A17.1, OEM's standard materials and equipment may be used in elevator construction, subject to acceptance by the DB Entity. Materials cited below are intended to establish the standard of quality for comparable materials used by the elevator manufacturer/installer.
- B. Structural shapes, plates, sheets and tubing: ASTM A36 Steel.
- C. Sheet steel: ANSI/ASTM A446, Grade B.
- D. Stainless steel: ASTM A167, Type 316L.
 - 1. Embossed texture to be rolled into exposed surface, locations as noted.
 - 2. Type 316L, #4 finish, locations as noted.
- E. Aluminum: ASTM B211 or ASTM B221, Alloy 6061, T6.
- F. Glazing panels: 9/16" minimum laminated safety glass conforming to the requirements of ANSI Z97.1 and 16CFR Part 1201.

- G. Flooring: Poured epoxy in accordance with Article 2.10, Cab Enclosures.

2.5 DOOR OPERATOR EQUIPMENT

- A. Provide GAL's MOVFRW-HSL door operator with encoder less VVVF drive, closed loop door operator designed to operate car and hoistway doors simultaneously at the speed specified. Door shall open automatically when car stops at landing to discharge passengers or to answer valid calls and close automatically after predetermined time interval has elapsed. Door shall be capable of smooth and quiet operation without slam or shock. Door operator shall have the following features:
1. 1/2 HP motor and heavy duty sprocket, chain, belt and sheaves.
 2. Closed loop regulated speed performance.
 3. Hand-held keypad programming.
 4. Adjustments can be stored in the keypad and downloaded to another operator.
 5. Adjustable door obstruction reversal.
 6. Optical cams with LED indicators.
 7. Test switches for open, close, nudging and speed zone set up.
 8. Universal inputs for open, close and nudging.
 9. Reversing switch to back up the door reversal device.
 10. Cab door interlock: Cab doors shall be equipped with approved interlocks of the cab unit system type tested as required by code.
 - a. Interlock shall prevent operation of the car away from a landing until doors are locked in the closed position. Interlock shall prevent doors from opening at any position within the hoistway and/or landing from the cab side unless car is at rest at that landing, or is in the leveling zone and stopping at that landing.
 - b. Cab door unlocking devices shall conform to the requirements of the code and shall be provided to permit authorized persons to gain access to hoistway when car is away from landing.
 - c. Provide an electric contact mounted on the car that will prevent the car from moving away from landing unless car doors are closed.
- B. Electronic entrance detector screen door protection: Provide TriTronics electronic door detector device, which projects an infrared curtain of light guarding the door opening. Arrange to reopen doors if one beam of the curtain is penetrated. Unit shall have transmitters and receivers spaced at a minimum distance to provide the maximum amount of protection within the height of the doorway. Systems which have the availability to turn off or on individual zones within the curtain will not be allowed.

2.6 HOISTWAY EQUIPMENT

- A. Guide rails:
1. Guides shall be steel T-section rails. Rail surfaces shall be machined smooth to insure proper operation of guides. Rail ends shall be accurately machined with tongue and matching groove

- centrally located on web. Non-wearing rail surfaces are to be painted at the completion of the elevator work in color selected by Architect.
2. Guides shall be joined and installed in accordance with Section 2.23 of the code.
 3. Guide rails shall not be in view from within the elevator cab.
- B. Car buffers: Spring type with blocking and support.
- C. Counterweight buffers: Spring type with blocking and support.
- D. Roller guides: Roller guides shall be mounted on top and bottom of car and counterweight frames to engage the guide rails.
- E. Suspension means: If steel core ropes are supplied, a means to provide constant lubrication shall be provided. An alarm indicator shall be provided when the oil reservoir is at 25% of capacity.
- F. Machine: AC gearless machine, with permanent magnet synchronous motor, direct current electro-mechanical disc brakes and integral traction drive sheave. Machine to be mounted to the car guide rail or support beam mounted at the top of the hoistway.
- G. Stop switch: An enclosed stop switch, mounted in the pit of each elevator in accordance with Rule 2.2.6 of the Code, shall prevent operation of elevator when switch is activated. Switch shall be of the type described in Rule 2.2.6 of the code.
- H. Emergency auxiliary stop switch: An enclosed stop switch, mounted in the overhead machine area and/or on the machine of each elevator in accordance with Rule 2.7 of the code, shall prevent operation of elevator when switch is activated. Switch shall be of the type described in Rule 2.7 of the code.
- I. Dead end hitch assemblies: Provide dead end hitch assemblies in accordance with OEM's loading requirements.
- J. Counterweight: Counterweight shall consist of a steel frame welded or bolted together and necessary steel weight sections. These weight sections shall be held securely in place within the frame. A minimum of 2 tie rods shall pass through the holes in the weight sections. Submit paint finish of counterweights for approval, color selection as determined by the DB Entity.
1. A required counterweight screen where no compensation is used.
 2. The bottom of the counterweight shall have a buffer striking plate and means to attach knock-off blocks during rope stretch.
 3. Idler sheave: Locate directly above the counterweight frame and integral with counterweight frame. The sheave material shall be accurately machined of semi-steel of hardness BHN 220-250 or as per manufacturer's requirements.
 4. Roller guides shall be mounted on top and bottom of the counterweight frames to engage the guide rails. Counterweight guides shall be of the roller type; each guide shall consist of a set of 3 large diameter polyurethane rollers equipped with sealed preloaded ball bearings. Each roller shall be supported by a pivoted rocker arm that shall automatically adjust itself to guide rail misalignment and prevent excessive lateral car movement.
- K. Governor: Friction type over-speed governor rated for the duty of the elevator specified and to operate the car safely. Finish of pit tension sheave shall be factory paint.

1. Locate the governor where the car or the counterweight in case of over travel cannot strike it, and where there is adequate space for full movement of governor parts.
 2. An electrical governor overspeed protective switch that, when operated, shall remove power from the driving machine motor and brake before or at the time of application of the safety.
 3. Seal and tag the governor with the running speed, tripping speed and date last tested as required by code.
- L. Tension sheave: Provide tension sheave in accordance with OEM's governor and car safety loading requirements.
- M. Terminal limits: Limit switches shall slowdown and stop the car at the terminals if the primary automatic stopping system fails.
- N. Life safety provisions: Life safety hooks and/or other life safety devices for fall protection shall be in accordance with OSHA standards and guidelines. Life safety hooks and/or other safety device locations shall be coordinated with other equipment and installed by the installer.

2.7 MACHINE COMPONENTS

- A. Motor:
1. Bearings shall be rated with an AFBMA L10 life of 65,000 hours.
 2. The motors shall be of the alternating current reversible asynchronous or synchronous type of a design adapted to the severe requirements of elevator service. Motor shall be capable of developing the torque required to meet or exceed an acceleration rate of 2 ft/sec squared for the elevator car.
 3. A means to protect the windings and bearings from airborne dust shall be provided.
 4. Insulation of all windings shall be impregnated and baked to prevent absorption of moisture and oil. The insulation resistance between motor frame and windings shall not be less than one megohm. The motor windings shall stand a dielectric test of twice the normal voltage plus 1000 RMS volts of 60 Hertz alternating current for one minute.
 5. Motor leads in the conduit box shall have the same insulation class as the windings. Motor lead wire shall be rated 125 C and shall be sized for 105 C at the motor nameplate amperes at 1.0 Power Factor per Electrical Apparatus Service Association (EASA) recommendations. Leads shall be numbered for clockwise rotation when facing opposite the shaft end.
 6. The motor shall be designed to stand the severe loads encountered in elevator service and the windings shall have a minimum insulation temperature rating 2 ratings higher than the actual temperature rise of the motor, with a minimum rating of NEMA class F.
 7. The motor shall be designed to ASME/ANSI A17.1 rated load requirements.
- B. Brake: The brake(s) shall be of the self-adjusting fail-safe (spring applied and electrically released) type provided with an external manual brake release and designed to meet the service factor demand of its intended use.
- C. Gearless machine:

1. Sheave: The sheave material shall be accurately machined of semi-steel of hardness BHN 220-250.
2. Antivibrational mounts: For machines that are support beam mounted, an antivibrational mounting pad shall be provided.

2.8 CONTROLLER COMPONENTS

- A. Motion control engineering controller that supports DF1 communication over Ethernet/TCP/IP shall be provided to accomplish the type of elevator operation as indicated herein. Controller shall govern starting, stopping and direction of travel of the elevator. The controller shall utilize solid state start control.
- B. Controller shall protect the motor against current overload, phase reversal and phase failure. A reverse phase relay shall be provided on the controller. Controller shall automatically open the power supply, and bring car to rest if any of the safety devices fail to operate or if the power fails.
- C. Selective collective operation: Shall be as defined by ASME/ANSI A17.1. Pressure upon one or more car buttons shall send the car to the designated landings in the order in which the landings are reached by the car, irrespective of the sequence in which the buttons are pressed, providing the hoistway door interlock and car door switch circuits are completed. During this operation, the car shall also answer calls from the landings which are in the prevailing direction of travel. Each landing call shall be canceled when answered.
 1. Pressure upon a hall button at a floor above the car location shall cause the car to start up and answer any up calls as they are reached by the car, irrespective of the sequence in which the buttons have been pressed. The car shall not stop at floors where only down buttons had been pressed. If no further car or up hall calls are registered, the car shall reverse its direction preference to respond to car calls or down hall calls.
 2. The car shall start down to answer calls below the car and shall not stop where only up calls are registered. When traveling up, the car shall reverse at the highest call and proceed to answer calls below it. When traveling down, the car shall reverse at the lowest call and answer calls above it.
 3. Should both an up and a down call be registered at an intermediate landing, only the call responding to the direction in which the car is traveling shall be canceled upon the stopping of the car at the landing.
- D. Controller shall be provided with starting switches of adequate size, together with all relays and switches to accomplish the type of elevator operation indicated herein. Switches that operate power circuits shall be designed to prevent sticking due to fusing. Overload relay shall be of the manual reset type of suitable size for the motor furnished.
- E. All controller components shall be neatly mounted and wired in a vented NEMA 4X stainless steel enclosure. All terminals and wires shall have identification markings. Steel enclosure shall be supplied with a 6" high base to prevent potential water infiltration.
- F. The elevators shall be connected to a separate battery-powered unit that senses loss of power. Two batteries shall be 12 volt minimum, sealed nickel cadmium or gel cell construction. When loss of power occurs, elevator shall descend to nearest landing and open doors automatically. After a predetermined time, the doors shall close and the elevator shall remain inoperative until power is restored. The door

open and alarm button shall operate under battery power. Reduced speed for evacuation on battery operation is permitted.

- G. The PLC shall communicate directly with the Lift-Net Monitoring System.
1. General: Provide an interactive system to monitor and manage the elevator equipment (“units”), hereinafter called the “system”. Data collection, data storage and real-time monitoring portion of the system shall be based on Microsoft Windows and be able to run on Windows 2000 Pro, XP Pro, or later operating systems. Provide the following features:
 - a. Network based, capable of interfacing with control systems via either serial data link or hardwired interface connections.
 - b. Operate on any TCP/IP based network system including but not limited to an Ethernet, Lift-Net, etc.
 - c. Expansion capability to add unlimited number of monitoring terminals on the network.
 - d. Monitoring terminals shall operate “peer to peer” or with a single client server. Failure of a single network device shall not affect the operation of the remainder of the system.
 - e. Complete backup of system data shall be accomplished at any single terminal/server location.
 - f. Display multiple banks, including multiple buildings, on a single monitoring terminal screen.
 2. Monitoring display: The system shall be capable of simultaneous monitoring of at least 500 units on a single monitoring station utilizing a graphical representation of a plan view of the facility. Each elevator shall be visible on the monitoring system display terminal without the need to scroll. Each individual unit, when operating “normally”, shall be displayed in green. In the event of a malfunction of any individual unit, the unit shall be displayed by a red blinking light on the monitoring system display. Units which are intentionally placed out of service shall be shown as yellow in the display mode. When malfunctioning units, or units intentionally placed out of service, are returned to normal operation, the graphical representation for that unit(s) shall automatically return to green. The user shall have the ability to display additional information, such as the cause of fault/alarm, for all units by selecting the unit with a “mouse click” from the plan view of the facility. All monitored units shall be visible from any monitoring terminal on the network. Entry into the network shall be multi-level password protected.
 3. System capabilities:
 - a. The system shall be capable of real time display of all monitored status points on all monitored equipment. Fault and event notification screens and audible alarms shall be immediately displayed on selected monitoring stations. Different fault and event tables shall be defined on a per-bank basis. The system shall collect and store all status, fault and event information for later reporting and analysis. The system shall provide statistical analysis of hall call response times, traffic patterns, fault conditions, service logs and security usage in graphical and tabular format.
 - b. The system shall maintain a record of every status point change occurring on the monitored equipment, and provide the ability to replay these events in a simulation at a later time in real time, slow speed, single step, reverse or fast forward. This information shall be

retained for a period of at least 26 weeks, and a mechanism shall be provided whereby this information may be archived.

- c. The system shall store traffic fault and statistical data for a period of at least 3 years. The system shall log error type, car number, floor position and major system status points whenever a fault or logged event occurs.
 - d. The system shall provide interactive control of certain features provided in the elevator control system. These features may be revised as the requirements of the building change. Some of these interactive controls may include, but are not limited to, security floor lockouts, entering car and hall calls, firefighters' service, lobby recall, VIP service, up/down peak service, etc.
 - e. In the case of a power failure the system shall be capable of connecting to emergency power back-up unit. The loss of power shall not affect any stored data. The system shall have the capability to detect the loss (disconnect) of any individual unit from the monitoring system by periodically polling all units to ensure that normal communications between the unit(s) and the terminals/server are maintained.
 - f. The system will automatically re-boot the program and continue to operate after a power loss or other system malfunction.
4. **Monitoring Equipment:** The monitoring equipment shall have the following minimum characteristics:
- a. **Monitoring Station Hardware:** Provide 2 monitoring stations with the following characteristics:
 - 1) Central processing unit: IBM compatible microcomputer, desktop or mini tower (multiple machine rooms or lobby displays).
 - 2) Type: Most current high-performance processor.
 - 3) Speed: Most current high-performance.
 - 4) Internal hard drive: Adequate storage for 3 years of data for entire system.
 - 5) Modem: Most current high-performance.
 - 6) Display monitor: 19"-20" LCD flat panel, color, capable of simultaneous display of all monitored units.
 - 7) Printer: current HP Color DeskJet Series
 - 8) Keyboard: MS Windows compatible.
 - 9) Mouse: MS Windows compatible.
 - 10) Power requirements: 90-230 volts AC, 50-60 Hz @ 8A.
 - b. **Monitoring Station Operating System Software:**
 - 1) MS Windows 2000 Pro, XP Pro, or later.
 - 2) MS Windows 2000 Server, or later.
5. **Network Requirements:**
- a. Maximum local network rated distance (2-20 gauge shielded TP): >10 miles
 - b. Maximum number of nodes (combined PC, inputs/outputs): 500

- c. Maximum I/O points per node (input or output): 2040
- d. Access time to status bit change (typical 6-car bank): <25ms
- e. Must be capable of operating on RS485, RS422, Ethernet, Token Ring, Arc-Net, Lift-Net, Fiber Optic and mixed WAN TCPIP Networks.

6. Monitoring Requirements:

- a. Elevator group status:
 - 1) Group operational mode.
 - 2) All units to be monitored on the same screen in a graphical format.
 - 3) In/out of service.
 - 4) Standby power.
 - 5) Supervisory failure.
 - 6) Location and direction of hall calls.
- b. Individual car status – expandable menus:
 - 1) Direction of travel.
 - 2) Independent service.
 - 3) Inspection service.
 - 4) Firefighters' service.
 - 5) Hospital Code Blue service.
 - 6) Position of elevator.
 - 7) Door status (open, opening, closing, closed)
 - 8) Door dwell time.
 - 9) Load by-pass.
 - 10) Standby power.
 - 11) Power on/off.
 - 12) Door detector.
 - 13) Safety circuit.
 - 14) Door zone.
 - 15) Stop switch.
 - 16) Alarm button.
 - 17) Registered car calls.
 - 18) Out of level.
 - 19) Machine room temperature exceeds 90 degrees.
 - 20) Stop counter (number of starts).
 - 21) Car speed.
 - 22) Door open time.

- 23) Door close time.
 - 24) Start to stop motion time.
 - 25) Emergency 2-way communication device.
 - c. Keyboard, mouse and time clock control capabilities:
 - 1) Floor lockouts (car or hall).
 - 2) Lobby recall.
 - 3) VIP service.
 - 4) Firefighters' service.
 - 5) Hospital Code Blue service.
 - 6) Up/Down peak.
 - d. Faults monitored with visual and audible alarm, triggered by combinations of any of the above status points:
 - 1) Safety circuit.
 - 2) Alarm bell.
 - 3) Stop switch.
 - 4) Emergency 2-way communication device.
 - 5) Door reversal device.
 - 6) At least 6 user selectable faults or events (i.e. water in pit, high machine room/cab temperature).
7. Reporting Requirements: System shall provide reports in color graphical format both on-screen and in printed form, with capability of conveniently switching from one report type to another and from one bank to another using minimal mouse clicks and key strokes. Reports shall be displayed after minimal waiting time. Data for all reports shall be continuously recorded and stored. Reports shall be displayed by simply selecting a date and time range, bank of equipment and report type. Date and time range selections shall carry forward from one report selection to the next. Reporting functions shall be sub-divided into the following categories:
- a. Traffic reports:
 - 1) *Number of hall calls* per floor (hall call distribution on a per floor basis).
 - 2) Number of hall calls per hour (24 hour time-line).
 - 3) Hall call waiting times per floor (hall call waiting time distribution on a per floor basis).
 - 4) Hall call waiting times per hour (24 hour time-line).
 - 5) Distributed hall call response graph (24 hour time-line).
 - 6) Detailed hall call response graph (% calls / x seconds).
 - 7) Longest waiting times including floor number, wait time, date, time and direction.
 - b. Fault reports:
 - 1) Ten most recent faults (most recent faults listed per bank).

- 2) Fault log (display the entire fault log for a given time period).
 - 3) Faults per car (fault distribution on a per car basis).
 - 4) Faults per floor (fault distribution on a per floor basis).
 - 5) Faults per day/week/month (fault distribution on a per unit or group basis).
- c. Car use statistics:
- 1) Car use by hour (24 hour time-line of car calls, car starts, door cycles, delayed car, load by-pass).
 - 2) Car use statistics (same as above, shown for an entire bank).
- d. Group service log:
- 1) Cars in service (24 hour time-line with text log of group availability of each car).
 - 2) Group functions (24 hour time-line with text log of actuation of group functions – up peak, down peak, fire service, emergency power, etc.).
8. Interface to third party building management systems: The elevator monitoring system shall be capable of interfacing and exchanging data with a variety of third party building management systems such as Siemens, Landis & Staefa, Johnson Controls, SCADA, and others. Information should be exchanged by Modbus protocol, open protocol or other suitable methods as required.
9. Interactive features: The control system shall be capable where desired of operating interactive control features provided in the elevator control system. These features may be revised as the requirements of the building change. Some of these interactive controls may include, but are not limited to: security floor lockouts, entering car and hall calls, firefighters’ return service, lobby recall, VIP service, up/down peak or Hospital Code Blue service. Local codes may affect the availability or operation of these features.
- a. Security access features: The monitoring system shall be capable of providing security enable/disable of all hall and car calls through on-screen menus at a minimum. The monitoring system shall also be capable of interfacing directly with card readers and security keypads in stand-alone mode, and indirectly through a serial interface with a third party security system. When in stand-alone mode, the monitoring system shall maintain a database of elevator users and security pass codes. When on secure mode the use of each elevator will be recorded in a file together with the time, authorized pass code and destination for each call.
- b. Elevator control features: Each elevator shall be capable of being controlled through the monitoring system. All control points shall be capable of 7 day / 24 hour time clock automatic operation or manual operation from the mouse and keyboard. The control points shall include, but not be limited to, the following (where allowed by local codes):
- 1) Lobby recall.
 - 2) Car call security lockout.
 - 3) Hall call security lockout.
 - 4) Firefighters’ service.
 - 5) Independent service.
 - 6) VIP service.

- 7) Hospital Code Blue service.
 - 8) Standby power to selected car.
 - c. Paging feature: The monitoring system shall be capable of paging a service technician or other personnel base on predefined parameters of elevator faults or conditions. The paging system shall provide the ability to page multiple numbers determined by the type of event triggering the notification and shall be able to page different numbers based on preset times of day (i.e. different shifts). The system shall be capable of sending text messages to full text pagers in addition to supporting standard DTMF pagers.
 - d. Remote access feature: The monitoring system shall be capable of allowing approved individuals under multi-level password control, to access all system features via the local area network, internet, or via modem over the public telephone network to review the performance of the equipment or to evaluate a fault condition. The remote access feature shall be integrated into the monitoring system and shall not use third party “remote control” software products.
 - e. Data transmission to central support location: The system shall be capable where desired of transmitting fault, car usage and other data to a remote service desk or other office location for further processing, technician dispatch or other purposes. The data may be transmitted via the local area network, internet, or via modem over the public telephone network.
- H. Dielectric matting: Dielectric rubber matting shall be supplied on floor in front of controller to prevent accidental shock.

2.9 HOISTWAY ENTRANCES

A. General:

- 1. Hoistway entrances shall be of the horizontal sliding type, with location and number of panels as indicated on the Design Documents.
- 2. All materials and finished surfaces exposed to public view shall be stainless steel with glass panels and finish as indicated on DB Entity’s accepted Shop Drawings and as specified herein. Glass panels shall be flush with door assembly.

B. Hoistway frames and doors:

- 1. Entrance frames shall be of welded and mitered construction for complete one-piece unit assembly. All frames shall be sound deadened and securely fastened to fixing angles mounted in the hoistway and shall be of Type 316L stainless steel with directional grain in the vertical direction. The landing sills shall be extruded stainless steel with a mill finish.
- 2. Entrance frames shall be provided with an extended sill floor plate the full width and depth of each entrance frame assembly. The extended sill floor plates shall be extruded stainless steel with a mill finish.
- 3. Hoistway doors are to be stainless steel with a Rimex #5 S-M finish and shall be reinforced and provided with keyways as required for operating mechanisms and door hangers. Provide glass panels flush with door, as indicated. Each door panel shall have Z-style/shaped stainless steel bottom guides that run in landing sill slots. Guides are to be replaceable without removing door panels.

4. Provide die cast jamb markings (2 per entrance) mounted at 5'-0" above finish floor.
 5. Hoistway door hangers and operator shall be as specified herein.
- C. Struts and closer support angles: For load bearing walls (masonry, concrete, etc.) submit for DB Entity's acceptance shop drawings of the method to be used to support hanger housing and door closers on the wall.
- D. Landing sills: Landing sills shall conform to Rule 2.11 of the Code and shall be extruded stainless steel with a mill finish supplied with grooves and trash slots for door guides and machine planed for minimum clearance. Mount sills on combination of concrete/grout and steel supports anchored to floor construction.
- E. Hanger supports and cover plates: Hanger supports shall be Type 316L 3/16" thick stainless steel bolted to strut angles and closer support angles. Hanger cover plates shall be of type 316L nominal 0.078" thick stainless steel, minimum and shall extend as indicated. Covers shall be made in sections for convenient access when servicing hangers. Hanger sections above door openings shall be removable from within the elevator car.
- F. Dust cover: Dust cover shall be Type 316L nominal 0.078" thick stainless steel with a #4 finish, reinforced as necessary to ensure a flat even surface throughout. Dust cover shall extend at least the full width of door opening on each side and be fastened to hanger housings. Dust cover shall extend above entrance opening as indicated.
- G. Interlocks and contacts:
1. The doors at each hoistway entrance shall be equipped with approved hoistway door interlocks of the hoistway unit system type tested as required by the code.
 2. Interlock shall prevent operation of the car away from a landing until doors are locked in the closed position. Interlock shall prevent doors from opening at any landing from the corridor side unless car is at rest at that landing, or is in the leveling zone and stopping at that landing.
 3. Hoistway door unlocking devices shall conform to the requirements of the Code and shall be provided to permit authorized persons to gain access to hoistway when car is away from landing. Stainless steel ferrules shall be supplied for all hoistway unlocking device keyholes to protect elevator hoistway doors.
 4. Provide an electric contact mounted on the car that will prevent the car from moving away from any landing unless car doors are closed.
- H. Sight guards: Shall be stainless steel to match hoistway entrance finish.
- I. Hoistway sill and extended sill floor plate heat trace/heaters: Provide heat trace/heaters at each hoistway entrance to prevent the accumulation of snow, ice and water. Heaters shall be manufactured by Electro Plastics Inc. (www.warmfloor.com) Model #VEP-30-70W-24V, or approved equal. Heaters shall be provided with the following:
1. Commercial grade PVC-coated polyester tarpaulin.
 2. Thermostatic control: Control shall be mounted next to adjacent wall closest to hoistway and in proximity to elevator controller.
 3. Moisture sensor.

4. Electrical box for direct wiring to 115VAC, 20 Amp separate circuit.

2.10 CAB ENCLOSURES

A. General:

1. Elevator car and car components shall meet the applicable requirements of the code. Car control station and position indicator shall be as specified herein.
2. Entire car assembly, including car frame and platform, shall be free from warps, buckles, squeaks and rattles. Joints shall be lightproof.

B. Car frame and platform:

1. Car frame and platform shall be welded galvanized steel units designed and fabricated in accordance with applicable requirements herein and Rule 2.14 of the code.
2. Protect car platform with fire retardant material. The platform shall be recessed as required to accept the specified floor finish.
3. Sub floor material shall be nominal 1/4" thick galvanized steel to prevent water infiltration between finished floor, cab and platform base.
4. Idler sheaves: Shall be located directly below the car platform and integral with platform frame. The sheave material shall be accurately machined of semi-steel of hardness BHN 220-250 or per OEM's requirements.

C. Elevator car guides: Car guides shall be of the roller type; each guide shall consist of a set of 3 large diameter polyurethane rollers equipped with sealed preloaded ball bearings. Each roller shall be supported by a pivoted rocker arm that shall automatically adjust itself to guide rail misalignment and prevent excessive lateral car movement.

D. Car enclosures:

1. Car top: Car top shall be stretcher leveled, cabinet grade, nominal 0.109" thick furniture sheet steel, reinforced to support 300 lbs. on any one square foot area. An emergency exit shall be installed in the car top in conformance with the code. Interior surface of car top shall be painted reflective white. Exterior surface of car top shall be painted black.
2. Supporting frame size and detail shall withstand design stresses and provide for attachment and support of cladding, housing, ceiling, glass panels and appurtenances. Paint all members after fabrication. Exterior of car glazing shall be accessible for cleaning.
3. Suspended Ceiling:
 - a. Construction: 3/4" nominal overall thickness. Ceiling shall be constructed by bending and forming individual ceiling sections which shall be bolted together. Additional ribbing material on non-exposed side is allowed to be added for reinforcement to panel sections and to compensate for heavy vandal-resistant type light fixtures. Material shall be nominal 0.109" thick stainless steel Type 316L. Finish shall be Rimex Pattern No. 5-SM or

approved equal. All edges shall be deburred and ground smooth. Ceiling shall provide for dedicated location for installation of a security camera.

- b. Lighting: Car lighting shall provide a minimum of 15 foot candles and shall be located as shown on the Design Documents. Car lighting shall be provided with emergency battery backup upon failure or interruption of normal or emergency power. Emergency lighting unit shall provide required lighting for a minimum of 4 hours. Battery charger shall be capable of restoring battery to full charge within 16 hours after resumption of normal power. Provide an external means for testing battery, lamps and alarm bell. Lighting shall be Benfield Electric Luminaire Model RVP 26 PLC (NYC Housing Authority Grade), total quantity of fixtures as indicated. Fixtures shall be supplied with stainless steel face plate and stainless steel backer box. Gasketing/weatherstripping shall be supplied on interior portion of hinged portion of flange to prevent water and dust accumulation when in the closed position. Outer mounting flange to be supplied with welded nuts for vandal-resistant spanner head screw mounting.
4. Interior walls: Interior walls shall be as shown on the DB Entity's accepted shop drawings and in accordance with the following:
 - a. Material shall be Type 316L stainless steel with rigidized textured surface. Finish shall be Rimex Pattern No. 5-SM or approved equal.
 - b. Glazing shall be in accordance with Article 2.4, Materials.
 5. Hinged front and rear returns with piano hinge, transom and entrance column shall be provided with Type 316L stainless steel. Exposed surfaces shall be finished with Rimex Pattern No. 5-SM or approved equal.
 6. Car doors: Car doors shall be supplied with glazed panels as shown on Contract Drawings. Glazed panels shall be flush with door frames. Doors shall be of the horizontal sliding type with operator, number of door panels as indicated. Exposed surfaces are to be finished with Rimex Pattern No. 5-SM or approved equal. Doors shall protect the full width and height of car entrance opening when in the fully closed position. Car door frame shall be integral with front wall of cab.
 7. Car floor and cove base shall be poured epoxy: basis of design: Dur-A-Quartz flooring system by Dura-A-Flex or approved equal. Color selection and samples shall be submitted to DB Entity for acceptance.

E. Car Door Equipment:

1. Door hangers: Door hangers shall be of the 2-point suspension sheave type equipped with grease-packed heavy duty precision ball bearings, eccentric up-thrust rollers and oilers/cleaners. Track shall be of formed cold rolled steel or cold drawn steel with rounded track surface to receive sheaves. Track shall be mounted on an eccentric stud to provide for adjustment.
2. Car/Hoistway door operator: Car and hoistway doors at each landing shall be opened and closed simultaneously, quietly and smoothly by a direct current electric operator.
3. Door protection: Electronic entrance detector screen: Provide TriTronics electronic door detector device, which projects an infrared curtain of light guarding the door opening. Arrange to reopen doors if one beam of the curtain is penetrated. Unit shall have transmitters and receivers spaced at a minimum distance to provide the maximum amount of protection within the height of the doorway. Systems which have the capability to turn off or on individual zones with the curtain will not be allowed.

F. Appurtenances:

1. Handrails: Tubular type 316L stainless steel with #4 satin finish. Tube steel to be 1-1/2" diameter minimum with rolled and tapered ends and supplied with stainless steel spacers. Provide as shown on Design Documents.
2. Bumper rails: Flat stock Type 316L stainless steel with #4 satin finish. Flat stock stainless steel shall be minimum 5" in height to prevent damage to cab walls. Bumper rails shall have rolled and tapered ends and be supplied with stainless steel spacers. Provide as shown on Design Documents.

G. Safety: A governor-actuated mechanical safety device mounted under the car platform and securely bolted to the car sling. The car safety shall be sized for the capacity and speed noted in Article 2.2, elevator schedule.

1. When tripped, the safety mechanism shall engage the rails with sufficient force to stop a fully loaded car with an average rate of retardation within the limits given by the ANSI/ASME A17.1 code for the given capacity.
2. Make provisions to release the car safety. In no event shall the safety be released by downward motion of the car. Raising the car to reset the safety shall be allowed.
3. Include an electrical safety plank switch that will interrupt the power to the hoisting machine when the safety is set. Resetting the plank switch shall be separate from resetting the safety jaws.
4. Install a car safety marking plate of corrosion resistant metal showing the data required by the code.

2.11 SIGNAL DEVICES AND FIXTURES

A. General: Provide signal fixtures and control devices for each elevator. Buttons and signals shall be tamper-resistant illuminated type that light up when activated and remain lit until call or other function has been fulfilled. All signal fixture and control device faceplates shall be of Type 316L, nominal 0.135" thick stainless steel with #4 finish, unless otherwise shown.

B. Car operating station:

1. Provide one main station in front and one auxiliary station at the rear return panel. Car operating panels shall conform to the latest edition of MBTA Elevator Design Standard, Appendix B.
2. Car operating stations shall contain Braille plates that spell out the landings served adjacent to each call button. Coordinate proper landing call outs based on maximum characters as indicated in Article 2.2, Elevator Schedule. Buttons for DOOR OPEN, DOOR CLOSE, ALARM and EMERGENCY PHONE call functions shall be supplied. Buttons shall be vandal-resistant and of the positive stop type. Buttons shall be Monitor Control Model #HPS1300 with rounded edges and 1-3/8" diameter, including rounded rim.
3. Station shall also have keyed switches for car light, ventilation fans, inspection and independent operation.
4. Station faceplate shall be Type 316L stainless steel with #4 finish.
5. Engrave the car operating panel with the following:

- a. No Smoking, minimum 1” high lettering.
 - b. In Case of Fire Do Not Use the Elevator, as per 524 CMR regulations.
 - c. Elevator Capacity: 3000 lbs., minimum 3/8” high lettering.
 - d. Firefighters Operating Instructions.
 - e. No Smoking Symbol.
6. Provide die cast raised markings for the car buttons and car controls in compliance with the “Handicapped Requirements” of ANSI/ASME A17.1. Die cast plates shall be flush with faceplate surface.
 7. Provide die cast raised markings for the elevator and station identification in compliance with the “Handicapped Requirements” of ANSI/ASME A17.1. Die cast plates shall be flush with faceplate surface.
 8. Emergency communication: “Hands-free” ADA compliant telephone/intercom, VPP Model T-1250E.
- C. Top of car operating device: Provide a top-of-car operating device in compliance with the requirements of Rule 2.26 of the code. The device shall have control switches for UP, DOWN, OPERATE/INSPECT and EMERGENCY STOP. The device shall also have an 110V AC outlet for an extension cord and be provided with a light and rigidized guardrail.
- D. Hall stations: Hall stations of the push-button, call-acknowledging, stainless steel, tamper-resistant type shall be recess mounted flush into the wall and/or returns at all elevator landings, as indicated on the Design Documents. Hall stations shall conform to the latest edition of MBTA Elevator Design Standard, Appendix C.
1. Buttons shall be vandal-resistant and of the positive stop type. Buttons shall be Monitor Control Model #HPS1300 with rounded edges and 1-3/8” diameter with red jewel.
 2. Highest landing shall have a single DOWN button. Lowest landing shall have a single UP button. Intermediate landings shall have UP and DOWN buttons with the UP button on top.
 3. All hall stations to be supplied with PUSH FOR HELP button.
 4. Phase 1 Fire Service illuminated fire hat shall be supplied.
 5. Provide die cast raised markings for the hall buttons in compliance with the “Handicapped Requirements” of ANSI/ASME A17.1. Die cast plates shall be flush with faceplate surface.
 6. Provide die cast raised markings for the elevator and station identification in compliance with the “Handicapped Requirements” of ANSI/ASME A17.1. Die cast plates shall be flush with faceplate surface.
 7. Engrave the hall station with the following:
 - a. In Case of Fire Do Not Use Elevator, in compliance with 524 CMR regulations.
 - b. Firefighters Operating Instructions.
 8. “Hands-free” ADA compliant telephone/intercom, VPP model T-1250E, per section 16750 Elevator Emergency Intercom System.
 9. Additional switches for hoistway access, Phase 1 firefighters operation and parking feature shall be supplied. Key switch requirements for Phase 1 firefighters services shall be in accordance

with national and local code requirements. Key switch requirements for hoistway access and Parking feature shall be per MBTA's current standard lock requirements and/or MBTA approval.

10. Faceplate finish shall be Type 316L stainless steel #4 finish.

E. Hall lanterns:

1. Tamper-resistant hall lanterns shall be equipped with illuminated UP and DOWN signal arrows, but provide single arrow where only one direction is possible. Provide units projecting from faceplate for ease of angular viewing. Match materials, finishes and mounting method with hall stations. Lanterns shall conform to the latest edition of MBTA Elevator Design Standard, Appendix C.
2. In conjunction with each hall lantern, provide an adjustable electronic chime signal to indicate that a car is arriving in response to a hall call and to indicate direction of car travel. Signal shall sound one for up direction of travel and twice for down direction.

F. Bell alarm system: Bell alarm system for each elevator shall be properly located within building and audible outside hoistway when activated by the EMERGENCY STOP switch or the ALARM call button on each car control station.

G. Firefighters service system: Shall be provided in compliance with national and local code requirements.

H. In cab CCTV system: Install a corner mount CCTV camera as specified in section 16725 - CLOSED CIRCUIT TV SYSTEMS.

2.12 WIRING AND ELECTRICAL INSTALLATION

A. Electrical installation shall be in accordance with Division 16.

B. Conduit and wiring:

1. Unless otherwise specified, all electrical conductors in the pits and hoistways, except traveling cable connections to the car, shall be provided in rigid zinc-coated steel conduit with steel outlet boxes, except that a small amount of flexible conduit may be used where conduit is not subject to moisture or embedded in concrete. Terminal boxes and other similar items shall be of approved construction, thoroughly reinforced, and in no case less than number 12 USSG. All electrical boxes exceeding 150 cubic inches shall be supported independently of the conduits. Rigid conduit shall conform to the specifications herein before specified. All raceway shall be threaded rigid steel conduit. Flexible heavy-duty service cord, type SO, may be used between fixed car wiring and switches on car doors for door reversal devices.
2. All conduit terminating in steel cabinets, junction boxes, wireways, switch boxes, outlet boxes and similar locations shall have approved insulation bushings. If the bushes are constructed completely of insulation material, a steel locknut shall be installed under the bushing. At ends of conduits not terminating in steel cabinets or boxes, the conductors shall be protected by terminal fittings having an insulated opening for the conductors. All conduits terminating in NEMA 4X boxes shall be backed up with flat rust-resistant steel plates to fit the entire area where the conduit penetrated the box.
3. Conduit fittings and connections using set screws or indentations as a means of attachment are not permitted.

4. Connect motors and other components subject to movement or vibration to the conduit systems with flexible conduit.
5. The DB Entity shall furnish all materials and completely wire all parts of the elevator electrical equipment, including electrical devices on hatch doors.
6. All solid state and electrical components located on top of the car enclosure or in the hoistway shall be installed within NEMA 4X enclosures.
7. The conduits shall be of such size that the wires or cables can be readily installed and replaced, if necessary. No conduit or raceway shall be less than 3/4" trade size, except that for small devices such as door switches, interlocks, etc., 1/2" conduit may be used. The total overall cross sectional area of the wires contained in any conduit shall not exceed 40% of the internal area of the conduit.
8. Conduits shall be neatly and systematically run. All exposed conduit and boxes shall be supported by approved substantial straps, hangers or clamps to the structural steel, reinforced concrete, masonry or other approved supports. Riser conduits in hoistway shall be supported at each floor level.
9. All interlock, hall button and limit switch branch wiring shall be enclosed in flexible steel conduit with covering of liquid tight Type "EF" with connectors having nylon insulated throat.
10. All screws used for terminal connections of all wiring (control room, machine area, hoistway and pit) shall be provided with "star washers" of proper size and type.

C. Conductors:

1. No joints or splices shall be permitted in wiring except at outlets. Tap connectors may be used in wireways provided they meet all UL requirements.
2. All wiring shall test free of short circuits or grounds. Insulation resistance between individual external conductors and between conductors and ground shall be not less than 1 megohm.
3. Provide all necessary conduit and wiring between all remote control rooms, machine areas and hoistway.

D. Traveling Electrical Cable:

1. Shall be Type EO, rated for a maximum of 300 volts, and shall comply with the requirements of UL Standard #62 and Articles 400 and 620 of ANSI/NFPA No. 70.
2. Travel cables shall include separate coaxial cable shielded for the communication system.
3. Provide 10% spares, but not less than 6 spare conductors in each traveling cable.
4. Provide 2 spare CCTV wires and 2 twisted shielded pair.
5. Provide separate traveling cables for car lighting and fan control circuits.
6. Provide traveling cable for telephone in the elevator car. Cable shall extend from junction box in hoistway to telephone box in car.
7. Provide traveling cable for car work lights.
8. All insulated wiring, control wiring and wiring in traveling cables shall be tag coded at their terminals in the motor room or controller location and hoistway junction box, elevator cab junction box, and push-button stations within the cab, and shall agree with the accepted wiring diagrams.
9. Provide spare cable for in-cab intercom system.

- E. Car and hall operating signal circuits shall not exceed 48 volts.
- F. All cabinets containing motor drives, filter boxes, transformers and power reactors shall be supported on rails and isolated from the base building structure with elastomer pads having a minimum static deflection of 3/8" (mason type N, or equivalent). All connections to and from the cabinetry shall be flexible in order not to compromise the isolation system. Use non-rigid conduit for the final electrical connection, with all other conduit supports and clamps provided on a neoprene sponge insert.

2.13 OPERATION

- A. General: Operation shall be selective collective as follows:
 - 1. Operation shall be automatic by means of the car and landing buttons. Stops registered by the momentary actuation of the car or landing buttons shall be made in the order in which the landings are reached in each direction of travel after the buttons have been actuated. All stops shall be subject to the respective car or landing button being actuated sufficiently in advance of the arrival of the car at that landing to enable the stop to be made. The first car or landing button actuated shall establish the direction of travel for an idle car.
 - 2. "Up" landing calls shall be answered while the car is traveling in the up direction and "Down" landing calls shall be answered while the car is traveling down. The car shall reverse after the uppermost or lowermost car or landing call have been answered, and proceed to answer car calls and landing calls registered in the opposite direction of travel.
 - 3. If the car without registered car calls arrives at a floor where both up and down hall calls are registered, it shall initially respond to the hall call in the direction that the car was traveling. If no car or hall is registered for further travel in that direction, the car shall close its doors and immediately reopen them in response to the hall call in the opposite direction. Direction lanterns, if provided, shall indicate the changed direction when the doors reopen.
- B. Independent service: Provide a key switch in the car operating panel which, when actuated, shall cancel previously registered car calls, disconnect the elevator from the hall buttons so that all operation is from the car buttons only.
- C. Non-contact door reopening device operation shall be as follows:
 - 1. The doors shall be prevented from closing from their full open position if any obstruction comes within the zone of detection. The detection zone shall move with the doors and if a person or object enters the zone as the doors are closing, the doors shall reverse and reopen. The doors shall re-close after a minimum time interval. A passenger entering or leaving the car shall not cause the doors to stop and reverse unless the doors reach a predetermined proximity to the passenger.
 - 2. After a stop is made, the doors shall remain open for a time interval to permit passenger transfer, after which the doors shall close automatically. The interval shall be less for a car call stop than for a hall call stop or a coincident car/hall call stop.
- D. Car stall protective circuit: Provide a protective circuit which shall stop the motor and return the car to its first floor landing in the event that the car, while traveling up, does not reach its designated landing within a predetermined time interval. This circuit shall permit a normal exit from the car but prevent further operation of the elevator until the problem has been corrected.

- E. Door operation:
1. Door close shall be arranged to start after a minimum time, consistent with accessibility requirements, from notification that a car is answering a hall call.
 2. Doors shall be arranged to remain open for a time period sufficient to meet accessibility requirements.
 3. The time interval for which the elevator doors remain open when a car stops at a landing shall be independently adjustable for response to car calls and response to hall calls.
 4. An approved positive interlock shall be provided for each hoistway entrance, which shall prevent operation of the elevator unless all doors for that elevator are closed and shall maintain the doors in their closed position while the elevator is away from the landing. Emergency access to the hoistway as required by governing codes shall be provided.
- F. Standby power transfer: Provide logic in each elevator controller when normal power fails and standby power is operational do not allow more than one elevator to start the lift motor within 5 seconds of another elevator. If normal power fails and standby power does not repower the elevator circuits within 20 seconds, then enable the following sequence: Upon the loss of normal power for greater than 20 seconds, provide controls to automatically lower the elevators nonstop to the lowest landing designated by the Fire Department. When arriving at the lowest landing, the elevator doors shall open automatically and remain open until regular door time has expired. The elevator shall then become deactivated.
- G. Battery standby power transfer: If normal power fails and emergency power does not repower the elevator circuits within 20 seconds then enable the following sequence: Upon the loss of normal power for greater than 20 seconds, provide controls to automatically lower the elevators nonstop to the landing designated by the fire department. When arriving at the designated landing, the elevator doors shall open automatically and remain open until regular door time has expired. The elevator shall then become deactivated. The control panel for the automatic lowering device shall be located in the elevator control area. The panel shall contain 2 gel batteries, solid-state controls, charger, monitor lights and a test button. Battery shall be rechargeable with a 5-year life expectancy.
- H. Automatic leveling: Machine room-less gearless machine/motor design shall be coordinated with the control so that car shall slow down and stop automatically at the floor after transition from contract speed. Car level shall be maintained automatically within 1/4" of the landing by an anti-creep leveling device regardless of any deviation that may be caused by the loading or unloading of the car. Landing zone detection shall indicate to the control system the position with respect to the floor level.
- I. Top-of-car operating device: Operation of elevator from top-of-car device shall be subject to applicable electrical protective devices required in Rule 2.26 of the code.
- J. Elevator control room cabinet:
1. A metal cabinet of not less than 20 cubic feet in volume shall be provided and located in the control room. Cabinet shall be rated to hold flammable materials.
 2. Cabinet shall have lockable doors and shall be mounted on legs or a pedestal, minimum 4" off the floor.
 3. Cabinet shall be painted and marked for elevator purposes, as directed by the MBTA, and OEM shall store small parts, supplies, tools and other materials within.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Prior to commencing with the installation of elevator equipment, examine the following and verify that no irregularities exist that would affect the quality of execution of work as specified:
 - 1. Hoistway size and plumbness.
 - 2. Anchor brackets.
 - 3. Sill support.
 - 4. Pit depth.
 - 5. Overhead clearance.
- B. Do not proceed with installation until work in place conforms to Design Documents.

3.2 INSTALLATION

- A. Install elevator in accordance with the OEM's installation procedures and accepted shop drawings.
- B. Verify that electrical wiring installation is in accordance with the OEM's submittal and in accordance with the installation requirements of other Sections of the Mandatory Specifications.
- C. Erect all items square, plumb, straight and accurately fitted with tight joints and intersections.
- D. Coordinate all trades to ensure that the installation of the elevators is not in conflict with the work performed by other trades.
- E. Isolate non-compatible, dissimilar materials from each other by providing vibration isolation, gaskets or insulating compounds.
- F. Provide protective coverings for finished surfaces.
- G. Upon completion, touch up and restore damaged or defaced factory finished surfaces. Touch up any marred finishes or replace as directed by the MBTA.
- H. Remove protective coverings and clean exposed surfaces after completion.
- I. Welding shall comply with AWS D1.1. Identify field welds with welder's identification stamp.
- J. No visible markings on finishes including finishes through glass except required by code or regulation.

3.3 FIELD TESTING

- A. Acceptance testing:
 - 1. General: After installation and before date accepted for start of interim maintenance, inspect and test the elevator and related equipment to the MBTA's satisfaction that operation of every part of equipment complies with applicable requirements of ASME/ANSI A17.1, including sound level

criteria specified in Article 1.8, Environmental Requirements. Elevator shall be inspected in accordance with procedures outlined in ASME/ANSI A17.2 and as required by the Authority having Jurisdiction. Provide test instruments, materials, other necessary facilities and all labor required for acceptance tests specified.

2. Notification Requirements: Notify the DB Entity and the MBTA a minimum of 5 working days prior to each scheduled test.
3. Full load run test: Run elevator continuously a minimum of 24 hours with full specified rated load, during which time car shall be stopped at top and bottom landings with a minimum standing period of 10 seconds at each landing.
4. Speed test: Make tests before and after full load tests. Using a tachometer on guide rail, determine actual speed of car in both directions of travel, both with full specified rated load and no load in car. Tolerances for determining if car speeds meet the specified requirements are as follows:
 - a. Ascending car speed: Not more than 10% above or more than 10% below required speed.
 - b. Descending car speed: Not more than 10% above or more than 10% below required speed.
5. Car leveling test: Determine accuracy of floor landing tests both before and after full load run tests. Minimum of 1/4" leveling must be maintained. Test accuracy of landing at all floors with full load and no load in car, in both directions of travel.
6. Electrical tests: Ensure elevator wiring system is free of short circuits and accidental grounds. Test ground resistance of elevator structure, equipment and raceways for continuity. Using megohm meter, determine that insulation resistance of each circuit is more than one megohm or higher as required by cable manufacturer. Insulation resistance for motors shall be determined under actual conditions after installation.
7. Burn in testing: Conduct in accordance with Article 1.3, definitions, and provide test report in accordance with Article 1.14, acceptance and warranty.
8. Acceptance: Elevator acceptance will be based upon elevators meeting requirements of DB Entity's accepted shop drawings and upon evidence of passing specified acceptance tests and inspections. Final testing and burn in shall occur after elevators are connected to permanent power.
9. Test Reports: Within 5 days after completion of a test, submit a test report stating type of test, test requirements, failures or problems, and name of certifying Engineer and Title. Safety device failure or defective equipment shall be identified, with description of cause and corrective action taken.
10. Failures for any reasons shall be identified with cause(s) and corrective action taken.
11. Retest notification requirements:
 - a. The DB Entity and MBTA shall be notified 10 days prior to the scheduled retest.
 - b. If any equipment is found to be damaged or defective, or if the performance of the elevator does not conform to the requirements of the Contract Specifications or the safety code, no approval or acceptance of elevators shall be issued until all defects have been corrected. When the repairs and adjustments have been completed and the discrepancies corrected, the MBTA shall be notified and the elevator shall be reinspected. Rejected elevators shall not be used until they have been reinspected and approved.
12. The certificate of inspection for operational use will be issued to the MBTA by the enforcing inspection agency. The certificate shall be posted in the elevator control room and the car operating station.

- B. Any deficiencies and defects discovered during the field-testing shall be corrected, repaired, replaced and retested to the satisfaction of the MBTA.

3.4 ADJUSTING AND CLEANING

- A. Immediately upon the completion of the elevator installation, thoroughly clean each elevator including car and hoistway doors and install 3/4" fire-retardant plywood on wood studs 2'-0" o.c. to protect all hoistway doors, frames and sills. This protection shall be maintained until the MBTA orders its removal, just prior to acceptance. At that time the installer shall perform a complete re-cleaning of the elevators, including hoistways, cars, car enclosures, entrances, operating and signal fixtures, and trim of dirt, oil, grease and finger marks.
- B. Remove all items and debris not necessary for the elevator's operation that could cause safety problems.
- C. Keep areas orderly and free from debris during the progress of the work.
- D. Remove all loose materials and filings resulting from the work from hoistway surfaces, pits and control room spaces.
- E. Clean control room floor of dirt, oil and grease.

3.5 MBTA COORDINATION

- A. Check operation of elevators with MBTA's personnel present and just prior to date of elevator turnover. Determine that operation systems and devices are functioning properly.
- B. Engage OEM authorized service representative to train MBTA's maintenance personnel to operate elevators.
- C. Check operation of elevators with MBTA's personnel present not more than one month before the end of warranty period. Determine that operation systems and devices are functioning properly.

END OF SECTION

SECTION 14450

VEHICLE LIFTS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the DB Entity shall be provided at no additional cost to the agency and shall be as approved by the Contracting Officer.
- D. Furnish and install the equipment items listed below by their identifier:
 - 1. Hoist, LRV, in-ground, w/ body stands, rotating hoists (EQ ID: 9400)
- E. The work specified in this section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The DB Entity shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 2 – SITE WORK of the Mandatory Specifications
 - 2. Division 3 – CONCRETE of the Mandatory Specifications
 - 3. Division 5 – METALS of the Mandatory Specifications
 - 4. Division 15 – MECHANICAL of the Mandatory Specifications
 - 5. Division 16 – ELECTRICAL of the Mandatory Specifications

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
 - 1. Operations and maintenance manual: Provide a complete parts, operating, and maintenance manual covering the equipment at the time of installation, including but not limited to:
 - a. Description of system and components.

- b. Schematic diagrams of any electrical, plumbing, or compressed air systems.
 - c. The manufacturer's printed operating instructions.
 - d. A printed listing of periodic preventive maintenance items and the recommended frequency required to validate warranties.
2. All material submitted to the MBTA will be reviewed for accuracy and detail, and shall be accepted by the MBTA.
 3. Assemble and provide copies of the manual in 8 ½" x 11" format. Fold out diagrams and illustrations are acceptable. The manual is to be reproducible by dry copy method. The manuals shall also be provided in Microsoft Word on CD so reproducing to original quality can be performed. Provide Five (5) copies of each manual, appropriately labeled in a three (3) ring binder.
- B. Shop Drawings
1. Submit shop drawings in accordance with Volume 2, Section 2.0.
 2. Submit the foundation design including drawings depicting the anchor bolt layout, structural loads, and all dimensions of the pit and embedments to be incorporated into the foundations.
 3. Submit drawings showing details of any caisson design and fabrication.
 4. Submit drawings depicting all system components, assembly dimensions, and all services required to connect with equipment, to include detailed wiring schematics and controls diagrams.
 5. Submit drawings showing equipment and component layout.
 6. Submit necessary installation details, including infrastructure items that may be furnished by others.
 7. Submit drawings showing all dimensions and clearances for interface with the MBTA's LRVs. These include, but are not limited to, the following: Lifting jack pads, jack pad centerlines, LRV truck center lines, truck axle spacing, and the LRV body.
 8. Submit catalog cuts of all purchased components.
- C. Submit a maintenance spare parts list for the LRV hoist systems as recommended by manufacturer. The quantity of spares to be provided in the list shall be sufficient to support the manufacturer's maintenance program for a two (2) year duration, based on the predicted rate of failure of all components. The DB Entity shall develop and submit a spare parts list to the MBTA for acceptance thirty (30) days prior to the scheduled delivery of the specified equipment.
- D. Thirty (30) days prior to testing, a comprehensive procedure for testing the equipment and documenting this testing shall be submitted to the MBTA.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years' experience supplying the specified equipment. A list of comparative installations currently in operation for a period of at least one (1) year prior to the bid date, including the names and phone numbers of the authorities using these systems, shall be provided.
- B. At any time during the fabrication of the lift system and body stands, and subject to reasonable notice, the MBTA and their representatives may visit the manufacturer's facility to inspect the fabrication and quality control processes.

C. Manufacturer's representative:

1. Installation: Provide a qualified manufacturer's representative on site to supervise the work related to equipment installation, check out, and start up.
2. Training: Provide a technical representative for training the MBTA's maintenance personnel in the operation and maintenance of the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the DB Entity.
- B. Substitution approval: Prior to delivery or installation, submittals for each item by equipment identifier shall be provided in accordance with Volume 2, Section 2.0.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Items shall be preassembled in the manufacturer's shop to the greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- B. Prior to shipment, the equipment manufacturer shall make the equipment ready for a pre-shipment inspection and test if so desired by the MBTA.
- C. Deliver equipment in the manufacturer's containers, appropriately packaged and/or crated for protection during shipment and storage in humid and/or dusty conditions.
- D. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; abnormal deterioration of finish; and any failure of the system to operate as designed. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with the Contract Documents.

1.8 EQUIPMENT LABELING

- A. The manufacturer shall securely attach in a prominent location, on each major item of equipment, a non-corrosive nameplate showing the manufacturer's name, address, model number, serial number, and pertinent utility or operating data.
- B. All electrical equipment and materials shall be new and shall be listed by the Underwriter's Laboratories, Inc. (UL) in categories for which standards have been set by that agency and labeled as such in the manufacturer's plant.

PART 2 – PRODUCTS

2.1 HOIST, LRV, W/ BODY STANDS, ROTATING HOIST (EQ ID: 9405)

- A. Manufacturer's reference:
 - 1. Prime manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Ray-Jurgen Company, LLC, Bristol, CT (860) 585-0111
 - 1) Model: Custom
 - 2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Volume 2, Section 2.0, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Whiting Corp., Monee, IL - (800) 861-5744
 - b. Macton Corporation, Oxford, CT - (301) 829-6227
 - c. Railquip Inc., Atlanta, GA - (800) 325-0296
- B. General description:
 - 1. The hoist system shall be designed and constructed to lift one of the MBTA's Type 7, Type 8, and Type 9 LRVs and shall be capable of supporting each LRV type with body stands using the jacking pads located on the permanent structure of these LRVs.
 - 2. One (1) complete system shall be furnished and installed at the GLX Vehicle Maintenance and Storage Facility (VMSF). The hoist system shall be furnished in place as a complete operational system with all of the necessary components that may be required to meet the requirements of these specifications. This contract includes all infrastructure and services to make a complete and operational system for the GLX VMSF.
 - 3. Railcar hoist stands shall be of a C-frame design, which shall allow the passage of a removed truck under the raised and supported car after hoists have been lowered.
 - 4. The system shall include three (3) pits with car hoists and body stands in each pit.
 - 5. Each of the holding cylinders will be equipped with pads designed to contact and safely support the body of the lifted rail car when the trucks are being changed.
 - 6. The lift operation shall be controlled by a PLC (programmable logic controller) that will maintain equalized travel of each cylinder within ½"

7. The lifts specified herein shall comply with all requirements of ANSI standard B153.1, "Safety Requirements for the Construction, Care and Use of Automotive Lifts," as published by the American National Standards Institute.
8. All electrical components shall be UL/CSA approved.
9. A PPG Alkyd enamel industrial coating will be applied to all unprotected metal surfaces.

C. Capacities/Dimensions:

1. Car hoist:

- a. System shall be capable of lifting any of the MBTA LRV Types previously mentioned.
- b. Lift capacities: 20 tons (per individual hoist)
- c. Lifting and lowering speed: 4.5 ft./min. (minimum)
- d. Hoist rise: 5'-6"
- e. Track gauge: 4'-8 1/2"
- f. The car hoist system shall take into account and be compatible with the truck wheel base for all MBTA LRV types previously mentioned.
- g. The car hoist system shall take into account and be compatible with the truck centers for all MBTA LRV types previously mentioned.
- h. Each hoist shall have the ability to be rotated at least 90 degrees while in an intermediate height position, and then lowering to floor level so as to allow rolling the removed truck away on tracks installed perpendicular to the main tracks.

2. Body stands:

- a. A minimum of eight (8) body support stands are required per LRV system. The (8) body support stands shall have rotating heads to accommodate the different vehicle types. Twelve (12) Additional body support stands will be allowed only if the manufacturer cannot accommodate the different vehicle types with the use of eight (8) stands.
- b. The end pits shall each have two body stands, the center pit requires four body stands.
- c. The heads of the body stands shall be configured to mate with the vehicle lifting pads and shall also accommodate any pocket inserts required by the different cars.
- d. Stand capacities: Fifteen (15) tons per pair of body support stands.
- e. Lifting and lowering speed: 4.5 ft./min. (minimum)
- f. Stand rise: As required when the car hoist is raised to a maximum height. The body stand screw length shall be the same for all body stands in the system in order to allow interchangeability.

D. Features/Performance/Construction:

1. Wheel base

- a. All posts will be fixed front to rear to provide the safe alignment of lifting points with rail car pick up points.

2. Adapter Adjustment

- a. The lifting adapters will be designed to safely engage all rail cars lifting points specified.
3. Hydraulic power units
- a. The electric hydraulic power unit will be 230/460 or 575v/3 phase
 - b. *Design Requirements:*
 - 1) The power unit shall be mounted in the control console cabinet in accordance with the lift manufacturer recommended installation instructions.
 - c. *Capacity and Dimensions:*
 - 1) Motors: four (4) 3 HP.
 - 2) Pumps: (4) - 1 GPM
 - 3) Hydraulic fluid displacement: 1 gallon.
 - 4) Overall dimensions: 32 ¼” Width, X 15 7/16” Depth, X 47 15/16” Height
 - 5) An optional remote control pendant shall be supplied with 50’ cable (or wireless remote) to allow the operator to raise and lower all cylinders (optional front or rear) with clear visibility of the vehicle being lifted.
 - d. *Features and construction:*
 - 1) Configuration: Unit shall consist of geared pumps each coupled to a 3HP motor assembly complete with relief valves, and check valves mounted on an appropriately sized hydraulic fluid reservoir. All components shall be factory assembled and tested. The motors shall be direct coupled to the pumps with a common shaft/coupling arrangement.
 - 2) Operation: The pumps shall provide hydraulic pressure through electric solenoid controlled valves to raise or lower any combination of the cylinders within the lift system simultaneously synchronized to within plus or minus 1/2” of each other throughout their full stroke. Equalization of rate of lifting or lowering of the cylinders shall be automatically controlled by the PLC controller so that the operator will not be required to make any adjustments during operation.
 - 3) Magnetic motor starter: A full voltage, 3 pole, reversing magnetic type for 3 phase, 60 cycle motor control with manual reset and “UP / DOWN / STOP” push-buttons in cover. NEMA 12 enclosure for floor mounting.
 - 4) The hydraulic power units will be a minimum 3HP each, and of a North American manufacture, with a minimum of 1 GPM flow. Electrical requirements: 230/460 or 575volts 60cycle 3phase.
4. Design requirements:
- a. *Lifting unit:*
 - 1) Pick up adapters: The lifting cradle and adapters will be designed to provide a sufficient engagement that will not require the operator to have to crawl under the vehicle to make adjustments.

- 2) The adapters shall be recessed in the floor and not extend higher than the surface of the floor when the cylinders are fully lowered.
- 3) (Cylinder and Casing Assembly): There will be a one piece that does not require adjustment or lubrication.
- 4) The lifting pistons will be manufactured of 3/8" wall chrome plated machined steel tube, finished and polished over its entire surface. There will be safety stops welded to the bottom of the cylinder to prevent it from leaving the casing. The cylinder shall be removable for inspection and/or replacement.
- 5) The outer casing shall be steel pipe with flanges welded to the top and bottom. The casing assembly shall have a removable bearing assembly. The bearing will provide minimum cylinder to bearing friction for smooth operation and insure maximum rigidity and support for design loads.
- 6) Cover plates will be provided to keep the trench opening covered at all times. Cover plates will be made of diamond plate steel capable of withstanding the drive over loading of the typical vehicle being lifted.

b. *Controls:*

- 1) The PLC control console will include out of level monitoring, synchronization and rail car positioning. There will be a remote control pendant provided with a lower, raise and park position with sufficient cable to allow the operator safe visibility of the rail cars being lifted. The pendant control will have an active "E stop". Controls shall have UL/ CSA certification.

c. *Lift Locks:*

- 1) The locking legs shall be rated at same capacity as the corresponding cylinders capacity. The legs shall be constructed of rectangular tubing and a minimum wall thickness of 3/8" to prevent rotation out of alignment with load holding device. Round notched struts are not acceptable. Each strut shall have a 3/8" steel plate welded to it with a minimum of 26 locking slots spaced at 1.5 " increments. The locking latches shall be spring loaded to the locked position and shall be released at the control console location. The lift locking leg shall be attached to the cradle to prevent unintended rotation during use, and insuring proper location of releases at all times. The locking latch shall be removable for on-site replacement of the latch at any time. The locking latches will be automatically released for lowering.

5. Warranty

- a. Lifts shall be warranted to be manufactured from sound materials in a workman like manner and guaranteed against failure due to defective materials and workmanship for a period of two years on parts and one year on labor. There will be a limited corrosion warranty of seven years. Structural components will be warranted for twenty (20) years.

6. Descriptive data

- a. An installation-operation-service manual and complete repair parts list showing illustrations of individual components shall be furnished by the manufacturer.
- b. Installation shall be provided by factory trained and authorized technicians.
- c. Inspection warranty service, continued maintenance and repair shall be available by local factory trained and authorized personnel who are ALI Certified as well. Emergency service shall be available within eight hours. Local service firm shall maintain an inventory of common replacement parts.

2.2 VARIATIONS

- A. Alternate equipment may be proposed. In all cases the DB Entity shall provide in writing at the time of bid submission sufficient technical description of the alternate units(s) to enable MBTA to determine if the proposed equipment is equal to that specified.

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.
- C. Report in writing to the MBTA any damaged, missing, or incomplete scheduled equipment and improper rough-in or utility stub-outs.

3.2 INSTALLATION

- A. Perform work under the direct supervision of the Foreman or Construction Superintendent who has the authority to coordinate the installation of scheduled equipment with the DB Entity or designated representative.
- B. Install equipment in accordance with the plans, shop drawings, and manufacturer's instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 - 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 - 3. Anchorage: Attach equipment as directed by the DB Entity or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications in the presence of the DB Entity or designated representative using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the DB Entity or designated representative for acceptance inspection.

3.5 TRAINING

- A. Prior to installation the DB Entity shall submit for review a program which shall adequately train MBTA maintenance personnel to correctly operate and maintain the equipment. The DB Entity shall be responsible for supplying all materials required for the program, in addition to the materials and training required to train an MBTA trainer.
- B. Direct the technical representative to provide training to the designated MBTA's maintenance personnel in the operation and maintenance of the equipment. Coordinate, with the MBTA, the training schedule and list of personnel to be trained.
- C. The training period shall start after the system is functionally completed but prior to final acceptance. Course instructions shall cover pertinent points involved in operating, starting, stopping and servicing the equipment, including all major elements of the operations and maintenance manual. Course instructions shall demonstrate all routine maintenance operations such as lubrication and general inspections. The MBTA shall be given at least two (2) weeks advance notice for training.
 - 1. Provide training session of a minimum of four (4) hours in the operation of the hoist system.
 - 2. Provide training session of a minimum of eight (8) hours in the inspection and maintenance of the hoist systems.
 - 3. The DB Entity will provide a suitable LRV for these training sessions.
 - 4. Provide DVD formatted material conveying the essential information contained in the training sessions.
- D. Obtain from the technical representative, a list of the MBTA's personnel trained in equipment operations and maintenance.

3.6 FINAL ACCEPTANCE

- A. Final acceptance shall be granted when the following items have been satisfactorily completed:
 - 1. The equipment installation is complete.
 - 2. Equipment testing is complete and any and all deficiencies have been remedied.
 - 3. A spare parts list has been submitted.

4. Final versions of the Operation and Maintenance manual have been provided.
5. Equipment training is complete.

END OF SECTION

SECTION 14500

MATERIAL HANDLING EQUIPMENT

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions apply to the work in this section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the DB Entity shall be provided at no additional cost to the Agency and shall be as approved by the Contracting Officer.
- D. Furnish and install the equipment items listed below by their identifier:
 - 1. Forklift, electric, Very Narrow Aisle, 4,000 lbs (incl. battery & charger) (EQ ID: 9307)
- E. The work specified in this section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The DB Entity shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 3 – CONCRETE of the Mandatory Specifications
 - 2. Division 15 – MECHANICAL of the Mandatory Specifications
 - 3. Division 16 – ELECTRICAL of the Mandatory Specifications

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.

- B. Operations and maintenance manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years' experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the DB Entity.
- B. Substitution approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided. Acceptance will be based on the technical requirements herein as determined by the MBTA.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the equipment identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from Contract Substantial Completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.

PART 2 – PRODUCTS

2.1 FORKLIFT, ELECTRIC, VERY NARROW AISLE, 4,000 LB W/CHARGER (EQ ID: 9307)

A. Manufacturer's reference:

1. Prime manufacturer: Specifications are based on furniture identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Landoll, Marysville, KS, (717) 485-5161
 - 1) Model: Bendi B40VAC
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in the Mandatory Specifications, furniture produced by other manufacturers, including the following, may be considered as equal.
 - a. Caterpillar, Houston, TX, (713) 365-1000
 - b. Yale Materials Handling Corporation, Greenville, NC, (252) 931-5100

B. General description:

1. A forklift truck (also called a lift truck, a fork truck, or a forklift) is a powered industrial truck used to lift and transport materials.

C. Capacities/Dimensions:

1. Capacity at 24" load center: 4,000 lbs.
2. Weight with battery: 13,770 lbs.
3. Travel Speed
 - a. Loaded: 6.5 mph
 - b. Unloaded: 7 mph
4. Lift Speed
 - a. Loaded: 90 fpm
 - b. Unloaded: 110 fpm
5. Lowering Speed
 - a. Loaded: 100 fpm
 - b. Unloaded: 90 fpm
6. Mast tilt
 - a. Mast tilt-back / fwd: 2/1 degrees
7. Lost load center: 9.2 in.
8. Wheelbase: 62.2 in.
9. Overall length to face of forks: 100.1 in.
10. Underclearance - under mast: 3 in.
11. Operator floor height: 31 in.

12. Overhead guard height: 87 in.
 13. Chassis width: 48 in.
 14. Right angle stacking aisle - with 48"L x 40"W Load: 78 in.
 15. Intersecting aisle - with 48"L x 40"W Load: 108 in.
 16. Gradeability - loaded / unloaded: 15%
 17. Hydraulic motor rating (AC) - continuous duty rating: 12 kw
 18. Traction control type – induction: AC
 19. Wheel sizes
 - a. Front 2 each smooth poly-dia. x face: 12 x 5 in.
 - b. Rear 2 each smooth rubber-dia x face: 18 x 7 in.
 20. Front articulation: 180 degrees.
 21. Provide one battery meeting the manufacturer’s recommended specifications:
 - a. Battery weight: 2,600 lbs. (min) – 3,100 lbs. (max)
 - b. Battery designation: 24-85-19, 48 V, 765 AHC (6 Hour Rate)
 - c. Nominal size: 25 15/16” x 44 9/16” x 22 5/8”
 22. Provide with Battery Charger
 23. Mast Dimension: Select mast lift height to allow the handling of pallets at the highest level of pallet rack provided in the storage and racking rooms.
- D. Features/Performance/Construction:
1. High visibility 3-stage mast
 2. Integral 10.31" stroke sideshifter and 36" high load backrest
 3. Dual inside / outside capability
 4. Large diameter smooth rubber drive tires
 5. Discharge indicator and hour meter
 6. Horn and seatbelt
 7. Hydraulic power steering
 8. Safety deadman seat switch
 9. Capable of freezer operation to -22°F (-30°C)

PART 3 – EXECUTION

3.1 INSPECTION

- A. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Perform work under the direct supervision of the Foreman or Construction Superintendent who has the authority to coordinate the installation of scheduled equipment with the DB Entity or designated representative.
- B. Install equipment in accordance with the plans, shop drawings, and manufacturer's instructions:
- C. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications in the presence of the DB Entity or designated representative using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the DB Entity or designated representative for acceptance inspection.

END OF SECTION

SECTION 14610 - VEHICLE HOIST SYSTEM

PART 1 – GENERAL

1.1. DESCRIPTION

- A. The lift specified shall be of a high pressure (low oil volume) design that minimizes the use of oil below ground through high pressure hydraulic system and use of structural cylinder casing as containment.
- B. The lift shall consist of four (4) lifting cylinders installed in existing pit structure in the center of the track and eight (8) holding cylinders installed in existing structure four on each side of the track directly under lifting points of the rail cars in line with each other.
- C. Each of the four (4) lifting cylinders will be equipped with rail lifting frame to safely lift the two rail cars simultaneously or one rail car at the time.
- D. Each of the holding cylinders will be equipped with pads designed to contact and safely support the body of the lifted rail car when the trucks are being changed.
- E. The lift operation shall be controlled by a PLC (programmable logic controller) that will maintain equalized travel of each cylinder within 1/2”
- F. Each cylinder will have an internally mounted hydraulic ram style piston with chrome plated plunger, and velocity fuse.
 - 1. The structural cylinder casing will be galvanized for rust protection.
 - 2. The lifts specified herein must comply with all requirements of ANSI standard B153.1, "Safety Requirements for the Construction, Care and Use of Automotive Lifts," as published by the American National Standards Institute.
- G. All electrical components must be UL/CSA approved.
- H. A PPG Alkyd enamel industrial coating will be applied to all unprotected metal surfaces.
- I. All current operational features of the lift must be included in the replacement system.

1.2. QUALITY ASSURANCE

- A. The DB Entity shall be certified in vehicle hoist, material handling equipment refurbishment, shop equipment refurbishment, and installation with a minimum of five (5) years of experience providing these specified services.

- B. The DB Entity shall provide a technical representative to instruct and train MBTA's personnel in operation and maintenance of the new hoist.

1.3. SUBMITTALS

- A. Submit one (1) reproducible drawing and five (5) prints of each shop drawing. Complete catalog information and dimensioned shop drawings. Tolerances, clearances, and dimensions shall follow the system of ounces, pounds, gallons, inches, and feet, as used in the United States (metric conversions may be provided parenthetically). Shop drawings shall include, but not necessarily be limited to, the following:
 - 1. Control schematic and detail diagrams showing vehicle hoist system operation.
 - 2. Electric power requirements with wiring diagrams and any new conduit runs.
 - 3. Outline dimensions of equipment.
 - 4. Equipment and component layout.
 - 5. Details of equipment and controls.
 - 6. Other necessary installation details, including infrastructure items that maybe furnished by others.
 - 7. Catalog cuts of all purchased components.
- B. Submit for MBTA's review, data such as technical descriptions, performance specifications, working drawings or other appropriate data, on new accessories, components, and systems to be added or replaced on or to equipment (Programmable Logic Controllers).
- C. Provide at the time of installation, complete parts, operating, and maintenance manuals covering any new accessories, components, or systems. All material submitted to the MBTA will be reviewed for accuracy and detail, and must be accepted by the MBTA. Manuals shall include those listed in Section 2.6.

1.4. DELIVERY, STORAGE AND HANDLING

- A. Vehicle hoist systems equipment and components shall be suitably crated to prevent damage in transit or during handling. Items shall be carefully stored at the site as required in a manner to avoid misalignment or distortion, and shall be adequately protected against damage by weather or other cause.

- B. Special precautions shall be taken to prevent damage to electrical components such as motors, controls and conductors.

1.5. WARRANTY

- A. Lifts shall be warranted to be manufactured from sound materials in a workman like manner and guaranteed against failure due to defective materials and workmanship for a period of two years on parts and one year on labor. There will be a limited corrosion warranty of seven years. Structural components will be warranted for twenty (20) years.
- B. The warranty for work specified herein shall be for one year from final acceptance of the vehicle hoist systems and shall warranty against defects in function, materials, and workmanship.
- C. The warranty shall cover all materials and labor necessary to correct defects.
- D. Defects shall include but not be limited to noisy, rough, or substandard operation, incorrect installation, loose, damaged, and missing parts, abnormal deterioration of finish and any failure of the system to operate as designed.
- E. The warranties shall be submitted in writing to the MBTA at time of completion and final acceptance of modification and refurbishment of each vehicle hoist system.
- F. All parts shall be readily available locally in the United States. (Applies to new or replaced systems or components only)

1.6. EQUIPMENT LABELING

- A. Securely attach in a prominent location, nameplate showing manufacturers name and address, date of refurbishment, and other pertinent data.
- B. All electrical equipment and materials shall be new and shall be listed by Underwriter's Laboratories, Inc. (U.L.) in categories for which standards have been set by that agency and labeled as such in the manufacturer's plant.

PART 2 - PRODUCTS

2.1 CAPACITY AND DIMENSIONS

- A. The overall lifting capacity of the electric/hydraulic system will be a minimum of 160,000 lbs. with 40,000 lbs. in each of the posts when supplied with a maximum operating pressure of 3200psi.

2.2 WHEEL BASE

- A. All posts will be fixed front to rear to provide the safe alignment of lifting points with rail car pick up points.

2.3 ADAPTER ADJUSTMENT

- A. The lifting adapters will be designed to safely engage all rail cars lifting points specified.

2.4 HYDRAULIC POWER UNITS

- A. The electric hydraulic power unit will be 230/460 or 575v/3 phase.

1. Design requirements:

- a. The power unit shall be mounted in the control console cabinet in accordance with the lift manufacturer recommended installation instructions.

2. Capacity and dimensions:

- a. Motors: four (4) 3 HP.
- b. Pumps: (4) - 1 GPM
- c. Hydraulic fluid displacement: 1 gallon.
- d. Overall dimensions: 32 ¼" width, X 15 7/16" depth, X 47 15/16" height
- e. An optional remote control pendant shall be supplied with 50' cable (or wireless remote) to allow the operator to raise and lower all cylinders (optional front or rear) with clear visibility of the vehicle being lifted.

3. Features and Construction

- a. Configuration: Unit shall consist of geared pumps each coupled to a 3HP motor assembly complete with relief valves, and check valves mounted on an appropriately sized hydraulic fluid reservoir. All components shall be factory assembled and tested. The motors shall be direct coupled to the pumps with a common shaft/coupling arrangement.
- b. Operation: The pumps shall provide hydraulic pressure through electric solenoid controlled valves to raise or lower any combination of the cylinders within the lift system simultaneously synchronized to within plus or minus 1/2" of each other throughout their full stroke. Equalization of rate of lifting or lowering of the cylinders shall be automatically controlled

by the PLC controller so that the operator will not be required to make any adjustments during operation.

- c. Magnetic Motor Starter: A full voltage, 3 pole, reversing magnetic type for 3 phase, 60 cycle motor control with manual reset and “UP / DOWN / STOP” push-buttons in cover. NEMA 12 enclosure for floor mounting.
- d. The hydraulic power units will be a minimum 3HP each, and of a North American manufacture, with a minimum of 1 GPM flow. Electrical requirements: 230/460 or 575volts 60cycle 3phase.

2.5 DESIGN REQUIREMENTS

A. Lifting unit:

1. Pick up adapters: The lifting cradle and adapters will be designed to provide a sufficient engagement that will not require the operator to have to crawl under the vehicle to make adjustments.
2. The adapters shall be recessed in the floor and not extend higher than the surface of the floor when the cylinders are fully lowered.
3. (Cylinder and casing assembly): There will be a one piece that does not require adjustment or lubrication.
4. The lifting pistons will be manufactured of 3/8” wall chrome plated machined steel tube, finished and polished over its entire surface. There will be safety stops welded to the bottom of the cylinder to prevent it from leaving the casing. The cylinder shall be removable for inspection and/or replacement.
5. The outer casing shall be steel pipe with flanges welded to the top and bottom. The casing assembly shall have a removable bearing assembly. The bearing will provide minimum cylinder to bearing friction for smooth operation and insure maximum rigidity and support for design loads.
6. Cover plates will be provided to keep the trench opening covered at all times. Cover plates will be made of diamond plate steel capable of withstanding the drive over loading of the typical vehicle being lifted.

B. Controls:

1. The PLC control console will include out of level monitoring, synchronization and rail car positioning. There will be a remote control pendent provided with a lower, raise and park position with sufficient cable to allow the operator safe visibility of the rail cars being lifted. The pendant control will have an active “E stop”. Controls must have UL/ CSA certification.

C. Lift locks:

2. The locking legs shall be rated at same capacity as the corresponding cylinders

capacity. The legs shall be constructed of rectangular tubing and a minimum wall thickness of 3/8" to prevent rotation out of alignment with load holding device. Round notched struts are not acceptable. Each strut shall have a 3/8" steel plate welded to it with a minimum of 26 locking slots spaced at 1.5 " increments. The locking latches shall be spring loaded to the locked position and shall be released at the control console location. The lift locking leg shall be attached to the cradle to prevent unintended rotation during use, and insuring proper location of releases at all times. The locking latch should be removable for on-site replacement of the latch at any time. The locking latches will be automatically released for lowering.

2.6 SUPPORT MATERIALS

A. Installation, operation, and maintenance manual

1. Manuals shall include but not be limited to the following:
 - a. Description of system or component.
 - b. Schematic diagrams.
 - c. Manufacturer's printed operating instructions.
 - d. Printed listing of periodic preventive maintenance items and recommended frequency required to validate warranties.
 - e. List of original manufacturer's parts, including supplier's part numbers and cut sheets, recommended spare parts quantity, and local parts and service source.
2. Shall be assembled and copies of manuals in 8-1/2 by 11 inch format provided. Foldout diagrams and illustrations are acceptable. The manuals shall be a quality that copies can be reproduced by dry copy method. Five (5) copies of each manual, appropriately labeled in a three (3) ring binder. The manuals should also be provided in Microsoft Word on CD so reproducing to original quality can be performed.

PART 3 - EXECUTION

3.1 TRAINING

- A. Prior to installation the DB Entity shall submit for review a program which shall adequately train MBTA maintenance personnel to correctly operate and maintain the equipment. The DB Entity shall be responsible for supplying all materials required for the program, in addition to the materials and training required to train an Authority trainer.

- B. A complete training class of minimum two (2) hours duration for up to ten (10) trainees including test materials and manuals provided to the Authority in Microsoft Word format on CD. Training shall be comprised of hands-on training.

3.2 INSTALLATION

- A. Installation must be provided by factory trained and authorized technicians.
- B. Inspection warranty service, continued maintenance and repair must be available by local factory trained and authorized personnel who are ALI certified as well. Emergency service must be available within eight hours. Local service firm must maintain an inventory of common replacement parts.

3.3 DESIGN-BUILDER TASKS

- A. The DB Entity shall provide barricades, dust shields, warning signs, and other safety devices necessary to protect MBTA and other personnel working in the area.
- B. The DB Entity shall be responsible for proper disposal of all equipment and parts removed during this work.
- C. The DB Entity shall provide appropriate safety caps, wrapping, or other appropriate protection on utility source stub outs in order to protect personnel, equipment and the utility supply.

END OF SECTION

SECTION 14630

BRIDGE CRANES

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of DB Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the DB Entity shall be provided at no additional cost to the Agency and shall be as approved by the Contracting Officer.
- D. Furnish and install the equipment items listed below by their identifier:
 - 1. Top running single girder bridge crane, 10-Ton (EQ ID: 9105)
 - 2. Top running single girder bridge crane, 7½ -Ton (EQ ID: 9126)
- E. The work specified in this Section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The Design-Builder shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 3 – CONCRETE of the Mandatory Specifications
 - 2. Division 15 – MECHANICAL of the Mandatory Specifications
 - 3. Division 16 – ELECTRICAL of the Mandatory Specifications

1.3 REFERENCES

1.4 SUBMITTALS

- A. Product Data - Submit product data in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
- B. Product data for crane and accessories. Describe capacities, performance, operation, and applied forces to overhead support framing.
- C. Design: Manufacturer's standard pre-engineered load tables and other data annotated to identify Project selections and conditions. Indicate type, size, material, spacing, and other attributes of components being provided to accommodate performance requirements.
- D. Shop drawings showing crane configuration, dimensions, wiring diagrams, and fabrication and installation details.
- E. Copy of warranty required for review by DB Entity.
- F. Manufacturer's installation instructions.

G. Operations and maintenance manual:

1. Provide a complete parts, operating, and maintenance manual covering the equipment at the time of installation, including but not limited to:
 - a. Description of system and components.
 - b. Schematic diagrams of any electrical, plumbing, or compressed air systems.
 - c. The manufacturer's printed operating instructions.
 - d. A printed listing of periodic preventive maintenance items and the recommended frequency required to validate warranties. Failure to provide maintenance information will indicate that preventive maintenance is not a condition for validation of warranties.
 - e. A list of the original manufacturer's parts, including suppliers' part numbers and cut-sheets, recommended spare parts stock quantities, and local parts and service sources.
2. Assemble and provide copies of the manual in 8 ½" x 11" format. Fold out diagrams and illustrations are acceptable. The manual is to be reproducible by dry copy method. Provide copies of the manual per the provisions stated in Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions.

H. Shop drawings

1. Submit drawings depicting all system components, assembly dimensions, and all services required to connect with equipment, to include detailed wiring diagrams and structural attachment details.

- I. Submit a maintenance spare parts list for the monorail/hoist as recommended by manufacturer. The quantity of spares to be provided in the list shall be sufficient to support the manufacturer's maintenance program for a two (2) year duration, based on the predicted rate of failure of all components. The Design-Builder shall develop and submit a Spare Parts List to the MBTA for acceptance thirty (30) days prior to the scheduled delivery of the specified equipment.

1.5 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years' experience supplying the specified equipment. A list of comparative installations currently in operation for a period of at least one (1) year prior to the bid date, including the names and phone numbers of the authorities using these systems, shall be provided.
- B. Single source responsibility: Single company shall design, fabricate, and supply all major components for monorail crane including track, track suspension system, bracing, auxiliary framing, track electrification, trolleys, motor drives, hoists, controls, track curves, switches, lifting beams, transfer sections, lift and drop sections, and installation fittings and hardware.
- C. Installer: Company experienced in assembly and installation of cranes with five (5) years successful experience and acceptable to crane manufacturer.
- D. Crane shall be designed, fabricated, and installed in accordance with ANSI B30.11, ANSI B30.16, and OSHA 1910.179.

- E. Hoists shall be designed, fabricated, and installed in accordance with ASME HST-4M.
- F. Service class: Design crane to perform in operating conditions defined in ANSI MH27.1: Class A - Infrequent use.
- G. Impact allowance: Base crane structural design on live load capacity plus 0.5 % of rated load for each foot per minute of hoisting speed with 15 % minimum and 50 % maximum. For bucket and magnet applications, impact allowance shall be 50 % minimum of rated load.
- H. Perform welding by certified operators in accordance with AWS D14.1.
- I. Bolted connections shall be in accordance with torque tightening procedures specified in AISC Manual, Part 5.
- J. Clearly label crane with rated load capacity. Place label at height and location easily read from floor level and loading position.
- K. Manufacturer's representative:
 - 1. Installation: Provide a qualified manufacturer's representative on site to supervise the work related to equipment installation, check out, and start up.
 - 2. Training: Provide a technical representative for training the MBTA's maintenance personnel in the operation and maintenance of the specified equipment.

1.6 PRODUCT SUBSTITUTIONS

- A. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the DB Entity.
- B. Substitution Approval: Prior to delivery or installation, submittals for each item by equipment identifier shall be provided in accordance with Volume 1 Contract Terms and Conditions and Volume 2 Technical Provisions. Acceptance will be based on the technical requirements herein as determined by the MBTA.

1.7 DELIVERY, STORAGE AND HANDLING

- A. Items shall be preassembled in the manufacturer's shop to the greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- B. Deliver equipment in the manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- C. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- D. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.8 WARRANTY

- A. Warrant work specified herein for two (2) years from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with Volume 1 Contract Terms and Conditions.

1.9 EQUIPMENT LABELING

- A. The manufacturer shall securely attach in a prominent location, on each major item of equipment, a non-corrosive nameplate showing the manufacturer's name, address, model number, serial number, and pertinent utility or operating data.
- B. All electrical equipment and materials shall be new and shall be listed by the Underwriter's Laboratories, Inc. (UL) in categories for which standards have been set by that agency and labeled as such in the manufacturer's plant.

PART 2 – PRODUCTS

2.1 CRANE, BRIDGE, TOP RUNNING, 10 TON (EQ ID: 9105)

- A. Manufacturer's reference:
 - 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. R & M Materials Handling Inc., 4501 Gateway Blvd., Springfield, OH (937) 328-5100
 - (i) Model: QXSka10-Ton
 - 2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Mannesman Demag, Cleveland, OH (440) 248-2400
 - b. KCI Konecranes, Santa Fe Springs, CA (949) 248-549
- B. General requirements:
 - 1. Top running single girder electric overhead traveling cranes shall be designed and manufactured as per CMAA specification #74, Revised 2000.
 - 2. In addition, the crane design and installation shall meet all the applicable local, state, and federal laws and OSHA regulations having jurisdiction.

3. Cranes shall operate in the given spaces and shall match the runway dimensions and rails indicated.
4. The crane shall be designed and manufactured to meet the appropriate service conditions based on the particular application. The crane service class shall be clearly indicated by the manufacturer at the time the crane proposal is submitted.

C. Capacities/Dimensions:

1. Lifting capacity: 20,000 pounds
2. Lower load block or assembly of hook, swivel bearing sheaves, pins and frames suspended by the hoisting ropes shall not be considered part of the rated capacity.
3. CMAA service class: Crane shall be designed and constructed to CMAA specification #74 (revised 2004) for Class "C" service requirements and operation in a non-hazardous environment.
4. Crane dimensions - Field verify required dimensions prior to fabrication:
 - a. Span: Per plans
 - b. Runway length: Per plans
 - c. Clear hook height: Per plans
 - d. Lift: Hoist design shall maximize hook coverage, hook vertical travel (i.e. end approach), and clear hook height (i.e. headroom). The use of a low headroom hoist is mandatory.
 - e. Rated speeds (FPM) $\pm 10\%$:
 - f. Hoist: Maximum high 20; Minimum low 3 FPM
 - g. Trolley: Maximum high 65; Minimum low 65 FPM
 - h. Bridge: Maximum high 130; Minimum low 130 FPM

D. Features/Performance/Construction:

1. Hoists and trolleys
 - a. All top running single girder cranes shall utilize low headroom electric wire rope hoists as manufactured by R&M Materials Handling Inc., Springfield, OH., or approved equal.
 - b. The hoist shall be equipped with an electro-mechanical load-limiting device that shall prevent lifting more than 110% of the rated load.
 - c. Hoist and trolley motors shall be per capacities and dimensions above, as applicable.
 - d. Hoisting motor(s) shall be two-speed/two winding squirrel cage type with a speed ratio of 6:1.
 - e. Hoisting motor(s) shall be totally enclosed with IP55 protection, minimum class F insulation, Klixon type bimetal switch for thermal protection and shall have a 60% ED rating.
 - f. Trolley shall be furnished with an adjustable frequency inverter drive and two-step or infinitely variable speed control for smooth acceleration and deceleration.
 - g. Trolley motors shall be inverter duty motors with minimum class "F" insulation and motor enclosures shall be TENV [totally enclosed non-ventilated].
 - h. Rotary cam type limit switch equipped with 4 micro-switches shall be provided. Limit switch shall provide upper and lower limit of hoist travel, hoist slow down prior to reaching upper limit

and phase sequence supervision at upper limit. An additional block operated limit shall be included.

- i. Hoist motor brake shall be DC disc type with adequate torque to stop and hold over 125% of the hoist rated load.
 - j. Large diameter rope drum with a minimum of 36:1 drum to wire rope diameter ratio. Groove depth shall be at least 35% of rope diameter. The rope drum shall be equipped with a rope guide to help keep the rope aligned in the grooves of the drum.
 - k. Wire rope shall be constructed from galvanized steel having a minimum safety factor of 5.
 - l. Hoist reeving shall be single reeved. Lateral hook drift shall not exceed 1/8 inch per foot of vertical travel on single reeved models.
 - m. The hoist nameplate is to carry a CSA c/us rating. The actual hoist control enclosure rating shall be at least equivalent to IP55 / NEMA 4 type.
 - n. Hooks shall be made of forged alloy steel (34CrMo4QT or 34CrNiMo6QT) and shall be fitted with a spring-loaded flipper-type safety latch.
 - o. Hoist shall have a duty rating suitable for the load class and load cycles of occasional use.
 - p. AGMA quality class 12 machine cut, hardened and precision ground hoist gearing. The gears inside the hoist gearboxes on models up to 5 ton capacity are lubricated by semi-fluid grease. On models over 5 ton capacity the gears inside the hoist gearbox are lubricated with semi-fluid grease or oil.
 - q. AGMA quality class 10, hardened and precision ground trolley drive gearing, lubricated by semi-fluid grease.
 - r. Trolleys shall have safety drop lugs and energy absorbing bumpers.
 - s. Any proposed equivalent shall meet or exceed the dimensional and performance specification of the above-mentioned products.
2. Bridge girder:
- a. Bridge girder shall be per capacities/dimensions above, as applicable.
 - b. Bridge girders shall be constructed from welded box girders or Structural beams, Steel, ASTM A36 or A992, as required.
 - c. High-strength bolted connections shall utilize SAE Grade 5 bolts with corresponding lockwashers and nuts, conforming to requirements of AISC S329 bolts. Bolts, nuts, and washers shall conform to ASTM 325 bolts. Galvanized bolts are not acceptable.
3. Bridge end trucks and bridge drive:
- a. End trucks shall be designed in accordance with CMAA specifications as applicable (reference appendix B)
 - b. End trucks shall be bolted to bridge girder.
 - c. Bridge drive shall be dual-motor (A-4 arrangement per CMAA).
 - d. Bridge drive shall be designed to stop the bridge within CMAA specifications.
 - e. End trucks shall be equipped with rail sweeps and energy-absorbing rubber bumpers.

- f. Travel limit switches to be provided as necessary for safe operation.
- g. Bridge shall be furnished with an adjustable frequency inverter drive and two-step or infinitely variable speed control for smooth acceleration and deceleration.
- h. Bridge motors shall be inverter duty motors with minimum class “F” insulation and motor enclosures shall be TENV [totally enclosed non-ventilated].
- i. AGMA quality class 10, hardened and precision ground bridge drive gearing, lubricated by semi-fluid grease.

2. Power supply

- a. Power supply for the hoist shall be 460 volt, 3 ph., 60 Hz. All power required for the operation of the hoist, trolley, and end trucks shall be developed from this source.
- b. Runway electrification shall be 4-bar safety type rigid conductors as manufactured by Insul-8, Duct-O-Wire Company or Wampfler. Wall mounted disconnect switch and power to runway conductors provided by the DB Entity.
- c. Cross bridge electrification shall be flat cable style festoon system with terminal box, multi-conductor cord, plug connectors (when available) and accessories. Cables are to be hardwired when plug connectors are not available.

3. Controls

The following controls shall be used as applicable:

- a. Six-way operation, plug-in pushbutton pendant suspended from independent festoon track. Radio control may be quoted as an option.
- b. Pendant shall include start (momentary) button and emergency stop (push to maintain, turn to release) that controls a mainline contactor in the bridge control panel.
- c. Pushbutton shall be clearly marked with hoist, trolley and bridge travel directions.
- d. Hoist shall be 2 speed magnetic reversing type (standard) or variable frequency inverter control (optional) and the trolley and bridge controls shall be variable frequency inverter control (standard), as required per above sections.
- e. Electrical control enclosures shall be IP55 or NEMA 4 type. Pushbutton enclosure shall have a rating of IP65, NEMA 4X, 4 or 5.

4. Labeling:

- a. Two capacity plates including the crane capacity in tons are required, one secured to each side of bridge crane. Each capacity plate shall be fabricated of steel or a quality/ fade-resistant stick-on label with letters large enough to be easily read from the floor. Capacity plates shall be placed in a location visible to pendant operator’s position after the crane has been installed.
- b. Readable warning labels shall be affixed to each lift block or control pendant in a readable position in accordance with ASME B30.16, ASME B30.2 and ASME B30.17. The word “warning” or other legend shall be designed to bring the label to the attention of the following information concerning safe-operating procedures: operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; with a rope that

is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

5. Crane runway rail: Manufacturer to provide crane runway rail to match end truck wheel assembly and include crane stops as required.

B. Finish:

1. Bridge crane including bridge, trolley, hoist, and all attached items shall be painted (2-part epoxy) in accordance with the manufacturer's standard practices.
2. Bridge shall be shop cleaned, primed, and painted per manufacturer's standards.
3. The following items shall not be painted:
 - a. Rail surfaces in contact with wheels
 - b. Wheel running surfaces
 - c. Hoist wire rope
 - d. Conductor bar, festoon cables and supports

2.2 CRANE, BRIDGE, TOP RUNNING, 7.5 TON (EQ ID: 9126)

A. Manufacturer's reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. R & M Materials Handling Inc., 4501 Gateway Blvd., Springfield, OH (937) 328-5100
 - (i) Model: QXSka7.5-Ton
2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Mannesman Demag, Cleveland, OH (440) 248-2400
 - b. KCI Konecranes, Santa Fe Springs, CA (949) 248-549

B. General requirements:

1. Top running single girder electric overhead traveling cranes shall be designed and manufactured as per CMAA Specification #74, Revised 2000.
2. In addition the crane design and installation shall meet all the applicable local, state, and federal laws and OSHA regulations having jurisdiction.
3. Cranes shall operate in the given spaces and shall match the runway dimensions and rails indicated.

4. The crane shall be designed and manufactured to meet the appropriate service conditions based on the particular application. The crane service class shall be clearly indicated by the manufacturer at the time the crane proposal is submitted.

C. Capacities/Dimensions:

1. Lifting capacity: 15,000 pounds
2. Lower load block or assembly of hook, swivel bearing sheaves, pins and frames suspended by the hoisting ropes shall not be considered part of the rated capacity.
3. CMAA service class: Crane shall be designed and constructed to CMAA Specification #74 (revised 2004) for Class "C" service requirements and operation in a non-hazardous environment.
4. Crane dimensions - Field verify required dimensions prior to fabrication:
 - a. Span: Per plans
 - b. Runway length: Per plans
 - c. Clear hook height: Maximize hook height; at a minimum the crane shall be able to lift equipment loads from vehicle roofs.
 - d. Lift: Hoist design shall maximize hook coverage, hook vertical travel (i.e. end approach), and clear hook height (i.e. headroom). The use of a low headroom hoist is mandatory.
 - e. Rated speeds (FPM) $\pm 10\%$:
 - f. Hoist: Maximum high 20; Minimum low 3 FPM
 - g. Trolley: Maximum high 65; Minimum low 65 FPM
 - h. Bridge: Maximum high 130; Minimum low 130 FPM

D. Features/Performance/Construction:

1. Hoists and trolleys
 - a. All top running single girder cranes shall utilize low headroom electric wire rope hoists as manufactured by R&M Materials Handling Inc., Springfield, OH, or approved equal.
 - b. The hoist shall be equipped with an electro-mechanical load-limiting device that shall prevent lifting more than 110% of the rated load.
 - c. Hoist and trolley motors shall be per Capacities and Dimensions above, as applicable.
 - d. Hoisting motor(s) shall be two-speed/two winding squirrel cage type with a speed ratio of 6:1.
 - e. Hoisting motor(s) shall be totally enclosed with IP55 protection, minimum class F insulation, Klixon type bimetal switch for thermal protection and shall have a 60% ED rating.
 - f. Trolley shall be furnished with an adjustable frequency inverter drive and two-step or infinitely variable speed control for smooth acceleration and deceleration.

- g. Trolley motors shall be inverter duty motors with minimum class “F” insulation and motor enclosures shall be TENV [totally enclosed non-ventilated].
 - h. Rotary cam type limit switch equipped with 4 micro-switches shall be provided. Limit switch shall provide upper and lower limit of hoist travel, hoist slow down prior to reaching upper limit and phase sequence supervision at upper limit. An additional block operated limit shall be included.
 - i. Hoist motor brake shall be DC disc type with adequate torque to stop and hold over 125% of the hoist rated load.
 - j. Large diameter rope drum with a minimum of 36:1 drum to wire rope diameter ratio. Groove depth shall be at least 35% of rope diameter. The rope drum shall be equipped with a rope guide to help keep the rope aligned in the grooves of the drum.
 - k. Wire rope shall be constructed from galvanized steel having a minimum safety factor of 5.
 - l. Hoist reeving shall be single reeved. Lateral hook drift shall not exceed 1/8 inch per foot of vertical travel on single reeved models.
 - m. The hoist nameplate is to carry a CSA c/us rating. The actual hoist control enclosure rating shall be at least equivalent to IP55 / NEMA 4 type.
 - n. Hooks shall be made of forged alloy steel (34CrMo4QT or 34CrNiMo6QT) and shall be fitted with a spring-loaded flipper-type safety latch.
 - o. Hoist shall have a duty rating suitable for the load class and load cycles of Occasional Use.
 - p. AGMA quality class 12 machine cut, hardened and precision ground hoist gearing. The gears inside the hoist gearboxes on models up to 5 ton capacity are lubricated by semi-fluid grease. On models over 5 ton capacity the gears inside the hoist gearbox are lubricated with semi-fluid grease or oil.
 - q. AGMA quality class 10, hardened and precision ground trolley drive gearing, lubricated by semi-fluid grease.
 - r. Trolleys shall have safety drop lugs and energy absorbing bumpers.
 - s. Any proposed equivalent shall meet or exceed the dimensional and performance specification of the above-mentioned products.
2. Bridge girder:
- a. Bridge girder shall be per Capacities/Dimensions above, as applicable.
 - b. Bridge girders shall be constructed from welded box girders or Structural beams, Steel, ASTM A36 or A992, as required.
 - c. High-strength bolted connections shall utilize SAE Grade 5 bolts with corresponding lockwashers and nuts, conforming to requirements of AISC S329 bolts. Bolts, nuts, and washers shall conform to ASTM 325 bolts. Galvanized bolts are not acceptable.
3. Bridge end trucks and bridge drive:
- a. End trucks shall be designed in accordance with CMAA specifications as applicable (reference appendix B)

- b. End trucks shall be bolted to bridge girder.
- c. Bridge drive shall be dual-motor (A-4 arrangement per CMAA).
- d. Bridge drive shall be designed to stop the bridge within CMAA specifications.
- e. End trucks shall be equipped with rail sweeps and energy-absorbing rubber bumpers.
- f. Travel limit switches to be provided as necessary for safe operation.
- g. Bridge shall be furnished with an adjustable frequency inverter drive and two-step or infinitely variable speed control for smooth acceleration and deceleration.
- h. Bridge motors shall be inverter duty motors with minimum class “F” insulation and motor enclosures shall be TENV [totally enclosed non-ventilated].
- i. AGMA quality class 10, hardened and precision ground bridge drive gearing, lubricated by semi-fluid grease.

2. Power supply

- a. Power supply for the hoist shall be 460 volt, 3 ph., 60 Hz. All power required for the operation of the hoist, trolley, and end trucks shall be developed from this source.
- b. Runway electrification shall be 4-bar safety type rigid conductors as manufactured by Insul-8, Duct-O-Wire Company or Wampfler. Wall mounted disconnect switch and power to runway conductors provided by DB Entity.
- c. Cross bridge electrification shall be flat cable style festoon system with terminal box, multi-conductor cord, plug connectors (when available) and accessories. Cables are to be hardwired when plug connectors are not available.

3. Controls

The following controls shall be used as applicable:

- a. Six-way operation, plug-in pushbutton pendant suspended from independent festoon track. Radio control may be quoted as an option.
- b. Pendant shall include start (momentary) button and emergency stop (push to maintain, turn to release) that controls a mainline contactor in the bridge control panel.
- c. Pushbutton shall be clearly marked with hoist, trolley and bridge travel directions.
- d. Hoist shall be 2 speed magnetic reversing type (standard) or variable frequency inverter control (optional) and the trolley and bridge controls shall be variable frequency inverter control (standard), as required per above sections.
- e. Electrical control enclosures shall be IP55 or NEMA 4 type. Pushbutton enclosure shall have a rating of IP65, NEMA 4X, 4 or 5.

4. Labeling:

- a. Two capacity plates including the crane capacity in tons are required, one secured to each side of bridge crane. Each capacity plate shall be fabricated of steel or a quality/ fade-resistant stick-on label with letters large enough to be easily read from the floor. Capacity plates shall be placed in a location visible to pendant operator’s position after the crane has been installed.

- b. Readable warning labels shall be affixed to each lift block or control pendant in a readable position in accordance with ASME B30.16, ASME B30.2 and ASME B30.17. The word “warning” or other legend shall be designed to bring the label to the attention of the following information concerning safe-operating procedures: operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.
5. Crane runway rail: Manufacturer to provide crane runway rail to match end truck wheel assembly and include crane stops as required.

B. Finish:

1. Bridge crane including bridge, trolley, hoist, and all attached items shall be painted (2-part epoxy) in accordance with the manufacturer’s standard practices.
2. Bridge shall be shop cleaned, primed, and painted per manufacturer’s standards.
3. The following items shall not be painted:
 - a. Rail surfaces in contact with wheels
 - b. Wheel running surfaces
 - c. Hoist wire rope
 - d. Conductor bar, festoon cables and supports

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.
- C. Report in writing to the MBTA any damaged, missing, or incomplete scheduled equipment and improper rough-in or utility stub-outs.

3.2 INSTALLATION

- A. Perform work under the direct supervision of the Foreman or Construction Superintendent who has the authority to coordinate the installation of scheduled equipment with the DB Entity or designated representative.
- B. Install equipment in accordance with the plans, shop drawings, and manufacturer’s instructions:
 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.

2. **Fitting:** Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 3. **Anchorage:** Attach equipment as directed by the DB Entity or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. It shall be the responsibility of the manufacturer to provide grounding for the equipment to the nearest grounding electrode as shown on the electrical drawings.
 - D. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications in the presence of the DB Entity or designated representative using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the DB Entity or designated representative for acceptance inspection.

3.5 TRAINING

- A. Direct the DB Entity to provide training to the designated MBTA's maintenance personnel in the operation and maintenance of the equipment. Coordinate, with the MBTA, the training schedule and list of personnel to be trained.
- B. The training period shall start after the system is functionally completed but prior to final acceptance. Course instructions shall cover pertinent points involved in operating, starting, stopping and servicing the equipment, including all major elements of the operations and maintenance manual. Course instructions shall demonstrate all routine maintenance operations such as lubrication and general inspections. The MBTA shall be given at least two (2) weeks advance notice for training.
- C. Obtain from the DB Entity, a list of the MBTA's personnel trained in equipment operations and maintenance.

3.6 FINAL ACCEPTANCE

- A. Final acceptance shall be granted when the following items have been satisfactorily completed:
 1. The equipment installation is complete.
 2. Equipment testing is complete and any and all deficiencies have been remedied.
 3. A spare parts list has been submitted.

4. Final versions of the operation and maintenance manual have been provided.
5. Equipment training is complete.

END OF SECTION

SECTION 16100

POWER UTILITY COORDINATION FOR THE TRACTION POWER SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work included: This section specifies the coordination requirements between the DB Entity, the MBTA and EVERSOURCE.
- B. Each Traction Power Substation (TPSS) (Red Bridge and Pearl Street (formerly Gilman Square)) will be supplied power from the local utility company (EVERSOURCE Electric) at 13.8kV. The main equipment within each TPSS will be the MBTA owned equipment and coordination with EVERSOURCE is therefore required. All equipment required by EVERSOURCE in relation to accepting these power supplies at each Substation is the responsibility of this contract.
- C. EVERSOURCE interfaces include:
 - 1. 13.8kV Utility power infeeds at each TPSS (except Ball Square).
 - 2. 13.8kV AC switchgear line circuit breakers, controls and relay protection.
 - 3. 13.8kV AC switchgear line metering equipment.
 - 4. 13.8kV EVERSOURCE grounding and test device
 - 5. EVERSOURCE revenue metering equipment requirements at each TPSS. Refer to specification 16311 2.1.G and Appendix A of this section.
 - 6. TPSS relay and protection coordination study.
- D. The requirements related to EVERSOURCE's interfaces for the traction power system are laid out in these specifications. Compliance with the specifications and the associated submittals shall meet the interface requirements stated above.
- E. Submissions of information to EVERSOURCE related to these interfaces and requirements will be by the MBTA. The Design-Builder shall allow an additional 4 weeks for the review the affected submittals to allow time for the EVERSOURCE review to be completed.
- F. Related work: Refer to the following sections:
 - 1. Related requirements are included in, but not limited to, the following sections.
 - a. Section 16201, Basic Materials and Methods for Electrical Work for the Traction Power System
 - b. Section 16203, Traction Power Equipment General Requirements
 - c. Section 16300, Ductbanks and Ductbank Manholes for the Traction Power System
 - d. Section 16311, Traction Power Electrical Equipment
 - e. Section 16495, Electrical Acceptance Tests for the Traction Power System

1.2 SUBMITTALS

- A. Provide submittals in accordance with Volume 2 Technical Provisions Subsection 2.8, Construction Submittal Requirements.
- B. The following submittals shall be required to be submitted for the acceptance of EVERSOURCE and the MBTA in accordance with Contract Technical Provision Subsections 2.7 and 2.8.
 - 1. Manhole details
 - 2. Ductbank details
 - 3. Revenue metering equipment, layout and connections
 - 4. Cable pulling calculations
 - 5. Ductbank and manhole layouts
 - 6. Product submittals for all components proposed to be used by the Design-Builder.
 - 7. Power system protection coordination studies and relay settings including a PE stamped executive summary document clearly stating all information:
 - a. Table of contents
 - b. Executive summary
 - c. Input data report
 - d. Short circuit study report
 - e. Equipment evaluation
 - f. Analysis of the time current curves
 - g. Time current curves
 - h. Protective device setting reports
 - i. Protective relay setting schedules
 - j. One-Line diagram
 - 8. Electrical Equipment in accordance with Specification Section 16311. Including 13.8kV switchgear submittals for metering and circuit breakers – layouts, schematic and wiring details, and 13.8kV switchgear EVERSOURCE ground and test device.
- C. The MBTA will provide all relevant submittals to EVERSOURCE for review. The MBTA review period for submittals shall be extended by four weeks to allow EVERSOURCE to provide comments on all relevant submittals. The MBTA will identify the submittals which will be forwarded to EVERSOURCE for their review.

1.3 SCOPE OF WORK AND WORK LIMITS

- A. The DB Entity shall develop all required information and coordinate with the MBTA to make utility applications to ensure that Eversource work orders are in place in a timely manner to facilitate the project. Any existing work orders a, active or inactive, shall be the responsibility of the DB Entity to progress, replace, modify or cancel as necessary.
- B. The DB Entity shall coordinate the work limits with EVERSOURCE and the MBTA.

- C. DB Entity shall install all manhole and ductbanks from the EVERSOURCE-MBTA demarcation point to each traction power substation. Expected demarcation is the EVERSOURCE manhole on public property. The DB Entity shall install all infrastructure on MBTA property.
- D. DB Entity shall install and connect all electrical equipment within the MBTA substation.
- E. Coordination is required to connect the utility metering equipment to EVERSOURCE requirements.
- F. EVERSOURCE will supply and install the AC incoming supply cable in the DB Entity installed ductbanks and manholes. EVERSOURCE will terminate the cables at the AC switchgear. MBTA, DB Entity and EVERSOURCE shall coordinate the schedule for all activities, scheduling shall be DB Entity led.

1.4 RESPONSIBILITIES

A. Limits of EVERSOURCE responsibility:

1. EVERSOURCE is responsible for (but not limited to):

a. General:

- 1) Review of AC switchgear submissions for incoming line breakers and all associated control, relays, protection and indications, and ground and test devices.
- 2) Review of all utility metering equipment submittals
- 3) Provision of utility line fault data for use in the relay protection & coordination study.
- 4) Inspection of DB Entity installed facilities to ensure compliance with EVERSOURCE requirements.
- 5) EVERSOURCE to supply the revenue meters (wireless).
- 6) Review and acceptance of testing & commissioning reports.
- 7) Review and acceptance of relay coordination and protection setting reports.

b. Red Bridge:

- 1) Providing interface manhole in Water Street.
- 2) Providing ductbanks from EVERSOURCE Sta. 850 to the interface manhole in Water Street.
- 3) Support to EVERSOURCE for installing power cables from EVERSOURCE power source to EVERSOURCE interface manhole.

c. Pearl Street

- 1) Providing interface manhole in School Street.
- 2) Providing ductbanks from EVERSOURCE supply substation to the interface manhole in School Street.
- 3) Support to EVERSOURCE for installing power cables from EVERSOURCE power source to EVERSOURCE interface manhole.

- B. The DB Entity is responsible for:
1. Coordination and changes to Eversource work orders as necessary including support to the MBTA for all related matters.
 2. Compliance with Eversource technical requirements.
 3. Coordination with Eversource for utility fault information in order to complete studies and equipment assessments.
 4. 13.8kV Switchgear and associated submittals.
 5. Relay protection and coordination study.
 6. Procurement, installation of 13.8kV manholes and ductbanks from utility interface point to each TPSS.
 7. If required by EVERSOURCE, procurement, installation and termination of high voltage 13.8kV cables from utility interface point to each TPSS, under EVERSOURCE supervision
 8. If required by EVERSOURCE, splicing utility power cables in the interface manhole, under supervision of EVERSOURCE personnel.
 9. Procurement, installation and connection of utility metering equipment, cables and conduits. See Appendix A for revenue metering requirements.
 10. Providing 120V ac supply to the EVERSOURCE revenue meters.
 11. Testing and commissioning.
 12. Scheduling and notifying all parties in advance of work commencement.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Refer for specifications 16300 and 16311 for equipment and product requirements.
- B. Refer to appendix A of this section for the layout and typical requirements of the revenue metering panel.

PART 3 - EXECUTION

3.1 GENERAL

- A. Refer for specifications 16300, 16311 and 16495 and this Section for equipment installation and testing requirements.

APPENDIX A

EVERSOURCE Typical Revenue Metering Panel Layout at MBTA Traction Power Substations.

END OF SECTION

SECTION 16120

MEDIUM VOLTAGE POWER CABLE FOR THE TRACTION POWER SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies furnishing, installing and testing of medium voltage power cable including cable terminations.
1. Medium voltage power cable includes the following:
 - a. 15kV EPR insulation, PE covered cable (133% insulation) for MBTA use (Ring Feeder Cables, Units Substation Feeder cables and Rectifier Transformer Feeder Cables).
 - b. Utility Supply Cables supplying MBTA substations.
 - 1) Eversource shall supply and install cable from the utility interface point to the Eversource/MBTA interface point. The interface point shall be within the last utility manhole before the traction power substation. Eversource shall splice the cable in the manhole.
 - 2) The DB Entity shall supply and install the cable and accessories (identical to the Eversource cable, see Appendix A) from the last manhole to the AC switchgear in the traction power substation. DB Entity shall terminate cable at the AC switchgear and test the cable.
- B. The medium voltage power cables shall be installed aerially or in conduits as stated in the accepted Drawings. Aerial cables shall be supported on a copperweld messenger wire.
- C. Related works are included in, but not limited to, the following Sections:
1. Section 16201: BASIC MATERIALS AND METHODS FOR ELECTRICAL WORK FOR TRACTION POWER SYSTEM.

1.2 REFERENCES

- A. ANSI/IEEE C2, National Electrical Safety Code.
- B. ICEA (Insulated Cable Owners Association) standards including S-93-639 and S-97-682
- C. IEEE 48, Test Procedures and Requirements for High Voltage Alternating Current Cable Terminations.
- D. UL 1072, Medium-Voltage Power Cables
- E. ASTM B-496
- F. NETA (National Electrical Testing Association)
- G. MBTA Standard Specifications (reference numbers to be advised)
- H. EVERSOURCE Material Standard M1601

1.3 SUBMITTALS

- A. Submittals shall be in accordance with Volume 2 Technical Provisions Subsections 2.7 and 2.8, except as modified herein.
- B. Product Data/Catalog Cuts
 - 1. Cable
 - a. Include data on manufacturer's cold weather temperature limitations.
 - 2. Stress cones / Cable Terminations
 - 3. Fire proofing tape (See MBTA Standard Specifications for requirements)
 - 4. Cable Splices – as applicable
- C. Cable Test Reports
 - 1. Manufacturer's standard physical and electrical test reports.
 - a. Submit test reports (minimum of 2 weeks) prior to shipment of cable from manufacturer.
 - 2. Field Tests
 - a. Independent testing company shall submit testing procedure a minimum of two (2) weeks prior to testing and written reports no later than two (2) weeks after testing was performed.
- D. Certificates of Compliance
 - 1. Cable
 - a. Submit certificates of compliance prior to shipment of cable from manufacturer.
- E. Manufacturer's Instructions
 - 1. Cable terminating procedures.
 - 2. Cold weather installation procedures for cable.
 - 3. Cable splicing procedures, as applicable.
 - 4. Cable shield installation and termination procedures.

1.4 DELIVERY, HANDLING, TRANSPORTATION, STORAGE AND PROTECTION

- A. Delivery, handling, transportation, storage and protection shall be in accordance with Contract Technical Provisions Exhibit 21, except as modified herein.
 - 1. Cable shall be unloaded in a manner such that the unloading equipment used does not come into contact with the cable surface and protective wrap.
 - 2. Cable reels shall be stored on a hard surface so that the flanges do not sink into the soil and allow the weight of the reel and cable to rest on the cable surface.
 - 3. Cable reels shall be stored in an area where construction equipment, falling or flying objects or other material shall not come into contact with the cable, and where chemicals, and petroleum products shall not be spilled or sprayed on the cable.
 - 4. Cable shall be stored in an area away from open fires and sources of high heat.

5. When a reel of cable is to be rolled from one point to another, the surface over which the reel of cable is to be rolled shall be examined for objects which could contact and damage the cable surface or protective wrap.
 - a. Remove objects prior to moving the reel of cable.
6. If a length of cable has been cut from the reel, the cable end shall be immediately resealed to prevent the entrance of moisture.

1.5 QUALITY ASSURANCE

A. Environmental Requirements

1. When cables are to be installed in cold weather, the cables shall be stored in a heated area for a minimum of 24 hours prior to installation.
2. Cold weather temperature installations shall be in accordance with the manufacturer's recommendations. Submit manufacturer's cold weather temperature limitation data, including, but not limited to, data on temperature ranges.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. The cable shall be suitable for use in wet and dry locations in conduit and underground duct systems.
- B. The cable shall be rated for 90°C normal, 130°C emergency and 250°C short circuit operating conditions.
- C. Utility Supply Cables Feeding MBTA Substations
 1. The DB Entity shall supply and install cable from the utility interface point to the MBTA substation.
 2. DB Entity shall terminate cable at the AC switchgear and shall provide all cable supports, terminations and accessories.
 3. The infeed cable connecting to the EVERSOURCE supply cable at the EVERSOURCE/MBTA interface point shall match the EVERSOURCE cable being installed.
 4. EVERSOURCE shall supply the cable splice, and splice the cables in the manhole at the EVERSOURCE/MBTA interface point. DB Entity shall provide support as necessary.
 5. 700 kcmil flat strap primary Copper cables in accordance with EVERSOURCE material specification M1601 included in Appendix A of this Section.

2.2 ETHYLENE-PROPYLENE RUBBER INSULATED CABLE

- A. MBTA Cable shall be as follows:
 1. Between 15kV AC switchgear and the Rectifier Transformer
 - a. 350kcmil three 1-phase, shielded, ethylene-propylene rubber insulated cables rated 15 kV, 133% insulation.
 2. Ring Feeder / MBTA distribution feeders

- a. 500kcmil three 1-phase, shielded, ethylene-propylene rubber insulated cables rated 15 kV, 133% insulation. Where installed aerially, the installation shall comprise the 3 1-phase cables per circuit supported on the same messenger wire. The cable shall be suitable for use aerially or underground in ductbanks.
- 3. Unit Substation Feeders
 - a. #4/0AWG three 1-phase, shielded, ethylene-propylene rubber insulated cables rated 15 kV, 133% insulation. Where installed aerially, the installation shall comprise the 3 1-phase cables per circuit supported on the same messenger wire. The cable shall be suitable for use aerially or underground in ductbanks.
- B. Basic Construction: Basic construction shall be 3-1/C Class B strand copper, extruded semiconducting ethylene-propylene rubber strand shield, EPR insulation and semiconducting ethylene-propylene rubber insulation shield, copper shield tape/concentric neutral, binder tape and covered with low smoke zero halogen jacket or PE jacket. The cable shall be rated for use on the MBTA 15 kV system in accordance with MBTA Standard Specifications (reference number to be advised).
- C. Conductor Shield
 - 1. Conductor shield shall be an extruded layer of semi-conducting EPR thermosetting compound applied directly over the conductor and shall have a volume resistivity not in excess of 100-ohm meters at 90°C.
 - 2. The compound shall have a minimum elongation after an air oven test at 136°C for 168 hours of 100% and a brittleness temperature not warmer than minus 40°C.
- D. Insulation
 - 1. Insulation shall be a red colored flexible thermosetting dielectric based on an ethylene-propylene elastomer. The ethylene content of the elastomer used in the insulation compound shall not exceed 72% by weight of ethylene nor contain polyethylene.
 - a. The insulation shall be compounded by the cable manufacturer in their own facility using a closed system.
 - b. Ingredients shall be mixed, screened through a 120 mesh screen pack and then treated with an accelerator or cross linking agent to insure complete blending and uniformity of the final compound.
- E. Insulation Thickness
 - 1. The minimum average insulation thickness shall be as specified. The minimum thickness at a cross-section of the insulation shall not be less than 90% of the specified minimum average thickness.

Minimum Average Insulation Thickness, mils		5 Minute AC Withstand kV		15 Minute AC Withstand kV	
100%	133%	100%	133%	100%	133%
175	220	35	44	70	80

F. Insulation Screen

- G. The insulation screen shall be an extruded semiconducting EPR compound. The extruded shield must be clean stripping and have a peel strength from the insulation between 6 and 18 pounds per half-inch width.
- H. The thickness of the insulation screen shall be per AEIC standards, and shall be continuously printed with contrasting colored ink, "semiconducting- remove when splicing or terminating."
- I. Metallic Shield/Concentric Neutral
 - 1. The insulation semiconducting shield shall be covered with an uncoated copper tape. The uncoated copper tape shall be applied helically with 12.5% overlap.
 - 2. A concentric neutral comprising flat copper straps or metallic shield shall be applied over the bare copper tape.
- J. Jacket
 - 1. A low smoke zero halogen thermoplastic jacket shall be extruded over the copper tape shield/concentric neutral. The jacket color shall be black.
 - 2. An identifying legend shall be printed on the jacket in contrasting ink with the following information: manufacturer, plant number, conductor size, conductor material, EPR, UL type MV- 105, voltage, insulation thickness and year of manufacture. Indent printing may be substituted for ink marking.

2.4 STRESS CONES

- A. Stress relief cones shall be manufactured by G & W Electric Specialty Co., Thomas & Betts, Raychem, or approved equal. Cable manufacturer shall recommend the cable terminations for use with the cable. DB Entity shall submit proposed cable terminations.
- B. Connectors shall be long barrel compression type.
- C. Cable terminations shall be rated at 15 kV phase to phase.

2.5 FIRE PROOFING TAPE

- A. Fire proofing tape shall be manufactured by 3M Company, Scotch Brand 77; Plymouth Brand Ply-Are; Elastimold, fire and arc proofing tape, or approved equal. Refer to MBTA Standard Specifications for further requirements. Cable manufacturer shall recommend the cable terminations for use with the cable. DB Entity shall submit proposed cable terminations.

2.6 AERIAL CABLE

- A. The messenger wire shall be high strength copperweld wire. Unless otherwise specified, the messenger size shall be based on 150 foot spans at equal elevation and heavy loading conditions or per the Design Documents and OCS pole spacing.
- B. The messenger shall be applied parallel to the cable axis and bound by a strap covered with min. 40mils of PVC. The dimensions and material for the binder strap shall be determined by the manufacturer for agency approval.
- C. The assembled cable shall be tightly wound on take-up reels so that the messenger is parallel and equal in length to the cable axis.

2.7 SOURCE QUALITY CONTROL

- A. Cable Testing
 - 1. Cable shall receive the manufacturer's standard physical and electrical tests prior to shipment from the factory. Testing, shall be in accordance with ICEA S-68-516.
 - a. Conductor resistance: In accordance with AEIC, paragraph 1.2
 - b. AC withstand (5 minutes): 15 kV - 44 kV
 - c. IR constant (at 15.6°C), minimum: 50,000 megohms/MFT
 - d. DC withstand (15 minutes): 15 kV - 80 kV

PART 3 - EXECUTION

3.1 INSTALLATION

- A. The cable installation shall be in accordance with Section 16201 and MBTA Power Division standard specifications, except as modified herein.
- B. Hardware
 - 1. Hardware shall be assembled and installed as shown on accepted drawings. Nuts shall be tightened with locknuts and cotter pins properly installed. Nuts and cotter pins shall be oriented toward the pole or downward as applicable.
 - 2. Hardware shall be inspected for missing parts and visual defects prior to installation. All metal shall be free of dirt, corrosion or damage to the galvanizing.
- C. Cable Stringing
 - 1. Cables shall be handled with care. Cables shall not be run over by vehicles or any other object that could damage the insulation or conductors. Each reel shall be examined for cuts, kinks, or other damage. Damaged portions shall be removed and replaced or repaired as directed by the MBTA.
 - 2. Temporary guard structures shall be installed as required to maintain adequate clearance over roads and other lines.

3. Scrap materials such as timbers or other supports, shall be gathered up and disposed of in a manner satisfactory to the MBTA. The scrap cable pieces shall be salvaged and returned to the MBTA.
4. The cable shall be inspected continuously as it leaves the reel. If severe cuts are detected, the stringing operation shall be stopped until the damage is repaired. Repair sleeves may be used only with permission of the MBTA. Damaged cable shall not be installed without re
5. No splices shall be permitted in spans over road crossings. In other spans, only one splice per span will be permitted in each wire and this splice shall not be within 10 feet of any structure. Splices shall not be pulled through stringing sheaves or sagging blocks.
6. Stringing tension shall be adjusted to correspond to the conductor temperature as recommended by the manufacturer. The conductor temperature shall be measured after taping a bulb type thermometer in contact with the bare conductor and shading the thermometer from direct sunlight. The DB Entity shall record conductor temperature and tension at each end of the cable length and any temperature variations during sagging operation. These records shall be retained and copies submitted daily to the MBTA. All cables in the same span, whether existing or new, shall be sagged evenly. The DB Entity shall correct any cable length installed at incorrect tension.
7. All equipment such as sheaves, clamps, pulling devices, and tension stringing equipment shall be in good condition. Any such equipment that, in the opinion of the MBTA could result in damage to the cables shall be removed from the work site.
8. Stringing blocks shall be properly mounted on the pole or crossarm in such a manner that no binding shall occur while stringing. Stringing blocks that are not properly maintained shall not be used and shall be removed from the job site.

D. Aerial Cable Splicing and Terminating

1. The DB Entity shall splice the aerial cables as described herein.
2. In order to obtain optimum electrical contact and adequate insulation at the points of connection of each cable, only the most highly skilled cable splicers shall be employed. Cable splicers shall have experience in making splices of similar cables for similar applications. The DB Entity shall submit the name of the individual, with the number of years and type of experience on similar projects. The DB Entity shall obtain prior approval of all individuals who will be making splices.
3. Each splicer shall be accepted for the job by the MBTA prior to any splicing activities. The MBTA may request the splicer to make test splices in the presence of the MBTA before the acceptance is granted.
4. All faulty, imperfect, or damaged splices found during or after installation, shall be removed and replaced. New splices shall be subject to the same tests as are required for the cables after initial installation.
5. The DB Entity shall splice the aerial cables using a full tension compression type connector recommended by the cable manufacturer for the conductor size and expected service conditions and shall cover the joint and seal the cable insulation using heat shrinkable insulating tubing.
6. Full tension cable splices shall be installed with the cable laid out in a straight line for approximately 10 feet on each side of the connection.
7. Ends of the aerial cable shall be sealed or terminated at equipment as shown on the Design Documents.

- E. Stress Cones
 - 1. Stress relief cones shall be made at cable terminations in 15 kV switchgear, at transformers, outdoor load centers and 15 kV switches.
 - 2. Terminations shall be made in accordance with cable manufacturer's instructions, with high-voltage, ozone-resistant self-fusing tape.
 - 3. For Utility infeed cables, ring feeder cables and unit substation feeder cables, the shields shall only be grounded at one end. The grounded ends shall be as shown in the Design Documents. The shield at the opposite end of each cable shall be pulled back and insulated for possible future connection if required.
- F. Splices will not be permitted in the 15 kV cable, except at designated manholes.
- G. Splicing procedures, if allowed, shall be in accordance with the manufacturer's instructions.
- H. Fireproofing of Cables
 - 1. All terminations and open cables (cables in manholes and junction boxes) shall be fireproofed with fire proofing tape.
 - 2. All splices shall be wrapped with fire proofing tape.
- I. Cable Identification Tags
 - 1. Install standard cable tags on all feeder cables at the feeder tap locations. The aerial cable tag shall be the standard MBTA embossed aluminum tag and will identify the power section. The cable tag in switch boxes shall identify the cable number as described in the Mandatory Specifications and to MBTA Standards of cable identification.

3.3 TESTING

- A. General
 - 1. The DB Entity shall provide all instruments, materials, and labor required for tests specified herein on the dc traction feeder cable furnished and installed for the Project.
 - 2. The DB Entity shall formulate an overall test program for the installation, which shall include, but not be limited to, the tests specified in this Section to ensure equipment and material compliance with the relevant standards, this specification and satisfactory and reliable performance in actual intended operation.
- B. Conditions for Tests
 - 1. Prior to testing of any cable and the installation, the following conditions shall be fulfilled by the DB Entity:
 - a. The DB Entity shall have in his possession, all the shop drawings duly accepted by the MBTA.
 - b. The DB Entity shall have submitted testing procedures for the MBTA's acceptance at least 45 days in advance of the testing.
- C. Witnessing Tests
 - 1. The MBTA will witness complete field- testing on all cable installations.

2. Responsibility

- a. The DB Entity shall assume full responsibility during field-testing of all cable installation provided under the Contract Documents. Should there be any loss or damage to such cable or installation as a result of these tests, the DB Entity shall be fully responsible for replacing the damaged cable. Replacement of damaged cable shall include all costs, including, but not limited to, removal of damaged cable, furnishing of, transportation of, and installation of replacement cable.

D. Rejection and Retesting

1. Failure of cable or splice to withstand tests or to meet ratings shall be sufficient grounds for rejection of the item tested.
2. Any cable or splice rejected shall be retested in the presence of the MBTA after rectification.
3. If it is not possible to rectify rejected cable to the satisfaction of the MBTA, new cable shall be installed.

E. Costs of Tests

The price for conducting all field tests and checkouts in the presence of the MBTA, including entire cost of rectification, retesting, and/or supplying of new items shall be deemed to be included in the Contract Price.

F. Field Tests

1. All DB Entity installed cables shall be tested to ascertain that the cable insulation has not been impaired during installation, that splices and terminations are properly made, and demonstrate that the integrity of the cable system prior to energization is adequate.
2. The DB Entity shall perform continuity tests, insulation resistance tests, high-potential tests on each cable installed. Each circuit shall be tested separately while other equipment is grounded.
3. Tests after cable installation shall be performed with latest NETA-ATS by the independent test company. Refer to Mandatory Specifications 16495 and 16311 for requirements.
4. Independent testing company shall submit testing procedure a minimum of four (4) weeks prior to testing and written reports no later than two (2) weeks after testing was performed.

APPENDIX A

EVERSOURCE MATERIAL SPECIFICATION – M1601

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION	M1601
Revised 7/27/09		Revision #5 Page 1 of 9

M1601R5

*** Supersedes: BECO E2.9-27.4 and COM 1-0696, 2-0196, & 5-0385 ***

#2 AWG to 1000 KCMIL CONCENTRIC NEUTRAL JACKETED CABLES
RATED 5 - 35 kV

1.0 Scope

These Specifications cover single conductor "Tree Retardant" Crosslinked Polyethylene Insulated (TRXLP) and Ethylene Propylene Rubber (EP Rubber or EPR) Insulated Concentric Neutral Jacketed Cables having either a "standard" or "reduced" overall diameter. These Cables shall be suitable for installation in underground ducts and direct burial in earth in wet and dry locations. The operating voltages and system BIL levels shall be as follows:

<u>Cable Voltage Rating</u>	<u>System Voltage</u>	<u>System BIL</u>
5 kV	2.4/4.16 kV & below	65 kV
15 kV	8.0/13.8 kV & below	110 kV
25 kV (NSTAR South)	13.2/22.9 kV	150 kV
25 kV (NSTAR North)	13.8/24.0 kV	125 kV

- The general system category is in accordance with Table 4-4, Note C of ANSI ICEA S-94-649 (i.e., 100% level).
- 35 kV rated cable will be used at the 13.2/22.9 kV voltage level

2.0 General

2.1 The cable shall be manufactured and tested in accordance with the latest edition of the ANSI/ICEA Standard S-94-649 "Standard for Concentric Neutral Cables Rated 5 through 46 kV" and AEIC Specification CS-8 except as otherwise required by this material specification.

2.2 If a conflict occurs between any of the Standards, Specifications and Publications referenced herein, they shall supersede each other in the following order of priority, except that the referenced AEIC Specification shall take priority over ICEA/ANSI for the Materials Qualification Test.

- A. NSTAR Material Specification M1601 R5
- B. ANSI/ICEA S-94-649
- C. AEIC CS8

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION	M1601
Revised 7/27/09		Revision #5 Page 2 of 9

2.0 General, cont'd

Conductors shall be in accordance with the following, as specified by the Purchase Order:

Aluminum

- #1 AWG – 1/0 AWG Solid Aluminum
- 4/0 AWG – 1000 kcmil, Class B Compressed Stranded Aluminum

Copper

- #2 AWG – 4/0 AWG, Class B Compressed Stranded Bare Copper
- 250 kcmil - 1000 kcmil, Compact Round Stranded Bare Annealed Copper

3.0 Conductor Shield (Stress Control Layer)

For cables having compact round conductors, the manufacturer may reduce the conductor shield thickness in accordance with the referenced ANSI/ICEA Standard, paragraph 3.2.1.

4.0 Insulation

- 4.1 Insulation materials shall be qualified by the manufacturer in accordance with AEIC CS8 and specifically approved by the Company. Cables shall have either TRXLP or EPR insulation as specified in the cable ordering specifications on the purchase order. Specific compound or formulation shall be subject to Company approval. AEIC Qualification Long Form Test Report shall be submitted for this approval. Compound supplier and formulation must also be provided and is not subject to change without Company authorization.
- 4.2 The insulation thickness and diameter over the insulation for #2 AWG, #1 AWG, 1/0 AWG, 4/0 AWG, 250 kcmil, 500 kcmil, 750 kcmil and 1000 kcmil 5kV - 35 kV "standard diameter" cables shall be in accordance with the referenced ANSI/ICEA Standard. The 133% level of insulation shall be furnished for #2 AWG & #1 AWG 15 kV cables and 4/0 AWG 5 kV cables while all other 5 kV – 35kV cables shall have the 100% level of insulation.

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION	M1601
Revised 7/27/09		Revision #5 Page 3 of 9

4.0 Insulation, cont'd

4.3 The insulation thickness for 1000 kcmil copper "standard diameter" 15kV and 25 kV cables having the 100% level of insulation shall be in accordance with the referenced ANSI/ICEA Standard except that the diameter over the insulation for the 25kV cable shall be 1.605" minimum to 1.700" maximum.

4.4 The Minimum, Maximum and Nominal Insulation Thickness and diameter over the insulation for "reduced" diameter" cables shall be in accordance with the following:

<u>Conductor Size/ Voltage Rating</u>	<u>Minimum Point</u>	<u>Maximum Point</u>	<u>Nominal</u>
350 - 700 kcmil, 15 kV**	0.155"	0.195"	0.165"
350 - 700 kcmil, 25 kV**	0.230"	0.275"	0.240"

Diameters over the Insulation for "Reduced Diameter" Cables

<u>Conductor-Voltage, Ins. Tk</u>	<u>Minimum</u>	<u>Maximum</u>
350 kcmil cpt-15 kV, 0.165" Nom.**	0.965"	1.050"
500 kcmil cpt-15 kV, 0.165" Nom.**	1.070"	1.155"
700 kcmil cpt-15 kV, 0.165" Nom.**	1.235"	1.325"
350 kcmil cpt-25 kV, 0.240" Nom.**	1.110"	1.195"
500 kcmil cpt-25 kV, 0.240" Nom.**	1.235"	1.325"
700 kcmil cpt-25 kV, 0.240" Nom.**	1.385"	1.480"

** Insulation and jacket thickness have been reduced to fit into existing conduit

5.0 Extruded Insulation Shield for 15kV to 35kV Cables

5.1 The Insulation Shield for 15 kV to 35 kV rated cables shall comply with the referenced ANSI/ICEA Standard except that the Thickness and Indent Requirements for all 250 kcmil – 1000 kcmil copper conductor cables shall be as follows: (The Minimum Point Thickness does not apply to locations at metallic shield indents)

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION 	M1601
Revised 7/27/09		Revision #5 Page 4 of 9

5.0 Extruded Insulation Shield for 15kV to 35kV Cables – cont'd

<u>Minimum Point</u>	<u>Maximum Point</u>	<u>Maximum Indent</u>
0.024"	0.048"	0.015"

5.2 Metallic Shield grooves or indents on the outer surface of the insulation shield shall not appear on the outer surface of TRXLP cables and shall not exceed a depth of 0.003" on EPR cables.

6.0 Semi – Conducting Fabric Tape Insulation Shield (5 kV Cables Only)

6.1 For 5 kV rated cables only, the insulation shield shall be a black semi – conducting fabric tape that is conspicuously labeled "semi – conducting" over its entire length. The tape shall be applied so that it can be removed without leaving traces of semi conducting material on the underlying insulation. The manufacturer shall not apply a semi-conducting coating or paint to the surface of the underlying insulation.

6.2 The semi – conducting tape insulation shall not protrude or indent inward toward the conductor from the outer surface of the insulation by more than 0.005" on EPR cables.

7.0 Marker Tape

Cables having a "reduced" overall diameter shall have the Company Name and Year of Manufacture durably applied to a longitudinal, non-hydroscopic marker tape applied directly over the insulation shield. This marker tape may be applied to, but is not required for, cables having a "standard" overall diameter.

8.0 Concentric Neutral

8.1 The concentric neutral for #2 AWG copper and #1 AWG - 1000 kcmil aluminum cables shall consist of a serving of round annealed bare copper wires in accordance with the following table:

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION 	M1601
Revised 7/27/09		Revision #5 Page 5 of 9

8.0 Concentric Neutral- cont'd

<u>Conductor Size & Voltage Rating</u>	<u>Concentric Neutral X-Section (Appx) Equivalent</u>	<u>Concentric Wires Number & Size</u>
15 kV, #2 AWG Copper	#2 AWG Cu	16 - #14 AWG
15 kV, #1 AWG Aluminum	#4 AWG Cu #3 AWG Cu*	10 - #14 AWG 13 - #14 AWG*
15 kV, 4/0 AWG Aluminum	#3 AWG Cu	12 - #14 AWG
25 kV 1/0 AWG Aluminum	#2 AWG Cu 24.66 kcmil Cu **	16 - #14 AWG 6 - #14 AWG**
25 kV 500 kcmil Aluminum	1/0 AWG Cu	16 - #12 AWG
35 kV 1000 kcmil Aluminum	258.5 kcmil Cu	25 - #10 AWG
* Acceptable Alternative	**When specifically Specified	

8.2 The concentric neutral for 4/0 AWG - 1000 kcmil copper cables shall consist of flat annealed bare or tinned copper straps. The concentric neutral cross section area shall be equivalent to #2 AWG Copper for 4/0 AWG - 500 kcmil cables and 1/0 AWG copper for 700 kcmil - 1000 kcmil cables.

9.0 Jacket

9.1 The jacket thickness for "standard" and "reduced" diameter cables, as measured over the round wires or flat straps shall be in accordance with the following, unless otherwise specified by the Company's Purchase Order.

<u>Conductor-Voltage Rating</u>	<u>Overall Diameter</u>	<u>Minimum Point Thickness</u>	<u>Maximum Point Thickness</u>
4/0 - 500 kcmil - 5 kV	Standard	0.040"	0.075"
#2-750 kcmil-15 kV	Standard	0.045"	0.080"
1000 kcmil-15kV, 25 kV, & 35 kV	Standard	0.070"	0.120"
350-700 kcmil-15 kV & 25kV**	Reduced	0.025"	0.050"

9.2 Jackets over round wire concentric neutral wires for "standard" diameter cables shall be extruded to fill. The material shall be linear low-density polyethylene.

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION	M1601
Revised 7/27/09		Revision #5 Page 6 of 9

- 9.3 Jackets over flat strap concentric neutral wires for "standard" diameter cables shall be sleeved and vacuum drawn to, as much as practical, fill the spaces between the flat straps. The portion of jacket material between the flat straps that is in contact with the insulation shield shall be free stripping. The material shall be linear low-density polyethylene.
- 9.4 Jacket material for low smoke cables (specified in the ordering specs on purchase order) shall be a black, non-halogen, flame retardant, thermoplastic, low smoke, low corrosive and low toxic compound.
- 9.5 Jackets for "reduced" diameter cables shall be extruded to overlay the underlying flat straps, without a separator tape over the flat straps. The material shall be a high temperature, high tensile strength, and abrasion resistant compound such as a polyethylene/polypropylene blend that has been specifically approved by the Company.
- 9.6 If the diameter over the insulation and/or concentric neutral of a particular length(s) of single conductor cable is such that the maximum diameter requirements of Section 11.0 of this Specification cannot be met, the manufacturer may seek specific approval from the Company to make appropriate adjustments in the jacket thickness of cables having either a "standard" or "reduced" overall diameter.
- 9.7 The outer surface of all jackets shall be ink indent printed (or approved equal) with the information required by Part 8 of the referenced ANSI/ICES Standard. Jackets for all #2 AWG copper, #1 AWG & 4/0 AWG aluminum conductor 15 kV cables and all aluminum conductor 25 kV - 35 kV cables shall have three equally spaced red stripes extruded along the length of the cable. These stripes shall be approximately 0.3" wide and 5 mil deep and shall not affect the jacket integrity.
- 9.8 The outer jacket surface of one single conductor cable on each parallel lay or triplexed reel put up and all single cable per reel put ups shall have ink indented (or approved equal) sequential footage markings.
- 9.9 The outer jacket surface of each single conductor cable of a parallel lay or triplexed reel put up shall be ink indent printed with **1 1 1**, **2 2 2**, and **3 3 3** respectively for phase identification.
- 9.10 The outer jacket surface of each cable on the reel shall be ink indent printed with the name NSTAR at 2 foot intervals. This requirement applies

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION	M1601
Revised 7/27/09		Revision #5 Page 7 of 9

to all 15 & 25 kV, cables, 250 kcmil and larger and any other cables as may be specified on the purchase order.

- 9.11 The outer jacket of each cable on the reel of low smoke cables shall have 3 equally spaced yellow stripes for identification.

10.0 Maximum Cable Diameters

To facilitate installation of three single conductor triplexed or paralleled cables in existing conduit, the maximum overall diameter of the single conductor cable shall not exceed the following:

<u>Conductor-Voltage, Ins. Tk</u>	<u>Maximum Cable Diameter</u>
4/0 AWG-5kV, 0.115" Nom	1.03"
500 kcmil-5kV, 0.090" Nom.	1.21"

1000 kcmil str -35 kV, 0.345" Nom.	2.45"

** Insulation and jacket thickness have been reduced to fit into existing conduit

11.0 Drawings

Drawings shall be submitted for approval. Drawing details shall include reference to applicable NSTAR and industry specifications, NSTAR cat id, diameters of individual layers and overall diameter for triplexed assemblies. Conductor or shield wire Stranding compressed/compact and diameters.

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION	M1601
Revised 7/27/09		Revision #5 Page 8 of 9

12.0 Factory Tests

- 12.1 The Manufacturer shall satisfactorily complete all tests required by this specification and all referenced industry Standards, Specifications and Publications. The 5 minute AC withstand production test for all cables and the partial discharge test for 15 kV – 35 kV partial discharge free cables shall be performed in accordance with referenced ANSI/ICEA Standard. The test voltage levels shall be at the 133% voltage rating level for the #2 - #1 AWG conductor sizes and at the 100% voltage rating level for all 1/0 - 1000 kcmil cables (i.e., both “*standard diameter*” and “*reduced diameter*”).
- 12.2 The 5 kV cables having a semi – conducting fabric tape insulation shield shall be tested in accordance with the referenced ICEA/ANSI Standard and AEIC Specification except that maximum level of partial discharge shall be 5 Pico coulombs at 4.8 kV (2X the system voltage to ground) rather than the 200 volts/mil of nominal insulation thickness required for cables having an extruded insulation shield.
- 12.3 The manufacturer shall furnish a certified certificate of compliance stating that each shipping length has been tested in accordance with this specification and that the results of the tests comply with this specification and all applicable industry Standards, Specifications and Publications. The certificate of compliance shall include the information required by AEIC CS8 (except that gross tare and net weight may be omitted), the Company Stock Code and the starting and ending sequential footage marks for each reel.
- 12.4 The Manufacturer shall maintain a paper and/or electronic file of Certified Test Reports in accordance with the referenced AEIC Specification for a minimum of 7 years after the date of shipment. These Certified test reports shall be available to the Company upon request.

13.0 Packaging

- 13.1 All copper conductor cables shall be packaged with one cable per reel or three cables in a triplexed configuration, on steel reels unless otherwise specified. The reels shall have a maximum flange diameter of 84 inches and a maximum width of 57 inches. The maximum width shall include the arbor hub, bolts, and protruding ends. The trailing end of triplexed cables

Issued 16-Aug-00	MATERIAL STANDARD ELECTRIC OPERATIONS ORGANIZATION	M1601
Revised 7/27/09		Revision #5 Page 9 of 9

shall protrude through an opening in the drum rather an opening in the reel flange. The maximum weight of cable on the reel shall not exceed 16,000 lbs.

13.2 Aluminum conductor cables shall be packaged with one cable per reel or three cables in a parallel put up on wood reels unless otherwise specified.

13.3 The trailing end of all cables shall be tied to reel drum using double rope with two half-hitches spaced two feet apart. Duct tape shall be wrapped over the jacket in the area where the rope is to be applied to prevent slippage. The assembled half - hitches shall be covered with an additional wrapping of duct tape and a tie down rope should be covered by a protective sleeve until it is clear of the drum opening. Use 1/4" 3 Ply Polypropylene Rope, Super Danline manufactured by Tubbs Cordage or approved equal.

13.4 All reels shall have a weatherproof tag or marking showing all information required by AEIC CS8, the Company cat id and the starting and ending sequential footage marks for reel of triplexed or parallel lay cable

14.0 Cable End Seals

Cable ends shall be sealed with sealing mastic and heat shrink caps or approved equal to prevent the entry of moisture.

15.0 Exceptions

If the manufacturer wishes to take exceptions to provisions of this specification or offer alternatives, his proposal shall clearly describe his exceptions and/or recommended alternates.

16.0 Delivery

Shipping lengths and delivery location shall be specified on the Company's Purchase Order.

Approved by: Amin Jessa
Director, Distribution Engineering

END OF SECTION

SECTION 16121

INSULATED CONDUCTORS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies furnishing and delivery of insulated conductors for use in feeder taps, jumpers and other assemblies as part of an overhead contact system with a nominal voltage of 600 volts dc as indicated in Section 11.

1.2 REFERENCES

- A. Insulated conductors shall be manufactured and tested in accordance with the pertinent provisions of the most current applicable standards of the American Society for Testing and Materials (ASTM), Insulated Cable Engineers Association (ICEA), National Electrical Manufacturer's Association (NEMA), National Electric Safety Code (NECS), National Electric Code (NEC), Association of American Railroads (AAR), and other recognized standards including, but not limited to those listed below:

ICEA No. S-68-516/NEMA No. WC8-1976 - Standards Publication for Ethylene-Propylene Rubber Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy

ASTM-B8 - Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-hard or Soft

ASTM-B33 - Standard Specification for Tinned Soft or Annealed Copper Wire for Electrical Purposes

ASTM-B172 - Standard Specification for Rope-Lay-Stranded Copper having Bunch-Stranded Members for Electrical Conductors

ASTM-B173 - Rope-Lay-Stranded Copper Conductors having Concentric-Stranded Members for Electrical Conductors

ASTM-B174 - Specification for Bunch-Stranded Copper Conductors for Electrical Conductors

NEMA WC26 - Wire and Cable Packaging

One copy each of the above standards shall be furnished to the MBTA for their use and permanent record.

1.3 SUBMITTALS

- A. The following information shall be submitted in accordance with Volume 2 Technical Provisions Subsection 2.8, Construction Submittal Requirements.
1. Shop drawings, catalog cuts, and other forms of descriptive data delineating the construction of the cables specified herein.
 2. Special storage instructions, if applicable.
 3. Recommended splicing, repair materials and procedures.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Shipping shall take place in conformance with appropriate industry standards for packing, sealing and shipping. The DB Entity shall ensure that all materials furnished are suitably packaged and protected against damage during delivery and transportation. All conductors shall be shipped on reels, suitable for the weight of the conductors and shall be protected from damage. The diameter of drum shall be

sufficiently large so as to minimize difficulty with waves or kinks when the conductor is strung.

- B. The conductors shall be handled and otherwise used in accordance with the manufacturer's instructions, so as to ensure that the products are not damaged or misused prior to installation.
- C. Any damage to the conductors in transit shall be the DB Entity 's responsibility, and all repairs and replacements shall be accomplished by the DB Entity at no cost to the MBTA.
- D. Each reel shall consist of one continuous, unspliced conductor and shall have the required length of conductor within a tolerance of plus 50 feet and minus zero feet.
- E. Each reel shall have a strong, weatherproof tag or marker securely fastened to it, showing the size and type of conductor as well as the ASTM designation, name and mark of the manufacturer, total reel length, weight and manufacturer's special instructions.
- F. Reels shall be tagged with material description and purchase order number.

1.5 WARRANTY

- A. The DB Entity shall guarantee that the cable furnished under this Contract is of first-class material and workmanship throughout and agrees to replace any length of cable failing during normal and proper use, within one year of date of placing in service which shows defects of material or workmanship, provided, in each case, that immediate written notice of such failure is given to the MBTA with all reasonable opportunity to inspect such failure.
- B. The date of placing in service shall be interpreted as the date on which operating voltage was first applied.

PART 2 - PRODUCTS

2.1 4/0 AWG, EXTRA FLEXIBLE, INSULATED CONDUCTOR

- A. Cable shall be used for feeder tap connections on an overhead contact system with nominal voltage of 600V. The cable shall be in accordance with MBTA Specification P-179, except as modified herein, which shall be included as Appendix A to this Section.
- B. The cable conductor shall be single conductor, black, extra flexible ethylene-propylene rubber insulated, neoprene or hypalon jacketed in accordance with applicable requirements of ICEA No. S-68-516/NEMA No. WC8-1976, 5/64 inch insulation and 3/64 inch jacket and rated 1,000 volts, 90°C.
- C. The conductors shall be 4/0 AWG, 259 strands minimum, tinned copper in accordance with ASTM-B33 with Class H stranding as specified in ASTM-B173.
- D. The cable shall be marked at intervals of no more than 36 inches to show manufacturer's name, year of manufacture, AWG size, voltage class, type and thickness of insulation (mils), and type and thickness of jacket (mils).

2.2 500 KCMIL INSULATED CONDUCTOR

- A. Cable shall be used for feeder tap connections on an overhead contact system with nominal voltage of 600 volts. The cable shall be in accordance with MBTA Standard Specification P-25A, except as modified herein, which shall be included as Appendix B to this Section.

2.3 1000 KCMIL INSULATED CONDUCTOR

- A. Cable shall be used as feeder cable for supplying power to the rail vehicles for an overhead contact system

with nominal voltage of 600 volts. The cable shall be in accordance with MBTA Standard Specification P-118A, except as modified herein, which shall be included as Appendix B to this Section.

2.4 NO. 2 AWG INSULATED CONDUCTOR

- A. Cable shall be used for track switch heater connections for an overhead contact system with nominal voltage of 600 volts. The cable shall be in accordance with MBTA Specifications for 2,000 volt low smoke cable except as modified herein, which shall be included as Appendix B to this Section.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Insulated conductors shall be installed either separately or as part of one or more assemblies.

END OF SECTION

SECTION 16122

TROLLEY AND MESSENGER WIRE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies furnishing and delivery of No. 4/0 AWG grooved bronze trolley wire conforming to ASTM B9 for use in an overhead contact system with a nominal voltage of 600 volts direct current, as indicated in Technical Provision 11.1 Traction Power. Trolley wire shall conform to MBTA Standard Specification P-102B with exception of the material makeup being Cu Mg as defined herein and other provisions within this specification.
- B. This section also specifies furnishing and delivery of 4/0 Copperweld Type EK messenger wire for use in an overhead contact system with a nominal voltage of 600 volts dc as indicated in Technical Provision 11.1 Traction Power System. Messenger wire is to be used for catenary suspension of a contact wire and shall conform to MBTA Standard Specification P-178 and this specification.

1.2 REFERENCES

- A. Conductors shall be manufactured and tested in accordance with the pertinent provisions of the applicable standards of the American Society for Testing and Materials (ASTM), Insulated Power Cable MBTAs Association (IPCEA), National Electrical Manufacturers Association (NEMA), National Electrical Safety Code (NESC), Institute of Electrical and Electronics Engineers (IEEE), and National Electric Code (NEC), and other recognized standards including, but not limited to, those listed below:
 - 1. ASTM-B9 - Specification for Bronze Trolley Wire
 - 2. ASTM-B193 - Resistivity of Electrical Conductor Materials, Test Method
 - 3. ASTM-B229 – Standard Specification for Concentric-Lay-Stranded Copper and Copper-Clad Steel Composite Conductors
 - 4. ASTM-B258 - Standard Nominal Diameters of Cross-Sectional Areas of AWG Sizes of Solid Round Wires used as Electrical Conductors
 - 5. IEEE Standard for Identification of Contact Wire used in Overhead Contact Systems 1896-2016

1.3 SUBMITTALS

- A. The following information shall be submitted in accordance with Section 2.
 - 1. The DB Entity shall submit shop drawings prior to trolley wire manufacture, which shall include, but not be limited to, the following:
 - a. Physical Characteristics, chemical content and Parameters
 - b. Size
 - c. Type
 - d. Material
 - e. Dimensions of wire
 - f. Overall diameter
 - g. Cross section area

- h. Weight per foot
 - i. Rated breaking strength
 - 2. Electrical Characteristics
 - a. Rated current carrying size (AWG/ kcmils)
 - b. Resistance per unit length
 - B. The DB Entity shall submit certification verifying that the wire has been designed, manufactured, inspected and tested in accordance with applicable portions of the referenced standards, these Mandatory Specifications, and Section 11.
 - C. The DB Entity shall submit three (3) certified copies of test reports for the specific conductors furnished, which shall include the following:
 - 1. Initial and Final Modulus of Elasticity (E)
 - 2. Coefficient of Thermal Expansion (CTE)
 - 3. Yield stress
 - 4. Hardness values
 - 5. Chemical content
 - 6. Breaking strength
 - D. One copy of ASTM-B9 shall be furnished to the Authority for their use and permanent record.

1.4 DELIVERY, STORAGE, AND HANDLING OF TROLLEY WIRE

- A. Shipping shall take place in conformance with appropriate industry standards for packing, sealing and shipping. The DB Entity shall ensure that all trolley wire furnished is suitably packaged and protected against damage during delivery and transportation. The wire shall be wound on the reel without crossing itself and shall lay parallel and tight against each coil. The vertical axis of the trolley wire, when installed on the reel shall be at 90° to the axis of the reel with the small lobe on the outside facing up. Vertical axis deviation in excess of 5° will be cause for rejection of the wire and reel. All trolley wire shall be shipped on reels with designated lengths and shall be protected from damage. Reels shall be constructed of wood for insulation purpose and the diameter of reel rims shall be 46 inches and have sufficient clearance between the top of the rim and the top coil of wire to prevent damage to the wire when the reels are rolled about and shall have sufficient strength to prevent the reel from bulging out or collapsing. Each disc or head of the reel shall be provided with an iron plate or cast iron bushing in the center of which shall be a circular hole not less than 2-1/8" in diameter. The plates or bushings shall be fastened to the head of the reel by means of bolts through the head. The contact wire on the reel shall be electrically insulated by the construction of the reel from any metallic hardware used in the reel construction. The inner end of the wire shall be securely fastened to the reel so that it will not loosen when the inner layers of wire are being strung out during installation.
- B. Trolley wire reel lengths shall be determined by the DB Entity so that during installation these reel lengths may be cut without waste. Each reel shall have the length of contact wire on it marked clearly and in indelible ink or paint on the side of the reel.
- C. The contact wire shall be handled and otherwise used in accordance with the manufacturer's instructions, so as to ensure that the products are not damaged or misused prior to installation.
- D. Contact wire shall have identifying marks placed on the upper lobe as spelled out in IEEE Standard 1896-2016. The agency mark shall be: MBTA. This is included for the identification of the type of wire and for theft prevention.

- E. Any damage to the wire in transit will be the DB Entity 's responsibility, and all repairs and replacements shall be undertaken by the DB Entity at no cost to the Authority.
- F. A stripe in any contrasting color approximately one inch wide shall be painted across the outermost layer on each reel prior to shipping from manufacturing plant. Any visible conductor shift at this line, upon receipt at the job site, will be treated as indicating relative wire movement during shipment, and is cause for wire and reel rejection.
- G. Each reel shall have a strong, weatherproof tag or marker securely fastened to it, showing the wire number, length of wire on the reel and type of conductor as well as the ASTM designation, name and mark of the manufacturer, total reel weight, manufacturer's special instructions, and contract number.

1.5 DELIVERY, STORAGE, AND HANDLING OF MESSENGER WIRE

- A. Shipping shall take place in conformance with appropriate industry standards for packing, sealing and shipping. The DB Entity shall ensure that all messenger wire furnished is suitably packaged and protected against damage during delivery and transportation. The wire shall be wound on the reel without crossing itself and shall lay parallel and tight against each coil. Deviation will be cause for rejection of the wire and reel. All messenger wire shall be shipped on reels with designated lengths and shall be protected from damage. Reels shall be constructed of wood for insulation purpose and the diameter of reel rims shall be 48 inches in height, 28 inches in width overall and the inside reel drum diameter shall be 20 ¼ inches. There shall be sufficient clearance between the top of the rim and the top coil of wire to prevent damage to the wire when the reels are rolled about and shall have sufficient strength to prevent the reel from bulging out. Each disc or head of the reel shall be provided with an iron plate or cast iron bushing in the center of which shall be a circular hole not less than 3" in diameter. The plates or bushings shall be fastened to the head of the reel by means of bolts through the head as shown on MBTA Drawing SK-595 or approved equal. The messenger wire on the reel shall be electrically insulated by the construction of the reel from any metallic hardware used in the reel construction. The inner end of the wire shall be securely fastened to the reel so that it will not loosen when the inner layers of wire are being strung out during installation.
- B. Messenger wire reel lengths shall be determined by the DB Entity so that during installation, the reel lengths may be cut without waste. Each reel shall have the length of messenger wire on it marked clearly and in indelible ink or paint on the side of the reel.
- C. The messenger wire shall be handled and otherwise used in accordance with the manufacturer's instructions, so as to ensure that the products are not damaged or misused prior to installation.
- D. Any damage to the wire in transit shall be the DB Entity's responsibility, and all repairs and replacements shall be undertaken by the DB Entity at no cost to the Authority.
- E. A stripe in any contrasting color approximately one inch wide shall be painted across the outermost layer on each reel prior to shipping from manufacturing plant. Any visible conductor shift at this line, upon receipt at the job site, will be treated as indicating relative wire movement during shipment, and is cause for wire and reel rejection.
- F. Each reel shall have a strong, weatherproof tag or marker securely fastened to it, showing the wire number, length of wire on the reel and type of conductor as well as the ASTM designation, name and mark of the manufacturer, total reel weight, manufacturer's special instructions, and contract number.

1.6 WARRANTY

- A. The DB Entity shall guarantee that the wire and cable furnished under this Project are of first-class material and workmanship throughout and agrees to replace any length of cable failing during normal and proper use, within one year of date of final inspection which shows defects of material or

workmanship, provided, in each case, that immediate written notice of such failure is given to the DB Entity with all reasonable opportunity to inspect such failure.

PART 2 – PRODUCTS

2.1 TROLLEY WIRE

A. The trolley wire shall be No. 4/0 AWG grooved ASTM B9 alloy 80 magnesium-bronze trolley wire (minimum conductivity 80%) in accordance with MBTA Specification P-102B, (which is included as Appendix to this Section) except as modified herein.

1. Trolley wire shall be composed of the following elements:

(1) Magnesium (Mg) Max 0.3-Min 0.1

(2) Phosphorus (P) ≤ 0.01

(3) Others ≤ 0.1

(4) Remainder Copper (Cu)

2. Splicing of rods used in drawing down process into the finished trolley wire shall not be permitted.

3. Grooved Cu Mg 0.2 trolley wire shall incorporate identification on the upper lobe of the wire according to IEEE Standard 1896-2016.

4. Tensile properties of Cu Mg 0.2 shall meet or exceed the requirements of ASTM B9.

5. Electrical Conductivity @ 20°C shall be equal to or greater than 80% IACS.

6. Testing shall be in accordance with ASTM B9.

2.2 MESSENGER WIRE

A. The messenger wire shall be 4/0 Copperweld Type EK wire in accordance with MBTA Standard Specification P-178, except as modified herein, which is included as Appendix to this Section.

B. Messenger wire repair shall be undertaken only if strands become damaged after installation and at the acceptance and direction of the MBTA. In the event the completed messenger wire has broken strands, a preformed repair assembly may be used to contain and strengthen the messenger wire. The preformed assembly shall be of bronze wires and designed to impart the full breaking strength of the messenger wire when placed onto the messenger. Where the messenger wire cannot be repaired due to too many broken strands (three or more), the wire shall be cut and spliced with a full tension messenger wire compression splice as accepted by the MBTA.

PART 3 – EXECUTION

3.1 INSTALLATION

- A. Trolley and messenger wire shall be installed in accordance with Section 16123 – OVERHEAD CONTACT SYSTEM INSTALLATION.

END OF SECTION

SECTION 16123

OVERHEAD CONTACT SYSTEM INSTALLATION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the furnishing and installation of an overhead contact system (OCS) over all tracks to be constructed as shown and described in the DB Entity accepted Design Documents and as specified herein. Furnishing and delivery of trolley wire and messenger wire shall be in accordance with Section 16122 – TROLLEY AND MESSENGER WIRE.
- B. The work consists of the following:
1. Installation of new overhead contact system poles, back guys, pole and anchor foundations, crossbeam portal structures, structural steel, concrete, bridge attachments, sound wall supports, and all else associated with the OCS system shown and described in the DB Entity's accepted Design Documents.
 2. Installation of a new catenary overhead system, including the messenger wire, contact wire, overlaps, balance weights, constant tension springs, standard springs, cantilevers, pulloffs, span wires, deadend assemblies, insulators, catenary hangers, section insulators, special catenary system at vertical curves, pole clamps, bridge supports, suspension assemblies, cross contact clamps, jumpers and all else required for a new catenary system, as described herein and the DB Entity's accepted Design Documents.
 3. Installation of a new single contact wire system including contact wire, deadends, suspension assemblies, span wires, inclined pendulum hangers, stitch supports, balance weights, deadend tension springs, section insulators, elastic arms, cross contact clamps, jumpers, insulators, bridge supports and pulloffs, and all else as required for a new single contact wire system as described herein and the DB Entity's accepted Design Documents.
 4. Installation of new 600 volt aerial DC feeder cable and feeder tap system for the new overhead system, including disconnect switches, surge arrestors, aerial feeder cables, crossarms, messenger support ties, crossarm supports and braces, pole clamps, feeder taps, bridge ground wire system, surge arrestor ground wire system, head guys, surge arrestors, and all else required for a new aerial feeder system as described herein and the DB Entity's accepted Design Documents.
 5. Revisions to the OCS and disconnect switches on the Historic Viaduct by separating the power sections. Work to include temporarily installing catenary deadends to hold the existing OCS at Land Boulevard, removing cross taps between inbound and outbound catenary, removing common top buss of disconnect switches so that each switch and feeder tap feeds the appropriate power section, isolating the existing OCS from the new OCS at Land Boulevard with temporary section insulators and making the OCS safe to run trains from the historic Viaduct onto the new viaduct as described herein and the DB Entity's accepted Design Documents.
 6. Installation of a new 13,800 volt AC aerial cable system as indicated on the DB Entity's accepted Design Documents and as described herein and specified in Section 16120 – MEDIUM VOLTAGE POWER CABLE, including all cable with self-supporting messenger wire, pole clamps, messenger wire terminations, back guys, cable splices, messenger support ties, messenger wire splices, and all else required for a new aerial AC cable system as described herein and the DB Entity's accepted Design Documents.
 7. Installation of an aerial fiber optic cable system as described herein and in the DB Entity accepted Design Documents including all cable with supporting messenger guy wire, pole clamps,

messenger wire terminations, back guys, guy wire splices, messenger support ties, and all else required for a new aerial fiber optic cable system as described herein and the DB Entity's accepted Design Documents.

8. Installation of new traction power disconnect switches with associated cabling, supports, and hardware. Work pertaining to the 600VDC distribution and switching systems is shown on the DB Entity accepted Design Documents and as described herein and specified in Section 16120 – MEDIUM VOLTAGE POWER CABLE. Work shall include but not be limited to installation of cables, pole clamps, support structures for enclosures, cable anchors, disconnect switches in enclosures, switch box signs, cable tags, cable supports, insulated bushings, and all else required for a new traction power disconnect system as described herein and the DB Entity's accepted Design Documents.
 9. Testing of the OCS for alignment, height, stagger, tension, and performance as described herein and the DB Entity's accepted Design Documents.
 10. Testing of the OCS for electrical continuity, integrity of insulation and isolation between power sections as described herein and the DB Entity's accepted Design Documents.
- C. The DB Entity accepted Design Documents are intended to convey all work required to construct an overhead contact system. Where the plans or specifications do not exactly state the method, assembly, alignment, component or other exact direction for construction, the DB Entity shall determine what is necessary to install the OCS to obtain a fully functioning and operationally compliant system. All connections shall be verified and if dimensions are not correct, the DB Entity shall be responsible for corrections. If assemblies are inappropriately specified in the DB Entity's accepted Design Documents, the DB Entity shall install the correct assembly. It shall be the DB Entity's responsibility to design the OCS system, make the system work and construct it with the information available on the Mandatory Specifications and DB Entity's accepted Design Documents and from manufacturer's instructions and recommended practices.

1.2 REFERENCES

A. Codes and Standards

1. Standards applicable to the overhead contact system installation that have been listed in other sections of this Specification shall also apply to this section.
2. Comply with the most current provisions of the following, except as otherwise indicated. If there is a conflict between specifications and standards or between the various standards, then the most stringent requirement shall apply.
 - a. American National Standards Institute (ANSI)
 - b. National Electrical Safety Code (NESC)
 - c. Occupational Safety and Health Act of 1970 (OSHA)
 - d. National Electrical Manufacturers' Association (NEMA)
 - e. Institute of Electrical and Electronics Engineers (IEEE)
 - f. Rules and regulations of the MBTA for performing work on MBTA property.
 - g. National Electrical Testing Association, Inc. (NETA)
 - h. American Institute of Steel Construction (AISC)

1.3 SUBMITTALS

- A. The following information shall be submitted in accordance with Volume 2 Technical Provisions Subsection 2.8 “Construction Submittal Requirements.
1. Submit individual component and/or assembly drawings in detail of each component or assembly proposed. Each component or assembly shall be on its own drawing. The DB Entity may, if space provides, without cluttering or confusing the assembly, include several variations of the same assembly on one drawing. All assemblies and variations shall be clear and concise for ease of interpretation. A parts list shall be provided on the drawing in an easily readable matrix fashion that clearly identifies:
 - a. The part;
 - b. The quantity for each assembly;
 - c. The number it refers to on the drawing; and
 - d. Where the part itself can be found to review for detail.
- B. The DB Entity shall submit to the MBTA, descriptions and sketches explaining proposed methods and procedures for new OCS and trolley wire and support system installation. These submittals shall include, but not be limited to, the following:
1. Sequential phases of the work
 2. Equipment to be used
 3. Procedure for temporarily supporting new wire, if required
- C. The DB Entity shall submit a detailed sequence of work at least one month in advance and updated as frequently as need be to keep one month in advance. The sequence shall show how many crews will be working, when, where and what equipment will be utilized, and define the area of work and the proposed limits. This will be reviewed by the MBTA for reasonableness so that MBTA requirements can be evaluated and set up. An alternate plan for work shall be submitted in the event that the DB Entity is restricted from the planned location of work.
- D. The DB Entity shall utilize qualified personnel to perform all aspects of the work. Journeymen linemen, groundmen, cable splicers, and all others performing the construction of the total overhead contact system, shall be trained in the work and have adequate experience in general line work, electrical work and trolley line work. As such, only trained IBEW electrical workers shall work on the electrical system. The foreperson in charge of the work shall have experience with trolley line work and shall work closely with the DB Entity’s Catenary Engineer to direct crews for the proper and safe installation of the OCS system.

1.4 QUALITY ASSURANCE

- A. The DB Entity shall examine the condition of the overhead components and/or assemblies for condition and completeness. Parts shall be examined for missing components, broken hardware, cracks, quality workmanship, bad galvanizing, bolt and nut thread interface, lockwasher construction, shipping damage, improperly constructed components, defective castings and all else that would be considered not acceptable for use in an overhead contact system or that could potentially fail in service. Any and all bad parts shall be returned to the manufacturer for new parts which shall then be examined as stated herein. The DB Entity shall inform the MBTA of any bad parts, assemblies or components that are returned to the supplier or manufacturer. Return of components shall be done at the DB Entity’s expense and at no cost to the MBTA.
- B. General: Examine the conditions under which the components of the overhead contact system are to be installed.
- C. Notify the MBTA of conditions encountered or unforeseen, which could affect the proper and correct installation of the overhead contact system.

1.5 CATENARY ENGINEER

- A. The DB Entity shall have on their staff and dedicated to the Project, the services of a Catenary Engineer. The Catenary Engineer will provide the design of the OCS and assist the DB Entity's line construction forces with the construction of all catenary wires, aerial feeder cables, disconnect switches, surge arrestor assemblies, riser cables, feeder taps, balance weights, constant tension spring devices, pole installations, pole rake, clearance and fit issues, assembly allocations, contact wire offsets and alignments and all else required to ensure that the overhead system and components function as an integral system and provide safe and reliable operation.
- B. The Catenary Engineer shall evaluate the OCS design and make alterations and changes where warranted if conflicts arise with other systems or the catenary system itself. Due diligence and sound engineering practices must be exercised in the OCS design and in the preparation of the Design Documents and the Mandatory Specifications and in the event any discrepancies occur, the DB Entity's Catenary Engineer shall identify and make known to the Project such situations, and shall present an alternative method of construction, if required, but shall ensure compatibility and workability of the catenary system as designed and specified herein and on the DB Entity's accepted Design Documents.
- C. The Catenary Engineer shall oversee all testing of wires, cables, poles, staggers, offsets, energizing of the OCS, and certifications. The Catenary Engineer shall ensure that the system is fully functional and have the final recommendation on the worthiness and acceptability of the OCS.
- D. The DB Entity /Catenary Engineer shall bring to the attention of the MBTA any problems or incompatibilities discovered during the shop drawing process and the construction period and present a proposed method of construction if one is needed. If components utilized do not fit together or do not function to the intent of the design, the DB Entity shall fix the problem without cost to the Project. Where a situation arises that is beyond the DB Entity's ability to make a situation work, the DB Entity shall inform the MBTA of the situation and take direction.
- E. The Catenary Engineer shall be familiar with catenary systems for both transit and electric railroads and shall be intimately familiar with the MBTA's complete traction power system including catenary, underground cabling, aerial cabling, and substation operation and design. The DB Entity shall submit to the MBTA the name of the Catenary Engineer with their resume for review and approval. The Catenary Engineer shall have a minimum of 20 years of experience.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Items shall be furnished that are of the materials, design, sizes and ratings shown on the DB Entity's accepted Design Documents and as specified herein, and required by the installation specified in Sections 16122, and 16124 and required by the installation section specified in this Section.
- B. In order to ensure compatibility with MBTA requirements and the existing overhead contact system, to provide continuity and interchangeability of hardware throughout the entire MBTA overhead network. The DB Entity shall not substitute manufacturer specific components with other manufacturer's components or types of overhead hardware. DB Entity shall verify that indicated components function properly as indicated on the DB Entity's accepted Design Documents. Substitutions of "as equal" shall be per approval of the MBTA.
- C. All assemblies and components shall be installed as described in the DB Entity's accepted Design Documents and the manufacturer's installation recommendations. It is the MBTA's preference to have all OCS span wire sized to 3/8 inch for standardization of fittings.

PART 3 - EXECUTION

3.1 INSTALLATION OF POLES AND FOUNDATIONS

A. General

1. Poles shall be wide flange sections as shown on the DB Entity's accepted Design Documents. All poles shall be anchor base (unless the DB Entity elects to use direct embedded poles) and located in optimal positions along the line. These poles shall have a hot dipped galvanized protective surface.

B. Direct Buried

1. Wide flange poles shall be placed into the pole hole with either a nylon sling or the attachment of a shackle to the hole in the top of the pole. When inserted into the hole, the pole bottom shall be in the middle of the inner pipe and then oriented as indicated on the DB Entity's accepted Design Documents. It shall be raked by an amount determined by the DB Entity and secured with steel angle as described herein. Concrete at the top of the outer pipe shall be poured level. The concrete at the top of the inner pipe shall be poured and then mounded for water runoff.

C. Anchor Base

1. The pole shall be placed onto the foundation anchor bolts by using a nylon sling wrapped around the pole for lifting or with the lifting eye as previously described. When placed onto the foundation, the pole bottom shall be placed onto four bottom nuts. The four bottom anchor bolt nuts and washers shall be placed on the bolts first and then the pole set onto the bolts. The second set of nuts and washers shall then be put onto the anchor bolts and the pole raked by an amount determined by the DB Entity by adjusting the eight anchor bolt nuts. Once the pole has been properly raked and secured, the nuts shall be tightened and then jam nuts placed onto the anchor bolts and tightened against the top nut. All nuts shall be properly torqued for the size and type of bolt and nut.

D. Foundations shall be used for pole installations and back guy anchor installations where indicated on the DB Entity's accepted Design Documents.

1. Foundations shall be for anchor base poles or for back guy anchors. Size of foundation and method of construction shall be determined by the DB Entity. Direct embedded pole foundations, if used, shall consist of an outer pipe (removed after installation) and an inner pipe. Back guy anchor foundations shall consist of a concrete reinforced cylindrical foundation, a reinforcing bar cage, and protruding anchor bolts for attaching a back guy connection plate. Overall sizes and depths shall be determined by the DB Entity.
2. Pole foundations shall be drilled with a pipe or cylindrical drill which will remain in the ground during the excavation and concrete pouring process. All soil will be excavated from it by any practical means including vacuum, hand digging, auger, shovel or other method as accepted by the MBTA. Upon excavation of soil, an interior pipe will be inserted into the hole and pushed into the soil by a minimum of 12 inches. The inner pipe shall rise above the outer pipe so that the top of foundation is level with proposed top-of-rail. Both the outer and inner pipe shall be parallel and plumb.
3. Concrete shall be poured and vibrated between the inner and outer pipes to the top of the outer pipe and into the inner pipe to a depth of 24 inches. Upon completion of the concrete pour between the inner and outer pipes, the outer pipe will be carefully removed leaving the inner pipe in place. The inner pipe shall have only a 24 inch concrete pad placed into it at this point. The concrete at the top of the outer pipe shall be poured level.

4. Poles shall not be inserted into the hole or attached to the anchor bolts for 7 days minimum to allow the concrete to set up properly. Upon initial concrete setup, the pole shall be inserted into the hole, oriented to the proper position and raked. When in position, a steel angle will be welded to the pole and the inner pipe to hold the pole in position. This will also electrically connect the pole to the inner pipe which is embedded into the earth so that it will act as an electrical ground. The galvanized coating shall be removed through grinding. The securing angle iron shall be placed 6 inches below the top of the inner pipe. No span wires, cantilevers, feeder cables or other hardware shall be attached to the pole for 28 days after the inner pipe concrete pour.
6. Concrete shall then be poured and vibrated between the inner pipe and the pole and mounded up at the inner pipe to the pole to permit water runoff.
7. Excavation of a back guy anchor foundation shall be the same as for direct embedded poles except that after the outer drill pipe is in place and the soil inside of it excavated, the reinforcing cage shall then be inserted into the hole. The cage shall not sit on bare soil or touch the sides of the pole hole. Concrete block spacers shall be placed in the bottom of the hole for the cage to sit on. Concrete block spacers may be placed onto the sides of the cage to keep it from touching the sides of the outer pipe. The anchor bolts shall then be placed into the hole and the reinforcing cage and secured to the correct positions and height above the top of foundation. Reinforcing cage dimensions and size of rods shall be determined by the DB Entity.

Once the cage and anchor bolts are in place, concrete shall be poured into the hole with vibration to ensure there are no voids in the concrete. When the pour is level with the top of the foundation outer pipe, the pipe drill shall be pulled out of the hole for reuse. Great care shall be exercised so as not to disturb the cage and the anchor bolts during the outer can removal. Should they be disturbed, the DB Entity shall reset them immediately to the correct position. The top of the foundation shall have a slight slope for water runoff as shown.

Where the top of the foundation is above grade, a shorter cylindrical form shall be placed on top of the existing pour and then additional concrete placed into this form immediately after removal of the outer pipe drill. The top of the foundation shall have a slight slope for water runoff.

3.2 INSTALLATION OF INSULATORS AND HARDWARE

A. General

1. The sections following are suggested methods of installation. The DB Entity shall determine the best methods for their work.
2. Deadends with insulators shall be attached to structures and poles prior to stringing operations to prevent overstress or damage.
3. All braces, brackets, and supports shall be attached, complete to receive the OCS hardware and devices to support the conductors in their final position.
4. Care shall be exercised in joining individual hardware components to form complete assemblies.
5. Clamped and bolted connections shall be made as to prevent damage and distortion of the joined pieces.
6. Hardware pieces joined to provide flexibility of movement shall be installed to prevent excessive bonding or chafing of surfaces when movement does occur.
7. Insulators shall be cleaned before installation according to the manufacturer's recommendations. Protective coverings shall be removed and properly disposed of after the unit is installed. Only clean rags, free from abrasive material, shall be used for cleaning insulators. Wire brushes shall not be used for cleaning parts, metal or non-metal. After installation, insulator assemblies and

hardware shall be clean, bright and free from nicks or blemishes. Touch-ups to insulator surfaces shall be done in a manner accepted by the MBTA.

B. Hardware:

1. Hardware shall be inspected for quality of construction and damage. Any item that does not fit, is damaged during installation, or is found defective shall be rejected.
2. All hardware shall be installed as indicated in the DB Entity's accepted Design Documents or supplied by the DB Entity using tools and methods as recommended by the manufacturer of those components. Bolts and nuts shall be properly tightened and torqued in accordance with the manufacturer's recommendations. All bolts, excluding foundation bolts, shall be of sufficient length to protrude at least two full threads, but not more than 1/2 inch beyond the nut. Bolt ends shall not be cut off. Standard split lockwashers shall be provided.
3. All cotter pins should have each leg-opened 45° after installation unless they are humped back type in which they shall be completely inserted through the clevis pin so that the hump prevents it from backing out.

C. Connectors:

1. Current-carrying connectors shall be as shown on the DB Entity's accepted Design Documents and shall be installed in accordance with the manufacturer's recommendations. Connectors for copper or bronze wire shall be bronze and utilize silicon bronze bolts, nuts and lockwashers.
2. Bolts in bolt-type connectors shall be lubricated as recommended by the manufacturer and torqued to the manufacturer's recommendation using a calibrated torque wrench.
3. The connectors where possible, shall be factory-loaded with a corrosion inhibitor, which is made for the specific purpose.
4. Wire surfaces which are in contact with conducting surfaces of the connector shall be thoroughly wire brushed or chemically cleaned to bright metal prior to makeup and shall have an inhibitor applied. Where connectors are not factory-loaded, the same inhibitor shall be applied in the field to the connector.
5. Corrosion inhibitors shall be stable over a wide temperature range, able to adhere to cold or hot metal surfaces, water-repellent, weather resistant, and inert to copper, aluminum, zinc, tin, cadmium, steel, and neoprene rubber. Silver-bearing inhibitors shall be used except for flat lugs, sliding surfaces or where the connector manufacturer recommends omission. Silver bearing inhibitors shall be compatible with the connector and wire metal. Inhibitor for copper and bronze shall be T&B "Kopr Shield", Fargo "Fargolene", Penn-Union "Cual-Aid", Burndy "Penetrox A", or approved equivalent.

3.3 INSTALLATION OF TROLLEY AND MESSENGER WIRES

A. General

1. The method of erecting the wires shall be submitted to and accepted by the MBTA prior to erecting the wire.
2. Care shall be taken to prevent kinks in the wires. The MBTA reserves the right to reject any wire in its entirety if it is judged that any kink is non-removable and will prejudice current-collection performance.
3. Splices shall not be permitted at any location except as accepted by the MBTA.
4. Any damage to the wires shall be reported to the MBTA. Remedial action shall be indicated and recorded.

5. Stringing of the wires will start from the location shown on the DB Entity's accepted Design Documents at Land Boulevard along the new right of way. The DB Entity shall determine the starting locations and methods employed in the stringing of wires. As the wires are pulled from the reel and lifted into position on the suspension supports, sufficient tension must be maintained in each wire during stringing to ensure that under no circumstances do the wires touch the ground between support points or sag excessively.
 6. When the termination location is reached, each wire shall be tensioned above the specified final tension by 15%. This tension can be slackened to the specified erection tension right after pre-stressing the wire. Tension measuring devices shall be installed at both ends of the wire during installation and tensioning.
 7. Erection tensions shall be in accordance with tables furnished for the purpose, based on the span and temperature of the wire, as determined by the DB Entity.
 8. Wire temperatures shall be measured by digital thermometer. The probe of the thermometer shall be in intimate contact with the wire when read.
 9. A record of temperature and tension measured at both ends of the tension lengths shall be submitted to the MBTA.
 10. The contact wire and the messenger cable shall be re-tensioned, if necessary after initial installation to achieve required tension.
 11. Wire runs shall be complete from termination to termination without splicing. Where it is necessary to splice either trolley wire or messenger wire, it shall be done as described herein and at the recommendation of the manufacturer of the splice. Any wires that are to be spliced must have the expressed acceptance of the MBTA.
- B. Installation of the messenger and contact wires may be undertaken so that each wire run is installed as a variable tensioned system. Temporary hangers can be used to support the contact wire to the messenger wire. The wires shall be pre-stressed and then let off to the tensions shown on the stringing tension charts to be developed by the DB Entity. All cantilever assemblies and steady arms can then be placed perpendicular to the wires and locked in place. After all wires have been installed and when the catenary is attached to the balance weights and the weights set to the design temperature location, the pins can then be pulled from the cantilevers so that they swing into the correct position according to their along-track movement position for temperature. The cantilever position relative to the track can be checked against the tables developed by the DB Entity.
- C. Cross contact wire clamps shall be positioned on the under running wire and the center of it located in relation to the along-track movement position so that they do not bind up with the wire they are fixed with.
- D. Trolley/Messenger Wire Reels
1. The DB Entity shall dispose of the wire reels after use.
 2. The wire shall not be ordered with several lengths of wires on one reel to satisfy several runs. Wire runs shall be from a continuous length of wire on the reel. As each length is cut and removed, the length remaining on the reel may be recomputed and properly recorded both on the reel and on substantiating documentation.
 3. Care must be taken with reels so as not to disrupt the stringing operation. Damaged reels shall be set aside for repair or replacement before use.
- E. Precautions in Handling Trolley Wires
1. The wire shall be handled in such a manner that it shall not be scratched, cut, or nicked with tools or clamps.
 2. The wire shall not lie upon or be dragged across, sharp or rough surfaces.

3. Wire shall not be annealed.
4. Sharp bends shall not be put in the wires.
5. The wire shall not be marred with temporary wire or hook hangers.
6. Only approved parallel jaw clamps shall be used in tensioning all wire. The grooves of the clamps must be free from burrs, fins or roughness and the ends of the grooves must be flared (bell-shaped). Acceptable trolley wire pulling grips are MAC Products part number E0205-04, Brecknell-Willis Come-Along Clamp Number D7068 or other approved equal. Upon removal of the grip from the contact wire after pulling, there shall be no kinks, gouges, scrapes or other damage to the contact wire.
7. Vertical and lateral kinks in the wire shall be removed. Kinks shall be removed with a specific tool designed to remove kinks such as Arthur Flury Kink Remover Type XDH41, Brecknell-Willis trolley Wire Straightener Number D7252 or other approved device. In the event the device cannot completely remove the kink or wave, a rubber hammer shall be used, beating against an 18 inches long steel block with a smooth semi-circular groove, ½” radius milled out for the length of the bar. The bar shall be held to underside of the contact wire and the top shall be beaten with the hammer until the wire is straight. The deviation from the straight bottom of the contact wire over the length of the bar shall not exceed 1/32”.

F. Splicing of Trolley Wires

1. Trolley wire splices shall be MBTA standard style, ImpulseNC Bulldog Splicer as supplied by ImpulseNC, Mac Products or Phoenix or approved equal.
2. Joining and splicing of two separate pieces of contact wire may be done as follows:
 - a. Cut the wire with a bolt cutter or special cutting device designed for cutting contact wire.
 - b. Cut approximately ½” of the end of the wire off using a hack saw.
 - c. File the ends smooth so that no burrs or sharp edges are present.
 - d. Straighten ends of the wires a distance of 8” from the end.
 - e. Slide the splice over one contact wire a distance where there is approximately 1/4” of groove extending beyond the wire.
 - f. Insert the other contact wire into the splice and push down on the splice until the wires slide into the splice and butts up against the other contact wire.
 - g. Push the splice or strike the end with a hammer until the center of the splice coincides with the ends of the two contact wires.
 - h. Apply “blue Loctite” to the set screw threads and then tighten the set screws until they bottom out.

G. Splicing of Messenger Wires

1. Joining and splicing of two separate pieces of messenger wire may be done as follows:
 - a. Cut the wire with a bolt cutter or special cutting device designed for cutting Copperweld type wire. Remove any burrs or sharp edges with a file.
 - b. Full Tension Compression Splice: lay the splice against the wire and place the center of the splice at the wire end. Mark the wire at the splice end and then insert the splice over the wire and stop at the mark. Secure the splice against the wire and then insert the other wire into the splice until it butts up against the other wire inside the splice. Place hydraulic crimping device on the splice to one side of the center and make a crimp. Do the same to the other side

of center. Each crimp position shall be 180 degrees to the previous on each side of center to prevent a “banana” shape from occurring. After the first two crimps are installed, start crimping one side of the splice and then the other and follow instructions for installation of the splice by the manufacturer.

3.5 TENSION EQUIPMENT INSTALLATION

A. Balance Weights

1. Balance weights shall be used on the main line with catenary and yard leads. The weight set for the main line shall have a total weight of 2,333 lbs +/- 100 lbs for a messenger tension of 4,000 lbs and a contact wire tension of 3,000 lbs and have a pulley ratio of 3:1.

2. Mainline balance weights may be installed as follows:

They may be installed on poles at heights determined by the length from the cross contact wire clamp to the deadend pole using a slope of 1:100. The pulley assembly clamp may be adjusted higher to clear pole obstructions or gain sufficient height for pantograph clearance. Where balance weights are used on the new Lechmere Viaduct, sufficient travel distance may not be realized due to pole base parapet height. The maximum tension length under this condition may have to be shortened to compensate for reduced weight travel.

3.6 EQUIPMENT AND HARDWARE INSTALLATION

- A. As far as practical, bolts shall be installed in the various clips so that the nuts are on the same side giving uniform appearance. On curves, the nuts shall be placed on the outside of the curve to provide the best clearance to the pantograph. Lock washers shall be used and shall be completely flat after installation.
- B. All clamp ears and feed tap clamp ears and other clamps on the trolley wire shall utilize hollow hex screws to allow the passage of a trolley pole current collector shoe. Contact wire clamps shall be placed on the contact wire so that both sides of the clamp fit completely into the groove of the wire. Hollow hex screws shall be tightened with a torque wrench using torques recommended by the manufacturer of the clamp.
- C. Clamps used for pulloffs shall have the clamp body bearing against the wire so that it is on the inside of the curve pull. The clamp portion shall be on the outside of the curve.

3.7 SUPPORT, REGISTRATION AND FEEDER ASSEMBLIES

- A. All support, registration and feeder assemblies, unless specifically stated to be a certain configuration or manufacturer may be determined by the DB Entity. All components and assemblies shall be compatible with the OCS system installed by the DB Entity and interchangeable with the MBTA’s standard OCS equipment.
- B. **Stitch Support Assemblies**
 1. New Stitch Support assemblies are to be manufactured in accordance to the parts, dimensions, materials and working loads as shown on the DB Entity’s accepted Design Documents.
 2. New Stitch Support assemblies shall be installed to support and register the trolley wires at the positions and heights as shown on the DB Entity’s accepted Design Documents. If no stagger at the assembly location is stated on the DB Entity’s accepted Design Documents, the stitch shall be slightly staggered to provide an inclination. Adjacent stitch assemblies shall be staggered in opposite directions on tangent track and shall be installed according to the manufacturer’s recommendations.
- C. **Feeder and Crossarm Assemblies**

1. New feeder and crossarm assemblies shall be manufactured in accordance to the dimensions, materials and working loads as shown on the DB Entity's accepted Design Documents.
2. Feeder tap cables will be supported from span wires or cantilever pipes. Feeder taps on span wires shall have an insulated tie wrap attaching them to the span wire. On cantilevers, they shall have a clamp insulator supporting them, both conforming to MBTA standards.
3. Feeder taps for electric track switch heaters will be attached to either span wires or cantilever pipes and run out to the messenger wire and shall be attached to the wire with a Fargo vise type connector separately from the feeder tap. The conduits and cables for the switch heaters will be installed by the signal DB Entity and sufficient slack will be left hanging out of the riser conduit for messenger wire attachment. The DB Entity shall attach and support the heater cable in the same manner and with the same hardware as the feeder taps.
4. Crossarms shall be wood with steel braces. All arms on poles shall be double arms whether on tangent or curve alignment. Mounting holes, brace holes and double arm bolt holes shall be pre-drilled for the type of pole to which they will be mounted. If holes are incorrectly drilled for the mounting pole, new arms shall be used and then field drilled. The DB Entity shall have on hand, spare undrilled crossarms to be used if pre-drilled arms do not fit. Where insufficient strength is encountered, the individual arms shall be doubled with another arm bolted directly to it.

D. Steady Arm Assemblies

1. New steady arm assemblies shall be manufactured in accordance to the dimensions, materials and working loads as determined.
2. Steady arms shall be adjustable with a rod with dimples inserted into a pipe held in place with a set screw. The arm shall be connected to an articulated swivel that will allow the arm to rotate 360° horizontally and 90° vertically. It shall be placed on the contact wire directly under the cantilever pipe at the neutral position of the cantilever at 60°F. If adjustment by extending or retracting the arm is done, the set screw shall be sufficiently tightened and then the jam nut shall be tightened. The clamp ear attached to the arm shall have a liberal coating of grease in the boss and shall be screwed on so that it can rotate and that the body of the clamp bears against the wire on the outside of the curve pull.

E. Pulloff Assemblies

1. New pulloff assemblies for contact wire and messenger cable shall be manufactured in accordance to the dimensions, materials and required working loads as DB Entity's accepted Design Documents.
2. Pulloff assemblies shall consist of a pullover rod, insulator, and clamp ear. The boss of the ear shall have a liberal coating of cup grease applied to it for corrosion prevention. The ear shall be screwed onto the insulator so that it can rotate for along-track movement in contact tension zones. Both boss and stud shall be 5/8-11 thread. The ear shall be secured onto the pullover so that the ear body is pulling the contact wire over and the clamp portion is on the outside of the curve and shall be able to rotate.
3. Contact wire may be strung on curves with a stringing hook attached to the line insulator if the pullover is attached to a cantilever or span wire. If the pullover is a flying pullover, use the pullover itself to hold the wire. After contact wire is strung and tensioned, relieve tension from the stringing hook and remove it. Then attach the pullovers to the contact wire and relieve tension so that the pullovers take all of the curve pull. Make adjustments to alignment and height as needed. Double pullover rods are to be spaced 24 inches at the contact wire.

F. Messenger Cable Support Assemblies

1. New Messenger Cable Support assemblies shall be manufactured in accordance to the dimensions, materials and working loads as shown on the DB Entity's accepted Design Documents.
2. New Messenger Cable assemblies shall be installed to support and register the messenger cable and trolley wires at the positions and heights as described in the DB Entity's accepted Design Documents.
3. Where messenger cables cross each other or overlaps or crossovers, the turnout wire shall be over the mainline wire. Distance between messengers shall be 3-6 inches and is to be developed through the assembly components. Adjustments are to be made in the field to keep the messenger wires from chafing against each other.
4. Messenger cables shall be suspended under the top cantilever pipe with insulation between the clamp and the pipe

G. Catenary Hangers

1. New Messenger Catenary Hanger assemblies shall be manufactured in accordance to the dimensions, materials and working loads as shown on the DB Entity's accepted Design Documents.
2. Adjustable Flexible Catenary Hangers required are current carrying and shall be used to support the trolley wire from the messenger wire where catenary suspension is utilized as shown on the DB Entity's accepted Design Documents. They may be either prefabricated or field cut, and lengths are based on the catenary hanger tabulation table shown on the DB Entity's accepted Design Documents. It is recommended that the DB Entity make up one side of the hanger assembly and keep the other side loose for adjustment after all stringing and adjustment operations have been made. The hanger heights can then be finalized. Along track positioning of each hanger shall be plus or minus 3 inches of intended position. Hangers shall be furnished and installed in accordance with MBTA Standard Specification P-160, as modified herein, and as shown on the DB Entity's accepted Design Documents.
3. Adjustable rigid insulated Catenary hangers and shall be used to support the trolley wire from the messenger wire where catenary suspension is utilized as shown on the DB Entity's Accepted Shop Drawings. They are to be used in locations where vertical distance between the messenger and trolley wires is less than 12 inches. When all adjustments have been completed and the correct contact wire height has been achieved, the rods of the hangers shall be bent inward 90 degrees and cut off so that they do not protrude beyond the sides of the hanger.

H. Section Insulators-Main Line

1. New section insulator assemblies shall be manufactured in accordance to the parts, dimensions, materials and working loads as shown on the DB Entity's accepted Design Documents.
2. Section Insulators for main line operation shall be the standard MBTA Double Beam Cut Out type, non-bridging and shall be suspended by either messenger wire or span wire. In main line catenary with a messenger wire, the section insulator shall be installed directly under the center of the messenger wire insulator and such that the length that the insulated portion extends beyond the double eyes of the sectionner. Split insulated messenger protector spools shall be fixed to the insulator for attaching the hanger wires. The messenger wire on each side of the sectionner shall terminate in automatic deadends fixed to the messenger insulator. The messenger wire shall be directly over the contact wire perpendicular to the track plane.
3. The sectionner shall be cut into the tensioned contact wire without the runners attached. Lay the unit on the contact wire directly under the messenger insulator. Mark the contact wire where it corresponds to inside end of the anchor tip. Remove tension from the contact wire and cut it in the middle. Saw cut the wire at the marks and file any burrs or rough edges. Cuts shall be square.

Slide one end of the unit onto one wire and tighten the set screws until they bottom out on the tip. Release tension in the contact wire and then put the end into the other tip and jack up the wire hitting the top of the tip to get the wire in. When completely inserted, tighten the set screws, release the tension on the contact wire and remove any kinks in the wires.

4. The plane of the sectionner runners shall lie parallel with the track. Make adjustments by either shortening one hanger wire or physically twisting the contact wire on each side of the unit so that it lays parallel to the track. The unit should then be lifted by the hanger wires so that it is slightly "hogged" so that hanger wires have the weight of the sectionner on them.

I. Section Insulators-Yard

1. Section insulators for yard operations shall be the standard MBTA NO-BO style section insulator or approved equal and shall be suspended by either span wire or without suspension close to a span wire or other support. It shall be installed according to the manufacturer's recommendations and shall stand vertically when installed with no tipping. The underrun shall be completely smooth with no burrs, gaps or other obtrusions to chip pantograph carbons. Length of insulated underrun shall be 14 inches.

3.8 OTHER SUPPORT SYSTEMS AND FITTINGS

A. Installation of Jumper Assemblies

1. New jumper assemblies shall be manufactured in accordance to the parts, dimensions, materials and working loads as shown on the DB Entity's accepted Design Documents.
2. All jumpers shall be installed at locations denoted on the DB Entity's accepted Design Documents. In-span jumpers between messenger and contact wire shall be shaped as shown on the DB Entity's accepted Design Documents. Overlap jumpers shall have sufficient slack to allow for along-track movement.
3. Before making up the jumper clamps, the conductor shall be wire brushed for good electrical connection.
4. The DB Entity shall install the jumpers in accordance with the normal direction of travel and all jumpers shall be installed in a similar manner.
5. In span jumpers for the catenary equalizers shall be shaped as shown on the DB Entity's accepted Design Documents.

B. Installation of Trolley Wire and Messenger Wire Deadends

1. The DB Entity shall install the trolley wire and messenger wire deadends in accordance with the manufacturer's recommendations.
2. Trolley Wire Deadends shall be placed in the deadend wire at a distance from the gage of the nearest running rail at no less than 18 inches. The messenger wire deadend shall be placed directly over the contact wire deadend and both shall be no less than 18" to the gage of the closest running rail.
3. The contact wire and messenger wire shall be placed into the deadend device and the end of it bent back 180 degrees for additional security against pulling out.
4. The deadends shall not droop below the main line contact wire. If this occurs, raise the deadend clamp on the pole for single wire or shorten the catenary hangers to pull it up.

3.9 FINAL ADJUSTMENTS

- A. After support registration, and termination assemblies have been installed, a final check of the construction and adjustment to final position shall be made.
 - 1. Height and lateral position of wire shall be checked, adjusted where necessary.
 - 2. The wire heights shall be finalized after tensioning and proper registration.
 - 3. Cantilever along-track movement shall be checked for each tension length to determine proper location. Tolerance of cantilever position is +/-1 inch
 - 4. The stagger of the trolley wire is relative to the centerline of the track. The stagger is measured in inches to left or right of this centerline. Tolerances shall be as follows:
 - a. Stagger of trolley wire: +/- 1/2 inch.
 - b. Height trolley wire: +/- one inch.

3.10 TROLLEY WIRE MEASUREMENTS AT SUPPORTS AND MIDSPAN

- A. The following measurements shall be made and recorded with the wire in its final position:
 - 1. Wire height above the plane of the track at each support point.
 - 2. Wire temperature and air temperature including time of day at the balance weight or deadend of each wire run.
 - 3. Trolley wire stagger and offset relative to centerline of the pantograph travel at each registration point and at midspan.
- B. The pantograph does not travel over the track center line on curves but is offset by an amount varying according to the track radius. The center of the pantograph from the center of the track on a curve will correspond approximately to mid-ordinate of a 20.11 foot chord set on the outer rail head edge of the inner curve rail. The DB Entity shall verify the offsets and staggers shown on the DB Entity's accepted Design Documents and make modifications to meet the criteria of a +/- six inches pantograph stagger.
- C. The DB Entity shall devise a measuring gage that locates the contact wire and allows adjustment so that the offset/stagger corresponds to the location of the pantograph on tangents and curves.
- D. After all wires, cables, and other OCS components have been installed; all systems tested, approved and energized, the DB Entity shall test the operation of the overhead system with a light rail vehicle in conjunction with MBTA forces. Any deviations to stagger/offset and adverse pantograph operation shall be adjusted or remedied so that the pantographs can travel along the overhead system at full rated allowable speed with no pantograph bounce, shimmy or arcing (except at section insulators) and with safe stagger.
- E. A complete set of the final height and stagger dimensions as accepted shall be submitted to the MBTA by the DB Entity before the final inspection and shall be incorporated into the final as-built drawings.

3.11 TROLLEY WIRE ELECTRICAL TESTING

- A. All measurements and tests to the catenary system shall be made in the presence of the MBTA unless the MBTA assigns another person to witness the tests.
- B. Catenary, trolley wire testing
 - 1. When all catenary is completely installed and ready to be energized, the DB Entity shall check the positions of all wayside disconnect switches for correct position, i.e. open or closed.

2. All surge arrestors shall be disconnected at their positive wire lead stud and the end of the wire shall be temporarily taped during OCS testing.
3. Each power section of contact wire (messenger/contact wire for catenary) shall be checked for insulation resistance using a constant voltage sourced 2,000 volt Meggar instrument. The positive lead will be attached to the contact wire and the negative lead wire attached to the running rails. The voltage shall be brought up to 2,000 volts and left in place for one minute and the readings recorded. Minimum reading shall be no less than 2 megohms.
4. Perform an acceptance test on the OCS including all contact wire insulators and feeder cables in accordance with NETA Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems, Section 7.3.3. Switch box cable lugs should be disconnected and covered with a rubber boot prior to the test and then reattached after the test. Any insulator or cable that fails shall be either replaced or repaired to the satisfaction of the MBTA.

C. Surge Arrestor Testing

1. Each surge arrestor shall be tested in place prior to testing and energizing the OCS to ensure the viability of the unit. The positive and negative wire leads shall be disconnected and the device prepared for test. Test instruments and test procedure shall be as recommended by ANSI/NETA ATS-2009 Section 7.19.2 and the manufacturer.
2. Test results and leakage values shall be noted and a report of the test results provided to the MBTA. Any arrestor that fails the test shall be replaced at no cost to the MBTA with a new unit which shall then be tested as described herein.
3. Upon successful (or unsuccessful) completion of the test, the unit shall have a ground placed on the negative lead to drain any residual voltage. The positive and negative wire leads will then be re-attached and the unit readied for operation.

END OF SECTION

SECTION 16124

GALVANIZED STEEL WIRE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies furnishing and delivery of stranded steel guy wire, Class C zinc-coated as described in MBTA Specification P-108B or approved equal for use in the OCS construction.
- B. All span wire for OCS suspension shall be 3/8" guy wire. Back guys, head guys and down guys shall be sized by the DB Entity.

1.2 REFERENCES

- A. Pertinent provisions of ASTM Standard A475 Zinc-Coated Steel Wire Strand shall apply to the work of this Section, except as it may be modified herein, and is hereby made a part of this Section to the extent required. One copy of the ASTM A475 Standard shall be furnished to the MBTA for their use and permanent record.
- B. Pertinent provisions of the MBTA "Specifications for the Purchase of Zinc-Coated Steel Wire Strand", Specification P-108B or approved equal, shall apply to the work of this Section, except as it may be modified herein and in Volume 2 Technical Provisions Sections 11.2 and 11.3.

1.3 SUBMITTALS

- A. The following information shall be submitted in accordance with Volume 2 Technical Provisions Subsection 2.8.
 - 1. The DB Entity shall submit shop drawings prior to steel wire delivery or manufacture, which shall include, but not be limited to, the following:
 - a. Physical Characteristics, chemical content and parameters
 - b. Size
 - c. Type
 - d. Material
 - e. Dimensions of wire
 - f. Overall diameter
 - g. Cross sectional area
 - h. Weight per foot
 - i. Rated breaking strength
- B. The DB Entity shall submit a certification to the MBTA verifying that the galvanized steel wire has been designed, manufactured, inspected and tested in accordance with the applicable portions of the referenced standards and these Mandatory Specifications.

1.4 DELIVERY, STORAGE AND HANDLING

- A. The wires shall be shipped on reels suitable for the weight of the wires.

- B. Materials shall be protected against damage in ordinary handling and shipping. Each reel shall have a strong, weatherproof tag securely fastened to it showing the physical and mechanical properties as well as the steel type designation, ASTM designation and the name and mark of the manufacturer, the length and weight of the wire.
- C. Reels shall be tagged with material description, contract number, and item number.

PART 2 – PRODUCTS

2.1 MATERIALS

- A. Components: The zinc-coated stranded wire shall be manufactured and tested in accordance with ASTM A475.
- B. Performance: Physical properties of the zinc-coated stranded wire shall conform to Table 1 of ASTM A475.
- C. Zinc Coating: The weight of coating for zinc-coated steel wire shall not be less than that specified in Table 4, under Class C of ASTM A475.
- D. Size of the wire shall range from 5/16” to 3/4” diameter, 7 strand guy wire.
- E. The grade of wire shall be determined by the DB Entity.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Galvanized steel wire shall be installed as part of one or more assemblies in accordance with these Mandatory Specifications, as indicated in Volume 2 Technical Provisions Sections 11.2 and 11.3, and shall be installed in accordance with Section 16123 – OVERHEAD CONTACT SYSTEM INSTALLATION.

END OF SECTION

SECTION 16125
CATENARY POLES
PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. This section specifies the following:

1. Furnishing of catenary poles and foundations which will include new poles on the new Lechmere Viaduct and along the right of way and in the yard area.
2. Poles comprised of wide flange beams with base plates for the new Lechmere Viaduct, and wide flange beams with base plates along the right of way and the yard. Anchor base poles will be mounted onto anchor bolts provided integrated into the viaduct or supplied by the DB Entity.
3. Foundations for anchor base poles (or embedded if used by DB Entity).
4. Foundations consisting of drilled holes with steel pipe liners and cast-in-place concrete.
5. Furnishing structural steel components as related to poles and supporting structural hardware.
6. Testing of pole to earth ground resistance.
7. Reference is made to SECTION 03300 "CAST IN PLACE CONCRETE" for concrete material requirements, and to SECTION 16124 GALVANIZED STEEL WIRE for guy wire requirements. Related section is SECTION 16123 OVERHEAD CONTACT SYSTEM INSTALLATION.

1.2 SUBMITTALS

A. Provide submittals in accordance with Volume 2 Technical Provisions Subsection 2.8.

B. Welding Records and Data

1. Submit certified copies of qualification test records for each welder, welding operator and tacker who will be performing work for material supplied to the Project. All said qualification test records shall be accepted by the MBTA in writing prior to any work being undertaken. Comply with the requirements of ANSI/AWS D1.1, Section 5, Parts A, C, D, and E.
2. Submit certifications that magnetic particle and dye penetrant inspections have been satisfactorily completed.
3. Submit records of ultrasonic testing.
4. Mill Certificates: Submit mill certificates and certified copy of reports for all analyses and tests required by referenced ASTM and AWS specifications.

C. Erection and Detail Drawings

1. Submit drawings of erection and detail of steel structures for review and acceptance before material is ordered or fabrication begins. Upon acceptance, the required number of sets of all prints shall be furnished before delivery of steel to the job site.
2. All details shall be completely dimensioned.

D. Submit the following for poles and hardware.

1. Shop drawings, catalog cuts, and descriptive data.
 2. Special storage instructions
 3. Certificates of Compliance.
- E. Submit the following for poles.
1. Listing of pole types, lengths and sizes (section type)
 2. Data sheets noting the deflection of poles
 3. Certificates of compliance to these Mandatory Specifications and testing criteria
- F. Submit factory test reports in accordance with Volume 2 Technical Provisions Subsection 2.8.

1.3 REFERENCES

- A. Pertinent latest edition provisions of the following listed standards shall apply to all work of this Section, except as modified herein, and are hereby made part of these Mandatory Specifications to the extent required.

 9. Conflicts
 - a. When a conflict exists between two referenced industry standards, the more stringent requirement shall govern.
 - b. When a conflict exists between a referenced standard and this specification, the more stringent requirements shall govern unless stated otherwise.

1.4 DELIVERY AND STORAGE

- A. Ship poles suitably covered to protect them from damage during shipment. The poles shall be handled and stored in accordance with the manufacturer's instructions to protect them from damage. Protect poles during storage from collisions with vehicles, falling equipment, and rolling off of the storage pile. Each pole shall be laid above the ground so that they are not in contact with soil or other debris and each successive layer shall have wood dunnage of sufficient strength to prevent it from being crushed.
- B. Poles damaged during delivery or during storage shall be inspected by the DB Entity for extent of damage. Those poles deemed non-useable for the project shall be rejected and replaced by the DB Entity at the DB Entity's expense. Poles that are deemed repairable by the DB Entity shall have those repairs needed to put them in a state of good condition completed by the DB Entity and at the DB Entity's expense. Repaired poles shall be inspected by the MBTA and shall receive the MBTA's acceptance for re-use on the project.

1.5 QUALITY CONTROL

- A. Conduct factory testing in accordance with Section 01400.
- B. Welders: Certified by the MBTA and experienced in making steel welds for pole construction (minimum five years proven experience).
- C. The Project may request the welder to make test welds in the presence of the MBTA before certification is granted.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All new pole structures shall be steel, hot dipped galvanized except for those poles requiring a painted finish coat. Poles requiring a painted finish shall not be galvanized.

2.2 WIDE FLANGE BEAMS

- A. Wide flange beams and cross beams for portal structures shall be wide flange sections conforming to ASTM A992 with minimum yield strength of 50,000 psi. They shall be either anchor base type or direct embedment type. Where wide flange beams require an anchor plate at the base of the pole, it shall be comprised of steel per ASTM A572 grade 50 with minimum yield strength of 50,000 psi.
- B. Poles having anchor plates shall have the pole welded to the plate with full depth penetration welds as described herein. All welds shall be inspected for integrity of workmanship.
- C. Poles shall be one piece up to 45' long. Where excessive lengths are required, the pole shall be extended in length by splicing another wide flange section to it of the same type. Splices shall consist of steel splice plates to which the two sections of pole shall be attached. All holes drilled in the pole sections shall be done in the fabrication shop and prior to hot dip galvanizing. Splice plates shall be located on the spliced pole where the splice plate would be on the section of the pole that is inserted into the pole foundation hole.
- D. Poles and connecting hardware shall be hot dipped galvanized after fabrication according to ASTM A123 and A153.

2.3 FOUNDATIONS

- A. Foundations shall be classified as anchor base (unless DB Entity chooses embedded poles). Anchor base type poles which are mounted on the viaduct structure, on walls will not utilize drilled caisson foundations but will be mounted and secured to anchor bolts installed separately from the pole installation. For anchor base poles requiring an earth foundation, the foundation shall consist of a drilled caisson to the depth and diameter indicated in Volume 2 Technical Provisions Sections 11.2 and 11.3. Foundations shall be cast in place. The method of installing these foundations is further described in SECTION 16123 – OVERHEAD CONTACT SYSTEM Installation.
- B. Steel Casing
 - 1. Steel casing shall be carbon steel, free of cracks and other signs of distress, conforming to ASTM A36, or ASTM A252, seamless or welded. Surface shall be free of loose scale or rust, grease and other foreign matter.
 - 2. Inner diameter of casing shall be large enough to construct pole foundations as described herein and elsewhere within the Construction Documents. All casings shall extend the full length of the embedded pier. Splicing of casings by full penetration butt welds will be acceptable. Welding shall conform to AWS Structural Welding Code D1.1.
 - 3. Steel casing thickness shall be no less than 3/8". The steel liner may remain in place or be removed and the inner casing shall remain in place after installation.
- C. Concrete
 - 1. Concrete shall have 28 day strength (fc) of 4,000 psi.
 - 2. Aggregate shall be no greater than 3/8".
- D. Steel Reinforcement
 - 1. Steel reinforcement shall conform to ASTM A615, Grade 60 and shall be bare steel without coating.

2.4 FACTORY TESTS

- A. Conduct tests in accordance with ASCE standards for fabricated structures.
 - 1. Poles: deflection tests

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General
 - 1. The DB Entity shall inform the MBTA about any field conditions encountered which are not covered or are substantially different from those specified in this Specification and perform the work in question in accordance with the MBTA's instructions and direction.
 - 2. The DB Entity shall coordinate this work with the installation of the overhead contact system, other systems, structural and civil work. All pole installations shall be complete and accepted by the MBTA.
 - 3. The DB Entity shall conform to safety features and requirements specified herein and to those required by the MBTA.

4. Any pole that is damaged during installation shall be assessed by the MBTA. Poles which cannot be repaired shall be replaced with an in-kind new pole at no cost to the MBTA. Finishes damaged during installation shall be restored in a manner consistent with manufacturer's instructions for finish restoration and shall be accepted by the MBTA.
5. Poles may be moved laterally along track or back from the track by up to 12" for clearance of obstructions. Poles may not be moved closer to the track unless the DB Entity is directed to do so by the MBTA. The DB Entity shall inform the MBTA of any pole location changes.

B. Foundation Excavation-Suggested

1. Foundation holes shall be drilled using a steel pipe casing with a minimum thickness of 3/8 inch and with a diameter specified in the Volume 2 Technical Provisions Sections 11.2 and 11.3. Each foundation shall be staked in advance of drilling and receive acceptance of the MBTA prior to excavation. The steel pipe drill shall remain in place when drilling is complete.
2. Soil shall be excavated after the drill has reached the proper depth.
3. Excavated soil shall be considered contaminated due to the nature of the railroad environment and shall be properly disposed of as indicated in other sections of the Contract Documents.
4. Where complete depth penetration cannot be achieved due to encountering bedrock or hard ledge, the remainder of the hole shall be drilled in rock to a diameter 6" greater than the pole width. The depth in rock shall be no less than 4 feet.
5. Where any unforeseen obstruction is encountered that prevents the hole from being drilled, the DB Entity shall inform the MBTA and take direction.

C. Foundation Steel Reinforcement Placement

1. Upon completion of drilling to the desired depth, the soil shall be removed from the interior of the pipe and reinforcing and anchor bolts shall be installed. The reinforcing shall not be placed directly to earth contact but be spaced 6 inches from any soil.
2. Concrete shall be poured into the hole with care so as to not unseat the anchor bolts. A pencil vibrator shall be placed into the hole to ensure that all concrete is properly distributed and that no voids are created.
3. Upon completion of the concrete pour, the steel liner may remain in place or be removed. If removed, care shall be exercised to prevent disturbance of the anchor bolt arrangement. If disturbed, the DB Entity shall reposition the anchor bolts as required.
4. The foundation shall remain in place until the concrete is set up (7 days minimum) at which time, the pole can be inserted into the anchor bolts.

D. Direct Embedment

1. Direct embedded poles may be used but at the discretion of the DB Entity.
2. Direct embedded poles shall be set into the pole foundation interior pipe when the concrete has set up sufficiently to support the pole weight and wind load.
3. The pole shall be set in the center of the hole so that its axis coincides with the center axis of the pipe and it shall remain supported until supports are attached.
4. Upon insertion of the pole into the foundation hole and orienting the web to the proper direction, it shall be raked by an amount determined by the DB Entity.
5. When the pole is properly raked, the DB Entity shall insert steel angles into the interior pipe on two sides of the pole and weld them, the angles, to the pole and the pipe so that the angles hold the pole in place and electrically connect the pole and the interior pipe together. The angles shall be

placed 6 inches from the top of the pipe and all galvanized surfaces to which the angles are being welded shall have grinding applied to remove the zinc coating. All welding shall be done on a bare steel surface. Upon completion of welding and when sufficiently cool, the exposed surfaces shall be coated with a zinc rich paint type coating.

E. Concrete Pouring

1. Concrete shall be mixed, placed, finished and cured. Concrete may be placed by a tremie pipe or hose when free drop is not practical. If a tremie is used, fabricate the tremie in sections with joints that allow the upper sections to be removed as the placement progresses. Sections may be jointed by flange, bolted connections (with gaskets) or be screwed together. Whatever joint technique is selected, joints between tremie sections must be watertight. The joint system selected shall be tested for water-tightness before beginning placement. The tremie pipe shall be marked to allow quick determination of the distance from the mouth of the tremie. Provide the tremie with a suitably sized funnel or hopper to facilitate transfer of sufficient concrete from the delivery device to the tremie. Provide a stable platform to support the tremie during the placement. The platform shall be capable of supporting the tremie while sections are being removed from the upper end of the tremie.
2. Concrete shall be vibrated during the entire course of the pour to ensure complete compactness and prevention of voids. Each foundation shall be completely poured and no partial pours will be accepted. Excess concrete shall be removed and disposed of by the DB Entity off the construction site. Any spilled concrete shall be immediately cleaned up and disposed of. Care shall be exercised during the pour to prevent concrete spillage and any staining of OCS poles with concrete shall be cleaned off the pole completely.
3. Concrete shall be certified as to strength and aggregate size and the DB Entity shall provide documentation of such for each batch delivered.
4. The DB Entity shall inform the MBTA of all scheduled concrete pours 24 hours prior to the pour.

F. Attachment to Retaining Walls

1. Poles attached to retaining walls shall be considered anchor base type and shall be set onto anchor bolts protruding from the wall.
2. Installation shall be as described herein and on the Contract Documents.

G. Control of Excavated Material from Pole Foundations

1. All excavated material shall be considered contaminated and shall be disposed of in a manner consistent with the Contract Documents and the MBTA's requirements for disposal of contaminated materials.
2. Safety to personnel from excavated pole holes shall be of primary concern and the DB Entity shall cover all open excavations with heavy steel plates so that they cannot be inadvertently moved or removed. They shall be installed over the pole hole in such a way that it shall be impossible for personnel to fall into the hole.

H. Installation of New Viaduct Poles

1. All poles on the new viaduct shall be anchor base type and shall be mounted onto anchor bolts protruding from the viaduct pole haunches.
2. Anchor bolts will be provided and installed by the constructor of the new viaduct.
3. DB Entity shall verify the height of the pole base parapet above the top of rail and determine the required height of the pole. New viaduct poles shall have a nominal height above top of high rail of 24'-0" unless DB Entity determines otherwise.

I. Installation of Portal structures

1. Portal structures shall be installed on wide flange beams if required.
2. Design of portal structures shall be according to the DB Entity. They shall be installed to the heights above top of rail providing safe clearance. They shall be no less than 3' above the messenger wire for catenary construction or 3' above the contact wire for single wire construction.

3.2 TESTS

A. General

1. The DB Entity shall provide all instruments, materials, and labor required for tests specified herein on all poles and related structural steel furnished and installed by him.
2. The DB Entity shall formulate an overall test program for the installation, which shall include, but not be limited to, the tests specified in this Section to ensure equipment and material compliance with the relevant standards, this Specification and satisfactory and reliable performance in actual intended operation.
3. The DB Entity shall perform field tests of pole to earth resistance ground tests.

B. Conditions for Tests

1. Prior to testing of any pole prior to the installation, the following conditions shall be fulfilled by the DB Entity:
 - a. The DB Entity shall have in his possession, all the shop drawings duly accepted by the MBTA.
 - b. The DB Entity shall have submitted testing procedures for the MBTA's acceptance at least 45 days in advance of the testing.

C. Witnessing Tests

It is the discretion of the MBTA, to witness all testing of poles. Should the MBTA not witness testing, the DB Entity shall document all tests for submission to the MBTA. All tests, whether or not in the presence of the MBTA, shall be certified.

D. Responsibility

The DB Entity shall assume full responsibility during installation of all poles and structural steel provided by them. Should there be any loss due to theft or damage to such material or installation as a result of these installations, the DB Entity shall be fully responsible for replacing the damaged poles and materials. Replacement of damaged poles and materials shall include all costs, including, but not limited to, removal of damaged material, furnishing of, transportation of, and installation of replacement material.

E. Rejection

1. The MBTA reserves the right to reject any pole or installation that is in non-conformance to the Contract Documents.
2. Any rejected pole, foundation, cross beam or other associated pole installation shall be replaced in total to the complete satisfaction of the MBTA.
3. Replacement of rejected installations and hardware shall be undertaken at the expense of the DB Entity and at no cost to the MBTA.

F. Costs of Tests

The price for conducting all factory, field tests and checkouts in the presence of the MBTA, including entire cost of rectification, retesting, and/or supplying of new items shall be deemed to be included in the Contract Price.

G. Field Tests

1. All tests required herein shall be undertaken and performed by the DB Entity.

H. Defective Poles and Material

1. Any DB Entity furnished pole or material found defective before installation shall be replaced by the DB Entity. Cable found defective after installation shall be repaired or replaced at the DB Entity's expense.
2. Any pole or material installed under this Contract found defective during the testing shall be replaced with a new material. Rectification of defects of any pole or related material shall be done only with the specific acceptance of the MBTA.
3. Anchor base poles shall have a pole ground installed and that shall be tested after the pole, ground wire, and ground rod has been installed. If the resistance test indicates a resistance greater than 25 ohms, the DB Entity shall drive additional ground rods until the required resistance can be met. If resistance cannot be met, take direction from the MBTA.
4. Testing of pole grounds shall be performed on the pole after it is installed. If the resistance to earth is 25 ohms or less, taking into account temperature, the test shall be considered successful. If the earth resistance is greater than 25 ohms, additional 4/0 AWG ground wires shall be welded to the pole and passed through foundation ground wire conduit and run to a separate ground rod. The test shall then be redone and the resistance noted. If still greater than 25 ohms, the DB Entity shall take direction from the MBTA.
5. If the drilling caisson remains in place, it may be used as a ground electrode and the ground wire may be welded to it.

I. Test Reports

1. The DB Entity shall submit five copies of certified test reports of all factory and field tests for the MBTA's review and acceptance. Test reports of field tests shall be submitted no later than seven days after testing. Test reports shall be self-explanatory, noting the personnel involved, and shall show the instruments used for testing and the date(s) of their last calibration. Test reports shall contain identification of each pole tested in a manner that can be referenced to the Contract Documents.

3.3 POLE IDENTIFICATION TAGS

- A. Install standard pole tags on all poles, two pole tags to each location, one cable tag on the front of the pole facing the track and one cable tag on the pole facing the direction of traffic. The pole cable tag will be the standard MBTA type embossed aluminum tag as described herein and as indicated on the Contract Documents.
- B. Pole tags shall be placed 10' above the top of rail unless stated otherwise.
- C. Numbers shall be black on yellow background. Letter/number height shall be 2".
- D. Each pole tag shall consist of two holders placed so that they butt up against each other providing route number and pole number as shown on the Contract Documents. The route number shall be on top of the pole number. Each holder shall be fixed to the pole surface with 1/4-20 stainless steel machine screws.

Each hole shall coincide with the hole on the holder and shall be drilled and tapped into the pole. The hole threads shall have Loctite 242 (“Blue Loctite”) applied. Tags shall be horizontal to the pole sides.

- E. Poles on the right of way shall have numbers facing the track. Where the pole is between two tracks, the numbers shall be on two sides of the pole facing each track.

END OF SECTION

SECTION 16126

DIRECT CURRENT POWER CABLE AND DIRECT CURRENT POWER FEEDER DISCONNECT SWITCHES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following:
1. Furnishing, installing, testing, terminating and splicing EPR/XLPO insulated DC power cables and installing and testing, 2000/4000 Amp feeder disconnect switches.
 2. Furnishing, installing, terminating, splicing, and testing new aerial 1,000 kcmil ethylene propylene rubber (EPR) insulated cross-linked polyolefin (XLPO) jacketed cable rated for 2,000 Volts for 600 Volt DC positive supplementary feeders.
 3. Furnishing, installing, terminating, splicing, and testing new 1,000kcmil and 2,000kcmil ethylene propylene rubber (EPR) insulated cross-linked polyolefin (XLPO) jacketed cable for 650VDC positive feeders.
 4. Furnishing, installing, terminating, splicing, and testing, new 1,000,000 and 2,000,000 circular mil cross-linked polyolefin (XLPO) insulated cable for 600 VDC negative return circuits.
 5. Furnishing, installing, connecting and testing of manual DC traction power disconnect switches at locations as described in Volume 2 Technical Provision Section 11 Railroad Systems and Exhibit 2A.1 Mandatory Specifications.
 6. Furnishing and installing of galvanized and stainless steel channel supports, miscellaneous cable clamps, exterior grade FRE conduit, cable terminations, pole supports and cable insulators for DC cables as described in Technical Provision Section 11 Railroad Systems and Exhibit 2A.1 Mandatory Specifications.
 7. Furnishing and installing aerial feeder taps of 4/0 AWG extra flexible cable as described herein.
 8. Furnishing and installing aerial 500 kcmil insulated, ethylene propylene rubber (EPR) insulated cross-linked polyolefin (XLPO) jacketed cable for 600 Volt DC positive feeders as described herein.
 9. Installation of new cable tags of the same type as the pole tag and switch box identification plates of vitreous porcelain enamel.

1.2 REFERENCES

- A. Pertinent latest edition provisions of the following listed standards shall apply to all work of this Section, except as modified herein, and are hereby made part of these specifications to the extent required.
1. American Society for Testing and Materials (ASTM)
 - a. B8 - Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard or Soft.
 - b. B33 - Standard Specification for tin coated Soft or Annealed Copper Wire for Electrical Purposes.
 - c. B172 - Standard Specification for Rope-Lay-Stranded Copper having Bunch-Stranded members for electrical conductors.

1.3 SUBMITTALS

- A. Submit the following for each type of cable in accordance with Volume 2 Technical Provision Subsections 2.7 and 2.8.
 - 1. Shop drawings, catalog cuts, and descriptive data
 - 2. Special storage instructions.
 - 3. Installation, termination, splicing and repair materials and procedures recommended by the cable manufacturer.
 - 4. Certificates of Compliance in accordance with these Mandatory Specifications.
- B. Submit the following for DC traction power disconnect switches in accordance with Volume 2 Technical Provision Subsections 2.7 and 2.8.
 - 1. Detail drawings of the disconnect switch and enclosure, including composite of switch in enclosure.
 - 2. Bill of materials.
 - 3. Data sheets noting the electrical and thermal ratings of the switch.
 - 4. Switch assembly drawings, outline and detail drawings of switch enclosure, showing materials, methods of assembly, anchorage to other work and other significant data for cable racks, cable clamps and cable splicing components.
 - 5. Certificates of Compliance to these Mandatory Specifications and testing criteria.
 - 6. Design test reports as specified in MBTA Standard Specifications.
- C. Submit factory test reports in accordance with Volume 2 Technical Provision Section 2, Volume 1 Section 4.
- D. Prior to making splices, submit the name and qualifications of each individual who will perform cable splicing including experience on similar previous projects.
- E. Submit materials list and assembly details of cable support arrangements, cable clamps and aerial termination details.

1.4 DELIVERY AND STORAGE

Ship cable on reels suitably covered to protect the cable from damage during shipment. Seal, secure, and protect cable ends from damage. Make both ends available for testing, unless prevented by cable size or reel construction. The cables shall be stored in accordance with the manufacturer's instructions to protect them from damage.

1.5 QUALITY CONTROL

- A. Conduct factory and field testing in accordance with Volume 2 Technical Provision Section 2, Volume 1 Section 4.
- B. Cable splicers: certified by the MBTA and experienced in making or breaking splices of similar cables for similar application (minimum five years proven experience).
- C. The MBTA may request the splicer to make test splices in the presence of the MBTA before certification is granted.

PART 2 - PRODUCTS

2.1 GENERAL

All insulators, connectors and support hardware for installation of new traction power feeder cable shall be new, having the physical dimensions, electrical ratings and mechanical strength required for the intended service as shown on the Contract Documents and as specified herein.

2.2 DC POSITIVE FEEDER CABLE AND NEGATIVE CABLE

- A. Cables covered in this section are intended for use in DC traction power service operated at a nominal 600 Volts, subjected to additional Voltage stresses resulting from the operations of light rail vehicles with regeneration and substation rectifier equipment. Cables shall be suitable for installation in dry or wet locations, in exposed or underground conduits, trays, cable racks, directly buried or run exposed.
- B. Furnish positive/negative 1,000 kcmil, single conductor, EPR insulated, XLPO jacketed cable in accordance with MBTA Specification P-118F.
- C. Furnish positive/negative 2,000 kcmil, single conductor, EPR insulated, XLPO jacketed cable in accordance with MBTA Specification P-120F.
- D. Furnish positive 500 kcmil, single conductor, EPR/XLPO insulated cable in accordance with MBTA Specification P-129C.
- E. Furnish 4/0 AWG, single conductor, EPR insulated, XLPO jacketed cable in accordance with MBTA Specification P-179.

2.3 MISCELLANEOUS INSULATED CABLE

- A. No. 4/0 AWG Extra-Flexible Cable for Jumpers
 - 1. Cable shall be extra flexible containing 259 strands of copper wire with rope-lay-stranding, without insulation. The cable shall be tin coated copper in accordance with ASTM-B33 with Class H stranding as specified in ASTM-B173.
- B. Feeder Cable Tie Wire
 - 1. The tie wire used with pin-type insulators shall be No. 2 AWG annealed solid copper, with black XLPO jacket.

2.4 TRACTION POWER DISCONNECT SWITCHES

- A. Furnish open knife blade type, unfused, no load break, single throw, front-connected, front operated disconnect switches mounted on an insulated base. The switch shall be arranged so that feeder cables can be disconnected easily and reattached easily for cable testing. Cable configurations shall be as shown on the Contract Documents or as required by MBTA.
- B. Furnish new traction power 2,000 amp or 4000 amp disconnect switches with enclosures in accordance with the Contract Documents and MBTA Specifications P-150F.

2.5 AERIAL AND NON-AERIAL CABLE SUPPORT

- A. Aerial feeder cables shall be self-supporting and shall not use a messenger cable. They shall be attached to insulators mounted on wood crossarms or attached to cable cleat insulators where attached to walls or bridge ceilings. Where the feeder cable deadends on a pole or crossarm, strain insulators with deadend clamps shall be utilized to take the tension of the cable. Strain insulators shall be constructed with 3/4-inch diameter epoxy-fiberglass rods with end fittings of the strain insulator of ductile iron or stainless steel with clevis end and eye end in the same plane. Ends shall be crimped over the fiberglass rod. The rod portion of the strain insulator shall have a heat shrink Teflon® tube shrunk completely over it and to

protect the rod from UV radiation. Nominal insulation length shall be 12 inches and maximum design tension shall be 35,000 pounds. The heat shrink Teflon® tube shall pass under the crimped end fitting.

- B. Strain clamps for traction feeder cable may contain two mating pieces connected with U-bolts. One end shall contain an offset clevis fitting for attaching to eye of insulator, the other end a pulling eye. Strain clamps must withstand breaking strength of the cable.
- C. Ferrous hardware, including bolts, nuts, and washers, shall be hot-dip galvanized as indicated on the Contract Documents.
- D. Non-Aerial feeder cables, positive and negative shall be mounted on Porce-A-Clamp or approved equal, which will be attached to 1-5/8" x 1-5/8" double side stainless steel unistrut channel at 3ft intervals, secured to the building structure.
- E. Cable clamps of the G10 fiberglass for supporting the cable risers to the switchgear and all power switches shall be provided. G10 blocks shall be attached to 1-5/8" x 1-5/8" double side stainless steel unistrut channel secured to the building structure.

2.6 CABLE CONNECTORS, CLAMPS, CONDUIT AND HARDWARE

- A. Connectors for connections to new aerial DC feeder cables shall be mechanical, vise type of high strength, high conductivity bronze alloy. The connector opening shall be sized to accommodate the size cables being connected and as noted on Contract Documents. All connectors shall be new.
- B. Connectors for splicing DC aerial cable shall be full tension compression type as recommended by the cable manufacturer.
- C. Beam clamps, cable supports and dead-ending hardware shall be furnished in accordance with details on the Contract Documents.
- D. Cable riser clamps shall be of two-piece grade G10 fiberglass blocks for supporting riser cables or tap cables on beams and poles and shall be furnished either separately or as part of an assembly as shown on the Contract Documents.
- E. Connectors for connections to switchgear and power switches shall be mechanical, high conductivity copper alloy. The connector opening shall be sized to accommodate the size cables being connected and as noted on Contract Documents. All connectors shall be new.
- F. Temporary connectors for splicing supplementary cable shall be full tension compression type as recommended by the cable manufacturer.
- G. All feeder cables, positive and negative, with the exception of the aerial cables, shall be installed in FRE conduit. FRE conduit shall be suitable for outdoor exposure and shall be in accordance with MBTA Specification P-175. FRE conduit shall be located and installed in accordance with the details on the Contract Documents.

2.7 FACTORY TESTS

- A. Conduct tests in accordance Volume 2 Technical Provision Section 2, Volume 1 Section 4 and the following.
 - 1. Cable: standard manufacturers' tests and in accordance with the following standards: NEMA WC8; ANSI/IEEE-48; ANSI/IEEE-400; ANSI/IEEE-532; and ANSI/UL-1072.
 - 2. Disconnect Switches:
 - a. Allowable maximum temperature rise of the switch parts during continuous operation at rated current as specified in ANSI C37-3 when the ambient temperature outside switch in its enclosure is 40°C.

- b. Allowable maximum temperature rise when operating at overload capacity as specified for 15 seconds every 90 seconds over a two-hour period.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

1. The cable installation shall be in accordance with the manufacturer's recommended installation procedures and SECTION 16127 - AC AND DC AERIAL CABLE INSTALLATION and the Contract Documents.
2. The cable installation for non-aerial DC power cable shall be per this Section.
3. The DB Entity shall inform the MBTA about any field conditions encountered which are not covered or are substantially different from those shown on Contract Documents or specified in this Section and perform the work in question in accordance with the MBTA's instructions.
4. The DB Entity shall coordinate this work with the installation of the substation and overhead contact system per the Design Documents and other sections of the Mandatory Specifications. All riser and tap connections to the switchgear and power switches shall be completed prior to turning over to the MBTA.
5. The DB Entity shall conform to safety features and requirements specified.

B. Splicing and Terminating – Non-Aerial Cables

1. The DB Entity shall splice the cables only where permitted in Article 3.1 of this Section.
2. In order to obtain optimum electrical contact and adequate insulation at the points of connection of each cable, only the most highly skilled cable splicers shall be employed. Cable splicers shall have experience in making splices of similar cables for similar applications. The DB Entity shall submit the name of the individual, with the number of years and type of experience on similar projects. The DB Entity shall obtain prior approval of all individuals who will be making splices.
3. Each splicer shall be accepted for the job by the MBTA prior to any splicing activities. The MBTA may request the splicer to make test splices in the presence of the MBTA before the acceptance is granted.
4. All faulty, imperfect, or damaged splices found during or after installation, shall be removed and replaced. New splices shall be subject to the same tests as are required for the cables after initial installation.

C. Other Cables

1. The DB Entity shall install other overhead cables and cable assemblies as shown on the Design Documents, such as feeder taps and equalizer jumpers.
2. Riser cables shall be supported using new split G10 fiberglass as shown on the Contract Documents, or approved equal. Tap cables shall be supported on support brackets or span wires using new clamps.

3. The DB Entity shall cut new riser and tap cables to final length, install lugs and clamps, and connect these cables to disconnect switches and trolley wires, respectively.
4. The DB Entity shall reinsulate the cable at locations where tap connections are removed from new supplementary cable and thermo-seal the exposed ends of all new cables after cutting if final connection will be delayed.
5. Current-carrying connectors shall be installed in accordance with the following:
 - a. Wire surfaces, which are in contact with conducting surfaces of the connector, shall be thoroughly wire brushed and shall have an inhibitor applied. Where connectors are not factory-loaded, the same inhibitor shall be applied in the field to the connector.
 - b. Corrosion inhibitors shall be stable over a wide temperature range, able to adhere to cold metal surfaces, water-repellent, weather resistant, and inert to copper, aluminum, zinc, tin, cadmium, steel, and neoprene rubber. Grit-bearing inhibitors shall be used except for flat lugs, sliding surfaces or where omission is recommended by the connector manufacturer. Grit shall be compatible with the connector and wire metal. Inhibitor for copper and bronze shall be T&B "Kopr Shield", Fargo "Fargolene", Penn-Union "Cual-Aid", Burndy "Penetrox A", or approved equivalent.
 - c. Bolts in bolt-type connectors shall be lubricated as recommended by the manufacturer and torqued to the manufacturer's recommendation using a calibrated torque wrench.

D. Control of Scrap

1. Scrap components including any abandoned ac and dc cable shall be collected, removed daily from the job site and delivered to the DB Entity at a site designated by the DB Entity.
2. All cable, wire, OCS components, balance weights, pullovers, insulators, poles and other associated OCS material removed from the old viaduct and Lechmere Station shall be returned to the DB Entity at a site designated by the DB Entity.

E. Installation of Traction Power Disconnect Switches and Supports

1. Install traction power disconnect switches assembled in boxes including cable clamp supports. Install a cable tag on each cable entering the box.
2. Install switch enclosures plumb and level and in alignment with adjoining work or structure.

3.2 TESTS

A. General

1. The DB Entity shall provide all instruments, materials, and labor required for tests specified herein on the dc traction feeder cable furnished and installed by him.
2. The DB Entity shall formulate an overall test program for the installation, which shall include, but not be limited to, the tests specified in this Section to ensure equipment and material compliance with the relevant standards, this Specification and satisfactory and reliable performance in actual intended operation.

B. Conditions for Tests

1. Prior to testing of any cable and the installation, the following conditions shall be fulfilled by the DB Entity:
 - a. The DB Entity shall have in his possession, all the shop drawings duly accepted by the MBTA.
 - b. The DB Entity shall have submitted testing procedures for the MBTA's acceptance at least 45 days in advance of the testing.

C. Witnessing Tests

The MBTA will witness complete field-testing on all the cable installation.

D. Responsibility

The DB Entity shall assume full responsibility during field-testing of all cable installation provided by him. Should there be any loss or damage to such cable or installation as a result of these tests, the DB Entity shall be fully responsible for replacing the damaged cable. Replacement of damaged cable shall include all costs, including, but not limited to, removal of damaged cable, furnishing of, transportation of, and installation of replacement cable.

E. Rejection and Retesting

1. Failure of cable or splice to withstand tests or to meet ratings shall be sufficient grounds for rejection of the item tested.
2. Any cable or splice rejected shall be retested in the presence of the MBTA after renewal.
3. If it is not possible to rectify rejected cable to the satisfaction of the MBTA, new cable shall be installed.

F. Costs of Tests

The price for conducting all field tests and checkouts in the presence of the MBTA, including entire cost of rectification, retesting, and/or supplying of new items shall be deemed to be included in the Contract Price.

G. Field Tests

1. All DB Entity installed DC positive traction feeder cables and DC traction power switches shall be tested to ascertain that the dielectric strength of the insulation has not been impaired during installation, that the splices and terminations are properly made and to confirm the integrity of the cable system prior to energization. Tests shall include continuity tests, insulation resistance tests and high potential direct current tests. High potential direct current tests specified herein shall be applicable only to dc positive cables. Rectification of defects of any cable shall be done only with the specific acceptance of the MBTA.
2. Acceptance Tests: After installation of any length of a cable and completing all connections to risers, jumpers, and taps, the DB Entity shall perform the below listed tests on each cable circuit. To preclude damage to equipment and devices the tests shall be conducted before the cable is connected to the disconnect switches and trolley wires.
 - a. Continuity Test: This test shall be performed to prove the continuity of cable circuits.
 - b. Insulation Resistance Test

- 1) This test shall be performed to determine the cable insulation resistance to ground.
 - 2) Tests shall be conducted with a 2,000-volt motor operated megger. Test voltage shall be applied between the conductor and ground and shall be held until the reading reaches a constant value for five minutes. Insulation resistance values obtained by the megger tests shall not be less than two megohms. The DB Entity shall bring to the attention of the MBTA, the results of similar tests having unequal ratings with the variations of 25% or more.
 - 3) For each test, the DB Entity shall record the temperature, humidity, duration of the test and the voltage of the megger used.
- c. High Potential Test, DC positive cables: This test shall be performed only after the insulation resistance test has been successfully completed and shall be performed on each cable circuit installed under this Contract. Before conducting the high potential direct current tests, the DB Entity shall comply with the following requirements:
- 1) Nearby equipment, the conductors of nearby insulated cables not under test, except those in service, and the ground stick shall be all securely tied to the grounding system.
 - 2) The insulated conductor under test shall have a safe clearance from adjacent conductors and surrounding metal objects. For every 1,000 volts of dc test voltage, 1/4-inch clearance is regarded as a safe distance.
 - 3) High voltage tested gloves shall be worn by each participant.
 - 4) The test voltages shall meet the recommendations of the cable manufacturer.
 - 5) Danger signs and sentries shall be posted at all critical points along the entire cable route under test.
 - 6) The operator's manual for the particular test set being used shall be read and understood.
 - 7) All safety precautions shall be observed at the testing end and at the far end of the cable.
- d. Each cable circuit shall be tested separately while grounding test equipment and all cables not under test, except those in service.
- 1) The test equipment shall be supplied from a stable, constant voltage source having a maximum variation of the voltage of plus or minus five percent. Preferably, a motor-driven generator shall be used for the supply. The output voltage of the test set must be filtered, regulated, and spike free.
 - 2) The direct current test voltage shall be applied between conductor and ground slowly in equal steps (in steps of five to seven percent of full test voltage) until the designated test voltage is reached. The rate of voltage acceleration shall be consistent under each step.
 - 3) Sufficient time shall be allowed after each step for the leakage current to stabilize.
 - 4) Total leakage current shall be recorded in micro-amperes after each step. The same length of time shall be allowed after each step for the total current to stabilize before taking the readings.
 - 5) The test voltage shall be 80% of the original factory test voltage. The test voltage shall be maintained for five minutes after it has reached the specified value.
 - 6) Total current values shall be recorded in micro-amperes at one minute intervals for the duration of the test.
 - 7) The test set voltage control shall be set at zero at the end of each test. The residual voltage on the circuit shall be allowed to decay to approximately 1.0 kV before applying the

manual grounds.

- 8) The insulated conductor under test shall be grounded with ground stick after each test. The conductor should remain grounded for at least 30 minutes after completion of the test.
- e. Failure of the initial leakage current to decrease, or any increase in the leakage current at any time during the test shall be presumed to be indicative of a cable defect and the test shall be continued until cable failure occurs.

H. Defective Cables

1. Any DB Entity furnished cable found defective before installation shall be replaced by the DB Entity. Cable found defective after installation shall be repaired or replaced at DB Entity's expense.
2. Any cable section installed under this Contract found defective during the testing shall be replaced with a new cable section. Rectification of defects of any cable shall be done only with the specific acceptance of the MBTA.

I. Test Reports

The DB Entity shall submit five copies of certified test reports of all field tests for the MBTA's review and acceptance. Test reports of field tests shall be submitted no later than seven days after testing. Test reports shall be self-explanatory, noting the personnel involved, and shall show the instruments used for testing and the date(s) of their last calibration. Test reports shall contain identification of each conductor tested in a manner that can be referenced to the Design Documents.

3.3 CABLE IDENTIFICATION TAGS

Install MBTA standard cable tags on new cables, two cable tags to each box, one cable tag on the cable in the box and one cable tag on the cable below (or above) the box. The aerial cable tag will be the standard MBTA embossed aluminum tag.

END OF SECTION

SECTION 16127

AC AND DC AERIAL CABLE INSTALLATION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies furnishing, installing and testing of AC and DC power cable at voltages of 13.8 kV and 600 volts.
 - 1. AC voltage power cable includes the following:
 - a. Three-conductor ethylene-propylene rubber insulated cable (EPR cable) rated 15 kV for use on Authority 13.8 kV system – refer to Section 16120 for requirements.
 - 2. DC voltage power cable includes the following: Refer to SECTION 16126 DC POWER CABLE AND DC POWER FEEDER DISCONNECT SWITCHES for requirements.
 - a. Insulated 4/0 feeder tap cable.
 - b. Insulated 500 kcmil feeder cable
 - c. Insulated 1000 kcmil feeder cable
- B. Related works are included in, but not limited to, the following Sections:
 - 1. SECTION 16201 BASIC MATERIALS AND METHODS FOR TRACTION POWER ELECTRICAL WORK.

1.2 REFERENCES

- A. MBTA Standard Specification
 - 1. P-179A 4/0 AWG Flexible Feed Tap Cable
 - 2. P-129C – 500 kcmil Ethylene-Propylene Rubber Insulated Cross-Linked Polyolefin Jacketed Cable
 - 3. P-118F 1,000 kcmil Ethylene-propylene Rubber Insulated Cross Linked Polyolefin Jacketed Cable
- B. Insulated Cable MBTAs Association (ICEA) S-68-516 standards

1.3 SUBMITTALS

- A. Submittals shall be in accordance with Volume 2 Technical Provision Subsections 2.7 and 2.8, except as modified herein.
- B. Product Data/Catalog Cuts
 - 1. Cable

- a. Include data on manufacturer's cold weather temperature limitations.
 2. Stress cones
 3. Fire proofing tape
 4. Splicing materials
- C. Cable Test Reports
1. Manufacturer's standard physical and electrical test reports.
 - a. Submit test reports prior to shipment of cable from manufacturer.
- D. Certificates of Compliance
1. Cable
 - a. Submit certificates of compliance prior to shipment of cable from manufacturer.
- E. Manufacturer's Instructions
1. Cable terminating procedures.
 2. Cold weather installation procedures for cable.
 3. Cable splicing procedures.

1.3 DELIVERY, HANDLING, TRANSPORTATION, STORAGE AND PROTECTION

- A. Delivery, handling, transportation, storage and protection shall be in accordance with the contract documents, except as modified herein.
1. Cable shall be unloaded in a manner such that the unloading equipment used does not come into contact with the cable surface and protective wrap.
 2. Cable reels shall be stored on a hard surface so that the flanges do not sink into the soil and allow the weight of the reel and cable to rest on the cable surface.
 3. Cable reels shall be stored in an area where construction equipment, falling or flying objects or other material will not come into contact with the cable, and where chemicals, and petroleum products will not be spilled or sprayed on the cable.
 4. Cable shall be stored in an area away from open fires and sources of high heat.
 5. When a reel of cable is to be rolled from one point to another, the surface over which the reel of cable is to be rolled shall be examined for objects which could contact and damage the cable surface or protective wrap.

- a. Remove objects prior to moving the reel of cable.
- 6. If a length of cable has been cut from the reel, the cable end shall be immediately resealed to prevent the entrance of moisture.

1.4 QUALITY ASSURANCE

A. Environmental Requirements

- 1. When cables are to be installed in cold weather, the cables shall be stored in a heated area for a minimum of 24 hours prior to installation.
- 2. Cold weather temperature installations shall be in accordance with the manufacturer's recommendations. Submit manufacturer's cold weather temperature limitation data, including, but not limited to, data on temperature ranges.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. The cable shall be suitable for use in outdoor environments, wet and dry locations in conduit and underground duct systems.
- B. The cable shall be rated for 90°C normal, 130°C emergency and 250°C short circuit operating conditions.

2.3 AC AERIAL CABLE

- A. AC aerial cable shall be either 4/0 or 500 kcmil, ethylene-propylene rubber insulated cable in accordance with SECTION 16120 MEDIUM VOLTAGE POWER CABLE FOR THE TRACTION POWER SYSTEM, assembled with a 9/16" copperweld messenger. Size of cable installed shall be as indicated in the Contract Documents.

2.4 STRESS CONES

- A. Stress relief cones shall be manufactured by G & W Electric Specialty Co., Thomas & Betts, Raychem, or approved equal.
- B. Connectors shall be long barrel compression type.
- C. Cable terminations shall be rated at 15 kV phase to phase.

2.5 FIRE PROOFING TAPE

- A. Fire proofing tape shall be manufactured by 3M Company, Scotch Brand 77; Plymouth Brand Ply-Are; Elastimold, fire and arc proofing tape, or approved equal.

2.6 SOURCE QUALITY CONTROL

- A. Cable Testing

1. Cable shall receive the manufacturer's standard physical and electrical tests prior to shipment from the factory. Testing shall be in accordance with ICEA S-68-516.
 - a. Conductor resistance: In accordance with AEIC, paragraph 1.2
 - b. AC withstand (5 minutes): 15 kV - 44 kV
 - c. IR constant (at 15.6°C), minimum: 50,000 megohms/MFT
 - d. DC withstand (15 minutes): 15 kV - 80 kV

PART 3 - EXECUTION

3.1 INSTALLATION: AC CABLE

- A. The cable installation shall be in accordance with the manufacturer's recommended installation procedures and SECTION 16120 MEDIUM VOLTAGE POWER CABLE FOR THE TRACTION POWER SYSTEM, and the Contract Documents.

3.2 INSTALLATION: DC CABLE

A. General

1. The DB Entity shall inform the MBTA of any field conditions which prevents construction and perform the work in question in accordance with the MBTA's instructions.
2. The DB Entity shall coordinate this work with the installation of the overhead contact system and other disciplines. All riser and tap connections in the overhead system work area shall be completed prior to turning over the overhead system to revenue service.
3. The DB Entity shall conform to safety features and requirements specified, especially the requirements related to safety vests and flagmen when required.

B. Insulators and Hardware

1. Insulators and hardware shall be assembled and installed as indicated in Contract Documents. Nuts shall be tightened with lockwashers and cotter pins properly installed. Nuts and cotter pins shall be oriented toward the pole or downward as applicable.
2. Hardware shall be inspected for missing parts and visual defects prior to installation. All metal shall be free of dirt, corrosion or damage to the galvanizing.
3. Insulators shall be bright and clean when installed. Abrasive materials shall not be used for cleaning of insulators. Chipped or cracked insulators shall not be reused.

C. Feeder Cable Stringing

1. Cables shall be handled with care. Cables shall not be run over by vehicles or any other object that could damage the insulation or conductors. The cable on each reel shall be examined for cuts, kinks, or other damage. Damaged portions shall be removed and replaced or repaired as directed by the MBTA.
2. Temporary guard structures shall be installed as required to maintain adequate clearance over roads and other lines.
3. Scrap materials such as timbers or other supports, shall be gathered up and disposed of in a manner satisfactory to the MBTA. The scrap cable pieces shall be salvaged and disposed of by the DB Entity.
4. The cable shall be inspected continuously as it leaves the reel. If severe cuts are detected, the stringing operation shall be stopped until the damage is repaired. Repair sleeves may be used only with permission of the MBTA. Damaged cable shall not be installed without repair. All repairs shall be accepted by the MBTA.
5. No splices shall be permitted in spans over road crossings. In other spans, only one splice per span will be permitted in each wire and the splice shall not be within 10' of any structure. Splices shall not be pulled through stringing sheaves or sagging blocks.
6. Stringing tension shall be adjusted to correspond to the conductor temperature as indicated in Contract Documents but all stringing tensions shall be developed by the DB Entity. The conductor temperature shall be measured after taping an electronic type thermometer in contact with the bare conductor and shading the thermometer from direct sunlight. The DB Entity shall record conductor temperature and tension at each end of the cable length and any temperature variations during sagging operation. These records shall be retained and copies submitted daily to the MBTA. All supplementary cables in the same span, whether existing or new, shall be sagged evenly. The DB Entity shall correct any cable length installed at incorrect tension.
7. All equipment such as sheaves, clamps, pulling devices, and tension stringing equipment shall be in good condition. Any such equipment that, in the opinion of the MBTA could result in damage to the cables shall be removed from the work site.
8. Stringing blocks shall be properly mounted on the pole or crossarm in such a manner that no binding shall occur while stringing. Stringing blocks that are not properly maintained shall not be used and shall be removed from the job site.

D. Aerial Cable Splicing and Terminating

1. The DB Entity shall splice the aerial cables only where permitted in Section 3.2 of this section.
2. In order to obtain optimum electrical contact and adequate insulation at the points of connection of each cable, only the most highly skilled cable splicers shall be employed. Cable splicers shall have experience in making splices of similar cables for similar applications. The DB Entity shall submit the name of the individual, with the number of years and type of experience on similar projects. The DB Entity shall obtain prior approval of all individuals who will be making splices.

3. Each splicer shall be approved for the job by the MBTA prior to any splicing activities. The MBTA may request the splicer to make test splices in the presence of the MBTA before the acceptance is granted.
4. All faulty, imperfect, or damaged splices found during or after installation, shall be removed and replaced. New splices shall be subject to the same tests as are required for the cables after initial installation.
5. The DB Entity shall splice the aerial cables using a full tension compression type connector recommended by the cable manufacturer for the conductor size and expected service conditions and shall cover the joint and seal the cable insulation using heat shrinkable insulating tubing. Tubing shall be rated for 2,000 volts and for outdoor use.
6. Full tension cable splices shall be installed with the cable laid out in a straight line for approximately 10' on each side of the connection.
7. Ends of the aerial cable shall be sealed or terminated at pole mounted disconnect switches, if required or at other location.

E. Other Cables

1. The DB Entity shall install other overhead cables and cable assemblies as indicated in the Contract Documents, such as feeder taps and equalizer jumpers.
2. Riser cables shall be supported using new split Glastic G10 clamps as shown on the Project Standard Plans. Tap cables shall be supported on support brackets or span wires using new clamps or tie wire.
3. The DB Entity shall cut new riser and tap cables to final length, install lugs and clamps, and connect these cables to disconnect switches and conductors, respectively.
4. Current-carrying connectors shall be installed in accordance with the following:
 - a. Wire surfaces, which are in contact with conducting surfaces of the connector, shall be thoroughly wire brushed and shall have an inhibitor applied. Where connectors are not factory-loaded, the same inhibitor shall be applied in the field to the connector.
 - b. Corrosion inhibitors shall be stable over a wide temperature range, able to adhere to cold metal surfaces, water-repellent, weather resistant, and inert to copper, aluminum, zinc, tin, cadmium, steel, and rubber. Grit-bearing inhibitors shall be used except for flat lugs, sliding surfaces or where omission is recommended by the connector manufacturer. Grit shall be compatible with the connector and wire metal. Inhibitor for copper and bronze shall be T&B "Kopr Shield", Fargo "Fargolene", Penn-Union "Cual-Aid", Burndy "Penetrox A", or approved equivalent.
 - c. Bolts in bolt-type connectors shall be lubricated as recommended by the manufacturer and torqued to the manufacturer's recommendation using a calibrated torque wrench.
5. Install and connect the feeder tap cable used to provide 600-volt power to the messenger cable from the manual disconnect switch.

F. Control of Scrap

1. Scrap and debris shall be collected, removed daily from the job site and disposed of by the DB Entity.

G. Installation of Traction Power Disconnect Switches and Supports

1. Install traction power disconnect switches assembled in enclosures including cable clamp supports, as indicated in the Contract Documents. Install a cable tag on each cable in the switch box as indicated in the Contract Documents.
2. Install switch enclosures plumb and level and in alignment with adjoining work or structure in accordance with the Contract Documents.

H. Cable Identification

1. Install a cable tag indicating the power section on the cable at all feeder tap locations as described herein.

3.3 TESTS

A. General

1. The DB Entity shall provide all instruments, materials, and labor required for tests specified herein on the DC traction feeder cable furnished and installed by the DB Entity.
2. The DB Entity shall formulate an overall test program for the installation, which shall include, but not be limited to, the tests specified in this Section to ensure equipment and material compliance with the relevant standards, this Specification and satisfactory and reliable performance in actual intended operation.

B. Conditions for Tests

1. Prior to testing of any cable and the installation, the following conditions shall be fulfilled by the DB Entity:
 - a. The DB Entity shall have in his possession, all the shop drawings duly accepted by the MBTA.
 - b. The DB Entity shall have submitted testing procedures for the MBTA's acceptance at least 45 days in advance of the testing.

C. Witnessing Tests

1. The MBTA will witness complete field-testing on all the cable installation.

D. Responsibility

1. The DB Entity shall assume full responsibility during field-testing of all cable installation provided by them. Should there be any loss or damage to such cable or installation as a result of these tests, the DB Entity shall be fully responsible for replacing the damaged cable. Replacement of damaged cable shall include all costs, including, but not limited to, removal of damaged cable, furnishing of, transportation of, and installation of replacement cable.

E. Rejection and Retesting

1. Failure of cable or splice to withstand tests or to meet ratings shall be sufficient grounds for rejection of the item tested.
2. Any cable or splice rejected shall be retested in the presence of the MBTA after rectification.
3. If it is not possible to rectify rejected cable to the satisfaction of the MBTA, new cable shall be installed.

F. Costs of Tests

The price for conducting all field tests and checkouts in the presence of the MBTA, including entire cost of rectification, retesting, and/or supplying of new items shall be deemed to be included in the Contract Price.

G. Field Tests

1. All DB Entity-installed DC positive traction feeder cables shall be tested to ascertain that the dielectric strength of the cable insulation has not been impaired during installation, that the splices and terminations are properly made and to confirm the integrity of the cable system prior to energization. Tests shall include continuity tests, insulation resistance tests and high potential direct current tests. High potential direct current tests specified herein shall be applicable only to DC positive cables. Rectification of defects of any cable shall be done only with the specific acceptance of the MBTA.
2. Acceptance Tests: After installation of any length of a cable and completing all connections to risers, jumpers, and taps, the DB Entity shall perform the below listed tests on each cable circuit. To preclude damage to equipment and devices the tests shall be conducted before the cable is connected to the disconnect switches and trolley wires.
 - a. Continuity Test: This test shall be performed to prove the continuity of cable circuits.
 - b. Insulation Resistance Test
 - 1) This test shall be performed to determine the cable insulation resistance to ground.
 - 2) Tests shall be conducted with a 1,000-volt motor operated megger. Test voltage shall be applied between the conductor and ground and shall be held until the reading reaches a constant value for five minutes. Insulation resistance values obtained by the megger tests shall not be less than two megohms. The DB Entity shall bring to the attention of the MBTA, the results of similar tests having unequal ratings with the variations of 25% or more.

- 3) For each test, the DB Entity shall record the temperature, humidity, duration of the test and the voltage of the megger used.
- c. High Potential Test, DC positive cables: This test shall be performed only after the insulation resistance test has been successfully completed and shall be performed on each cable circuit installed under this Contract. Before conducting the high potential direct current tests, the DB Entity shall comply with the following requirements:
- 1) Nearby equipment, the conductors of nearby insulated cables not under test, except those in service, and the ground stick shall be securely tied to the grounding system.
 - 2) The insulated conductor under test shall have a safe clearance from adjacent conductors and surrounding metal objects. For every 1,000 volts of DC test voltage, 1/4-inch clearance is regarded as a safe distance.
 - 3) High voltage gloves, tested for insulation integrity, shall be worn by each participant.
 - 4) The test voltages shall meet the recommendations of the cable manufacturer.
 - 5) Danger signs and sentries shall be posted at all critical points along the entire cable route under test.
 - 6) The operator's manual for the particular test set being used shall be read and understood.
 - 7) All safety precautions shall be observed at the testing end and at the far end of the cable.
- d. Each cable circuit shall be tested separately while grounding test equipment and all cables not under test, except the one being tested. The following test procedure shall be followed:
- 1) The test equipment shall be supplied from a stable, constant voltage source having a maximum variation of the voltage of plus or minus five percent. Preferably, a motor-driven generator shall be used for the supply. The output voltage of the test set must be filtered, regulated, and spike free.
 - 2) The direct current test voltage shall be applied between conductor and ground slowly in equal steps (in steps of five to seven percent of full test voltage) until the designated test voltage is reached. The rate of voltage acceleration shall be consistent under each step.
 - 3) Sufficient time shall be allowed after each step for the leakage current to stabilize.
 - 4) Total leakage current shall be recorded in micro-amperes after each step. The same length of time shall be allowed after each step for the total current to stabilize before taking the readings.
 - 5) The test voltage shall be 80% of the original factory test voltage. The test voltage shall be maintained for five minutes after it has reached the specified value.

- 6) Total current values shall be recorded in micro-amperes at one minute intervals for the duration of the test.
 - 7) The test set voltage control shall be set at zero at the end of each test. The residual voltage on the circuit shall be allowed to decay to approximately 1.0 kV before applying the manual grounds.
 - 8) The insulated conductor under test shall be grounded with ground stick after each test. The conductor should remain grounded for at least 30 minutes after completion of the test.
- e. Failure of the initial leakage current to decrease, or any increase in the leakage current at any time during the test shall be presumed to be indicative of a cable defect and the test shall be continued until cable failure occurs.

H. Defective Cables

1. Any DB Entity furnished cable found defective before installation shall be replaced by the DB Entity. Cable found defective after installation shall be repaired or replaced at DB Entity's expense at the direction of the MBTA.
2. Any cable section installed under this Contract found defective during the testing shall be replaced with a new cable section. Rectification of defects of any cable shall be done only with the specific acceptance of the MBTA.

I. Test Reports

The DB Entity shall submit five copies of certified test reports of all field tests for the MBTA's review and acceptance. Test reports of field tests shall be submitted no later than seven days after testing. Test reports shall be self-explanatory, noting the personnel involved, and shall show the instruments used for testing and the date(s) of their last calibration. Test reports shall contain identification of each conductor tested in a manner that can be referenced to the Contract Documents.

3.4 CABLE IDENTIFICATION TAGS

- A. Install standard cable tags on all cables, one cable tag on the cable in the enclosure below the switch and one cable tag on the cable above the switch. Where cables are common to a power section and do not have an identifying number, install a cable tag with the power section number on the riser cable. Tag to read: "SECTION XX" with XX being the associated power section number. The aerial cable tag will be the standard MBTA embossed aluminum tag and held onto the cable with double tie wraps that are UV stable.

END OF SECTION

SECTION 16128

OVERHEAD CATENARY SYSTEM SURGE ARRESTOR PROTECTION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies furnishing and installation of surge arrestor devices for protection of the overhead contact system from lightning strikes and overvoltage surges.

1.2 REFERENCES

- A. The installation shall conform to the requirements of the National Electrical Safety Code (NESC), National Electric Code (NEC), Rural Electric Association (REA), National Fire Protection Association (NFPA), applicable MBTA standards and the Contract Documents.
- B. Components shall conform to the latest editions of the following national standards and codes:
 - 1. ICEA
 - 2. ANSI/IEEE C62.11
 - 3. ANSI C29, EEI TD-17
 - 4. NEMA
 - 5. IEEE 80

1.3 SUBMITTALS

- A. Submittals shall be in accordance with the Contract Documents.
- B. The DB Entity shall submit a certification to the MBTA verifying that the surge arrestor has been designed, manufactured, inspected and tested in accordance with the applicable portions of the referenced standards.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Arrestors shall be inspected for damage upon receipt of delivery and handled with care. They shall be stored in a clean, dry environment.
- B. Materials shall be protected against damage in ordinary handling and shipping. Each arrestor shall have a strong, weatherproof tag securely fastened to it showing the operating properties as follows:
 - 1. Duty cycle voltage.
 - 2. Maximum continuous operating voltage (MCOV)
 - 3. Part number

PART 2 – PRODUCTS

2.1 MATERIALS

- A. Surge arrestors shall be inherently resistant to corrosion or properly protected against corrosion. No

materials shall be combined which form an electrolytic coupling that accelerates corrosion such as copper-aluminum couplings.

- B. Surge arrestors shall consist of a metal oxide varistor housed in polymer rubber rated for 3,000 volts. They shall be Ohio Brass PDV-65, the MBTA standard or approved equal.
- C. All metallic hardware used in the arrestor shall be stainless steel. Each arrestor shall have a protective insulating cap to insulate the positive terminal on the top of the arrestor. Arrestors shall have attachment hardware for attaching to cross-arms or pole clamps.
- D. The arrestor positive wire lead shall be copper wire supplied separately by the DB Entity. It shall be No. 2 AWG stranded insulated copper wire rated for 2,000 volts. Strands shall be tinned.
- E. All cable connectors where arrestor lead wires connect to feeder tap or feeder cables shall be of bronze and suitable for the application as indicated in the Contract Documents.
- F. Arrestor ground wires shall be AWG 4/0 stranded copper cable, tinned and jacketed/insulated for 2,000 volts. Markings on the cable jacket shall be consistent with other MBTA specifications.
- G. Ground wire shall be placed in a 1" FRE conduit as indicated in the Contract Documents. The conduit shall be bolted to either a pole or wall with a conduit.
- H. Ground rods shall be 3/4" x 10'-0" and be comprised of copper clad steel. If necessary, provide additional ground rods as required to achieve a resistance ground of 5 ohms or less.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Surge arrestors shall be installed as part of one or more assemblies in accordance with these Mandatory Specifications, and shall be installed in accordance with Section 16123 – OVERHEAD CONTACT SYSTEM INSTALLATION.
- B. Surge arrestors shall be installed at all locations where an underground cable rises up to tap into the OCS. They shall also be installed at feeder tap locations every 500' along the right of way, only when coming from an underground cable.
- C. They shall be installed on the OCS pole or cross arms at the height of the feeder tap but not below the feeder tap or cable to which they are connected. Arrestors shall not be located directly above disconnect switch enclosures but mounted on the same pole at the feeder tap or feeder cable height.
- D. Arrestor positive lead wire shall be no longer than 12 inches. Where this length cannot be achieved, the DB Entity shall take direction from the Engineer of Record and lead wire size may have to be increased to ensure the same resistance. Lead wires shall be attached directly to the feed tap or feeder cable. The connector shall be fully insulated to the level of the cable.
- E. Surge arrestors shall be installed on individual cables so that there is one arrestor for each feeder tap or feeder cable. The ground wire of multiple arrestors on a pole can be common so that all arrestor ground wire leads are connected and one ground wire is run down the pole. The ground wire shall be an insulated 4/0 AWG stranded copper cable. Where multiple ground wire leads are connected to a common ground wire, the wire leads from the negative terminals can be a No. 2 AWG insulated wire as used for the positive lead wire. These shall be connected to one 4/0 AWG insulated ground wire that will run down the pole.
- F. Ground wires shall run straight with as few bends as possible. Where the cable must be bent, it shall be

done with as large a radius as possible. Kink bends are not allowed. All connections of ground wires except at the top of the OCS pole shall be by exothermic weld.

- G. Where bolted connectors are used, the conductors shall be thoroughly cleaned of corrosion and a liberal coating of anti-oxidation paste applied to the cable, wire and connector prior to makeup of the connector. The connection shall be insulated by a combination of layering of rubber insulating tape with a covering of electrical tape to an insulation level consistent with the cable insulation.
- H. Acceptance testing of surge arrestors shall be as stated in SECTION 16123 OVERHEAD CONTACT SYSTEM INSTALLATION.

END OF SECTION

SECTION 16140

OVERHEAD CONTACT SYSTEM FITTINGS AND HARDWARE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies furnishing, delivery and installation of ferrous and non-ferrous metal material, hardware and fittings for a catenary system as shown in the Volume 2 Technical Provisions, including, but not limited to, the following:
1. Hangers
 2. Wire splices
 3. Clevis-clevis fittings
 4. Wire terminations
 5. Parallel wire clamps
 6. Nuts, bolts, washers and cotter pins
 7. Turnbuckles
 8. Double clevis end fittings
 9. Thimbles
 10. Wire sleeves
 11. Wire clips
 12. Registration fittings and components
 13. Feeder, suspension and supports
 14. Section insulators

1.2 REFERENCES

- A. Pertinent provisions of the MBTA reference drawings and standards contained in the appendices and the following listed codes and standards shall apply to the work of this Section, except as modified herein, and are hereby made a part of this Specification to the extent required:
1. Ferrous Metals: American Society for Testing and Materials (ASTM)
 - A27 - Mild to Medium-Strength Carbon-Steel Castings
 - A36 - Structural Steel
 - A47 - Malleable Iron Castings
 - A153 - Zinc coating (Hot-Dip) on Iron and Steel Hardware
 - A167 - Stainless and Heat-Resisting Steel
 - A501 - Hot-Formed Welded and Seamless Carbon Steel Structural Tubing

A518 - Corrosion-Resistant High Silicon Cast Iron

A536 - Ductile Iron Castings

A668 - Steel Forgings, Carbon and Alloy for General Industrial Use

A711 - Carbon and Alloy Steel Blooms, Billets and Slabs for Forgings

A747 - Steel Castings, Stainless, Precipitation Hardening

2. Non-Ferrous Metal: American Society for Testing and Materials (ASTM)

B26 - Specification for Aluminum-Alloy Sand Castings

B140 - Copper-Zinc-Lead (Leaded Rod Brass or Hardware Bronze) Rod, Bar and Shapes

B148 - Aluminum-Bronze Sand Castings

B179 - Aluminum Alloys in Ingot Form for Sand Castings, Permanent Mold Castings and Die Castings

B248 - General Requirements for Wrought Copper and Copper-Alloy Plate, Sheet, Strips and Rolled Bar

B249 - General Requirements for Wrought Copper and Copper-Alloy Rod, Bar and Shapes

B315 - Specification for Seamless Copper Alloy Pipe and Tube

B557 - Methods of Tension Testing Wrought and Cast Iron Aluminum - and Magnesium - Alloy

B584 - Copper Alloy Sand Castings for General Applications

B686 - Specification for Aluminum Alloy Castings - High Strength

One copy of each of the standards for Ferrous and Non-Ferrous Metals shall be furnished to the MBTA for their use and permanent records.

1.3 SUBMITTALS

A. The following information shall be submitted in accordance with Section 01300:

1. Shop drawings: The DB Entity shall submit shop drawings for all components for approval prior to manufacture, showing details and dimensions, and giving designations of the materials comprising the various components together with technical, mechanical and electrical characteristics as appropriate.
2. Parts, materials, components and all other hardware shall not be accepted without the submittal and acceptance of shop drawings. The MBTA reserves the right to require the DB Entity to remove any and all materials and methods that have not been approved before installation.

1.4 DELIVERY, STORAGE AND HANDLING

- A. The identification mark of the manufacturer or foundry and the pattern numbers assigned by the supplier shall be cast or stamped into all castings and fabrications. Marks and numbers shall be readable size, and placed in such a position that they will not affect the electrical or mechanical performance.
- B. Fittings and hardware shall be packed adequately to ensure acceptance and safe delivery, in accordance with the best commercial practice.
- C. Overhead fittings and hardware shall be adequately packaged to allow stacking and outdoor storage until installation, with no harmful effects until installation.
- D. Each part shall be tagged with description, purchase order and line item numbers, as well as assembly and item number.

1.5 QUALITY CONTROL

- A. The DB Entity shall submit certification to the MBTA verifying that all hardware items are in conformance with either ASTM Standards referenced herein, other applicable standards and requirements, or Volume 2 Technical Provisions.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Material for hardware and fittings shall comply with the MBTA standard specifications for overhead components and Volume 2 Technical Provisions. Substitutions may only be submitted to the MBTA for consideration if the part is not manufacturer specific. The DB Entity shall be responsible for form and fit of all components and hardware. Maximum interchangeability of components shall be considered to reduce inventory.
- B. All OCS components and parts thereof shall be time proven and in use in other transit systems and railroads utilizing overhead catenary systems. Manufacturers providing equipment and parts shall have been doing business in the OCS industry for a minimum of 10 years.
- C. In order to ensure compatibility with MBTA requirements and the existing overhead contact system, certain specific components of the overhead system have been specified by manufacturer's part number or designated as approved equal on the Contract Documents. This provides continuity and interchangeability of hardware throughout the entire MBTA overhead network. DB Entity shall verify that indicated components function properly as indicated on the Contract Documents. Substitutions of "as equal" shall be per acceptance of the MBTA.

2.2 METAL CHARACTERISTICS

- A. Malleable Iron: Fittings or components made of malleable iron shall be Grade 32510 or better and shall conform to ASTM-A47. All components and fittings shall be galvanized in accordance with ASTM-A153.
- B. Forged Steel: Material for forged steel shall comply with ASTM-A711 or A668. All components and fittings shall be galvanized in accordance with ASTM-A153.
- C. Structural Steel Tubing: Structural steel tubing shall conform to ASTM-A501 and be galvanized in accordance with ASTM-A153.
- D. Ductile Iron: Fittings or components requiring high yield strength shall be of ductile iron, Grade 60.40.18 or better and shall conform to ASTM-A536. All fittings shall be galvanized in accordance with ASTM-A153.
- E. Stainless Steel: Stainless Steel hardware shall conform to ASTM-A747. Cotter pins shall be made of stainless steel.
- F. Non-Ferrous Metals: Copper alloys for fittings and components shall conform to ASTM-B584 and B148.
- G. Copper: All copper components shall conform to ASTM-B248 or B249.

2.3 FABRICATION AND CASTING

- A. Castings shall be of uniform quality and shall be made in such a manner that the material of the casting conforms to the chemical and mechanical properties prescribed in the referenced ASTM standards. Castings shall be tested for anomalies, inclusions, cold forming and other defects that could affect the performance of the component. The DB Entity shall provide an adequate supply of parts, equipment, materials and required tools available at the site for orderly installation and testing of equipment without delay.
- B. Material to be fabricated shall be performed in a manner consistent with best practices. Formed steel pieces shall be heated and bent while red hot. Cold bending of components for OCS is not allowed.

2.4 TECHNICAL SUPPORT EQUIPMENT

- A. General: The DB Entity shall provide an adequate supply of parts, equipment, materials and required tools available at the site for orderly installation and testing of equipment without delay.
- B. Requirements for Installation: An additional quantity of ten (10) percent or a minimum of two of each item of fittings and hardware, whichever is greater, shall be provided at no additional cost to the MBTA and shall be made available for use after the installation. These items shall be turned over to the MBTA's Power Division at 21 Arlington Avenue, Charlestown, Massachusetts.
- C. Special Tools: If any special tools are required for installation, the DB Entity shall furnish two sets of each, to be turned over to the MBTA upon Contract Substantial Completion.

2.5 SPARE PARTS

- A. The DB Entity shall provide supply of spare parts at the end of the contract. The quantity of spare parts shall be for all types of OCS components, wire and cable and it shall be 10% of the amount used on the project. Poles shall be an exception where a specific quantity of spare poles shall be required as indicated in the following list:

Description	Quantity
Pole, wide flange, 10 x 39, 40 ft	5
Pole, wide flange, 10 x 53, 40 ft	5
Pole, wide flange, 12 x 79, 40 ft	5
Pole, wide flange, 12 x 106, 40 ft	5

PART 3 – EXECUTION

3.1 INSTALLATION

Overhead fittings and hardware shall be installed as part of one or more assemblies shown on the Contract Documents in accordance with Section 16123 – OVERHEAD CONTACT SYSTEM INSTALLATION and per manufacturer’s recommendations.

END OF SECTION

SECTION 16201

BASIC MATERIALS AND METHODS FOR ELECTRICAL WORK FOR THE TRACTION POWER SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies basic materials and methods for electrical work for providing a complete traction power system.
- B. Related Work: Refer to Section 16450 - Grounding for the Traction Power System, for proper installation of components identified in this section. The following items are not included in this Section and will be performed under Specification Sections 16100, 16203 and 16311:
 - 1. Determine interfaces and coordinate electrical work with utility company or the MBTA where power source is the MBTA's.
 - 2. Determine interfaces and coordinate with work completed, progressing, or to be performed under other sections of these Specifications. Make indicated connections to previously completed work. Where future connections to or extensions of the work are indicated, make safe and convenient provisions for such future connections and extensions.
 - 3. Where indicated, take possession of, maintain, and operate as required any electrical plant and equipment left in place by others. Where indicated, leave temporary and interim electrical work, plant and equipment in place for maintenance and operation by others.

1.2 REFERENCES

- A. Comply with applicable requirements of the following:
 - 1. National Electrical Code
 - 2. Massachusetts Electrical Code

1.3 SUBMITTALS

- A. Submit shop drawings for review showing fabricated work being furnished and installed under these Specifications. Submit such drawings prior to fabrication and within ample time to prevent delays in the work.
- B. Submit verified test results to the MBTA promptly upon completion of test.
- C. Before procurement of the wire and cable, submit the following information for each type and size of wire and cable:
 - 1. Manufacturer of the wire and cable.
 - 2. Number and size of strands composing each conductor.
 - 3. Conductor insulation composition and thickness in mils.
 - 4. Average overall diameter of finished wire and cable.
 - 5. Minimum insulation resistance in megohms per 1000 feet at 20°C ambient.
 - 6. Jacket composition (if any) and thickness in mils.
 - 7. Total number of conductors per cable.
 - 8. Shield material (if any) and thickness.
 - 9. Conductor resistance and reactance in ohms per 1000 feet at 20°C ambient.

10. Conductor ampacity at 20°C ambient.
- D. Conduit fill and cable pulling calculations shall be provided.
- E. Cable tray and raceway system design
1. Manufacturer
 2. Material
 3. Methods of support
 4. Fill calculations
 5. Grounding/bonding
 6. Loading calculations
 7. Layout of raceway systems and location of anchoring supports

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Furnish all items of the materials, design, sizes, and ratings shown on the Design Documents and herein specified.
- B. Furnish materials and equipment bearing evidence of UL listing where UL standards exist and such product listing is available.
- C. Methods of fabrication, assembly and installation shall be proposed by the DB Entity unless otherwise specifically indicated.
- D. Provide products that are free from defects impairing performance, durability, or appearance, and of the commercial quality best suited for the purpose shown on the Design Documents or specified herein.
- E. Steel conduit and accessories specified to be zinc coated: Hot-dipped galvanized after fabrication in accordance with ASTM A286.
- F. Conform to applicable requirements of Insulation Power Cable Owners' Association (IPCEA).

2.2 RIGID GALVANIZED STEEL CONDUIT AND ACCESSORIES

- A. Conduit, couplings, elbows, bends, and nipples: ANSI C80.1 and UL 6, with each length bearing manufacturer's stamp and UL label.
- B. Method used to determine the thickness of zinc coating: The Referee Test included in the appendix to ANSI C80.1.
- C. Fittings and Accessories:
 1. Galvanized steel or malleable iron, ANSI C80.4.
 2. Provide separable watertight hub fittings with a gasket, separate nylon insulated throat and a case hardened locknut.
 3. Bushings: Nylon insulated metallic and grounding type.
 4. Furnish conduit straps, clamps, and clamp backs made of galvanized malleable iron.
- D. PVC Coated Conduit

1. NEMA Standard No. RN1, Coating Type A-40.
 2. Thread protectors installed on both ends of conduit for shipment and handling, couplings packaged separately.
 3. Submit full technical parameters for review by the MBTA.
- E. Almost without exception, exposed conduit in any below grade structures, the MBTA requires the use of RGS conduit.
- F. All conduits penetrating floors and ceilings must have brass labels for ease of tracing circuits.
- G. Buried conduits cannot have buried pull boxes.

2.3 LIQUID-TIGHT FLEXIBLE METALLIC CONDUIT AND FITTINGS

- A. Furnish conduit consisting of a core of flexible galvanized steel with an extruded liquid-tight plastic or neoprene jacket overall. Jacket shall be moisture and oil-proof, capable of conforming to the minimum radius bends of flexible conduit without cracking.
- B. Furnish conduits with a continuous copper bonding conductor spiral wound between the convolutions, as required by NEC, and as indicated.
- C. Fittings: UL Standard 514, cadmium or zinc-coated.
- D. Liquid-tight conduit may not be used for High Voltage circuits.

2.4 PVC ELECTRICAL CONDUIT AND FITTINGS (ONLY FOR OUTDOOR USE IN CONCRETE ENCASED DUCTBANKS)

- A. Heavy wall, high impact strength, rigid PVC conforming to the requirements of EPC-40-PVC conduit of NEMA TC2 and fittings for EPC-40-PVC conduit of NEMA TC3.
- B. UL listed in accordance with Article 347 of the NEC for underground and exposed use.
- C. Flammability rated as self-extinguishing, and having the following minimum properties:
 1. Tensile strength, ASTM D638 at 78°F: 6,000 psi.
 2. Flexural strength, ASTM D790: 11,000 psi.
 3. Compressive strength, ASTM D695: 8,500 psi.
 4. Hardness (Durometer D), ASTM D2240: 77.
 5. Water absorption, percent maximum, in 24 hours at 72°F. ASTM D570: 0.03.
 6. Dielectric strength, volts per mil, ASTM D149: 1,100.
 7. Thermal conductivity: 1.3 BTU per square foot per degree F per inch.

2.5 NON-METALLIC CONDUIT

- A. Non-metallic conduits shall be used for conduits entering the DC switchgear and Rectifier equipment, including connections to DC surge arresters.
- B. Fiberglass conduits shall conform to MBTA Standard Specification P-138 "Specification for Fiberglass Reinforced Thermosetting Resin Conduit".

2.6 CONDUIT EXPANSION FITTINGS

- A. Fabricate from material similar to the type of conduit with which they are to be used.
- B. Include a factory installed packing ring, designed to prevent the entrance of moisture, and a pressure ring.
- C. Also include a grounding ring or a grounding conductor for metallic expansion couplings.

2.7 MULTIPLE PIPE HANGERS (TRAPEZE TYPE)

- A. Fabricate of two or more steel hanger rods, a steel horizontal member and all U-bolts, clamps, and other attachments necessary for securing hanger rods and conduits.
- B. Hanger Rod: Not smaller than 3/8" diameter, threaded either full length or for a sufficient distance at each end to permit at least 1-1/2" of adjustment.
- C. Horizontal Member
 - 1. Standard structural steel shapes such as angles or channels, 1-1/2" x 1-1/2" or 1-5/8" x 1-5/8", 12 gauge, cold-formed, lipped channel, and designed to accept special spring-held hardened steel nuts for securing hanger rods and other attachments.
 - 2. Two or more channels may be welded together to form horizontal members of greater strength than single channels.
 - 3. Galvanize after fabrication.
- D. Design
 - 1. Capable of supporting a load equal to the sum of the weights of the conduits and wires, the weight of the hanger itself, plus 200 pounds.
 - 2. The stress at the root of the thread of the hanger rods; not more than 9,475 psi at design load.
 - 3. Size the horizontal member such that the maximum stress will be not more than 12,650 psi at design load.

2.8 INSERTS

- A. Channel Inserts. Fabricate from not less than 12 gauge steel channel having an overall size of 1-1/2" x 1-1/2" or 1-5/8" x 1-5/8" inches with continuous 7/8" wide slot, in lengths as indicated. Galvanize after fabrication.
- B. Channel Inserts for Embedding in Concrete
 - 1. Fabricate from channels having a solid base.
 - 2. Weld concrete anchors to the channel during fabrication and before coating.
 - 3. Galvanize after fabrication
 - 4. Provide assemblies with a minimum pull-out load rating of 4,500 pounds per linear foot uniformly distributed.
 - 5. Furnish all channel inserts for installation embedded in concrete with the channel interior completely filled with styrofoam to prevent seepage of concrete into the channel during installation.
- C. Channel Inserts for Surface Mounting
 - 1. Fabricate from channel having 3/8" x 3" slots on 4" centers in the base.

2. Galvanize inserts for surface mounting on concrete surfaces or for installation in damp or wet areas.

D. Spot Inserts for Embedding in Concrete

1. Steel, galvanized after fabrication
2. Designed for a maximum loading of 800 pounds with safety factor of three.
3. Knockout openings to accommodate either square or rectangular nuts.

2.9 SURFACE METAL RACEWAYS AND FITTINGS

- A. ANSI/UL 5 and the NEC.

2.10 OUTLET, JUNCTION AND PULL BOXES

- A. Conform to NEC Article 370. Electrical boxes shall conform to UL-50, "Standard for Electrical Cabinets and Boxes", and UL-514, "Standard for Electrical Outlet Boxes and Fittings".
- B. Provide electrical boxes of the material, finish, type and size indicated and required for the location, kind of service, number of wires, and function. Boxes shall have mounting holes retapped for 10-24 machine screws.
- C. Provide boxes complete with accessible covers designed for quick removal and suitable for the purpose for which they will be used, except that boxes in which or on which no devices or fixtures are to be installed, shall be equipped with flat or raised blank covers as required. All ceiling fixture outlet boxes shall be equipped with 3/8" boltless fixture studs.
- D. Boxes less than 40 cubic inches in size shall be cast. Boxes over 40 cubic inches in size shall conform to the requirements for cabinets.
- E. Covers: Same thickness as boxes and secured in position by means of No. 10-24 stainless steel machine screws. Arrange covers to be readily and conveniently removed.
- F. Coat junction boxes inside and outside to prevent oxidation. Where outlet boxes are used as junction boxes they shall be cast aluminum and not be smaller than 4 inches square by 1-1/2" deep. Provide such boxes with flat blank covers.
- G. Outlet Boxes: Cast aluminum, not be smaller than 4 inches square by 2-1/8" deep.
- H. Concealed Switch Boxes: Cast aluminum, not less than 4 inches square by 1-1/2" deep for two devices unless otherwise indicated. Provide covers with rectangular openings of proper size and shape. Furnish and install special boxes required to suit the kind of service and location requirements, as indicated, and as may be directed by the MBTA.
- I. Cast metal boxes shall be of aluminum alloy, with compatible conduit fittings.
- J. Boxes for exposed switches and receptacles: Cast metal, FS and FD Types.
- K. Furnish brackets, supports, hangers, fittings, bonding jumpers and all other accessories required.
- L. Provide neoprene gaskets 1/8" thick with boxes subjected to weather, and as directed by the MBTA.

- M. Grounding. Provide each box to which a lighting fixture or receptacle is to be attached with a grounding terminal.
- N. Grounding Terminal: Either a green-colored washer-in-head machine screw not smaller than No. 10-32 in a drilled and tapped hole in the back of the box, or a grounding bushing with green-colored machine screw terminal attached to one of the conduits.
- O. Provide suitable grounding terminals in motor connection boxes.
- P. Install grounding jumpers as specified in Section 16450 – Grounding for the Traction Power System.
- Q. Junction and pull boxes must be surface mounted and not buried.

2.11 CABLE TRAYS

- A. General. Provide cable tray systems conforming to the requirements of NEMA VE1, except for modifications indicated. Cable tray system shall be designed to withstand Seismic Zone 2A earthquake.
- B. Cable tray within 6' of the DC switchgear and rectifiers shall be fiberglass to avoid the possibility of grounding the equipment.
- C. Cable Tray System Components: Hot-dipped, galvanized steel with PVC coating; or, stainless steel, unless as indicated in B above.
 - 1. Hot-dipped galvanized after fabrication in accordance with ASTM A 386. PVC coating of 20 mils minimum having Shore A durometer hardness of 75.
 - 2. Stainless steel as indicated.
- D. Dimensions
 - 1. Straight sections and fittings: Inside clear width as indicated, measured between the rails. Overall width not exceeding inside depth by more than 2-1/2". Inside nominal depth: 4". Overall tray depth not exceeding inside depth by more than 3/4".
 - 2. Rung spacing for ladder-type straight sections: 9" on centers maximum.
- E. Fabrication
 - 1. Straight sections and fittings consisting of stiffened channel rungs located between channel-shaped side rails having outward projecting flanges.
 - 2. Straight-section side rails shall have a top flange at least 1-1/4" wide and minimum 3/8" vertical stiffening lip.
 - 3. Rungs shall be positioned to provide a flat, cable support surface at least 1-1/8" wide, excluding corner radii, and shall be 0.060" thick. MIG-weld rungs to side rails and clean welds.
- F. Test Requirements
 - 1. Cable tray system shall be capable of supporting a total cable load of 55 pounds per linear foot on a maximum span of 8' with a safety factor of 2 based on the destructive load, regardless of the type of splice plates or type of span, when tested in accordance with load test procedure described in NEMA VE1.
 - 2. Straight sections and fittings shall not permanently deform under a 202 pound static concentrated load applied vertically along a 4" length for both of the following conditions:

- a. Load applied to one side rail of tray section having specified cable load and support spacing. Load shall be applied at midpoint between supports over a splice connection.
- b. Load applied to one rung of empty tray section having specified support spacing. Load shall be located at midpoint between side rails and supports. Cable tray support shall be capable of supporting 0.625 of the sum of the total load on both spans adjacent to support with safety factor of 2.

2.12 CABLE TRAY CHANNEL SUPPORTS

- A. Fabricate from minimum 12 gauge steel channel, 1-5/8" x 1-5/8" inches, with a continuous 7/8" wide slot. Hot-dipped galvanized.
- B. Hardware, Fittings, and Brackets: Zinc or cadmium coated.
- C. Design assembled supports, fittings, brackets, and hardware to carry the loads calculated for the tray with a factor of safety of three or greater.
- D. Supports shall provide at least 1-1/8" bearing length for each rail and shall have provision for tray hold-down clamps and fasteners.

2.13 UNDERFLOOR DUCTS, TRENCHES, AND FITTINGS

- A. Manufacture ducts and trenches from 14 gauge galvanized steel, furnished with a UL listed corrosion-resistant coating.
- B. Design fittings for use with the duct or trench to form a complete underfloor raceway system.
- C. Ducts for Power Service: 3-1/8" wide by a minimum 1-1/4" deep, or 6" wide by 1- 1/2" deep, as indicated, with threaded 2" IPS inserts spaced on 2' centers.
- D. Ducts for Low Voltage, Communication, or Signal Use; 6" wide by 1-1/2" deep with 2" IPS inserts spaced on 2" centers.
- E. Floor Trenches: 18" wide by 4" deep with 5/16" thick floor plate. Cover plates of maximum length, as indicated.
- F. Equip inserts with caps and countersunk-head floor marking screws.
- G. Size junction boxes for underfloor ducts to accommodate the ducts, and finish similar to the duct.
- H. Provide approximate tile holders of a depth as required for installation of the floor finish.
- I. Provide service fittings where required, complete with adapters and locking nipples suitable for use with the duct.

2.14 WIRE AND CABLE (600 VOLT)

- A. Conductors: Conform to the requirements of the NEC.
 1. Feeder and Branch Circuit Conductors: Soft-drawn copper.
 2. Control Circuits: Soft-drawn copper.

3. Conductor Sizes: Standard American Wire gauge sizes. Conductors No. 10 and smaller, solid copper; No. 8 and larger, stranded copper.
 4. Minimum AWG sizes unless otherwise indicated:
 - a. No. 12 for branch circuits.
 - b. No. 14 for control wire and fixture wire
 - c. No. 16 for low voltage circuit and indication wire.
- B. Wire and Cable 600 volts and Below Installed in Raceways: Single conductor, NEC type XHHW, conforming to requirements of NEMA WC 7, or THWN. Conductors shall be tray cable rated when used in cable trays.
- C. Fixture Wire: Type AF single conductor, rated for 150°C conductor temperature, 300 volts.
- D. Color Coding of Conductors
1. Color code supply cables and branch circuit conductors throughout the secondary alternating current wiring system as follows:

Conductor	208/120 Volts	480/277 Volts
Phase A	Black	Brown
Phase B	Red	Orange
Phase C	Blue	Yellow
Neutral	White	Off-White
Ground	Green	Green

2. Color code single-conductor wires as follows:
 - a. 480/277 volt circuits, blue with yellow tracer.
 - b. 120/208 volt circuits, yellow with blue tracer.
 3. Branch circuit phase conductors No. 10 and smaller and all neutral and equipment conductors: Solid color insulation or solid color coating.
 4. Solid color coatings and tracers: A strongly adherent paint or dye not injurious to the insulation and which will not be obliterated by pulling into a conduit or raceway.
 5. On-site coloring of ends of conductor may be permitted by the MBTA upon receipt of satisfactory evidence that the DB Entity is unable to order color-coded wire and cable as specified. Provide certification from the cable manufacturer that the paint or dye proposed for field application is non-injurious to the insulation. Colored tape may be used to mark the ends of conductors in lieu of paint or dye.
- E. Identification Tags
1. Provide waterproof identification tags of brass, aluminum, plastic, or pressure-sensitive moisture-resistant labels designed for fastening to cables, feeders, and power circuits in vaults, pull boxes, manholes, and switchboard rooms and at all terminations of cable or wire.
 2. Stamp or print tags or labels to correspond with markings on the Design Documents or accepted Shop Drawings, or mark so that feeder, cable or conductor may be readily identified. Tags on conductors at switches, receptacles, motor control panels, wireways, and junction boxes shall bear the circuit number of the conductor as it appears in the circuit directory. Mark conductors in motor control panels with the terminal number.
 3. If suspended type tags are provided, design tie tags with slip-free plastic cable lacing unit or design for attachment by nylon bundling straps.

F. Cable Supports and Fasteners: Design for use with channel inserts.

G. Conductor Bundling Straps

1. Formed from self-extinguishing nylon having a temperature range of minus 65°F to plus 250°F.
2. Equip each strap with a locking hub or head with a stainless steel locking barb on one end and a taper on the other end.
3. Make wire and cable ties for installation outdoors and in exposed locations of ultraviolet resistant nylon material.

H. Splice and Terminal Connectors

1. Design termination fittings for use with the cable furnished, NEMA Standard, and UL approved.
2. Termination and splice fittings for No. 10 and smaller conductors; Screw on, spring pressure-type copper connectors with nonflammable, self-extinguishing insulation of temperature rating equal to that of cable being connected. Terminals to provide a metal insulation grip on the conductor for stain relief.
3. Termination and splice fittings for No. 8 and larger conductors: Tool-applied compression connectors of material and design compatible with the conductors for which they are used.
4. Terminal connectors for conductors Size No. 4/0 and larger: Long-barrel, double compression type, and furnished with two bolting holes in the pad.

I. Insulating Material for Splices and Terminations

1. Of the type accepted by the MBTA for the particular use, location and voltage, 3/4 inch nominal width.
2. Plastic electrical insulating tape for general use: Vinyl plastic with rubber-based pressure-sensitive adhesive. Pliable at temperature of minus 18°C to 105°C. When tested in accordance with ASTM D 3005, the tape shall have the following minimum properties:
 - a. Thickness: 7 mils.
 - b. Breaking Strength: 15 pounds per inch.
 - c. Elongation: 200%.
 - d. Dielectric Strength: 10,000 volts/mil
 - e. Insulation Resistance (Direct method of electrolytic corrosion): 1,000,000 megohms.
3. Rubber electrical insulating tape for protective overwrapping: Silicone rubber with a silicone pressure-sensitive adhesive. When tested in accordance with ASTM D1000, the tape shall have the following minimum properties:
 - a. Thickness; 15 mils.
 - b. Tensile Strength: 11 pounds per inch.
 - c. Elongation: 525%.
 - d. Dielectric Strength: 13,000 volts
 - e. Insulation Resistance (Indirect Method of Electrolytic corrosion): 1,000,000 megohms.
4. Arcproof Tape: Flexible, conformable organic fabric, coated one side with a flame-retardant flexible elastomer-self-extinguishing, with the following minimum properties:
 - a. Thickness, ASTM D1000: 55 mils.
 - b. Tensile strength, ASTM D1682; 50 pounds per inch.
 - c. Thermal conductivity, ASTM D1518; 0.478 btu/hour/square foot/degrees F.
 - d. Electrical Arc Resistance: Withstand 200 ampere arc for 40 seconds.
5. Mark each tape package to indicate shelf-life expiration date.
6. Glass Cloth Electrical Insulating Tape (for use with arcproof tape): Woven glass fabric; when tested in accordance with ASTM D1000, the tape shall have the following minimum properties:
 - a. Thickness: 7 mils
 - b. Breaking Strength: 170 pounds per inch.
 - c. Elongation: 5%.
 - d. Dielectric Breakdown: 2,500 volts.

e. Insulation Resistance (Indirect Method of Electrolytic Corrosion): 5,000 megohms.

J. Wire Harnesses

1. Wire harnesses shall be supported with a bracket fastened to the enclosure via a tack welded stud or a machine screw utilizing a shake-proof washer. Welding and/or drilling and tapping for machine screws shall be accomplished before finish paint is applied. Nylon composite tie wraps may be used for securing the harness to the support. Wire support brackets attached to the enclosure with adhesives are not acceptable. Harnesses shall be arranged to ensure that one harness does not support another and each harness can be accessed without removal of another.

2.15 WIRING DEVICES

A. General. Wiring devices include switches, receptacles and special outlets installed in raceway or conduit boxes, complete with cover plates.

B. Switches

1. AC tumbler-toggle switches: Meeting minimum requirements of UL 20 and further requirements herein specified and of specification grade, heavy duty, of the type indicated.
2. Provide switches that operate in any position and are fully enclosed with entire body and cover of molded phenolic, urea or melamine. Do not use fiber, paper or similar insulating material for body or cover.
3. Equip switches with metal mounting yoke with plaster ears, insulated from the mechanism and fastened to the switch body by bolts, screws, rivets or other substantial means that meet test requirements.
4. Provide a green-colored equipment grounding screw on the yoke.
5. Provide the section of the yoke normally intended to bear on the surface outside the box with a minimum over-all dimension of 3/4", measured at right angles to the longitudinal axis of the yoke.
6. Make switch contacts between silver or silver alloys.
7. Switches shall be back and side wired with terminals of screw or combination screw-clamp type.
8. Terminal Screws: No. 8 or larger, captive or terminal type.
9. Provide access holes for back wiring.
10. Wiring terminals capable of receiving and holding proper wire sizes as shown below:

Switch Rating	Wire Size, AWG No.
20 amperes	12 and 14
30 amperes	10

C. Wall switches: Tumbler type, totally enclosed, heavy duty, in accordance with NEMA WD 1.

D. Switches for use on incandescent or fluorescent lighting circuits: Fully rated 20 amperes at 120 or 277 volts, as indicated. Actual connected lamp wattage not to exceed the following:

Switch Rating at 120- 277 Volts	Maximum Wattage Allowed	
	120 Volts	277 Volts

20 amperes	1,400	3,000
------------	-------	-------

- E. Switches controlling outlets other than lighting, such as motors less than 1/4 horsepower may be specification grade, flush type, AC - DC, T-rated 20 ampere, 125 volts. Switches controlling straight resistance loads may be snap switches as specified herein, of the proper rating up to 30 amperes at 120-277 volts.
- F. Provide ac 120-277 volt snap switches capable of withstanding tests as outlined in NEMA WD 1, Paragraphs WD 1-2.04, WD 1-2.05A, WD 1-2.05C, WD 1-2.05E2, WD 1-2.05F2, and WD 1-2.05G. If requested by the MBTA, submit satisfactory evidence that the types of switches proposed have satisfactorily withstood these tests.

2.16 RECEPTACLES AND PLUGS

- A. Configuration and requirements for connector and outlet receptacles; UL 498 and NEMA WD 1 for heavy duty general use type.
- B. Receptacles: Fire-resistant nonabsorptive, hotmolded phenolic composition or equal bodies and bases with metal plaster ears integral with supporting member.
- C. Type: Flush type, except where otherwise indicated.
 - 1. Wall receptacles; Single or duplex as shown on the Design Documents.
 - 2. Provide receptacles and plugs (caps) with light-colored terminal facilities for neutral connections, amber or brass colored for phase conductor connections, and green-colored hexagonal machine screws for the equipment grounding conductor or connections.
 - 3. All contracts of the receptacles, including the grounding contract: Double grip bronze type with spring steel backup clips so that both sides of each male prong of the plug will be in firm contact.
 - 4. Provide all receptacles with self-grounding clip or mounting strap screws.
 - 5. Ground fault circuit interrupter duplex receptacles shall be 120 volt, 60 Hz, 15 ampere with built-in test, reset buttons, and ground fault tripped indication. They shall interrupt the circuit within 1/30th of a second on a 5 milliampere earth leakage current. They shall be designed for end of run installation or with provisions for feeding through to protect other outlets on the circuit. Maximum circuit capacity for the latter shall be 20 amperes. The receptacles shall be furnished with necessary wire connectors, clips, mounting scores and instruction.
- D. Clock Receptacles
 - 1. Receptacles for clocks are not required for clocks operating on less than fifty volts, and flush-mounted clocks (inserted type).
 - 2. Provide receptacles for clocks conforming to NEMA 5-15R, recessed so that male cap will be flush with the wall to permit the clock to cover the outlet.
 - 3. Provide plates, including finishes, as specified for cover plates, adapted to the recessed receptacles and with substantial hooks to support the clocks.
 - 4. Receptacles for surface-mounted clocks connected to the building 120-volt electrical system: As indicated.
 - 5. Where clock receptacles are shown on the Design Documents or specified, furnish the grounded type and provide with a ground jumper.

2.17 COVER PLATES

- A. Provide cover plates for each switch, receptacle, and special purpose outlet.
- B. Use multi-gang plates for multi-gang boxes.
- C. Unless otherwise indicated, use cover plates conforming to FS W-P-455.
- D. Provide and install cover plates of brushed stainless steel in ancillary spaces, mechanical rooms, fan rooms, wire closets, AC switchboard rooms, traction substations, and all unfinished areas.
- E. In public areas provide cover plates fabricated of corrosion-resistant steel, 18% chromium, 8% nickel with baked porcelain enamel bronze finish.
- F. For special purpose outlets commercially produced using special material, configuration, and size, use plate of brushed stainless steel and of a design for the particular application.
- G. Where plates of material and finish herein specified are not available commercially for these special purpose outlets, plates commercially available and suitable for enameling to match adjacent surface will be acceptable.
- H. Use stainless steel cover plates of 0.040" thickness for flush devices.

2.18 DISCONNECTION DEVICES

- I. Safety Switch Type Disconnecting Devices: Enclosed, conforming to UL Standards and the following:
 - 1. Motor Circuit Switches (600 Volts AC):
 - a. Furnish motor circuits with a separately mounted disconnect switch where required within sight of the motor.
 - b. Switch: HP rated, UL listed, quick make quick break, full cover interlock and indicator handle, conforming to FS W-S-865 for heavy duty switches.
 - c. Enclosure Type: As indicated.
 - d. Furnished handle mechanism with continuous engagement of the switch handle whether the door is open or closed, and is pad-lockable in the OFF and ON position.
 - 2. Heavy Duty Safety Switches (240 Volts AC):
 - a. Furnish heavy-duty safety switches having electrical characteristics, ratings, and modifications indicated.
 - b. Furnish switches with NEMA 12 General Purpose Enclosures, unless otherwise indicated, and with metal nameplates, front cover mounted, containing a permanent record of switch type, catalog number, and HP ratings.
 - c. Furnish handle with visible blades; reinforced fuse clips; nontearable, positive, quick make-quick break mechanism, and which is pad-lockable in the OFF and ON position.
 - d. Furnish switches meeting NEMA KS 1 requirements.
 - 3. Heavy Duty Safety Switches (600 Volts AC):
 - a. Furnish heavy-duty safety switches having electrical characteristics, ratings, and modifications shown on the Design Documents.
 - b. Furnish all switches with NEMA 12 General Purpose Enclosures, unless otherwise indicated, meeting NEMA KS 1 requirements.

2.19 INSULATED WALL COVERING

- A. As required by reduced clearances install insulated wall covering adjacent to DC switchgear and Rectifier equipment. Reduced clearance shall be a clearance less than 6'.

- B. The wall covering shall extend from floor to ceiling in the area required. The insulation shall be located to ensure that personnel cannot bridge the gap between the DC equipment and a grounded component.
- C. The insulated wall covering shall be fabricated from fiberglass and as a minimum meet the requirements for NEMA Grade GPO-1. The material shall be fire-resistant and have a high di-electric strength.
- D. The wall insulation shall be mounted to provide a flush level finish. Measures shall be provided to avoiding warping of the insulation. All securing fasteners or anchors shall be non-metallic or covered to prevent personnel contact.
- E. The wall mountings shall be provided for acceptance by the MBTA. The mountings shall be moisture resistant and not subject to warping.

PART 3 - EXECUTION

3.1 GENERAL

- A. Install all items in their proper locations as required, rigid and secure, plumb and level, and in true alignment with related and adjoining work. Do not weld electrical materials for attachment or support.
- B. Furnish anchor bolts and anchorage items as required, and field check to ensure proper alignment and location. Provide templates, layout drawings, and supervision at the job site to ensure correct placing of anchorage items in concrete. Check embedded items for correctness of location and detail before concrete is placed.
- C. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts and angles as required to set and connect rigidly the work.
- D. Control erection tolerance requirements to not impair the strength, safety, serviceability, or appearance of the installations, as accepted by the MBTA. Determine exact location of conduit. Route all conduit parallel to building lines.
- E. The trade size, type and general routing and location of conduits, raceways, and boxes shall be as indicated.
- F. Install exposed conduit so as to avoid conflicts with other work. Install horizontal raceway close to the ceiling or ceiling beams, and above water or other piping whenever possible.
- G. Install individual conductors in conduits, raceways, cable trays, ducts, and trenches and multiple-conductor sheathed cables as shown on the Design Documents to complete the wiring systems.
- H. Install switches, receptacles, special purpose outlets, and cover plates complete in a neat manner in accordance with the NEC and local electrical codes.

3.2 CONDUIT AND FITTINGS

- A. Metallic Electrical Conduit
 1. Install metallic conduit in accordance with the NEC and as indicated. Prevent concrete and other materials from obstructing the conduit. Pack all outlet, pull and junction boxes with paper

- prior to pouring concrete ends of embedded conduit. Do not use conduit smaller than 3/4" diameter.
2. Make all conduit bends in accordance with the NEC, with not more than 3 bends or 270 degrees of bends per run.
Where more than 3 bends totaling more than 270 degrees are required in a particular run, install pull boxes as required to facilitate pulling conductors.
 3. Unless otherwise indicated, terminate metallic conduit installed for future extension with flush couplings set to finished floor level.
 4. Provide metallic numbering tags indicating the conduit number on the end of conduit. Identify train control and communication conduit as indicated.
 5. Conduit shall be routed to minimize the use of embedded runs. Properly support conduit to be embedded to maintain correct location and spacing during concreting operations. If necessary, provide suitable metal supports for this purpose.
 6. Install conduit so that any moisture collecting in the conduit will be drained to the nearest outlet or pull box.
 7. Whenever exposed or buried conduit passes through an expansion or contraction joint in the structure, install the conduit at right angles to the joint, and provide an approved conduit expansion joint at the joint. Paint the conduit with an approved bituminous compound for one foot on each side of the expansion couplings.
 8. Provide expansion joints in conduit runs where required to compensate for thermal expansion.
 9. Rod and swab embedded conduit after installation to remove foreign matter, which may have worked in at the joints. If obstructions are encountered which cannot be removed, or if any conditions exist which may result in damage to wires and cables pulled through the conduit, install new conduit at no additional expense to the MBTA.
 10. After the conduit has been rodded and swabbed, repack boxes and protect conduit ends to prevent any foreign material from entering the conduit.
 11. Where metallic conduit is exposed to different temperatures, seal the conduit to prevent condensation and passage of air from one area to the other.
 12. Use only conduits that are electrically and mechanically continuous and connect to the structure ground system. Secure continuous ground by bonding where required.
 13. Apply conductive anti-seize compound to the threads of threaded rigid conduit joints. Do not use compounds containing lead. Terminate the conduit in appropriate boxes at all motors, switches, outlets, and junction points.
 14. When field cutting of conduit is required, thread and ream the conduit to remove any rough edges. Where a conduit enters a box or other fitting, provide a bushing to protect the wire from abrasion. Provide insulation type bushings and double locknuts on ends of rigid conduits terminating at steel boxes, panelboards, cabinets, motor starting equipment, and similar enclosures.
 15. Support individual horizontal conduits not larger than 1-1/2" diameter by means of one-hole pipe straps with back spacers or individual pipe hangers.
 16. Space conduits installed against concrete surfaces away from the surface by clamp backs or other approved means.
 17. Support individual horizontal conduits larger than 1-1/2" diameter by individual pipe hangers.
 18. In dry locations, spring steel fasteners, clips, or clamps specifically designed for supporting exposed single conduits may be used in lieu of pipe straps or pipe hangers.
 19. Hanger rods used in connection with spring steel fasteners, clips, and clamps shall be either 1/4" diameter galvanized steel rods or, if concealed above a suspended ceiling, galvanized perforated steel strapping. Do not use wire for support of conduit.
 20. Support parallel conduits at the same elevation on multiple conduit hangers or channel inserts. Secure each conduit to the pipe hanger or channel insert member by a U-bolt, one-hole strap, or other specially designed and approved fastener suitable for use with the pipe hangers or

channel inserts.

21. Space supports not over 10' on centers for vertical conduits spanning open areas. Securely anchor conduit at each end and run so as not to interfere with the installation and operation of equipment at the location.
22. Support conduits and raceways above suspended ceilings from either the floor construction above or from the main ceiling support members, using the applicable method specified herein.
23. Install liquid-tight flexible metal conduit so that liquids tend to run off the surface and not drain toward fittings. Provide sufficient slack to reduce the effects of vibration. Running threads are not acceptable. Where necessary for connecting conduits, use right and left hand couplings.

B. Non-Metallic Electrical Conduit

1. Non-metallic electrical conduit includes polyvinyl chloride (PVC) and asbestos cement conduit.
2. Cap or plug the ends of embedded conduit to prevent concrete and other materials from obstructing the conduit.
3. Sandpaper joints in PVC conduit to remove all burrs, clean and dry the joints, and brush with a solvent cement acceptable to the manufacturer before installing.
4. Properly support conduits to maintain the correct location and spacing during concreting operations and, if necessary, provide suitable plastic supports and spacers for this purpose.
5. Wherever buried non-metallic conduit passes through an expansion or contraction joint, or where required to compensate for thermal expansion and contraction, provide a conduit expansion joint. Install the conduit to cross the joint at right angles. In areas of floating slabs, install horizontal runs of conduit beneath the floating slab. Conduit shall pass through the floating slab only where required to terminate in a vertical direction as shown on the Design Documents.

C. Pull Wires

1. Use nylon pull wires of tensile strength not less than 240 pounds in each conduit and duct, leave pull wires in ducts and conduit after cleaning.
2. No splices in pull wire will be allowed.
3. Leave ample slack length at each end of pull wire.

D. Filling of Openings: Wherever slots, sleeves, or other openings are provided in floors or walls for the passage of raceways, including bus ducts, fill such openings as follows:

1. Use fire-resistive filling material for openings similar to the material of the floor, wall or ceiling being penetrated, and finish to prevent passage of water, smoke, and fumes.
2. Where conduits passing through openings are exposed in finished rooms, use filling material that matches, and is flush with, the adjoining finished floor, ceiling or wall.

3.3 INSERTS

A. Channel Inserts. Install embedded channel inserts with the slotted face flush with the finished concrete surface.

B. Spot Inserts

1. Install with the insert face flush with the finished concrete surface, firmly embedded, with no evidence of movement.

2. Test selected inserts, as required by the MBTA, by suspension of 800 pounds of weight from the insert. If there is evidence of failure, replace the inserts in a manner satisfactory to the MBTA.

3.4 SURFACE METAL RACEWAYS

- A. Securely ground surface metal raceways to outlet boxes or to backplates and fixtures by means of bolts, screws or other approved means and as specified in Section 16450 GROUNDING.
- B. Install surface metal raceways where indicated, in accordance with the NEC. Use fittings and accessories designed for the raceway.

3.5 OUTLET, JUNCTION AND PULL BOXES

- A. Outlet Boxes
 1. Unless otherwise indicated, flush mount outlet boxes with the front edges of the boxes or plaster covers attached thereto flush with the finished wall or ceiling.
 2. Mount boxes so that the long axis of the devices will be vertical, unless otherwise indicated.
 3. Locate conduit boxes and conduit box knockouts so as not to interfere with the reinforcing steel.
 4. Unless otherwise specified, provide boxes in plastered walls and ceilings with plaster covers.
 5. Do not install these covers until the finish plaster line is determined for the particular location.
 6. The mounting height indicated for a wall-mounted outlet box shall be construed to mean the height from the finished floor to the horizontal centerline of the cover plate.
 7. Mount outlet boxes for switches and receptacles located on columns and pilasters so as not to interfere with installation of partitions.
 8. Install boxes located near doors on the lock sides, even where the symbols appear on the hinge sides on the Design Documents, unless other locations are accepted by the MBTA.
- B. Junction and Pull Boxes
 1. Install so that covers are readily accessible after completion of the installation.
 2. Do not install boxes above suspended ceilings, except where the ceiling is of the removable type or where definite provisions are made for access to each box.
- C. Boxes Set in Concrete
 1. Adequately support boxes to prevent movement during placement of concrete.
 2. Unused nailing holes or other holes in the side or bottom of the boxes will not be permitted.
 3. After installation, clean boxes placed in concrete.

3.6 CABLE TRAYS

- A. Install as required and in accordance with NEC Article 318 using approved fittings and adequately supporting the complete system.
- B. Provide anti-sway brackets on all horizontal tray assemblies where necessary as determined by calculation, field installation review or MBTA request.
- C. Connect each isolated cable tray system or the entire tray system to the building equipment grounding system with a green insulated conductor in accordance with the NEC.
- D. Base size determination on the largest power conductor in the rack.

1. Minimum size: No. 6
2. Maximum size: 4/0 copper

3.7 UNDERFLOOR DUCTS AND FITTINGS

- A. Install as required.
- B. Accurately align and level the ducts with the top of inserts 1/8" below the finished concrete floor.
- C. Hold ducts in place during pouring of concrete by use of duct support fitting designed for the duct used, spaced at five-foot intervals. Carefully level all boxes, with the tops flush with the finish floor.
- D. Install appropriate insert markers in the last insert at all dead ends, on each side of partitions, and first insert adjacent to junction box to indicate high and low voltage services.
- E. Seal duct installation watertight with an approved sealing compound.

3.8 WIRING

- A. General
 1. Furnish wires and cables to the site in unbroken standard coils or reels, to which shall be attached a tag bearing the manufacturer's name, trade name of the wire, and the UL label for 600 volt wire and cable.
 2. Provide all wiring complete as indicted. Provide ample slack wire for motor loops, service connections and extensions. In outlet or junction boxes provided for installation of equipment by others, tape ends of wires and install blank covers.
 3. Do not bend cables during installation, either permanently or temporarily, to radii less than 12 times the outer diameters, except where conditions make the specified radius impracticable, and shorter radii are permitted by the NEC and NEMA Standard WC 7, Appendix N.
 4. Neatly and securely bundle cable conductors located in branch circuit panelboards, cabinets, control boards, switchboards and motor control centers and pull boxes. Use nylon bundling straps.
- B. Wire Pulling
 1. Install wire and cable in conduit as indicated. Do not pull wiring into any conduit until conduits and outlets have been thoroughly cleaned and swabbed to remove water and debris. Do not use block or tackle or other mechanical means in pulling conductors smaller than No. 2 AWG in raceways.
 2. Provide suitable installation equipment to prevent cutting and abrasion of conduits and wire during the pulling of feeders. Use lubricant and installation procedure as recommended by the cable manufacturer, and as accepted by the MBTA.
 3. Use masking or other means to prevent obliteration of cable identifications when solid color coating or colored tracers are used.
 4. Pull together all cables to be installed in a single conduit.
- C. Cable Supports. Install cable supports for vertical feeders in accordance with the NEC.
- D. Splices and Terminations
 1. Make wire and cable splices only in outlet, junction or pull boxes, or in equipment cabinets.
 2. Splices in conduit or raceway will not be permitted. Make splices by means of compression type connectors, and cover with tape to an insulation level equal to that of the cable.

3. Use positive type connector installation tools as recommended by the manufacturer.
4. Mechanical hand tools, with dies for each conductor size, recommended by the manufacturer, may be used on conductor sizes through No. 4/0.
5. For conductor sizes larger than No. 4/0, use hydraulic tools with hexagonal or circumferential installing dies for each conductor size, as recommended by the manufacturer.
6. For inspection purposes, clearly mark die numbers on the installed connectors.
7. Before installation, apply anti-corrosion electrical joint compound to conductors and terminal bolting pads.

3.9 WIRING DEVICES

- A. Locate switches four feet above finished floor, except as otherwise indicated.
- B. Attach receptacles rigidly to outlet box by means of two screws.
- C. Wire duplex receptacles, where so indicated, so that one unit of the duplex may be controlled by a wall switch and the other unit remain continuously energized.
- D. For exterior locations, mount receptacles in watertight cast type outlet boxes with threaded hubs or bosses and equipped with gasketed cover and captive cap of the screw or twist type.
- E. Provide equipment permanently connected to exterior receptacles, or in areas subject to spray or hose cleaning, with watertight male plugs to suit. Such receptacles shall be of the ground fault circuit interrupter type, as specified herein.
- F. Furnish one matching plug with each receptacle, as indicated, installed in the work.

END OF SECTION

SECTION 16203

TRACTION POWER EQUIPMENT GENERAL REQUIREMENTS

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the general requirements for the supply and delivery of new traction power substation equipment including AC switchgear units, transformer/rectifier unit, DC switchgear units, interconnecting bus duct, and DC disconnect switch assemblies. Specific requirements for each substation equipment item are included in subsequent sections of these Mandatory Specifications.
- B. Additionally, this Section identifies the expected documentation required for Traction Power under the design phases of the project.

1.2 MAJOR ELECTRICAL EQUIPMENT

- A. Major electrical equipment includes the following:
 - 1. 15 kV AC switchgear assembly
 - 2. Rectifier transformer(s)
 - 3. Rectifier(s)
 - 4. 750 Volt DC switchgear assembly
 - 5. Anode (AC) bus and Cathode (DC) bus
 - 6. Negative bus and Drainage Board
 - 7. DC Feeder Disconnect Switches
 - 8. 15 kV circuit breaker control and indication panel
 - 9. DC circuit breaker test cabinet
 - 10. 15 kV ground and test devices
 - 11. AC circuit breaker test cabinet
 - 12. Station battery, charger and accessories
 - 13. Technical Support Equipment
 - 14. Supervisory Equipment (SCADA) System
 - 15. 125 VDC Control Voltage Distribution System
 - 16. Substation Automation System (SAS)

1.3 REFERENCES

- A. The DB Entity shall comply with all applicable regulatory requirements, national codes and technical references and publications listed in Section 16201.
- B. All major electrical equipment furnished under this Contract shall be in accordance with the latest applicable standards of NEMA, IEEE, ANSI, NFPA, ICEA, OSHA, UL, National Electrical Code and Massachusetts Electrical Code with regard to material, design, construction and testing, except for variations as specified in the Specification. The standards applicable shall include, but not be limited to the following:

1. IEEE 1584 Guide for Performing Arc Flash Hazard Calculations
2. IEEE 1653.2 Uncontrolled Traction Power Rectifiers for Substation Applications
3. ANSI C37.06 AC High Voltage Circuit Breakers Rated on a Symmetrical Current Basis Preferred Ratings & Related Required Capabilities
4. IEEE C37.09 Test Procedure for AC High Voltage Circuit Breakers Rated on a Symmetrical Current Basis
5. IEEE C37.1 IEEE Standard Definition, Specification, and Analysis of Systems Used for Supervisory Control, Data Acquisition, and Automatic Control
6. ANSI C37.2 IEEE Standard Electrical Power System Device Function Numbers
7. IEEE C37.11 Requirements for Electrical Control for AC High Voltage Circuit Breakers Rated on a Symmetrical Current Basis
8. IEEE C37.13 Low Voltage AC Power Circuit Breakers Used in Enclosures
9. IEEE C37.14 Low Voltage DC Power Circuit Breakers Used in Enclosures
10. ANSI C37.16 Low Voltage Power Circuit Breakers and AC Power Circuit Protectors Preferred Ratings, Related Requirements, and Application Recommendations
11. ANSI C37.17 Trip Devices for AC and General Purpose DC Low Voltage Power Circuit Breakers
12. IEEE C37.20.1 Metal-Enclosed Low Voltage Power Circuit Breaker Switchgear
13. IEEE C37.20.2 Metal-Clad and Station-Type Cubicle Switchgear
14. IEEE C37.20.7 IEEE Guide for testing medium voltage metal enclosed switchgear for internal arcing faults
15. ANSI C37.32 High Voltage Air Switches, Bus Supports, and Switch Accessories Schedules of Preferred Ratings, Manufacturing Specifications, and Application Guide

16. IEEE C37.34 Standard Test Code for High-Voltage Air Switches
17. IEEE C37.40 Service Conditions and Definitions for High Voltage Fuses, Distribution Enclosed Single-Pole Air Switches, Fuse Disconnecting Switches, and Accessories
18. ANSI C37.90 Relays and Relay Systems Associated with Electric Power Apparatus
19. ANSI C39.1 Requirements for Electrical Analog Indicating Instruments
20. ANSI/UL 1561 Standard for Safety for Dry-Type General Purpose and Power Transformers
21. ANSI C57.12.01 General Requirements for Dry-Type Distribution and Power Transformers
22. ANSI C57.12.10 Transformers 230 kV and Below – Safety Requirements
23. ANSI C57.12.50 Ventilated Dry-Type Distribution Transformers 1 to 500 kVA Single-Phase and 15 to 500 kVA Three-Phase,
24. ANSI C57.12.51 Ventilated Dry-Type Power Transformers, Three-Phase, 501 kVA and Larger
25. ANSI C57.12.91 Test Code for Dry-Type Distribution and Power Transformers
26. ANSI C57.13 IEEE Standard Requirements for Instrument Transformers
27. ANSI C57.13.2 Conformance Test Procedures for Instrument Transformers
28. ANSI C57.18.10 IEEE Standard Practices and Requirements for Semiconductor Power Rectifier Transformers
29. ANSI C57.110 IEEE Recommended Practice for Establishing Transformer Capability When Supplying Non-sinusoidal Load Currents
30. ANSI B1.1 Unified Inch Screw Threads
31. ANSI B1.10-58 Unified Miniature Screw Threads
32. ANSI Z55.1.61 Gray Finishes, Light Gray Color Chip No. 61
33. ANSI 634 Cable Penetration Fire Stop Qualification Test
34. IEEE 4 Standard Techniques for High Voltage Testing
35. IEEE 48 Standard Test Procedures and Requirements for Alternating Current Cable Terminations 2.5 kV Through 765 kV
36. IEEE C62.11 IEEE Standard for Metal-Oxide Surge Arresters for Alternating Current Power Circuits (>1 kV)

37. IEEE 82	IEEE Standard Test Procedure for Impulse Voltage Tests on Insulated Conductors
38. ICEA S-73-532 (NEMA WC 57)	Standard for Control Cables
39. ICEA S-95-658 (NEMA WC70)	Standard for Nonshielded Cables Rated 2000 Volts or Less for the Distribution of Electrical Energy
40. ICEA S-96-659 (NEMA WC71)	Standard for Nonshielded Cables Rated 2001-5000 Volts for Use in the Distribution of Electrical Energy
41. ICEA S-93-639 (NEMA WC 74)	Nonshielded Power Cables Rated 5000-46000 Volts for the Distribution of Electrical Energy
42. NEMA AB 3	Molded Case Circuit Breakers and Their Application
43. NEMA FU-1	Low Voltage Cartridge Fuses
44. NEMA ICS 1	Industrial Control and Systems: General Requirements
45. NEMA ICS 4	Industrial Control and Systems: Terminal Blocks
46. NEMA KS 1	Enclosed and Miscellaneous Distribution Equipment Switches
47. NEMA LA 1	Surge Arresters
48. NEMA LS 1	Low Voltage Surge Protection Devices
49. NEMA PE 5	Utility Type Battery Chargers
50. NEMA SG 4	Alternating Current High Voltage Circuit Breaker
51. NEMA SG 6	Power Switching Equipment
52. NEMA FG-1	Fiberglass Cable Tray Systems
53. NFPA 70	National Electric Code
54. NFPA 70E	Standard for Electrical Safety Requirements for Employee Work Places
55. NEMA ST 20	Dry-Type Transformers for General Applications
56. NEMA TR 1	Transformers, Regulators, and Reactors
57. NEMA 250	Enclosures for Electrical Equipment (1000V Max.)

58. NFPA262	Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air Handling Spaces.
59. UL-44	Thermoset-Insulated Wires and Cables
60. UL-224	Extruded Insulating Tubing
61. UL-508	Industrial Control Equipment
62. UL-1581	Standard for Safety Electrical Wires, Cables and Flexible Chords
63. EIA 232-F	Interface Between Data Terminal Equipment and Data Circuit Terminating Equipment Employing Serial Binary Data Interchange
64. EIA 455-11-177A	Standards for Test measurements and Inspection for Fiber optic Cables, Connectors and/or Other Fiber Optic devices.
65. IEEE C37.90.1	Standard Electrostatic Discharge Tests for Protective Relays
66. IEEE 802.3	Carrier Sense Multiple Access with Collision Detection.
67. UL 1581	Standard for Safety Electrical Wires, Cables and Flexible Cords
68. NETA ETT-2000	Standard for Certification of Electrical Technicians
69. NETA ATS	Standard for Acceptance testing Specifications for Electrical Power Equipment and Systems.
70. IEC 61850	Communication Protocol for Network Automation in Substations
71. IEEE 730-2014	Standard for Software Quality Assurance
72. IEEE C37.90	Standard for Relays associated with Electric Power Apparatus
73. OSHA- 29 CFR Part 1910 Sub Part S	-

- C. Where any requirements specified herein or shown on the Design Documents exceed those of the above listed standards, the DB Entity shall adhere to the higher standard. In case of conflict in requirements between two or more standards, the decision of the MBTA shall be final.
- D. In cases where equipment from U.S. suppliers is not available, equivalent British, European, Japanese or IEC standards are acceptable, provided a tabulation is furnished citing the comparison between the applicable U.S. and the equivalent non-U.S. standards. In addition, the non-U.S. suppliers shall note where U.S. standards are not met, for evaluation and acceptance by the MBTA. Factory testing shall be performed whenever possible. If factory testing must occur outside of the USA, then the DB Entity shall bear the costs associated with the witness testing by the MBTA and one additional MBTA representative.
- E. All equipment and materials furnished under Division 16 of Exhibit 2A.1 shall conform to all Federal, State or Municipal laws or ordinances, and if any requirement shown or specified conflicts with such laws or ordinances, the DB Entity shall make such changes as are necessary to meet said requirements. The

cost of such changes shall be borne by the DB Entity and shall be included in the DB Entity's original bid. Where any standards shown on Design Documents or specified herein exceed the minimum standard set by law, the DB Entity shall adhere to the higher standard.

- F. Where materials or equipment are specified to conform to the standards of the Underwriters Laboratories, Inc., or to be constructed or tested in accordance with the standards of the National Electrical Manufacturers' Association or American National Standards Institute, the DB Entity shall submit proof that the item furnished conforms to such requirements. The label of, or listing by the Underwriters' Laboratories, Inc. will be acceptable as sufficient evidence that the item is in accordance with the Underwriters' Laboratories standard. A company listed as a member company of NEMA for an item under consideration will be acceptable as sufficient evidence that the item conforms to the requirements of the National Electrical Manufacturers Association. In lieu of such stamp or certification label listing, the DB Entity may submit a written certificate from any nationally recognized testing agency adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the requirements listed herein including methods of testing by the specified agencies. Conformance with the agency requirement does not relieve the item from complying with any other requirements of the Mandatory Specifications.
- G. The DB Entity shall clearly state compliance / non-compliance with the traction power specifications however small, on a clause-by-clause basis. The list shall identify all specification clauses in the Traction Power Specifications and adjacent to each listed clause a category of 'compliant', or 'non-compliant'. Each non-compliance shall be provided with a description or explanation and the DB Entity's proposed alternative or solution.

1.4 GENERAL

A. DESIGN SUBMITTAL REQUIREMENTS

1. Refer to the Sections 2.7 and 2.8 for the overall requirements related to design and construction submittals.
2. Also refer to Specification 16311 for detailed of the product and installation design submittals required including meetings and design conferences.
3. As detailed in the Contract Documents, there are four design submittals required. Phase I: Preliminary, Phase II: Intermediate, Phase III: RFC (Readiness for Construction) and Phase IV: Final
4. Phase I: Preliminary
 - a. The deliverable should be similar to a 30% level design submittal. The following deliverables shall apply to the traction power documentation to be provided. The submittal shall include but not be limited to:
 - AC and DC System Sectionalizing and Feeding Diagrams
 - Preliminary Systemwide ductbank layout
 - TPS relay and metering diagrams / Single Line Diagrams
 - TPS substation building and equipment layout drawings
 - TPS substation elevations views and sections.
 - Main equipment arrangement drawings.
 - Ground grid design and calculations
 - Overall dimensional drawings showing clearances and access
 - Typical equipment operating schematic drawings

- Foundation plan
- SCADA system points list
- SAS block diagram and system definition report
- Concept and definition of Utility interfaces
- Building electrical, mechanical, plumbing, structural and architectural details as required by the respective discipline deliverables.
- Specifications
- Design basis report or narrative

5. Phase II: Intermediate

- a. The deliverable should be similar to a 75% level design submittal. The following deliverables shall apply to the traction power documentation to be provided. In addition to the documentation listed in the previous phase, the submittal shall include but not be limited to:

- Equipment details including mounting arrangements and all equipment locations
- Equipment functional schematics
- Equipment interconnection details and terminal charts
- Grounding and bonding details
- Systemwide Grounding Schematic
- Details of Utility Interfaces
- Cable block diagram
- Conduit and Cable routing (Systemwide and TPS)
- Cable schedules
- Systemwide Ductbank layouts and profiles
- Typical Manhole details
- Cable pulling calculations and conduit fill calculations
- AC and DC distribution systems
- Traction power negative return system schematic diagram
- Traction power negative connection diagrams
- SCADA points address list
- SAS equipment details and functional report showing screens, hierarchy and operational intent
- Details of any stray current system connections to the TPSS
- Building electrical, mechanical, plumbing, structural and architectural details as required by the respective discipline deliverables.
- Technical Specifications
- Calculations
- Design basis report or narrative

6. Phase III: RFC (Release for Construction)

- a. The deliverable should be similar to a 100% level design submittal and include all details required for procuring equipment and installing the equipment. The following deliverables shall apply to the traction power documentation to be provided. In addition to the documentation listed in the previous phase, the submittal shall include but not be limited to:

- Cable schedules
- Conduit schedules and allocation charts
- Installation details
- Interconnection/interface drawings

- Manhole / pullbox development drawings
- Building electrical, mechanical, plumbing, structural and architectural details as required by the respective discipline deliverables.
- Technical Specifications
- Final calculations

7. Phase IV: Final

- a. Stamped and sealed plans for construction.

B. EQUIPMENT

1. The design of the equipment shall provide features for the safety of personnel during operation, maintenance, and repair.
2. All equipment and materials supplied by the DB Entity shall be new, of recent manufacture and of highest grade as specified. They shall be resistant to moisture and corrosion to withstand their environment and operational conditions with minimum maintenance and long life.
3. Wherever practicable, all major electrical equipment and materials furnished under this Contract shall be the product of a single manufacturer. In the case of major items, the manufacturer shall maintain a service organization within a reasonable distance from the project which is properly staffed and equipped to make repairs as required.
4. Materials and equipment shall be essentially the products of a manufacturer regularly engaged in the manufacturing of the product and the manufacturer shall have such products of comparable capacity and function to that specified in satisfactory use on a rapid transit system.

1.5 MANUFACTURER'S DRAWINGS

- A. All units of measurement of length-weight-time shall be in the United States system of feet-pounds and seconds. Unit of measurement of temperature shall be in degrees Celsius, denoted by degrees C. Design Documents may use metric dimensions and tolerances provided the equivalent United States units are clearly shown in parenthesis on all drawings defining general arrangements and interfaces, and on all drawings used for installation, repair, maintenance or disassembly. Design Documents shall be prepared using terms and units standard to U.S. industry.
- B. Unit of measurement for wire and cables shall be American Wire Gauge (AWG) up to size 4/0 and circular mils for larger sizes. Conductor stranding shall be as per ASTM.
- C. All Design Documents shall be in English language only, irrespective of country of origin.
- D. All Design Documents shall have a blank 3” x 4” space on the top right hand corner, clear of all markings, for acceptance stamping by the MBTA. If the DB Entity's standard drawing does not provide this space, the drawing shall be prepared on the next larger sheet, or the 3” x 4” space may be provided elsewhere on the Design Documents.
- E. The submittal requirements identified in Section 16311 shall be observed by the DB Entity. The process of highlighting drawing changes for progress submittals shall be complied with.

1.6 BUS AND BUS CONNECTIONS AND JOINTS

- A. The buses within equipment supplied by the DB Entity shall be fabricated of high conductivity rectangular copper bars as specified herein. Aluminum may be used for rectifier heat sinks. Buses shall be designed to carry rated currents without exceeding the maximum allowable temperature rise as specified in ANSI, NEMA and IEEE standards when operating at specified overloads. Bus connections and joints shall have an ampacity equal to that of the bus ampacity, and be fabricated so that there will be no loss of conductivity during the life of the equipment.
- B. The entire contact area of all bolted current carrying connections in copper buses shall be factory silver-plated. Ring-plated method of silver plate and tin-plated contact surfaces will not be acceptable. Silicon bronze bolts, nuts and lockwashers, or approved equal, shall be used. Connections shall be made with a minimum of two ½" - 13 bolts at each end of the joint.
- C. All bolted current carrying connections in aluminum heat sink assemblies of rectifiers, where accepted by the MBTA, shall be first copper plated, then nickel plated and provided with proper spring tensioning devices to maintain proper joint pressure under load (heat) cycle. Stainless steel bolts, nuts and lockwashers shall be used.
- D. The DB Entity shall coordinate all connections to mate with adjacent equipment terminals and enclosures. Provisions shall be made for access to permit assembly of these connections and inspection after installation or removal without displacing the major components within the enclosure.

1.7 POWER AND GROUNDING CONNECTORS

- A. All terminal lugs furnished for power and grounding cables shall be heavy duty, bolted type, of high copper content alloy, complete with silicon bronze bolts, nuts and lockwashers. Lugs shall have tongues with either two or four ½" - 13 bolts, as specified, spaced per standard NEMA drillings, and four-bolt cable clamps. All contact surfaces shall be machined smooth and silver-plated.

1.8 NAMEPLATES

- A. Each major component of equipment shall have, as a minimum, the manufacturer's name, address, and catalog number, model, style or type on a nameplate securely attached to the item in an area easily accessible to normal visual demands by maintenance and service personnel. Nameplates for electrical apparatus shall conform to the referenced standards and as specified elsewhere in this specification.
- B. Each rectifier and transformer, switchgear assembly unit, circuit breaker and auxiliary unit, auxiliary transformer, bus ducts, battery charger, panel board, terminal box, and all panel mounted and individually mounted equipment and devices shall be provided with nameplates for proper identification. Panel and door mounted devices shall also be identified in the rear with the designations indicated on manufacturer's connection diagrams. Internally mounted devices shall be similarly identified with nameplates and manufacturer's connection diagram designations.
- C. Nameplates identifying major equipment shall be provided in duplicate: one on front and the second on the rear of the equipment, when not located against a wall. The major equipment labels shall have 2" black lettering on white background. Lettering shall not be closer than 1/4" from the edge of the nameplate and if more than one line of text is required each line shall be separated by 1/4".
- D. Nameplates identifying AC and DC circuit breaker and auxiliary units shall have inscription including

circuit breaker number and service. One nameplate shall be provided on front, the second on the rear of each unit. DC circuit breaker nameplates shall include the breaker name/number, cable designation, and associated track section designations. When applicable, AC circuit breakers shall include the breaker name/number, cable designations, and associated equipment designations.

- E. Nameplates for panel boards, terminal boxes and similar equipments shall have lettering in accordance with MBTA standards.
- F. Nameplates for panel and door mounted relays, meters, control and instrument switches, fuses and auxiliary devices and individually mounted circuit breakers, disconnect switches and all other components, shall have 1/4", minimum, lettering. For protective and auxiliary relays, the nameplate inscription shall include device number and function. Nameplates for fuses shall note the type and rating of fuse, polarity and identify the circuit.
- G. All nameplates shall be laminated plastic with dull white surface and black core unless otherwise specified. Letters shall be engraved through outer layer to expose black core. All exposed edges shall be beveled. Nameplates shall be fastened with machine screws. Use of self-tapping screws or adhesives will not be permitted.
- H. The legends of all nameplates shall be submitted to the MBTA for acceptance.

1.9 WIRING AND TERMINAL BLOCKS

A. Wiring

1. All secondary and control wiring in equipment, including wiring on removable elements of circuit breakers, shall be ICEA/NEC type SIS, or approved equal, stranded tinned copper switchboard wire, rated for a minimum conductor temperature of 90 degrees C. Wire shall be insulated for 600 volts unless otherwise specified. Wire shall comply with UL-44 for flame retardant properties for thermo-plastic insulated wire. Wire crossing hinged joints shall be similar except extra flexible, suitably protected against abrasion.
2. Wiring to and from the rectifier and DC switchgear (including 15kV AC control panel if integral) shall have minimum insulation rating of 1000V DC.
3. Current and potential transformer secondary wiring shall be No. 12 AWG copper or larger, unless otherwise specified.
4. All elements of control wiring operated at 600V DC shall be connected with red colored wire rated for 2000V.
5. Control wiring, including internal wiring and wiring between equipment in separate enclosures, shall be No. 12 AWG copper or larger, unless otherwise specified.
6. Analog indication wiring to SCADA shall be No. 16 AWG or larger, unless otherwise specified.
7. Wiring shall be provided with ring-type compression terminals with insulated sleeves at each termination. Locking fork-type compression terminals are acceptable except for current transformer wiring. All wiring shall be identified at each termination by printing on wire jacket or on an insulating sleeve. Adhesive wire markers are not acceptable.
8. Wiring installed through openings in metal barriers or structural members shall be protected against abrasion by approved grommets.

9. Wire harnesses shall be supported with a bracket fastened to the enclosure via a tack-welded stud or a machine screw utilizing a "shake-proof" washer. Welding and/or drilling and tapping for machine screws shall be accomplished before finish paint is applied. Nylon composite tie wraps shall be used for securing harness to the support. Wire support brackets attached to the enclosure with adhesives are not acceptable.
10. All fiber optic or Ethernet cable shall be run independently within orange colored innerduct when installed on cable tray and within equipment. The length of the inner duct shall run the entire length of the circuit, equipment to equipment. For Cat 5E Ethernet cables, the requirement for 1kV insulation level at the rectifier and DC switchgear shall be maintained, through combination of the innerduct and insulation properties of the cable.

B. Terminal Blocks

1. Circuits requiring external connections shall be factory-wired to terminal blocks, readily accessible for field wiring entering from top or bottom as specified for the equipment involved. Sufficient number of terminals to satisfy all external connection requirements and 20 percent additional unassigned terminals shall be provided.
2. Terminal blocks shall be heavy-duty, washer-head screw type with insulating barriers between circuits, 1000V dc rated for DC switchgear and rectifier equipment and 600 Volts for miscellaneous lighting and control circuits, unless otherwise specified, complete with marking strips and plastic covers. Similar terminal blocks, complete with properly tagged jumper wires, shall be provided at each shipping split to facilitate field assembly.
3. Current and potential transformer secondary leads shall be wired directly to terminal blocks before being wired to relaying, metering or control devices. Terminal blocks for current transformer leads shall be short-circuiting type. For multi-tap or multi-ratio devices all taps shall be wired to adjacent terminal blocks.

1.10 RELAYS, SWITCHES AND DEVICES

A. General

1. The type of relays, switches and devices used in the control and supervision of the supplied equipment shall have proven record of successful operation in similar application to the satisfaction of the MBTA.
2. All externally mounted relay, switches, and devices mounted to the DC switchgear shall be insulated from the enclosure by mounting on glastic sheeting. Minimum clearance from the electrical components to enclosure shall be 2".

B. Relays and Meters

1. All single-function protective relays shall be of draw-out construction, provided with semi-flush mounting cases. Relays shall be connected to external wiring through built-in test switches or connection blocks arranged to allow in case testing of the relay. Single-function and multi-function protective relays shall be microprocessor based with resettable targets (flags), and 125 VDC control. Current versions of the relay software shall be provided with each relay. The relays shall have facility or communication to a laptop PC and interface to the substation automation system.
3. All control and auxiliary relays shall be front connected, surface mounting type, with cover, suitable for use in switchgear equipment in accordance with ANSI C37.90. Operating coils of direct current

relays shall be suitable for continuous operation between 80 percent and 110 percent of rated voltage and for alternating current relays between 85 percent and 110 percent of rated voltage.

4. The coils of interposing relays, Devices 201C and 201T (if required depending on integration within the SAS), for interfacing with supervisory system equipment shall be rated for operation on 125 volts DC and shall have a burden of not more than 12.5 watts. Coils shall be provided with surge limiting diodes to suppress noise during operation which may cause momentary false indication. Contacts shall be rated 30 amperes DC, minimum.
5. Auxiliary relays shall be rated for 750 volts DC service, minimum. Relays shall be isolated from equipment enclosures for 1,000 volts DC, minimum.
6. If not integral to the DC switchgear protection relay, the pickup of relays for cable energized indication, Device 197X, of DC traction feeder circuits shall be adjustable for a minimum range of 50 volts to 750 volts.
7. All indicating instruments shall be switchboard type, one percent accuracy, semi-flush mounted having metal scales with black figures on white background. They shall be approximately 4-1/2" square with a minimum of 240-degree scale, furnished with anti-glare glass, unless otherwise specified. Digital meters may be used on the AC control panel as shown on the Design Documents.
8. Ammeters for space heater circuits shall be panel type, two percent accuracy, semi-flush mounting, approximately 2-1/2 inch square. A red mark shall indicate the normally expected current reading.
9. All meters shall be provided with insulating covers on exposed terminals.

C. Switches

1. All control, selector and instrument switches shall be rotary type, provided with properly designated black escutcheon plates, clearly marked with white letters to show operating position. General Electric type SBM, Shallco Series 26, Electroswitch Series 24 or Type W2 or approved equal.
2. Breaker control switches shall be spring-return to normal with escutcheon engraved TRIP-CLOSE, trip counter-clockwise, close clockwise, furnished with target and red pistol grip handle.
3. Breaker control mode selector switches, Devices 43 and 143, shall be four -position, maintained contact type with escutcheon engraved LOCAL-HMI-OFF-SUPV off position at 12 o'clock, with black oval handle.
4. Instrument switches shall be maintained contact type, shall have an OFF position and black knurled round handle.
5. Load measuring circuit bypass switch shall be key-operated, two position, with escutcheon engraved "NORMAL-OPERATED", maintained contact type. Key shall be held captive at "OPERATED" position. All switches shall be set to operate with the same key. Information related to lock setting and number of keys to be supplied will be furnished by the MBTA.
6. At least one of each type of switch shall be provided as spare parts along with the equipment, unless otherwise identified.

D. Test Switches

1. Test switches shall be provided for in-service testing and calibration of indicating instruments,

transducers and other devices not furnished with built-in test devices, for removal of these devices from potential and current circuits without disturbing switchgear wiring. Test switches are not required for devices on DC switchgear.

2. Each test switch shall be provided with a minimum of three poles for potential circuits and six poles for current circuits. Current switches shall be provided with features for short-circuiting current transformer secondaries prior to disconnecting the instruments and devices from current circuits. The individual switch units shall be assembled on an insulated base provided with insulated barriers between each pole. Test switches shall be arranged for semi-flush mounting in front of the switchgear. The DB Entity shall furnish a set of necessary test plugs and jumper cables with the switchgear assembly.

E. Indicating Lamps

1. All indicating lights shall be of the light emitting diode (LED) type, mounted in assemblies which include an appropriate series resistor, hardware for panel mounting, and colored lenses. LED element(s) shall be mounted on a socket to facilitate replacement and shall have a rated life of 100,000 hours, minimum.
2. Internal surfaces of the lenses shall be Fresnel-cut to produce a brilliance comparable to that of a low-burden incandescent light unit, and a wide viewing angle. The DB Entity shall forward one assembled light unit of each color proposed to be supplied with the equipment to the MBTA for acceptance.
3. Indicating lamps shall be red for circuit on or breaker closed, green for breaker open or de-energized, white for circuit breaker spring charging, blue for heater circuits on.
4. Breaker closed red lamp and open green lamp shall be located above the associated circuit breaker control switch. Red to the right, green to the left.

F. Fuses and Fuse Holders

1. All fuses for control, auxiliary, and metering circuits shall be located in such a position that they are easily and safely accessible. Fuses shall be of the non-renewable, cartridge type, with "finger-safe" holders where available.
2. Fuse holders and fuses installed in solidly grounded equipment assemblies shall be rated for 250 volts AC service. Fuses shall have a minimum interrupting rating of 20,000 amperes rms, symmetrical, at 250 volts AC and DC.
3. Fuse holders and fuses installed in rectifier units and in DC switchgear for control and auxiliary circuits shall be rated for 1,000 volts DC service. Fuses shall have a minimum interrupting rating of 20,000 amperes, rms, symmetrical, at 600 volts AC or DC.
4. Fuse holders and fuses for metering circuit taps to 600-volt nominal DC power buses at rectifier DC switchgear shall be rated for application on systems capable of delivering DC short circuit current of 200,000 amperes. Fuse holder shall be designed to reject fuses of lower interrupting ratings. Fuses shall be either pull-out mounted or the bolted-on type. Disconnect means shall be provided with bolted-on fuses, for safe disconnection of the fuse holder from the energized bus.

G. Protection and Control Equipment Voltage Ratings

1. Auxiliary relays, control and selector switches, fuse holders and fuses, terminal blocks and other

devices which are located in the rectifier unit and DC switchgear and which operate on 125 VDC may be rated for 600 volts AC or DC insulation only under the following conditions:

- a. Similar 1000VDC rated devices are not available; and
- b. Such devices are insulated for 1,000 volt, minimum, from equipment enclosure.

1.11 TRANSDUCERS AND ISOLATION AMPLIFIERS FOR TELEMETERING AND LOCAL INSTRUMENTATION

A. Transducers

1. General

- a. Transducers for converting the measured AC and DC quantities into DC milli-ampere signal for telemetering via Authority's SCADA system shall be of the solid state design, suitable for installation in switchgear equipment. The transducers shall integrate the signals into the substation automation system either directly or via a local digital input/output device.
 - b. The transducers shall be of the 0.2 percent accuracy class, having a DC output signal linearly proportional to the measured quantity. Devices shall have an operating temperature range from minus 20°C to plus 60°C, minimum, and shall perform satisfactorily in an atmosphere containing up to 95 percent humidity (noncondensing). Transducers shall withstand for one minute a hi-pot test of 1,500 Volts, rms, 60 Hz applied between the input and output circuits and from input and output circuits to ground. Output shall be adjustable within plus-minus 10 percent of the full output range.
 - c. Potential circuits of transducers shall be designed for continuous operation at 20 percent higher than the rated voltage. Current circuits shall be capable of continuous operation at twice the rated current and shall withstand a fault current of 250 amperes for one second.
 - d. The surge withstand capability of all transducers shall be in accordance with IEEE Standard C37.90.1.
 - e. Transducers with dc current and voltage inputs shall be isolation amplifier type, providing electrical isolation of the input signal from the output signal.
2. Ratings: Transducers shall have the electrical ratings and characteristics specified below:
- a. For measuring average ac voltage and current:

	<u>Voltage Transducers</u>	<u>Current Transducers</u>
Input, 60 Hz	0-150 V	0-5 A
Output - dc into 10k ohm load	4-20 mA	4-20 mA
Output ripple - peak, max.	< 0.2 percent	< 0.2 percent
Response time for 0-99 percent output, max.	< 250 msec.	< 250 msec.
Accuracy - percent of rated output	0.2 percent	0.2 percent

60 Hz dielectric withstand (one minute)	2500 Volts rms	2500 Volts rms
Auxiliary Power	125V, DC $\pm 20\%$ < 3W With reverse surge protection	125V, DC $\pm 20\%$ < 3W With reverse surge protection

Voltage
Transducers

- b. For measuring average dc bus voltage:
- | | |
|--|---|
| Input, DC | 0 -750 V |
| Output - DC into 10k ohm load | 4-20 mA |
| Response time for 0-99 percent output, max. | < 250 msec. |
| Accuracy - percent of rated output | +/- 0.2 percent |
| 60 Hz dielectric withstand (one minute), output/power/case | 2500 Volts rms |
| Auxiliary Power | 125V, DC $\pm 20\%$ < 3W
With reverse surge protection |
- c. For measuring average dc voltage from a 50 mV current shunt:
- | | |
|--|---|
| Input, DC | 0 to ± 50 mVdc |
| Output - DC into 10k ohm load | 4-20 mA |
| Response time for 0-99 percent output, max. | < 250 msec. |
| Accuracy - percent of rated output | +/- 0.2 percent |
| 60 Hz dielectric withstand (one minute), output/power/case | 2500 Volts rms |
| Auxiliary Power | 125V, DC $\pm 20\%$ < 3W
With reverse surge protection |
- d. For measuring average dc power (Watts):
- | | |
|---|------------------------|
| Input, DC: | |
| Voltage | 0-750 V |
| Current shunt | 0 to ± 50 mV, from |
| Output - DC into 10k ohm load | 4-20 mA |
| Response time for 0-99 percent output, max. | < 250 msec. |

Accuracy - percent of reading	+/- 0.2 percent
60 Hz dielectric withstand (one minute), output/power/case	2500 Volts rms
Auxiliary Power	125V, DC \pm 20% < 3W With reverse surge protection

B. Isolation Amplifiers and Power Supply

1. For telemetering rectifier DC current, DC traction feeder currents and DC drainage currents via Authority's SCADA system, the millivolt signal, obtained from shunts at the circuit breakers, shall be insulated from the supervisory equipment at the substations by use of isolation amplifiers. An isolation amplifier, suitable for installation in the DC switchgear assembly, shall be furnished for each rectifier and traction feeder circuit.

2. Isolation Amplifier

- a. The isolation amplifiers shall be of high precision, low non-linearity, three-port insulation design, having an operating temperature range from minus 20 degrees C to plus 60 degree C, minimum. The device shall be designed to withstand for one minute a hi-pot test of 2,500 volts, rms, 60 Hz applied from input port to output port and from input port to power supply. The isolation amplifier shall be designed to operate on DC supply derived from an external power source.
- b. Isolation amplifiers shall have the electrical ratings and characteristics specified below:

Input differential

For rated linearity	1-10 Volts DC*
Continuous	120 Volts, rms
For 1 minute	240 Volts, rms
Gain, adjustable	1 Volt/1 Volt -to-1 Volt/100 Volts**

Output nonlinearity

Error at 10 volt P-P output	\pm 0.25 percent
Power supply range	15-25 Volts DC
	*With 1 Volt/1 Volt gain
	**Use external potentiometer, if required

3. Power Supply

- a. The DB Entity shall furnish a self-contained DC power supply for the isolation amplifiers. The power supply shall employ solid-state circuitry and shall have a regulated, filtered output.
- b. The power supply shall be rated to simultaneously power all isolation amplifiers. The output of the power supply shall be fully insulated from the input and be protected with suitable circuit breakers or fuses. All components shall be assembled in a metal enclosure, suitable for installation in the DC switchgear assembly.
- c. The power supply shall have the following ratings:
 - (1) Input: 120 Volts AC or 125 Volts DC
 - (2) Output
Voltage: 15-25 Volts DC, adjustable

Current: 3.0 Ampere, minimum

- d. The power supply shall include, but not be limited to, the following accessories:
 - (1) 1 - Red indicating LED for AC supply "on"
 - (2) 1 – Output voltmeter
 - (3) 1 - Voltage adjusting rheostat

1.12 ANNUNCIATORS

- A. Annunciator shall be integral to the Substation Automation System and viewable via the HMI. Refer to specification sections 16311 and 16311A.

1.13 KEY INTERLOCK SYSTEM

- A. Rectifier main DC circuit breaker, Device 72R, and rectifier negative lead disconnect switch, Device 89N, shall be provided with a key interlock system to prevent operation of the negative disconnect switch in either direction, unless the rectifier main circuit breaker is open and in fully disconnected position. To open the negative disconnect switch, the following operations shall be performed:
 - 1. Trip the rectifier main DC circuit breaker and rack it into fully disconnected position. The captive key at the rectifier main circuit breaker is now free to be turned and removed. Turning of the key will mechanically block the circuit breaker removable element from being placed into the test and connected position, but will allow the withdrawal of the circuit breaker removable element from its housing.
 - 2. Insert key in the lock at the negative disconnect switch and turn to unlock the operator of the switch. Key is now held captive.
 - 3. Open negative disconnect switch.
 - 4. Reverse sequence to restore service.
- B. The 15 kV feeder circuit breaker Devices 52-F (unit substations) shall be provided with a key interlock system to prevent the opening of the interrupter cubicle door in the unit substations (provided by others) unless the 15 kV feeder circuit breaker is open and in the fully disconnected position and the associated secondary main circuit breaker in the unit substation is open. The DB Entity shall coordinate the opening sequence of the interrupter cubicle door with the unit substation equipment. The following is a description of the required sequence of operations.
 - 1. Trip the 15 kV circuit breaker and rack it into the fully disconnected position. The captive key (A) at the circuit breaker is now free to be turned and removed. Turning of the key will mechanically block the circuit breaker removable element from being placed into the test or connected position.
 - 2. Trip the main secondary breaker. The captive key (B) at the circuit breaker is now free to be turned and removed. Turning of the key will lock the circuit breaker in the open position.
 - 3. Insert key (B) into the interlock housing of the interruption switch operating mechanism. Turn key (B) to open interrupter switch. Kirk Key (B) is held captive.
 - 4. Insert key (A) into the interlock housing of the interruption switch. Turning key (A) will allow the door to be opened. Once the door is opened both key (A) and key (B) will be held captive.
 - 5. Mechanical interlocks and/or additional key interlocks shall be provided to prevent the turning and removal of keys (A) and (B) unless both the doors and the interrupter switch are closed. Upon

manual closing of the interruption switch, keys (A) and (B) can be turned and removed, locking the manual operator. The keys can now be returned into their respective interlock housings, allowing the closure of the 15 kV and the secondary main circuit breakers for restoration of the service.

- C. Tumbler settings of locks shall be different for each interlock system. Information related to lock settings will be furnished to the DB Entity by the MBTA.
- D. The DB Entity shall prepare and forward to the MBTA for acceptance a detailed schematic diagram of each key interlock system supplied, showing the equipment involved and key travel, identifying each component and fully describing the operation. The accepted key interlock drawings and data shall be included in the instruction and maintenance manual for the substation equipment.
- E. A kirk key diagram shall be engraved on a nameplate and attached to all applicable equipment.

1.14 SURGE ARRESTERS

- A. 15 kV system surge arresters shall be of the intermediate class, suitable for installation in metal clad switchgear. Arresters shall be rated for application on the specific voltage system on which it is being used. The manufacturer shall be responsible to coordinate the size of the surge arresters for the system on which it is being used. DB Entity's proposed intermediate class, MOV type, polymer-housed surge arresters will be subject to the acceptance of the MBTA.
- B. Surge arresters associated with the 600-volt nominal DC power system shall be designed to protect DC traction power equipment and distribution circuits. DB Entity's proposed polymer-housed, MOV type DC surge arresters will be subject to the acceptance of the MBTA.
- C. DC feeder circuit surge arresters shall be mounted in an insulating, blast resistant protective enclosure external to the dc switchgear. Location and enclosure shall be as indicated on the Design Documents. The enclosure and any alternate mounting location shall be proposed by the DB Entity and subject to acceptance by the MBTA.
- D. Surge arrester for the negative equalizer bus and drainage board shall also be MOV type and rated for the intended service, subject to the acceptance of the MBTA. Surge arrester location shall be proposed by the DB Entity and subject to acceptance by the MBTA, but shall not be mounted inside the negative drainage board enclosure.

1.15 FINISH

- A. All metalwork shall be carefully finished to remove sharp edges and burrs.
- B. All surfaces shall be thoroughly cleaned and treated with a rust inhibiting phosphatized coating prior to painting, then finished with two coats of semi-gloss ANSI-61 light gray paint, unless otherwise specified. Electrostatically-applied polyester powder coat of semi-gloss ANSI-61 light gray paint with average final thickness after baking of 2-4 mils, minimum, will also be acceptable.
- C. Unfinished galvanized steel panels inside the enclosures will not be acceptable.

1.16 DELIVERY

- A. Equipment and materials shall be delivered to the site in original containers, suitably sheltered from the elements, but readily accessible for inspection by the MBTA until installed. All items prone to moisture

damage, such as control equipment and electrical apparatus, shall be stored in dry, heated spaces. Equipment and materials shall be tightly covered and protected against dirt, water, chemical and mechanical injury and theft. Damage or defects which occur before acceptance of the work shall be repaired or replaced as directed, without additional cost to the MBTA.

- B. All major electrical equipment shall be shipped with impact indicators attached for inspection by the MBTA. In particular, rectifier transformers, rectifiers, ac switchgear, dc switchgear, SAS and HMI panels to which damage could cause severe failures and delays should be fitted with analog accelerator impact recorders to verify no damage is sustained in transit. The recording shall be inspected upon delivery by suitably trained personnel.

1.17 INSTALLATION

- A. Equipment shall be installed level.
- B. The substation floor shall be surveyed and where the existing floor level under the equipment varies by more than 1/8", the floor shall be leveled by the application of concrete based self-leveling grout/underlayment (Sika Level 125, or equal).
- C. Shims used to level equipment shall be a maximum of 1/8". Use of shims over 1/8" is not acceptable, in such situations the floor shall be leveled by the application of self-leveling grout.
- D. Shim material shall be submitted and accepted by the MBTA.
- E. Self-leveling grout shall not be used in the areas of the epoxy insulated floor.

END OF SECTION

SECTION 16300

DUCTBANKS AND DUCTBANK MANHOLES FOR THE TRACTION POWER SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. Provide all labor, materials, construction equipment and services necessary for constructing the concrete encased reinforced duct banks, cast-in-place manholes and installing cable support hardware as shown on the Design Documents. DB Entity may propose precast manholes meeting all the requirements identified in the specifications.
- B. The size, configuration, construction features, and approximate locations of the duct banks and manholes required shall be developed and proposed by the DB Entity.
- C. Specification applies to MBTA's AC and DC ductbanks and manholes.
- D. For all ductbanks and manholes related to Eversource incoming line feeders refer to Eversource specifications in Appendix A of this specification provided for reference only. Where ductbanks containing Eversource cables are installed on MBTA's property the MBTA shall determine which specifications take precedence.

1.2 SUBMITTALS

- A. In accordance with Section 2.8, the DB Entity shall submit the following shop drawings and data for the MBTA's review and acceptance.
 - 1. Field data findings
 - 2. Fiberglass reinforced thermosetting conduit and fittings and spacers (DC Ductbanks)
 - 3. PVC conduit and fittings and spacers (AC ductbanks only)
 - 4. Rebar drawings for manhole and duct banks
 - 5. Cable support hardware and grounding provisions

1.3 PERMITS

- A. The DB Entity shall obtain all necessary permits for the work effort. Costs of permits are part of the lump sum cost.

1.4 UNDERGROUND UTILITIES

- A. All the known underground utilities adjacent to the proposed routing of the duct banks and manhole locations are shown on the drawings. The DB Entity shall inform all utilities and DIG SAFE of the proposed work area prior to the commencement of work so that the actual locations can be better identified and marked by the respective utility.
- B. If the performance of this work will cause interruption or discontinuance of service to the public utilities like gas, water, sewer, electrical, telephone and transit systems. The DB Entity shall be solely

responsible for making necessary arrangements for executing the work with the public utility involved at no additional cost to the contract.

- C. Any damage or settlement to existing conditions caused by the work under this contract shall be reconstructed, restored or reset by the DB Entity to the satisfaction of the MBTA at no additional cost to the contract. Pavement shall be in accordance with applicable Mass Highway Standards.

PART 2 - PRODUCTS

2.1 MATERIAL

A. ORDINARY BACKFILL

1. The material removed in excavation may be used for common backfill provided it is clean and free from refuse, debris, organic material, stumps, frozen material, large boulders or lumps of clay larger than 3 inches, or other undesirable material.
2. Backfill against concrete shall be clean fill (free of salt contamination) as accepted by the MBTA.
3. If fill of sufficient quantity and quality is not available at the site, the DB Entity shall furnish ordinary backfill conforming to applicable Mass Highway Standards at no additional cost to the contract.

B. CRUSHED STONE

1. Crushed stone shall be installed beneath the manholes a thickness of 8” to 6” beyond the face of the manhole, if possible, and under the duct banks for a thickness of 4” for the full width of the trench.

C. CONCRETE

1. Concrete mixes for manholes and duct banks shall consist of Portland cement mixes, Classification 4000 psi-3/4” aggregate for manholes and 4000 psi-3/8” aggregate for duct banks. Cement type shall be Type II Portland Cement conforming to ASTM C150.

D. DUCTBANK AND MANHOLE REINFORCEMENT

1. Ductbank reinforcing bars shall be as shown in the Design Documents.

E. WATER STOPS AND DEWATERING

1. The DB Entity shall develop and propose any necessary water-stops. They shall be submitted for review and approval. If dewatering is required during construction, then the DB Entity shall make the appropriate provisions.

F. BITUMINOUS DAMP-PROOFING

1. Damp-proofing shall be applied on the exterior surfaces of all manholes where feasible. Material shall be cold applied liquid asphalt emulsion. Damp-proofing and primer shall be all types specifically recommended for use on similar applications and shall be applied in accordance with the manufacturer’s recommendations.

G. CABLE SUPPORT HARDWARE

1. Cable support hardware such as cable racks, support brackets, porcelain insulators and all other hardware shall be as shown on the Design Documents.
2. In AC manholes, all steel hardware shall be grounded

H. MANHOLE FRAMES AND COVERS

1. Manhole frames and covers shall be of cast iron and shall be manufactured in accordance with MBTA Standards.

I. CONDUITS

1. Conduits (ducts) in the MBTA's DC duct banks shall be fiber reinforced thermosetting resin conduit. Minimum conduit size for DC positive feeder cables and negative return cable shall be 5" diameter.
2. Conduits in the MBTA's AC ductbanks shall be fiber reinforced thermosetting resin conduit or PVC conduit. PVC conduit may only be used if the conduit is fully encased in concrete.
3. Conduit shall be straight and true and shall be furnished in lengths of 20'. A cross section taken at any point perpendicular to the duct shall not vary more than 1/8" from a true circle. Conduits shall be complete with all couplings, adapters, expansion joints, bends and supports as required and/or shown on the Design Documents. All couplings and fittings shall be products of the conduit manufacturer.
4. Fiberglass conduits shall conform to MBTA's Standard Specification P-138 "Specification for Fiberglass Reinforced Thermosetting Resin Conduit".
5. PVC Conduit shall conform to Section 16201.
6. The ends of the conduits entering the manholes shall be provided with end bells. End bells shall be of the fiberglass reinforced compound manufactured using the same process for manufacturing the conduit and machined to the proper flare. End bells require smooth and round surfaces at the edge to prevent injury to the cables during normal movement. If end bells are not used, the DB Entity shall propose an alternative method of conduit termination that will prevent damage to the cables when installed.
7. Duct spacers or separators for the conduit bank shall be plastic suitable for the type of application and shall be of the size required for the size of the conduit, configuration and clearances shown on the Design Documents.

PART 3 - EXECUTION

3.1 CONSTRUCTION METHODS

A. GENERAL

1. Before commencing work, the DB Entity shall familiarize himself with the accepted drawings indicating the work to be done for this effort. The locations are not definitely fixed due to the nature of the work. The exact locations of equipment and materials shall be determined by the DB Entity.
2. If the field conditions warrant change in the routing or configuration of duct banks and/or location, shape and size, DB Entity shall obtain MBTA's acceptance for such changes. Such changes shall be done at no additional costs unless the changes are substantially different than those depicted.
3. Shoring and traffic decking system, if required, for all excavations including those which undermine the tracks shall be stamped by a professional engineer and submitted to the MBTA for review and acceptance.

B. CLEARING

1. Clearing and site preparation before commencing work shall conform to all applicable requirements as determined by the MBTA.

C. REMOVAL OF PAVEMENT

1. The paving on the streets or pathways shall be removed only to the extent necessary for the excavation. Bituminous pavement shall be removed either by breaking up or ripping up. The edges shall be even and neat, cut with a saw or other approved method so that a neat line separates the existing pavement and the pavement removed.

D. EXCAVATION AND BACKFILL

1. Excavation, including support of excavation, dewatering, traffic decking, and filling and backfilling, shall conform to the following requirements:
 - a. The DB Entity shall excavate test pits as may be necessary to locate various obstructions which may occur along the route of the underground duct bank installation. This will enable changes that need to be made in size or configuration of the duct bank to minimize changes in direction due to obstructions.
 - b. The DB Entity shall excavate the entire length of the duct bank, wherever possible, before any conduit is laid. Width and depth of duct bank shall be as shown on Design Documents. Unless otherwise approved, the minimum depth from top of duct bank to finished grade is 30".
 - c. Soft or unstable material encountered below the required sub grade of the duct bank or manhole shall be removed and replaced with compacted gravel borrow as directed by the MBTA. Rocks or boulders greater than 3" shall be removed below the sub grade to a minimum depth of 6" below the bottom of the trench and backfilled with compacted gravel borrow.
 - d. Backfill shall not be placed on surfaces that are muddy, frozen or contain frost, or that have not attained specified strength.

- e. Excavation shall be solidly sheathed with sheathing extending 3' above street level.
- f. All pipes, cables, conduits, sewers, connections, catch basins, edge stones or other structures uncovered by the excavation or adjacent thereto shall be protected from damages and shall be maintained in such a manner as to prevent displacement or damage. The DB Entity shall be solely responsible for and shall make good any damage to such structures.
- g. Steel plating over excavation, if used, shall be of sufficient strength to sustain traffic loads and shall be secured from movement.

E. CONCRETE

- 1. Concrete for duct banks shall be placed the entire length of the run between manholes stopping approximately 4' from the manholes. The remainder shall be placed as an integral part of the manhole.
- 2. Construction joints in duct banks shall be keyed or interlocked in order not to produce a vertical break and weakening of the structure. The concrete in duct banks and manholes shall be well vibrated to ensure complete fill without voids.

3.2 INSTALLATION

A. UNDERGROUND DUCT BANKS (STREET OR UNDER TRACK)

- 1. The conduits shall be installed with a minimum continuous slope of 6" x 100'. Unless otherwise shown or specified or impractical conduits shall slope downward from one manhole to the next in both directions from a high point between the manholes.
- 2. Changes in directions in duct runs exceeding a total of 10 degrees, either vertical or horizontal, shall be accomplished by long sweep bends having a minimum radius of curvature of 25', except when turning up to a switch along the right of way. The bends shall be made by installing five degree angle couplings between successive short lengths of conduit. At the end of the conduit run, manufactured elbows having a minimum radius of 36" may be used.
- 3. The conduit shall be laid in the trench in the designated formation using precast concrete block or plastic spacers for spacing conduit. Metallic spacers shall not be used. Joints in conduits shall be staggered at least 6" horizontally and vertically. Conduits between joints shall be supported by at least two separators. Reinforcing around the conduit envelope, spaced as specified, at the rim of the envelope and reinforcing along the ducts shall be provided as shown on the Design Documents. Reinforcing steel shall not be placed between the ducts. Cross tie members of reinforcing shall be installed so that they will not form loops around any duct or group of ducts.
- 4. Conduit shall be installed in not less than 20' lengths, except at the end runs or at bends. Conduit shall be free of chips and cracks. The DB Entity shall furnish and have available at the job sufficient quantity of conduit so that the cracked or chipped conduits can be discarded.
- 5. Couplings and fittings shall be of the slip on, friction type, assembled without adhesives, except the end bells in manholes. The end bells shall be secured to the conduit with an epoxy adhesive in strict accordance with the manufacturer's recommendations.

6. All field cuts of the fiberglass conduit shall be made with a hacksaw. Cuts shall be smooth and square to conduit axis. The cut end of the conduit shall be reamed smooth. Field cut conduits shall be joined with double ended couplings designed for the purpose.
7. Repairs to new conduits will not be permitted. All individual lengths of broken, cracked, chipped or impaired conduit shall be removed and replaced with new conduits.
8. When changes in the formation of a bank of conduits within a duct run are necessary, the transition shall be accomplished in as straight an alignment as possible, maintaining continuous earth support under the conduits.
9. The entire conduit envelope assembly shall be firmly anchored in position to prevent “floating” when concrete is placed.
10. Following the duct rodding device, a mandrel not less than ¼” smaller than the inside diameter of the conduit preceded by a wire brush tied to the same string shall be pulled through the conduit once in each direction. If difficulty is encountered in passage of the duct rodding device or mandrel, a series of wire brushes shall be drawn through the conduit, once in each direction, using a trailing line. The wire brushes shall be 1/8” less in diameter than the diameter of the conduit, and if the correct size cannot be passed through on the initial attempt, the operation must be repeated until accomplished as specified. When the conduit is partially or fully obstructed with mud, dirt, or gravel, the duct shall be flushed clean by use of water from a long flushing nozzle attached to a water hose which shall be pushed into the conduit and applied until the conduit is clean. After cleaning, the procedure outlined above for rodding and wire brushing shall be followed. Any damaged conduit shall be replaced with a new conduit.
11. After all obstructions have been removed and the conduits wire brushed clean, a nylon cord of suitable strength shall be threaded in each conduit of duct bank and tried to the nearest pulling eye with a 6’ length left at each end. Immediately upon completion of threading the conduit with a nylon cord, both ends of the conduit shall be plugged to prevent entry of foreign matter before the cables are pulled.

B. NEW MANHOLES

1. Manholes shall be of the reinforced concrete, field constructed type or precast manholes.
2. Design and construction of new manholes shall be in accordance with details on Design Documents. Manhole frame and cover shall be per MBTA Standard design and construction.
3. Manholes constructed under this contract shall be complete with the following features, as shown on the Design Documents.
 - a. Manhole frame and cover, supported on brick collar with cement mortar joints.
 - b. Cable racks, brackets, porcelain insulators and other cable racking hardware.
 - c. Pulling in irons.
 - d. Water stop placed around all duct openings and around at bottom of manhole.
 - e. Twelve-inch square sump pit at the bottom of the manhole. Sump pit shall be located directly under the manhole cover casting, unless directed otherwise by the MBTA.

- f. Reinforcement.
 - g. Grounding of frame, cover and support channels as shown on Design Documents, including installation of ground rods, ground cable and ground lugs.
4. Manholes shall be constructed in approximately the locations required by the design. The exact elevations and window locations shall be determined after careful consideration has been given to the location of existing and proposed utilities, drainage systems and grades. Manholes in roadways shall have covers set to finish paving grades.
 5. Manhole floors shall be put in place before the walls are started and the cement finish put on before the concrete has attained a final set. All steel for manhole roofs, and cast iron manhole frames and covers shall be set by the DB Entity.
 6. Pulling irons shall be installed in each manhole in locations determined by the MBTA.
 7. Bituminous damp-proofing shall be applied to the outside of the walls and top of roof.
 8. The DB Entity may propose the use pre-cast manholes subject to acceptance by the MBTA.

C. CABLE SUPPORT SYSTEM

1. In manholes or other location where walls are available to support the cable system for racking and splicing the system shall consist of a channel support system, or equal bolted to the wall structure.
2. Sufficient quantities of channels and channel saddles shall be installed to accommodate the maximum number of cables that could occupy the manhole based on the number of ducts into and out of the manhole.
3. Racks and associated equipment shall be installed on all four walls of a manhole unless otherwise directed.

C3813

INSTALLATION OF PRECAST CONCRETE MANHOLES

1.0 Purpose

This purpose of this standard is to detail construction and materials required for the installation of precast concrete manholes, including frames and covers.

2.0 Bill Of Materials

Note: Table lists common standard sizes, covers and frames. Refer to EVERSOURCE Material Standard Index for less commonly needed manholes.

Item	Description	Catalog ID	Compatible Unit
1	<p>Common Manholes (Inside Dim. W x L x Ht), Material Standard Numbers Listed: M1201 - 4'x4'x4'ht -secondary, split fiber w/bottom M1202 - 4'x6'x6'ht - primary splicing (URD) M1203 - 6'x10'x6'ht - primary splicing M1204 - 6'x10'x8'ht - primary splicing M1205 - 6'-6"x12'- 6"x7'-10" ht - HA-300 M1208 - 4'x4'x4'ht -secondary (URD, open bottom) M1212 - 10'x13'x8'ht - 3-way station get-a-way M1214 - 8'x14'x8'ht - station get-a-way M1216 - 5'x5'x5'ht - primary splicing (URD) M1217 - 13'x13'x8' ht - 4-way station get-a-way</p>	16246 16238 16239 16240 16241 9435 16243 16245 9437 18090	NMH-4x4x4 NMH-4x6x6 NMH-6x10x6 NMH-6x10x8 NMH-6x13x8 NMH-4x4x4NB NMH-10x13x8 NMH-8x14x8 NMH-5x5x5 NMH-13x13x8

3.0 General

- 3.1 The precast manhole(s) to be installed shall be EVERSOURCE approved precast manhole(s). Refer to the Bill of Materials list of commonly used approved EVERSOURCE precast manholes.
- 3.2 The manhole frame and cover shall also be approved EVERSOURCE items, refer to Bill of Materials.
- 3.3 The location of proposed precast manholes shall be approved and located per EVERSOURCE local engineering dept. before installation begins.
- 3.4 All excavation, backfill and paving shall be done in accordance with this standard and all applicable local and state regulations. When conflicts exist between local/state regulations and this standard the more stringent requirement shall be adhered to unless otherwise directed by EVERSOURCE.
- 3.5 DIG Safe marking and notification regulations are to be understood and adhered to prior and during all construction.

ISSUED 21-Nov-08	<p style="text-align: center;">CONSTRUCTION STANDARD ELECTRIC OPERATIONS ORGANIZATION</p> <p style="text-align: center;"></p>	C3813 Revision 0 Page 5 of 9
---------------------	--	--

- 3.6 All EVERSOURCE safety standards as well as all applicable OSHA and DOT worker safety requirements shall be adhered to at all in times.
- 3.7 Test pits shall be dug at proposed location of precast manhole before installation is confirmed. Test pits shall extend 12 inches beyond the extreme length and width and depth of the proposed manhole.

4.0 Excavation and Installation

- 4.1 The excavation shall be made to fully accommodate the proposed precast manhole, allowing for a minimum of 12 inches clear all around the outside length and width dimensions (of the manhole) and of sufficient size to safely and properly install all required shoring and bracing.
The depth of the excavation shall be a minimum of 6 inches deeper than the installed underside of the manhole to allow for a minimum of 6 inches of bedding.
- 4.2 Manhole shall be installed using properly rated rigging equipment, adhering to OSHA work methods. The manhole shall be set level on firm well compacted bedding.
- 4.3 Install, operate and maintain pump or dewatering equipment as necessary to prevent water from accumulating in excavation during excavation and installation of manhole.

5.0 Backfill Material

- 5.1 Backfill material to be used for bedding shall be 6 inches (minimum) of ¾” diameter crushed stone per Figure 1, page 7.
- 5.2 Backfill material to be used between the surrounding earth and the exterior sidewalls of the manhole and shall be “Type IE”, (Controlled Density Fill, “CDF”, or excavatable flowable fill).
- 5.3 Backfill material above the top of the manhole to final grade or paving if required shall conform to Massachusetts Highway Department Specification, “MHD M1 M1.03.1 Process Gravel for Subbase”. Backfill shall be compacted mechanically in eight inch (8”) loose layers to 95% of the maximum density per ASTM D1557 unless otherwise approved by EVERSOURCE.

ISSUED 21-Nov-08	<p style="text-align: center;">CONSTRUCTION STANDARD ELECTRIC OPERATIONS ORGANIZATION</p> <p style="text-align: center;"></p>	C3813 Revision 0 Page 5 of 9
---------------------	--	--

6.0 Pavement Cuts

- 6.1 All cuts in bituminous or concrete pavement shall be vertical and made with the proper tools to ensure minimum repaving. The pavement cut shall be straight and uniform.
- 6.2 Excavated pavement and street base, if any, shall be kept at least two (2) feet back from the edge of the excavation cut and shall be piled so as not to endanger the work or restrict, hamper or inconvenience Owners or tenants of property or interfere with the normal flow of traffic. All excess materials not suitable for backfill shall be removed from the job site and disposed of as directed by EVERSOURCE.

7.0 Sod Removal

Sod shall be removed carefully, when possible, in regular and uniform blocks with sharp edged tools. It shall be placed in uniform piles along the excavation and kept moist until time for relaying. The DB Entity shall be responsible for suitable reseeding, if necessary and shall maintain until grass has grown.

8.0 Street Restoration

All street paving of open excavations shall be restored using temporary or Interim pavement with two – 1-1/2 inch lifts of compacted hot mix asphalt binder (unless otherwise noted by EVERSOURCE). Cold patch repairs when approved by EVERSOURCE shall be cold patch EVERSOURCE Cat ID 1628. Permanent street paving shall be by the governing municipality.

9.0 Grounding of Manhole

- 9.1 Manhole grounding shall be as detailed on Figure 2, page 8. Refer to table below for typical manhole grounding accessories and compatible unit assemblies.
- 9.2 Install two copperweld ground rods, one outside each corner of manhole. Connect 4/0 bare copper wire to ground rods using grounding mechanical or exothermic connector in two places. Connect 4/0 bare copper wire to 4/0 copper ground wire tails projecting from manhole with two mechanical connectors.

Table of Precast Manhole Ground Ring Accessories

Description	Quantity	Catalog ID	Compatible Unit
4'x4' or 5'x5' – small manhole ground ring includes: -5/8" x 8' Ground rod -1/0 Cu Ground wire -Ground Rod Connector to 1/0 Cu wire -Ground Wire connector 1/0-1/0 Cu wire	 2 40 2 4	 9229 100 9009 608	 UGN4x4

Description	Quantity	Catalog ID	Compatible Unit
10'x6' – standard manhole ground ring includes: -5/8" x 8' Ground rod -4/0 Cu Ground wire -Ground Rod Connector to 4/0 Cu wire -Ground Wire connector, bronze , 4/0-4/0 Cu wire	 2 55 2 4	 9229 116 597 608	 UGN10x6
14'x8' – large manhole ground ring includes: -5/8" x 8' Ground rod -4/0 Cu Ground wire -Ground Rod Connector to 4/0 Cu wire -Ground Wire connector 4/0-4/0 Cu wire	 2 65 2 4	 9229 116 597 608	 UGN14x8

10.0 Manhole Frame & Cover

10.1 EVERSOURCE approved manhole frame(s) shall be installed on a two brick collar course (unless required otherwise by EVERSOURCE) over the opening(s) on the roof of the manhole as shown in Figure 1, page 7. Refer to EVERSOURCE Standards in the Bill of Materials for approved frames and covers.

10.2 The brick collar course shall be installed directly around the manhole roof opening as shown on Fig. 1, page 7. The bricks shall consist of the best

ISSUED 21-Nov-08	CONSTRUCTION STANDARD ELECTRIC OPERATIONS ORGANIZATION 	C3813 Revision 0 Page 5 of 9
---------------------	--	------------------------------------

quality steam cured brick manufactured per the latest revision of ASTM Standard C55 or the latest revision of ASTM Standard C32 (if red brick is specified). The brick collar and flange of the manhole frame shall be completely covered with a concrete seal. The concrete (approved 2500 psi pea stone mix using Type 2 Portland Cement) seal shall completely encase the lower 3 inches of the frame and the brick course layers.

11.0 Miscellaneous Manhole Accessories

- 11.1 The items in the table, on page 6 (not shown on figures in this standard) are either pre-installed by precast manhole vendor or installed as required after installation.
- 11.2 All manholes shall have Manhole ID Tag fastened to the chimney. Refer to Figure 1, page 7.

PRECAST CONCRETE MANHOLE
6'- 0"W x 10'- 0"L x 8'- 0"H INSIDE DIMENSIONS

1.0 Scope – This specification details the dimensions, strength, reinforcement, and appurtenances required for fabrication of precast, concrete manholes.

2.0 General – Vendor design and fabrication drawing shall conform to the minimum requirements of this specification and shall be signed and stamped by a Massachusetts registered professional engineer.

3.0 Design Notes

- 3.1 Concrete minimum strength - 5000 psi @ 28 days.
- 3.2 Steel reinforcement - ASTM A615, Grade 60.
- 3.3 Minimum Steel Cover – 1inch.
- 3.4 Design Loading - AASHTO HS20-44.
- 3.5 Design Specifications – ACI 318 & AASHTO Load Factor Design Method.
- 3.6 Manufacturer's name and year of fabrication shall be stenciled on vertical wall of access chimney.
- 3.7 All Termaducts to have bell ends flush with the inside wall.
- 3.8 Termaducts may be specified in lieu of knockouts at the direction of NSTAR.
- 3.9 Construction Joint – Sealed with 1" diameter Butyl Rubber or approved equal.

4.0 Bill of Materials

- 4.1 The catalog ID for the precast manhole is "16240".
- 4.2 The catalog ID's for the "3" & "4" position stanchions are "1752" & "1753". Stanchions shall be manufactured by J. S. Products, Whitman, MA (or approved equal).
- 4.3 The catalog ID for the bonding frame is "1229". Bonding frame consist of 1 - #4/0 stainless steel ground clamp, 1 - #10 x 1-1/2" lg x 5/16" dia SS screw and 1- lead plug as supplied by Tools Unlimited Inc, Stoughton, MA (or approved equal).

- 4.4 The recessed pulling eye, "New PI-2", shall be manufactured by Pennsylvania Insert Corp., Spring City, PA (or approved equal).
- 4.5 The sump grate shall be "Polylock Part No. 3037" as manufactured by Polylock Corp., Wallingford, CT (or approved equal).

-----------------------------	--	--

1.0 Scope

The purpose of this standard is to provide ductbank construction details, installation requirements and material lists for concrete-encased and direct buried conduit systems.

2.0 General

- 2.1 All excavation, backfill and paving shall be done In accordance with this standard and all applicable local and state regulations. When conflicts exist between local/state regulations and this standard the more stringent requirement shall be adhered to unless otherwise directed by EVERSOURCE.
- 2.2 Before placing concrete within ductbank forms and backfilling an EVERSOURCE inspection is required to ensure compliance with all referenced specifications.
- 2.3 DIG Safe marking and notification regulations are to be understood and adhered to during all construction.
- 2.4 All EVERSOURCE safety standards as well as all applicable OSHA and DOT worker safety requirements shall be adhered to at all in times. Refer to EVERSOURCE Work Method Standard, "W1000, Entering and Working in Underground Locations including Subsurface Vaults" specific requirements.

3.0 Conduit & Fittings Specifications

All encased conduit shall be PVC conduit (Type EB) and fittings shall be schedule 40 unless otherwise specified by EVERSOURCE. Direct buried conduit and fittings shall be schedule 40 minimum. Refer to EVERSOURCE Material Standard "M1000, PVC Conduit & Fittings" for details.

4.0 Conduit Plan and Records/Data Requirements

- 4.1 All proposed electric utility plans shall be approved by EVERSOURCE local engineering dept. before construction begins. New subdivision or commercial development plans to be submitted for local authority petitions (town approval) shall also be provided to EVERSOURCE as AutoCAD data files. These shall show all proposed and existing utility plan view layers including electric, gas, water, sewer, drain, cable/data, telephone, and fire alarm.

<p>Issued 24-Apr-08</p>	<p style="text-align: center;">CONSTRUCTION STANDARD ELECTRIC OPERATIONS ORGANIZATION</p> <p style="text-align: center;"></p>	<p style="text-align: center;">C1100 Revision 0 Page 27 of 25</p>
-----------------------------	--	---

- 4.2 The proposed electric utility plans shall include profile views that show relative elevation and clearances where proposed electric duct banks or lines intersect with non-electric utilities. Separation in any direction from electric to other utilities of 12" or less shall be detailed on the drawings.
- 4.3 GPS land based x-y-z coordinates shall be in NAD83 state plane feet format, with a minimum one foot accuracy. These plans shall show the road layout, curb lines, property lines (parcel boundaries), utility easements and utilities. Center coordinate positions shall be provided for all new manholes/pull boxes, equipment pads, and riser poles. Conduit location coordinates shall be provided at every 50 ft on straight sections or curves with less than 5 degree radii, and at every 20 ft for curves/sweeps over 5 degrees. GPS data for new conduit and infrastructure shall have accuracy of 6 inches or better.
- 4.4 The DB Entity shall provide EVERSOURCE Survey and Records department (or local engineering) with as-built new facility location data in electronic file format within 20 business days of completing the project (CD or EFT). All files shall be labeled with the project title, town, EVERSOURCE work order number and date of completion.

5.0 Application

- 5.1 Typically all primary and secondary distribution duct banks shall be unreinforced concrete encased using Type EB conduit. Stocked fittings are generally Schedule 40 unless otherwise specified.
- 5.2 If the interval between concrete pours for a continuous duct bank is expected to be more than 4 hours apart, industry standard construction joints shall be formed to ensure that the continuation of the ductbank pour shall create an interlocking joint between different pours. Refer to Figure "E" for detail.
- 5.3 The concrete specified for ductbanks shall be an approved 2500 psi pea stone mix using Type 2 Portland cement.
- 5.4 Reinforced distribution ductbanks maybe required per EVERSOURCE for locations where ductbanks cross over other utilities and/or a future excavation could expose EVERSOURCE ductbank without support. Reinforced ductbanks may also be required when installation is in soils that do not meet EVERSOURCE specified backfill.
For reinforced concrete ductbank standards refer to EVERSOURCE Construction Standard, "C1101, Distribution Duct bank Construction, and (Steel Reinforced Concrete)".
- 5.5 Exceptions to concrete encased ductbanks, i.e. direct buried conduit, may be allowed by EVERSOURCE for secondary conduits installed off roadways and areas not subject to vehicle loads such as greenbelts and yards. Also when approved by EVERSOURCE, single or double primary conduit runs in URD

<p>Issued 24-Apr-08</p>	<p style="text-align: center;">CONSTRUCTION STANDARD ELECTRIC OPERATIONS ORGANIZATION</p> <p style="text-align: center;"></p>	<p style="text-align: center;">C1100</p> <p style="text-align: center;">Revision 0 Page 28 of 25</p>
-----------------------------	--	--

residential subdivisions may be direct buried as long as minimum schedule 40 conduit is used and local regulations allow it.

6.0 Excavation, Backfill and Street Restoration

6.1 Excavation

The roadway surface shall be cut in reasonably straight and parallel lines using a jackhammer, saw or other accepted method to insure the least amount of damage to the roadway surface.

Sheeting and bracing shall be required for excavations in excess of 5 feet deep in accordance with the latest OSHA Standards.

6.2 Backfill Material

- A. Backfill material shall conform to "MHD M1.03.1 Process Gravel for Subbase". Backfill shall be mechanically compacted in eight inch (8") loose layers to 95% of the maximum density per ASTM D1557 unless otherwise approved by EVERSOURCE.
- B. Excavated material that has been evaluated as unsuitable for backfill shall be removed from the site and disposed of properly.
- C. If directed by EVERSOURCE only "Type IE", (Controlled Density Fill , "CDF", or excavatable flowable fill), shall be used as backfill in certain instances, such as filling hard to reach areas where maneuvering compaction equipment would be difficult or when directed by the governing municipality.
- D. Note, EVERSOURCE approved red caution tape, marked "CAUTION ELECTRIC LINES BURIED BELOW", shall be installed 6-9 inches below surface grade, centered above the buried line or ductbank.
- E. Backfilling shall not commence less than two hours after the duct bank concrete has been placed.

6.3 Street Restoration

All street paving of open excavations shall be restored using temporary or Interim pavement with two – 1-1/2 inch lifts of compacted hot mix asphalt binder (unless otherwise noted by EVERSOURCE). Cold patch repairs when approved by EVERSOURCE shall be cold patch EVERSOURCE Cat ID 1628. Permanent street paving shall be by the governing municipality.

<p>Issued 24-Apr-08</p>	<p style="text-align: center;">CONSTRUCTION STANDARD ELECTRIC OPERATIONS ORGANIZATION</p> <p style="text-align: center;"></p>	<p style="text-align: center;">C1100</p> <p style="text-align: center;">Revision 0 Page 29 of 25</p>
-----------------------------	--	--

7.0 Installation

- 7.1 Duct Bank Forms – In general duct banks shall be constructed using forms for the sidewalls. Where suitable stable soil conditions exist the trench walls may be used to form the sidewalls. Duct bank standards shall be maintained.
- 7.2 Common Trench – Other utilities sharing a common trench with EVERSOURCE ductbank shall not be enveloped within the same concrete formed encasement, but shall be separate from our encasement and a minimum clearance of 12 inches away.
- 7.3 Cutting Duct – Use a fine tooth wood saw to cut conduit. All ruff or abrasive edges shall be sanded smooth.
- 7.4 Duct Plugs – EVERSOURCE approved duct plugs shall be installed in all open conduit. The plugs shall be installed during construction when a conduit installation is partially complete to manhole or equipment as well as at all terminations in manholes.
- 7.5 Joining Duct – All conduit ends shall be cleaned by wiping off all dust, dirt and moisture from the surfaces to be cemented and brushed gently with a fine abrasive paper or cloth. Apply the approved PVC solvent cement with a non-synthetic bristle brush evenly coating the full length PVC socket of the fitting. Refer to manufacturers’ instructions for additional detail.
- 7.6 Depth of Cover – The minimum depth of cover over a single conduit or multiple duct bank shall be 36 inches unless otherwise directed by EVERSOURCE. In limited situations EVERSOURCE may allow shallow depth ductbank installations less than 36 inches. Prior approval from EVERSOURCE is required for shallow depth construction as well as the requirement to use ¼ inch thick steel plates above and adjacent to the side wall of the ductbank.
- 7.7 Clearance– The minimum clearance between an EVERSOURCE conduit or ductbank and any other subsurface structure or utility (EXCEPT Steam Lines) shall be 12 inches unless otherwise approved by EVERSOURCE. Steam lines shall maintain a 10 ft. minimum from EVERSOURCE ductbank or lines.
- 7.8 Conduit Spacers – Conduit Spacers shall be of the approved type per EVERSOURCE Material Standard, “M1000, PVC Conduit and Fittings”. Spacers shall be installed at typically 5 ft. spacing (7 ft. maximum) along the ductbank. Refer to Figure “B” for conduit construction plastic spacers details.
- 7.9 Conduit Sweeps and Bends – Conduit heat bending is not allowed. All sweeps and bends shall be constructed using pre-fabricated approved fittings. Refer to “Table 3 – Conduit Sweeps and Angle Fittings”.
- 7.10 Mandrel – Upon completion of the duct bank installation or direct buried ducts, a standard flexible mandrel, (not less than 12 inches long with a diameter not less than ½ inch less than the inside diameter of the duct) shall be pulled through each duct to loosen particles of earth, sand and other foreign material left in the

<p>Issued 24-Apr-08</p>	<p style="text-align: center;">CONSTRUCTION STANDARD ELECTRIC OPERATIONS ORGANIZATION</p> <p style="text-align: center;"></p>	<p style="text-align: center;">C1100 Revision 0 Page 30 of 25</p>
-----------------------------	--	---

line. A brush with stiff bristles shall then be pulled through each duct to remove the loosened particles. The diameter of the brush shall be the same as, or slightly larger than the diameter of the duct.

- 7.11 Building Wall Construction – When conduit or ductbank enters a structure and differential settlement is expected, construction details shall be per Figure “C”.
- 7.12 Riser Construction – When conduit transitions from underground to above ground a galvanized steel conduit with a 36 inch radius sweep shall be used. For typical riser construction details refer to Figure “D”.
- 7.13 All conduit shall have “mule tape” or equal, i.e. pulling tape made of woven polyester with a strength of 2500 lbs. installed within.
- 7.14 Transposition of Ducts – When ducts leaving one manhole/pad/equipment foundation require altering the duct bank cross section along the run, the revised configuration (and corresponding duct numbering) shall be as shown on Figure “G” unless otherwise approved by EVERSOURCE.

8.0 Breaking into existing Manholes

- 8.1 Manhole breaks for new ductbank penetrations shall receive prior approval from EVERSOURCE inspector. The DB Entity must be pre-qualified by EVERSOURCE to work in or break into live manholes. Sidewall breaks are generally not allowed unless prior approval from EVERSOURCE inspector.
- 8.2 All newly formed bell mouths shall be installed per Figure “F”.

9.0 Compatible Unit Format for Conduit & Fittings

The Compatible Unit format for Conduit & Fittings, which are considered Non-electric Facilities, is described below:

- 9.1 Conduit, Banks and Riser CU Formats -unit lengths are noted in CU title:

NC (Application/Material) (Size) - (Quantity {row x height})

(Application/Material) -

- D** – Direct Buried (schedule 40 PVC)
- E** – Concrete Encased PVC (Type EB with spacers needed)
- RP** – Riser PVC (pipe and sweep- schedule. 40)
- RS** – Riser steel (pipe and sweep – galv. steel)
- S** – Steel Conduit
- FLEX** – flexible PVC, schedule 40
- (Size)** – Conduit inside diameter (inches)

<p>Issued 24-Apr-08</p>	<p style="text-align: center;">CONSTRUCTION STANDARD ELECTRIC OPERATIONS ORGANIZATION</p> <p style="text-align: center;"></p>	<p style="text-align: center;">C1100</p> <p style="text-align: center;">Revision 0 Page 31 of 25</p>
-----------------------------	--	--

(Quantity) – Cross section, rows x height (greater than one only, if one leave blank)
Examples: NCE4-3x3: 3x3 duct bank, 4”, PVC type EB
NCRS4: 4”, galvanized steel, riser pipe and sweep
NCD2: single 2” schedule 40 PVC duct, direct buried

9.2 Conduit Fitting CU Formats:

NF (Material) (Size) - (Type) – {detail below}

(Material) – **P** – PVC schedule 40 or DB/EB, **S** – Steel, **I** - Iron
(Size) – Conduit inside diameter in inches
(Type) - **SW** – Sweeps & angle fittings in degrees
(Angle)-(Radius) - For 36 in. radius bends leave blank, show all others.
R - Reducers (**A side – B side**) – in inches
CAP - Riser Caps, **PLUG** – Duct Plugs, **CPL** – Straight Couplings
RADP - Riser Adapter, **FA** – Fairleader, **BEL40** – Endbell – Sch 40,
BELEB - Endbell – EB, **SLIP** – Slip Coupling, **SPLIT** – Split Repair
PS - PVC to Steel Coupling, **GNDBUSH** – Grounding Bushing,
GNDUCONN – pipe ground connector
Examples: NFP4-SW90-24: 4”, PVC, 90 degree angle sweep with 24 in radius
NFP5-SW22: 5” PVC duct, 22.5 degree sweep, 36 in radius
NFP6-CAP: 6” PVC riser cap (for spare)
NFP5-CPL: 5” PVC straight coupling
NFS4-GNDBUSH: 4” Grounding Bushing:

9.3 Conduit Accessory CU Formats:

NA (Material) - (Size option if any)

Material – **CM** - PVC cement, **MT** - marker tape, **FL**- fish line, **DX** - duxseal,
DF - duct foam, **CP** - cold patch, **FA** – fairleader

10.0 Ductbank Compatible Units

- 10.1 Ductbanks shall be designed using Compatible Units (CUs). The table below references the CUs for the most commonly used ductbanks for distribution construction. Refer to EVERSOURCE Material Standard, “M1000, PVC Conduit & Fittings” for additional information.
- 10.2 Refer to Figure “E” for typical ductbank construction details.
- 10.3 Figures 1 thru 21 noted below refer to standard cross sections on pages 19-24.

DUCTBANK COMPATIBLE UNIT REFERENCE TABLE

Note: Each single duct bank CU includes 20 ft of trenching, needed lengths of conduit, spacers, concrete, backfill & resurfacing.

END OF SECTION

SECTION 16311

TRACTION POWER ELECTRICAL EQUIPMENT

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies the conditions and technical requirements for the furnishing and installation of AC and DC switchgear, rectifier transformers, rectifiers, busducts, negative drainage board and accessory equipment for traction service.
- B. This Section also identifies the requirements of the design submittals required as part of this Project.
- C. Installation includes the furnishing of all labor, materials, tools, equipment, facilities, permits, insurance and incidentals necessary for design completion, testing, shipping, rigging, installation and commissioning of the following major electrical equipment:

(* indicates some of the equipment has been procured by the MBTA)

- 1. 15 kV class AC switchgear assembly (Article 2.1)(*)
 - 2. Rectifier transformers (Article 2.2)(*)
 - 3. Traction power rectifiers (Article 2.3)(*)
 - 4. 750 Volt class DC switchgear assembly (Article 2.4)(*)
 - 5. Anode (AC) and cathode (DC) buses (Article 2.5)
 - 6. Negative equalizer bus and drainage board (Article 2.6)
 - 7. 15 kV circuit breaker control and instrument panel (ACCP)(Article 2.7)
 - 8. Station battery, charger and accessories (Article 2.8)
 - 9. Supervisory equipment (Article 2.9)
 - 10. Substation Automation Equipment – Refer to Appendix A
 - 11. Technical Support Equipment
 - 12. Testing and Safety Equipment
- D. The DB Entity shall furnish, install and connect any additional components, parts, items and devices not specifically mentioned in this Section or shown on the Contract Documents, but necessary for the proper operation of the equipment in accordance with the intent of the Contract Documents, at no additional cost to the MBTA.

- E. The DB Entity shall employ or retain the services of a Designer and Power Engineer. The duties and responsibilities of the Designer / Power Engineer shall include but not be limited to the following.
1. Participate at Design Submittal Review Conferences
 2. Participate at the Design Conference.
 3. Review equipment shop drawings to insure they comply with the requirements of specifications and plans. This will occur prior to submittal of shop drawings to the MBTA.
 4. Develop relay co-ordination curves/settings for AC switchgear and DC switchgear.
 5. Review Factory and Field Testing Procedures to insure they comply with the specifications. This will occur prior to submitting the procedures to the MBTA.
 6. Attend Factory Design and Production Tests.
 7. Make monthly visits to the substations during equipment installation to resolve problems.
 8. Attend Field Testing of the Substations.
 9. Co-ordinate As-Built Equipment Drawings.

1.2 RELATED WORK

- A. Related requirements are included in, but not limited to, the following Sections.
1. Section 16100, Power Utility Coordination for the Traction Power System
 2. Section 16201, Basic Materials and Methods for Electrical Work For the Traction Power System
 3. Section 16203, Traction Power Equipment General Requirements
 4. Section 16492, SCADA Master Station and SCADA interface

1.3 EQUIPMENT ENVIRONMENT

- A. All substation equipment specified in this Section shall be installed indoors, in the substation building with the exception of the oil filled rectifier transformers and connected section of the AC busducts.
- B. The substation site is located at approximately sea level with a normal barometric pressure of 29.21 inches Hg. Outdoor temperatures in the Boston area range approximately from minus 15°F to plus 105°F.
- C. Ventilation shall be supplied to the substation building with filtered outside air when the inside temperature reaches 90°F and above. Maximum expected air temperature within the building is

104°F during hot summer days. During cool periods the temperature within the substation shall be maintained at 50°F and above by thermostatically controlled heaters.

- D. The atmosphere in Boston has a combination of industrial pollutants expected of a metropolitan area with a concentration of various types of industries.
- E. All equipment and materials supplied under this Contract shall be designed to resist dynamic earthquake loadings based on the Massachusetts State Building Code (Seismic Zone 2A).

1.4 INSTALLATION DESIGN CONFERENCE and DESIGN SUBMITTAL REVIEW CONFERENCES

- A. The DB Entity shall start design development immediately upon Notice to Proceed. The design development shall provide submittals for each TPSS for the 30%, 60%, 90% and 100% design stages as is normal for the MBTA.
- B. The design submittal schedule shall be developed in accordance with the Contract requirements.
- C. The DB Entity shall provide a Contract Deliverable Requirements List (CDRL) for the design phase of the project for review and acceptance by the MBTA within 21 days of the Notice to Proceed.
- D. The design submittals shall include as a minimum but not be limited to design plans, specifications, reports, calculations and studies necessary to clearly show the detailed design at the appropriate stages. Documents shall include:
 - 1. Substation location plans
 - 2. Substation layout plans (integrating MBTA procured equipment as necessary)
 - 3. Single line diagrams
 - 4. System configuration diagrams
 - 5. Equipment schematic diagrams
 - 6. Typical equipment drawings (integrating MBTA procured equipment as necessary).
 - 7. Section views and elevations
 - 8. Access and egress details
 - 9. SCADA system points list
 - 10. SAS block diagrams and details
 - 11. Cable and conduit routing drawings
 - 12. Interface drawings
 - 13. Grounding and bonding design drawings

- E. Upon completion of each design stage, the MBTA shall be provided an 8 week period to review the design plans. Upon completion of that period, the DB Entity shall arrange for a design submittal review conference. All necessary parties of the MBTA and its representative shall be invited. The DB Entity shall present the design and receive comment verbally or in written form. The DB Entity shall reply to all comments and record in the meeting minutes. The intent of the meeting is to enable the DB Entity to proceed to the next design stage with agreed actions and issues resolved. The DB Entity shall take the meeting notes and distribute accordingly.
- F. The final design documents shall be stamped and sealed by a PE in the State of Massachusetts.
- G. Upon completion of the design, the DB Entity shall proceed to develop the specific detailed equipment designs from its selected vendors. The DB Entity's vendors shall start detail design and drafting work for all equipment immediately upon Notice to Proceed and shall process design work to completion without delay and without regard to normal manufacturing schedule.
- H. An Installation Design Conference shall be arranged in the Metropolitan Boston area as directed by the MBTA. The Design Conference shall be scheduled so that it can be completed within 60 calendar days from the Notice to Proceed. It is estimated that the Design Conference, dealing with the design and manufacturing of traction power and substation auxiliary equipment, will take not more than two full working days, provided the DB Entity will produce the data and drawings specified herein in full compliance with the Specification requirements. The Design Conference will be attended by the MBTA, MBTA's consulting Engineer for the Project, DB Entity's Project Manager, DB Entity's Power Engineer and, on as-needed basis, technical personnel from major equipment manufacturers. All of the DB Entity's costs associated with arranging and attending the Design Conference, including meeting space and incidentals, shall be borne by the DB Entity.
- I. A minimum of 21 days prior to the Design Conference, the DB Entity shall submit the following for the MBTA's review:
1. Certified overall dimension drawings showing weights and bases of all equipment covered by the Contract.
 2. Contract Deliverable Requirements list (CDRL) – see 1.5.A below.
 3. Compliance / Non-Compliance List – see 1.5.B below.
 4. Written notification of any difficulties encountered with fitting the proposed equipment into the equipment outlines shown on the Design Documents.
 5. Complete design calculations as specified in Part 2, Products, of this Section for MBTA's review and comment. Design details are to be accepted by the MBTA in accordance with this Specification. Specific design calculations that will be reviewed are the calculations for the transformer and rectifier. The submitted calculations should include:
 - a. Resistance
 - b. Impedance
 - c. X/R Ratio
 - d. Temperature Rise Curve
 - e. Power Loss Curve
 - f. Efficiency - Load Curve

6. Power Factor - Load Curve: All pertinent information for equipment proving general compliance with the Specification requirements. The submittal shall include published product literature showing construction features of equipment offered, electrical ratings of equipment, reference list of users in USA, and any other information useful in illustrating the compliance with the Specification requirements.
 7. Performance data of rectifier main DC circuit breaker during the operation on forward current at rated, overhead and short-circuit condition with and without polarizing supply applied and on reverse current, with and without polarizing supply.
 8. Sketches or drawings clearly showing the conceptual design of the ground and test devices associated with the 15 kV switchgear, including the list of components. Written descriptions of all known deviations from the Specifications. Without this written statement the DB Entity shall be assumed to be fully compliant with all clauses in the Specifications. A clause by clause commentary is preferred.
- J. During the Design Conference, the DB Entity shall provide the following:
1. Detailed traction power engineering/design and construction schedule showing as a minimum: DB Entity drawing submittals for each main item of equipment; drawing review periods; equipment design period; manufacturing period; and, delivery, installation and testing periods including test notification milestones. Schedule shall show start and finish milestones for the project and identify the critical path items. A detailed list of drawings to be submitted shall also be provided.
 2. Manufacturing plan, specifically showing material planning for equipment, estimated period of manufacture, planned date of completion, and scheduled date for witnessing of tests.

1.5 SUBMITTALS

- A. Provide submittals in accordance with Volume 2 Technical Provisions Subsection 2.8, Construction Submittal Requirements. The DB Entity shall develop and submit a Contract Deliverable Requirements List (CDRL) for the installation drawings and submit within 15 calendar days of Notice to Proceed. The List shall include all proposed submittals and the associated specification section which specifies the deliverable.
- B. The DB Entity shall submit a compliance / non-compliance list for the traction power specifications 16100, 16120, 16203, this Section, 16450, 16495. The list shall identify all specification clauses in the Traction Power Specifications and adjacent to each listed clause a category of 'compliant' or 'non-compliant'. All non-compliances shall be listed however small and insignificant it may appear and shall include the technical support equipment sections of the specifications. Each non-compliance shall be provided with a description or explanation and the DB Entity's proposed alternative or solution.
- C. Drawings and reference data: The below listed drawings, diagrams and instruction manuals, shall be submitted for all equipment furnished for the substation, in accordance with the requirements in Contract Technical Provision Subsections 2.7 and 2.8. The documentation shall be submitted separately for each main item of equipment. The documentation shall be further split into separate submittals for equipment drawings, calculations, nameplate list, product data book and bill of material list.

- D. Within 45 calendar days after the Design Conference, the DB Entity shall submit the following for acceptance:
1. Certified outline drawings of all major equipment, indicating overall dimensions, space requirements, location of control and protective devices on panels and reference tables to other drawings furnished. The submittal shall include the front and rear view of the AC and DC switchgear, rectifier transformer, rectifier, negative drainage board and the 15 kV circuit breaker control panel, substation automation equipment cabinets showing all door and panel mounted devices, equipment and device nameplates and door swings.
 2. Certified floor plans of equipment, showing dimensions necessary for installing equipment, clearances from building structure, equipment base details; dimensions and weights of shipping sections.
 3. Certified top and bottom views of equipment, showing available space for entrance of power and control circuit wiring from the top or bottom, as specified and entry of anode and cathode buses; for DC switchgear, clearance above from grounded objects and structures.
 4. Certified section views of each non-identical unit showing buses and bus supports, location of circuit breakers in withdrawn, test and fully connected positions and the location of outgoing power and control terminals. Drawings must be in sufficient detail to illustrate accessibility for maintenance and for adjustments while energized.
 5. Certified front view and side panel views of each non-identical control compartment unit, with control compartment door(s) open, showing internally mounted control devices. All devices shall be shown in their respective locations with identifying nameplates.
 6. One line diagram of equipment supplied, showing all power and auxiliary circuits, protective devices, and the location of all current, potential and auxiliary transformers and shunts with the devices energized by them. Also, inclusive of equipment interlocking requirements (electrical and mechanical).
 7. Block diagrams for the substation communications system and automation, function diagrams and logic diagrams, product data and equipment dimensions and housings.
 8. Schematic diagrams of transformer, rectifier, negative board and DC circuit breakers and circuit connections, controls and alarms, as follows.
 - a. Schematic diagrams shall be self-explanatory and shall be specifically prepared for this Contract and shall include AC schematic (three line) and DC elementary diagrams for all circuits.
 - b. Wire numbers shall be assigned to each schematic and elementary diagram so that each segment of all circuits can be identified on internal wiring diagrams of the equipment and on the interconnection diagrams. Wire sizes shall also be identified.
 - c. Wire numbers of similar schematics of different circuits shall be prefixed or suffixed to differentiate between the wires of separate pieces of equipment.
 - d. Terminal blocks in all equipment shall be assigned unique labels.

- e. Circuits and portions of circuits which will be routed external to the originating cubicle shall be clearly indicated as external wiring. Interconnection wire sizes shall also be identified.
 - f. Schematic diagrams shall show originating and terminating terminal block numbers for all wiring which enters or leaves an equipment compartment (“external wiring”). These terminal block numbers shall match the terminal block numbers shown on subsequent wiring diagrams.
 - g. Circuit breaker reference position for all equipment contacts shall be: circuit breaker racked-in and open (tripped).
- 9. Internal connection diagrams of devices, including relays and meters. Contact development of control, selector and instrument transfer switches, test switches and lockout relays.
 - 10. Equipment trip and lockout schedule, in tabulated form.
 - 11. Calculations of 125 volt DC control power requirements and for sizing of station battery, charger, and DC panel.
 - 12. SCADA points list and SAS equipment, locations and product information.
- E. After the return of the schematic diagrams marked "For Approval", or equivalent, the following drawings shall be submitted within 60 calendar days for acceptance (wiring diagram submittal):
- 1. Dimensioned general arrangement plans and elevation views of the substation, locating all DB Entity's furnished and installed equipment.
 - 2. Bus duct layout plans, sections, and support and connection details.
 - 3. Composite one line diagram of the substation power systems.
 - 4. Connection diagrams of each non-identical unit showing the following:
 - a. Terminal block arrangement, identifying each outgoing power and control terminal and showing interconnections between individual units and shipping splits of an equipment assembly. Each terminal block shall have a unique numbering convention (unique within a unit, and among all units)
 - 5. Internal wiring diagrams of rectifier transformer, rectifier, AC and DC switchgear cubicles and circuit breaker drawout elements, and 15 kV breaker control and instrument panel, showing electrical devices in their relative physical locations, left to right and top to bottom. Each wire and jumper shall be shown on the wiring diagrams. Terminal blocks for external control cable connections shall be shown in their relative physical locations. Inboard wiring connected to these terminal blocks shall be positively identified and marked so as to be readily located at the device end. All wiring shall be identified with the wire numbers shown on schematic and elementary diagrams.
 - 6. Wiring diagrams shall also comply with the following requirements:

- a. Schematic or figurative type wiring diagrams which do not portray the physical wiring of the panels will not be accepted.
 - b. Wiring diagrams shall provide sufficient empty space next to terminal blocks for interconnecting wiring cable bundle numbers and individual wire color designations.
 - c. Circuit purpose/description shall be noted adjacent to the terminal blocks to which the circuits are connected.
 - d. Wiring diagrams shall be orderly, legible and neat in appearance. Line crossings and drawing call-outs, if used, shall make use of different line widths or CAD line screening techniques to improve readability. Wiring diagrams that, in the opinion of the MBTA, do not meet this requirement, will be rejected.
 - e. Circuit breaker reference position for all contacts shown on the diagrams shall be: circuit breaker racked-in and open (tripped).
 - f. Substation automation functional and wiring diagrams showing communications ports, equipment location, cable numbering and logic diagrams with points list, programming and software.
7. Substation cable routing block diagram and wire/cable schedule including fiber optic cabling.
 8. Equipment rating nameplate data, bills of materials of equipment, devices and accessories with catalog cuts of all devices and accessories listed.
 9. Instrument transformer ratio, phase angle and excitation characteristic curves.
 10. Protective device coordination as follows.
 - a. Protective device settings and relay co-ordination requirements shall be provided. The study to develop the required settings shall be produced and approved by the DB Entity's Power Engineer. The study shall be submitted to the MBTA for acceptance.
 - b. The studies shall include but not be limited to portions of the electrical distribution system from the 13.8 kV infeed power sources, ring network and the 750 VDC system and shall include normal system connections as well as those which result in maximum fault conditions.
 - c. All supporting calculations shall be clear and neatly documented and submitted to the MBTA.
 - d. The studies shall be submitted by the DB Entity prior to receiving final acceptance from the MBTA for shop drawings on the power equipment.
 - e. The studies shall be certified (prepared and stamped) by a registered professional electrical engineer registered in the Commonwealth of Massachusetts.
 - f. The DB Entity shall be responsible for gathering all necessary data for the studies and shall expedite the data collection process to assure completion of the studies as required for final approval of the distribution equipment and/or prior to release of the equipment

for manufacture. As necessary, the DB Entity may obtain relay information and short circuit data from the MBTA via a request for information. The DB Entity shall coordinate with the MBTA in obtaining short-circuit data from Eversource (Formerly NSTAR) (incoming lines).

- g. The studies shall be in accordance with applicable IEEE and ANSI standards, and shall satisfy the requirements of the National Electrical Code.
- h. The DB Entity shall submit graphic proof of protective device coordination of equipment furnished for the substation. Coordination curves shall be submitted on 11 x 17" log-log paper showing full load currents, phase and ground fault currents, and relay and fuse coordination for all equipment furnished, including new rectifier transformers and their associated 13.8 kV AC circuit breakers. The plots shall include complete titles, representative one-line diagram and legends and complete parameters of transformers. The coordination plots shall indicate the types of protective devices selected, proposed relay taps, time dial and instantaneous trip settings, transformer magnetizing inrush and ANSI transformer withstand parameters, cable thermal overcurrent withstand limits and significant symmetrical and asymmetrical fault currents. All restrictions of the National Electrical Code shall be conformed to and proper coordination intervals and separation of characteristic curves shall be maintained. Special attention shall be paid to the Rectifier-Transformer permissible overloads and the coordination of the upstream AC relays. The rate of rise relay shall be properly set to distinguish between short circuits and vehicle starting currents. Plots shall be provided to demonstrate achievement of coordination. Current values shall be shown on 13.8 kV base; a multiplier shall be noted for conversion to DC output current. Electronically produced coordination curves will be acceptable.
- i. Coordination curves shall include a plot of rectifier output capability and shall clearly indicate the time margin of coordination between breaker trip and output capability at each of 150, 300 and 450 percent full load current and short circuit current, taking into account de-rating due to rectifier phase leg current unbalance and loss of one diode in each phase leg. In addition, the coordination shall prove that the rectifier equipment is capable of delivering maximum through-fault current for 1.5 seconds, or longer, without exceeding the safe operation limits of diodes and other components within the rectifier package. Final coordination will be subject to MBTA's acceptance.
- j. The settings of the protective devices shall be provided separately in a tabulated form listing circuit identification, IEEE device number, current transformer ratios and connection, manufacturer and type, range of adjustment and recommended settings. For multifunction electronic relays a complete listing of all relay setting and parameters shall be provided to ensure the complete configuration of the relay is provided. This shall be in hardcopy format with the downloaded setting file being made available during testing and commissioning. Settings provided shall include timer settings, alarm and trip setting of thermal devices, shunt ratios and transducer ratios/settings.
- k. Bound copies of the final report shall be submitted in quantities identical to the quantities required for shop drawing submissions. The report shall include:
 - Description, purpose, base and scope of the study and an overall single line diagram of the power system at each substation which is included within the scope of the study

- Tabulation of circuit breaker, fuse and other protective device ratings versus calculated short circuit duties, and commentary regarding the same.
 - Protective device time versus current coordination curves, tabulations of relay and circuit breaker trip settings and commentary regarding the same.
 - Calculations
11. Certified outline drawings of battery charger, battery and battery rack; schematics and wiring diagrams of battery charger; battery and charger installation details and connection diagrams.
 12. 125 Vdc distribution panel and substation low voltage AC distribution panel details and schedules.
- F. After the return of the wiring diagrams submittal marked "For Approval", or equivalent, the following drawings, schedules and diagrams shall be submitted within 60 calendar days:
1. Cable tray and conduit layout plans and sections.
 2. Bus duct drawings as follows:
 - a. Dimensioned detailed plan and elevation drawings.
 - b. Connection details.
 - c. Support details, including loads on supports and weight capacity of proposed supports and anchors.
 - d. Electrical ratings and weights of bus sections.
 - e. Bill of materials for bus duct components, keyed to detail drawings.
 3. Detail drawings of cable tray and conduit.
 4. Installation/Mounting details of equipment and auxiliary devices. Busduct supports for DC cathode busses shall be provided with in-line insulation. Insulation shall meet or exceed 1000V and shall be installed in the trapeze hanger vertical rods at a minimum of 6" from the anchor into the ceiling.
 5. Interconnection cable schedules and cable routing block diagram including submission of cables/wire types and sizes proposed to be utilized.
 6. Bills of installation materials.
 7. Cable tray loading schedule including support details, loads on supports and weight capacity of proposed supports and anchors. Cable tray directly above the area of the epoxy insulated floor, above the traction rectifiers and above the DC switchgear shall be fiberglass.
 8. Spare parts list.
 9. Interconnection wiring diagrams, showing the terminal blocks of each individual unit, interconnections between each piece of equipment and each device installed external to the

equipment. Interconnection diagrams shall show cable and terminal numbers, make reference to internal wiring of the equipment and note the drawing on which the cable run is continued. Characteristic curves of circuit breaker trip elements and fuses, on log-log paper.

11. Equipment nameplate drawings for all equipment.
 12. Factory test procedures and proposed factory test schedule for all items of equipment. See Article 3.03 of this Section for test requirements.
- G. Upon successful completion of factory tests and at the same time the equipment is shipped for installation, the following documents shall be submitted:
1. Instruction materials for each piece of equipment furnished, including installation instructions, operating instructions, maintenance manuals and recommended spare parts lists (with manufacturer's part or drawing numbers). The instructions shall be comprehensive, descriptive and illustrative enough to install, operate and maintain all the equipment furnished. All instruction materials shall be in the form of manufacturer's printed originals; photo-reproductions of manufacturer's originals are not acceptable.
 2. Factory test reports, punch list and punch list clearance records.
 3. Training Plan and proposed training schedule.
 4. On-site installation, field testing and commissioning plan and schedule. Schedule is required to show the individual tests to be performed, expected duration and personnel required. See Article 3.03 of this Section for test requirements.
- H. Submittals of "As-Built" drawings shall be in accordance with requirements set forth in Section 16465 Drawings and Records for the Traction Power System.
- I. Completed and properly indexed instruction/maintenance manuals and "As-Built" drawings, incorporating all field changes and corrections, must be delivered to the MBTA before the completion of the Contract.

1.6 DESIGN REQUIREMENTS

A. General

1. The rectifier, rectifier transformer, switchgear assemblies and auxiliary equipment specified herein and shown on Design Documents shall function as a complete, coordinated package for normally continuous and unattended operation within the Massachusetts Bay Transportation MBTA's traction power system. All components shall be sized and selected for safe, reliable operation.
2. Unless otherwise specified, all similar equipment of the same ratings shall be identical and shall be electrically and mechanically interchangeable.
3. The rectifier and switchgear assemblies specified herein shall be designed to permit ready installation in the substation as indicated on the Design Documents. The Design Documents

show space available and the extent of overall equipment to be installed. They also set forth certain limiting area dimensions which are to be maintained for MBTA's exclusive usage and the minimum clearances as required by the MBTA for safe operation. Dimensions of equipment supplied shall have approximately the same dimensions but under no circumstance exceed those shown on the Design Documents.

4. The DB Entity may make MBTA-accepted changes in the layouts shown as may be required to fit the equipment in the substation, provided that relative positioning of equipment is not altered, limiting area dimensions and minimum clearances are maintained and that the arrangement will provide for safe operation of all equipment and that there will be no extra charges to the MBTA for such modifications of the building structure and other systems affected.
5. All equipment to be installed within the substation shall be shipped in pieces small enough to be moved into the designated location assuming all other equipment is in place. Shipping dimensions shall be such that any piece can be removed from the building in the future without dismantling and minimal disturbance to other equipment. Final arrangements will be subject to the acceptance by the MBTA. It is required that all equipment and the AC and DC buses be designed, manufactured and shipped in such manner as to require a minimum of erection, assembly and wiring work in the field.
6. The DB Entity shall be responsible for the proper application and satisfactory operation of each component furnished under this Specification. Proposed designs and materials which in the judgment of the MBTA, would require unreasonable and frequent maintenance, repair or replacement shall be reason for rejection of the equipment. The MBTA reserves the right to make this judgment after all equipment has been installed and tested on site. Such items shall be placed on the project punch list for resolution.
7. The threads of all bolts, nuts and screws installed in the equipment and those that are used during initial assembly or normal maintenance shall be Unified Threads as per ANSI Standards B1.1 and B1.10.

B. Service Conditions

1. Power at 13.8 kV is supplied to the traction power substation 15 kV AC switchgear from Eversource (Formerly NSTAR) Electric. Refer to Specification 16100 for coordination requirements with the Utility. The available maximum and minimum phase and ground short circuit currents for each substation supply circuit as of the date of this specification are listed below. Data shall be obtained during design by the MBTA and provided to the DB Entity upon request.

MBTA Substation	Supplying Utility	Supply Circuit #	3-Ph. Max. SC Amps	3-Ph Min. SC Amps	3-Phase SC X/R	Phase-Gnd. SC Amps
Redbridge	Eversource (Formerly	850-1308 (STA. 850 Q BUS)	12kA	n/a	11.8 **	5kA

	NSTAR)	850-1315 (STA. 850 S BUS)				
Pearl Street	Eversource (Formerly NSTAR)	250-1N35H (N.C.) 250-1N38H (N.C.)	14.3kA	9.7kA	13 **	8.3kA
Ball Square	MBTA Ring Feeders	TBD	TBD	TBD	TBD	TBD

** X/R ratios are approximate. Designer shall use X/R of 15 for a conservative approach.

(TBA is for information that is awaited from Eversource (Formerly NSTAR))

2. The substation 15 kV bus tie breaker Device 52-BT will be operated normally-open. For substations with three AC busses, two Bus-tie breakers will be provided and interlocked according to the project requirements. One 52-BT will be operated normally open, the other normally closed. Additional interlocking as specified in Section 2.01 will be required,
3. Voltage at the substation 15 kV buses during light and heavy traction load periods is expected to vary from a maximum of 14.4 kV to a minimum of 13.2 kV.
4. The rectifiers and DC switchgear assemblies specified herein will supply DC traction power to the MBTA Green Line 600Vdc distribution system.
5. It is expected that this installation, if properly manufactured and installed, will not present harmonic or other interference problems for public telephone systems and the MBTA's two-way communication system and signal systems. Should such problems arise, the DB Entity shall give immediate and full engineering assistance to the MBTA in determining proper corrective measures, including preparation of specifications for additional equipment, if required.

C. Equipment Control, Supervision and Alarms

1. General

- a. The switchgear and rectifier equipment furnished by the DB Entity shall be provided with protective, control and interlocking features to safeguard personnel and the various pieces of equipment. It shall permit local, HMI workstation and supervisory control as specified herein and as shown on Design Documents. The Contract Specifications and Drawings indicate the basic protection and control requirements which shall be implemented. However, the DB Entity may submit alternate schemes to the MBTA for consideration and acceptance.
- b. The listed devices included in the discussion hereinafter so that the DB Entity can have a more complete understanding of the integration of the equipment.

- c. The actual equipment is specified elsewhere in this Section. For purposes of discussion, the following device numbers are used, which shall also be used on DB Entity's schematic and wiring diagrams, arrangement drawings, and bill of materials (Note – not all device numbers are used):

DEVICE NO.	FUNCTION
01 – Master Element (e.g. Control Switch)	
01	AC circuit breaker remote control switch (located on station 15 kV control and instrument panel)
01-R	Rectifier 15 kV AC circuit breaker remote control switch (located on rectifier DC main breaker, Device 72R)
11 – Communications Failure	
11	Communications watchdog relay. DC equipment - IED – loss of power or communications failure.
111	Communications watchdog relay. AC equipment IED – loss of power or communications failure.
04 – Master Contactor	
04	Rectifier master control relay
25 – Sync Check relay	
25	Sync check relay (AC breaker interlocking)
26 – Apparatus Thermal Devices	
26R 26RX	Rectifier heat sink over-temperature - Alarm - Auxiliary relay for 26R
26RH 26RHX	Rectifier heat sink over-temperature - Trip - Auxiliary relay for 26RH
26T 26TX	Rectifier transformer oil over-temperature (alarm) - Auxiliary relay for 26T
26TH	Rectifier transformer oil over-temperature (trip)
27 – Undervoltage Relays	
27B1 27B2	15 kV Bus 1 and Bus 2 - Bus differential relay DC supply undervoltage
27BA	AC output circuit undervoltage relay
27BB	DC output circuit undervoltage relay
27Q	Oil Containment – Sump Pump – Supply Fail
27R	Rectifier - DC circuit undervoltage – Lockout relay
27RA	Rectifier/transformer DC auxiliary circuit undervoltage relay
27RB	Rectifier reliable AC supply under-voltage relay
27SA	DC switchgear reliable AC supply undervoltage relay
27SB	DC switchgear DC auxiliary circuit undervoltage relay
30 – Annunciator Relay	
30	Annunciator
30X	Auxiliary relay for Device 30

DEVICE NO.	FUNCTION
32 – Directional Power Relay	
32	Rectifier DC breaker directional/reverse current instantaneous overcurrent trip device
32X/32PX	Auxiliary relay for Device 32
33 – Position Switches	
33R	Rectifier compartment door safety interlock
33T	Rectifier transformer compartment door safety interlock
33	Substation door alarm
43 – Manual Transfer or Selector Device	
43	AC breaker control mode selector switch
47 – Phase Sequence / Phase Balance Voltage Relays	
47-1 47-2 47-3	15 kV bus 1, 2 and 3 phase sequence/undervoltage
47-1X	Time delay relay for bus No. 1 under-voltage alarm
48 – Incomplete Sequence Relay	
48	Rectifier incomplete starting sequence relay
49 – Machine or Transformer Thermal Relays	
49WT	Rectifier transformer winding overtemperature (alarm)
49WTH	Rectifier transformer winding overtemperature (trip)
50/51 – Instantaneous & Timed Overcurrent Relays	
50/51	Phase
50N/51N	Ground
51 – AC Timed Overcurrent Relays	
51	Phase
51C	Cable overload detection
51CX	Auxiliary relay for Device 51C
51N	Ground
51R	Rectifier overload detection
52 – AC Circuit Breaker	
52-RF	Ring Feeder
52-BT	Bus Tie
52-F	Feeder
52-L	Line (Sub-transmission system)
52-T	Rectifier Transformer
58 – Rectification failure relay	
58A	Diode failure monitoring relay (alarm) – single diode failure
58AX	Auxiliary relay for Device 58AX
58T	Diode failure monitoring relay (trip) – multiple diode failure

DEVICE NO.	FUNCTION
59 – Overvoltage relay	
59	DC output circuit overvoltage relay
62 – Time-delay stopping or opening relay	
62	Time delay relay
63 – Pressure switches	
63MR	Pressure relief device
63P	Sudden pressure relay (for oil-filled transformers) -
63PX	Lockout Relay
64 – Ground Detector Relays	
64R	Rectifier ground relay, hot structure (trip)
64RX	Rectifier ground relay, grounded structure (alarm)
67 – AC Directional Overcurrent Relay	
67	Directional overcurrent relay - phase
67N	Directional overcurrent relay – ground
71 – Level Switches	
71T	Oil level relay (for oil-filled transformers)
71W	Oil Containment – High Water Level
72 – DC Circuit Breaker	
72R	Rectifier DC circuit breaker
74 – Alarm Relays	
74, 74X	Alarm auxiliary relays
83 – Automatic Selective Control or Transfer Relay	
83	Reliable AC power source inverter – transfer to inverter
83A	Reliable AC power source automatic transfer switch – transfer to standby supply
86 – Lockout Relay	
86-T1	Rectifier No. 1 lockout relay, hand reset
86B-1	Bus No. 1 bus differential lockout relay, hand reset
86X-T1	Rectifier No. 1 conditional lockout relay, electrically reset
87 – Differential Protective Relay	
87B-1	Bus differential relay for bus No. 1
89 – Line Switch	
89N	Rectifier negative lead disconnect switch
Custom Device Numbers	
95D	Annunciator flasher and bell cutoff relay
98	Rectifier Diode failure
98A	
98T	
99Q	Oil Containment – Oil Detected - Alarm

DEVICE NO.	FUNCTION
99Y	Rectifier surge protection auxiliary circuit monitoring relay
101	DC circuit breaker local control switch
102	DC feeder reclosing cycle timer
102X	Auxiliary for Device 102
127	Reliable AC control supply undervoltage relay
129	DC feeder load measuring contactor
143	DC breaker control mode selector switch
150M	DC feeder multifunction instantaneous, time overcurrent and rate-of-rise relay
164S	DC switchgear ground relay, hot structure (alarm)
164SX	DC switchgear ground relay, grounded structure (alarm)
169	DC feeder permissive setup relay
172	DC traction feeder circuit breaker
176	DC feeder breaker instantaneous series (direct acting) trip device
176F	DC feeder breaker timed overcurrent trip device – may be combined in 150M multi-function relay
182	DC feeder load measuring relay
183	DC feeder voltage measuring transfer relay
197X	DC feeder cable energized monitoring relay
201C	Supervisory interposing relay (close)
201T	Supervisory interposing relay (trip)
AM	Ammeter
A-XD	Current transducer
CS	AC circuit breaker local control switch (located on AC breaker cubicle)
HAM	Heater Ammeter
HS	Heater selector switch
IA	Isolation Amplifier
LMR	Load measuring resistor
LMBP	Load measuring by-pass switch
VS	Voltage selector switch
V-XD	Voltage transducer

2. Basic Breaker Control and Interlocking.

- a. The control circuits of 15kV AC and all 750 Volt DC traction circuit breakers shall be arranged for the following:

- (i) LOCAL Local control (for the 15kV AC switchgear this is either at the circuit breaker or at the ACCP);
- (ii) HMI Remote control via the local PLC via the HMI;
- (i) SUPERVISORY Remote control via the MBTA's SCADA system.
- (ii) OFF

Each of these circuit breakers shall be provided with a four position control mode selector switch, Device 43 and Device 143, for transferring the circuit breaker between local control, workstation control (HMI) and supervisory control. The selector switch positions shall be "LOCAL", "HMI", "OFF", "SUPV". The selector switch positions shall be "LOCAL", "HMI", "OFF", "SUPV". The switch shall be integrated into the SAS system via the DIO device at the ACCP. The switch position status shall be reported to SCADA system via the substation automation system.

- b. All control switches (Device CS, Device 01 and Device 101) shall be provided with green and red indicating LED lights, mounted above the switch, green at left, red at right. For circuit breakers with stored energy type operating mechanisms the red light shall be connected in series with the trip coil to monitor the trip circuit; in addition, a third white indicating LED shall be provided at the breaker to indicate mechanism-charged condition. The LED lights shall be provided with nameplates as follows:
 - (i) Green LED "BREAKER OPEN"
 - (ii) Red LED "BREAKER CLOSED"
 - (iii) White LED "SPRING CHARGED"
- c. Control switch Device 01 and associated indicating lights, and the control mode selector switch Device 43, for all 15 kV circuit breakers except Device 52-T, shall be located on the 15 kV circuit breaker control and instrument panel/ AC Control Panel as specified in Article 1.06.C.2.e below and Article 2.07 of this Section.
- d. A local control switch Device CS with indicating lights shall be provided in front of each 15 kV switchgear unit to allow the following functions:
 - (i) Close the circuit breaker only when the removable element is in the "TEST" position;
 - (ii) Trip the circuit breaker when the removable element is either in the "OPERATING" or "TEST" position (Note: a 52-T trip when the a 52-T breaker is in the "OPERATING" position will also trip the associated 72-R breaker if the 72-R breaker is closed and in the "CONNECTED" position).
- e. Control circuits of all 15 kV circuit breakers except Device 52-T shall be arranged to provide the following scheme of operation:
 - (i) With the 43 switch in the "SUPERVISORY" position local closing functions will be disabled and the circuit breaker can be closed only via the MBTA's

supervisory systems and only when the removable element is in the "OPERATING" position. Tripping function of the control switch, Device 01, at the 15 kV circuit breaker control and instrument panel (ACCP) will be disabled and the circuit breaker can be tripped via the supervisory systems only when the circuit breaker removable element is in the "OPERATING" position, or by the control switch, Device CS, at the 15 kV switchgear.

- (ii) With the 43 switch in the "LOCAL" position i.e. operable from the ACCP, all supervisory control functions will be disabled. When the removable element is in the "OPERATING" position, the closing function of the control switch at the 15 kV AC switchgear will be disabled and the circuit breaker can be closed only by the control switch at the 15 kV circuit breaker control and instrument panel (ACCP), the circuit breaker can only be tripped by the control switches at the control panel and at the AC switchgear. When the removable element is in the "TEST" position, the closing and tripping functions of the control switch at the 15 kV circuit breaker control and instrument panel will be disabled and the circuit breaker can be closed and tripped only from its control switch at the 15 kV switchgear.
 - (iii) With the 43 switch in the "HMI" position, all supervisory control functions will be disabled. When the removable element is in the "OPERATING" position, the closing function of the control switch at the 15 kV AC switchgear will be disabled and the circuit breaker can be closed only by the HMI, the circuit breaker can only be tripped by the HMI, or the control switches at the AC control panel and at the AC switchgear. When the removable element is in the "TEST" position, the closing and tripping functions of the control switch at the 15 kV circuit breaker control and instrument panel will be disabled and the circuit breaker can be closed and tripped only from its control switch at the 15 kV switchgear.
 - (iv) With the 43 switch in the "OFF" position, all local, HMI and supervisory control functions will be disabled, except the tripping function of the control switch Device CS at the AC switchgear, if the removable element is in the "OPERATING" position.
- f. Rectifier AC circuit breaker Device 52-T control switch, Device 01-R, and indicating lights and the control mode selector switch, Device 43, shall be located on the front of the rectifier main DC circuit breaker unit, Device 72-R. The rectifier main DC circuit breaker control switch Device 101 and indicating lights shall also be located on the front of the main DC circuit breaker unit. In addition, a control switch Device CS with indicating lights shall be provided on the front of the rectifier 15 kV AC circuit breaker unit 52-T to close the breaker only when the removable element is in the "TEST" position and trip the circuit breaker when the removable element is either in "OPERATING" or "TEST" position. Circuit breaker Device 52-T control circuits shall be configured to provide the following schemes of operation:
- (i) With the 43 switch in the "SUPERVISORY" position, local and HMI closing functions will be disabled and the rectifier AC and DC circuit breakers, Devices 52-T and 72-R, can be closed only via MBTA's supervisory systems and only when the respective circuit breaker removable elements are in the

"OPERATING" position. Tripping function of the rectifier AC circuit breaker control switch on the DC circuit breaker, Device 01-R, and the tripping function at the HMI will be disabled and the AC circuit breaker can be tripped via the supervisory systems if the circuit breaker removable element is in the "OPERATING" position.

- (ii) With the 43 switch in "HMI" position, all supervisory functions will be disabled and all LOCAL functions will be disabled and the rectifier AC and DC circuit breakers, Devices 52-T and 72-R, can be closed only via HMI system and only when the respective circuit breaker removable elements are in the "OPERATING" position. Tripping function of the rectifier AC circuit breaker control switch on the DC circuit breaker, Device 01-R, will be disabled and the AC circuit breaker can be tripped via the HMI system if the circuit breaker removable element is in the "OPERATING" position. Closure of rectifier AC circuit breaker shall automatically close the rectifier DC breaker as described in Article 1.06, paragraph C.3, of this Section
- (iii) With the 43 switch in "LOCAL" position, all supervisory and HMI functions will be disabled. When the removable elements of the rectifier AC and DC circuit breakers are in the "OPERATING" position, the closing function of the AC circuit breaker control switch Device CS on the 15 kV switchgear will be disabled and the rectifier AC circuit breaker can be closed only by its Device 01-R control switch on the rectifier DC circuit breaker. Closure of rectifier AC circuit breaker shall automatically close the rectifier AC breaker as described in Article 1.06, paragraph C.3 of this Section. With the circuit breaker removable element in the "OPERATING" position, the rectifier AC circuit breaker can be tripped by the Device 01-R control switch on the DC circuit breaker unit and by the Device CS switch on the 52-T breaker. The rectifier DC circuit breaker can be tripped from its Device 101 control switch on the DC switchgear. When the rectifier AC circuit breaker removable element is in the "TEST" position, the closing and tripping function of the Device 01-R control switch on the 72-R unit will be disabled and the 52-T circuit breaker can be closed and tripped only from its control switch Device CS. Similarly, the rectifier DC circuit breaker 72-R, when racked into "TEST" position, can be closed and tripped only from its Device 101 control switch on the DC switchgear.
- (iv) With the 43 switch in the "OFF" position, both the local, HMI and supervisory control functions will be disabled except the following:
 - (a) Tripping function of the rectifier AC circuit breaker control switch Device CS at the 15 kV switchgear
 - (b) Tripping function of the DC circuit breaker control switch Device 101 at the DC switchgear, provided that the circuit breaker removable element is in the "OPERATING" position.
- (v) The control scheme for the rectifier transformer AC breaker Device 52-T is summarized in the following table.

Breaker Position	Control Switch Being Actuated (and location)	Status of Breaker 52-T Control Switch According to Breaker Device 43 Position					
		43-L (LOCAL)		43-S (SUPV.) or 43-H (HMI)		43-O (OFF)	
		close	trip	close	trip	close	trip
OPERATING	CS	NO	YES	NO	NO	NO	YES
TEST	on 52-T	YES	YES	NO	NO	NO	NO
OPERATING	01-R	YES	YES	NO	NO	NO	NO
TEST	on 72-R	NO	NO	NO	NO	NO	NO

(vi) The control scheme for the rectifier DC breaker Device 72-R is summarized in the following table.

Breaker Position	Control Switch Being Actuated (and location)	Status of Breaker 72-R Control Switch According to Breaker Device 43 Position					
		43-L (LOCAL)		43-S (SUPV.) or 43-H (HMI)		43-O (OFF)	
		close	trip	close	trip	close	trip
OPERATING	101 (on 72-R1)	NO	YES	NO	NO	NO	YES
TEST	101 (on 72-R1)	YES	YES	NO	NO	NO	NO

g. In addition to the above 52-T control features, the rectifier circuit shall be provided with a 'transformer soak' mode within the SAS system. This mode will enable the MBTA to energize the rectifier and transformer and leave energized without connection to the DC bus. This would be used to 'soak' the rectifier transformers, or keep them operating while the DC switchgear and/or cable work is being completed over a pro-longed period.

- (i) Initiating the "Soak" would only be allowed with 52-T/72-R 43 device in the HMI position. The requirements for the control and switch positions per 16311.1.06.C.2.f still apply when the 43 device is in the HMI position. Separate functions to be provided for each rectifier/rectifier transformer circuit.
- (ii) AC switchgear bus/lockout protection, Transformer and rectifier protection would still be active and trip the AC Breaker (as if the DC breaker was connected), including SAS loss of communications.

- (iii) To achieve this, the SAS shall be provided with a separate on-screen button to allow 'Xfmr soak override' to be initiated. To initiate override 43 switch must be in HMI, 72-R breaker must be OPEN and in NOT CONNECTED/DISCONNECTED position, no 86T or 86B lockout in place, 52-T in CONNECTED/OPERATING position, 89N should be open.
 - ** NOTE: that in soak override mode the open position of 89N for the respective rectifier needs to be disabled in the rectifier lockout circuit – proposed methodology is that when personnel setup the circuit the open 89N will activate the 86T lockout (prior to selecting soak mode on the HMI). When soak mode is initiated this should enable the lockout to be reset/or should reset it automatically but only if 89N is the only lockout activator i.e. a check routine on the 86T lockout inputs). The 89N open status will be disabled from the 86T lockout circuit until ‘soak override’ is cancelled. The remaining functions of the 86T lockout will remain and activate the lockout if operated. **
 - (iv) Closure of the circuit may only be done from the HMI and would be as normal for energizing the rectifier i.e. operate command for close 52-T/72-R; 52-T shall close but 72-R closure shall not occur i.e. the timing circuit for DC breaker closure and incomplete sequence (device 48) monitoring following AC breaker closure that is used under normal rectifier energization is not required.
 - (v) The closure of 72-R will be inhibited while in 'soak override'.
 - (vi) Once soak mode has been initiated through the HMI and the 52-T breaker has closed the 43 device shall be operable.
 - (vii) Tripping of the circuit can only be achieved only via the HMI system in HMI mode, via the CS on the 52-T breaker, via SCADA when 43 device is in REMOTE or HMI position or by operation of the 01-R on 72-R when in LOCAL.
 - (viii) Tripping 52-T shall cancel the ‘soak override’ mode.
 - (ix) The following actions shall also trip the 52-T breaker:
 - (a) Closure of the 89N switch shall should trip the 52-T breaker and cancel the ‘soak override’ mode.
 - (b) The 72-R being placed in CONNECTED position should trip the 52-T breaker and cancel the ‘soak override’ mode.
 - (x) In addition, status indication of ‘XFMR ## IN SOAK OVERRIDE IN EFFECT’ should be provided to the SCADA system for indication to the Power Control Center.
- h. DC traction feeder circuit breaker control switch, Device 101, associated indicating lights and the control mode selector switch, Device 143, shall be located on the front of the circuit breaker unit, Device 172. The control circuit of the circuit breaker will be provided with load measuring and automatic reclosing features described in

Article 1.06.C.4 of this Section. Circuit breaker control circuit shall be configured to provide the following scheme of operation:

- (i) With the 143 switch in the "SUPERVISORY" position, local and HMI closing functions will be disabled and the closing (load measuring) cycle can be initiated only via MBTA's supervisory systems and only when the circuit breaker removable element is in the "OPERATING" position. Breaker can be tripped via local control switch 101.
 - (ii) With the 143 switch in the "HMI" position, supervisory and local closing functions will be disabled and the closing (load measuring) cycle can be initiated only via the HMI system and only when the circuit breaker removable element is in the "OPERATING" position. Breaker can be tripped via local control switch 101.
 - (iii) With the 143 switch in the "LOCAL" position, the supervisory control functions and HMI system will be disabled. The closing (load measuring) cycle can be initiated and the circuit breaker tripped only from its control switch and only when the breaker removable element is in the "OPERATING" position. With the breaker removable element in the "TEST" position, the breaker can be closed and tripped only from its control switch, initiating the load measuring cycle, but not actuating the load measuring contactor, Device 129.
 - (iv) With the 143 switch in the "OFF" position, local, HMI and supervisory closing functions and supervisory tripping functions will be disabled. The circuit breaker can be tripped by its local control switch, if the circuit breaker removable element is in the "OPERATING" position.
- i. At all locations, the control mode selector switches, Device 43 and Device 143, shall be mounted directly above their respective breaker control switches Devices 01, 01-R and 101.
 - j. The protective device and relay circuitry of circuit breakers shall not be affected by the control mode selector switches, Device 43 and Device 143; when actuated, these devices shall trip their respective breakers regardless of the position of the 43 and 143 switches. Similarly, these devices shall trip their devices regardless of the status of the communications system associated with substation automation i.e. the breaker and its associated protection relay(s) shall operate independently of the SAS system.
 - k. Control circuits of the 15 kV circuit breakers shall be so arranged that manual trip or trip via supervisory systems will not actuate circuit breaker auto trip alarm.
 - l. For substations with two AC 13.8kV busses, the 15 kV switchgear is normally operated with the tie circuit breaker between the two bus sections, Device 52-BT, open. At substations with three 13.8kV busses, the 15 kV switchgear is normally operated with one tie circuit breaker between two bus sections, Device 52-BT1, open and the other, Device 52-BT2, closed, or vice versa.
 - m. In the event of the loss of an incoming line at any substation, the open bus-tie breaker shall be closed. Any closed 52-RF breakers connected to the affected source shall be tripped.

- n. In the event of the loss of both incoming lines at Red Bridge or Pearl Street substations, the associated ring feeder circuit breaker shall be closed to supply power one half of the AC circuits at the affected substation.
- o. 15kV AC Circuit Breaker interlocking shall be required as follows:
 - (i) 52-L (incoming line circuit breaker) (Subject to approval by Eversource (Formerly NSTAR))
 - (a) At 2 bus substations: 2 out of 3 interlocking for 52-L1, 52-L2, 52-BT (i.e. only 2 out of the 3 listed circuit breakers can closed at any one time). This shall be hardwired within the AC switchgear equipment
 - (b) Breaker can only be closed if the associated 15kV AC bus is not energized.
 - (ii) 52-BT (Bus Tie breaker) (Subject to approval by Eversource (Formerly NSTAR))
 - (a) At 2 bus substations: 2 out of 3 interlocking for 52-L1, 52-L2, 52-BT. This shall be hardwired within the AC switchgear equipment
 - (b) Breaker cannot be closed while both busses either side of the BT breaker are energized.
 - (iii) 52-F (Feeder circuit breaker)
 - (a) For circuit breakers supplying unit substations refer to key interlocking requirements in Section 16203 Article 1.13.
 - (iv) 52-RF (Ring Feeder Circuit breaker.)
 - (a) Breaker cannot be closed when line side and load side of circuit breaker are energized.

3. Rectifier Control

Under substation automation the functionality of the rectifier controls shall be as stated below. The functions shall be employed within the software programming of the substation automation PLC. The operating logic is provided in the Design Documents. All such programming shall be centrally located at the PLC and not distributed to IEDs/DIOs within the substation. Input/output modules shall be provided as necessary to interface the equipment with the PLC. The lockout functions shall be programmed within the substation SAS and manually reset using at the HMI.

- a. Rectifier equipment shall be started by energizing the operating coil of the latching type master control relay, Device 4. This can be accomplished, depending on the positioning of rectifier AC circuit breaker control mode selector switch, Device 43, by operating the rectifier AC circuit breaker control switch, Device 01-R, or remotely via supervisory control through operation of the supervisory closing relay, Device 201C. Note that the rectifier equipment shall be able to be energized locally while the associated DC breaker Device 72-R is in the disconnected position. The following shall prevent energization of Device 4 operating coil:
 - (i) Operation of rectifier lockout relay, Device 86-T
 - (ii) Operation of rectifier conditional lockout relay, Device 86X-T.

- (iii) Operation of bus differential lockout relay, Device 86B, for the 15 kV bus section supplying the rectifier.
 - (iv) Loss of voltage to rectifier lockout relay control circuit, as detected by Device 27R.
- b. Energization of Device 4 operating coil shall cause closure of the rectifier transformer 15 kV circuit breaker, Device 52-T and start the timing cycle of the incomplete sequence relay, Device 48. Closure of breaker 52-T shall energize the closing circuit of the rectifier DC breaker, Device 72-R, but only if Device 72-R is in the CONNECTED/OPERATING position. Failure of breaker 72-R to close and remain closed within the preset length of time will cause Device 48 to operate which shall result in rectifier lockout.
 - c. After closure of rectifier AC and DC circuit breakers, an "a" contact from each of the two breakers, connected in series, shall energize the Device 4 reset coil, setting up the master control relay for the next rectifier starting operation. Device 4 reset coil shall also be energized by a reset operation for Device 86-T, provided that Device 48 has completed its timing cycle.
 - d. Shutdown of the rectifier (via the 52-T breaker) shall be accomplished, depending on the positioning of Device 43, locally by operating the rectifier AC breaker control switches Devices CS or 01-R (if Device 43 selector switch is set to "LOCAL"), or via the HMI or remotely via the supervisory control through operation of the supervisory trip relay, Device 201T.
 - e. Automatic shut-down of the rectifier shall be caused by operation of Devices 86-T, 86X-T, 86B, and 27R. The rectifier shall be shut down by these devices via direct tripping of the rectifier transformer 15 kV breaker 52-T, regardless of the positioning of Device 43. The rectifier shall also shut down upon failure of the respective components of the substation automation system
 - f. The following devices shall operate Device 86-T and cause shutdown of the rectifier unit until Device 86-T is manually reset. This type of shut-down is termed LOCKOUT. Loss of AC control power shall not cause operation of any of these devices.
 - (i) Open door on rectifier diode and positive 600 Volt bus compartment, Device 33R.
 - (ii) AC fault, Devices 50/51 and 50N/51N.
 - (iii) Equipment overload detected by AC relay, Device 51R.
 - (iv) Incomplete starting sequence, Device 48.
 - (v) Rectifier negative disconnect switch open, Device 89N.
 - (vi) Operation of rectifier DC breaker directional overcurrent trip device, Device 32.
 - (vii) Operation of "rectifier hot structure" relay, Device 64R.
 - (viii) Operation of transformer sudden pressure relief, Device 63P.

- (ix) Operation of transformer low oil level trip, Device 71T.
 - (x) Multiple diode failure monitoring relay trip, Device 58T.
- g. The following overtemperature devices shall energize the Device 86X-T operating coil and cause shutdown of the rectifier unit until the normal condition is restored. This type of shut-down is termed 'CONDITIONAL LOCKOUT'.
- (i) Rectifier diode heat sink overtemperature second step and auxiliary power circuit undervoltage, Devices 26RHX and 27RA.
 - (ii) Transformer winding hot spot overtemperature second step, Device 49WTH.
 - (iii) Transformer oil overtemperature second step, Device 26TH.
- h. Device 86X-T shall be automatically reset by energization of its reset coil when the equipment which caused the conditional lockout has cooled down to safe operating temperatures.

4. DC Traction Feeder Breaker Control

Under substation automation the functionality of the DC circuit breaker controls shall be as stated below. The functions shall be employed within the software programming of the substation automation PLC. Each DC feeder breaker shall self-protect and function independently of the PLC as stated below. Input/output modules shall be provided as necessary to interface the equipment with the PLC.

- a. All DC traction feeder breakers shall be provided with a load measuring scheme to prevent closing of the DC feeder circuit breaker, Device 172, on a faulted circuit. Load measuring circuits shall be provided that are in service during both local and supervisory control of the DC feeder breakers. This circuit shall also permit the testing of the entire load measuring scheme with the circuit breaker removable element in the "TEST" position, including closure of the breaker, except that the operation of Device 129 shall be blocked.
- b. Equipment associated with the load measuring scheme shall include:
 - (i) A load measuring, or resistance measuring relay, Device 182, to measure "feeler" current through a load resistor during the load measuring cycle. Circuit shall be provided with means to allow load measuring only when the voltage drop in the negative return circuit is below a preset value that is adjustable over a range of 10-100 Volts.
 - (ii) A voltage measuring relay, Device 183, with an adjustable range of 300 Volts to 625 Volts, for measuring feeder DC voltage.
 - (iii) A load measuring resistor, Device LMR, for limiting the "feeler" current to approximately 50 Amperes.
 - (iv) A contactor, Device 129, for connecting Device LMR across the open feeder circuit breaker, Device 172.

- (v) Associated accessory devices, as required.
- c. The load measuring system shall be insensitive to variations in DC bus voltage from 750 Volts to 300 Volts and shall be arranged to determine feeder load condition automatically, whether connected to an independent (single feed) power section or a multi-feed power section. Traction feeder circuit breaker closing circuit shall be provided with devices which will allow the closing of the circuit breaker at a switchgear bus voltage of 450 Volts or higher. Load measuring circuit and its components will be subject to the acceptance of the MBTA.
- d. Each DC traction feeder circuit breaker shall also be equipped with a scheme for automatic reclosing of the breaker in conjunction with load measuring. Reclosing into unfaulted energized or unfaulted de-energized traction feeder circuits shall occur after a feeder breaker is tripped by automatic protective devices. The automatic reclosing of the circuit breaker shall be initiated by an unsuccessful attempt to close the breaker from its local control switch or via the MBTA's supervisory systems. The reclosing-load-measuring circuitry shall not be actuated if the traction feeder circuit breaker is tripped by its local control switch or tripped via the supervisory systems.
- e. The reclosing cycle, once initiated, shall be continued for a maximum of four cycles (reclosures) and shall be stopped only by one of the following: successful closure of the circuit breaker; lockout upon completion of the minimum number of unsuccessful reclosing cycles; or, by tripping of the breaker permissive setup relay, Device 169, either locally or via supervisory. A cycle timer, Device 102, shall be provided for repeated load measuring and circuit breaker closing on a 14 second cycle, including a four-second interval between the end of load measuring phase and the energization of breaker closing circuit. Circuitry shall provide for anti-pump circuit breaker operation and for verification of resetting of the load measuring devices for each cycle. The initiation of each reclosing cycle shall be indicated to SCADA.
- f. In addition to the above-specified control and protective devices, each DC traction feeder circuit breaker shall be equipped with a direct-acting, series, bi-directional instantaneous trip device, Device 176, adjustable for at least 100 to 400 percent of rated current.
- g. Each DC traction feeder circuit breaker shall be equipped with a microprocessor-based, multifunction feeder protection package Device No. 150M for each DC feeder breaker. Proposed device shall be of proven design in current use and manufacture, and will be subject to the MBTA's acceptance. This device shall include the following features as a minimum. Operation of protection provided by the relay shall be independent of the status of the substation automation system.
 - (i) Current rate-of-rise detection channel providing unidirectional overcurrent detection with target indication, and adjustable initial current slope (di/dt), current step, and time duration.
 - (ii) Instantaneous overcurrent detection channel providing unidirectional high current detection with target indication, and adjustable pickup with maximum pickup setting equal to at least 400% of the feeder breaker frame rating.

- (iii) Short time overcurrent channel (STOC) providing unidirectional overcurrent detection with target indication, and adjustable pickup and time delay based on a family of inverse-time characteristic curves.
 - (iv) Long time overcurrent channel (LTOC) providing unidirectional overcurrent detection with target indication, adjustable pickup and time delay suitable for thermal protection of DC feeder cables and overhead contact systems. LTOC channel operation shall trip the feeder breaker but not lock it out.
 - (v) Adequate shielding for radiated and conducted EMI to prevent false operations from other equipment and devices, including portable radios.
 - (vi) Isolated inputs, rated 5 kV DC for 1 minute, minimum.
- h. The closing and reclosing cycle for the DC traction feeder circuit breaker shall be started by energizing the operating coil of the latching type permissive setup relay, Device 169. This shall be accomplished, depending on the positioning of the circuit breaker control mode selector switch Device 143, locally by operating the circuit breaker control switch, Device 101, or remotely via supervisory closing relay, Device 201C.
 - i. Energization of the Device 169 reset coil shall cause tripping of the circuit breaker or stop the reclosing cycle in case it is in progress. This shall be accomplished, depending on the positioning of Device 143, locally by operating the circuit breaker control switch or remotely via the supervisory control through operation of the supervisory trip relay, Device 201T.
 - j. A key-operated switch shall be provided to bypass the load measuring scheme to permit closing of traction feeder circuit breakers during an emergency, and when the Device 143 is in "LOCAL" position. Closing circuit shall be arranged to provide a ten-second interval between the rotation of the breaker control switch to "CLOSE" position and the energization of breaker closing circuit. A "LOCAL" contact of Device 143 shall be wired in series with the timer so that the timer can be actuated only when Device 143 is in the "LOCAL" position and the load measuring by-pass switch is operated.

5. Supervisory Control and Indication

- a. The MBTA has in operation two independent supervisory systems for remote control of power system AC and DC circuit breakers and for monitoring equipment and auxiliary circuits at their substations: a computer-assisted systemwide SCADA system and a "one-on-one" backup system for each of the individual traction power substations and switching stations. The master station and computer equipment for the SCADA system is located at the MBTA's High Street Operations Center in Boston. The substation SCADA interface shall be provided via the PLC and a traditional SCADA RTU is not required. In addition, the back-up SCADA system RTU (one-on-one) is not required for the Green Line Extension Project.
- b. Under substation automation the functionality of the SCADA operation shall be as stated below. The functions may be employed within the software programming of the substation automation PLC. All such programming shall be centrally located at the PLC and not distributed to IEDs/DIOs within the substation. The substation automation PLC

shall interface with the SCADA system. Input/output modules shall be provided as necessary to interface the SCADA equipment with the PLC.

- c. The DB Entity shall furnish, install and connect interposing relays or PLC software equivalent, Devices 201C and 201T, for proper interfacing of breaker control and indication circuits and contacts with the supervisory systems. The DB Entity shall also provide all contacts, relays and devices necessary for remote monitoring of below-listed equipment and circuits. The interposing relays shall be supplied from the 125 Vdc control bus of the switchgear via fused circuits. The load side of the positive fuse, one side of the interposing relay coil and all supervised status contacts shall be wired to outgoing wiring terminal blocks at new switchgear and rectifier equipment. As necessary to interface substation wiring, the DB Entity shall provide a Supervisory terminal Board (STB). The wiring between the STB and new equipment and any new wiring required between the STB and the supervisory equipment cabinets shall be furnished and installed by the DB Entity.
- d. The following equipment at the substation shall be provided with devices for remote close-trip control and indication (a normally open circuit breaker contact) via the MBTA's Power SCADA system. Independent and separate contacts shall be used for indications via SCADA. Trip/Close control shall also be via independent and separate contacts.
 - (i) 15kV Incoming Line Circuit Breakers (52-L)
 - (ii) 15kV Ring Feeder Circuit Breakers (52-RF)
 - (iii) 15kV Feeder Circuit Breakers (52-F)
 - (iv) 15kV Bus-Tie Circuit Breakers (52-BT)
 - (v) Rectifier transformer 15 kV circuit breakers, Devices 52-T. The interposing relays, Devices 201C and 201T shall start the rectifier transformer breaker closing and tripping cycles by energizing the latching type master control relay, Device 4, and by tripping Devices 52-T as described in Article 1.06.C.3, of this Section.
 - (vi) 750 Volt DC traction feeder circuit breakers, Device 172. The interposing relays, Devices 201C and 201T, shall start the circuit breaker closing cycle and trip the breaker by energizing and resetting the latching type permissive setup relay, Device 169, as described in Article 1.06.C.4, of this Section.
 - (vii) 480V unit substations Main circuit breaker
 - (viii) 480V unit substation bus-tie circuit breaker
- e. Circuits and devices listed below that are furnished and installed under this Contract shall be provided with independent monitoring contacts/points for remote indication via MBTA's SCADA system. All local alarms reported on the annunciator screen on the SAS system HMI (see C.8 below) shall also be provided to SCADA as discrete points.

Item	Alarm Function	Actuating Device
(i)	Position of control mode selector switches for all supervisory-controlled breakers. (Provide SCADA indication contacts for each Device 43 and 143)	Device 43 Device 143
(ii)	Rectifier DC circuit breakers.	Device 72R
(iii)	DC traction feeder circuit breaker load measuring cycle in progress	Device 102 or 102X
(iv)	Rectifier lockout relays	Device 86-T
(v)	15kV Bus Lockout Relays	Device 86-B
(vi)	15kV Bus Differential Relays	Device 87-B
(vii)	15kV Phase Loss/Undervoltage Relays	Device 47
(viii)	DC feeder circuit breaker trip via the instantaneous direct acting series overcurrent trip un	Device 176
(ix)	DC feeder circuit breaker trip via the rate-of-rise channel of multifunction relay	Device 150M
(x)	DC traction feeder circuit breaker trip via the timed overcurrent channel of multifunction relay May be combined with device 150M	Device 176F
(xi)	DC traction feeder cable energized indication	Device 197X
(xii)	13.8 kV feeder cable overload auxiliary relay	Device 51CX
(xii)	13.8 kV feeder breaker overcurrent Instantaneous / Overcurrent phase / Overcurrent Neutral	Device 50/51/51N
(xiii)	Station Battery Trouble	
(xiv)	Substation access door alarm	Device 33
(xv)	Negative disconnect switch open.	Device 89N
(xvi)	Rectifier structure alive/grounded	Device 64R Device 64RX
(xvii)	DC switchgear structure alive/grounded	Device 164S Device 164SX
(xviii)	Rectifier DC breaker reverse current trip	Device 32
(xvix)	Room high temperature and room low temp alarm	
(xx)	Rectifier transformer sudden pressure relief trip	Device 63P
(xxi)	Rectifier/Transformer over-temperature	Device 49WT / 26T / 26R (combined indication)
(xxii)	Oil containment sump pump fail or power failure (if applicable)	
(xxiii)	PLC / Communications Healthy	Device 11 / 111
(xxiv)	Rectifier Transformer in Soak Override	-

6. Telemetry Requirements

- a. Under substation automation the provision of analog metering shall be as stated below. The functions may be employed within the software programming of the substation automation PLC. All such programming shall be centrally located at the PLC and not

distributed to IEDs/DIOs within the substation. Input/output modules shall be provided as necessary to interface the equipment with the PLC.

- b. The DB Entity shall furnish, install and connect all measuring devices, transducers, amplifiers, totalizers, resistors and all other devices necessary for providing proper inputs to the MBTA's SCADA system for remote telemetering of below-listed quantities. The transducers shall have the characteristics specified in Section 16203, Article 1.11. The telemetering signal circuits shall be wired to outgoing wiring terminal blocks at the switchgear. As necessary, the circuits shall be extended by the DB Entity through the interface Supervisory Terminal Board (STB) to the supervisory equipment, as described in Article 1.06.C.5 of this Section for supervisory control and indication circuits.
 - c. The following power quantities shall be provided with devices for telemetering:
 - (i) Voltage of each 15 kV switchgear bus section (signals from bus voltage transducers). One voltage per bus section required.
 - (ii) Phase B current of each 13.8 kV feeder circuit except rectifier transformer (signals from current transducers).
 - (iii) Voltage of 600 Volt nominal DC switchgear bus (signal from voltage transducer). One required.
 - (iv) Kilowatt hour demand of each 13.8 kV feeder circuit.
 - (v) Totalized kilowatt hour demand of the 13.8 kV sub-transmission system supply feeder circuits. One per 13.8 kV bus section required.
 - (vi) DC traction feeder current (signal from feeder shunt through isolation type transducer). One per feeder breaker required.
 - (vii) Rectifier DC output current (signal from rectifier shunt through isolation type transducer). One per rectifier breaker required.
 - (viii) Totalized kilowatt hour demand of the 13.8 kV sub-transmission system supply feeder circuits (52-L1 and 52-L2). The totalizer shall be located at the AC common control panel.
 - (ix) Totalized DC kilowatt hour demand of the Traction power supply main circuits (72-R1 and 72-R2). The totalizer shall be located in the DC switchgear.
7. Ground Detection/Hot Structure of Rectifier and DC Switchgear
- a. Rectifier and DC switchgear shall be installed with enclosures insulated from ground, from the substation building structure and from each other. For the rectifier and the DC switchgear lineup, the DB Entity shall provide a set of ground detection equipment, including:
 - (i) High resistance ground relay, Device 64R, for rectifier;
 - (ii) High resistance ground relay, Device 164S, for DC switchgear;

- (iii) Solid state rectifier for auxiliary DC power supply (copper oxide or selenium rectifiers are not acceptable);
 - (iv) Relay, Device 64RX, for monitoring the continuity of the Device 64R detecting circuit and associated devices, for continuous monitoring of the insulation of the rectifier enclosure from station ground and negative bus and from rectifier positive bus and components operated at bus potential; and
 - (v) Relay, Device 164SX, for monitoring the continuity of the Device 164S detecting circuit and associated devices, for continuous monitoring of the insulation of the DC switchgear enclosure from station ground and negative bus and from DC switchgear positive bus and components operated at bus potential.
- b. Ground detection equipment shall be rated for operation on 120 Volts, 60 Hz, supplied from the reliable AC source at the AC control and instrument panel or 125V DC control power. The ground relay, monitoring relay and associated circuit components shall be rated for 750 Volt DC service, minimum.
 - c. For the rectifier, the Device 64R shall be set to pick up at 50 Volts positive potential of the high resistance grounded rectifier structure or enclosure and shall cause lockout and de-energizing of the rectifier as described in Article 1.06.C.3 of this Section. Pickup of Device 64R shall also provide local alarm on annunciator Device 30 and remote indication via supervisory. Electrical contact of a transformer secondary lead to the ungrounded structure or enclosure shall also cause rectifier lockout. Device 64RX shall provide local alarm on Device 30 and remote indication, via supervisory, in the event of loss of AC control power, opening of the ground detection circuit or an electrical contact of the ungrounded structure to ground or the negative bus. Device 64RX alarm and remote indication circuits shall be provided with two second time delay to override momentary dips in the AC control power supply.
 - d. For the DC switchgear, Device 164S shall be set to pick up at 50 Volts positive potential of the high resistance grounded switchgear structure or enclosure and shall provide local alarm on Device 30 and remote indication via supervisory. Device 164SX shall provide local alarm and remote indication, via supervisory, in the event of opening of the ground detection circuit or an electrical contact of the ungrounded structure to ground or negative bus. Device 164S shall not be activated during the normal fault clearing operation of the rectifier AC circuit breaker. Device 164SX alarm and remote indication circuits shall be provided with a two-second time delay to override momentary dips in the AC control power supply.
 - e. For the DC switchgear assembly, the DB Entity shall provide a 120 Vac alarm bell, supplied from the reliable 120 Volt AC or 125V DC control bus of the DC switchgear through a set of fuses, energized by operation of Device 164S. The bell shall be wired through each personnel access substation door switch, to prevent operation during substation unattended periods. An adjustable timer shall be provided to limit the bell operation. In addition, the DB Entity shall provide for the DC switchgear assembly a flashing illuminated sign bearing the legend "SWITCHGEAR FRAME ALIVE", supplied from the 125 Volt DC control bus of the DC switchgear through a set of fuses, also energized by operation of Device 164S. The sign shall be prominently mounted on the switchgear assembly. The alarm bell circuit shall be provided with a relay to energize the warning sign. The warning sign shall also be energized in the event of the 120 Volt

AC or 125V DC alarm supply failure. The alarm devices and the warning sign shall be insulated from switchgear enclosure for a minimum of 1,000 Volts DC.

- f. All ground detection alarm, supervisory and auxiliary circuits requiring external connections shall be wired to outgoing wiring terminal blocks for connection to field wiring.

8. Local Alarm

- a. Each of the following trouble conditions of substation equipment and circuits shall be provided with an alarm point on the local HMI that shall be installed at each substation. Each alarm point shall be available to SCADA.

- (1) HMI Annunciation

Item	Alarm Function	Actuating Device
1.	Rectifier #1 lockout (for Rectifier #1)	86-T1
2.	Rectifier #1 conditional lockout	86X-T1
3.	Rectifier/transformer #1 DC auxiliary supply failure	27RA
4.	Rectifier/transformer #1 AC auxiliary supply failure	27RB
5.	Rectifier #1 surge protection circuit failure	99Y
6.	Rectifier #1 heat sink overtemperature	26RHX
7.	Rectifier #1 Diode Failure/Fuse Blown	98/58A/58T
8.	Rectifier #1 structure grounded	64RX
9.	Rectifier #1 structure hot	64R
10.	Rectifier #1 incomplete start	48
11.	Rectifier #1 door open	33R
12.	Rectifier Transformer #1 oil/winding overtemperature	26TH/ 49WTH
13.	Rect. Transformer #1 Low Oil Level Alarm (oil filled xfmrs only)	71-T1
14.	Rect. Transformer #1 Sudden Pressure Relay/Pressure Relief (oil filled xfmrs only)	63P-1/63MR-1
15.	Rectifier #1 negative disconnect switch open / closed	89N-1
16.	72-R1 Main DC breaker reverse current trip	32X
17.	72-F DC feeder breaker Rate of rise	150
18.	72-F DC feeder breaker Direct Acting Overcurrent	176
19.	72-F DC feeder breaker Timed/backup overcurrent	176F
20.	72-F DC feeder breaker Load measuring	182 / 183 / 102
21.	DC switchgear structure grounded	164SX
22.	DC switchgear structure hot	164S

Item	Alarm Function	Actuating Device
23.	DC protective relay / IED Device failure	111
24.	15 kV Bus 1, 15kV Bus 2, 15kV Bus 3 lockout	86B-1/ 86B-2/ 86B-3
25.	15 kV Bus 1, 15kV Bus 2, 15kV Bus 3 differential	87B-1/ 87B-2/ 87B-3
26.	15 kV feeder cable overload	51CX
27.	15 kV feeder protective relay	50 / 51 / 51N
28.	15 kV Bus 1 and/or 2 and/or 3 phase loss/undervoltage	47-1, 47-2, 47-3
29.	15 kV Bus 1 and/or 2 differential circuit DC supply failure	27B1, 27B2
30.	15 kV feeder protective relay / IED device failure	11
31.	Oil Containment Sump pump trouble	
32.	Unit Substation Trouble	
33.	Rectifier #2 lockout (for Rectifier #2)	86-T2
34.	Rectifier #2 conditional lockout	86X-T2
35.	Rectifier/transformer #2 DC auxiliary supply failure	27RA
36.	Rectifier/transformer #2 AC auxiliary supply failure	27RB
37.	Rectifier #2 surge protection circuit failure	99Y
38.	Rectifier #2 heat sink overtemperature	26RHX
39.	Rectifier #2 Diode Failure/Fuse Blown	98/58A/58T
40.	Rectifier #2 structure grounded	64RX
41.	Rectifier #2 structure hot	64R
42.	Rectifier #2 incomplete start	48
43.	Rectifier #2 door open	33R
44.	Rectifier Transformer #2 oil/winding overtemperature	26TH/ 49WTH

Item	Alarm Function	Actuating Device
45.	Rect. Transformer #2 Low Oil Level Alarm (oil filled xfmrs only)	71-T2
46.	Rect. Transformer #2 Sudden Pressure Relay/Pressure Relief (oil filled xfmrs only)	63P-2/63MR-2
47.	Rectifier #2 negative disconnect switch open / closed	89N-2
48.	72-R2 Main DC breaker reverse current trip	32X
49.	208/120V AC supply failure	27A
50.	Station battery trouble	59, 27BA, 27BB
51.	Fire	FIRE ALARM PANEL
52.	Fire Alarm Trouble	FIRE ALARM TROUBLE SW.
53.	DC Switchgear 125Vdc supply fail	27SA

D. Protective Device Coordination

1. General

- a. The DB Entity shall furnish protective devices in the switchgear and power rectifier equipment as listed elsewhere in this Section, or as may be required, to provide reliable, coordinated electrical protection for the system. All such devices shall be adjustable and shall be factory calibrated to provide the general scheme of protection outlined below. The DB Entity shall submit to the MBTA, for acceptance, the recommended settings of the protective devices. The recommended settings shall include all settable relay parameters whether enabled or disabled, used or unused. In addition, the protective device settings shall be provided on log-log paper for graphic proof of the required device coordination based on requirements specified in Article 1.05.C.9 Paragraph C of this Section.

2. Protective Devices at 15 kV Switchgear

- a. Rectifier Transformer AC feeder instantaneous overcurrent relay, Device 50, shall trip rectifier transformer circuit breaker, Device 52-T, for 13.8 kV circuit and rectifier transformer faults. Pickup shall be set 125 percent above the maximum inrush current of

the transformer-rectifier package, or 125 percent above bolted secondary fault at the DC traction feeder load terminal, whichever is greater.

- b. Rectifier Transformer AC feeder time overcurrent relay, Device 51, shall trip the rectifier AC and DC circuit breakers for rectifier transformer secondary circuit faults and DC switchgear bus faults. Pickup shall be set to coordinate with the reverse current trip, Device 32, of the rectifier DC circuit breaker, Device 72-R of the second rectifier operating in parallel and with the protective devices of DC traction feeder circuit breakers, Device 172. In addition, the settings of Device 51 shall be selective with the individual series fuses of the rectifier diodes so that the diode fuses will not blow on a fault external to the rectifier.
 - c. Rectifier AC feeder time overcurrent relay, Device 51R, shall trip the rectifier AC circuit breaker for rectifier overload. Relay shall be set to pick up in approximately 60 seconds at 300 percent of rectifier full load current. The setting shall also allow two hour operation of the rectifier at 150 percent of rated full load and 450% full load current for 15 seconds. The setting of Device 51R shall provide selectivity with the rectifier series diode fuses and with the DC traction feeder circuit breaker protective relays.
 - d. An automatic trip of the rectifier AC circuit breaker 52-T shall sequentially trip the rectifier DC circuit breaker, Device 72-R.
 - e. The devices for 52-T / 72-R shall interface with the substation automation system within the substation.
 - f. Each 15kV AC Circuit breaker shall be provided with a Microprocessor-based multifunction relay and metering unit with the following minimum functions (for additional required features see Article 2.01, Paragraph O, this Section). Protection requirements for the 52-L1 and 52-L2 circuit breakers shall be subject to approval by Eversource (Formerly NSTAR) who may insist on specific relays meeting their system requirements:
 - Phase overcurrent relay with instantaneous function for each phase, Devices 50/51, initially programmed with very inverse time coordination curve (TCC). For Ring Feeder circuit breakers and Bus-Tie Circuit breakers this protection shall be bi-directional.
 - Residually-connected ground overcurrent relay with instantaneous function, Devices 50N/51N, initially programmed with very inverse TCC.
 - Breaker failure detection contact closure which trips associated line breaker and bus tie breaker when rectifier breaker fails to trip after a user-selectable time delay.
3. Protective Devices at Rectifier Transformer
- a. Rectifier transformer winding over-temperature device, Device 49TH, and oil over-temperature device, Device 26TH, shall be set to trip the rectifier conditional lockout relay, Device 86X-T, following operation of the rectifier at 160 percent of full load for approximately two hours at the design temperature listed in Article 2.02 of this Section.
 - b. These devices shall interface with the substation automation system within the substation.

4. Protective Devices at Rectifier
 - a. Each diode shall be protected with an individual series current limiting fuse selected to blow for a diode-shortening failure only.
 - b. Rectifier heat sink overtemperature devices, Device 26RH, shall be set to trip the rectifier conditional lockout relay, Device 86X-T, on heat sink high temperature that could result in failure of rectifier elements and fuses before AC and DC switchgear protective devices can operate.
 - c. These devices shall interface with the substation automation system within the substation.
5. Protective Devices at DC Switchgear
 - a. Rectifier DC circuit breaker reverse current device, Device 32, shall instantaneously trip the rectifier DC and AC circuit breakers, Devices 72-R and 52-T, and shall be nominally set between 10%-20% of the DC circuit breaker rated current. The adjustable setting range shall be provided by the manufacturer.
 - b. The settings of all DC feeder circuit breaker protective devices shall be coordinated with the protective devices of the 15 kV rectifier transformer circuit breakers so that DC traction feeder faults will not cause the tripping of the AC circuit breaker. Load measuring and automatic reclosing features of DC traction feeder circuit breakers will cause automatic re-closure as soon as the condition that caused tripping is corrected.
 - c. These devices shall interface with the substation automatic system within the substation.

PART 2 - PRODUCTS

2.1 15kV AC SWITCHGEAR

A. General

1. The switchgear assembly shall consist of indoor, metal-clad, single-height, self-supporting units rated for operation on nominal 13.8 kV, three-phase, three wire, 60 Hz grounded neutral service. The switchgear shall be arranged for future extensions to the switchgear at either end.
2. The DB Entity shall submit within 30 days before the Design Conference, for MBTA's acceptance, design calculations or test data defining the amplitudes of transient overvoltages produced by the proposed vacuum circuit breaker during switching operations. The data submitted shall address switching transients caused by pre-striking, current chopping, virtual chopping and repetitive re-ignition phenomena for the following switching operations:
 - a. On- and off-switching of the transformer and rectifier package at no load, rated load and 150 percent of rated load. Circuit from the circuit breaker to rectifier transformer high voltage terminals shall be assumed to consist of 30' of three single conductor, 350kcmil 15 kV, EPR insulated (133%), shielded cables in conduit unless more precise cable distances are available from the Design Documents.

3. If the data submitted during the Design Conference or obtained during the rectifier package test, as specified in Article 3.03.C. of this Section, indicates a transient peak surge voltage in excess of 50 kV at circuit breaker or transformer terminals, the DB Entity shall furnish and install intermediate class surge arresters at the load side terminals of each of the circuit breakers feeding the rectifier, and at unit substation transformers provided under this Contract. Surge suppressor equipment and proposed installation location will be subject to the acceptance by the MBTA.
4. Where a 13.8kV AC breaker supplies aerially installed cables, surge arresters shall be installed within the AC switchgear. Surge arrester requirements shall be as identified in Section 16203, Article 1.14.

B. Ratings

1. The switchgear assemblies shall be rated as follows, in accordance with IEEE C37.20.2:
 - a. Nominal voltage 13.8 kV
 - b. Rated maximum voltage 15.0 kV
 - c. Rated power frequency 60 Hz
 - d. Power frequency withstand voltage 36 kV
 - e. Lightning impulse withstand voltage 95 kV
 - f. Main bus continuous (rated) current 1200 Amperes
 - g. Rated short-time withstand current, minimum 36 kA
 - h. Rated momentary withstand current, kA crest 97 kA
 - i. Nominal MVA class 750 MVA

C. Switchgear Assembly

1. The metal-clad switchgear assembly shall consist of rigid, self-supporting and self-contained, electrically-welded steel structure units. Individual units shall be enclosed with not less than 11 gauge formed steel sheets on all exterior surfaces and minimum of 12 gauge on other surfaces. Each unit shall be bolted to each other to form a continuous, free standing switchgear assembly.
2. The switchgear dimensions shall be of sufficient depth and height to allow the racking-in of the ground and test device with the front door of the circuit breaker compartment closed, as specified in Article 2.01.F of this Section. The depth and height of the switchgear shall be increased, as required, if manufacturer's standard switchgear does not allow the specified operation of the ground and test device. Ground and test device clearances shall not be compromised due to switchgear cubicle size. All required modifications and additional equipment necessary for each breaker cell to maintain the original functionality of the standard arrangement shall be provided in each cell at no extra cost to the MBTA. Modified operating tools necessary for the proper operation of the equipment shall also be included at no extra cost.
3. Hinged doors shall be provided with each unit, located both on the rear and on the front of the switchgear assembly, for access to breakers, instruments and terminal blocks, relays, meters, control devices, and buses. Instruments and relays mounted on the front door and not

barriered or compartmented from the circuit breakers are acceptable with the exception of the incoming line (52-L) breakers supplied directly by Eversource (Formerly NSTAR), where controls shall be located on the adjacent metering cubicle. Doors shall be formed of sheet steel and shall be properly reinforced against distortions by suitable flanges and stiffening members. Hinges shall be heavy duty of a type accepted by the MBTA. Full height doors shall be securely fastened in the closed position with a minimum of three latches easily opened without the use of tools. For doors less than the full height of the switchgear, a minimum of two latches will be acceptable.

4. Front doors shall be provided with two-position automatic self-stopping mechanism with the first automatic stop at 90 degrees and the second at 120 degrees. Manual defeating feature of the mechanism shall be provided for moving the door from one position to the other. At each stop, the door shall be held securely in the open position. With the front door of any compartment open at 90 degree position, it shall not prevent the adjacent compartment door from being opened and its breaker completely removed from its housing. Rear doors shall be provided with stops to hold them securely open at 90 degrees in a manner to allow the opening of the doors of adjacent cubicles.
5. The circuit breakers, buses, instrument transformers, incoming and outgoing cables, instruments, and control devices in each switchgear unit shall be isolated within separate grounded compartments formed by sheet steel barriers. All compartments shall be sufficiently gas tight to assure that no ionized gas will pass from one compartment to another. Each compartment shall be provided with a separate hinged door or a removable bolted-on cover with handles for gripping for servicing, without exposing circuits in adjacent compartments. All unused holes and openings between compartments shall be sealed.
6. Vent openings on top of switchgear shall be installed through vertical surfaces to prevent the entry of foreign objects. Openings shall be arranged so that hot gases or other materials cannot be discharged through them in a manner which might be injurious to operating personnel. Grills located on top of switchgear shall be reinforced so that they will not be damaged if stepped on.
7. Each circuit breaker unit shall be provided with protective shutters which are forced to close and cover live high voltage terminals as the removable element of breaker is racked out of the cubicle. If the shutters are made of steel, the clear distance from the shutter plate to any un-insulated primary circuit component on the circuit breaker shall not be less than seven inches at any point during the circuit breaker and the ground and test devices racked-in and withdrawal operation.
8. Primary circuit portholes shall be identified with permanently attached nameplates engraved "BUS" and "CABLE" at each circuit breaker housing, and phases "A", "B", "C".
9. Finish of inside and outside of the switchgear assembly shall be in accordance with Section 16203 Article 1.15, Section 16203.
10. The front door of each circuit breaker housing shall be provided with a properly sized opening covered with a sliding door, for the passage of the push button station and the control cable of the ground and test device.

D. Buses

1. Main buses and bus taps shall be in accordance with Section 16203 Article 1.06 and as follows:
 - a. Main buses and bus taps shall be fully insulated with flame-retardant, track-resistant molded insulation rated for 15 kV in accordance with IEEE C37.20.1 and C37.20.2. Bus conductors shall be supported and braced to withstand short circuit stresses at least as great as those for which the circuit breakers are rated. Insulated supports of main bus shall be arranged to form a gas-tight barrier which shall isolate each unit from the adjacent unit.
2. Two ground buses shall be provided in the switchgear assembly in accordance with the following:
 - a. A continuous copper “equipment” ground bus, minimum 2” x ¼”, shall extend throughout the entire length of the switchgear assembly. Each switchgear unit shall be grounded directly to this bus. The frame of each circuit breaker shall be grounded through a rugged contact shoe at all times, except when the primary disconnecting devices are separated by a safe distance. A bolted-type terminal lug, with a NEMA two bolt tongue in accordance with Section 16203 Article 1.07, shall be provided at each end of ground bus for field connection to the station ground. The lugs shall be suitable for stranded copper ground cable within the range of No. 4/0 AWG through 500 kcmil.
 - b. A continuous copper “isolated” ground bus, 1-1/2” x 1/4”, insulated from the switchgear frame, shall be provided for bonding the shields and sheaths of 13.8 kV feeder cables that are connected to the MBTA’s 13.8 kV cable network. The isolated ground bus shall be installed near the rear doors, at a maximum of six inches above floor, and shall extend throughout the entire length of the switchgear assembly. A bolted type terminal lug, with a NEMA two bolt tongue in accordance with Section 16203 Article 1.07, suitable for stranded copper cable within the range of No. 4 through No. 4/0 AWG, shall be provided at each end of the ground bus for future field connection to the negative bus and drainage board. Routing for these connections shall be provided by the DB Entity via suitably sized conduits installed during the substation construction.
 - c. Ground bus splices shall be made with a minimum of four bolts, two bolts on each side of the splice plate.

E. Power Circuit Breakers

1. Power circuit breakers shall be draw-out type, nominal 13.8 kV class, three pole, employing vacuum interrupters, designed for 60 Hz operation and rated on a symmetrical current basis in accordance with ANSI C37.06 as follows:
 - a. Rated continuous current 1200 A
 - b. Rated maximum voltage 15.0 kV
 - c. Nominal voltage 13.8 kV
 - d. Rated voltage range factor (K) 1.3
 - e. Rated withstand test voltage:

Low frequency (rms)	36 kV
---------------------	-------

- | | |
|---|----------|
| Impulse, crest | 95 kV |
| f. Nominal MVA class | 750 MVA |
| g. Rated short circuit current at maximum voltage (rms) | 28 kA |
| h. Maximum symmetrical interrupting capability (rms) | 36 kA |
| i. Rated short time current(3 sec.) | 36 kA |
| j. Closing and latching capability, crest | 97 kA |
| k. Rated interrupting time | 5 cycles |
2. Operating mechanisms shall be of the stored energy type, suitable for operation from a 125 Vdc supply, and electrically and mechanically trip free. Operating circuits shall successfully close the breaker over a voltage range of 90 to 140 Volts and trip the breaker over a voltage range of 70 to 140 Volts. The breakers shall be designed so that they may be tripped manually in an emergency. A removable handle shall be provided for manual closing of the breaker for maintenance and adjustment. An operating mechanism shall be provided with a mechanism charging motor cut-off switch mounted on the breaker removable element and a mechanical breaker contact position indicator visible from the front when the breaker is inserted in its housing.
 3. The stabs of the movable element and the bus will be insulated to the same requirement as Article 2.01.D paragraph 1.a of this Section in so far as practically possible.
 4. In addition to auxiliary switches required for control, interlock, indication, and alarm circuits, provide each circuit breaker with a minimum of four "a" and four "b" spare auxiliary switch contacts wired to outgoing wiring terminal block for MBTA's use. Auxiliary switches mounted on stationary structures are acceptable.
 5. Auxiliary switches and breaker control circuit wiring connected through the secondary disconnecting devices shall be operable when breaker is racked to the test position so that the breaker can be closed and tripped, electrically or mechanically, with primary disconnecting devices open.
 6. Normally closed auxiliary switches mounted on the removable element and used for interlocking shall be shunted with truck operated cell switches to permit operation of interlocked equipment when breaker is in the withdrawn position. A minimum of two "a" and two "b" spare cell switch contracts shall be provided, wired to outgoing wiring terminal block for MBTA's use.
 7. Each circuit breaker shall be mounted on a mobile steel frame equipped with main and secondary circuit disconnecting devices. The frame shall be permanently attached to the circuit breaker and shall be equipped with wheels for rolling the circuit breaker on the floor of the substation. All breakers are required to be a direct roll-in design which allows moving the breaker over the concrete substation floor into the switchgear unit without the need for portable ramps or wedges or cradles. A four-digit register type operations counter shall be mounted on the removable element of each circuit breaker.
 8. Circuit breakers of same rating shall be mechanically and electrically interchangeable.

9. The primary disconnecting devices shall consist of self-aligned assemblies. The female contacts shall be constructed of bridging segments of fatigue-resistant zirconium copper alloy with silver tungsten arching tips or similar approved high quality material, designed to ensure high-pressure contact and guaranteed not to distort or fail under the mechanical stresses and heating due to duties specified for circuit breakers. All contact surfaces shall be heavily silver plated.
10. Secondary disconnecting devices shall provide connections for the control circuits and interlocks between the removable element and the housing. The devices shall be accurately located and securely mounted to maintain alignment.
11. Each switchgear unit housing a circuit breaker shall be equipped with a cranking device for moving the removable breaker element to and from its operating position. The cranking device shall be permanently attached to either the stationary housing or to the removable breaker unit. Suitable guide rails which prevent misalignment shall be provided for centering the breaker in proper position when inserting or withdrawing the removable element. A positive stop shall be provided for the test position and fully disconnected position. Provisions shall be made for padlocking the removable element in the operating and fully disconnected positions. Provisions shall be made to the front of the cubicle's hinged door to provide a sliding shutter to cover the aperture utilized for the cranking device. The circuit breaker shall be able to be racked or cranked from the "test" position to the "operating" position with the breaker compartment door closed. The doors of each cubicle shall have provisions for padlocking.
12. Front ends of guide rails shall be flared and the bottom plate of the enclosure within the guide rails beveled to facilitate the lining-up and insertion of the circuit breaker removable element.
13. Mechanical interlocks shall be provided on each circuit breaker to prevent the withdrawal of the removable element when the breaker is in the closed position and to prevent the insertion of a closed breaker from the test to the operating position. The interlocks shall also discharge the spring of the stored energy operating mechanism before the breaker removable element can be fully withdrawn from its housing.
14. The racking-in mechanism shall be manually operated, threaded shaft type, employing a removable crank. A portable electric racking in device with time delay shall be provided to supplement the manual racking operation. Lever type rack-in mechanism will not be acceptable.

F. Ground and Test Device (GTD)

1. Two types of ground and test devices shall be provided at each substation (except at Ball Square where only the MBTA type ground and test device is required). One for incoming line breaker directly fed by Eversource (Formerly NSTAR) and one for MBTA circuit breakers.
2. MBTA Ground and Test Device
 - a. The DB Entity shall provide Two (2) Ground Test Devices at each substation.
 - b. A ground and test device (GTD) shall be provided for the grounding of primary switchgear circuits during maintenance work, and to provide access to high voltage circuits for high potential (hi-pot) testing and phase checking. The ground and test

device shall be a mobile draw-out element that can be inserted into a switchgear cubicle in place of a circuit breaker. The ground and test device shall be constructed in compliance with all mechanical features and applicable electrical ratings specified for the 15 kV class circuit breaker removable element, in accordance with IEEE Standard C37.20.6, IEEE Standard for 4.76 kV to 38 kV Rated Grounding and Testing Devices Used in Enclosures, and this Section. The GTD is required to be a direct roll-in design which allows moving the breaker over the concrete substation floor into the switchgear unit without the need for portable ramps or wedges or cradles

- c. The ground and test device shall be designed so that it can be racked from the "test" to "operating" position with the breaker compartment door closed. Clearly indexed positive stops shall be provided for the operating, test and disconnected positions.
- d. The ground and test device shall be provided with three primary disconnecting devices for connection to the feeder cable terminals and with three uninstalled primary disconnecting devices for connection to the switchgear bus. The ground and test device will be accepted with all six primary disconnecting devices installed, provided that those for connection to the switchgear bus can be readily removable in the field. The ground and test device shall be provided with a sliding contact assembly, of appropriate ampacity, for connecting to switchgear ground bus; a 15 kV three pole, two position, manually operated air break primary selector switch; and a stored energy operated air break ground switch capable of closing and latching against a live circuit. Windows of non-shatterable material shall be provided for observation of ground switch contact position when the grounding and testing device is racked into the switchgear. Windows on the top and side panels of transparent insulating, non-shatterable material shall also be provided for viewing the position of the selector switch, the ground switch, the bus work and the primary circuit cable from the buses at the primary circuit disconnect devices to the test ports. Viewing mirrors may be added to facilitate easy viewing of the switch position. The mirrors, if used, shall be secured such that once in the necessary position they cannot be easily dislodged or adjusted.
- e. Ground and test devices employing a vacuum interrupter as the ground switch will not be acceptable.
- f. Test port cables shall be firmly supported and installed with phase-to-phase distances based on in-air clearances without the benefit of the cable insulation, unless barriers of insulating material are installed to separate the phases.
- g. The stabs of the movable element and the bus will be insulated to the same requirements as Article 2.01.D, Paragraph 1.a of this Section.
- h. Interlocks shall be provided so the primary circuit selector switch can be operated only while the ground and test device is outside the switchgear. Mechanical interlocks shall be provided to permit the insertion and removal of the ground and test device only when the ground switch is open. A mechanical interlock shall be bolted to the selector switch operator to prevent positioning of the ground switch from cable side to bus side unless the interlock is removed. Means for padlocking the ground switch in open and closed positions shall be provided.
- i. The ground and test device shall have the same voltage, three second current carrying capability, and closing and latching capability as specified in this Section, for the circuit breakers. The ground switch control circuit shall be rated for operation on 125 Volts DC. The control circuit shall be wired to the secondary disconnecting devices matching those furnished with the circuit breaker removable elements. A 20' long control cable, with a

pushbutton station at one end and quick-type disconnecting plug on the opposite end, shall be provided for electrically closing and tripping the ground switch. A timing relay, adjustable between 5 and 50 seconds, shall be provided for the ground switch closing circuit. Interlocks shall be provided to permit the closure of the ground switch only when the ground and test device is racked into the "operating" position. A manual handle shall be provided for closing the ground switch when the ground and test device is inserted in the breaker housing and the cubicle door is closed.

- j. The GTD will normally be operated with the switchgear cubicle door closed. Provide shuttered openings in the substation 15 kV switchgear cubicle doors to accommodate the GTD control cable. The cubicle door openings for the GTD control cable shall be provided with means of securely fastening them in the closed position when GTD is not in use.
- k. Arrangements shall be made to prevent the operation of the structure-mounted circuit breaker auxiliary switches during the racking-in and withdrawal operation of the ground and test device.
- l. Opening and closing of the GTD grounding switch shall occur only as a separate operation independent of the charging of the ground switch mechanism. A ground switch mechanism that charges and then automatically closes or opens will not be acceptable.
- m. Mechanical means of charging the ground switch mechanism shall be provided, enabling the GTD to be opened in the event the charging motor fails.
- n. Primary circuit test terminals shall be recessed, and the access ports furnished with automatic shutters. The DB Entity shall provide the ground and test device with two (2) sets of high voltage test probes for applying an external test voltage (hi-pot) to the incoming feeder cable or switchgear bus. These test probes shall be self-powered, requiring no auxiliary supply for operation. Battery-operated test probes are not acceptable. The DB Entity will request all connector detail requirements to the MBTA.
- o. The primary disconnect devices, test port openings and the selector switch positions shall be identified with permanently attached nameplates engraved "BUS" and "CABLE". Similarly, all references to the primary circuit positions on the schematic and wiring diagrams and in the operating instructions shall be "BUS" and "CABLE".
- p. A nameplate, depicting the primary circuit in single line from shall be permanently attached to the front or side of the ground and test device.
- q. The ground and test device will be used for hi-pot testing of substation 13.8 kV cable circuits. A DC test source up to 45 kV will be applied to the cable through the ground and test device for five minutes while the ground switch is open.
- r. Provide a charging motor cut-off switch mounted on the front of the GTD similar to that provided for the substation 15 kV class circuit breakers.
- s. Provide a white LED lamp as well as a mechanical flag to indicate "mechanism fully charged" status.
- t. Provide a mechanical flag to indicate ground switch open and closed status.
- u. The diameter of the GTD test ports shall accommodate the MBTA standard "shotgun" telescopic high voltage detector stick, which is a Biddle Instruments DETEX Neon Voltage Detector Cat. No. 51440-1 or 51440-2. Provisions shall be made to allow verification of cable de-energized status using the detector stick when the GTD is racked into position and open, in accordance with MBTA standard operating procedures. The

DB Entity shall provide two (2) MBTA standard high voltage detector sticks with the GTD. These two detectors shall be present at the time of factory testing for use in the testing of the equipment.

- v. The construction details, list of components, single line and schematic diagrams and operating procedure of the ground and test device shall be submitted to the MBTA for acceptance. Construction details shall include dimensioned front, side and section views illustrating dimensions of internal and external features. Demonstration of the approved GTD operating procedure shall be considered part of the factory witness testing requirements.
 - w. The GTD shall be tested in accordance with IEEE Standard 1286, with certified test reports provided for MBTA's acceptance.
3. Eversource (Formerly NSTAR) Ground & Test Device (extracted from Eversource (Formerly NSTAR) Specifications)
- a. The DB Entity shall provide One (1) Ground Test Device, at each substation connected to the Eversource (Formerly NSTAR) system, 15kV, suitably designed for transporting between the switchgear and the storage location, to provide means of application of low tension phasing, probe and DC insulation cable testing and application of cable fault location equipment of the incoming line cables and grounding of the incoming line cables.
 - b. The GTD shall be capable of racking into the incoming line positions. Blocking plates are to be used so that this device is incapable of being racked into any other position on the switchgear.
 - c. This test device shall have only three (3) female contacts of similar design of the circuit breaker which when put into position shall make connection to the stationary contacts on the line side of the breaker unit.
 - d. The test device shall be self-aligning in the breaker unit and shall be put into position in the same manner as the circuit breaker.
 - e. Each phase terminal shall extend to the front portion of the device with a 2" x 1/4" flat copper bar for test connections.
 - f. Each copper phase shall have micarta barriers (or equivalent) between each of the other phases and/or ground.
 - g. The device shall have a grounding shoe for grounding the device when in position.
 - h. A grounding terminal with wing nut arrangement shall be provided at the front of the device for connection thereto for test purposes.
 - i. The front of the device shall have a suitably insulated hinged door.
 - j. Three (3) 6' flexible cable jumpers with an equivalent short circuit rating of the switchgear for connection between each phase terminal and ground shall be provided.
 - k. The Ground and Test Device (GTD) will be limited to insertion into the incoming line breaker cubicles ONLY.
 - l. The vendor will install the appropriate blocking plates so that the GTD is incapable of being inserted into a tie breaker or customer feeder position.

- m. Each phase terminal shall be fitted with a nameplate indicating which utility phase is connected to each terminal.
- n. For grounding, there shall be one ball stud fitted per phase and 3 individual ground ball studs fitted to the ground bus.

G. Eversource (Formerly NSTAR) Revenue Metering (extracted from Eversource (Formerly NSTAR) Specifications)

1. The following are the requirements for primary metering equipment that will be installed in separate metal enclosed bays. The DB Entity shall furnish, install the metal clad bay for approved metering current and potential transformers. This will include cubicle heaters and interior connections. The metering transformers will be furnished and installed by the DB Entity's switchgear manufacturer. The metering transformers will become the property of the Eversource (Formerly NSTAR) Electric Company.
2. No instruments, meters, or devices other than the aforementioned current and potential transformers shall be mounted on or inside the metering bay unless specified herein.
3. All ground connections shall be copper to copper connection.
4. The metallic metering instrument transformer bases shall be grounded to their supporting structures by serrated metal mounting washers with screws that penetrate the painted surface, and by #6 AWG bare copper ground connections to the switchgear ground bus. The bases of each of the metering transformers are to be grounded individually to the ground bus. Daisy chain grounding arrangements are not acceptable.
5. Metering Current Transformers
 - a. A separate section, isolated with a solid barrier, shall be provided for the installation of two metering current transformers. Compartment design shall be such that after proper electrical isolation, the transformers can be readily replaced.
 - b. The approved current transformers will be mounted in phases 1 and 3, and the area of the primary connections to the bus shall be treated to inhibit corrosion and oxidation. Current transformers will be mounted on phase 1 and 3 when connected to a delta connected transformer. These current transformers shall be of one of the following or approved equal:

Manufacturer	Type	Accuracy	Burden
General Electric	JKM 5	0.3	B-0.1 to B-1.8
	755X142043 200/400:5		

- c. Current transformers shall not be ordered until consultation with the Meter Technical Central Operations of the Eversource (Formerly NSTAR) Electric Company has occurred.
 - d. The current transformers shall be located in the top section of the metering bay.
6. Metering Potential Transformers

- a. The potential transformers and fuses shall be mounted on a drawout carriage located in the bottom half of the metering bay and shall be completely isolated from the high voltage bus or connections. Phasing shall be 1-2-3 left to right facing the drawout carriage for Boston Edison Territories. Phasing shall be 3-2-1 (C-B-A) left to right facing the draw out carriage for Cambridge Electric territories. Note: MBTA phasing at the front to the switchgear is 1-2-3 or A-B-C. These potential transformers shall be of one of the following or approved equal:

Manufacturer	Type	Primary Voltage	Ratio	Primary Fuses (3 total)
General Electric	JVM	14,400	120:1	½ E
	#765X023026			

- b. Primary connections shall be 4/0 copper equivalent. The primary connections to the potential transformers shall be suitably treated to insure low resistance, eliminate moisture and resist oxidation. A two bolt connection at each end of the PT connection to the drawout/dropout stabs is required.
- c. Two (2) revenue metering potential transformers with primaries connected in an open delta configuration for a delta connected transformer, the high voltage side of the potential transformers shall be connected via three current limiting fuses, type ½ E. The fuses shall indicate when blown.
- d. Primary contacts for the drawout carriage shall be of such design as to ensure continuous positive contact pressure. The design shall ensure the primary contacts are disconnected from the bus connections and grounded before the potential transformers and fuses become accessible for checking and replacement. Sufficient clearance shall be provided so that fuses can be changed while wearing high voltage insulating protective gloves. Preference shall be for braided connections shall be provide in lieu of spring connectors.
- e. Three spare fuses, type ½ E, shall be furnished for each set of metering potential transformers. Provisions shall be provided for fuse storage. The preferred location for the fuse storage is on the inside of the outside bay door.
- f. The front of the potential transformer drawout carriage shall extend up to close the section when the transformers are in the operating position. The section enclosing the fuses shall be so constructed that ionized gases and/or flame resulting from blowing of the fuses will not readily be conducted into other sections.
- g. The manufacturer shall insure that potential transformer fuse clips are held rigid with double bolt connections and cannot pivot when removing fuses.
- h. Mechanical latches shall be provided to allow the drawout carriage to be held in fixed positions when the PT carriage is in either the fully operational position or the fully disconnected position. The fully disconnected position is to mean the position the carriage would be in for fuse removal/insertion.

7. Secondary Wiring

- a. Secondary wiring from the current and potential transformers shall be limited to the following terminal blocks within the switchgear. Current transformer secondary conductors require GE shorting type EB27A6S and potential transformers require EB25B04 terminal blocks or equivalent. The wiring shall consist of thirteen (13) conductors of #12 AWG flameproof switchboard wire with ring type connectors; 3 wires

from each current transformer and 4 wires from the potential transformer (Eversource (Formerly NSTAR) Electric meter drawing will be provided upon request). Secondary wiring beyond the terminal block will be installed by the Meter Technical Central Operations of the Eversource (Formerly NSTAR) Electric Company.

- b. No instruments or meters other than Eversource (Formerly NSTAR) Electric revenue meters shall be connected to the secondaries of the metering current and potential transformers.

8. Meter Panel

- a. A remote outdoor cabinet with a meter panel drilled in accordance with a sketch furnished by Meter Technical Central Operations of the Eversource (Formerly NSTAR) Electric Company. The MBTA and Design-Builder shall consult with John Marcone (339 987 7078) of the Eversource (Formerly NSTAR) Electric Company for the location of the meter panel. The Design-Builder shall provide a run of 1-1/2" conduit from the terminal block location in the switchgear to the remote meter panel for the extension of the secondary wiring.

H. Instrument Transformers – MBTA circuit breakers

1. Instrument transformers shall be dry type. Transformers and associated wiring shall have mechanical strength and thermal rating commensurate with rating of associated equipment.
2. Voltage transformers for relaying and indication shall have ratios as specified in Article 2.01.Q.a of this Section, a minimum thermal rating of 1,000 Volt Amperes with 55 °C rise above a room ambient of 40 °C, and an accuracy of 0.3 with ANSI standard W, X, and Y burdens, 0.6 with Z burdens, and 1.2 with ZZ burdens. Voltage transformers shall be equipped with current limiting primary fuses and shall be mounted on draw-out or tilt-out carriages. The front of the carriages shall be designed to close the section when the transformers are in the operating position. Primary contacts for the draw-out feature shall be of a design which will ensure continuous positive contact pressure. Carriages shall be of sufficiently rigid design to maintain proper alignment of the primary contacts. Visible grounding devices shall be provided to ensure that the draw-out carriage mounted voltage transformer primary terminals are grounded when the carriage is withdrawn. The visible grounding devices shall not be able to be deflected out of position by repeated operations of the carriage. A flexible braided strap shall be provided for bonding the drawout carriage to the switchgear enclosure.
3. All voltage transformer primary circuit connections from bus or line side terminals of circuit breakers to the primary fuses shall be of No. 2/0 AWG minimum, copper wire, fully insulated for 15 kV. Connections from the fuses to the high voltage terminals of the transformers shall be No. 6 AWG minimum, copper wire, fully insulated for 15 kV. Phase-to-phase and phase-to-enclosure distances shall be based on in-air clearances, assuming bare conductors. Insulated wire shall be secured in position by the use of non-conductive cable clamps. The use of ty-wraps type cable ties will not be permitted.
4. Ungrounded conductors of voltage transformer secondary circuits shall be fused. Fuses shall be of the dual element, cartridge type, rated 20 Amperes, 250 Volts, mounted in barrier-type, porcelain base fuse holders.

5. Provisions shall be made for storing a set of three primary current-limiting fuses in each voltage transformer compartment.
 6. Current transformers for relaying and indication shall be of the window-type, with the ratio and accuracy class specified in Article 2.01.Q of this Section, rated 600 Volts, minimum, and designed to withstand full wave impulse test of 10 kV. The primary circuit busbar shall be located at the center of the current transformer window, firmly supported, and fully insulated for 15 kV class. The installation of current transformers shall withstand the dielectric and impulse tests specified for the switchgear assembly. Current transformers shall comply with IEEE Standards C37.20.2 and C57.13. All CT ratios shall be wired to accessible terminal blocks.
 7. Frames and cases of the current and voltage transformers, the secondaries of the current transformers, and the common secondary conductor of the voltage transformers shall be grounded to the switchgear ground bus. Grounding of the voltage transformers and the carriage to the switchgear ground bus shall be made with an extra flexible grounding cable. All grounding conductors shall be made as short as possible, not grouped with other conductors, and shall be No. 6 AWG copper wire or larger. Ground wires shall be continuous without splices or intermediate connections. The current transformer ground wire shall be separate from the voltage transformer ground wire. The case ground wires shall be separate from the ground connections to the instrument transformer secondary wiring.
- I. Instrument Transformers – Eversource (Formerly NSTAR) circuit breakers
1. These requirements apply to Eversource (Formerly NSTAR) Circuit Breakers (52-L1 and 52-L2 at Red Bridge and Pearl Street) and may be incorporated into the requirements of the MBTA instrument transformers.
 2. Instrument transformers shall satisfy the ANSI requirements, for relaying accuracy classification or metering accuracy classification as appropriate for the connected load, under the burdens imposed by the devices specified or implied. Instruments transformers shall be in accordance with the requirements of ANSI C57.13 and NEMA E-12.
 3. Current Transformers:
 - a. Three window type current transformers shall be provided between the incoming line terminations and the circuit breakers.
 - b. Ratings: 600/5 Amperes, 15kV, C200 Relay Accuracy Class. Current transformer ratios are subject to change and confirmation up to the return of shop drawings accepted.
 - c. The secondaries of these current transformers shall be located in an isolated compartment with the incoming line terminals and shall have at least the mechanical and thermal strengths of the circuit breaker.
 - d. All metallic transformer bases and all secondary circuits shall be grounded by connection to switchgear ground bus with a minimum #6 AWG bare conductor.
 - e. The current transformers shall be capable of withstanding high potential tests of 42kV, DC for five minutes.
 - f. Current transformer secondary neutrals shall be grounded to the switchgear bus with a minimum #12 wire.

- g. Current transformers shall be provided with covered secondary terminal blocks. Secondary leads shall be wired to terminal blocks in secondary control compartment, equipped with a device for conveniently shorting the current transformer, and readily identified.
 - h. Current transformer secondary neutrals shall be grounded to the switchgear bus with a minimum #12 AWG bare wire.
 - i. The lengths of these ground connections should be as short as possible and not grouped with other control wires.
4. Potential Transformers
- a. The phase presentation of the primary conductors of the potential transformers shall be 1-2-3 left to right as viewed from the draw-out carriage.
 - b. Potential transformers shall be of the draw-out, disconnecting type insulated for full voltage rating of switchgear. The transformers shall have mechanical rating equal to the momentary rating of the circuit breakers. Potential transformers placed in the upper section of a vertical stack shall be housed in the lower portion of the section to facilitate ease of the operation of the draw-out unit.
 - c. Potential transformer primary leads shall be insulated for full insulation level of main bus and shall be run individually cleated with air separation. Individual insulating bushings shall be provided at barrier penetrations.
 - d. Potential transformers shall be provided with current limiting fuses mounted on the draw-out assembly. Withdrawing a unit shall disconnect and ground the assembly.
 - e. The potential transformer carriage shall be grounded by a two flexible 1/0 AWG bare or clear jacketed copper conductors.
 - f. 15kV connections from the 15kV bus to the potential fuses shall be made with a minimum 4/0 AWG cable with double bolt connections at both ends of each connection.
 - g. The primary fuse clips shall be double bolted to their bases to prevent rotation and movement resulting in misalignment of the clips for fuse removal/insertion. A GPO-3 insulating material may be mounted across an individual fuse clip to prevent movement and rotation of the fuse clip in lieu of the double bolted base arrangement. In either case the fuse clips must be secured so that they do not rotate/move when the primary fuses are either inserted or removed.
 - h. Each transformer case shall have a positive bare copper connection to the ground bus equivalent to a #6 AWG wire. Daisy chain ground connections from one PT frame to another are not acceptable.
 - i. The primary contacts shall be disconnected and isolated from the bus connections and grounded before the fuses become accessible for checking and replacement.
 - j. Mechanical latches shall be provided to allow the draw-out carriage to be held in fixed positions when the PT carriage is in either the fully operational position or the fully disconnected position. The fully disconnected position is to mean the position the carriage would be in for fuse removal/insertion. The fuse clips shall remain positively grounded with the carriage in the disconnected/latched position.

J. Primary Circuit Terminations

1. Switchgear shall be arranged for top or bottom entrance of incoming and outgoing feeder cables, as shown on the Design Documents with exceptions as noted. The DB Entity shall provide necessary terminations for power cables connecting to the breaker load side terminals. Solid dielectric, EPR-insulated cables shall be 15 kV class, 133% insulated and shall have 15 kV class stress cone type terminations. Buses and current transformers in the cable entrance compartments of the switchgear shall be arranged to provide ample space for 15 kV cable termination stress cones.
2. Cable termination supports shall be insulated from the switchgear frame to prevent circulation of current between cable sheath and switchgear structure. The cable shields shall be connected to the insulated ground bus specified in Article 2.01.D.2.a of this Section, by means of an insulated, braided flexible copper connector.
3. 15 kV class stress cone termination kits for the EPR cables shall be provided in accordance with the cable manufacturer's recommendations.
4. The DB Entity shall provide heavy duty, bolted type terminal lugs for power cables in accordance with Section 16203 Article 1.07. For 350 kcmil and smaller cables, the terminal lugs shall have NEMA two-bolt tongues; for 500 kcmil and larger cables, four-bolt tongues shall be provided.
5. The DB Entity shall provide insulated cable supports for power cables, designed to withstand maximum short circuit stresses specified for switchgear assembly. Cable clamps shall be provided to secure the cables to the supports.
6. Each incoming line, ring feeders and feeder circuit breaker units, as indicated on the Design Documents, shall be furnished with two removable neon glow tubes per phase for "feeder alive" indication. The indicators shall be mounted for observation through windows of non-shatterable material located at a convenient viewing height. The neon tubes shall not be connected to switchgear buses, but be arranged for capacitive pickup. Additional capacitive pickup devices shall be provided, if necessary to obtain adequate brilliancy for observing the indicators in well-lit substation. The presence of the neon tube assemblies shall not reduce the impulse withstand level of the equipment.
7. Each circuit breaker that has supply cables connected to aerial AC feeders shall have surge arresters installed within the AC switchgear cable compartment. Refer to Design Documents for circuit breakers connected to aerial feeders. Refer to Section 16203 for description of the surge arrester requirements.

K. Wiring and Terminal Blocks

1. Secondary and control wiring and terminal blocks shall be provided in accordance with Section 16203 Article 1.09, and as follows:
 - a. Wiring and terminal blocks in switchgear housings and on circuit breaker removable elements and on the ground and test device shall be rated for 600 Volts.
 - b. Circuits requiring external connections shall be wired to outgoing wiring terminal blocks readily accessible from the front, with circuit breaker removable element in test or connected position.

- c. External control, indication and SCADA/SAS cabling shall enter and exit each control compartment from the top, front of the switchgear as indicated on the Design Documents. Cable tray above the switchgear shall be used for the routing of these cables.

L. Control Source

1. An ungrounded, two wire, 125 Volt DC control bus shall be provided integral with the switchgear assembly. The control bus shall be No. 4 AWG, stranded switchboard wire insulated for 600 Volts, minimum. An alternative to #4AWG may be proposed by the DB Entity with supporting calculations for acceptance by the MBTA. The supply shall be wired to suitable screw type terminal blocks located at or near the middle of the switchgear lineup for connection to the supply conductors entering from the top.
2. Each breaker control circuit shall be supplied from this bus through a separate set of disconnect switches and main (tripping circuit) fuses. Each circuit breaker closing circuit shall be provided with a secondary set of fuses with pullout disconnects to prevent blowing of main fuses on closing circuit faults.
3. Disconnect switches, fuse holders, and fuses shall be rated 250 Volts. Fuses shall be of the dual-element, cartridge type of appropriate rating. Necessary fuses shall be furnished with the equipment. In addition, a minimum of 15 percent, but not less than two, spare fuses of each rating shall be furnished.

M. Special Requirements

1. Each separate compartment within a switchgear cubicle shall be provided with an electric strip heater of adequate size to prevent condensation within the compartment. Heaters installed in a unit shall be monitored by means of an ammeter, scaled and marked for the heater load. Each cubicle shall be provided with an LED indicating light with blue lens to indicate operation of the heater and an ON-OFF switch. Heaters shall be provided with guards to protect operating personnel against accidental contact with hot surfaces.
2. A fluorescent or LED lamp receptacle, with conveniently located and properly labeled toggle switch or door operated switch, shall be provided in each compartment, accessible from the breaker draw out side of the switchgear. The DB Entity shall also provide a duplex, grounding type receptacle in each switchgear unit, connected for 120 Volt AC service.
3. The DB Entity shall provide a three-phase, four wire, 208/120 Volt AC supply bus, No. 8 AWG minimum, throughout the switchgear assembly. An alternative to #8AWG wire size may be proposed by the DB Entity with supporting calculations for acceptance by the MBTA. The heater, light, and receptacle circuits shall be supplied from this bus through fusible pullout disconnects with dual-element cartridge type fuses located in each switchgear unit. Fuse holders and fuses shall be rated at 250 Volts AC. Fuses shall be furnished with the equipment. A minimum of 15 percent, but not less than two, spare fuses of each rating shall be furnished. As far as practicable, loads shall be balanced between the phases of the supply bus. The supply shall be wired to terminal blocks located at or near the middle of the switchgear lineup for connection to the incoming supply from the substation 208/120 Volt distribution panel.

N. Nameplates

1. In addition to nameplates specified in Section 16203 Article 1.08.C, provide a nameplate on the front of the switchgear assembly, engraved with "DANGER - 13,800 VOLTS". The nameplate shall have white letters, 2 inches high minimum, on red background. Two similar nameplates shall be mounted on the rear of the switchgear assembly. The DB Entity shall furnish and ship loose eight similar nameplates for installation on exterior face of entry and exit doors of the substation.
2. The legends of all equipment nameplates shall be submitted to the MBTA for acceptance.
3. Switchgear identification nameplate shall be engraved "15 kV AC SWITCHGEAR".
4. Additional nameplates for the Eversource (Formerly NSTAR) incoming line breakers shall be provided meeting Eversource (Formerly NSTAR) requirements.

O. Supervisory Control Requirements

1. The 15 kV switchgear assembly shall be provided with supervisory control and indication, measuring and interface devices specified in Article 1.06.C, paragraph 5 of this Section.

P. 15 kV Circuit Breaker Test Cabinet

1. The DB Entity shall provide a wall mounted test cabinet for electrical operation of the 15 kV class circuit breakers as shown on the Design Documents. The test cabinet shall include a control switch, similar to that furnished with the switchgear, to close and trip the breaker; red and green LED breaker position indicating lights; 10' of control cable with a connector at the end for connection to the breaker; a set of properly sized fuses to protect the control circuit; and, screw type terminals for 125 Volt DC control supply No. 8 AWG conductors. An additional indicating LED with white lens shall be provided for monitoring the control supply. The 125 V DC control power shall be provided from a dedicated circuit breaker in the substation DC distribution panel.
2. The control switch and the indicating lights shall be mounted on the door of the test cabinet. The wiring and terminal blocks shall be provided in accordance with Section 16203 Article 1.09, and the nameplates in accordance with Section 16203 Article 1.08.
3. A proper connector shall be provided for protecting the control cable at the point of entry. Provisions shall be made for storing or racking the control cable and the connector at the test cabinet.
4. The test cabinet shall be finished inside and out in accordance with Section 16203 Article 1.15.
5. Switchgear identification nameplate shall be engraved "15 kV AC CIRCUIT BREAKER TEST CABINET".

Q. Protective Relays – MBTA Circuit Breakers

1. All 15 kV substation circuit breakers except for Eversource (Formerly NSTAR) incoming line breakers shall be equipped with identical multifunction intelligent digital relay and metering units. See below for Eversource (Formerly NSTAR) relaying requirement for the incoming line breakers. The specific ANSI device functions to be programmed for these individual

circuit breakers are described in Article 2.01, Paragraph Q of this Section. The multifunction relays shall include the following functions and features.

- a. At least nine time overcurrent relay curve shapes including ANSI, and at least one user-programmable time overcurrent curve shape.
 - b. At least five instantaneous time overcurrent curve shapes including ANSI
 - c. Instantaneous metering functions including circuit Volts, Amps, Watts, VARS and Power Factor.
 - d. Demand metering functions including kW, kVAR, and kVA, with peak demand time stamp.
 - e. Fault location and recording (Up to the ten most recent faults).
 - f. Event recording, date-stamped (up to the 128 most recent events).
 - g. Waveform capture (4 voltages, 3 currents).
 - h. Load profile reporting.
 - i. RS-232 or RS-485 or communication port computer interface on rear of unit, and RS-232 port on front of unit, for relay monitoring and control, downloading and uploading setting and event data, supporting DNP 3.0 protocol.
 - j. Numeric keypad and display to enable the relay to be controlled and programmed without a computer, if necessary.
 - k. Continuous self-checking function with contact closure for relay failure.
 - l. Communications to connect to the substation automation system.
 - m. Programmable to include software based interlocking from voltage inputs and breaker status indications.
 - n. Breaker operations counter and summary.
 - o. Breaker failure detection (adjustable) and relay health to be provided over the SAS system.
 - p. Draw-out unit with automatic CT shorting.
 - q. Front-mounted status indication.
 - r. Sufficient 30A make outputs contacts for specified control and indications, plus 25 % spares.
 - s. Manufacturer-supplied Windows®-based software for relay control and programming, including software operation training, running on a laptop computer to be provided with the relays (see Article 2.10, Technical Support Equipment)
 - t. Ten (10) year warrantee, minimum.
 - u. Model Nos.: Schweitzer 351, GE Multilin 750, ABB Power T&D DPU 2000, or approved equal.
2. The AC switchgear shall include protective devices to protect substation personnel and equipment from the incident energy that can develop in an arc fault in the AC switchgear which is directly proportional to the fault clearing time. Early detection and disruption of the energy being supplied to the fault limits the amount of damage to the switchgear, possible

revenue service delays and more importantly injury to substation personnel. Protective relays and fiber optic cables capable of detecting the development of an arcing fault in the early stages is to be included in the AC switchgear. High speed solid state relays / microprocessors designed to detect the development of an arcing fault are capable of sending tripping signals in as little as 2 to 4 msec. The total clearing time shall not exceed 100msec. Fault detection shall be sent to the substation HMI annunciator and to SCADA. The ARC Flash Assessment may be performed using "Power Analysis Software designed for this purpose.

R. Protective Relays – Eversource (Formerly NSTAR) Supply Circuit Breakers 52-L1 and 52-L2

1. Relays shall be of the electronic type, and shall be designed, constructed, and tested in accordance with the applicable provisions of ANSI C37.2 Manual and Automatic Station Control, Supervisory, and Associated Telemetering Equipment; ANSI C37.90, Relays and Relay Systems associated with Electric Power Apparatus; and C37.90a Guide for Surge Withstand Capability (SWC) Tests. Relays shall have built-in test facilities. Specific relay type and model numbers will be provided if specified by Eversource (Formerly NSTAR) Electric. The relays shall communication with substation automation system equipment.
2. Switchgear shall be furnished with all relays and accessories necessary to provide a complete and coordinated protective relay system for the circuits and switchgear as shown or as required to provide proper interlocks and sequence of operation as specified. Device function numbers shall be the standard device numbers for automatic switchgear as listed in ANSI C37.2. The relays for circuit breaker operation shall have an adjustment range suitable for coordinated tripping with other breakers in the switchgear. Relays shall provide all contacts shown. Where more contacts are required than are available on relays of the types specified, approved types of auxiliary relays shall be provided to supply the required additional contacts.
3. Protective relays shall be semi-flush, drawout type mounted on the front doors of the switchgear. Auxiliary relays of the semi-flush mounted type may also be mounted on the front doors of the switchgear. Other auxiliary relays shall be mounted inside the switchgear on the side sheets and/or on the internal swinging panels designed for this purpose. All relays, except certain auxiliary relays, shall be of a type that can be withdrawn by means of approved sliding contacts from the front of the panels without opening the current transformer secondary circuits or disturbing the external circuits, or requiring disconnection of leads on rear of the panels. Relays instruments and controls for individual feeders shall be located on the respective feeder panel, relays, indicating lamps, instruments and controls for mains [that have the suffix 'M'] shall be located on the associated incoming main and bus relays, indicating lamps, instruments and controls will be located on the bus tie panels. The trip circuits of the mains and ties shall be un-fused.
4. The relay cases shall be rectangular steel, zinc-chromate primed and painted black, back connected, dust tight switchboard type. The case shall be provided with removable covers with windows and with means of sealing against tampering.
5. Stability: Each protective relay shall be free from errors due to normal variations in frequency, waveform, power factor, and ambient temperature. All current coils shall be able to withstand currents caused by short circuits on the system. All potential coils shall be able

to withstand 110 percent of normal voltage continuously without damage to the coils or equipment.

6. Test Devices: The necessary test devices shall be accessible from the panels and shall be arranged to isolate the relays completely from the instrument transformers and other external circuits so that no other device will be affected during tests. Multiple test plugs shall be provided for testing either by an external source of energy or from the instrument transformers and other external circuits so that no other device will be affected.
7. Voltage and Vibration Tolerance: - Relays shall operate successfully at voltages ranging from 80 percent to 110 percent of rated voltage without overheating, chattering, or other malfunction. Protective and auxiliary relays shall not operate falsely due to vibration that may occur in closing or tripping operations of the circuit breaker or adjacent circuit breakers.
8. Other Relay Features: Each protective relay shall be provided with an operation indicator and an external target reset device. Relays shall be complete with all operating auxiliaries, including auxiliary transformers as required to adjust currents and potentials for amplitude and phase angle for proper operation of all relays supplied. Relays shall be suitable for use on 5 Ampere current transformer secondaries and 120 Volt potential transformer secondaries, 125V DC minimum tripping and closing circuits. The relay contacts shall have silver tips and shall be rated 5 Amperes continuous and 25 Amperes for one second at 250 Volts DC. The relay coils shall be rated for continuous duty at rated operating voltage.
9. Lock Out Relays: Lockout relays shall be electric trip reset type as shown on the drawings suitable for appropriate DC control and tripping power. Contacts shall be rated for 10,000 operations and made of silver overlaid bronze alloy. Single contact ratings shall be 30 Amperes continuous 60 Amperes for one minute and interrupting; 3 Amperes resistive, 1 ampere inductive. Each lockout relay shall have an associated white light that is lit when the lockout relay is reset. Provide a "t" operating handle and nameplate engraved "trip-reset".
10. All protective relays on the 52-L1 and 52-L2 circuit breakers are subject to the approval of Eversource (Formerly NSTAR) Electric Relay and Protection Group. The shop drawings are to clearly identify all protective relays proposed for the switchgear.
11. Eversource (Formerly NSTAR) requires fail-safe relay schemes. The incoming lines over-current relaying shall offer one of the following arrangements:
 - a. Three electromechanical phase relays with a ground relay.
 - b. Two microprocessor relays with phase and ground over-current in each relay. In this case one relay is to serve as the primary relay and one as the back-up relay. It is recommended each of these relays be from different vendors to attempt to make the system immune from defeat should a particular vendors relays be problematic.
 - c. One microprocessor relay with phase and ground over-current protection within the relay. An additional electromechanical ground over-current relay shall be provided with this arrangement.

In any case where microprocessor relays are used it is required that the relay health be monitored over the SAS system.

An FT-1 test switch shall be provided for each breaker position offering four current shorting poles and two tripping poles.

All relaying arrangements are subject to the approval of the Eversource (Formerly NSTAR) Protection Group.

12. Bus Differential Relaying Controls shall offer the following:

- a. Bus differential relaying shall be integrated with the relaying provided under the MBTA requirements.

13. Stuck Breaker/Breaker Fail Relaying Controls shall offer the following:

- a. Breaker failure protection shall be provided integral to the multifunction relay on each circuit breaker and shall trip all breaker on eth associated bus via the bus lockout relay.
- b. If an integral protection element is not acceptable to Eversource (Formerly NSTAR) then:
 - (i) Each feeder relay trip signal shall activate a 62 timing relay through an 'a' contact of the breaker to be tripped.
 - (ii) The 62 timing relay will, at the expiration of the time delay trip a lock-out relay that will trip all the breakers on the bus associated with the feeder breaker calling for the original trip signal.
 - (iii) The 62 timing relay will be set for 9 cycles.
 - (iv) Should the feeder breaker trip and the 'a' contact change logical state before the 62 times out, the 62 timer will automatically reset and will not trip the stuck breaker lock-out relay.
 - (v) Each 62 timing relay shall be equipped with a target to indicate the relay has timed out and called to trip the stuck breaker lock-out relay. Or
 - (vi) Each feeder breaker shall be equipped with a dedicated stuck breaker lock-out relay. In this case the stuck breaker lock-out relay will serve as the relay target.

S. Accessories

1. Per Substation, the DB Entity shall furnish two sets of special tools and equipment handling devices as recommended by the manufacturer for installation, assembly, adjustment and maintenance of the furnished 15 kV switchgear and associated circuit breakers. Special tools are defined as tools not readily available on the open market. All items shall be furnished as part of the initial delivery of the switchgear equipment.
2. Per Substation, the DB Entity shall also furnish and ship with the switchgear auxiliary equipment and accessories necessary for operation, maintenance, testing and handling of removable components outside the switchgear assembly. These shall include, but not be limited to, the following:
 - One - Floor-mounting steel cabinet with hinged doors with three point latching mechanism and key-locking handle and shelves for storing tools and accessories. Cabinet shall be fully rustproofed and finished in light gray enamel.
 - Two - MBTA Ground and test devices, rated 750 MVA nominal, as specified in this Section.

- One - Eversource (Formerly NSTAR) Ground and test device, rated 750 MVA nominal, as specified in this Section.
- One - Circuit breaker test cabinet, as specified in Article 2.01.P, this section.
- One - "Fifth-wheel" device for moving/handling the breaker removable element. A breaker lifting device and portable crane for moving the 15 kV AC breakers in and around the substation may be proposed in lieu of the fifth wheel device.
- Two - Racking-in cranks (if not already included as part of Article 2.01.S.1 above).
- Two - Manual spring charging handles (if not already included as part of Article 2.01.S.1 above).
- Two - Sets of tools required for breaker maintenance (if not already included as part of Article 2.01.S.1 above).
- Two - Sets of test plugs for drawout relays (if applicable).
- Two - One-quart cans of matching switchgear touch-up paint.
- One - Set of switchgear base channels for mounting the stationary units. These channels shall be shipped in advance of the switchgear for installation in the floor slab.
- Two - 15 kV circuit breaker guide floor plate for aligning the breaker for insertion into the cubicle. In addition to aligning the AC breaker for insertion, this plate shall maintain the cubicle door open at an angle of 95 degrees minimum, while the circuit breaker is being inserted or withdrawn.

T. Detailed Equipment Requirements

1. The DB Entity shall furnish and deliver to the substation the 15 kV switchgear assembly consisting of switchgear units of the type and quantity specified below. The individual units in the assembly shall be arranged to form a lineup as shown on Design Documents.
2. Individual switchgear units shall consist of the equipment, devices and appurtenances of the types and quantities detailed in the Design Documents.

- a. Incoming Line Breakers, Devices 52-L (also must comply with or exceed the requirements of Eversource (Formerly NSTAR))

Each 52-L circuit breaker unit includes, but not be limited to, the following.

- 1 - Metal-clad stationary unit, nominal 750 MVA class with 1,200 Ampere insulated bus and 1,200 Ampere tap.
- 1 - 1,200 Ampere circuit breaker removable element, as specified, nominal 750 MVA class.
- 3 - Current transformers, 600:5 Ampere for relaying and indication, ANSI accuracy class C-100.
- 3 - Current transformers, 1200:5 Ampere, for bus differential protection, ANSI accuracy class C-200.
- 1 set – Metering CT's and PT's per Eversource (Formerly NSTAR) requirements located in adjacent switchgear cubicle

- 1 - IED Microprocessor-based multifunction relay and metering unit with the following minimum functions (for additional required features see Article 2.01, Paragraph O of this Section):
 - Phase overcurrent relay with instantaneous function for each phase, Devices 50/51, initially programmed with very inverse time coordination curve (TCC).
 - Residually-connected ground overcurrent relay with instantaneous function, Devices 50N/51N, initially programmed with very inverse TCC.
 - Phase overcurrent relay, Device 51C, for cable overload alarm, providing annunciation and supervisory indication (provide same functionality as a Device 51CX auxiliary relay with 125Vdc coil and 3 single pole, double throw contacts). Relay initially programmed with inverse long time TCC.
 - Watt-hour demand metering with 15 minute demand interval. Outputs for the 52-L & 52-RF circuits shall be totalized for telemetry via supervisory system. Totalizing shall be provided by software within the SAS PLC.
 - Breaker failure detection contact closure which trips bus tie breaker when line breaker fails to trip after a user-selectable time delay.
- 2 - Interposing relays to close and trip the circuit breaker via supervisory, Devices 201C and 201T (if applicable).
 - 1 - Control switch, TRIP-CLOSE, with green, white, and red indicating LEDs, Device CS.
 - 1 - Indicating voltmeter, transformer rated, 0-18 kV scale.
 - 1 - Voltmeter switch, 4-position OFF-AB-BC-CA.
 - 1 - Indicating ammeter, transformer rated, 0-600 Ampere scale.
 - 1 - Ammeter switch, 4-position OFF-A-B-C, center-of-circuit type.
 - 1 - Current transducer, as specified, for telemetering phase B current, Device A-XD.
 - 1 - Test switch, 10-pole, for 4 potential and 6 current circuits.
 - 6 - Neon tube-type high voltage indicators installed on line side of circuit breaker, two per phase, type RS with antennae.
 - 2 - Potential transformers, 14400:120 Volts, draw-out mounted with primary current limiting fuses, connected to line side of circuit breaker, open delta primary, grounded open delta secondary.
 - 3 - 15kV class stress cone termination kit (see specification Section 16120).
 - 1 - Set of space heaters with Blue LED ON-OFF switch, and ammeter.
 - 1 - Set of DC and AC control and auxiliary power disconnect devices with fuses.
 - 3 - Surge Arresters, if required by switching surge study.
- b. MBTA Ring Feeders 52-RF

Each 52-RF circuit breaker unit includes but is not be limited to the following.

 - 1 - Metal-clad stationary unit, nominal 750 MVA class with 1,200 Ampere insulated bus and 1,200 Ampere tap.

- 1 - 1,200 Ampere circuit breaker removable element, as specified, nominal 750 MVA class.
- 3 - Current transformers, 600:5 Ampere for relaying and indication, ANSI accuracy class C-100.
- 3 - Current transformers, 1200:5 Ampere, for bus differential protection, ANSI accuracy class C-200.
- 1 - IED Microprocessor-based multifunction relay and metering unit with the following minimum functions (for additional required features see Article 2.01, Paragraph O of this Section):
 - Phase overcurrent relay with instantaneous function for each phase, Devices 50/51, initially programmed with very inverse time coordination curve (TCC). Bi-directional.
 - Residually-connected ground overcurrent relay with instantaneous function, Devices 50N/51N, initially programmed with very inverse TCC.
 - Phase overcurrent relay, Device 51C, for cable overload alarm, providing annunciation and supervisory indication (provide same functionality as a Device 51CX auxiliary relay with 125Vdc coil and 3 single pole, double throw contacts). Relay initially programmed with inverse long time TCC.
 - Watt-hour demand metering with 15 minute demand interval. Outputs for the 52-L & 52-RF circuits shall be totalized for telemetry via supervisory system. Totalizing shall be provided by software within the SAS PLC.
 - Breaker failure detection contact closure which trips bus tie breaker when line breaker fails to trip after a user-selectable time delay.
- 2 - Interposing relays to close and trip the circuit breaker via supervisory, Devices 201C and 201T (if applicable).
- 1 - Control switch, TRIP-CLOSE, with green, white, and red indicating LEDs, Device CS.
- 1 - Indicating voltmeter, transformer rated, 0-18 kV scale.
- 1 - Voltmeter switch, 4-position OFF-AB-BC-CA.
- 1 - Indicating ammeter, transformer rated, 0-600 Ampere scale.
- 1 - Ammeter switch, 4-position OFF-A-B-C, center-of-circuit type.
- 1 - Current transducer, as specified, for telemetering phase B current, Device A-XD.
- 1 - Test switch, 10-pole, for 4 potential and 6 current circuits.
- 6 - Neon tube-type high voltage indicators installed on line side of circuit breaker, two per phase, type RS with antennae.
- 2 - Potential transformers, 14400:120 Volts, draw-out mounted with primary current limiting fuses, connected to line side of circuit breaker, open delta primary, grounded open delta secondary.
- 3 - 15kV class stress cone termination kit (see Section 16120).
- 1 - Set of space heaters with Blue LED ON-OFF switch, and ammeter.

- 1 - Set of DC and AC control and auxiliary power disconnect devices with fuses.
 - 3 - Surge Arresters, if required by switching surge study or if circuit is connected to aerial feeder cables.
- c. Unit Substation Feeder Breakers, Devices 52-F
- Each 52-F Circuit breaker unit includes but is not limited to, the following.
- 1 - Metal-clad stationary unit, nominal 750 MVA class, with 1,200 Ampere insulated bus and 1,200 Ampere tap.
 - 1 - 1,200 Ampere circuit breaker removable element, as specified, nominal 750 MVA class.
 - 3 - Current transformers, 600:5 Ampere multi-ratio, connected for 150:5 Ampere for relaying and indication, ANSI accuracy class C-100.
 - 3 - Current transformers, 1200:5 Ampere for bus differential protection, ANSI accuracy class C-200.
 - 1 - IED Microprocessor-based multifunction relay and metering unit with the following minimum functions (for additional required features see Article 2.01, Paragraph O of this Section):
 - Phase overcurrent relay with instantaneous function for each phase, Devices 50/51, initially programmed with very inverse time coordination curve (TCC).
 - Residually-connected ground overcurrent relay with instantaneous function, Devices 50N/51N, initially programmed with very inverse TCC.
 - Phase overcurrent relay, Device 51C, for cable overload alarm, providing annunciation and supervisory indication (provide same functionality as a Device 51CX auxiliary relay with 125 Vdc coil and 3 single pole, double throw contacts). Relay initially programmed with inverse long time TCC.
 - Watt-hour demand metering with 15 minute demand interval, with outputs telemetered via supervisory.
 - Breaker failure detection contact closure which trips associated line breaker and bus tie breaker when feeder breaker fails to trip after a user-selectable time delay.
 - 2 - Interposing relays to close and trip the circuit breaker via supervisory, Devices 201C and 201T (if applicable).
 - 1 - Control switch TRIP-CLOSE, with green, white, and red indicating LEDs, Device 01.
 - 1 - Indicating voltmeter, transformer rated, 0-18 kV scale.
 - 1 - Voltmeter switch, 4-position OFF-AB-BC-CA.
 - 1 - Indicating ammeter, transformer rated, 0-150 Ampere scale, connected to phase B.
 - 1 - Ammeter switch, 4-position OFF-A-B-C, center-of-circuit type.
 - 1 - Current transducer, as specified, for telemetering phase B current, Device A-XD.
 - 1 - Key interlock system as specified in Section 16203 Article 1.13.
 - 1 - Test switch, 10 pole for 4 potential and 6 current circuits.

- 6 - Neon tube-type high voltage indicators installed on line side of circuit breaker, two per phase, type RS with antennae.
 - 2 - Potential transformers, 14400:120 Volts, draw-out mounted with primary current limiting fuses, connected to line side of circuit breaker, open delta primary, grounded open delta secondary.
 - 3 - 15kV class stress cone termination kits (see Section 16120).
 - 1 - Set of space heaters with Blue LED ON-OFF switch and ammeter.
 - 1 - Set of DC and AC control and auxiliary power disconnect devices with fuses.
 - 3 - Surge Arresters, if required by switching surge study or if circuit is connected to aerial feeder cables.
- d. Bus Tie Breaker Unit, Device 52-BT
- Each 52-BT circuit breaker unit includes but is not be limited to, the following.
- 1 - Metal-clad stationary unit, nominal 750 MVA class, with 1,200 Ampere insulated bus and 1,200 ampere taps.
 - 1 - 1,200 Ampere circuit breaker removable element, as specified, nominal 750 MVA class.
 - 6 - Current transformers, 1200:5 Ampere for bus differential protection, ANSI accuracy class C-200.
 - 1 - IED Microprocessor-based bus differential relays, Device 87B (3 phase).
 - 1 - Bus lockout relay, manually reset type, rated for operation on 125 Volts DC, Device 86B.
 - 1 - Bus voltage secondary undervoltage relays, Device 27B.
 - 1 - Bus undervoltage/phase sequence relay, solid state, three-phase, 120V, 60 Hz, connected to bus PT secondaries, Device 47.
 - 1 - Time delay relay for bus under-voltage alarm, Device 47-X
 - 1 - Indicating voltmeters, transformer rated, 0-18 kV scale.
 - 1 - Voltmeter switches, 4-position OFF-AB-BC-CA.
 - 1 - Voltage transducers, as specified, for telemetering, 13.8 kV bus potential, Device V-XD.
 - 1 - Interposing relays to close and trip the circuit breaker via supervisory, Devices 201C and 201T (if applicable).
 - 1 - Control switch, TRIP-CLOSE, with green, white, and red indicating LEDs, Device CS.
 - 1 - Set of space heaters with Blue LED, ON-OFF switch and ammeter.
 - 1 - Set of DC and AC control and auxiliary power disconnect devices with fuses.
 - 1 - 120 Vac grounded duplex receptacle.
 - 3 - Bus 2 potential transformers, 14400:120 Volts, draw-out mounted, with primary current limiting fuses, connected to the main bus, grounded wye primary, grounded wye secondary (mount in enclosure above bus tie breaker cubicle).

- 1 - Totalizer for Watthour metering, equipped for telemetering to SCADA.
- 3 - Surge Arresters, if required by switching surge study.
- e. Rectifier Transformer Feeder Breaker Units, Device 52-T

Each 52-T rectifier transformer circuit breaker unit includes but is not be limited to the following.

 - 1 - Metal-clad stationary unit, nominal 750 MVA class with 1,200 Ampere insulated bus and 1,200 Ampere tap.
 - 1 - 1,200 ampere circuit breaker removable element, as specified, 750 MVA class.
 - 3 - Current transformers, 600:5 Ampere multi ratio, connected for 300:5 Ampere for relaying and indication, ANSI accuracy class C-100.
 - 3 - Current transformers, 1200:5 Ampere for bus differential protection, ANSI accuracy class C-200.
 - 1 - IED Microprocessor-based multifunction relay and metering unit with the following minimum functions (for additional required features see Article 2.01, Paragraph O of this Section):
 - Phase overcurrent relay with instantaneous function for each phase, Devices 50/51, initially programmed with very inverse time coordination curve (TCC).
 - Residually-connected ground overcurrent relay with instantaneous function, Devices 50N/51N, initially programmed with very inverse TCC.
 - Phase overcurrent relay, three-phase, Device 51R, for rectifier overload detection. Relay initially programmed with inverse long time TCC.
 - Watt-hour demand metering with 15 minute demand interval, with output telemetered to supervisory.
 - Breaker failure detection contact closure which trips associated line breaker and bus tie breaker when rectifier breaker fails to trip after a user-selectable time delay.
 - 2 - Interposing relays to close and trip the circuit breaker via supervisory, Devices 201C and 201T (if applicable).
 - 1 - Control switch TRIP-CLOSE with green, white, and red indicating LEDs, Device CS.
 - 1 - Indicating ammeter, transformer rated, 0-300 Ampere scale, connected to phase B.
 - 1 - Ammeter switch, 4-position OFF-A-B-C, center-of-circuit type.
 - 3 - Bus 1 potential transformers, 14400:120 Volts, draw-out mounted, with primary current limiting fuses, connected to the main bus, grounded wye primary, grounded wye secondary (mount in enclosure above rectifier transformer breaker cubicle).
 - 3 - Bus 3 potential transformers, 14400:120 Volts, draw-out mounted, with primary current limiting fuses, connected to the main bus, grounded wye primary, grounded wye secondary (mount in enclosure above rectifier transformer breaker cubicle).
 - 1 - Test switch, 10 pole, with 4 potential and 6 current circuits.
 - 3 - 15kV class stress cone termination kits (see specification Section 16120).

- 1 - Set of space heaters with blue LED, ON-OFF switch and ammeter.
- 1 - Set of DC and AC control and auxiliary power disconnect devices with fuses.
- 1 - 120 Vac duplex grounded receptacle.
- 3 - Surge Arresters, if required by switching surge study.

2.2 RECTIFIER TRANSFORMERS

2.2.1 RECTIFIER TRANSFORMERS – OIL FILLED

A. General

1. Rectifier transformers shall be oil immersed, three phase, 60 Hz, three-winding, delta-delta/wye configured as a Circuit 31 per IEEE C.57.18.10, using ambient air for cooling under ambient conditions as specified in Article 1.03 of this Section.
2. Transformers shall be capable of withstanding short circuit forces in accordance with ANSI C57.12.00 and C57.12.90. Certified short circuit test data for a transformer of similar design, voltages and MVA capacity showing no evidence of failure during the short circuit test shall be provided to document the capability of the transformer plant and design. A description of the test code under which the transformer was tested shall be provided.
3. The transformer and its accessories shall be qualified in accordance with IEEE Standard 693, IEEE Recommended Practice for Seismic Design of Substations. The seismic qualification level shall be “MODERATE”.
4. The transformer shall be designed to meet the requirements of ANSI C57.18.10, IEEE Standard Practices and Requirements for Semiconductor Power Rectifier Transformers, and NEMA RI-9, for extra heavy traction service, with sequentially-applied loads as follows:
 - a. 100% load continuously;
 - b. 150 percent current for 2 hours following 100 percent load;
 - c. 300 percent current for five equally spaced periods of 1 minute during 150 percent load; and
 - d. 450 percent current for the final 15 seconds.
5. Transformers shall fully coordinate with and operate in conjunction with their associated rectifiers specified under Article 2.03 of this Section.
6. The DB Entity shall submit for MBTA's acceptance, 21 days prior to the Design Conference, design calculations for the transformer rated for use with the specified rectifier, which shall include, but not be limited to, the following. If computer simulations are submitted in lieu of calculations, all program input data, technical assumptions, and results must be clearly documented to the MBTA's satisfaction.
 - a. Resistance
 - b. Impedance

- c. X/R Ratio
 - d. Temperature Rise Curve
 - e. Power Loss Curve
 - f. Efficiency vs. Load Curve
 - g. Power Factor vs. Load Curve
7. The number of rectifier transformers to be furnished and shipped to the substation shall be as indicated on the Design Documents.
 8. Provision shall be made by the DB Entity for the clearances necessary for the removal of the equipment without the need to dismantle or remove other operating equipment located within the substation.

B. Ratings

1. The rms kVA rating of each rectifier transformer shall be based on the load requirements its associated rectifier as detailed in Article 2.03 of this Section, in accordance with the referenced standards.
2. Cooling class: ONAN.
3. Average winding temperature rise by resistance for the specified extra heavy traction overload cycle shall not exceed 65°C with an average ambient temperature of 30°C and a maximum ambient temperature of 40°C during a 24-hour period. Maximum temperature by hot spot shall not exceed 80°C.
4. High voltage windings shall be three phase 60 Hz, 13.8 kV nominal, delta connected, copper conductor. High voltage winding insulation class shall be 15 kV, rated for a basic impulse level (BIL) of 110 kV.
5. Transformer shall have two three phase low voltage copper windings: one delta connected, the second wye connected, arranged in accordance with ANSI Circuit No. 31, as defined in ANSI Standards C57.18.10 and C34.2, to provide six-phase (for connection to a twelve-pulse rectifier), multiple delta-wye, double-way supply to the rectifiers. Voltage and related characteristics shall be commensurate with the rectifier specified under Article 2.03 of this Section. Low voltage winding insulation class shall be 1.5 kV, rated for a BIL of 45 kV, minimum.
6. The transformer winding current rating at any tap position shall be based on rectifier rated current for the nominal full load operating voltage of 590 Vdc.

C. Impedance

1. The transformer impedance shall be as low as possible, consistent with good design and shall be determined by the overall requirements of the transformer, rectifier, AC and DC buses, particularly with respect to the DC output voltage regulation specified in Article 2.03 of this Section, and the limitation of fault current magnitudes in accordance with rectifier diode capabilities and the interrupting ratings of the DC circuit breakers. The specified maximum

and minimum short circuit capacity of the incoming 13.8 kV service at the substation shall be used for determining the total voltage regulation of each transformer-rectifier unit (Article 1.06.B of this Section).

D. Taps

1. Ten 2-1/2 percent no load, full capacity taps shall be provided in the high voltage windings, as tabulated below, for adjustment of sustained departures in AC supply voltage and for adjustment of output voltage as required for initial and future operation of the rectifiers.

	HV Winding	LV Winding	Rectifier Light Load
<u>Tap Position</u>	<u>Voltage Rating</u>	<u>Voltage Rating</u>	<u>Output Voltage</u>
0	14,835 Vac	466 Vac (Note 1)	563 Vdc (Note 1)
1	14,490 Vac	466 Vac	563 Vdc
2	14,145 Vac	466 Vac	577 Vdc
3	13,800 Vac	466 Vac	592 Vdc
4	13,455 Vac	466 Vac	607 Vdc
5	13,110 Vac	466 Vac	623 Vdc
6	12,765 Vac	466 Vac	640 Vdc
7	12,420 Vac	466 Vac	657 Vdc
8	12,075 Vac	466 Vac	676 Vdc
9	11,730 Vac	466 Vac	696 Vdc

Note 1: A 466 Vac rectifier transformer low voltage winding rating is typical, not mandatory, and is provided herein for illustrative purposes only.

2. In addition, application of 13,800 Vac to the rectifier transformer with the tap changer at position seven shall result in future rectifier operation in the range of 650 to 661 Vdc at rated full (100%) load. For future operation, the taps above and below tap seven shall be suitable for adjustments, in 2½ percent increments, for the deviations in the nominal 13,800 Vac supply system voltage.

E. Power Circuit Terminations

1. Transformer high voltage terminals shall be provided with bolted-type terminal lugs with NEMA four bolt tongue, in accordance with Section 16203 Article 1.07, for terminating one 350kcmil stranded copper cable per phase. Terminals shall be located to provide ample space and support for stress-coning the three 15kV class, single conductor, EPR-insulated, jacketed cables.

Terminals H1, H2, H3, R1, R2, R3, R4, R5, R6 shall be clearly and indelibly marked on the transformer.

F. Wiring and Terminal Blocks

1. All devices furnished with the transformer shall be factory wired to the maximum extent practicable. Circuits requiring external connections shall be wired to the terminal blocks in the instrument compartment for connection of the field wiring entering from the top.
2. Wiring for control and auxiliary circuits and terminal blocks shall be rated for 600 Volts, provided in accordance with Section 16203 Article 1.09. Minimum wire size shall be No. 12 AWG, except low voltage, low energy connections between components and alarm device pigtails may be No. 16 AWG.

G. Audible Sound Level

1. Audible sound level shall not exceed NEMA TR-1 limits at no load with excitation on the transformer, when measured in accordance with conditions outlined in ANSI Standard C57.12.90.
2. Major sound-producing components and the transformer enclosure shall be acoustically treated, if required, to meet this criterion.

H. Transformer Tank Construction

1. Transformers shall be of the sealed tank, welded steel plate and cover construction, outdoor type, liquid tight, with bolted and gasketed manhole(s) on top of tank. Mounted on steel skid base, suitable for skidding in any direction. Use care to avoid tank or component distortion during welding operations. Assembled transformer base shall be sufficiently flat to be installed on a flat concrete foundation without supplemental shims. Adequately designed and braced to allow full vacuum filling and vacuum drying operations in the field.
2. Provide jacking lugs and pulling eyes for lifting or moving along either axis when completely assembled and oil-filled. Lifting lugs to be mounted near the top of the tank. Jacking lugs shall be installed with approximately 13" of clearance to the bottom of the base plate.
3. Provide two NEMA 2-hole copper faced or stainless steel ground pads at diagonally opposite corners of transformer tank near base, with two-bolt terminal connectors for 4/0 AWG copper conductors.
4. Maintain positive pressure continually to prevent ingress of moisture during shipping.
5. Provide an adequately braced domed or sloped top on all major surfaces. Design tank and fittings to prevent water puddling on surfaces or in cavities.
6. Provide raised flanges with thru-bolts for all removable cover penetrations, including bushings, manhole/handhole covers and removable equipment. Welded studs are not acceptable.
7. All gasketed joints shall have machined surfaces on both sides, and shall be provided with gasket retainers and metal-to-metal stops to assure even the effective pressure and to avoid

over-stressing the gasket. Gaskets shall maintain oil-tight joints under all service and fault conditions.

8. The transformer manufacturer shall supply all necessary support devices and mechanisms required to “hold” the unit in place on the structural steel grillage if applicable. Details of these devices should be provided as part of the equipment product information submittal.

I. Transformer Core Construction

1. Provide highest quality, non-aging, cold-rolled, grain-oriented, stress free, thin silicon steel laminations, having high permeability and low hysteresis loss and properly annealed with smooth surfaces at edges.
2. Provide each sheet with an insulated surface treatment which is impervious to hot transformer oil.
3. Core shall be carefully assembled, rigidly clamped and blocked to prevent deteriorating vibrations, interference with oil circulation, objectionable noise conditions and short circuit and shipment distortions.
4. Provide a core ground lead connected to an external bushing for each core. Provide a flexible ground strap to connect the terminal of the bushing to the transformer tank, thereby grounding the transformer core. Provide a suitable cover or deflector to protect the core ground bushing from damage from falling objects. Provide an engraved nameplate clearly indicating the function of the bushing. Provide a separate core ground bushing and ground strap for each separate core, if more than one core is used.
5. Serial number shall be stamped on core or core clamp in conspicuous place, and shall be visible without the necessity for untanking or otherwise removing entire enclosure.
6. Provide means for properly handling core assembly when core assembly is untanked.

J. Transformer Windings

1. Comprised of electrolytic copper with high conductivity characteristics
2. Provided with insulation system of high dielectric and mechanical strength, arranged to permit free circulation of oil.
3. Made up, shaped and braced to provide for expansion and contraction due to temperature changes and avoid abrasion of insulation.
4. Adequately braced to prevent distortion due to any abnormal operating condition. Designed to withstand short circuit conditions in accordance with IEEE C57.12.90.
5. Brazed joints and pressure connectors are acceptable. No soldered connections will be allowed. No more than one connection shall be made in a single lead.
6. Each lead for connection to tap changers and bushings, shall be permanently identified.
7. The core and coil assembly shall be dried using a vapor phase process.

K. Transformer Cooling Equipment

1. Type: ONAN conforming to ratings previously specified.
2. Radiators:
 - a. Of nominal dimensions and interchangeable.
 - b. Galvanized steel, welded construction, with flanged connection and provisions for draining and venting, and without external cavities that would collect moisture.
 - c. Provided with lifting eyes or lugs.
 - d. Provided with oil-tight valves at all connections to main tank that will allow removal of radiators without taking transformer out of service.

L. Transformer Oil and Preservation System

1. FM Global approved less flammable insulating oil with characteristics similar to EnviroTemp FR3 Fluid or approved equal.
2. Dielectric strength not less than 30,000 Volts between one inch discs spaced 1/10" apart.
3. Transformer shall be provided with maintenance-free sealed tank type oil preservation system which does not require external nitrogen supply for normal operation. All other methods of oil preservation will be subjected to Engineers approval.

M. De-Energized Tap Changers (DETC):

1. Externally operated when transformer is de-energized
2. Provided with indicating pointer, dial, and means for locking in any tap position. Include provisions for MBTA supplied padlock.
3. Mounted at a convenient operating height.
4. Capable of withstanding full transformer short circuit current without damage.
5. Configured to prevent leaving a winding open or short circuited when operating handle is in locked position.
6. Provided with full capacity taps as specified herein.

N. Air Terminal Chambers

1. Transformer high voltage bushings shall be side-wall mounted and enclosed in a weather proof air-insulated terminal chamber. The DB Entity shall provide for each bushing a heavy duty bolted type terminal lug suitable for a 15 kV class, three-single conductor, EPR-insulated (133%), jacketed cables entering from below. Ample space and support shall be provided in the terminal chamber for stress-coning the 15 kV cables. The DB Entity shall

provide suitable insulating material and tape to properly insulate all exposed current carrying members of terminators and bushing studs.

2. Transformer low voltage bushings shall be either cover mounted or sidewall mounted, enclosed by a weatherproof flanged throat. The bushings and throat shall be provided with necessary connectors and hardware for direct bolted connection to the weather-proof bus duct or set of low voltage cables as accepted by the MBTA and shown in the Design Documents. Bolted, readily removable links shall be provided for connecting the bus bars/cables to the transformer terminals. The flanged throat and bus enclosure shall be joined by bolted and gasketed weatherproof connection providing ready means of separating the bus duct from transformer. A weatherproof access opening shall be provided for connecting the transformer to the bus duct/cables.
3. Terminals H1, H2, H3, R1, R2, R3, R4, R5 and R6 shall be clearly and indelibly marked on the transformer.
4. Chambers shall have gland plates for conduit entrances. They shall be removable, gasketed, bottom plates, ready for field drilling as needed.
5. High voltage cabinet shall have a hinge. Final cabinet dimension to be submitted and accepted by the MBTA.

O. Transformer Bushings

1. Bushing studs: Threaded, stud type, silver plated.
2. Provide stud connectors with NEMA standard 4-hole (minimum) pad drilling sized to accommodate the full rating of the bushing.
3. Color: ANSI 61, Light Gray (to match transformer)
4. High Voltage Bushings
 - a. Type: Interchangeable
 - b. BIL rating: 110 kV minimum
 - c. Current rating: To match transformer primary kVA rating
 - d. Creepage distance: Standard
 - e. Mounting: In high voltage air terminal chamber
 - f. Material: Porcelain manufactured by the wet process.
5. Low Voltage Phase Bushings
 - a. Type: Interchangeable
 - b. BIL rating: 45 kV minimum
 - c. Current rating: To match transformer secondary kVA rating.

- d. Creepage distance: Standard
 - e. Mounting: In low air voltage terminal chamber.
 - f. Material: Porcelain manufactured by the wet process.
6. Low Voltage Neutral Bushing
- a. Type: Interchangeable
 - b. BIL rating: 45 kV minimum
 - c. Current rating: To match transformer secondary kVA rating.
 - d. Creepage distance: Standard.
 - e. Mounting: In low voltage air terminal chamber.
 - f. Material: Porcelain manufactured by the wet process.

P. Wiring and Terminal Blocks

- 1. All devices furnished with the transformer shall be factory wired as far as practicable. Circuits requiring external connections shall be wired to the terminal in the instrument compartment for connection of the field wiring entering from the bottom.
- 2. All secondary and control wiring shall be ICEA type SIS, or approved equal, stranded tinned copper switchboard wire, No. 12 AWG or larger, rated for a minimum conductor temperature of 90 °C, insulated for 600 Volts AC minimum. Wire shall comply with Underwriters Laboratories, Inc. Flame Retardant Properties Test, in accordance with standard UL-44 thermoplastic insulated wire.
- 3. Wiring shall be provided with ring type compression terminals with insulated sleeves at each termination. All wiring shall be identified at each termination by printing on wire jacket or on an insulating sleeve. Adhesive wire markers are not acceptable.
- 4. Terminal blocks shall be heavy duty, washer-head screw type with insulating barriers between circuits, rated 600 Volts, General Electric Company type EB-25 or approved equal, complete with marking strips and plastic covers. A sufficient number of terminals to satisfy all external connection requirements and 20 percent additional unassigned terminals shall be provided. Able to accommodate up to No. 10 AWG wire.

Q. Main Transformer Control Cabinet

- 1. Weatherproof and fastened securely to transformer tank.
- 2. Doors: Vertically hinged with padlocks.
- 3. Conduit entrance: Removable, gasketed bottom plate, field drilled.
- 4. Mount terminal blocks and equipment at least 6" above bottom plate.

5. Provide anti-condensation space heaters powered from transformer auxiliary supply complete with a thermostat adjustable from 40 °F to 90 °F, and a by-pass switch wired in parallel with the thermostat. Heaters shall be rated at 240 V AC, operated at 120 V AC, and properly sized for reduced output. Provide an ammeter to measure heater current. Provide a nameplate indicating "Control Compartment Heater Ammeter - Normal = ____ A". Fill in normal amp reading.
6. Provide one set of incandescent lamp receptacle(s) with conveniently located toggle switch or door, operated switch to provide adequate light within the terminal cabinet and a grounding type receptacle, mounted inside the terminal cabinet.
7. Provide one 15A convenience outlet.

R. Protective Devices and Accessories

1. Protect all gauges and instruments with protective guards and mount at eye level when operator is standing on ground level.
2. Each rectifier transformers shall be furnished with suitable, factory-installed protective and maintenance devices. Devices shall be rated for operation on 125Vdc, unless otherwise noted.
3. All devices, valves, pipes and other projections from the sides of the transformer that may be used as a step shall be provided with a guard strong enough to support the weight of a 300 pound man. Any item located on the top of the transformer that may be inadvertently stepped on shall also be provided with a guard.
4. All electrical devices shall be provided with weatherproof enclosures. All temperature devices shall be installed in wells to permit removal of the sensing element without draining the transformer.
5. All control and alarm devices shall be wired to terminal blocks located in a single terminal cabinet accessible from ground level. The terminal cabinet shall be weatherproof and shall have a full access, hinged and gasketed door arranged for pad-locking. Wiring shall be in rigid, hot-dip galvanized steel conduit, except for short flexible connections to devices which shall be in Sealtite, or approved equal, liquid tight flexible conduit.
 - a. Alarms: Provide two auxiliary alarm contacts (form C) for each alarm point. Wire all outputs to transformer control cabinet terminal block for MBTA use.
6. Circuits requiring external connections shall be factory-wired to readily accessible terminal blocks within the terminal cabinet, for connection to field wiring entering from below.
7. The protective devices shall interface with the substation automation system within the substation to remotely provide the alarms and controls.
8. Each transformer shall be furnished with accessories in accordance with ANSI C57.12.10, including, but not limited to, the following:
 - a. 1 – Liquid level gauge and relay complete with two (2) sets of alarm and tripping contacts (Device 71T).

- b. 1 – Dial thermometer with two (2) two-step electrically independent high liquid temperature alarm contacts which close on rising liquid temperature for alarm (first step) and for tripping and self resetting conditional lockout relay (second step). Scale shall be in degrees Celsius. An additional red marker shall be provided to indicate maximum allowable oil temperature (Device 26T and 26TH).
- c. 1 – Winding hot spot temperature indicator, complete with a current transformer, top oil temperature device and relay with two (2) two-step electrically independent contacts which close on rising temperature for alarm (first step) and for tripping and self resetting conditional lockout relay (second step). Scale shall be in degrees Celsius (Device 49WT and 49WTH).
- d. 1 – Sudden Pressure Relay with two (2) sets of contacts for indication and control designed to respond to sudden increase of pressure caused by an internal arc. The relay shall not operate on pressure changes due to changes in transformer temperature, loading or through faults and shall be designed to safeguard against false tripping due to mechanical vibrations and shock. The relay shall be of the manually reset-able type (Device 63P).
- e. 1 – Pressure/vacuum gauge.
- f. 1 – Pressure relief device with self-resealing cover and hand-reset two electrically independent normally open contacts for lockout alarm. Relief device shall function to protect the tank, radiators, gaskets and all other appurtenances from damage. The pressure relief valve discharge shall be piped to a point adjacent to the base of the transformer and 12” above the base of the transformer. Discharge shall be located away from areas that are commonly accessed by personnel while the transformer is energized, including but not limited to the control cabinet. Device shall include mechanical target visible from ground level (Device 63MR).
- g. 1 – Combination drain and lower filter valve with two inch NPT thread complete with sampling valve. The drain/filter valve and the sampling valve shall be provided with means for padlocking in valve closed position.
 - i) 1 – Upper filter valve with two inch NPT thread.
 - ii) 1 – Lower valve with two inch NPT thread for removal of sludge, arranged for padlocking in closed position.
- h. 2 – Grounding pads on diametrically opposite corners, each provided with a bolted type terminal lug with two bolt tongue for stranded copper ground cable within range of No. 4/0 AWG through 500 kcmil.
- i. 1 – Complete set of spare gaskets, cut to size and drilled for all holes, for all covers, radiators, devices and fittings and sufficient amount of gasket cement. The gaskets shall be tagged to indicate their use.
- j. Equipment as necessary to interface the rectifier equipment with the substation automation system i.e. the Transformer IED / DIO will be located within the control compartment

- k. Spaces heater for terminal cabinet/control compartment with light and 120V AC receptacle. 120V AC supply will provide power to the AC busduct heater via this cabinet.

S. Nameplates

1. In addition to nameplates specified above and in Section 16203 Article 1.08, provide a nameplate on front and rear of the transformer enclosure, engraved "DANGER -13,800 VOLTS". The nameplate shall have white letters, two inches high, minimum, on red background.
2. Inscription of nameplate shall be in accordance with IEEE Std. C57.18.10, and shall be submitted to the MBTA for acceptance.
3. Equipment identification nameplates shall be engraved "RECTIFIER TRANSFORMER NO.1" and "RECTIFIER TRANSFORMER NO.2" (typical).

T. Finish

1. Prepare all surfaces of the transformer and the base in accordance with Section 16203 Article 1.15, and finish exterior surfaces with two coats of semi-gloss ANSI-61 light gray paint. Ensure that all surfaces are coated, including areas partially blocked by conduits, equipment and accessories.
2. Paint interior of transformer tank white.
3. Top surface of the transformer tank shall be coated with a non-skid paint.
4. Paint interior of cabinets white.
5. One quart of matching touch-up paint shall be shipped with the transformer.

2.3 RECTIFIERS AND ACCESSORIES

A. General

1. Rectifier shall be indoor, metal enclosed, natural convection cooled, using building air for cooling under ambient conditions as specified in Article 1.03 of this Section, for 12-phase multiple double way rectification.
2. The number of rectifiers to be furnished and shipped to the substation by the DB Entity shall be as indicated on the Design Documents.
3. The rectifier shall be supplied with AC traction power directly from the rectifier transformer specified in Article 2.02 of this Section, to serve as the source of supply for the DC switchgear specified in Article 2.04 of this Section. The rectifier shall be operated with enclosure high-resistance grounded. Rectifier shall be designed to meet the requirements of ANSI C34.2 and NEMA RI-9 for extra heavy duty traction service as noted in Article 2.02 of this Section.
4. Rectifier shall be designed for non-attended operation. Rectifier shall function as an integrated unit with associated transformer and DC switchgear. Rectifiers and accessories

shall also be capable of parallel operation with existing rectification equipment at adjacent MBTA traction power substations. Details about the MBTA's existing equipment can be supplied upon request.

5. The DB Entity shall submit for MBTA's acceptance, 21 days prior to the Design Conference, a set of complete design calculations for each type and/or rating of rectifier to be provided under this Contract, which shall include but not be limited to, the following. If computer simulations are submitted in lieu of calculations, all program input data, technical assumptions, and results must be clearly documented to the MBTA's satisfaction.
 - a. Voltage Regulation Curve
 - b. No Load Voltage
 - c. Power factor vs. Load Curve
 - d. Efficiency vs. Load Curve
 - e. Harmonic Amplitude vs. Load Curve for 11th, 13th, 23rd and 25th harmonics
 - f. Commutation Reactance for $X/R = 8$
 - g. Momentary Peak and Sustained Short Circuit Current for a single rectifier, and for all substation rectifiers in operation
 - h. Commutation Factor
 - i. Calculations to show compliance with Specification on number of parallel diodes furnished
 - j. Interphase transformer design criteria

B. Structures

1. Rectifier units shall be metal enclosed, provided with self-supported, electrically welded steel structures. The rectifier assembly shall consist of a power rectifier section and a control/auxiliary section, arranged to form a continuous, free-standing unit. The enclosures shall be constructed of structural members of sufficient strength to support the bus duct which interconnects the rectifier to the rectifier transformer, DC switchgear and negative equalizer bus and drainage board.
2. Rectifier section shall be provided with hinged front and rear doors for easy access to diodes, fuses, surge protection devices, heat sinks and buses for inspection, maintenance and cleaning. Each door shall be provided with safety glass windows, arranged to permit inspection of all indicating fuses and fuse failure indicating lights of surge protection devices. All doors shall be securely fastened in the closed position by vibration-resistant fasteners with provision for padlocking, and easily opened without the use of tools. Doors shall be provided with stops to hold them securely open at 90 degrees.
3. The control/auxiliary section shall be completely isolated from the rectifier section by suitable sheet steel barriers. The Auxiliary section shall extend the full height of the rectifier to facilitate top and bottom control wire entry. It shall contain the instruments and devices

required for control and monitoring of the rectifier transformer, rectifier and the rectifier DC main breaker. The control/auxiliary section shall be provided with hinged front and rear doors, for access to devices and terminal blocks and for mounting of relays, instruments and control devices. The doors shall be formed of sheet steel and shall be properly reinforced against distortions by suitable flanges or stiffening members. The door shall be securely fastened in the closed position and easily opened without the use of tools.

4. All control and supervisory circuit devices located in the control/auxiliary section are operated on 125 Volts DC or 120 Volts AC. Where the use of higher voltage is unavoidable, such circuits shall be connected with red-colored wire.
5. All doors of the rectifier section and the doors of control/auxiliary section compartments containing exposed buses or devices operated on 600 Volt nominal DC positive potential shall be provided with interlocks designed to prevent energization of the rectifier while any of the doors are open, and to de-energize and lockout the rectifier when any of the doors are opened while the rectifier is in operation. Control devices and wiring operated on 600 Volts DC nominal shall be grouped in separate compartments as far as possible so that the devices operated at lower voltage are accessible for maintenance without the need for de-energizing the rectifier.
6. All components within the control/auxiliary section shall be located for easy access for maintenance and inspection. The arrangement of devices will be subject to the acceptance of the MBTA.
7. Openings in doors or fixed panels on the rectifier section which are utilized for circulation of air through the rectifier, shall be screened for personnel safety. Screens shall be expanded metal of gage accepted by the MBTA, with openings approximately 1/4" x 1". Cooling air shall enter the rectifier enclosure no less than 6" above floor level.
8. All surfaces of the enclosure shall be finished in accordance with Section 16203 Article 1.15. One quart of matching touch-up paint shall be shipped with each rectifier.
9. As necessary, provide a raised flange for the busduct connections to accommodate an insulating busduct collar.

C. Buses and Power Connections

1. Rectifier internal buses shall be copper, provided in accordance with Section 16203, Article 1.06. Aluminum may be used for diode heat sinks, and for certain current carrying sub-assemblies as accepted by the MBTA. Appropriate barriers shall be provided to separate the positive and negative buses within the rectifier. Suitable means, accepted by the MBTA, shall be employed to prevent corrosion at connections of dissimilar metals.
2. Permanent corrosion inhibiting coatings shall be provided for all bolted connections to reduce maintenance.
3. Rectifier anode (AC) and positive and negative cathode (DC) terminals shall be copper, located at the top of the enclosure, in an air-filled terminal chamber or in a flanged throat, arranged for direct, bolted connection to the anode and cathode bus ducts specified in Article 2.05 of this Section and as accepted by the MBTA. Bolted, readily removable flexible links covered with insulating boots shall be provided, in accordance with Section 16203 Article

1.07, for connecting the bus conductors to rectifier terminals. The terminal enclosure and bus enclosure shall be joined by an approved bolted-on insulating collar, providing electrical insulation and a ready means for separating the bus duct from the rectifier. Openings with bolted-on covers shall be provided for access to the connecting links.

D. Ratings

1. Each rectifier shall have a continuous full load output rating of 3,000 kW at a maximum ambient room temperature of 40°C during initial operation, and 3,300 kW during future operation. Rated full load output voltage for determining the continuous current rating of the rectifier shall be taken as 590 Vdc for initial operation, and 650 Vdc for future operation. After constant temperature rise is reached following continuous full load, it shall be capable of operating at an overload equal to 150 percent of full load current for two hours and superimposed cyclic overload consisting of five periods of 300% full load current for one minute, equally spaced throughout the 2-hour period, followed by one period of 450% full load current for fifteen seconds at the end of the two hour period. The rectifiers shall be designed for two two-hour overload cycles within a 24 hour period, spaced 6 hours apart.
2. Each rectifier shall be capable of carrying the specified overload with one diode removed from service in each phase leg of the rectifier without exceeding the safe junction temperature of the remaining diodes.
3. Loss of one diode in each phase leg shall not adversely affect the ability of the rectifier to withstand a short circuit.
4. Each rectifier shall be capable of withstanding a bolted short circuit on the rectifier output terminals immediately following (within one second or less) the two hour overload period specified above until fault is cleared by the rectifier AC circuit breaker, without damage to any component, including protective fuses and rectifier elements.
5. Each rectifier shall have a full load overall efficiency of not less than 94 percent with a displacement power factor above 95 percent, lagging. The voltage regulation characteristic, based on the minimum short circuit supply MVA and the X/R ratio of the incoming 13.8 kV services specified in Article 1.06.B of this Section, shall be such as to provide output voltage within the limits set forth below when the AC system voltage at no load corresponds to transformer tap voltage. These limits shall be met on all transformer taps. All DC values shall be based on use of averaging type meters.

Output Voltage-Direct Current

	<u>Output Voltage</u>	<u>Output Voltage</u>
<u>Output Current</u>	<u>Initial Operation</u>	<u>Future Operation</u>
0.5% Full load.....	636 to 626.....	700 to 689
100% Full load.....	600 to 590.....	661 to 650
150% Full load.....	582 to 572.....	641 to 630
300% Full load.....	527 to 507.....	582 to 558

450% Full Load..... 474 to 425.....522 to 468

6. The rectifier transformers, AC and DC buses and the DC switchgear assemblies specified herein shall be capable of continuous operation under the voltages specified above.

E. Number of Diodes Required

1. The manufacturer shall provide a sufficient number of diodes per phase leg to fulfill all the requirements of this Specification (“N + 1” design). The DB Entity shall submit detailed calculations to MBTA demonstrating the adequacy of the number of diodes proposed.
2. Each rectifier shall not have less than four diodes per phase leg.
3. A single series fuse shall protect each diode. A fuse assembly comprising multiple diodes will not be accepted.

F. Rectifier Protection

1. Rectifiers shall be designed so that the diodes and other rectifier elements are protected against overcurrents and fault currents by the phase and ground instantaneous and time overcurrent relays, Devices 50/51, 50N/51N, and 51R (where present). The overcurrent relays shall be selective with the individual diode fuses so that the fuses will not blow on a through fault. Diode fuses shall blow on a diode shorting failure only.
2. Rectifier heat sinks shall be provided with thermal devices, Device 26RH, which shall take the rectifier out of service and prevent rectifier operation under any conditions where the rectifier elements and fuses are no longer afforded complete protection by the overcurrent relays. These thermal devices shall be mounted and wired to permit easy removal.
3. Provide rectifier diode fuse failure detection and monitoring system (two-stage). Device 58A/58T. The first stage shall be an alarm condition indicating a single diode fuse failure via the rectifier annunciator. The second stage shall activate upon failure of a second diode fuse on the same phase leg. The second stage shall trip the associated AC and DC circuit breakers via the rectifier lockout 86-T device.
4. Each rectifier unit shall be adequately protected against transient surge voltages caused by lightning, faults or switching operations and the DC spikes caused by operation of rolling stock. The DB Entity shall submit the proposed surge protection method and devices proposed to be used to the MBTA for acceptance.
5. These devices shall interface with the substation automation system within the substation.

G. Wiring and Terminal Blocks

1. Wiring for control and auxiliary circuits and terminal blocks shall be rated for 1000 Volts DC service, minimum, provided in accordance with Section 16203m Article 1.09.
2. Minimum size of wiring shall be No 12 AWG, except internal wiring of devices and device pigtails may be No. 16 AWG.

3. Circuits requiring external connections shall be wired to outgoing wiring terminal blocks in the control/auxiliary section for connection of field wiring entering from above via cable tray, unless otherwise indicated on the Design Documents. Minimum wire size of outgoing wiring shall be No 12 AWG in accordance with Section 16203, Article 1.09.
4. All elements of control devices operated on 600 Volts DC nominal shall be connected with red-colored wire.

H. Control Sources

1. Rectifier control and alarm circuits will receive the 125 Vdc supply from the station battery. Rectifier lockout relay and annunciator circuits shall be connected to this supply through a separate set of disconnect switches and properly sized fuses, rated for 1000 Vdc service, minimum. The DB Entity shall furnish an undervoltage relay, Device 27RA, for the rectifier DC control circuits to provide local alarm.
2. Terminal blocks, rated for 1000 Vdc service, minimum, shall be provided in the control/auxiliary section in accordance with Section 16203, Article 1.09.
3. Any control and indication wiring routed through the main DC power circuit compartment to the control compartment shall be sleeved or ran in conduit rated for a minimum of 1kV DC. Communications cables shall be run in orange innerduct or equal.
4. An independent isolating transformer shall be utilized for all 120 VAC requirements within the equipment. Isolating transformer shall not be located within the equipment.

I. Special Requirements

1. The control/auxiliary compartment of the rectifier shall be provided with electric strip heaters to prevent condensation within the compartment during shutdown periods. An ammeter shall be provided to monitor the heater circuit. The ammeter shall be properly scaled and marked for the heater load. In addition, an indicating blue LED light shall be provided to indicate operation of the heaters, and an ON-OFF switch.
2. Fluorescent lighting fixtures with conveniently located and properly labeled external toggle switch shall be provided in the rectifier section and in each compartment which contains relays, control devices and outgoing wiring terminal blocks. The light switch for the rectifier section shall be mounted on the control compartment door and switch for the relay compartment shall be mounted inside the compartment itself. The lighting fixtures in the rectifier section shall be located so that adequate lighting is provided for normal maintenance and observation, and to permit inspection of all indicating fuses, nameplates and other devices within the unit.
3. The heater and lighting circuits shall be rated for operation on a single phase, three wire, 120 Volt circuit. All devices shall be completely wired by the DB Entity and the circuit extended to a suitable terminal blocks for top connection to supply conductors, unless otherwise indicated on the Design Documents. The lighting fixtures, light switches, space heater devices and terminal blocks shall be insulated from rectifier enclosure for a minimum of 1000 Vdc.

4. Function to be incorporated into the Substation Automation System: A non-reset type elapsed time meter shall be provided in front of the control/auxiliary section, wired through series-connected "a" contacts of the rectifier AC circuit breaker, Device 52-T and rectifier DC circuit breaker, Device 72-R, to record the in-service time of the rectifier unit. The instrument shall be wired to outgoing wiring terminal blocks for top connection to supply conductors, unless otherwise indicated on the Design Documents. The elapsed time meter shall be rated 120 Volts, 60 Hz and shall have a six-digit display to record hours and tenths of hours. Instrument shall be connected to the 120 Volt, 60 Hz reliable supply.
5. The rectifiers shall be secured to the insulated epoxy floor with approved insulated anchors (see Design Documents). The insulated anchors shall be tested in accordance with Section 09671. The rectifier supplier shall recognize that MBTA preference is to insulate the anchor bolts in the floor in order to achieve the 40kV insulation level per the Section 09671. The standard MBTA anchor arrangement is shown in the Design Documents. Alternative floor anchoring arrangements may be proposed but the 40kV anchor insulation requirement shall be maintained.

J. Audible Sound Level

1. The maximum average audible sound level produced by the entire rectifier unit under no-load condition shall not exceed 60 decibels (A). Major sound-producing components, their supports and rectifier enclosure shall be acoustically treated, if required, to meet this criterion.
2. The rectifier unit shall be tested in accordance with NEMA Standard TR1, treating the rectifier (instead of the transformer) as the sound source.

K. Nameplates

1. In addition to nameplates specified in Section 16203, Article 1.08, the DB Entity shall provide nameplates, mounted in the front and rear of each rectifier assembly, engraved "650 VOLTS DC PRESENT IN RECTIFIER COMPARTMENT". The nameplate shall have white letters, two inches high minimum, on red background. Similar nameplates, engraved with one-inch high letters "650 VOLTS DC PRESENT IN THIS COMPARTMENT" shall be provided on the door of each compartment which contains control devices operated on nominal 600 Volts DC.
2. The legend of nameplates shall be submitted to the MBTA for acceptance.
3. Equipment identification nameplates shall be engraved "RECTIFIER No. 1 - 3000 kW" and "RECTIFIER No. 2 - 3000kW".

L. Supervisory Indication

1. Two normally open contacts for each of the following devices or functions, wired to outgoing wiring terminal blocks, shall be provided within each rectifier for remote indication via MBTA's supervisory systems:
 - a. Device 86-T (rectifier lockout). This feature shall be integrated into the substation automation system and the lockout reset be operated via the HMI screen.

M. Detailed Equipment Requirements

1. Each rectifier assembly shall include, but not be limited to, the following:
 - a. Lot of air-filled terminal chambers or flanged throats, connectors and hardware for direct bolted connections to AC anode bus and DC positive and negative cathode buses.
 - b. Silicon diode and heat sink assembly. Single diodes shall be connected in series for each leg and shall have a minimum repetitive peak reverse voltage rating of 2,200 Volts. Each individual silicon diode shall be hermetically sealed and mounted on air-cooled heat sink adequate for maximum heat dissipation. A current balancing arrangement employing reactors, or other equivalent means, shall be provided to ensure constant current balance between paralleled diodes of each individual phase and to maintain each individual diode current within guaranteed capability under all load conditions up to and including the current peaks specified in Article 2.03.D of this section, with one fuse per phase leg open. With any diode fuse open at any and all rated loads, the current in any other parallel diode in the same phase leg shall not exceed its pro-rated share by an amount greater than one percent times the number of paralleled diodes in that phase leg, or by an amount not greater than 20 percent, whichever is greater. Pro-rated share is defined as the total rated phase leg current divided by the number of paralleled diodes in that phase leg. The current balancing method is subject to acceptance by the MBTA. Reliance upon matched diodes for current balancing purpose will not be acceptable, unless the Design-Builder can prove to the satisfaction of the MBTA that each diode selected at random from a production run of diodes of the type to be installed in the rectifier has a tolerance sufficiently close to ensure the specified current balance between the paralleled diodes.
 - c. Set of current limiting fuses: One fuse shall be connected in series with each diode, complete with fuse monitoring system.
 - d. Set of heat sink over-temperature devices. Quantity of devices shall be as necessary with minimum of one device per top diode in each leg. The devices shall be circuit opening on rising temperature, bi-metallic thermal devices shall be furnished and mounted on diode heat sinks. A minimum of sixteen devices, eight on positive and eight on negative heat sinks, shall be connected to provide first-step high temperature alarm, Device 26R. A minimum of sixteen devices, eight on positive and eight on negative heat sinks shall be connected to provide second-step high temperature trip and lockout, Device 26RH. The devices shall be selected to allow for overloads specified in Article 2.03.D of this Section. Circuit shall be self-monitoring with provisions to actuate the alarm or trip circuits, after a time delay of approximately one second, in the event of detection of high temperature, device or circuit failure or loss of AC auxiliary power to Devices 26RX and 26RHX. Provide a white light for Device 26RHX, 120 Volt, AC control source and mount on the rectifier control compartment door with suitable identifying nameplate. Suitable isolating transformers shall be provided to isolate thermal switches from control circuits and from other thermal switches on heat sinks not rigidly at the same potential.
 - e. Resettable counter mounted in front of the control/auxiliary section, to count the number of trips due to heat sink overtemperature.
 - f. Set of surge protective devices. The surge protective devices shall limit the repetitive reverse voltage surges, induced during lightning, faults and switching or by operation of trains, across the diode to within 75 percent of the peak reverse voltage (PRV) rating of

the diodes. The transient surge voltage is assumed to have a crest of 3,000 Volts and 1.5 x 40 microsecond wave shape of either polarity, applied to all rectifier terminals, while operating at rated current and full rated temperature. In addition, the rectifier shall withstand lightning surges of 75 kV crest and 1.5 x 40 microsecond wave shape, applied to rectifier output terminals. Where surge protective devices are protected by a circuit interrupting component, a monitoring circuit employing a neon lamp shall be provided to indicate an inoperative circuit. The monitoring circuits shall be provided with a relay, Device 99Y, to actuate alarm in the event of fuse or surge protective device failure.

- g. Interphase transformer or a set of mutually coupled reactors, for interconnecting the negative side of the two three-phase double-way rectifier circuits. Interphase transformer shall have the voltage and current ratings and the ability to withstand short circuits equal to those specified in Article 2.03.D of this Section, for the rectifier.
- h. Set of interlock switches designed to de-energize the rectifier when any one rectifier access door is opened exposing 600 Volt nominal "live" parts. The interlocks shall trip Device 86-T and actuate alarm, Device 33R. Activation of Device 33R shall be transmitted to the annunciator. A door interlock shall not be provided on the control/auxiliary compartment if this compartment is completely isolated from the rectifier section by suitable sheet steel barriers per Article 2.03.B of this section.
- i. Lot of electric strip heaters, lights and accessories.
- j. Control/auxiliary compartment, completely wired, with all relays, controls and auxiliary devices, including but not limited to the following equipment and quantities:
 - 1 - Master control relay, electrically reset type. Device 4.
 - 1 - The substation HMI system shall replace the below identified annunciator. Functionality and associated requirements shall be provided within the automation system and shown on the HMI.

Annunciator, solid state type, with back-lit nameplates consisting of 30 alarm positions, arranged five high and six wide (see Section 16203, Article 1.12). Annunciator shall be rated for operation on 125 Vdc and shall be provided with three push buttons for acknowledge, reset and test functions. Annunciator cabinets shall be insulated from rectifier enclosure for a minimum of 1,000 Vdc. List of nameplate inscriptions shall be provided for review by the MBTA. All alarm points for which the actuating contacts are remote from rectifier unit and all retransmitting contacts shall be wired to outgoing wiring terminal blocks for connection to field wiring entering from top. Device 30.
 - 1 - Rectifier transformer auxiliary DC circuit undervoltage relay, Device 27RA.
 - 1 - Rectifier and transformer auxiliary AC circuit undervoltage relay, Device 27RB.
 - 1 - Two stage diode fuse failure monitoring relay, Device 58A/58T.
 - 1 - Set of 125 Vdc control power disconnect devices with overload protection, all rated at 1,000 Vdc and wired to terminal blocks for supply conductors entering from top.

- 1 - Set of ground detector circuit components, including relays, Devices 64R and 64RX, DC power supply and related devices, as detailed in Article 1.06.C of this Section.
- 1 - Lockout relay, manually reset type. Device 86-T.
- 1 - Lockout relay circuit undervoltage relay. Device 27R.
- 1 - Conditional lockout relay, electrically reset type. Device 86X-T.
- 1 - Set of auxiliary relays for heat sink overtemperature devices. Devices 26RX and 26RHX.
- 1 - Temperature indicator to show the air temperature within the rectifier enclosure.
- 1 - Resettable counter mounted in front of the control/auxiliary section, to count the number of trips due to heat sink overtemperature.
- 1 - One set of insulated anchor blocks for rectifier assembly, as required. These shall be shipped in advance of equipment.
- 1 - One set of equipment as necessary to interface the rectifier equipment with the substation automation system including IED's.

2.4 DC SWITCHGEAR ASSEMBLY

A. General

- 1. The switchgear assembly shall consist of indoor metal-enclosed, self-supporting structures rated for 750 Volt DC class traction service.
- 2. The switchgear assembly will be directly supplied from the power rectifiers specified in Article 2.03 of this Section, and shall serve as the DC traction power supply to the traction feeders as outlined in this Section. Switchgear shall be suitable for operation with switchgear structure high-resistance grounded.
- 3. Provisions shall be included to accommodate future extension from aisle end of the switchgear assembly.

B. Switchgear Assembly and Circuit Breaker Units

- 1. The metal-enclosed switchgear assembly shall consist of rigid self-supporting and self-contained electrically welded steel structures. The individual breaker units shall be enclosed with not less than 12 gauge formed steel sheets. The individual units shall be bolted to each other to form a continuous, free-standing switchgear assembly, divided into shipping sections as specified in Article 1.06.A of this Section.
- 2. Hinged doors shall be provided at front and rear of each circuit breaker unit, suitable for mounting relays, meters, instruments and control devices. Doors shall be formed of sheet steel and shall be properly reinforced against distortions by suitable flanges and stiffening members. Hinges shall be heavy duty of a type accepted by the MBTA. Full height doors shall be securely fastened in the closed position with a minimum of three latches easily

opened without the use of tools. For doors less than the full height of the equipment, a minimum of two latches will be acceptable. Doors shall be provided with automatic self-stopping capabilities, with the automatic stops at 90 degrees and at 120 degrees. Manual defeating mechanism shall be provided for moving the door from one stop to another. At each stop, the door shall be held securely in the open position. With the front door of any compartment open at 90 degree position, it shall not prevent the adjacent compartment door from being opened and its breaker completely removed from its housing.

3. Separate, steel-enclosed compartments shall be provided for the circuit breaker, main bus, outgoing buses, feeder cables, and for relays, instruments and control devices. All compartments shall be sufficiently gas tight to assure that no ionized gas will pass from one compartment to the other.
4. Compartments for circuit breaker, outgoing cables, and for relays and control devices, shall be provided with a separate hinged door for servicing without exposing circuits in adjacent compartment. In lieu of the hinged doors, circuit breaker compartments may be provided with hinged closure panels attached to breaker removable element. Cable compartments shall be accessible for connection of power cables from the rear of the unit.
5. The bus compartment shall contain the main (positive) bus and bus taps and shall be isolated from all rear cubicle compartments by an insulated barrier, and shall be provided with either a separate hinged door or a removable bolted-on cover for complete access to the bus and the taps.
6. Barriers shall be provided at the side of cubicles to insulate the bus compartment of adjacent units. A similar, completely isolated compartment shall be provided for termination of outgoing power cables. The cable compartment of each circuit breaker unit shall be isolated from the cable compartment of adjacent unit.
7. The breaker compartment shall be completely enclosed except for the insulated vent opening at the top, designed for rapid exhaust and deionization of ionized gases. The design shall prevent striking an arc to conductive members of the switchgear during and after fault interruption. Screws made of non-conducting material and insulating barriers shall be provided for all surfaces exposed to ionized gases. Metal screws covered with insulating caps are not acceptable. Insulation of circuit breaker compartment and its vent openings are not required if the DB Entity can prove to the satisfaction of the MBTA that the gases exhausted from the circuit breaker removable element during fault interruption are completely de-ionized.
8. Vent openings shall be designed to prevent damage to or malfunctioning of the circuit breaker, control circuits and other components from foreign objects and shall be so located that hot gasses or other materials cannot be discharged through them in a manner which might be injurious to operating personnel. Each circuit breaker housing shall be provided with protective shutters which close and block access to the positive bus and breaker load terminals as the removable element of circuit breaker is racked from the cubicle. Protective shutter mechanism shall be designed and installed in a manner that it can be removed for repair without necessitating de-energization of the main bus.
9. Rectifier main DC breaker housing and bus entry unit housing shall be of sufficient strength to support the DC cathode bus which interconnects the DC switchgear with the rectifier. Flexible connections between buses shall be provided as necessary.

10. The DC switchgear enclosure shall be arranged for insulated fastening to the DC cathode busduct enclosures connecting to the associated rectifiers specified in Article 2.03 of this Section. The insulation shall take the form of a glastic-type bolted on collar providing electrical insulation between the DC busduct enclosure and the DC switchgear enclosure. The collar shall also provide a ready means of disconnecting the bus duct from the switchgear. At the DC switchgear a removable jumper providing electrical continuity between the switchgear and the bus duct enclosures shall be provided. The material shall be 1/8" thick, minimum, and shall be flame-retardant, track resistant and have high mechanical impact strength. The electrical and mechanical properties of the material and the method of attachment will be subject to the MBTA's acceptance. As necessary, provide a raised flange for the busduct connections to accommodate the insulating busduct collar.
11. Unless otherwise indicated on the Design Documents, the width of individual switchgear units shall not exceed 24". Any proposed variation by the DB Entity shall be subject to acceptance by the MBTA but due to the existing space limitations may not be acceptable. Any such proposal shall be accompanied with a fully dimensions substation layout drawing. Equipment at all substations under the contract shall be identical.
12. The switchgear shall be secured to the insulated epoxy floor with approved insulated anchors (see Design Documents). The insulated anchors shall be tested in accordance with Section 09671. The switchgear supplier shall recognize that MBTA preference is to insulate the anchor bolts in the floor in order to achieve the 40kV insulation level per Section 09671. The standard MBTA anchor arrangement is shown in the Design Documents. Alternative floor anchoring arrangements may be proposed but the 40kV anchor insulation requirement shall be maintained.
13. Finish of inside and outside of switchgear assembly, including all steel panels and subpanels inside the cubicles, shall be in accordance with Section 16203 Article 1.15. Galvanized, unpainted steel panels are not acceptable.
14. The switchgear shall be designed with a minimum of 3/4" clearance between the removable breaker element and the control cabinet overhang to ensure there is no interference due to floor irregularities when racking the breakers in and out.
15. The base plate of each circuit breaker compartment shall be beveled to ease rolling the circuit breaker truck in and out of the compartment.

C. Buses and Bus Connections

1. Switchgear main bus and bus taps shall be copper and shall be provided in accordance with Section 16203 Article 1.06. Continuous current carrying capacity of buses and bus taps shall be as specified in Article 2.04 of this Section.
2. Main bus and bus taps shall be supported and braced to withstand short circuit stresses at least as great as those for which circuit breakers are designed.
3. The buses shall be supported on approved high-strength flame retardant polyester glass, epoxy, or porcelain insulators designed to ensure adequate electrical clearances and to withstand the specified short circuit stresses.

D. DC Power Circuit Breakers

1. Circuit breakers shall be 750 Volt DC class minimum, single pole, air break, draw-out type without negative disconnecting device, capable of withstanding a continuous no load or light load voltage of 750 Volts DC. The breakers shall be of high-speed classification as per ANSI Standard C37.14 and C37.16, suitable for operating on a substation DC bus supplied directly by all substation power rectifiers operated in parallel at 590 Vdc as specified below. The DB Entity is hereby informed that application of reactors between the rectifiers and DC switchgear or between the rectifiers and negative equalizer bus, to limit the short circuit current to be interrupted by the circuit breakers, will not be acceptable.
2. The DC circuit breakers shall have peak current, momentary current, short time current and short circuit current ratings required for operation in a substation with the number, type and rating of the power rectifiers specified in this Section and shown on the Design Documents, when operating under the service conditions specified in Article 1.06, Paragraph B of this Section. For selecting the rectifier and traction feeder circuit breaker ratings, The DB Entity shall add 50 percent to the peak current and sustained current values thus obtained. Short circuits specified herein are those that are applied between the load terminals of either traction feeder circuit breaker or rectifier main DC circuit breaker, and the negative load terminals of the rectifiers.
3. High speed DC circuit breakers which limit peak value of short circuit current shall have short circuit interrupting capability equal to or greater than the maximum available rate of rise of short circuit current under the short circuit conditions specified. The short circuit interrupting rating of the circuit breaker with delayed tripping shall not be less than 100,000 Amperes.
4. The rectifier main DC circuit breaker shall either be capable of withstanding a fault on the 600 Volt nominal DC bus until AC relays trip the rectifier transformer feeder breaker in the AC switchgear, or a tripping device which fully coordinates with all other specified coordination requirements may be supplied, if accepted by the MBTA, which shall protect the circuit breaker from damage under bus fault conditions.
5. The rectifier main DC circuit breaker shall have momentary current rating equal to or greater than the maximum available peak current due to a short circuit at the load terminals of the rectifier main circuit breaker.
6. The rectifier main DC circuit breaker shall have short time current rating which is equal to or greater than the maximum rms value of available current during a period of 250 milliseconds following application of short circuit to the load terminals of the circuit breaker. The rated short time current is defined as the designated limit of available rms current which the circuit breaker can carry for a period of 250 milliseconds, without impairing the circuit breaker's ability to meet all other ratings.
7. High speed DC feeder circuit breakers which limit peak value of short circuit current with a fast-acting tripping arrangement provided shall have a momentary rating no less than 125,000 Amperes.
8. All DC circuit breakers shall be rated to successfully dissipate the maximum value of energy stored in the system inductance during circuit breaker arcing under the short circuit conditions specified. Breaker maximum arc voltage shall not exceed 75 percent of the peak reverse voltage (PRV) of diodes furnished with the rectifiers and the limits dictated by DC power and control equipment.

9. Circuit breaker operating mechanism shall be of the mechanically latched or the magnetically latched type, solenoid operated, as specified below, and shall be electrically and mechanically trip free. The control circuits of all breakers shall be provided with anti-pumping protection.
10. The closing coil of solenoid operated circuit breakers shall be rated for operation on 125 Vdc supplied from the substation battery. Circuit shall be provided with a timing relay for closing coil cut-off. The closing coil shall successfully close the breaker over a voltage range of 90 to 140 Vdc.
11. All solenoid operated circuit breakers shall have trip circuit rated 125 Vdc supplied from the station battery and shall be capable of tripping the breaker over a voltage range of 70 to 140 Volts.
12. DC circuit breakers shall be designed so that they may be safely closed and tripped manually in the operating position with the enclosure door closed during an emergency. Removable, fully insulated handles shall be provided for manual closing. Mechanical interlocks shall be provided which will disable the manual closing mechanism if the breaker compartment door is open. Manual trip shall be from an approved mechanical trip device.
13. The operating mechanism of each circuit breaker shall be provided with a mechanical breaker contact position indicator.
14. Breaker tripping devices shall be furnished as required to provide reliable coordinated protection for the system. They shall have operating characteristics and adjustable ranges as outlined in Article 1.06.D of this Section. Range of trip settings shall be as specified and calibration scales shall be calibrated covering full range of adjustable settings.
15. Mechanically latched DC circuit breakers shall be provided with an undervoltage trip device which is magnetically held by flux produced by control power current and which mechanically trips the circuit breaker upon reduction of control power voltage to any level which does not allow reliable operation.
16. Mechanically latched DC circuit breakers which require control power for any part of an instantaneous overcurrent or reverse current trip arrangement shall be provided with a second overcurrent or reverse current trip arrangement. The redundant instantaneous overcurrent or reverse current trip arrangements shall independently sense magnitude of the circuit breaker current and may utilize control power for their tripping but shall have their own separate electrical components and not share any common electrical components with the first overcurrent or reverse current arrangement. One of the two tripping arrangements may utilize the undervoltage trip device to affect circuit breaker tripping. The discriminating rate-of-rise trip equipment will not be acceptable as the second tripping arrangement specified above. However, the discriminating rate-of-rise trip equipment may utilize a current sensor and trip coil in common with either of the required redundant instantaneous overcurrent or reverse current trip arrangements and may utilize the undervoltage trip device to affect circuit breaker tripping. Each of the redundant instantaneous overcurrent or reverse current trip arrangements shall provide the overall coordination specified in Article 1.06.D of this Section.
 - a. For the rectifier main DC circuit breaker, the second reverse current tripping arrangement may be a polarized electro-mechanical trip device, a current sensing polarized relay

which shunt trips or undervoltage trips the circuit breaker, or other arrangement in conformance with this Specification which is accepted by the MBTA.

- b. For the DC feeder circuit breaker, the required second overcurrent tripping arrangement may be an electro-mechanical trip device, a current magnitude sensing non-polarized relay which shunt trips or undervoltage trips the circuit breaker, or other arrangement which is accepted by the MBTA. Tripping for the redundant overcurrent arrangement shall be adjustable within the limits of 100 percent and 400 percent of the rating of direct acting instantaneous series trip device specified for the feeder circuit breakers.
17. Circuit breakers which are magnetically latched shall be latched by flux produced from control power and tripped by interaction between this flux and flux produced by circuit breaker primary current. No undervoltage trip device is required.
- a. For the rectifier main DC circuit breaker, the magnitude of latch flux shall be at least 200 percent of the minimum value required for successful closing of the circuit breaker without primary current. The circuit breaker tripping arrangement may be responsive to rate-of-rise of reverse current by use of inductive shunts or other means. Control power current for the magnetic latch shall not exceed 500 milliamperes.
 - b. For the DC feeder circuit breakers, the magnitude of latch flux shall be such that at least 30,000 Amperes of primary current are required to cause tripping by shift of flux. The circuit breaker tripping arrangement shall not be responsive to rate-of-rise of primary current. Control power current for the magnetic latch shall not exceed 500 milliamperes. DC feeder circuit breakers shall be provided with a second tripping arrangement which is easily adjustable to cause tripping between the limits of 100 percent and 400 percent of the rating of direct acting instantaneous series trip device specified for the breaker. This second tripping arrangement may be an electro-mechanical trip device which mechanically or electrically trips the circuit breaker, a current magnitude sensing non-polarized relay which shunt trips the circuit breaker, or other arrangement in conformance with this Section which is accepted by the MBTA. The rate-of-rise discrimination equipment will not be acceptable as the second tripping arrangement specified above, but may utilize a common trip coil.
18. Each circuit breaker shall be mounted on a mobile steel frame equipped with power and control circuit disconnecting devices, to make the circuit breaker and the operating mechanism a removable element. The frame shall be permanently attached to the circuit breaker and shall be equipped with rugged, non-metallic wheels for rolling the breaker on the floor of the substation. A “fifth wheel” device shall be installed on the breaker carriage to assist with moving the breaker. The supplier may request the requirement for a “fifth wheel” device be removed but must provide evidence, or a practical demonstration that this device is unnecessary for the type of breaker proposed, for acceptance by the MBTA. A four digit register type operations counter shall be mounted on the removable element of each circuit breaker.
19. The power disconnecting devices shall consist of self-aligned assemblies. Female contacts shall be constructed of bridging segments designed to ensure high pressure contact guaranteed not to distort or fail under the mechanical stresses and heating due to duties specified for the circuit breakers.

20. The control disconnecting devices shall provide rugged, heavy-duty connections for the control circuits and interlocks between the removable element and the housing. The devices shall be precisely located and securely mounted to maintain alignment.
21. Circuit breaker components requiring periodic maintenance and replacement and those which may require replacement due to deterioration shall be easily accessible without removal of major breaker assemblies.
22. Frames of relays and other devices mounted on energized breaker frame and operated on 125 Vdc shall be insulated for 1,000 Vdc from the frame of the circuit breaker. Relays, switches, terminal blocks and other components of the control circuitry on the breaker shall be labeled as identified on DB Entity's prepared and MBTA's accepted shop drawings.
23. In addition to auxiliary switches required for control, interlock, indication and alarm circuits, each circuit breaker shall be furnished with a minimum of four "a" and four "b" spare auxiliary switch contacts, wired to outgoing wiring terminal block for MBTA's use.
24. Normally-closed auxiliary switches mounted on the removable element and used for interlocking shall be shunted with truck-operated cell switches to permit operation of interlocked equipment when breaker is in the withdrawn position. A minimum of two "a" and two "b" spare cell switch contacts shall be provided, wired to outgoing wiring terminal blocks for MBTA's use.
25. All auxiliary switches, whether cell-mounted or mounted on removable element, and breaker control circuit wiring connected through control disconnecting devices, shall be made up and operable when breaker is racked to the test position so the breaker may be closed and tripped electrically or mechanically.
26. DC traction feeder circuit breakers shall be mechanically and electrically interchangeable with all other traction feeder breakers of the same ratings.
27. Main rectifier DC circuit breakers shall not be interchangeable with DC traction feeder circuit breakers, but the main DC breakers shall be interchangeable with each other.
28. A mechanical or electrical indicator shall be provided on the front of the breaker compartment to show that the breaker is in the "test" or "connected" position. An electrical breaker position indicator is acceptable.
29. Each circuit breaker unit shall be equipped with a cranking device for moving the removable breaker element to and from its operating position. The mechanism shall be mechanically operated by a hand crank, arranged to rack the breaker from test to operating position, also from disconnect to test position. Suitable guide rails shall be provided for centering the breaker in proper position when inserting or withdrawing the removable element. Front ends of guide rails shall be flared and the bottom plate of the enclosure within the guide rails beveled to facilitate the lining-up and insertion of the circuit breaker removable element. A positive stop shall be provided to prevent over-travel of the removable element when moving it into operating position. A similar positive stop shall be provided for the test position. The design of the circuit breaker unit having the access door mounted on the stationary structure of the switchgear, shall permit closing of the compartment door with the circuit breaker in test position.

30. Mechanical interlocks shall be provided on each circuit breaker to prevent the withdrawal of the removable element when the breaker is in the closed position and to prevent the insertion of a closed breaker from the test to the operating position. For circuit breakers with stored energy type operating mechanism, the interlocks shall also discharge the springs before the breaker removable element can be fully withdrawn from its housing. Breaker must be arranged so that personnel are guarded from contact with energized parts while racking the circuit breaker into or out of the connected position.
31. Rectifier main DC circuit breakers shall be key-interlocked with the negative disconnect switch of the respective rectifier, arranged to prevent closing or opening of the disconnect switch unless the main DC circuit breaker is in fully disconnected position, as specified in Section 16203 Article 1.13. The key interlock shall be mounted on the cubicle, not on the breaker.
32. Electrical breaker components such as relays, resistors, auxiliary switches, and terminal strips shall all have nameplates.

E. Arrangement of Control Devices

1. Normal control, indicating and protective devices associated with the circuit breaker operation shall be mounted in their respective DC breaker switchgear compartments, except as otherwise specified. All devices, whether mounted on the compartment door or other portion of the stationary unit structure, must be physically accessible and so connected as to permit testing and maintenance of relays and control circuitry in de-energized condition while the circuit breaker is in normal operating position. The arrangement of devices will be subject to acceptance of the MBTA. Insulated panels attached to cutouts in the doors for mounting of relays, switches and devices, are not acceptable. Individual cutouts shall be provided for mounting each relay, switch and device.
2. Current shunts, transducers and other such equipment shall be accessible for testing and maintenance with the switchgear bus energized.
3. Care shall be taken in arrangement of relays, control and key-operated switches, indicating lights and instruments so as not to violate the provision for the removal of an adjacent breaker when the door of adjacent unit is opened to 90 degrees. Refer to Article 2.04.B of this Section.

F. Power Circuit Terminations

1. Rectifier main DC circuit breaker unit shall be arranged for direct bolted connections to incoming DC positive cathode bus specified in Article 2.05 of this Section, using copper bus bars. All contact surfaces shall be silver plated. Buses and connections shall conform to Section 16203, Article 1.06. The bus connections shall be arranged for bottom cable entrance unless otherwise indicated on the Design Documents. Arrangement of buses will be determined at the Design Conference.
2. For each DC traction feeder, the DB Entity shall furnish four bolted type NEMA heavy duty terminal lugs suitable for stranded copper feeder cables of sizes shown on the Design Documents, entering from below, unless otherwise indicated on the Design Documents. All DC feeder breakers shall have provision for four DC feeder cables. Provision shall include holes, grommet/clamp hardware, such that future cable installations will match existing. All

unused openings shall be sealed with steel screw-on type plugs. Terminal lugs shall be provided in accordance with Section 16203 Article 1.07, and shall have NEMA four-bolt tongue. Provisions shall be made for quick disconnection and isolation of each cable from the terminal during an emergency without disturbing the remaining cables. This requires access to the terminals through an easily-opened hinged panel and sturdy, individual support for each cable close to the connection point. Back-to-back arrangement of terminal lugs will not be acceptable.

G. Wiring and Terminal Blocks

1. Secondary and control wiring in each unit, including that on removable element, shall be No. 12 AWG or larger, stranded tinned copper in accordance with Section 16203, Article 1.09, and insulated for 1,000 Vdc service.
2. Circuits requiring external connections shall be factory-wired to readily accessible terminal blocks within the control compartments for connection to field wiring entering from above. Provide terminal blocks rated for 1,000 Vdc and in accordance with Section 16203 Article 1.09. The field cabling shall have a minimum insulation rating of 1000 Vdc.
3. All elements of control devices operated on 600 Volts DC nominal shall be connected with red-colored or red-striped wire and terminals both rated for 2000 Volts. Associated terminals at equipment and devices shall be insulated for 1,000 Volts from adjacent terminals and from the frame of switchgear. Exposed terminals shall be capped or provided with insulating covers to prevent accidental contact by operating and maintenance personnel.
4. All supply, control and indication wiring shall enter the DC switchgear via a suitable opening in the front control compartment of Unit #1 and be routed along the switchgear as necessary. Externally, the wiring shall be routed via cable trunking on the end of the switchgear through a floor opening to the cable tray below as indicated in the Design Documents. Routing to all other equipment in the substation shall be via this route.

H. Control Sources

1. An ungrounded, two wire, 125 Vdc control bus shall be provided integral with the DC switchgear assembly. The control bus shall be not less than No. 4 AWG consisting of stranded copper switchboard wire (SIS), wired to suitable screw type terminal blocks in the auxiliary compartment for connection to No. 2 AWG supply conductors. Where smaller supply conductors are proposed, the DB Entity shall submit evidence in the form of calculations, showing circuit loading and wire current capacities, supporting the use of the smaller conductors for review and acceptance by the MBTA. Each circuit breaker control circuit shall be supplied from this bus through individual switches and fuses. In addition, the closing circuit and spring loading motor circuit of each stored energy operated circuit breaker shall be protected by a secondary set of fuses to prevent opening of main fuses and thus loss of trip supply on closing circuit or motor circuit faults. All fuses, fuse holders and switches shall be rated for 1,000 Vdc service. This supply shall be monitored, Device 27SA, and in the event of low voltage or voltage failure.
2. As required based on vendors design, a two wire, 120 Volt, 60 Hz control bus shall be provided for load measuring circuit timers, Device 102; rectifier and DC switchgear ground detection relays, Devices 64R, 64RX, 164S and 164SX; rectifier heat sink overtemperature device circuits; and, transducers and other control devices requiring AC supply. The 120 Vac control bus shall be no smaller than No. 10 AWG stranded switchboard wire. Both legs of

each take-off from this bus shall be separately fused. If required, this supply shall be monitored, Device 27SB, and indicate in the event of low voltage or voltage failure. An independent isolating transformer shall be utilized for all 120 VAC requirements within the equipment. Isolating transformer shall not be located within the equipment.

3. All fuses used for control shall be of the cartridge type of appropriate rating, conforming to Section 16203 Article 1.10, Paragraph F. All necessary fuses shall be furnished with the equipment. In addition, a minimum of 10 percent, but not less than two fuses of each rating shall be furnished with the switchgear assembly.

I. Special Requirements

1. Each separate compartment within a switchgear cubicle shall be provided with an electric strip heater of adequate size to prevent condensation within the compartment. All heaters installed in a switchgear cubicle shall be monitored by means of an ammeter scaled and marked for the heater load. Each individual heater circuit shall be provided with blue LED indicating lamp to indicate operation of the heater, and an ON-OFF switch. Heaters shall be provided with properly designed guards to protect operating personnel against accidental contact with hot surfaces.
2. A fluorescent lighting fixture with conveniently located and properly labeled toggle switch or a door operated switch, rated 250 Volts minimum, shall be provided in each compartment of the switchgear which contains relays, control devices and outgoing wiring terminal blocks. Incandescent lighting will be acceptable only for compartments where, in the opinion of the MBTA, the installation of fluorescent lighting fixtures would be impractical. In addition, a duplex receptacle, rated 250 Volts, 20 amperes minimum, shall be provided in each switchgear unit, connected for 120 Volt service. The outlet boxes of light receptacles, light switches and plug receptacle shall be insulated from switchgear enclosure for a minimum of 1,000 Vdc.
3. Two single phase, two wire, 120Volt, 60 Hz supply bus shall be provided throughout switchgear lineup. The AC supply buses shall be not less than No. 10 AWG, stranded copper switchboard wire (SIS). One supply shall provide power to the heaters, the other shall provide power to the light and receptacle circuits. Each supply bus shall be connected at each cubicle through fusible pull-out disconnects with cartridge-type fuses located in each switchgear unit. The fuse holders shall be insulated from switchgear enclosure for 1,000 Vdc. All necessary fuses shall be furnished with the equipment. In addition, a minimum of 10 percent, but not less than two, spare fuses of each rating shall be furnished. The supplies shall be wired to screw type terminal blocks, insulated from the switchgear enclosure for 1,000 Vdc, located in the auxiliary compartment of the switchgear lineup for connection of up to No. 6 AWG supply conductors from adjacent cubicles. DB Entity shall verify that the proposed wires sizes used are adequately sized and may propose alternative sizes to those specified above for acceptance by the MBTA.

J. Nameplates

1. Nameplates shall be provided in accordance with Section 16203 Article 1.08. The legend of nameplates shall be submitted to the MBTA for acceptance.
2. Switchgear identification nameplate shall be engraved: "750 VOLT DC SWITCHGEAR".

K. Supervisory Control Requirements

1. The DC switchgear assembly shall be provided with supervisory control, indication, measuring and interface devices as specified in Article 1.06.C.5 of this Section.

L. Circuit Breaker Test Cabinet

1. The DB Entity shall provide a wall-mounted test cabinet for electrical operation of circuit breakers at the location indicated on the Design Documents. The test cabinet shall include: a control switch, similar to that furnished with the switchgear, to close and trip the breaker; red and green breaker position LED indicating lamps; 10' of control cable with a connector at the end for connection to the breaker; a set of properly sized fuses to protect the control circuit; and, screw-type terminals for 125 Vdc control supply No. 8 AWG conductors which shall be connected to a dedicated circuit breaker in the DC distribution panel. An additional white LED indicating lamp shall be provided for monitoring the control supply.
2. The control switch and indicating lamps shall be mounted on the door of the test cabinet. The wiring and terminal blocks shall be provided in accordance with Article 1.09, and the nameplates with Article 1.08 of Section 16203.
3. An approved connector shall be provided for adequately protecting the control cable at the point of entry. Provisions shall be made for storing or racking the control cable and the connector at the test cabinet.
4. The test cabinet shall be finished inside and out in accordance with Article 1.15 of Section 16203.

M. Auxiliary Equipment and Accessories

1. The DB Entity shall furnish special tools and equipment handling devices as recommended by the manufacturer for installation, assembly, adjustment and maintenance of the DC switchgear and circuit breakers furnished. Special tools are defined as tools not readily available on the open market. All items shall be furnished as part of the initial delivery of the switchgear equipment.
2. The DB Entity shall also furnish and ship with the switchgear any auxiliary equipment and accessories necessary for operation, maintenance, testing and handling of removable components outside the switchgear assembly. One complete set of auxiliary equipment and accessories shall be provided at each substation. Auxiliary equipment and accessories shall include, but not be limited to, the following and shall be provided in addition to the items specified in Article 2.09 Technical Support Equipment.

One - Circuit breaker test cabinet, as specified in Article 2.04.L of this Section.

One - Floor-mounted steel cabinet with hinged doors, three-point latching mechanism and key-locking handle and shelves, for storing tools and accessories. Cabinet shall be fully rustproofed and finished in light gray enamel.

Two - "Fifth-wheel" device for handling breaker outside its housing, preferably as part of each breaker drawout element.

Two - Racking-in cranks.

Two - Manual spring charging handle (if required).

Two - Insulated lever for manual closing of the breaker.

Two - Arc chute lifting device.

One - Set of tools required for breaker maintenance.

One - Set of insulated anchor blocks for the DC switchgear assembly. These shall be shipped in advance of equipment.

Two - One-quart cans of matching touch-up paint.

N. Detailed Equipment Requirements

1. DB Entity shall furnish and deliver to the substation the 750 Volt DC switchgear assembly consisting of switchgear units of the type specified below; switchgear unit quantities shall be as shown on the Design Documents. The individual units in the assembly shall be arranged to form lineups as shown on the Design Documents.
2. Individual switchgear units shall consist of the equipment, devices and appurtenances of the types detailed below. The ratings provided are for used with 3,000 kW rectifiers. Refer to the Design Documents for switchgear unit quantities.

a. Rectifier DC Main Circuit Breaker, Device 72-R

750 Volt rectifier DC main circuit breaker unit(s), including, but not be limited to, the following:

- 1 - Metal-enclosed stationary unit with 10,000 Ampere bus and 8,000 Ampere tap, equipped with provisions for connection to 8,000 Ampere DC positive cathode bus entering the side.
- 1 - 8,000 ampere air circuit breaker removable element with direct acting series reverse current instantaneous trip device, Device 32, as specified in Article 2.04.D, this Section, set at the minimum value consistent with overall coordination of rectifier circuit protective devices. The reverse current device shall be provided with auxiliary contacts for operation of auxiliary relay, Device 32X, which shall be used for remote indication and lockout relay operation.
- 1 - Removable element position switch with a minimum of four convertible contacts.
- 1 - 8,000 Ampere, 50 millivolt shunt with indicating ammeter, 0-15 kA scale, and calibrated leads, Device AM.
- 1 - Isolation amplifier or isolation type transducer, input from 8,000 ampere, 50 millivolt shunt, for telemetering rectifier current, Device IA.

- 1 - DC indicating voltmeter, 0-750 Volt scale, connected to rectifier side of breaker, Device VM.
 - 1 - Control switch "TRIP-CLOSE" for closing and tripping the main DC breaker, with green, white (if breaker has stored energy type operating mechanism) and red LEDs, Device 101.
 - 1 - Control switch "TRIP-CLOSE" for closing and tripping the rectifier AC breaker, with green and red LEDs, Device 01-R.
 - 1 - Breaker control mode selection switch "LOCAL-OFF-HMI-SUPV" for rectifier AC circuit breaker, Device 43.
 - 1 - Set of space heaters with "ON-OFF" switch (Device HS), blue LED and ammeter (Device HAM) as specified.
 - 1 - Set of DC and AC control power disconnect devices with fuses.
 - 1 - Key interlock system as described in Article 1.13 of Section 16203.
 - 1 - Lot of nameplates as specified.
 - 1 - DC Watt-hour demand meter for telemetering power, Device WXD.
 - 1 - Two position voltmeter switch (Device VS) labeled "ON-OFF".
 - 1 - One set of equipment as necessary to interface the rectifier equipment with the substation automation system.
- b. DC Traction Feeder Breakers Device 172

750 Volt DC nominal automatic reclosing traction feeder circuit breaker units, each including, but not be limited to, the following:

- 1 - Metal-enclosed stationary unit with 10,000 Ampere bus and 4,000 Ampere tap.
- 1 - 4000 Ampere air circuit breaker removable element with direct acting series bi-directional instantaneous trip device, Device 176. The continuous current rating of the series trip device shall be 4000 amperes; the instantaneous trip device shall be adjustable between 100 percent and 400 percent of the continuous rating, with calibration marks at suitable intervals.
- 2 - Interposing relays with 125 Volt DC coils, to close and trip the circuit breaker via supervisory, Devices 201C and 201T.
- 1 - Removable element position switch with a minimum of four convertible contacts.
- 1 - 4,000 Ampere, 50 millivolt shunt with calibrated leads for providing input to: multifunction DC feeder protection relay, Device 150M/176F; and, ammeter and isolation amplifier, Device IA. Device 150M shall include the following protection channels:

- Bi-directional instantaneous overcurrent relay channel with an adjustable range of at least 4,000-0-12,000 Amperes.
 - Polarized discriminating overcurrent trip with short time and long-time protection channels.
 - Rate-of-rise overcurrent trip channel capable of discriminating between remote short circuits and inrush current of starting trains.
- 1 - Zero-center scale ammeter for operation with 4,000 Ampere, 50 millivolt shunt as specified. Ammeter scale shall be 4,000-0-12,000 Amperes or as shown on the Design Documents, Device AM.
- 1 - Isolation amplifier as specified, with input from 4,000 Ampere, 50 millivolt shunt for telemetering DC feeder current. Device IA.
- 1 - DC indicating voltmeter, 0-750 Volt scale, connected to cable side of the breaker, and a voltmeter switch wired to enable reading the DC bus voltage also, Device VM.
- 1 - Transducer for telemetering DC feeder voltage, Device V-XD.
- 1 - Permissive setup relay, electrically reset type, to start the closing/reclosing cycle of the DC traction feeder circuit breaker; operating coil and closing coil both rated 125 Vdc, Device 169.
- 1 - Set of load measuring, voltage measuring and automatic reclosing equipment, as specified in Article 1.06.C.4. of this Section, to prevent closing of the circuit breaker into a faulted circuit. The equipment shall include: a load measuring relay, Device 182; a voltage measuring relay, Device 183; load measuring resistor (LMR) and contactor, Device 129; a cycle timer, Device 102; and, all necessary accessories. The cycle timer shall be synchronous motor driven, cam-operated type for operation on 120 Volt, 60 Hz reliable AC supply. Load measuring resistor shall be located on top of feeder breaker stationary unit and shall be provided with ventilated enclosure. The DB Entity shall provide the interconnecting wiring and insulated resistor supports.
- The load measuring control circuitry may be combined into a single electronic control relay. If this is proposed by the DB Entity, relay details shall be submitted for acceptance by the MBTA. The DB Entity shall specifically state the limits of operation of the relay and any operational differences from the equipment described above.
- 1 - Control switch "TRIP-CLOSE" for closing and tripping the DC traction feeder breaker, with green, white (if breaker has stored energy type operating mechanism) and red indicating lamps, Device 101.
- 1 - Breaker control mode selector switch "LOCAL-OFF-HMI-SUPV", Device 143.
- 1 - Set of four heavy duty NEMA terminal lugs suitable for 2,000 kcmil stranded copper feeder conductor mounted on the load terminals for the DC traction feeder breaker, for traction feeder cables entering as shown on the Design Documents.

- 1 - Load measuring system bypass switch and associated timing relay, Device LMBP.
 - 1 - MOV type surge arrester with polymer housing rated for 750 Volt nominal DC service, 970 MCOV, connected to load side of circuit breaker. Arrester shall be located outside of the breaker cubicle in a wall-mounted cage-type enclosure as shown on the Design Documents.
 - 1 - Set of space heaters with blue indicating LED, ON-OFF switch (Device HS) and ammeter (Device HAM).
 - 1 - Set of DC and AC control power disconnect devices with fuses.
 - 1 - Lot of nameplates as specified.
 - 1 - "Cable alive" meter, 0-750 Vdc, complete with dropping resistor and two setpoints, Device 197X.
 - 1 - Three position voltmeter switch (Device VS) labeled "FEEDER-OFF-BUS".
 - 1 - One set of equipment as necessary to interface the rectifier equipment with the substation automation system.
- c. 750 Vdc Switchgear Auxiliary Equipment

750 Volt DC switchgear auxiliary equipment shall be integrated into the DC switchgear lineup and shall include, but not limited to the following items.

- 1 - Lot of alarm bell, timing relay, Device 74 and illuminated warning sign "SWITCHGEAR FRAME ALIVE" as specified in Article 1.06.C.7 of this Section, rated for operation on 120 Volt, 60 Hz.
- 1 - 120 Volt DC supply undervoltage relay, for operation on 125 Volts DC, Device 27SA.
- 1 - 120 Volt supply undervoltage relay, for operation on 120 Volts, 60 Hz, Device 27SB (if used for protection devices).
- 1 - DC Switchgear Structure grounded/hot relay, Devices 164S/164SX.
- 1 - DC power supply with adjustable 15-25 Volt output, as specified, for isolation amplifiers, Device IA (if used).
- 1 - 1 - Voltage transducer, as specified, for telemetering 750 Vdc switchgear bus potential, Device V-XD.
- 1 - Set of space heaters with ON-OFF switch (HS), blue indicating LED and ammeter (HAM) as specified.
- 1 - Lot nameplates as specified.

2.5 ANODE AND CATHODE BUSES

A. General

1. AC anode bus duct and DC positive and negative cathode buses shall be furnished for interconnection of the rectifier transformer, rectifier, the DC switchgear, and the negative bus. The Design Documents indicate the desired arrangement of AC and DC bus duct. A 15kV AC busduct shall also be provided to interconnect the two AC switchgear lineups at Red Bridge Substation. At the Design Conference, the DB Entity shall bring to MBTA's attention and approval any deviations the DB Entity proposes to make from the arrangement shown.
2. The following types of bus duct shall be furnished:
 - a. 15kV AC 1200A three phase busduct.
 - b. 600 Volt AC non-segregated phase anode bus duct assembly for connecting the rectifier transformer to the rectifier. Bus duct shall be complete with AC heaters for the outdoor sections of the equipment.
 - c. 750 Volt DC positive cathode bus duct assembly for connecting the rectifier positive terminal to the DC switchgear.
 - d. 750 Volt DC negative cathode bus duct assembly for connecting the rectifier negative terminal to the negative equalizer bus and drainage board.

B. Assembly Requirements

1. Metal Enclosure
 - a. Each bus duct assembly shall be metal enclosed, ventilated, non-segregated phase type, conforming to ANSI C37.20, except that an approved low impedance type bus duct may be applied as the anode bus, providing such requirement is dictated by the design of the transformer and rectifier package. The enclosure shall be fabricated from steel or aluminum as specified. Removable covers shall be provided to allow access to bolted bus connections and insulators for cleaning and inspection. Removable covers shall be secured with bolts to the frame.
 - b. Metal enclosures shall be finished in accordance with Article 1.15 of Section 16203. Two quarts of matching touch-up paint shall be shipped with the bus duct assemblies.
2. Copper Bus Bars
 - a. Bus bars shall be of high conductivity rectangular copper with round edges finished to required size by cold rolling or drawing. Bus bars shall have uniform shape and dimensions, free from defects in material and workmanship. All bus bars shall be individually insulated, properly supported and braced to each other and to the enclosure with approved, high quality, high strength, non-tracking insulators to withstand short circuit stresses to be encountered in use. AC and 750V DC positive bus bars shall be individually insulated. All bus taps and connections shall be tightly bolted. Contact surfaces of bolted joints shall be factory silver plated. The DB Entity may propose the use of non-insulated DC bus bars for acceptance by the MBTA. Busbars, joints and hardware shall conform to Article 1.06 of Section 16203.

- b. Bus bars shall be rated for the current and voltages specified. They shall be amply designed for continuous operation under the specified load conditions.
 - c. The temperature rise of bus bars at the hottest spot for the specified duty shall not exceed 65°C over an ambient of 40°C, thus limiting the maximum operating temperature of bus conductor to 105°C.
3. Lengths and Fittings
- a. Bus duct assemblies shall be supplied complete with connection flanges, taps, elbows, insulated housing sections, offsets, splicing plates, terminal connectors, and associated accessories. Bus duct assemblies shall be furnished in accordance with the arrangement, dimensions and details depicted on final, MBTA-accepted shop drawings.
 - b. The shipping sections shall be pre-assembled in the factory so that minimum installation is required at site. It is the responsibility of the DB Entity to furnish the equipment as specified here and shown on the Design Documents so that they can be installed as a complete, integrated system without any modifications or requiring additional materials and labor at site, except to carry out the manufacturer's installation instructions.
4. Hardware and Supports
- a. All hardware required to make the field connections between sections and terminations to the equipment shall be furnished in sufficient quantity.
 - b. Supports required for bus ducts between equipment enclosures shall be hanger type. Location of supports, arrangements of each support, anchoring details, and the support components shall be shown on DB Entity's equipment arrangement drawings and are subject to MBTA's acceptance. Supports for the positive cathode bus and the negative anode bus shall be provided with approved insulators to insulate the bus enclosure from building structure for a minimum of 1,000 Vdc. Insulation in hangers shall be installed a minimum of 6' from the ceiling.
 - c. The DB Entity shall provide calculations to demonstrate that the proposed hangers will support the weight of the equipment and also withstand the additional mechanical and thermal forces experienced during a short circuit condition.
5. Expansion Joints
- a. Expansion joints shall be provided by the DB Entity wherever required for proper operation of the equipment.
6. Induced Heating
- a. Bus ducts are intended for operation at high values of current. The design of bus ducts shall be such as to minimize the induced magnetic heating and induced circulating currents in the metallic enclosure of the bus duct, adjacent enclosures and supporting structures.
7. Insulated Sections

- a. Insulated sections of bus duct housing, where shown on the Design Documents, shall be designed for phase-to-ground potential existing in these sections. The material and detailed design of insulated sections are subject to MBTA's acceptance.

C. 15kV AC Bus Duct Assembly

- 1. The 15Kv AC bus duct assemblies shall meet all the applicable requirements of Article 2.05.B of this Section, conform to ANSI C37.20 and meet the following additional requirements:

Rated maximum voltage: 15kV, maximum
 13.8kV nominal

Rated insulation level (BIL): 95kV
power frequency withstand: 36kV (for one minute, dry)

- 2. Buses shall be rated to carry continuously 1200A. The temperature of the bus bars shall not exceed maximum limit of 105°C over a 40°C ambient under these loading conditions. The bus duct assembly shall be compatible in design and construction with the provisions made at the 15kV AC Switchgear and shall operate as an integral unit when assembled.
- 3. Enclosure of bus duct assemblies shall be ventilated, made of high strength, corrosion-resistant aluminum. AC bus with steel enclosure may be acceptable if the DB Entity can prove to the satisfaction of the MBTA that the induced magnetic heating will not increase the temperature of the enclosure above safe limits.
- 4. A single bus duct assembly shall be provided as shown on the Design Documents.
- 5. Bus enclosure(s) shall be grounded.
- 6. Suitable support of bus enclosures shall be provided as may be required to ensure a rigid structure and workmanlike installation of the system.
- 7. At both ends of the busduct, flexible bus conductor terminations shall be provided. The termination details shall be fully coordinated with the 15kV AC Switchgear specified in this Section. These connections shall be provided with an easily removable insulating boot.

D. 600 Volt AC Anode Bus Duct Assemblies

- 8. The 600 volt AC anode bus duct assemblies shall meet all the applicable requirements of Article 2.05.B of this Section, conform to ANSI C37.20 and meet the following additional requirements:

Rated maximum voltage: 635 Volts, maximum
 600 Volts, nominal

Rated insulation level
power frequency withstand: 2.2 kV (for one minute, dry)

- 9. Buses shall be rated to carry continuously the current of the rectifier transformer and rectifier operated at 160 percent of rated full load. The temperature of the bus bars shall not exceed

maximum limit of 105°C over a 40°C ambient under these loading conditions. The bus duct assembly shall be compatible in design and construction with the provisions made at the transformer and rectifier and shall operate as an integral unit when assembled.

10. Enclosure of bus duct assemblies shall be ventilated, made of high strength, corrosion-resistant aluminum. Anode bus with steel enclosure may be acceptable if the DB Entity can prove to the satisfaction of the MBTA that the induced magnetic heating will not increase the temperature of the enclosure above safe limits during the two hour overload cycle specified in Article 2.03.D of this Section, for the rectifier.
11. A single bus duct assembly containing the conductors from both secondary windings of transformer shall be provided as shown on the Design Documents. The DB Entity may furnish two separate anode bus ducts, one from each secondary windings of the transformer, only upon the acceptance of the MBTA.
12. Each anode bus duct assembly shall be provided with bus taps, rated not less than 1/3 of the continuous current rating of the main bus to enable connection of future bus ducts for harmonic suppression filters with minimum of labor and without involving drilling of main bus bars.
13. Grounded bus enclosure(s) shall be insulated from the high-resistance grounded rectifier enclosure by installation of boxed glastic or approved fiberglass sections in the vertical portion at the rectifier, providing a minimum of 6" clearance between the metal enclosure of bus duct and nearest metal on the rectifier. An acceptable alternate arrangement is an insulated section in horizontal bus run near the rectifier, providing a minimum 2' clearance between the metal bus enclosure and the nearest metal connected to the rectifier enclosure.
14. Suitable support of bus enclosures shall be provided as may be required to ensure a rigid structure and workmanlike installation of the system.
15. The bus conductors, because of the inherent characteristics of the circuit, remain at a DC potential relative to the bus enclosure while energized. Construction of the bus duct and the materials used shall be proper for this type of service.
16. At both transformer and rectifier, flexible bus conductor terminations shall be provided. The termination details shall be fully coordinated with the rectifier transformer specified in Article 2.02 and rectifier in Article 2.03 of this Section. These connections shall be provided with an easily removable insulating boot.
17. Space heaters rated 240 Vac, operating at 120 Vac, shall be provided in all outdoor bus duct sections to prevent condensation. The space heaters shall be completely factory wired with no exposed wiring inside the bus housing. Heaters shall be thermostatically controlled. The entire circuit shall be wired to an accessible terminal block providing for a single connection to the 120 Vac power source. Space heaters shall be accessible from the outside of the bus duct. A drip shield will be provided over the space heater opening to prevent entry of water into the enclosure. The bus duct heater power supply shall be provided from the rectifier transformer control compartment.
18. A fire resistant divider or barrier shall be provided at all points where the bus duct extends through the building wall. The barrier shall have a minimum rating of (3) three hours. The DB Entity shall propose suitable material for this purpose.

E. DC Positive and Negative Cathode Bus Assemblies

1. DC cathode bus assemblies shall meet all the applicable requirements of Article 2.05 of this Section, and conform to ANSI C37.20 and shall meet the following additional requirements. Current ratings shown are applicable for use with 3,000 kW rectifiers:

Rated maximum voltage: 750 Volts

Rated continuous current: 8000 Amperes

2. Cathode bus assemblies shall be rated to carry continuously the current of their associated rectifier operating at 160 percent of full load. The temperature of the bus shall not exceed a maximum limit of 105°C over a 40°C ambient under these loading conditions. The bus duct assembly shall be compatible in design and construction with the rectifier and DC switchgear and shall operate as an integral unit when assembled.
3. Enclosure of bus duct assemblies shall be ventilated, made of high strength, corrosion-resistant aluminum.
4. DC cathode bus enclosures and supports shall be insulated from building structure for 1000 Volts. In addition, the bus enclosures shall be insulated from the high-resistance grounded rectifier enclosure and the high-resistance grounded dc switchgear enclosures by installation of boxed glastic or fiberglass sections in the vertical portions at the rectifier and DC switchgear. This insulation shall provide a minimum of 6" clearance between the metal enclosure of bus duct and nearest metal on rectifier or DC switchgear. An acceptable alternate arrangement is an insulated section in horizontal bus run near the rectifier and DC switchgear, providing a minimum two foot clearance between the metal bus enclosure and the nearest metal connected to the rectifier enclosure or DC switchgear enclosure. A suitably sized jumper across the insulating collar at the DC switchgear shall be provided in accordance with Article 2.04.B.10 of this Section.
5. Suitable support of bus enclosures shall be provided as required to ensure a rigid structure and workmanlike installation of the system.
6. To enable connection of future harmonic suppression filters, the cathode bus assembly shall be provided with bus taps, rated not less than 1/3 of the continuous current rating of the main bus. The exact location where the tap will be provided in the bus shall be furnished by the DB Entity for acceptance of the MBTA. Taps provided shall enable connection of future bus connection with minimum of labor and without involving drilling of main bus bars.
7. Flexible terminations shall be provided at each end of positive and negative cathode buses for connecting the bus conductors to equipment. Positive and negative bus termination details shall be fully coordinated with the rectifier specified in Article 2.03, the DC switchgear specified in Article 2.04 and the negative equalizer bus and drainage board in Article 2.06 of this Section. All flexible connections shall be provided with an easily removable insulating boot.

2.6 NEGATIVE EQUALIZER BUS AND DRAINAGE BOARD

A. General

1. Negative drainage boards shall be provided, located as shown on the Design Documents. The negative drainage board shall contain the negative equalizer bus. Negative leads of the rectifiers shall be connected to the negative equalizer bus through a negative lead disconnect switch. The negative drainage board shall have provisions to accommodate future negative drainage board equipment to include three bonding cables from the AC switchgear insulated ground bus each connected to the negative equalizer bus through an assembly of one blocking diode and one drainage contactor. The diode shall be rated 600 A, 400 V for each of the three bonding cables.

B. Structure

1. The negative drainage board shall consist of a freestanding panel containing the negative equalizer bus, rectifier negative lead disconnect switches, Device 89N, and connectors for the negative return cables. The negative drainage board shall be equipped with nine units each comprising a contactor, blocking diode, shunt and isolation amplifier.
2. The drainage contactors shall be of the latched-in type, open rear connected, single pole rated 600 Vdc, 600 Ampere, having high contact pressure and rapid arc quenching properties. Operating and reset coils shall be rated for operation on 125 Vdc. A minimum quantity of six (6) contactors shall be provided as shown on the Design Documents. The DB Entity may propose using three 3-pole contactors for this purpose subject to acceptance by the MBTA.
3. Contactors shall be mounted on the panel as shown on the Design Documents and shall be factory wired to the negative equalizer bus. Contactors shall be provided with a four digit register type operations counter. The negative panel shall be fitted with doors containing viewing windows.
4. All contactors shall be electrically interlocked with the rectifier main DC breakers so that all the contactors will be in the closed position as long as at least one DC main breaker is closed. All the contactors shall automatically trip open when both the rectifier main DC breakers are open. All circuits requiring external connections shall be factory wired to an easily accessible terminal box for connection to field wiring.
5. A blocking diode rated 600 A, 400 V and a shunt rated 600 A, 50mV shall be provided, connected in series with each drainage contactor.
6. An isolation type transducer, as specified in Article 1.11.B of Section 16203, shall be provided for each drainage circuit connected to shunt leads for telemetering drainage current. These indications shall be available at the drainage board ready and provided through the SAS system for future use by SCADA.
7. The DB Entity shall provide a nameplate, mounted above the operating handle of each switch engraved "DO NOT OPEN UNDER LOAD". The nameplate shall have white letters. ½" high, minimum, on red background. The legend for the nameplates shall be submitted to the MBTA for acceptance.
8. Panel frame shall be fabricated from steel members of sufficient strength to provide rigid support for the negative equalizer bus and all devices. A 2" thick, minimum, insulating board shall be provided for mounting the negative disconnect switches and the drainage

contactors. The front face below the insulating board and the sides of the structure shall be enclosed with sheet steel plates.

9. The insulating board shall be 2" thick and shall have high mechanical and dielectric strength, be impervious to moisture, be non-tracking and be able to withstand high temperatures without disintegration. The front surface shall be smooth and true. The edges shall be beveled for ¼". Material for the insulating board shall be subject to acceptance by the MBTA. DB Entity shall submit material data sheets for the proposed insulation material.
10. The negative bus and drainage board panel shall be sufficiently sized to accommodate the incoming negative bus ducts, negative disconnect switches (Device 89N), outgoing negative return cables, control cables, outgoing drainage feeder cables and other specified accessories. The negative buses and negative control cables, negative return cables and drainage cables shall enter from above or below as shown in the Design Documents.
11. All metal surfaces shall be finished in accordance with Article 1.15 of Section 16203. One quart of matching touch-up paint shall be shipped with the board.

C. Negative Bus and Power Terminations

1. The negative bus shall run the full length of the panel. The negative equalizer bus shall have the same continuous current rating as the DC switchgear main bus. The bus shall be supported on insulators with bus clamps mounted on the back of the panel. Taps shall be provided for connecting to the negative disconnect switches. Negative equalizer bus and bus taps shall be of copper, provided in accordance with Article 1.06 of Section 16203. All bus taps and connections shall be tightly bolted. Contact surfaces of bolted joints shall be factory silver-plated.
2. Heavy duty bolted type terminal lugs having NEMA four-bolt cable clamp and four-bolt tongue shall be provided in accordance with Article 1.07 of Section 16203 for up to twelve (12) 2000 kcmil copper conductor negative return cables. Terminal lugs shall be arranged for disconnecting any cable without disturbing the remaining cables. Back-to-back mounting of terminal lugs is not acceptable. Individual supports for each cable shall be provided near the cable terminal. The use of nylon ty-wrap type cable ties for individual cable supports will not be acceptable.

D. Negative Bus Disconnect Switch

1. The negative bus disconnect switch shall be single pole, open type, rated for operation on 750 Vdc. The switch shall have the continuous current rating of 8,000 Amperes. The switch shall be mounted in the rear of the panel. One switch terminal shall be directly connected to the negative equalizer bus, the second shall be arranged for connection to the negative cathode bus from its associated rectifier. All connections shall be made with a minimum of four ½"bolts. Switch shall be operable by an insulated handle from the front.
2. Switch shall be equipped with a mechanical lock or catch to hold it firmly in either open or closed position. Nameplates shall be provided to indicate the open and closed position of switch. Nameplates shall also be provided to indicate the rectifier number to which the negative disconnect switch is connected to.

3. Switch shall be provided with a key interlock, as described in Article 1.13 of Section 16203, to prevent closing or opening of the switch unless the associated rectifier main DC circuit breaker is open. An auxiliary switch shall also be provided, having at least eight independent contacts with four open when the switch is closed and four closed when the switch is open, for remote trip and alarm. Switch shall be of the bolted pressure contact type with a proven record and verifiable references for similar application.
4. Auxiliary switch shall be wired to the negative bus and drainage board IED for use in the substation automation system.

E. Surge Arrester

1. An approved surge arrester shall be provided, rated for 750 Volt DC nominal service, factory wired from negative bus to equipment ground terminal.

F. Control Sources

1. Each separate compartment within the negative drainage board shall be provided with an electric strip heater of adequate size to prevent condensation within the compartment. All heaters installed shall be monitored by means of an ammeter scaled and marked for the heater load. Each individual heater circuit shall be provided with blue LED indicating lamp to indicate operation of the heater, and an ON-OFF switch. Heaters shall be provided with properly designed guards to protect operating personnel against accidental contact with hot surfaces.
2. A fluorescent lighting fixture with conveniently located and properly labeled toggle switch, rated 250 Volts minimum, shall be provided in each compartment of the switchgear which contains disconnect switches, relays, control devices and outgoing wiring terminal blocks. Incandescent lighting will be acceptable only for compartments where, in the opinion of the MBTA, the installation of fluorescent lighting fixtures would be impractical. The lighting toggle switch shall be located on the exterior of the negative drainage board enclosure. In addition, a duplex receptacle, rated 250 Volts, 20 amperes minimum, shall be provided on the exterior of the enclosure connected for 120 Volt service. The outlet boxes of light receptacles, light switches and plug receptacle shall be insulated from switchgear enclosure for a minimum of 1,000 Vdc.
3. One single phase, two wire, 120Volt, 60 Hz supply bus shall be provided to provide power to the heaters, lighting and receptacle circuits. The supply bus shall be connected at each cubicle through fusible pull-out disconnects with cartridge-type fuses located in inside the control area. The fuse holders shall be insulated from enclosure for 1,000 Vdc. All necessary fuses shall be furnished with the equipment. In addition, a minimum of 10 percent, but not less than two, spare fuses of each rating shall be furnished. The supplies shall be wired to screw type terminal blocks, insulated from the enclosure for 1,000 Vdc

G. Nameplates

1. Equipment identification nameplates shall be engraved "NEGATIVE EQUALIZER BUS AND DRAINAGE BOARD".
2. In addition to nameplates specified for equipment and devices in Article 1.08 of Section 16203, the DB Entity shall provide a nameplate, mounted above the operating handle of the

switch, engraved "DO NOT OPEN UNDER LOAD". The nameplate shall have white letters, ½" high, minimum, on red background.

3. Nameplates shall be submitted to the MBTA for acceptance.

2.7 15 kV BREAKER CONTROL AND INSTRUMENT PANEL (ACCP)

- A. The 15 kV breaker control and instrument panel (also called the AC common control panel) is intended to be used in conjunction with the substation HMI, for the local and remote control of all substation 15 kV circuit breakers except for the rectifier transformer breakers.
- B. Structure
 1. The panel shall be finished inside and outside in accordance with Article 1.15 of Section 16203.
 2. The control and instrument panel shall be a rigid, self-supporting, electrically welded steel structure fabricated from not less than 12 gauge formed sheet steel. The panel shall have the configuration and dimensions shown on the Design Documents and shall be fully insulated from the DC switchgear to ensure integrity of the high resistance grounding requirement.
 3. Hinged, full access single doors shall be provided in at the front of the enclosure. If necessary, an interior swing out panel may be proposed. Doors shall be formed of sheet steel and shall be properly reinforced against distortions by suitable flanges and stiffening members. Hinges shall be heavy duty of type to be accepted by the MBTA. If double doors are proposed, the doors shall be of the overlapping design. The doors shall be furnished with 3-point latching mechanism and key-locking handle. Doors shall be provided with stops to hold them securely in the open position. A single rear access door meeting the above requirements may be proposed by the DB Entity for acceptance by the MBTA where the door proposed will be less than 30" wide.
 4. The control panel enclosure shall be provided with electric space heaters of adequate size to prevent condensation within the panel. The heaters shall be monitored by means of an ammeter, marked for heater normal load. The heater circuit shall be provided with a blue LED indicating lamp to indicate operation of the heater and an ON-OFF switch. Heaters shall be provided with properly designed guards to protect operating personnel against accidental contact with hot surfaces. The space heaters shall be rated for operation on 120V, 60 Hz supply.
 5. The cabinet shall be provided with vent louvers to allow ventilations and ensure that heat buildup is not excessive for the electronic equipment. The louvers that shall be fitted with internal vent filters to protect from entry of dust and dirt. Filters shall be removable for cleaning and/or replacement.
- C. Arrangement of Devices
 1. Control and selector switches Devices 01 and 43 and indicating instruments shall be arranged to mimic the layout of the 15kV switchgear as shown on the Design Documents. Breaker control switches and breaker control mode selector switches are specified in Article 2.04 of this Section.

2. The ACCP shall house a SAS IED to integrate the AC switchgear controls and analog indications into the substation automation system.

D. Wiring and Terminal Blocks

1. All wiring shall be No. 12 AWG, stranded tinned copper, in accordance with Article 1.09 of Section 16203 unless otherwise specified.
2. Circuits requiring external connections shall be factory-wired to readily accessible terminal blocks rated 600 Volts as specified in Article 1.09 of Section 16203.
3. All necessary cable supports shall be provided with the ACCP for supporting the incoming control, indication and communication cables.

E. Meters, Switches, Indicating Lights

1. Indicating instruments, control and selector switches and indicating LEDs shall be provided in accordance with Article 1.10 of Section 16203 and as shown in the Design Documents.

F. Control Sources

1. A fluorescent lighting fixture with conveniently located and properly labeled toggle switch or door operated switch, rated 250 Volts minimum, shall be provided in each compartment which contains disconnect switches, relays, control devices and outgoing wiring terminal blocks. Incandescent lighting will be acceptable only for compartments where, in the opinion of the MBTA, the installation of fluorescent lighting fixtures would be impractical. In addition, a duplex receptacle, rated 250 Volts, 20 amperes minimum, shall be provided connected for 120 Volt service.
2. One single phase, two wire, 120Volt, 60 Hz supply bus shall be provided to provide power to the heaters, lighting and receptacle circuits. The supply bus shall be connected at each cubicle through fusible pull-out disconnects with cartridge-type fuses located in inside the control area. The fuse holders shall be insulated from enclosure for 1,000 Vdc. All necessary fuses shall be furnished with the equipment. In addition, a minimum of 10 percent, but not less than two, spare fuses of each rating shall be furnished. The supplies shall be wired to screw type terminal blocks, insulated from the enclosure for 1,000 Vdc

G. Nameplates

1. Nameplates shall be provided in accordance with Article 1.08 of Section 16203.
2. Panel identification nameplates shall be provided in front and rear of the panel, engraved "15 kV BREAKER CONTROL AND INSTRUMENT PANEL".

H. Detailed Equipment Requirement

1. Panel shall contain, but not be limited to, the following equipment and devices; Quantities shall be as shown on the Design Documents.
 - Control switches, TRIP-CLOSE with green and red indicating LEDs, Device 01

- Breaker control mode selector switches LOCAL-HMI-OFF-SUPV, Device 43
- Indicating bus voltmeters, transformer rated, 0-18 kV scale
- Indicating feeder voltmeters, transformer rated, 0-18 kV scale
- Ammeters (digital multifunction meters may be provided as shown in the Design Documents)

One - Lot of terminal blocks and wiring

One - Lot of nameplates

One - Set of space heaters with ON-OFF switch, blue LED light and ammeter

One - AC Watt-hour demand totalizer for totalizing the KWHr demand of 52-L1 and 52-L2. Meters shall interface with the substation automation system to provide output to SCADA.

One - One set of equipment as necessary to interface the ACCP equipment with the substation automation system i.e. IED / DIO for integrating all devices into the SAS

2.8 STATION BATTERY, CHARGER AND ACCESSORIES

A. General

1. The station battery will serve as the primary source of ungrounded 125 Vdc control power for AC and DC circuit breakers, rectifiers, and station auxiliary systems located in the substation.
2. One complete station battery system shall be furnished, including rack, charger, on-line battery monitoring system, distribution panel and accessories. The station battery shall be connected to the main circuit breaker of the 125 Vdc distribution panel and the charger to the DC distribution panel through a branch circuit breaker. Thus connected, the equipment can be used to supply the 125 Vdc control power system from the station battery and charger operating in parallel, or from the station battery alone, or from the charger alone. See Figure 1 below.

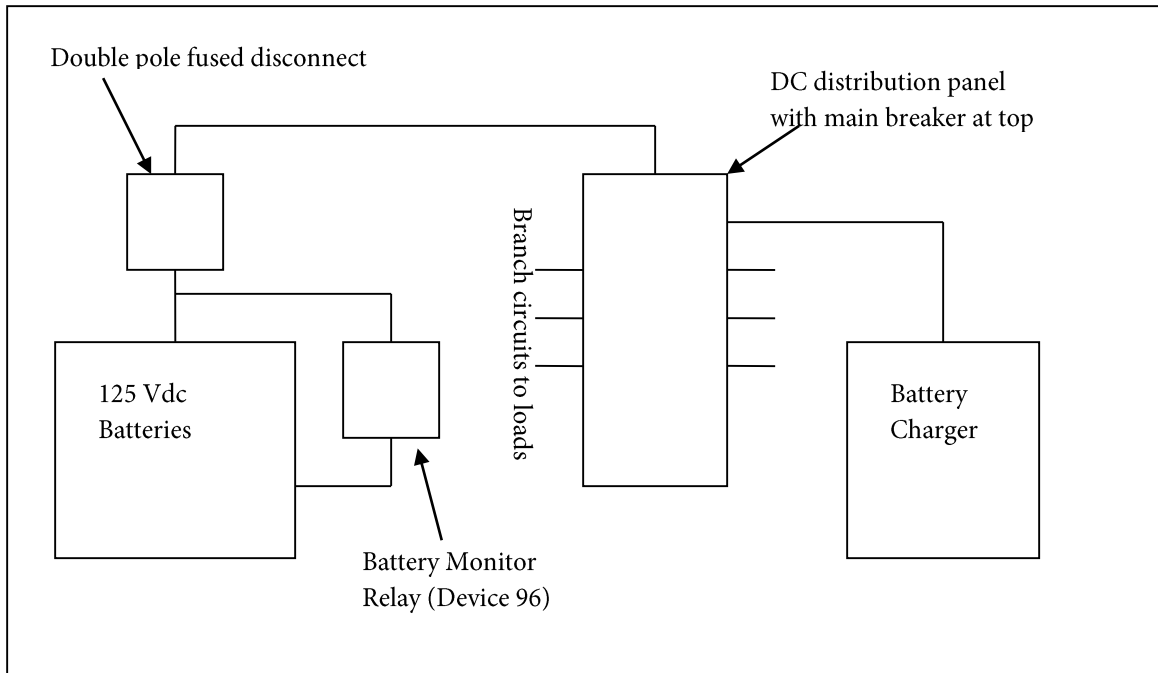

Figure 1

3. Provide a spill containment and absorption system for MBTA's acceptance.
4. All equipment shall be suitable for indoor installation as shown on the Design Documents.

B. Station Battery

1. Station battery shall be of an approved pasted plate type, designed for switchgear service. Battery, as applied, shall give a minimum of 20 years of satisfactory service with a minimum amount of maintenance. Under normal operation the station batteries will be operated in the steady float mode of charging with periodic equalizing and cycling as required by the manufacturer's operation and maintenance guidelines. The station batteries will not be deep-cycled under normal circumstances.
2. Each station battery shall consist of 60 cells connected in series for a nominal 125 Volt, ungrounded, control power system. Each cell or group of cells shall be housed in a heat resistant, shock absorbing clear plastic container (jar) of extra strength which will not deteriorate or become cloudy upon exposure to the electrolyte. Covers shall be cemented in place to form a permanent, leak proof seal. Each cell shall be provided with a filler opening fitted with a safety cap to prevent explosion of internal cell gases due to an external spark or flame. Sufficient sediment space shall be provided for the normal life of the battery.
3. Each cell jar shall be legibly and permanently marked with the manufacturer's name or trademark, cell type, eight hour discharge rate, ampere-hour capacity, electrolyte level and month and year of manufacture.
4. Cell terminal posts shall be of lead-alloy (with or without solid copper insert), clearly and permanently marked for polarity. Cell posts shall be equipped with approved lead covered or stainless steel terminal bolts and nuts. Lead covered solid copper intercell connection straps

shall be provided as required for interconnection of the individual cells. Interconnections shall be arranged to allow the removal of each cell from the battery. Battery terminals shall be furnished with approved lead covered, bolted type terminal lugs for external wiring. Cell posts, connection bolts, straps and terminal lugs shall have ample current carrying capacity and sufficient contact surface to provide for maximum discharge current of the battery. All hardware shall be sized to be compatible with the ratings required per Paragraph 7 below.

5. The terminals through the cell cover shall be sealed against seepage of electrolyte by burned-on seal rings, to ensure a clean, dry battery.
6. The batteries shall be of required ampere-hour capacity to supply the high discharge rates necessary to close and trip the specified number of 15 kV AC circuit breakers and 750 Vdc circuit breakers consecutively after the battery has supplied, without assistance from a charging source, the lower rate continuous load for 12 hours.
7. It shall be the responsibility of the DB Entity to determine the required battery rating, and to fit the battery into the space shown on the Design Documents. The DB Entity's proposed battery rating will be subject to acceptance by the MBTA. Battery rating shall be based on IEEE Standard 485 calculations, *IEEE Recommended Practice for Sizing Lead-Acid Batteries for Stationary Applications*, and the equipment loads shown on the following table. The voltage of the battery, when supplying the specified loads, shall at no time drop below 105 Volts or 1.75 Volts per cell, including the IR drop of inter-cell connections. Calculations shall be performed at an ambient temperature of 50°F.

	<u>Amperes</u>	<u>Assumed Load Duration</u>	<u>Interval of Load Application</u>
MBTA's Load	3.0A	12 hours	Continuous
Substation Automation System – including HMI	*	Continuous	Continuous
Control circuit load	*	12 hours	Continuous
Closing 8 – 15 kV breakers consecutively	*	30 sec.	30 sec. Apart
Closing 8 - DC breakers consecutively	*	30 sec.	30 sec. Apart
Tripping 8 - 15 kV breakers by Device 86B	*	30 sec.	Simultaneously
Tripping 8 - DC breakers	*	30 sec.	Simultaneously

*- Load to be determined by the DB Entity

8. Battery shall be delivered wet, fully charged (over 90% of rated battery capacity), ready for service, suitable for storage at site for at least three months from shipping date without deterioration.
9. The battery shall be lead-acid type, with flat pasted plates and lead-calcium alloy grid, Enersys type CC, EC or approved equal. Calcium alloy grids drastically reduce the frequency of watering when the battery is float charged and seldom cycled, and is therefore a mandatory

requirement of the specification. C&D Technologies KCR Lead-Calcium batteries meeting all specification requirements will also be acceptable.

10. Battery shall be furnished with accessories for normal operation and maintenance, including the following:
 - a. Two portable thermometers of adequate size to be read easily and accurately.
 - b. Two syringe type portable hydrometers of adequate size to be read easily and accurately.
 - c. A cell lifter.
 - d. An electrically insulated torque wrench for battery terminal connections.
 - e. A container of protective coating for battery terminals as recommended by the manufacturer.
 - f. An approved corrosive resistant wooden or metal cabinet suitable for wall mounting to house accessories. Drip-proof containers shall be provided for the portable thermometers and hydrometers.

11. The DB Entity shall furnish the MBTA with the following information for the provided battery. The DB Entity shall complete the table below and provide it with the design submittal for acceptance.

No.	Description	Equipment Information:
a.	Manufacture and type of battery	
b.	Ratings (to final voltage of 1.75 volts per cell, at 25°C):	
	Ampere rating for 8 hour discharge	
	Ampere rating for 1 hour discharge	
	Ampere rating for 1 minute discharge	
c.	Number of plates per cell	
d.	A complete description of separators and plate separation	
e.	Number of cells per jar	
f.	Overall dimensions of jar	
g.	Weight of complete jar with electrolyte	
h.	Type of connectors	
i.	Quantity of electrolyte per cell	
j.	Specific gravity of electrolyte when battery is fully charge at 25°C	
k.	Material used for covers and jars	
l.	Description of cell posts and terminals	
m.	Station battery loads used in sizing batteries. Calculations to be performed at an ambient temperature of 50°F.	

C. Combination Power Supply and Battery Charger

1. The combination power supply (“battery eliminator”) and battery charger furnished will be utilized for supplying nominal 125 Vdc to control and relay circuitry and for float charging the station battery. It shall be rated for operation on a 208 Volt, three-phase, 60 Hz supply.
2. The charger shall be convection cooled, solid state, full wave rectifier type. No internal cooling fans will be permitted. The rectifier shall consist of hermetically sealed units of silicon controlled rectifiers of adequate voltage and current rating for this service. The diodes shall be mounted on heat dissipating fins of proper size to limit the junction temperature of the diodes to a safe value.
3. The power supply shall consist of a three-phase isolation transformer and a rectifier with an adjustable regulated voltage and current limiting feature. Regulation shall vary less than plus or minus one percent at any control setting. It shall be adjustable between 127 and 140 Vdc and shall be capable of sharing the load with the battery when the load current exceeds a preset value. The preset current setpoint value shall be adjustable between 90 and 120 percent of the power supply continuous rating.
4. To function as a battery charger, the power supply shall have two separate voltage adjustments: one for float charge, adjustable between 115 and 140 Volts; the second for equalizing charge, adjustable between 124 and 150 Volts. A manually adjustable 0-72 hour timer shall be provided to control the charging and equalizing cycle. All of these adjustable functions shall be enabled with control knobs on the front of the charger panel.
5. The charger shall be provided with current limiting circuitry to keep the output of the charger within the safe operating limits under all loading conditions and during severe overloads. The circuit shall continuously monitor the load current and when the current begins to exceed charger rating (as may be the case of recharging depleted battery while supplying other DC loads in the substation), a feed-back feature provided as part of the circuit shall keep the output current within 110 percent of rated. The charger shall be designed to operate continuously at this rating without damage to any circuit components. The current-limiting mode of operation shall not cause the tripping of input (AC) or output (DC) circuit breakers. The input circuit breaker shall trip only in case of component failure and high DC output voltage; the output circuit breaker shall trip in the case of an external fault.
6. A blocking diode shall be provided in the output circuit, to prevent battery discharge through the charger in the event of AC power failure.
7. The power supply shall be capable of concurrently carrying the constant load of the associated battery and fully charging the battery within six hours after the batteries have been discharged to 1.75 Volts per cell, and shall be able to carry the entire battery load in the event of a battery failure. The power supply shall be capable of operating safely at building ambient temperatures from zero °C (32°F) to plus 50 °C (122°F).
8. The battery charger shall also be capable of functioning as a “filtered battery eliminator” to operate as a DC power supply without batteries. Filtered silicon controlled rectifiers shall be provided for this purpose to minimize output ripple voltage to 30mV rms or 0.06% of nominal output voltage, whichever is higher.

Since the associated battery is not considered to be part of the output filtering network, electrolytic capacitors may be used to smooth-out the high magnitude output ripple voltage, provided such capacitors have protective circuitry and are 50 percent in excess of the

capacitance value required for 0.06% ripple and are rated for operation at 100°C. In such case, three capacitors shall be used of such value that two will limit the ripple to 0.06%. The third capacitor is to be considered a spare which must be kept energized to prevent deterioration.

9. The battery charger shall include a “temperature compensation” feature to automatically adjust charger output voltage based on changes in ambient temperature.
10. All solid state electronic circuit components shall be provided with surge and transient voltage protection.
11. The power supply circuit components and control devices shall be mounted in a free-standing, floor mounting cabinet, with the base fabricated from not less than 12 gauge sheet steel and the enclosure sides and top fabricated from not less than 16 gauge sheet steel. The internal equipment shall be mounted on a panel of insulating material, supported on a swinging steel frame. The frame shall form a component part of a self-supporting steel cubicle. Heavy components such as reactors, transformers and other iron core devices shall be supported by bracing to the swinging steel frame. A swing-out panel may be omitted in the power supply and battery charger unit only if all components are accessible from the front for easy maintenance, removal and inspection and the arrangement meets MBTA's acceptance. Conduit knockouts shall be provided at appropriate locations.
12. Each resistor, capacitor, transformer and similar device shall be inscribed with an approved lettered identification corresponding to the apparatus or device with which it functions and as identified on the schematic and wiring diagrams. The proposed inscriptions should be identified on the equipment nameplate list which shall be provided with the design submission.
13. The cabinet shall have hinged full-access front door. Door shall be securely fastened in the closed position with a minimum of two latches easily opened without the use of tools. Arrangements shall be made to hold door securely in the open position.
14. Control wiring of circuits operated on 60 Volts AC or DC, or higher, shall be No. 14 AWG or larger, stranded tinned copper switchboard wire in accordance with Article 2.01.D of Section 16203. No. 18 AWG wire will be acceptable for low-voltage, low-energy control circuits only.
15. Circuits requiring external connections shall be factory-wired to terminal blocks, readily accessible for connection to field wiring.
16. Finish of equipment, inside and out, shall be thoroughly cleaned and rust-proofed, painted with one coat of approved rust inhibiting primer and a minimum of two coats of acid resistant ANSI No. 61 gray paint.
17. Battery chargers with microprocessor controls and associated extensive use of printed circuit boards are not considered to be an acceptable "equal" to the above specification. Any charger submittal with microprocessor controls shall be rejected.
18. The equipment for the power supply and battery charger shall include, but not be limited to, the following:

- (a). One - Three-phase isolation transformer in accordance with paragraph C.3 above.
 - (b). One - Charger rectifier unit and associated control equipment.
 - (c). One - Large scale DC switchboard type ammeter for charger DC output with suitable scale. Minimum face dimensions shall be 2" x 3".
 - (d). One - Large scale DC switchboard type voltmeter, 0-150 Volt scale. Minimum face dimensions shall be 2" x 3".
 - (e). One - 250 Volt, 3-pole alternating current molded case circuit breaker on the AC input.
 - (f). One - 250 Volt, 2-pole direct current molded case circuit breaker on the DC output.
 - (g). One - Set of alarms/status indications monitoring AC input undervoltage (Device 27BA), AC input overvoltage, DC output overvoltage (Device 59), DC output undervoltage (27BB), charger failure, ground fault detection and a common alarm relay providing a summary alarm for any one or all of the alarms stated above. Each alarm shall be provided with a red indication LED mounted on the front of the charger, appropriate time delays on alarm and shall be auto reset. Two sets of isolated, dry, form C contacts shall be provided for each alarm point with all contacts being wired to suitable terminal blocks for field wiring interconnections.
 - (h). One - Indicating LED test switch to verify correct operation of the indication lights.
 - (i). One - Large-scale 72-hour manually operated timer with sufficient contacts to switch the regulatory section of the power supply between float charge and equalization charge settings.
 - (j). One - Battery Fused disconnect switch to facilitate isolating the batteries from the DC distribution panel and charger. The fused disconnect switch shall be suitably located adjacent to the battery rack. The DB Entity can request instructions to the MBTA (see Figure 1).
 - (k). One - AC voltmeter for monitoring the incoming supply. Minimum face dimensions shall be 2" x 3".
19. In addition to nameplates specified in Article 1.08 of Section 16203, furnish a nameplate on the door of the cabinet engraved: "125 VOLTS DC POWER SUPPLY". Nameplate shall have white letters, 1/2" high on red background. In addition, the battery charger shall be provided with a permanently attached equipment rating plate stating the manufacturer's name, equipment model number, serial number, and electrical ratings.
20. Each battery charger/eliminator shall be shipped with a maintenance manual, which shall include a troubleshooting guide and schematic drawings for all component systems.

D. Battery Rack

- 1. The DB Entity shall provide a two-step rack for mounting the individual jars of the station battery.
- 2. Battery racks shall be constructed of galvanized steel rails, frames and braces, bolted together to form rigid, free-standing structures. Racks shall be furnished with plastic channels with a 1000 V minimum dielectric strength for mounting the battery cells. The rack assembly shall

be designed to withstand Uniform Building Code Zone 2A seismic forces for the Boston, Massachusetts metro area.

3. All steel members shall be thoroughly cleaned and rust-proofed, painted with one coat of approved rust inhibiting primer and a minimum of two coats of acid resistant ANSI No. 61 gray paint.
4. All assembly hardware shall be provided, including a battery rack frame ground connection point.

E. On-Line Battery Monitoring System

1. Provide an on-line battery monitoring system that can monitor the performance of each battery cell at each of the MBTA traction power substations, store the performance data locally, and distribute this information to two central PCs. Each monitor shall be supplied complete with all required battery cell wiring for connecting each battery post to the monitor, associated connection hardware, current transducers, temperature transducers, fuses, and any other hardware needed to complete the assembly of the battery monitoring system at each substation.

The system shall also include the necessary software to be installed at the two central PCs that are capable of managing the remote battery monitors and able to auto poll each system on a programmed schedule from a modem connection, Ethernet connection, or a combination thereof. This software shall be capable of receiving and archiving the measured data from each monitor, recalling and sorting it, printing and/or plotting it, and facilitating the observance of trends in the data which signify deteriorating conditions in a proactive manner. The software shall have a real time monitoring mode to allow a graphic presentation of real time voltage, temperature, and discharge data during a discharge test or live discharge event.

Each substation battery monitor shall have the capability of sending an alarm automatically to the central PCs when an alarm condition has been detected.

OR

Each substation battery monitor system shall also be capable of integrating with the substation automation system to provide all status, polling, archiving data as described above and shall be capable of integrating fully with the battery monitoring software.

2. Detailed specifications for each battery monitors are summarized as follows and shall equal or exceed the product specifications of Albercorp's MPM-100 Multi-Purpose Monitor:
 - (a). String Capacity: Each monitor shall have the capacity to monitor 60, 2-volt cells connected in series to provide a string voltage of 120 volts.
 - (b). Input Power: The monitor shall be DC powered from the 120 volt station battery system.
 - (c). Operating Temperature Range: 41 to 104 degrees Fahrenheit.
 - (d). Humidity: 0 to 80% RH (non-condensing) at 5 to 31 degrees Celsius; 0 to 50% RH (non-condensing) at 32 to 40 degrees Celsius.

- (e). Cell Voltage:
 - a. 0 to 4.000 volts; 0.1% of reading +_1mV.
 - b. 0 to 16.0 volts; +-20mV.
- (f). Cell Voltage Channel:
 - a. 2V range: (0-4V), 0.1%+_1mV
 - b. 4V range: (0-8V), 0.1%+-2mV.
 - c. 6V range: (0-8.5V), 0.1%+-2mV.
 - d. 8V range: (0-10V), 0.1%+-10mV.
 - e. 12V range: (0-16V), 0.1%+-10mV.
- (g). Cell Resistance: 0 to 32,000microOhms, 5% of reading +-1micro-ohm.
- (h). Inter-tier Resistance: 0 to 5milliOhms, 5% of reading +-5 micro-ohms.
- (i). String Voltage: 0 to 150 volts, 0.1% of reading +-0.1V.
- (j). Discharge Current: 0 to 4000Amps, +-5% of full scale using current transformer.
- (k). Temperature: 0 to 80 degrees Celsius, +-1 degree Celsius.
- (l). Float Current: 0 to 5000mA, +-50mA.
- (m). Communication:
 - a. One USB port
 - b. One modem serial port
 - c. One RJ-45 connection port or RS-232 connection port.
 - d. Protocols: MODBUS and SNMP
- (n). Local Data Storage:
 - a. E2 nonvolatile memory for calibration constants, alarm levels, telephone numbers, and setup information.
 - b. 100 alarm events in revolving nonvolatile memory.
 - c. 32K bytes of discharge data in nonvolatile memory.
 - d. 1.6K bytes resistance test records.
 - e. 1.65K bytes historical data.

- f. Flash memory for firmware upgrades.
3. Measurement Capability
- (a). Individual cell voltage
 - (b). Individual cell DC resistance accomplished by applying a momentary load at user defined intervals.
 - (c). Individual intertier resistance measurements performed at user defined intervals.
 - (d). Total overall battery voltage per string.
 - (e). Ambient or pilot cell temperature per string for temperature trending.
 - (f). System discharge logging of the overall voltage, individual cells, discharge current, and temperatures.
 - (g). Float current per string.
4. System Hardware Requirements
- (a). LEDs indicating alarms, communications, and processor status.
 - (b). Wiring harnesses with supplied connectors to be terminated in the field during installation.
 - (c). Individual fused leads to each battery cell/jar for resistance test load cables, and resistor terminated leads for voltage sense.
 - (d). Ring connector terminals at each connection.
 - (e). Ambient temperature probes, electrolyte temperature probes, shunt and shunt adapters, current/float cable assemblies, float current measurement transducer for each string, float charging current probes, external network interface equipment including necessary cables, and current and voltage transducers.
 - (f). “U” wall mount bracket for mounting each monitor to a concrete wall.
 - (g). One USB port for connection of a laptop for local data viewing or service.
5. System Software Requirements
- (a). The software shall operate on the Windows 7 Professional, Windows 2000, and XP compatible software for data analysis, display, archiving, and trending.
 - (b). The software shall be responsible for maintaining a database of all information gathered from the monitors for future analysis and reporting.
 - (c). The software shall be configurable for wither a central, local or service computer application. The central configuration shall be responsible for permanently removing

any data that may reside in the monitor E2 memory. The local configuration will not permanently remove data from E2 memory and will allow it to remain for the central computer. The service configuration will allow service technicians to call for real time analysis from any accessible phone line.

- (d). The software shall be able to auto-poll multiple monitoring systems on a programmed schedule.
6. Password Protection: The battery monitoring system shall require a password to allow any programming or calibration changes either via remote connection or local connection.
7. System Performance
- (a). The battery monitoring system shall monitor, display, and record the battery bank voltage, battery discharge current, individual cell voltages, configured temperature, individual cell resistance, and inter-tier resistances. All these parameters shall be continuously monitored in real time during normal operation and during all battery discharges, except for resistance test, which is a user programmable event.
 - (b). The battery monitoring system shall transfer all battery parameters specified above at the remote central computer at user defined intervals.
 - (c). The system shall automatically display, record, and provide a print-out of all alarm conditions, as and when they occur, at the remote central computer. The reporting shall include the following parameters:
 - (a). Individual cell voltage high and low alarm
 - (b). Individual internal resistance high alarm.
 - (c). Individual internal resistance warning as a percentage of alarm threshold.
 - (d). Inter-tier resistance high alarm.
 - (e). Overall voltage high and low alarm.
 - (f). Temperature high and low
 - (g). Individual cell voltage low alarm during discharge.
 - (h). Discharge string current.
 - (i). Discharge time alarm set in hours/minutes.
 - (j). Float current high alarm.
 - (d). Each alarm record shall include defined limits, alarming parameter, show the time and date of the event, and the peak value reached during the violation.
 - (e). Each parameter alarm shall be configurable for a latching or non-latching alarm contact function.

- (f). As user defined, the system shall automatically page or fax a report to responsible personnel when any alarm thresholds are violated.
- (g). The system shall provide and maintain a complete, real-time discharge event log and a dynamic on-line display of battery voltage, individual cell voltages, battery string current, and ambient temperature whenever the battery is in a discharge mode. In addition to the numerical display, the system shall provide a graphical display of the battery voltage and cell voltages versus time that allows playback of the discharge event.
 - (a). Store historical record of the internal cell resistance of each cell.
 - (b). Display the actual real time numbers (or stored snapshots) of all battery parameters at the remote central computer. Additionally, the display shall provide individual graphical representation of all battery parameters in relation to alarm thresholds.
 - (c). Provide automatic voltage logging of overall voltage, individual cell voltages, and temperature at user defined intervals for trending analysis.

8. System Report Generation Capabilities

- (a). Alarm condition reporting – tabular, fax, or pager.
- (b). Cell/jar out-of-limits summary report – tabular.
- (c). Individual cell voltages over time – graph or tabular.
- (d). Individual cell resistance values over time – graph or tabular.
- (e). Total battery voltage over time – graph or tabular.
- (f). Battery temperature / room temperature over time – graph or tabular.
- (g). Discharge report: total battery voltage decay vs. time – graph or tabular.
- (h). Discharge report: cell voltage decay vs. time – graph or tabular.
- (i). Discharge hit summary report – tabular.
- (j). Discharge hit interval summary report – tabular.
- (k). General summary report of battery and monitor status of all systems to the battery or string level base on user set thresholds.
- (l). Detail summary reports of battery and monitor status of all systems with a line graph trend of any parameter that violated a threshold.

9. User's Guide

- (a). Each substation with a battery monitor installation shall have one set of MBTA's manuals, which include the following information as a minimum:

- (a). Installation and commissioning instructions
- (b). Operating instructions

10. Laptop Computers

- (a). The vendor shall supply one laptop computer per substation for interfacing with the battery monitor's USB port in order to service the monitor and to locally download cell test data. Each laptop's specifications shall equal or exceed those for the Lenovo Model T410 provided with discrete graphics capability. Each laptop shall equal or exceed the following important equipment specifications and accessories:
 - (a). Processor: Intel Core i7-620M
 - (b). Operating System Language: Windows 7 Professional 32 US English, or later
 - (c). Total Memory: 4GB
 - (d). Hard Drive: 320 GB Hard Disk Drive, 7200 rpm.
 - (e). System Graphics: NVIDIA NVS 3100m Graphics 256MB DDR3 with AMT.
 - (f). External Connection Ports: VGA, Ethernet, DisplayPort, four USB slots, smartcard reader, card reader, single headset jack, ExpressCard/34, 1394, eSATA, Kensington lock port, and a modem jack.
 - (g). Integrated Wi-Fi: ThinkPad b/g/n
 - (h). Power Accessories: ThinkPad and Lenovo 65W AC Adapter (spare power adapter) and ThinkPad Battery 25+ (spare battery).
 - (i). Portable Carrying Case: Lenovo Messenger Max Case
 - (j). Security Accessory: Kensington MicroSaver Security Cable Lock from Lenovo.
- (b). The vendor shall supply with each laptop an extended warranty service package valid for a period of three (3) years transferable to the MBTA.

F. Spill Containment System

1. Station battery installation shall be provided with a spill containment and absorption system. The materials used, method of application, and completed installation must fully comply with all Federal, state and local requirements.
2. A spill containment and absorption system shall be supplied consisting of perimeter rails, synthetic membrane floor liner, and absorbent pillows as follows:
 - (a) Perimeter rails shall be 4" high and constructed of non-corrosive material, including all corner pieces and splices to form a free flow barrier. Flammability rating shall be V-0.
 - (b) The synthetic membrane floor liner shall be a minimum of 6 mil thick plastic material with a flame rating of VTM-0. No floor preparation or treatment shall be required prior to installation.

- (c) Absorbent pillows shall be constructed of rugged industrial fabric with a VTM-0 flammability rating. Absorbent pillows shall be manufactured in modular dimensions to facilitate placement within the perimeter rails of the containment structure. Each pillow shall be filled with an absorbent material capable of absorbing acids and/or base solutions that will discolor upon contamination to provide a visual indicator. Absorption capability per pillow shall be approximately 1 gallon of acid and/or base depending on the exact dimensions of each pillow.

G. DC Distribution Panelboard

1. A circuit breaker panelboard shall be provided with the substation battery system for distributing the 125 Vdc control power. Panelboard and all circuit breakers shall be Underwriters' Laboratory (UL) approved, and rated for operation on ungrounded 125 Vdc.
2. Panelboard interior shall consist of a steel backplate structure holding the bus and terminal assemblies. The backplate shall be removable and shall be adjustable in depth unless the assembly for the panelboard is specifically designed to ensure proper depth positioning of the panel interior without adjustment. Breakers shall be bolt-on type, factory installed. All spaces shall be fully bussed and equipped requiring no modification for the addition of future breakers. Unused space shall be covered to preclude accidental access to the bus.
3. Buses shall be of copper, silver plated, braced to withstand a short circuit equal to the highest short circuit capacity of any breaker installed in the panel.
4. Circuit breakers shall be molded case, two pole with trip free mechanism. Trip elements shall be thermal and magnetic type.
5. Circuit breakers shall have a minimum interrupting rating of 10,000 Amperes at 125 Vdc. The buses and main circuit breaker in the panelboard shall have a continuous current rating of approximately 200 percent of the maximum load of the duty cycle, or a minimum of 200A. Provide branch circuit breakers in the panelboard in the quantities and ratings required by the actual equipment proposed by DB Entity.
6. Panelboard shall be factory assembled, furnished with NEMA type 1 general purpose surface mounting cabinet. Cabinet shall be of a gauge not less than that specified by the applicable UL standard. Wiring gutters shall conform to the requirements of the National Electrical Code and the applicable UL standards, but in no case shall be less than four inches. Box shall be furnished with single size knockouts or may be field drilled. Spare knockouts or combination knockouts shall not be furnished.
7. Panelboard front shall be of a gauge not less than that specified by the applicable UL standard and shall be of cold rolled or other suitable steel with concealed hinges, concealed trim clamps and flush catch and lock. Lock shall be keyed as accepted by the MBTA. A typewritten directory with plastic covering shall be installed on the interior of the door.
8. Cabinet shall be hot-dipped galvanized after fabrication. Front shall be thoroughly cleaned and finished with a rust inhibiting primer. Panelboard shall be finished in accordance with Article 1.15 of Section 16203.

9. In addition to nameplates specified in Article 1.08 of Section 16203, the DB Entity shall provide a nameplate on the door of the panelboard engraved "125 VOLTS DC DISTRIBUTION PANEL". Nameplate shall have white letters, 1/2" high on red background.
10. The DB Entity shall provide the main circuit breaker at the top of the distribution panel which shall accommodate the two battery leads, sized as required by the DB Entity.

H. Equipment Experience and Serviceability:

1. The vendor shall demonstrate that the proposed equipment has a proven reliability record in a DC traction power substation environment by furnishing a minimum of three references with names of contact persons and phone numbers at the referenced transit authorities in the United States. The subject equipment must have been in service at the referenced facility for a minimum of ten (10) years.
2. The equipment vendor shall preferably have a service center within 250 miles of Boston MA in order to be able to provide technicians, spare parts and accessories at short notice to enable the MBTA to minimize any disruption to the operating system in the event of any battery system problems. The vendor shall provide the location and name of facilities within this radius.

I. Eyewash Station

1. Provide a self-contained, wall mounted eyewash station adjacent to the station batteries. The DB Entity shall propose the eyewash station for review and acceptance by the Agency.

J. Warranty

1. A written copy of the manufacturer's warranty for batteries and charger/eliminator shall be included with the bid proposal.
2. For station batteries, the MBTA requires a one-year full guarantee from in-service date or 18 months from date of shipment, whichever occurs first. There after the warranty should be pro-rated for the remaining 19 years of the designed battery service life.
3. For the battery charger/eliminator, the MBTA requires a one-year full guarantee from in-service date or 18 months from date of shipment, whichever occurs first. There after the warranty should be pro-rated for the remaining 19 years of the designed battery charger service life.

2.9 SUPERVISORY EQUIPMENT

A. General

1. The requirements for additions and modifications to MBTA's existing SCADA system and for furnishing substation supervisory equipment are specified in Section 16492.
2. Details of the requirements of the substation equipment to interface with the SCADA system are provided in Articles 1.05 and 1.06, this Section and also identified in Section 16311 Appendix A – Substation Automation System.

3. As necessary, a supervisory terminal cabinet shall be provided to provide an easily accessible point of interface between the substation and SCADA systems. Strong preference is for all SCADA interfaces to be provided via fiber optic cable or ethernet Cat 6 cable to the substation PLC / SCADA LAN.

B. Supervisory Terminal Board (STB) – If required

1. The Supervisory Terminal Board (STB) shall be housed in a NEMA 12 enclosure, fabricated from not less than 12 gauge sheet steel. It shall be provided with a factory-installed floor stand, to make the terminal box a free-standing, floor-mounting cabinet.
2. Hinged, full access double doors shall be provided in front. Doors shall be of overlapping design, furnished with neoprene gaskets and a three-point latching mechanism with key-locking handle. Doors shall be provided with stops to hold them securely in the open position.
3. A full size panel shall be installed in the enclosure for mounting of terminal blocks.
4. Terminal blocks furnished shall conform to the requirements specified in Article.109 of Section 16203. A minimum of 25 percent spare terminals shall be provided for future application.
5. The STB shall be finished inside and out in accordance with Article 1.15 of Section 16203.
6. The DB Entity shall provide a nameplate on the door in accordance with Article 1.08, Section 16203, engraved in ¾” black letters: ‘SUPERVISORY TERMINAL BOARD’.
7. The STB shall be suitable for top or bottom entry of cables as indicated on the Design Documents.

2.10 SUBSTATION AUTOMATION EQUIPMENT

Refer to Section 16311 Appendix A.

2.11 TECHNICAL SUPPORT EQUIPMENT

A. General

1. The DB Entity shall ensure that adequate supply of equipment, parts, materials, tools and required equipment for protection of operating personnel are available at the site for orderly installation and testing of equipment without undue delay. In addition to equipment and parts needed to commission the substation, the DB Entity shall furnish the following parts, listed in Article 2.11.B below, to the MBTA upon commissioning the substation.

B. Requirements

1. The DB Entity shall furnish the following items, delivered with the shipment of related equipment for which they are required, unless otherwise directed by the MBTA. A complete list of the support equipment being provided shall be provided by the DB Entity prior to commissioning, for review and acceptance by the MBTA. The list shall include relay model numbers and fuse ratings.

- a. One complete 15 kV class circuit breaker, identical to the other 15 kV breakers provided per substation.
- b. One complete 750 Vdc class feeder circuit breaker, identical to the other 750 Vdc breakers provided per substation.
- c. Three additional 13.8kV and 1000 Vdc current limiting fuses to match the fuses installed in the equipment per substation.
- d. Ten percent of all control and auxiliary circuit fuses and two percent of all fuse blocks installed in the equipment (but not less than two fuses and one fuse block of each rating).
- e. For each type and rating of power DC circuit breaker, one of each type for every four circuit breakers of electromotive device integral to the breaker, used for closing and tripping, including but not be limited to, closing coils, spring charging motors, trip coils or holding coils, per substation. This includes circuit breaker control modules where applicable.
- f. One of each type for every four circuit breakers of spring used in each type of circuit breaker, per substation.
- g. For each type of AC and DC power circuit breaker, one set of primary power current carrying disconnect assemblies, two complete sets of secondary control disconnect assemblies and one set of auxiliary switches, per substation.
- h. Six replacement diodes for each traction rectifier provided for each substation.
- i. Six diode fuses for each traction rectifier provided for each substation.
- j. One surge arrester assembly of each type provided per substation.
- k. One bimetallic thermal device for rectifier heat sink over-temperature detection per traction rectifier provided.
- l. Two protective relays of each type, including multifunction relays/intelligent protection relays, complete with case per substation.
- m. One of each type of rectifier-transformer over-temperature detection devices (Devices 26 and 49) per rectifier transformer provided. This includes temperature gauges as well as thermocouples.
- n. Spare Parts: Provide spare parts kits as recommended by the manufacturer for each installation.
- o. SAS requirements per Section 16311 Appendix A
- p. Two of each type of control, auxiliary, and timing relays of each type furnished in the 750 Vdc switchgear, rectifier, rectifier transformer, and negative equalizer bus. Foreign relays not available in this country from local suppliers (such as C&S relays) will require triple the amount.

- q. One plug-in electronic control card of each type, for the battery charger per substation.
- r. One complete set of accessories per substation, in a lockable tool cabinet, required for installation, adjustment, testing, maintenance and dismantling of all the equipment to be furnished in this Section. As a minimum the accessories listed as applicable to each piece of equipment in the appropriate Articles in this Section shall be provided and shall be those required for major equipment such as AC and DC switchgear, high and low voltage circuit breakers, rectifier transformers, rectifiers and auxiliaries, station battery and bus ducts. Below lists the expected tools, other than special tools, that are considered necessary for installation, adjustment, testing and maintenance.
 - (i) Box end combination Wrench Set – Metric – Suggested Item Craftsman Model # D818270 or equal.
 - (ii) Box end combination Wrench Set – Standard - Suggested Item Craftsman Model # D818260 or equal.
 - (iii) Socket Set: Metric & standard sockets - Suggested Item Craftsman Model # 34271 or equal.
 - (iv) Screw Driver set - Suggested Item Craftsman Model # 31798 or equal.
 - (v) Adjustable wrench set (large size) - Suggested Item Craftsman Model # 44916 or equal.
 - (vi) Pliers Set - Suggested Item Craftsman Model # 45450 or equal.
 - (vii) Adjustable Pliers - Suggested Item Craftsman Model # 45439 or equal.
 - (viii) Nut driver set & Allen (Hex) Keys - Suggested Item Craftsman Model # SRS358320 or equal.
 - (ix) Leveling Kit – Suggested Item Bosch Model #GLL 2-15 or equal.
 - (x) Vise grips/Locking pliers Set - Suggested Item Sheffield Model # 64002 or equal.
 - (xi) Crimper/stripper - Suggested Item Knipex Model # 97 21 215 or equal.
 - (xii) Wet & Dry industrial Vacuum (large capacity, on casters) - Suggested Item Craftsman Model # 12007 or equal.
 - (xiii) Portable Air Compressor - Suggested Item Craftsman Model # 15215 or equal.
 - (a) Short & long blower air compressor attachments
 - (xiv) Klein Items
 - (xv) Torque wrench – for bolts $\leq 1/2''$ - Suggested Item Klein Model # 57000 or equal.
 - (xvi) Torque wrench – for bolts $> 1/2''$ - Suggested Item Klein Model # 57010 or equal.
 - (xvii) Cat 5 Voice & Data Cable Termination Kit – Suggested Item Greenlee Model #45469 or equal.
 - (xviii) Advanced tool kit for fiber cables – Suggested Item Corning Model # TKT-Fibertech-Pro or equal.
- s. A three-step platform stool with wheels that lock when weight is applied and handrails, as accepted by the MBTA, per substation.

- t. One set per substation of the following substation operator's safety equipment meeting MBTA's safety requirements:
 - (i) Switchman's full length coat with hood (large), 40 calorie/cm² Salisbury Model No. SK40L, or similar as accepted by the MBTA. Complete with storage bag.
 - (ii) Class 2 Rubber gloves kit (large), Rubber, complete with leather hand protectors and storage bag, Salisbury Cat. No. GK214RB11, or similar as accepted by the MBTA.
- u. Touch-up paint as identified for each equipment in each associated Article of this Section shall be provided, per substation.
- v. One heater ammeter of each type per substation.
- w. One lot of load measuring meters, relays, contactors, timers and voltage multipliers or limiters, if used, per substation.
- x. Five (5) LED lamps of each color and five (5) lamp holders, per substation.
- y. Five (5) control switches of each type such as Device CS, 01, 101, 43, and 143, per substation.
- z. DC Circuit Breaker Tester – Supply Receptacle (per substation)
 - (i) A 3 phase, 480 Vac receptacle shall be provided supplied from the 480V distribution panel fitted with a 100A branch breaker.
 - (ii) The 3 phase wall receptacle, rated 100A, with spring loaded cover shall be installed by the DB Entity. Receptacle box to be Appleton #AJS, AJAC, ACP1034DC, or equal and shall be compatible with the 4 pin connector use by the existing DC circuit breakers testers owned by the MBTA.
- aa. AC Cable tester -Supply Receptacle (per substation)
 - (i) A 2 pole wall receptacle, rated 50A, with spring loaded cover shall be installed by the DB Entity. The receptacle shall be NEMA type 10-50R for connecting the MBTA's cable testing device. The receptacle shall be connected to the AC distribution panel in the substation and configured for 208V supply.
- bb. One single phase relay testing unit to test the AC and DC relays associated with the project. The unit shall provide for secondary injection of relays and be able to provide a variable DC supply voltage. Unit to be provided with all required operating instructions and computer software for interfacing with windows based office computers. EUROSMC type PTE-100-C-Plus or approved equivalent shall be provided. The unit shall be available for use, by the MBTA, during testing and commissioning of the first substation if requested.
- cc. One of each of the following piece of test equipment per every four traction power substations:

- (i) Fluke 117/323-KIT Electrician's Combo Kit with Digital Multimeter & RMS Clamp Meter
- (ii) Fluke 1555/KIT Insulation Resistance Tester Kit (10kV)
- (iii) Hipotronics Transformer Turn Ratio test equipment –TTR 2796
- (iv) Fluke VT02 Visual IR Thermometer
- (v) Omicron – CMC 256Plus

dd. DC Circuit Breaker Tester

- (i) Provide a 600 Vdc high current circuit breaker tester for field testing and calibration of the direct acting magnetic devices. This trip device is the primary protection for the traction power feeder breakers and therefore a safety critical aspect of the equipment. One tester per for every four traction power substations is required.
- (ii) ANSI standard C37.17, applicable for this testing is vague in regards to field testing. The acceptable tolerance for field testing is that the trip current must fall within 10% of the marked scaled setting.
- (iii) The breaker tester must be compatible with DC circuit breakers presently available. The breaker tester must also provide an output that will not produce inaccurate results when used to test circuit breakers manufactured by ABB, Myers, Whipp & Bourne, Siemens or GEC which are currently in use on the MBTA system. The intent is to have a DC circuit breaker tester which can be used to test the majority, if not all, of the MBTA DC circuit breakers.
- (iv) As a minimum, the DC circuit breaker tester shall provide an output current suitable to test the breakers provided under this Contract. The test unit shall have a minimum output of 20 kA for 1 second and shall satisfy the circuit breaker suppliers' recommendation for appropriate testing of their equipment.
- (v) The DC breaker tester shall comprise a variable high current output power and regulator unit(s), and a control unit housing control circuitry, instrumentation, overcurrent, thermal and ground fault protection, and a high accuracy digital output ammeter and timer. Phenix HC20C or approved equal will be acceptable.
- (vi) The tester shall be operated from a 3 phase, 480 Vac input. Maximum expected continuous input current shall be provided by the DB Entity.
- (vii) The tester shall be provided with two 25' supply cables fitted with Appleton 4 pin connectors. A 100A, 3 phase wall receptacle with spring loaded cover shall be installed by the DB Entity. Receptacle box to be Appleton #AJS, AJAC, ACP1034DC, or equal and shall be compatible with the 4 pin connector provided with the test unit.
- (viii) The tester must be portable, include lifting hooks and proper moving instructions.
- (ix) The DB Entity shall submit the proposed DC high current circuit breaker for acceptance by the MBTA. Details provided shall include current output capability, weights, accuracy of metering, dimensions, input supply requirements, accessories provided and harmonic distortion data.

- (x) Two full sets of operating and maintenance instructions must be provided. One set shall be provided with the breaker tester, the other set shall be submitted to the MBTA for review and acceptance.
- (xi) The DC high current breaker tester shall be delivered to the substation prior to substation commissioning.
- (xii) After arrival on-site and prior to the substation entering service, the DB Entity shall provide training on the use of the tester. The training shall occur on-site using the DC high current breaker tester provided and shall be set up for two classes with up to four Engineers attending each class. The DB Entity shall submit the proposed training procedure and schedule to the MBTA for review and acceptance.
- (xiii) Warranty: The DC high current breaker tester shall be provided with a manufacturer's warranty for a minimum period of one year from the date of the first training class.

PART 3 - EXECUTION

3.1 GENERAL

- A. The DB Entity shall install all equipment specified in this Section in accordance with requirements of this Section, DB Volume 1, Contract Terms and Conditions, and the DB Entity's accepted Shop Drawings, with MBTA-accepted changes only, if any. DC traction feeder positive and negative return cables and DC traction power disconnect switches shall be installed in accordance with Section 16126. Low voltage power and control wiring installation including installation of required conduit and fittings, cable trays, junction, pull and terminal boxes and related materials shall be in accordance with Section 16050. The completed installation shall provide fully coordinated and fully operational electrical system.
- B. The DB Entity shall take every precaution in handling, setting, aligning and assembling the equipment to avoid distortion of frames. The DB Entity shall become thoroughly familiar with the manufacturers' instructions before attempting to handle, install and operate the equipment. The DB Entity shall ensure that all personnel working with the equipment fully understand the operation of the various components to avoid mis-operation, damage to equipment and possible personnel injury.
- C. All equipment assembly connections to mechanically assemble the units shall be made by the DB Entity, including all bolted connections between shipping units, between equipment and bus duct enclosures and anchoring the equipment to the floor.
- D. All electrical connections between shipping units, including all bolted bus connections and connections of control and auxiliary circuits, shall be made by the DB Entity.
- E. Conduits, cable trays and cables for control and auxiliary circuits for interconnecting equipment and devices of this Section are not all shown on the Design Documents. The DB Entity shall determine the routing of these cables and raceways as required to satisfy all specified control, indication, supervisory and auxiliary functions. The DB Entity shall ensure that the specified cable entry locations identified in the equipment specifications, this Section, are complied with. Installation of cables shall be in accordance with DB Entity-prepared and MBTA-accepted cable schedules, routing diagrams and installation drawings. Cable trays directly above the area

of the epoxy insulated floor, above the traction rectifiers and above the DC switchgear shall be fiberglass.

- F. The DB Entity shall make all ground connections to the equipment from the ground buses in the substation as described in this Section and shown on the Design Documents.
- G. All structural steel members used for support of electrical equipment and materials to be furnished shall be hot-dip galvanized in accordance with ASTM A153.
- H. Complete installation shall be tested and checked out in accordance with Article 3.03 of this Section and as specified in other applicable Articles of this Section.
- I. The DB Entity shall be responsible for all equipment during transportation, delivery and installation. All equipment shall be suitably packaged at all times meeting the requirements of the equipment manufacturers. Equipment packaged for transport and storage shall be protected from damage due to environmental conditions and properly secured. 'Shockwatch' labels shall be applied to all main equipment during transport. Where necessary equipment shall be heated or stored in a controlled environment during storage. Any signs of equipment deterioration or damage during shipping or storage shall be rectified to the satisfaction of and at no expense to the MBTA.

3.2 INSTALLATION

A. 15 kV AC Switchgear

- 1. The 15 kV switchgear shall be fully assembled and completely installed in accordance with manufacturer's instructions at the location shown on Design Documents.
- 2. Switchgear base channels, furnished with the switchgear, shall be installed in the floor slab by the DB Entity. The switchgear units shall be anchored to the base channels with a sufficient number of bolts to withstand impact resulting from breaker operation and to satisfy the seismic requirements specified in Article 1.03 of this Section. All bolts required for anchoring the switchgear shall be furnished by the DB Entity.
- 3. Switchgear units shall be assembled in such a manner as to ensure proper leveling, proper alignment between the various shipping groups, and proper placement of all primary circuit conduits installed for purposes of equipment interconnection.
- 4. Breaker test cabinet shall be installed at the location shown on the Design Documents. A clear space of 1/4", minimum, shall be provided between the back of the cabinet and the wall. Steel channels or straps, or equal of suitable thickness shall be fastened to the masonry and be drilled and tapped for mounting the test cabinet using galvanized bolts. The DB entity shall furnish, install and connect the 125 volt DC control supply wiring from a dedicated circuit breaker in the DC distribution panel.
- 5. The DB Entity shall furnish and install 120V AC and 125V DC auxiliary circuits as required from dedicated circuit breakers in the AC and DC distribution panels.
- 6. After completion of switchgear installation, the DB Entity shall ensure that all doors and the drawout fuse and PT carriages operate freely and the breaker removable elements and the ground and test device can be moved into and removed from the housings easily in a

controlled and consistent manner. The DB Entity shall correct all misalignments to the satisfaction of the MBTA.

B. Rectifier Transformers

1. Rectifier transformers shall be fully assembled and completely installed in accordance with manufacturer's instructions at locations shown on the Design Documents.
2. Low voltage terminals of the transformers shall be connected to the non-segregated phase bus duct as specified in Article 2.05 of this Section.

C. Rectifiers and Accessories

1. Rectifier units shall be fully assembled and completely installed in accordance with MBTA's accepted manufacturer's drawings at locations shown on the Design Documents.
2. Insulated anchors, furnished with the rectifiers, shall be installed in the floor slab and tested by the DB Entity in accordance with manufacturer's instructions and Section 09671. The floor and wall area at the rectifier units and surrounding area as shown on the Design Documents shall be covered with a layer of epoxy insulating material by the DB entity, to insulate the rectifier enclosures from the building structure (see Section 09671). The adjacent building structure, as applicable, may be insulated using fiberglass sheets. Sheets shall be flame retardant, low smoke and provide electrical insulation to a minimum of 1000V. The insulation shall be installed from the floor up to the height of the substation lighting or minimum of 3' above the highest point of the equipment whichever is higher. Care shall be taken that the insulated floor area is not scraped or otherwise damaged during installation. All fastening hardware required for anchoring the rectifier units shall be furnished by the DB Entity. After completion of the installation the rectifier enclosures shall be completely insulated from the building structure. The installation of rectifiers shall satisfy seismic requirements specified in Article 1.03 of this Section.
3. Rectifier units shall be connected to the rectifier transformers via the AC anode buses and to the rectifier DC main circuit breakers in the DC switchgear via the positive cathode buses as specified in Article 2.05 of this Section. Rectifier negative terminals shall be connected to the negative equalizer bus and drainage board, specified in Article 2.06 of this Section, via the negative cathode buses.
4. The DB Entity shall furnish and install 120V AC and 125V DC auxiliary circuits as required from dedicated circuit breakers in the AC and DC distribution panels.

D. DC Switchgear

1. DC switchgear shall be fully assembled and completely installed in accordance with MBTA's accepted manufacturer's drawings at location shown on Design Documents.
2. Insulated anchors, furnished with the DC switchgear, shall be installed in the floor slab and tested in accordance with manufacturer's instructions by the DB Entity and Section 09671. The floor and wall area at the DC switchgear and surrounding area, as shown on the Design Documents, shall be covered with a layer of epoxy insulated material by the DB Entity to insulate the switchgear enclosure from building structure (see Section 09671). The adjacent building structure, as applicable, may be insulated using fiberglass sheets. Sheets shall be

flame retardant, low smoke and provide electrical insulation to a minimum of 1000V. The insulation shall be installed from the floor up to the height of the substation lighting or minimum of 3' above the highest point of the equipment whichever is higher. Care shall be taken that the insulated floor area is not scraped or otherwise damaged during installation. All fastening hardware required for anchoring the switchgear shall be furnished by the DB Entity. After completion of the installation, the DC switchgear structure shall be completely insulated from the building structure. The installation of switchgear shall satisfy seismic requirements specified in Article 1.03 of this Section.

3. The switchgear units shall be assembled in such a manner as to ensure proper leveling, proper alignment between the various shipping groups, and proper placement of all the conduits and cable trays that are required for equipment interconnection. The DB Entity shall make all necessary electrical connections between the units of the assembly, including the joints in the 750 Volt positive bus.
4. The rectifier main DC circuit breakers shall be connected to the rectifiers via the positive cathode buses as specified in Article 2.05 of this Section.
5. The DB Entity shall furnish and install 120V AC and 125V DC auxiliary circuits as required from dedicated circuit breakers in the AC and DC distribution panels.
6. The DC circuit breaker test cabinet shall be installed at the location shown on the Design Documents. A clear space of ¼", minimum, shall be provided between the back of the cabinet and the wall. Steel channels or straps, or equal, of suitable thickness shall be fastened to the masonry and tapped and drilled for mounting of the test cabinet using galvanized machine bolts. The DB Entity shall furnish, install the 125V DC control supply wiring from a dedicated circuit breaker at the DC distribution panel.
7. After completion of the installation, the DB Entity shall ensure that all doors operate freely and the breaker removable elements can be moved into and removed from the housings without encountering a change of elevation from within the housing to the floor. The DB Entity shall correct all misalignments to the satisfaction of the MBTA.

E. AC Bus Duct and DC Bus

1. The bus ducts interconnecting the rectifier transformer and rectifier equipment shall be fully assembled and completely installed in accordance with MBTA's accepted manufacturer's plan and detail drawings as shown on the Design Documents.
2. Bus ducts shall be provided with suitable mounting hangers supported from the ceiling slab or structural members, or as directed by the MBTA. DB Entity shall furnish and install all strut assemblies, brackets, rods, clamps, suspension fittings and miscellaneous steel to provide a complete, firm and rigid support system for the bus ducts under all operating conditions and during short circuits. Supports shall be designed and installed in a manner to minimize induced circulating currents and induced magnetic heating.
3. All ferrous elements of the support system shall be hot dipped galvanized in accordance with ASTM A153. Hangers supporting rectifier positive cathode buses and ungrounded portions of anode and cathode negative buses shall be provided with approved insulators to insulate the bus enclosures from the building structure.

4. Bus duct shall be assembled in such manner as to ensure proper alignment between the shipping sections and the associated equipment. After alignment and leveling, the bus enclosure shall be bolted to the equipment and then the enclosure splice plates shall be attached and securely fastened.
5. Insulated bus enclosure sections shall be installed as identified in Article 2.05 of this Section.
6. Before electrical connections are made, all contact surfaces shall be wiped clean (sandpaper or abrasive tools shall not be used) and covered with a coat of approved electrical antioxidant compound. Joints in bus conductors shall be made using splice plates on each side of the conductor. Connections to equipment terminals shall be made with flexible connectors as specified in Article 2.05 of this Section. All joints shall be made with a minimum of 4-½” silicon bronze bolts and nuts. All nuts shall be provided with approved locking devices. All bolts shall be tightened to the torque of 40 foot-pounds, or as required by the MBTA, using an accurate torque wrench.
7. After completion, all joints shall be covered by die-molded, flame retardant polyvinyl chloride boots, or approved equal providing full voltage insulation for the joint. These boots shall be easily removable for inspection of the joint without destruction of the boot.

F. Negative Equalizer Bus and Drainage Board

1. The negative equalizer bus and drainage board shall be fully assembled and completely installed in accordance with MBTA’s accepted manufacturer's drawings at the location shown on the Design Documents.
2. The enclosure shall be fastened to the floor slab using a sufficient number of machine bolts and expansion anchors provided by the DB Entity to satisfy the seismic requirements as specified in Article 1.03 of this Section.
3. The negative bus shall be connected to the rectifiers via the negative cathode busduct as specified in Article 2.05 of this Section. The negative busduct enclosures shall be accurately aligned and leveled for proper attachment to the negative equalizer bus enclosure.
4. The DB Entity shall furnish and install 120 Vac and 125 Vdc auxiliary circuits as required from dedicated circuit breakers in the AC and DC distribution panels.

G. 15 kV Circuit Breaker Control and Instrument Panel

1. The 15 kV circuit breaker control and instrument panel shall be completely assembled and installed in accordance with MBTA-accepted manufacturer's drawings at the location shown on Design Documents.

H. Station Battery, Charger and Accessories

1. Battery racks shall be assembled in accordance with manufacturer's instructions at location shown on the Design Documents. The individual rack members shall be firmly bolted together to form rigid structures. Battery cell jars shall be mounted on plastic rails and provided with restraining rails for earthquake protection.

2. Each battery cell on the racks shall be numbered with approved, clearly visible numerals as required in Article 2.08.B of this Section. Numbering shall start from battery positive terminal.
3. The DB Entity shall remove the battery cells from shipping containers and inspect each cell for damage. If electrolyte has been lost in transit and the level is higher than 1/2" below top of plates, the DB Entity shall top off the cells with manufacturer's approved electrolyte. Cells with electrolyte level lower than 1/2" below top of plates shall be replaced by the DB Entity.
4. Cell jars shall be set on rack with plates at right angles to the rails. Jars shall be spaced on the rack so that the intercell connectors can be installed without stressing the cell posts. All current carrying surfaces shall be scraped bright and clean and covered with a thin film of approved electrical grease. Bolts shall be tightened to proper tension and the surplus grease wiped off. After completion of all connection, the polarity of each cell shall be checked with a voltmeter.
5. The DB Entity shall install the power supply-battery charger unit at location shown at Design Documents, or as required by the MBTA. Unit shall be fastened to the floor using approved expansion anchors.
6. The DC distribution panel shall be installed at the locations shown on the Design Documents. A clear space of 1/4", minimum, shall be provided between the back of the panel and the wall. Steel channels or strips, or equal, of suitable thickness shall be fastened to the masonry and drilled and tapped for mounting the panel using galvanized machine bolts.
7. After the completed installation is tested and checked out in accordance with all applicable portions of Article 3.03 of this Section, the battery shall be given a freshening charge to assure that all cells are fully charged.
8. Install battery monitoring system in accordance with manufacturers' instructions.

I. Supervisory Equipment

1. The SCADA supervisory system shall be integrated in the substation in accordance with MBTA accepted manufacturer's drawings at the location shown on Design Documents. The DB Entity shall be responsible for programming both the supervisory master unit and the substation SCADA/SAS units.
2. The RTUs shall be fastened to the floor slab with a sufficient number of machine bolts and expansion anchors to satisfy the seismic requirements as specified in Article 1.03 of this Section.
3. Telephone circuits for communication and data transfer between the substation SCADA and backup RTUs and master terminal equipment will be provided and installed by others. These lines will be terminated with surge protection devices provided and installed by others. Extensions of these lines from the surge protectors to the RTU equipment shall be furnished, installed and connected by the DB Entity.
4. A qualified technical representative from the equipment manufacturer shall be provided by the DB Entity to assist in proper installation and interfacing of the supervisory equipment.

J. Substation Automation System (SAS)

1. The SAS and all associated components shall be completely assembled and installed in accordance with MBTA-accepted manufacturer's drawings at the location shown on the Design Documents.

3.3 TESTS

A. General

1. All equipment to be furnished and installed shall be subject to the following test program. Testing shall include factory tests and field tests.
2. The DB Entity shall formulate an overall test program for all equipment furnished under this Section, which shall include but not be limited to the tests specified in this Section, to ensure equipment compliance with the relevant standards, all requirements of this Section, and satisfactory and reliable performance in intended operation. The overall test plan and expected schedule for testing should be submitted to the Project for review and acceptance at least four weeks prior to the first expected factory test. All factory tests shall be identified in the overall test plan, and all tests shall be offered for witnessing in accordance with article 3.03.B below.
3. The DB Entity shall furnish detailed, step-by-step test procedures for each factory and field test. The test procedures shall be submitted for acceptance by the MBTA in accordance with article 3.03.B.1 below. Blank sample test record and result sheets shall be included for acceptance. Where applicable, test pass/fail criteria shall be included in the test procedure and check off boxes shall be provided to indicate when each step has been successfully performed.
4. The DB Entity shall maintain a consolidated factory and field testing punch list listing all items requiring repair, further testing and steps omitted for execution at a later date. All factory test punch list items must be addressed and the MBTA notified of such prior to the Equipment being released from the manufacturer's premises. All punchlist items shall be resolved to the satisfactory of the MBTA prior to equipment handover to the MBTA.
5. Tests at the factory shall include but not be limited to:
 - a. Manufacturer's standard tests.
 - b. Tests as listed in Article 3.03.C of this Section.
 - c. Tests as per relevant NEMA, IEEE and ANSI Standards not included in Article 3.03.C of this Section.
 - d. Any other tests to ensure satisfactory performance of equipment (including 'mock-up' tests of the substation automation system)
6. Tests in the field shall include but not be limited to:
 - a. Tests as listed in Article 3.03.D of this Section.

- b. Tests as per relevant NEMA, IEEE and ANSI Standards not included in Article 3.03.D of this Section.
 - c. Acceptance tests as per current NETA acceptance testing specifications.
 - d. Any other tests to ensure satisfactory performance of equipment, including full detailed functional tests specific to the operational requirements of the equipment detailed in this specification and in Section 16311A.
7. The DB Entity shall meet the requirements in Article 3.03.B of this Section, for testing and shall furnish certified test reports as specified in Article 3.03.E of of this Section for obtaining clearance for packing and shipment of equipment tested.

B. Conditions for Tests

1. General Conditions

- a. Prior to testing of any equipment specified in this Section, all of the following conditions shall be fulfilled by the DB Entity:
 - (i) The DB Entity has made the "For Record" submittal of shop drawings of the equipment scheduled for testing to the MBTA. Please note that the "For Record" submittal shall be made only after the previous submittal has been accepted by the MBTA.
 - (ii) The DB Entity-prepared test plan and detailed step by step test procedure has been submitted to and accepted by the MBTA.
 - (iii) Upon completion of (1) and (2) above, a minimum of four weeks advance notification shall be given to MBTA on the scheduled date of tests to enable them to witness the tests.

2. Witnessing Tests

- a. MBTA will witness complete testing of all equipment unless a waiver is granted, in which case test reports of equipment, and associated cleared punch list, for which waiver was granted shall be submitted for review to obtain clearance for packing and shipping. Waiver of witnessing tests on any one piece equipment shall not be construed as a waiver for all remaining equipment either of the same type or different type.
- b. Prior to witness testing, the supplier shall have previously tested the equipment to prove compliance with the test procedure and equipment requirements. A copy of these completed test documents should be made available to the MBTA for review prior to the witness testing.

3. Responsibility

- a. The DB Entity shall assume full responsibility during the factory and field testing of all equipment and installation provided by the DB Entity. Should there be any loss or damage to such equipment, materials or the building as result of these tests, the DB Entity shall be fully responsible for replacing the damaged equipment and repairing the

building. Replacement of damaged equipment shall include all costs, including but not limited to, transportation of, and installation and testing of replacement equipment.

4. Rejection and Re-testing

- a. Failure of equipment to withstand tests or to meet specified ratings or requirements shall be sufficient grounds for rejection of equipment.
- b. Any equipment rejected shall be re-tested in presence of the MBTA, and/or his representative, after rectification. If the modifications or changes are such as to affect any of the drawings, diagrams or any other documents submitted and accepted by the MBTA, revised drawings of diagrams shall be submitted, showing proposed changes and MBTA's acceptance obtained before changes or modifications are made on the equipment. Modification or changes which do not warrant revision of any drawing, shall be furnished to the MBTA along with notice of re-testing.
- c. If it is not possible to rectify rejected equipment, new equipment shall be manufactured and the requirements of the drawings and design calculations of the original unit shall be applicable for the new unit.

5. Cost of Rectification or New Unit

- a. The entire cost of rectification or new unit shall be borne by the DB Entity including retesting and cost of witnessing retesting.

6. Costs of Tests

- a. The price for conducting all factory and field tests and witness testing in presence of the MBTA, and/or his representative, including entire cost of rectification, re-testing and supplying new unit(s), shall be deemed to be included in the Contract Price. The expense related to travel, lodging and boarding for the MBTA and/or his representative for witnessing of test will, however, be borne by the MBTA at no expense to the DB Entity, except when re-testing is required. In the latter case, all expenses for travel and lodging will be borne by the DB Entity as directed by the MBTA. In the event a second retest is required for the same equipment, the DB Entity shall bear, in addition to the above costs, the cost of all meals and the hourly payroll costs, including overhead and fringe benefits of the MBTA and/or his representative(s) attending the retest.

C. Factory Tests

1. General

- a. If facilities for conducting any of the tests listed below are not available at manufacturer's plant, these tests shall be conducted elsewhere by manufacturer or by an independent agency as accepted by the MBTA. The DB Entity shall, however, clearly indicate in the DB Entity's proposal the tests for which manufacturer does not have facilities and intends to submit test reports from an independent agency. This should also be clearly identified in the overall test plan as required in article 3.03.A.2 above.

2. 15 kV Switchgear

- a. The following tests listed in ANSI C37.09 as "Design Tests" shall be conducted on one 15 kV class representative circuit breaker with the circuit breaker inserted in its housing:
 - (i) Maximum voltage tests
 - (ii) Power frequency tests
 - (iii) Continuous current carrying tests
 - (iv) Dielectric withstand tests
 - (a) Power frequency withstand voltage tests
 - (b) Lightning Impulse withstand voltage tests
 - (v) Standard operating duty tests
 - (vi) Interrupting time tests
 - (vii) Transient recovery voltage tests
 - (viii) Short-circuit current interrupting tests
 - (ix) Load current tests
 - (x) Capacitor switching current tests
 - (xi) Mechanical endurance tests
 - (xii) Control voltage tests
 - (xiii) Design tests on pressurized components
 - (xiv) Sealed pressure systems leakage tests
 - (xv) Radio influence voltage tests as per NEMA SG4
- b. Following tests listed in ANSI C37-09 as "Design Tests" for high voltage circuit breakers shall be conducted on the ground and test device of the 15 kV switchgear, with the ground and test device inserted in the switchgear:
 - (i) Maximum voltage tests
 - (ii) Power frequency test
 - (iii) Short-circuit current interrupting tests to establish the closing and latching capability, applying the short-circuit test supply between the line terminals of the ground and test device and the switchgear ground bus
 - (iv) Momentary current test, applying the test supply between the line terminals of the ground and test device and the switchgear ground bus
 - (v) Dielectric withstand tests:
 - (a) Power frequency withstand voltage test
 - (b) Lightning Impulse withstand voltage test
- c. Following tests listed in ANSI C37.09 as "Production Tests" shall be conducted at the manufacturer's facility on each and every 15 kV class circuit breaker and ground and test device:
 - (i) Current and linear coupler transformer tests
 - (ii) Nameplate check

- (iii) Resistors, heaters, and coil check tests
 - (iv) Control and secondary wiring check tests
 - (v) Clearance and mechanical adjustment check tests
 - (vi) Mechanical operation tests
 - (vii) Timing tests (not required for ground and test device)
 - (viii) Stored energy operating mechanism tests
 - (ix) Power frequency withstand voltage tests
- d. Following tests listed in ANSI C37.20 and NEMA SG5 as "Design Tests" shall be conducted on the 15 kV metal-clad AC switchgear assembly:
- (i) Dielectric tests
 - (a) Power frequency withstand tests
 - (b) Lightning Impulse withstand tests
 - (c) Test of busbar insulation
 - (ii) Rated continuous current tests
 - (iii) Momentary current tests
 - (iv) Mechanical operation tests
 - (v) Flame-retardant tests
- e. Following tests listed in ANSI C37.20 and NEMA SG5 as "Production Tests" shall be conducted at the manufacturer's facility on the 15 kV metal-clad AC switchgear assembly:
- (i) Mechanical operation tests
 - (ii) Grounding of instrument transformers cases test
 - (iii) Electrical operation and control wiring tests
 - (a) Control wiring continuity test
 - (b) Control wiring insulation test
 - (c) Polarity tests
 - (d) Functional and sequence tests
 - (iv) Checking of indicating instruments and transducers at zero, midpoint and full scale or full output
 - (v) Nameplate check
- f. In lieu of Design Tests specified above for AC circuit breakers and AC switchgear assembly, the DB Entity may submit detailed test certificates from the manufacturer or an independent agency conducted on similar circuit breakers and similar switchgear assemblies for MBTA's review. The MBTA may waive some or all of the tests at his discretion.

3. Rectifier Transformer

- a. The following tests shall be conducted at the manufacturer's facility on one rectifier transformer:
- (i) Temperature rise tests: Tests to determine that the winding temperature rise is within the permissible limits after delivering full load continuously plus fulfilling the additional specified duty cycle. For this purpose, manufacturer shall determine the temperature rise of the windings by resistance after applying the specified two hour load cycle to a transformer which has already attained steady state temperature rise at 100 percent continuous load. Dissolved Gas Analysis (DGA) tests shall be performed in accordance with ANSI C57.104 before the temperature rise test, and immediately after each test.
 - (ii) A demonstration of hottest spot temperature rise for the extra heavy traction service duty cycle shall be required of one transformer for essentially identical units with results that are consistent with the requirements of IEEE C57.18.10. The maximum allowable hottest spot temperature rise shall not cause insulation loss of life. Actual or calculated hot spot temperature rise during this extra heavy traction service test cycle shall be measured/calculated and recorded in the certified transformer test report for use by the MBTA. Furthermore, the manufacturer shall inform the MBTA of any other factor than may limit the rating of the transformer for the application noted herein.
 - (iii) Impedance and load loss tests at 100 percent and 150 percent of rated current on the rated voltage connection of the unit, and at 100 percent (ONAN rating) at all De-energized Tap Changer positions.
 - (iv) Commutating reactance and resistance test as per ANSI C57.18.10.
 - (v) Full design impulse test at ambient temperature on all transformer terminals. Test shall consist of reduced full wave, two chopped waves and a full wave of 110 kV on the HV and 45 kV on the LV windings. The resulting oscillograph records of the applied voltage and neutral current traces shall be submitted with the test reports.
 - (vi) Audible sound level test in accordance with C57.12.00 and C57.12.90. The audible sound level test of rectifier transformer shall be conducted at no load, nominal tap, with the transformer energized at rated voltage and frequency.
- b. The following tests listed in ANSI C57.12.90, ANSI C57.18.10 and ANSI C34.2 shall be performed at the manufacturer's facility on each rectifier transformer:
- (i) Resistance measurements on all windings on the rated voltage connection and at all taps.
 - (ii) Ratio tests on the rated voltage connection and on all tap connections.
 - (iii) Polarity and phase-relation tests on the rated voltage connection.
 - (iv) Excitation current loss test at rated voltage on the rated voltage connection.
 - (v) Excitation current test at rated voltage and frequency on the rated voltage connection.

- (vi) Dielectric tests:
 - (a) Applied voltage
 - (b) Induced voltage
 - (c) Insulation resistance
- (vii) Partial discharge test
- (viii) Nameplate check

4. Rectifier

- a. The following tests listed in ANSI C34.2 shall be performed on one rectifier:
 - (i) Rated current test
 - (ii) Harmonic analysis test which shall be performed on the AC input and DC output circuits.
 - (iii) Audible sound level test, in accordance with IEEE C57.12.91 but applied to a rectifier, rather than a transformer. The audible sound level test of the rectifier shall be conducted at no load with the rectifier energized at rated voltage and frequency.
 - (iv) Reduced voltage, 160 percent full load current balance test. With load on and temperature stabilized, measure temperature of ambient air in and air out of the rectifier unit, temperature of each of four selected diodes and their associated heat sinks using same positions on each unit and current in each diode.

Note: Increase current by 7 percent waveform and conduction angle adjustment factor to compensate for loadings by reduced voltage and short circuit.

- b. The following production tests specified in ANSI C34.2 shall be performed on each rectifier at the manufacturer's facility:
 - (i) Dielectric tests
 - (ii) Rated voltage test and efficiency
 - (iii) Rectifier loss tests
 - (iv) Rectifier balance test at 100% load
 - (v) Additional manufacturer's standard tests
 - (vi) Functional tests
 - (vii) Nameplate check

5. Rectifier Surge Voltage and Short Circuit Tests

- a. The following tests shall be conducted on one rectifier package consisting of the rectifier transformer, rectifier and interconnecting bus ducts, and 15 kV test circuit breaker provided by the DB Entity, all assembled in line. Test setups shall include primary supply system having minimum 150 MVA short circuit capacity, protective devices adjusted to provide pick-up values and operating times conforming to those proposed for final installation, shunts, properly calibrated meters and recording oscillographs, shorting devices, loading devices and other associated appurtenances as may be required. The 13.8 kV circuit connecting the AC circuit breaker to the rectifier transformers shall consist of 50' of 3-1/c 350kcmil cables, or a circuit having equivalent surge impedance. Tests specified other than the short circuit tests, may be carried out at less than 150 MVA test supply.
- b. Open circuit test to ensure ability to withstand transient surge voltages in steps as follows:
 - (i) Energize transformer and rectifier at rated voltage and no load by closing rectifier AC breaker.
 - (ii) De-energize transformer and rectifier by tripping rectifier AC circuit breaker.
 - (iii) Record voltage wave forms and amplitudes at AC circuit breaker line side terminals, rectifier transformer high and low voltage terminals, rectifier output terminals and at critical points in surge protection network during close and trip operation.
 - (iv) Repeat test a minimum of ten times to ensure maximum transient.
 - (v) Maximum crest of transient surge voltages at AC circuit breaker terminals and rectifier transformer high voltage terminals shall not exceed the value specified in Article 2.02 of this Section for the rectifier transformer bushings.
 - (vi) Maximum crest of transient surge impressed on rectifier shall not exceed 75 percent of the voltage withstand rating of the diodes.
- c. Short circuit test to determine short circuit current in steps as follows:
 - (i) Energize the transformer and rectifier at rated voltage with no load.
 - (ii) Short rectifier output terminals with shorting device.
 - (iii) Clear short (bolted fault) by tripping the rectifier AC circuit breaker by its protective devices.
 - (iv) Record current waveform and amplitude at rectifier output terminals during shorting operation.
 - (v) Calculate theoretical values of peak and sustained short circuit currents for rated voltage fault on a system having maximum and minimum available short circuit MVA and X/R ratios as provided in the Service Condition Article 1.06.B of this Section. Calculate theoretical transformer overvoltage and the test supply system X/R ratio required to obtain a minimum of these values on actual test set-up for the maximum and minimum MVA levels specified above.

(vi) Repeat short circuit test with transformer energized at theoretical overvoltage and the X/R ratio of the test supply system adjusted to the value calculated above. Continue to adjust voltage until calculated peak and sustained values of current are realized.

d. Determine the commutating reactance and resistance of the rectifier package so the voltage regulation may be calculated to ensure compliance with output voltage characteristics set forth in Article 2.03.D of this Section. Proof shall be provided by the DB Entity that methods proposed for measurement of commutating reactance and resistance are accurate and valid to the complete satisfaction of the MBTA. Failing acceptable proof, the DB Entity shall perform a voltage regulation test by actual loading of the rectifier package in a method to be specified by the MBTA.

6. Rectifier Current Unbalance and Load Current Tests

a. The following test shall be conducted on one rectifier package, including the rectifier transformer, rectifier and interconnecting bus ducts, assembled in line. Test set-up shall include necessary supply and loading systems, including switchgear and protective devices, air handling system with temperature controlled at 105°F, shunts, thermocouples, properly calibrated meters, and associated appurtenances as may be required. Reduced voltage and reduced capacity supply system will be acceptable for certain portion of these tests providing currents specified are increased by 7 percent wave form and conduction angle adjustment factor to compensate for loading by short circuit. Individual silicon diode junction temperatures shall not exceed design values established in DB Entity's load and short circuit calculations as determined from actual case temperature, using DB Entity's junction versus case temperature data.

b. Current balance/unbalance test to ensure compliance with requirement for current balance between paralleled legs in each phase in steps as follows:

(i) Apply 100 percent full load current and measure diode currents in each paralleled leg in each phase.

(ii) Remove one fuse in one leg of each phase so as to create maximum diode current unbalance; then apply 100 percent full load current and measure diode currents in remaining legs on each phase.

(iii) With one fuse removed in one leg of each phase, as in test above, apply 150 percent full load current for two hours, superimpose five one-minute overloads of 300 percent full load current and one 15-second overload of 450% full load current as specified in Article 2.03.D of this Section, and measure diode current in the leg which had maximum current in test with 100 percent load current.

c. Load current test to ensure compliance with rectifier current rating and ability of rectifier to withstand short circuit under load in steps as follows:

(i) With one fuse removed in one leg of each phase as in test above, apply 100 percent full load current until constant diode temperature is reached.

(ii) Apply 150 percent full load current for two hours immediately after completion of test above with 100 percent full load current.

- (iii) Superimpose five one-minute overloads of 300 percent full load current followed by one 15-second of 450% full load current per Article 2.03.D of this Section, during the step described above.
 - (iv) Apply the highest value of short circuit obtained in the short circuit tests identified above, duration of short circuit to be the operating time of the short time relays and ac breaker opening time, as soon as practical after the application of the 450% load, expected to be within one minute.
 - (v) Record load current, ambient air temperature, supply air temperature, discharge air temperature, transformer winding hot-spot temperature, and diode case temperature in leg having maximum current unbalance at sufficiently close time intervals to provide accurate current-time-temperature relationship.
 - (vi) Monitor rectifier commutation with oscilloscope during two hour test loadings set forth in test above to ensure normal operation. If possible, photograph trace or rectifier input voltage wave forms.
 - (vii) The above-specified current balance test and load current test may be conducted at a lower ambient temperature and the results interpolated for the specified ambient of 105 degrees F. Supporting data and calculations shall be submitted, together with the test results, to the MBTA for review and acceptance.
- a. The DB Entity may propose to combine some of the rectifier package tests identified above. The proposed combination of tests shall be submitted for acceptance by the MBTA but shall not omit any of the requirements identified.

7. 750 Vdc Switchgear

- a. The following tests listed in ANSI C37.14 as "Design Tests" shall be conducted on one representative DC circuit breaker of each rating:
- (i) Dielectric withstand test
 - (ii) Continuous current test
 - (iii) Load (low) current switching tests
 - (iv) Short-circuit current interrupting test: The short circuit current test value and X/R ratio shall be for the substation with the highest available short circuit current, and the equivalent of all substation rectifiers feeding the DC bus (refer to paragraph 1.06.B of this Section). The fault shall be between the load side terminals of the feeder breaker and the substation negative bus. The DC power source shall preferably be from silicon diode bridge rectifiers. MBTA's acceptance shall be obtained prior to testing if other sources of supply are to be used. Previous test certifications may be proposed, subject to acceptance by the MBTA, in lieu of repeating this test if they equal or exceed the MBTA system capacity as identified above.
 - (v) Endurance tests

- (a) Electrical endurance test
 - (b) Mechanical endurance test
- b. The following tests listed in ANSI C37.14 as "Production Tests" shall be conducted at the manufacturer's facility on each and every DC circuit breaker:
- (i) Calibration test on the individual direct acting trip device prior to final assembly
 - (ii) Control and secondary wiring check test
 - (iii) Dielectric withstand test
 - (iv) Mechanical operation test
 - (v) Calibration test on fully assembled circuit breakers
 - (a) Direct acting trip devices - The percent error for trip currents versus the calibration marks on the device and the repeatability errors must be within the tolerances specified in ANSI C37-17 for direct acting trip devices.
 - (b) Undervoltage trip device
 - (vi) Manufacturer's standard tests not included in the above tests.
 - (vii) Checking of indicating instruments and transducers at zero, midpoint and full scale or full output.
- c. The following tests listed in ANSI C37.20 as "Design Tests" shall be conducted on the DC switchgear assembly.
- (i) Dielectric tests
 - (ii) Rated continuous current tests
 - (iii) Momentary current tests
 - (iv) Short circuit withstand test
 - (v) Flame-retardant tests
- d. The following tests listed in ANSI C37.20 as "Production Tests" shall be conducted at the manufacturer's facility on the DC switchgear assembly:
- (i) Mechanical operation tests
 - (ii) Electrical operation and control wiring tests
 - (a) Control wiring insulation test
 - (b) Polarity tests

- (c) Sequence tests, including operation of load measuring scheme with actual voltages and currents applied. Sequence tests shall be made with breakers in "test" position also with breaker in "connected" position.
- (d) Tests to prove the operation of all devices and indicating instruments, including protective relays, at all settings.
- (e) Check indicating instruments, transducers and isolation amplifiers at zero, midpoint and full scale or full output.

(iii) Nameplate check

8. Bus Duct

- a. Following tests shall be conducted at the manufacturer's facility on one unit of each rating as specified under "Design Tests" in ANSI C37.23 for metal enclosed bus:
 - (i) Dielectric tests
 - (a) Power frequency withstand
 - (b) Impulse withstand
 - (ii) Temperature rise tests
 - (iii) Momentary current tests
 - (iv) Electrical operation and control wiring tests
- b. In addition, the temperature rise test as described below shall be conducted on one representative anode bus duct.
 - (i) Measure temperature rise of bus conductors in 40°C ambient at continuous 160 percent rated load, to be applied until all readings have stabilized. This test may be performed concurrent with the in-line tests specified for rectifier package tests, provided the readings have stabilized, during the two hour application of 160 percent load. For the purposes of this test, readings will be considered to have stabilized when the rate of temperature rise is less than one °C per hour.
- c. Power frequency withstand tests shall be conducted at the manufacturer's facility on each and every shipping length as specified under "Production Tests" in ANSI C37.23 for metal enclosed buses.
- d. If manufacturer submits detailed test report of these tests conducted on similar unit(s) for MBTA's review, MBTA may waive some or all of the design tests at his discretion.

9. Negative Drainage Board and Negative Equalizer Bus

- a. The following tests shall be conducted at the manufacturer's facility on the negative equalizer bus and drainage board:

- (i) Dielectric tests
 - (ii) Rated continuous current test
 - (iii) Momentary current test
 - (iv) Mechanical operation test
 - (v) Electrical operation and control wiring tests:
 - (a) Control wiring continuity test
 - (b) Control wiring insulation test
 - (c) Diode and shunt polarity tests
 - (d) Functional and sequence tests
 - (vi) Nameplate check
- b. If manufacturer submits detailed test reports of the rated continuous current and momentary current tests conducted on similar unit(s) for MBTA's review, MBTA may waive one or both of these tests at his discretion.

10. 15 kV Breaker Control and Instrument Panel

- a. The following tests shall be conducted at the manufacturer's facility on the 15 kV breaker control and instrument panel:
- (i) Electrical operation and control wiring tests:
 - (a) Control wiring continuity test
 - (b) Control wiring insulation test
 - (c) Functional and sequence tests
 - (ii) Checking of indicating instruments at zero, midpoint and full deflection
 - (iii) Nameplate check

11. Battery Monitor System

- a. Battery Monitoring System
- (i) Factory Acceptance Tests: Each battery monitors and its software shall be factory tested before shipment to the MBTA to demonstrate the functionality and performance required by this specification. The vendor shall provide written certification for each of the factory acceptance tests, complete with the signature(s) and date(s) for the responsible staff performing the acceptance tests. In addition, a written copy of the full factory test procedure shall be submitted to the MBTA

indicating the results of each test and the associated acceptance criteria for assigning a “pass” or “fail” outcome.

12. Supervisory Equipment

- a. All tests listed in DB Entity-prepared and MBTA's accepted factory test procedure shall be conducted on the supervisory equipment at the manufacturer's facility.

13. Substation Automation System

- a. All tests listed in DB Entity-prepared and MBTA's accepted factory test procedure shall be conducted on the supervisory equipment at the manufacturer's facility.

D. Field Tests

1. General

- a. The DB Entity shall perform the following field tests on all equipment specified in this Section after installation of the equipment. Field tests are to be performed to supplement the factory tests and to ensure proper operation of equipment and proper calibration and coordination of protective devices. The DB Entity shall furnish and set up all special equipment required for these tests, including relay test set, switches, properly calibrated indicating instruments, recording oscillographs, timing devices, shorting devices, loading devices and other associated appurtenances as may be required.
- b. The work includes furnishing of labor, material, test instruments and services necessary to perform required testing and checking of electrical equipment and installation.
- c. All tests shall be successfully completed to show that the installation meets the specification requirements and that the equipment and devices operate as intended, before final acceptance by the MBTA.
- d. Tests and checkouts shall be conducted in accordance with the DB entity-supplied, MBTA-accepted test procedures as specified herein and in National Electrical Code, Massachusetts State Electrical Code and applicable Standards and Specifications of ANSI, NEMA, IEEE, ICEA, AEIC, and NETA.
- e. The DB Entity shall provide properly qualified personnel who shall be responsible for supervising, coordinating, and performing all electrical field testing and checking work and who maintains a written record of all tests conducted and all punch list items for later correction or re-testing. The results of all field tests shall be verified by an independent test laboratory employed by the DB Entity.
- f. Testing and checkouts shall be performed in the presence of the MBTA.
- g. The DB Entity shall furnish five copies of all test results to the MBTA. Results sheets shall include date of test, personnel involved, items tested, type of tests and test data and shall be signed off by the test Engineer in charge. The DB Entity shall also submit the punch list signed off to showing completion.

- h. Any equipment or material damaged due to improper test procedure or test apparatus handling shall be replaced or restored to original condition by DB Entity at the DB Entity's expense.
 - i. Safety devices including but not limited to rubber gloves and blankets, screens and barriers, danger signs and padlocks, shall be used to protect and warn all personnel in the vicinity of the tests.
 - j. All test instruments used shall have a certified calibration sticker showing last date of calibration and expiration date.
2. Field Test Requirements

- a. The DB Entity shall formulate a complete, detailed step by step Field Test Procedure for all equipment to be furnished and installed under this Section and associated equipment interfaces associated with the work. Test procedure shall be comprehensive and shall include the required tests as specified in relevant standards of ANSI, NEMA, IEEE, and NETA, supplementing the Factory Test Procedure. The Field test procedure shall also include an index of all the proposed tests, estimated duration, overall schedule, test sequence and shall identify MBTA personnel requirements to fulfill the test program. The detailed procedure for performing the specified short circuit tests shall include step-by-step test procedure supplemented by circuit diagrams, details of instrumentation, safety interlocks and back-up trips provided.
- b. The DB Entity shall submit the detailed, step-by-step test procedures to the MBTA for review and acceptance well in advance of the commencement of field tests. The DB Entity may submit the procedures individually per equipment. MBTA reserves the right to add, delete or make necessary changes in the test procedure. The DB Entity is responsible for the performance and installation of the equipment furnished under this Section, he shall, therefore, prior to testing, verify that the installation is proper and in accordance with all applicable installation instructions specified herein.
- c. Perform continuity and dielectric tests to prove the correctness of circuitry per the MBTA Design Documents.
- d. Each and every AC and DC circuit breaker shall be thoroughly inspected and certified by the DB Entity's Engineer.
- e. Check relay and trip device settings and coordination.
- f. Perform functional and operational tests of all equipment and of all devices and circuits including operations between equipment.
- g. Perform phantom load tests on rectifier transformer AC switchgear protective devices to ensure calibration as outlined in Article 1.06.D of this Section. Phantom load tests may be carried out by secondary injection to the protection relays.
- h. Perform short circuit tests on rectifier and AC and DC switchgear to ensure calibration of rectifier, AC switchgear and DC switchgear protective devices, and overall coordination of protective devices as outlined in Article 1.06.D of this Section, and to confirm adequate short-time current capability or DC circuit breakers. Short circuit tests shall be

conducted at the substation. Circuit breaker of suitable rating furnished by the DB Entity may be used as a shorting device. Graphical results of all parameters for each test shall be recorded and furnished with field test reports. The MBTA may waive any or all of the short circuit tests described below at his/her discretion at any time. The DB Entity shall conduct the following tests:

- (i) Energize the both rectifiers in the substation and close the main (rectifier) DC circuit breakers. Short-circuit output terminals of one rectifier. Check for proper protective device coordination and fault isolation as follows:
 - (a) Main rectifier DC circuit breaker of short circuited rectifier should be tripped by the instantaneous reverse overcurrent device, Device 32 to clear the fault from the rectifier operating in parallel.
 - (b) Device 32 shall also trip the AC circuit breaker of short-circuited rectifier to clear the fault from the AC system.
 - (c) Protective devices of rectifier operating in parallel shall not operate during this test.
 - (d) Record results of test such as total inrush current, steady-state fault current, impulse time of faulted unit, clearing time of faulted unit. Primary system voltage and short circuit capacity shall be tabulated.
- (ii) Repeat the above test, short circuiting the output terminals of the other rectifier unit instead. Check for proper co-ordination of protective devices and fault isolation and tabulate the results.
- (iii) Energize one rectifier in the substation with its associated main DC breaker closed and close the DC feeder breaker specified by the MBTA. Short circuit the load side of the closed DC feeder breaker. For proper protective device coordination and fault isolation, the DC traction feeder breaker instantaneous series overcurrent trip channel in the Device 150M multifunction feeder protection relay shall trip the faulted feeder breaker and successfully clear the fault. No other breakers should trip. Load measuring should activate but be unsuccessful while the short circuit remains applied. Tabulate results such as total let-through current and total clearing time, and record primary system voltage and short circuit capacity.
- (iv) Repeat the above test (3) using the other rectifier unit and short circuit the load side of the MBTA specified DC feeder breaker. For proper protective device coordination and fault isolation, the DC traction feeder breaker instantaneous series overcurrent trip channel in the Device 150M multifunction feeder protection relay shall trip the faulted feeder breaker and successfully clear the fault. No other breakers should trip. Load measuring should activate but be unsuccessful while the short circuit remains applied. Tabulate results as outlined above.
- (v) Energize both rectifiers in the substation with both main DC breakers closed and close the DC feeder breaker specified by the MBTA. Short circuit the load side of the closed DC feeder breaker. For proper protective device coordination and fault isolation and DC breaker interrupting capability demonstration, the DC traction feeder breaker instantaneous series overcurrent trip channel in the Device 150M multifunction feeder protection relay shall trip the faulted feeder breaker and

successfully clear the fault. No other breakers should trip. Load measuring should activate but be unsuccessful while the short circuit remains applied. Tabulate results such as total let-through current and total clearing time, and record primary system voltage and short circuit capacity as above.

- (vi) Energize one rectifier in the substation and close the main (rectifier) dc circuit breaker. Short-circuit the load terminals of the main (rectifier) DC circuit breaker. For proper protective coordination, rectifier AC circuit breaker of the faulted unit shall be tripped by AC feeder time overcurrent unit of relay Device 50/51. The short circuit current will flow until interrupted by the AC circuit breaker. Tabulate the results.
- (vii) Equipment and substation building shall be inspected after each of the above mentioned tests for damage. Failure of the equipment either to withstand these tests or to coordinate or to meet other Section requirements shall be sufficient grounds for rejection of equipment.
- i. At the MBTA's discretion, MBTA's personnel in conjunction with the DB Entity shall test the rate-of-rise trip channel in each Device 150M multifunction DC feeder protection relay in the substation by placing a short circuit on the far end of the electrical section on which the associated feeder breaker is used. The MBTA may waive any or all of the short circuit tests described below at his/her discretion at any time.
 - (i) Relay settings shall be supplied by the DB Entity. Testing shall be done with the rate-of-rise device set no lower than 20 percent above its bottom setting corresponding to a fault farthest away from the breaker. The setting shall allow the start and acceleration of trains at any point in the section supplied by the circuit breaker, without tripping the rate-of-rise relay.
 - (ii) If the breaker fails this test, the DB Entity shall adjust or modify the breaker components or relay settings. The breaker or relay settings must fully meet the requirements to the satisfaction of the MBTA. Any deviation from these requirements will be considered cause for rejection of the DB Entity's rate-of-rise circuitry.
 - (iii) The DB will be furnished the feeder, overhead contact system or third rail, and return circuit impedance data, and related information of train equipment.
 - (iv) All the work external to the substation for conducting this test, including furnishing equipment for shorts along the various points shall be provided by the DB Entity.
- j. Equipment and Instruments
 - (i) Check alignment and proper operation of all equipment including relays, operating mechanisms, clearances, adjustment of contacts, and accessory equipment.
 - (ii) Test indicating instruments, such as ammeters, voltmeters, and other instruments, by checking and adjusting pointers on zero scale with no load or voltage applied, also at midpoint and full scale.

- (iii) Check the isolation amplifiers/transducers for linearity and gain from 1-Volt-to-1-Volt through 1-Volt-to-100-Volt.

k. Battery Monitoring System

- (i) Site Acceptance Tests: The battery monitor system supplier shall prepare site acceptance test procedures, which shall be used to validate the functionality and performance required by this specification.

- (ii) System Installation, Start-up, Commissioning and Training

- (a) The battery monitoring supplier shall provide a field start-up engineer to supervise the system installation at each battery monitor locations. Supervision of the installation does not necessarily imply full time presence during all installation work. However, the start-up engineer must be present during critical times of the installation process, which includes as a minimum, the initial site planning visit, initiation of work to familiarize installation workers with the methods and procedures to perform the work, and a daily presence at the site thereafter to confirm that the work is proceeding as planned.

- (b) After installation, the battery monitoring supplier shall provide a field engineer to start up each battery monitor location and perform all required site acceptance tests to demonstrate that the system meets the functionality and performance of this specification. Before initiating each acceptance test, the field engineer shall co-ordinate with the MBTA to schedule this event at a mutually agreed time and date. A copy of the acceptance test procedure shall be provided to the MBTA a minimum of five (5) days before the start of each test. A signed copy of the completed acceptance test shall be provided for the MBTA's records for each monitor location. Acceptance testing shall also take place at the two remote central computers to ensure that the vendor's monitoring software is performing as required in this specification. A copy of the acceptance test procedure for the central computers shall be provided to the MBTA a minimum of five (5) days before the start of each test. A signed copy of the completed acceptance report for each of the central computers shall be provided for the MBTA's record.

l. Supervisory Equipment

- (i) The DB Entity shall test and verify all wiring installed in the Contract, including wiring to the SAS and SCADA.
- (ii) The supervisory equipment at the substation interfacing with the supervisory system at the High Street Operations Center and Cabot Yard shall be end-to-end tested in accordance with a DB Entity-prepared, MBTA-accepted test procedure.
- (iii) All status, control and analog functions shall be individually tested and checked out and the results recorded, individually, in the test report. Analog devices shall be checked for linearity at zero, 50 percent and 100 percent output and calibrated for proper output to SCADA.

(iv) The DB Entity shall be responsible for conducting end-to-end function testing from the SCADA control room to the field equipment. Testing shall be performed in conjunction with the MBTA, who shall operate all SCADA control room equipment.

m. 600 Volt Wire and Cable

(i) Test in accordance with Article 3.08, Section 16201.

n. Grounding

(i) Test in accordance with Article 3.08, Section 16450.

o. Medium Voltage Cabling

(i) Test in accordance with section 16120.

E. Test Reports

1. The DB entity shall submit five certified copies of test reports for all the tests conducted at the factory and in field for the MBTA's acceptance. Test reports shall be submitted to the MBTA within seven (7) days after completion of tests. In case of "Design Tests" and tests on rectifier packages, test reports shall include original data, detailed calculation of test data used to arrive at the results and interpretation of results. Test reports shall contain the characteristics and curves where required for interpretation of results.
2. Result of AC and DC circuit breaker function test shall be tabulated individually for each breaker, indicating each function tested.

SECTION 16311 - APPENDIX A

SUBSTATION AUTOMATION SYSTEM AND SCADA INTERFACE

PART 1 – GENERAL

1.1 SUMMARY

- A. This section describes the work requirements for the Substation Automation System (SAS) to be provided traction power substations (TPSS) in this Contract and their integration to the existing SCADA system. The SAS shall be a fully redundant system which utilizes a combination of programmable automation controllers, intelligent electronic devices and other networking devices for the protection, monitoring and control of TPSS equipment via local control switches, human machine interface (HMI) workstations, and SCADA. The DB Entity shall provide hardware, software, and interconnections required for a complete and functional SAS. The SAS shall replace hard-wired interconnections between TPSS equipment and the SCADA terminal cabinet used for communicating control signals and monitoring device inputs and outputs (I/O). Interconnections between TPSS equipment and their respective Intelligent Electronic Device or Multipurpose relay shall be hard-wired. In addition, relay devices that trigger the 86-lockout relays shall preferably be hard-wired but

the DB Entity may propose an alternative software based method of hand-reset for these device subject to acceptance by the MBTA.

B. Section Includes:

1. Substation Automation System (SAS)
2. Interface and Integration to existing SCADA System
3. Programmable Automation Controllers (PAC)
4. Intelligent Electronic Devices (IED) and input/output devices
5. Multipurpose Relay (MPR)
6. Intelligent Protection Relay (IPR)

C. Related Sections:

1. Volume 2 Technical Provisions
2. Section 16201 – Basic Materials and Methods for Electrical Work
3. Section 16492 – SCADA Master Station and System Interface
4. Section 16495 – Electrical Acceptance Tests

1.2 REFERENCES

A. Definitions:

1. Intelligent Electronic Device (IED): Refers to any digital or numerical-based protection, metering, or automation device that has processing, recording and reporting capabilities and a local human machine interface (HMI).
2. DIO or IOM: Refers to a digital input and/or output device or module to integrate hardwired signals into the communications system. The DIO does not have integrated intelligence or processing or a HMI.
3. Human-Machine Interface (HMI): The user-interface for a device consisting of a display and buttons.
4. Failure: When the SAS or one of its components does not operate or communicate as designed and installed.
5. Repeated failure: Two or more failures of the same component; whether controller, IED, communications interface hardware, related hardware, or software.

6. Fail-safe: An attribute of a device where related substation equipment will be not left in an unsafe state or left unprotected in the event of a failure.
 7. Provide: Furnish and Install.
- B. Reference Standards:
1. Section incorporates by reference the latest revisions of the following documents, or the version required by the MBTA:
 2. Institute of Electrical and Electronics Engineers (IEEE)
 - a. IEEE C37.90.2, Standard for Withstand Capability of Relay Systems to Radiated Electromagnetic Interference from Transceivers
 - b. IEEE 730, Standard for Software Quality Assurance Plans
 3. International Electrotechnical Commission (IEC)
 - a. IEC 60529, Degrees of protection provided by enclosures (IP Code)
 - b. IEC 60255-21, Electrical Relays – Part 21: Vibration, shock, bump and seismic tests on measuring relays and protection equipment
 - c. IEC 61000-4, Electromagnetic compatibility (EMC)
 - d. IEC 1131-2, Programmable Controllers – Part 2: Equipment Requirements and Tests
 - e. IEC 61131-3, Programmable Controllers – Part 3: Programming Languages
 - f. IEC 61850, Communication networks and systems for power utility automation
 4. National Fire Protection Association
 - a. NFPA 70, National Electrical Code (with amendments by the MBTA)

1.3 SUBMITTALS

- A. Procedures: Contract Technical Provision Subsections 2.7 and 2.8
- B. System description of the SAS and subsystems
- C. Documentation demonstrating service proven design as described in this Section
- D. System support plan during commissioning and warranty period.
- E. Submit Product Data:

1. SAS components
2. Include technical details and operating manuals for hardware and software
3. MBTA information (reliability information of proposed product)
4. Upgrades, bug-fixes, patches and modification log

F. Submit Shop Drawings:

1. System block diagram
2. Panel layout plans
3. Rackmount layout plans
4. Substation layout plans (showing equipment location and access)
5. Equipment installation detail drawings
6. Input/output Lists
7. Input/output maps
8. SAS component list with IP addresses, user names, passwords, and function description
9. Wiring schematics with terminal block references
10. Wiring diagrams with detailed labels for components, contacts for each point and interface with equipment to be installed under this contract.
11. HMI application screen shots
12. Nameplate list
13. Bill of Materials

G. Software:

1. Provide development software for the SAS HMI applications.
2. Provide software used to program and maintain SAS components
3. Provide application code developed for the SAS in electronic format as directed by the MBTA. Application code shall not be proprietary.
4. Provide licenses for SAS software

- H. Technical Support Equipment list as described in this Section
- I. Recommended Spare Parts List
- J. Test procedures and reports:
 - 1. Prepare reports in accordance with Section 16950 Electrical Acceptance Tests.
 - 2. Submit factory design test procedure, test schedule and report
 - 3. Submit field test procedure, test schedule and report
- K. Operations and Maintenance (O&M) Manual:
 - 1. Submit data in accordance with Section 01700 Contract Closeout.
 - 2. Manufacturer's operating and maintenance instructions, parts list, illustrations and diagram for components.
 - 3. Include accepted revisions of SAS submittals described in this Section.

1.4 SOFTWARE INTELLECTUAL PROPERTY RIGHTS

- A. Application software developed under this Contract, including source code, shall become the property of the MBTA.
- B. Development software for SAS components and HMI shall be property of the MBTA.

1.5 QUALITY ASSURANCE

- A. SAS components shall be UL labeled.
- B. SAS components that are not UL certified may be furnished with a Field Evaluation label provided by a third party testing laboratory. The testing laboratory shall be accepted by the MBTA.
- C. SAS component manufacturers and integrator shall preferably be ISO 9001 certified. ISO status shall be provided.
- D. A software quality assurance plan shall be used in accordance with IEEE Standard 730 or equivalent. The plan shall describe a mechanism for orderly software development.

1.6 REQUIREMENTS FOR SERVICE PROVEN DESIGN

- A. SAS components and software shall be of a proven design.
- B. Provide evidence of at least 5 similar systems that have been in successful operation preferably in rail transit projects for a minimum of 3 years.

1.7 RELIABILITY AND MAINTAINABILITY

- A. SAS shall be fail-safe, such that a hardware or software failure condition shall not result in an unsafe equipment state.
- B. The following fail-safe logic should be applied to the SAS, at minimum:

	Event	Action
1	Failure of rectifier, transformer, 72R, or 52T IED/DIO	<ul style="list-style-type: none"> • Remove affected rectifier/transformer from service. • Remaining AC and DC switchgear remain in service.
2	Failure of any IPR in AC switchgear	<ul style="list-style-type: none"> • Trips affected breaker.
3	Failure of any MPR in DC switchgear	<ul style="list-style-type: none"> • Trips affected breaker.
4	AC switchgear Bus Lockout (86B)	<ul style="list-style-type: none"> • Trips affected AC circuit breakers via hard wiring • Via SAS associated 72-R breaker tripped
5	Loss of ACCP IED/DIO	<ul style="list-style-type: none"> • Loss of remote metering and status only if status is provided to SCADA via SAS
6	Loss of MPAC	<ul style="list-style-type: none"> • Auto failover to hot standby PAC (SPAC)
7	Loss of SPAC after loss of MPAC	<ul style="list-style-type: none"> • See 1 above
8	Loss of communications to any IED/DIO or MPAC (and PAC)	<ul style="list-style-type: none"> • See 1 above. • Report communications failure.
8	Loss of communications to any IED/DIO not included above e.g. DIO for battery system, fire alarm and building status.	<ul style="list-style-type: none"> • Report communications failure.

- C. Power supply failure shall not result in loss of data or require any manual re-work such as programming or reconfiguration.
- D. Failure of an SAS component shall not damage or inhibit status, control, or monitoring of any other equipment.
- E. Repeated Failure:
1. Investigate and provide a failure analysis report outlining the root cause of failure. Report shall include a download of the history and compared to similar status reports downloaded at commissioning and startup.
 2. Provide recommendations for correcting the failure. Corrective actions shall be submitted for review by the MBTA.

3. Apply the corrective action after obtaining acceptance by the MBTA at no cost to the MBTA.
- F. The following components shall have a minimum mean time between failures (MTBF):
1. Main Programmable Automation Controller: 87,600 Hours
 2. LCMS LCD Display: 50,000 Hours
 3. LCMS Industrial Computer: 87,600 Hours
 4. Industrial Ethernet Switches: 87,600 Hours
 5. MPRs/IEDs: 87,600 Hours
- G. SAS shall be capable of accommodating upgrades, bug-fixes, patches and modifications. Fully document changes and submit documentation to the MBTA.

1.8 ENVIRONMENTAL REQUIREMENTS

- A. SAS components shall be designed to operate in the environment in which they will be installed and shall comply with and fully function in the environmental conditions specified in Section 16311 Traction Power Electrical Equipment and in this Section.
- B. The presence of transients on communication interfaces shall not cause the malfunction or blocking of critical communications.
- C. SAS components shall comply with the following requirements:
 1. Mechanical shock withstand: IEC 60255-21-2, Class 1.
 2. Vibration resistance: IEC 60255-21-1, Endurance Class1, Response Class 2.
 3. Seismic withstand: IEC 60255-21-3, Class 2.
 4. Electromagnetic field impulse withstand: IEC 61000-4-3, 10V/m.
 5. Radio frequency withstand: ANSI C37.90.2, 35V/m.
 6. Electrostatic discharge: IEC 61000-4-2, 8kV contact discharge, 15kV air discharge
 7. Magnetic Field Immunity: IEC 61000-4-8, 1000A/m for 3 seconds
 8. Dielectric: IEEE C37.90, 2500Vac on I/O, 3100Vdc on power supply
 9. Impulse: C37.90-2005, 0.5 J, 5kV

- D. SAS component circuit-boards shall have conformal coating for protection circuitry hazards.

1.9 WARRANTY

A. Warranty:

- 1. Provide on-site and remote support for the SAS throughout the entire warranty period.
- 2. Support shall include assistance with operation and maintenance of the system.
- 3. Provide a 10-year unconditional warranty on parts and labor.

B. Develop a comprehensive System Support Plan and submit to MBTA.

- 1. Describe technical support services to be provided during warranty period
- 2. Provide contact information for a minimum of three SAS support engineers
- 3. Develop protocols to address SAS system errors

PART 2- PRODUCTS

2.1 SAS GENERAL REQUIREMENTS

A. Design, furnish and install SAS for monitoring and control of traction power substation equipment for the following MBTA Green Line Traction Power Substation (TPSS):

- 1. Red bridge
- 2. Pearl Street
- 3. Ball Square
- 4. 3rd Avenue

B. The SAS shall be used as a communications network within the substation to transmit device statuses, breaker control, metering data, and facility I/O between substation equipment and SCADA. Refer to SAS Local Area Network Requirements in this Section.

C. The SAS shall have a Local Control and Monitoring Station (LCMS) for control and monitoring substation equipment at a central location within each substation. The LCMS is the human machine interface, or HMI, for the substation.

D. SAS shall consist of the following components:

- 1. Local Control and Monitoring Station (LCMS)

- a. Industrial Computer (LCMS Component)
 - b. LCD Rackmount Display (LCMS Component)
 2. Main Programmable Automation Controller (MPAC)
 3. Secondary Programmable Automation Controller (SPAC)
 4. Industrial Ethernet Switches (Managed and Unmanaged)
 5. Intelligent Electronic Devices (IED)
 6. Digital input/output Devices (DIO)
 7. Multipurpose Relays (MPR) (SAS requirement may be the interface with MPR's provided under separate equipment).
 8. Intelligent Protection Relays (IPR) (SAS requirement may be the interface with IPR's provided under separate equipment).
 9. Equipment Rack Enclosures
 10. Associated Peripherals
- E. SAS components shall also provide protective functions as described in the Section and Section 16311.
- F. The SAS local area network (LAN) shall replace hard-wired interconnections and logic to the SCADA terminal board used for communicating control signals and monitoring device I/O. A dual fully redundant network shall be provided.
- G. The SAS LAN shall be a secure network. Access to the SAS devices and embedded software shall be password protected. Submit a list of user names and passwords for SAS components.
- H. Transformer-rectifier lockouts (86, 86X) circuit logic shall be incorporated into the software of automation system. If a lockout handle is provided, then the 86 lockout device shall be hardwired into the SAS. Failure of an SAS component shall result in the failure mode actions listed in the table in Section 1.07. The DB Entity may propose a software base lockout device.
- I. The AC switchgear 86B-lockout relays shall trip AC breakers via a hard-wire connection.
- J. SAS components shall provide a watchdog alarm output to the MPAC/SPAC and SCADA upon failure.
- K. The SAS shall have redundant primary and secondary MPAC/SPAC. The secondary PAC (SPAC) shall be a fully functional controller and shall automatically assume full control of the system when the MPAC fails. This shall be a hot standby configuration.

- L. SAS components shall be of the same brand and model with similar modules and programming.
- M. SAS component storage memory shall be solid-state and non-volatile.
- N. All SAS equipment and IED's shall be located within the equipment such there is easy access to all operating controls, screens and terminals.
- O. Nameplates: SAS components shall have descriptive phenolic nameplates. Submit a nameplates list for review. Refer to Section 16203 for additional nameplate requirements.
- P. Submit a complete list of SAS component input/outputs (I/O) based on Points List in this Section.
- Q. The quantity of IEDs/DIOs shall be proposed by the DB Entity but shall maintain the following philosophy
 - 1. Each rectifier-transformer circuit shall be utilizing independent IED/DIOs such that failure of a component of one rectifier or transformer shall not affect the other unit(s).
 - 2. Each AC bus section shall utilize independent IED/DIOs for the 52T circuit breakers such that failure of a component of one rectifier-transformer circuit shall not affect the other bus section(s) or rectifier transformer(s).
 - 3. Each rectifier DC breaker shall utilize shall utilize independent IED/DIOs for the 72R circuit breakers such that failure of a component of one rectifier-transformer circuit shall not affect the other rectifier-transformer circuit.
 - 4. Each DC circuit breaker shall utilize and independent MPR.
 - 5. Each AC circuit breaker shall utilize and independent IPR.
 - 6. The ACCP shall utilize an independent IED/DIO.
- R. Submit a substation layout plan and panel layout plans showing proposed SAS equipment locations.
- S. The DB Entity shall propose the quantity additional I/O points, for review and acceptance by the MBTA, for the SAS and at each TPSS for indication or monitoring upon request at no additional cost to the MBTA. Points shall be made available to the LCMS and SCADA.

2.2 SAS LOCAL AREA NETWORK (LAN)

- A. SAS components shall be connected via Ethernet 100Base-TX, 100Base-FX, 1000Base-T, or 1000Base-X. The DB Entity shall propose network cables to be used for review and acceptance by the MBTA.
- B. Provide fast Ethernet over twisted pair 100base-TX for the following connections:

1. Managed Ethernet Switch (MES) and LCMS
 2. MES and MPAC
 3. MES and Service Laptop
 4. MPAC and SCADA
- C. Provide fast Ethernet over fiber 100Base-FX for the following interconnections. The DB Entity may propose use of twisted pair 100base-TX connections:
1. MES and SAS components installed in the AC control panel, AC switchgear, DC switchgear, transformers, rectifier control enclosures, negative drainage bus enclosure and negative enclosures (as applicable).
 2. Fiber Optic Cable: Full-duplex multi-mode optical fiber.
- D. Provide Gigabit Ethernet over fiber for interface to SCADA network switch for the following connections:
1. Fiber Optic Cable: Full-duplex multi-mode optical fiber.
- E. Provide hard-wired copper for device I/O for the following interfaces:
1. MPAC / SPAC and Supervisory Terminal Board as required Refer to Section 16492 for additional requirements.
 2. IED/DIO and AC circuit breakers.
 3. IED/DIO and transformers.
 4. IED/DIO and AC Control Panel control switches, transducers, and meters as required
 5. IED/DIO and rectifiers/negative switchboards
 6. IED/DIO and DC cathode breakers
 7. MPR and DC feeder breakers
 8. IED/DIO and 480V Unit Substation
- F. Synchronize time for SAS components with MPAC and SPAC.
- G. Submit a list of SAS components with assigned IP addresses.
- H. Refer to Figure 1 for Typical SAS Block Diagram. CAT6 cable shall be used for communications connections within equipment.

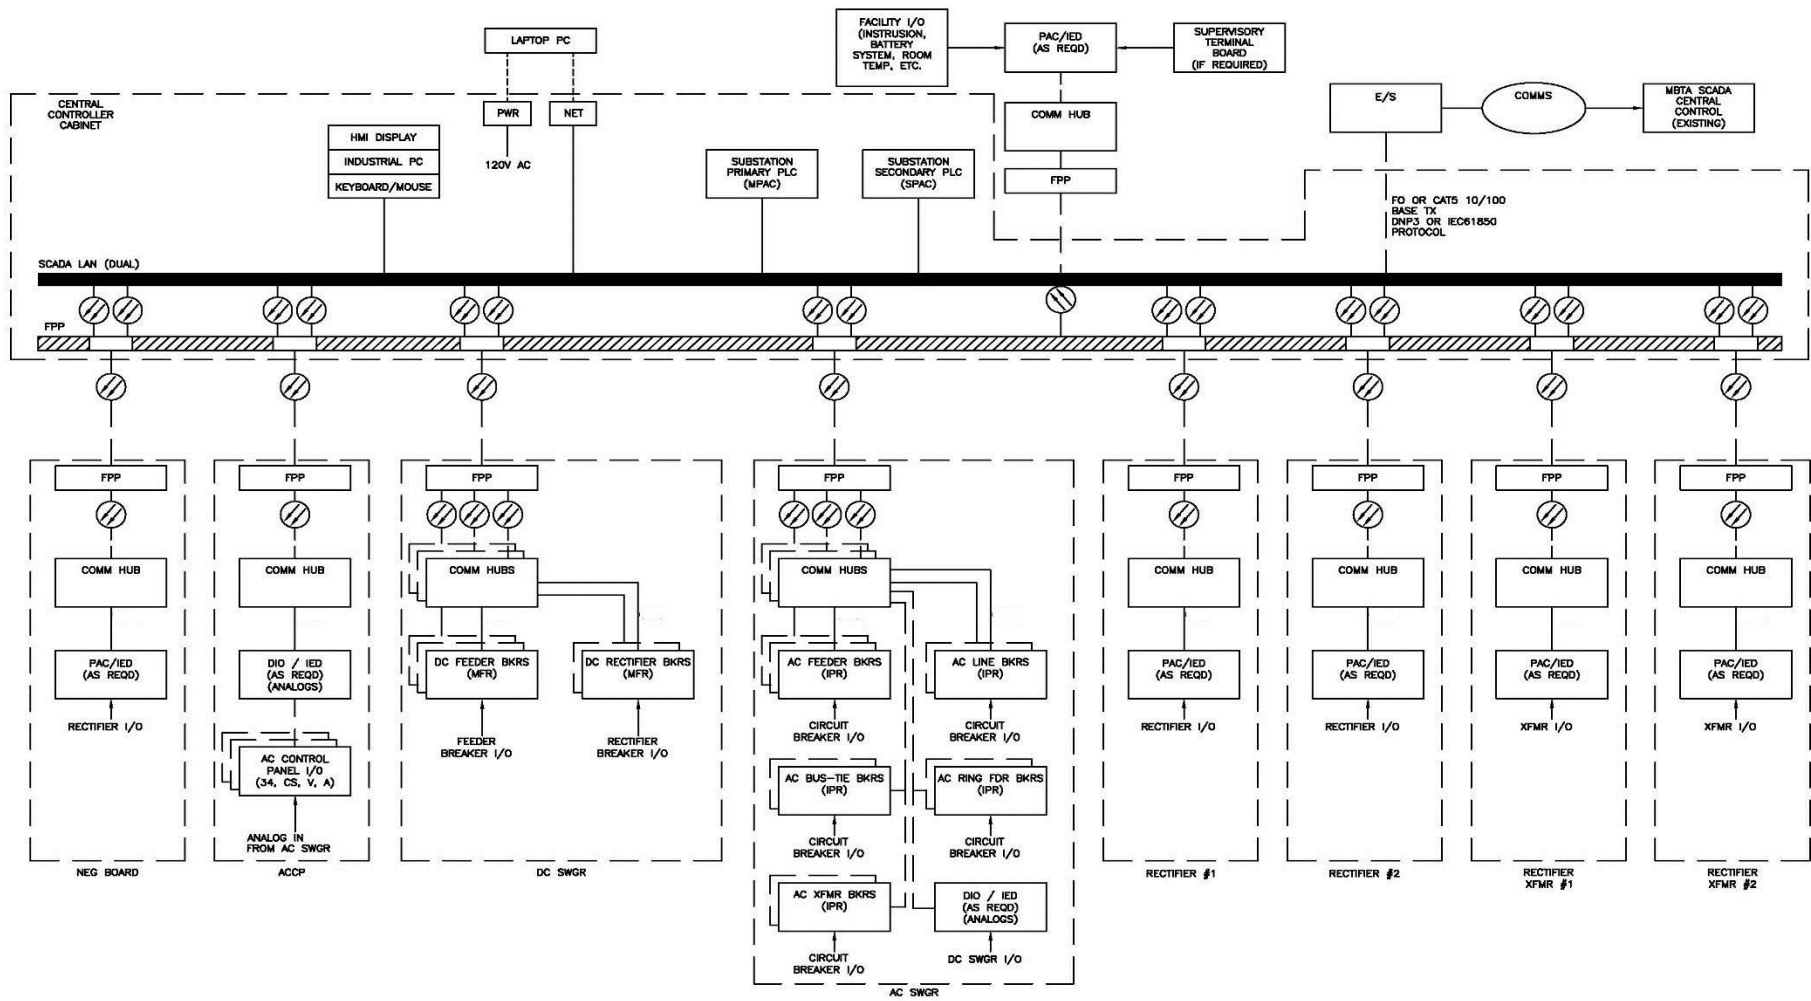

Figure 1 – Typical SAS Block Diagram

2.3 INTEGRATION TO EXISTING SCADA AND CENTRAL CONTROL

- A. Integrate the SAS to the existing SCADA system through the following interfaces and physical networks:
 - 1. Through SCADA Industrial Ethernet switch
 - a. Connect the SAS network to the SCADA network using fiber optic cable or CAT6 ethernet cable.
 - b. Configure SAS devices and network switch to communicate with the SCADA network.
 - c. Map SAS I/O for configuration of the SCADA system
 - d. Communication protocol: DNP3
- B. Refer to Section 16311/16492 Supervisory Terminal Board for additional information.

2.4 POWER REQUIREMENTS

- A. Available TPSS control power at substations: 125 Vdc
- B. For components that utilize 48Vdc or 24Vdc, provide redundant power supplies for each.
- C. Each component shall be separately fused from the 125 Vdc panel.

2.5 MAIN PROGRAMMABLE AUTOMATION CONTROLLER (MPAC) AND SECONDARY PROGRAMMABLE AUTOMATION CONTROLLER (SPAC)

- A. Provide a redundant, primary and secondary, MPACs for each TPSS.
- B. Primary and secondary MPACs shall be identical. The secondary PAC (SPAC) shall be configured to assume full control of the system upon failure of the primary MPAC.
- C. System shall be 'hot standby'. Standby configuration shall be provided for review and acceptance by the MBTA.
- D. MPAC/SPAC functional requirements:
 - 1. Data concentrator for the SAS
 - 2. Collect and log data, events, and alarms from the SAS, LCMS, TPSS facility I/O, and SCADA.
 - 3. Communicate indications, statuses, and control signals between SAS components.
 - 4. Send logged data to the LCMS.
 - 5. Time synchronization for SAS components

6. Role based user management security system with LDAP capability
 7. SAS event log server for local HMI and MBTA's Central Control SCADA Network
 8. Capable of converting data between communication protocols
 9. Utilizes IEC 61131 based logic engine for programming, including ladder diagrams, sequential function charts, function block diagrams, structured test and instruction lists.
- E. MPAC/SPAC specifications:
1. Storage: 4GB non volatile
 2. Communication Ports: USB, Ethernet, Serial
 3. Communication Protocols: DNP3, IEC 61850
 4. Power supplies: Redundant
 5. I/O modules: 8 output contacts, 24 input contacts.
 6. Time Sync: IRIG-B
- F. MPAC, SPAC and associated modules shall have free-standing terminals and shall be replaceable on site without requiring factory rewiring.

2.6 LOCAL CONTROL AND MONITORING STATION (LCMS)

- A. Provide an LCMS for each TPSS that consists of an Industrial Computer and an LCD Display to be used as the substation human machine interface (HMI).
- B. Industrial Computer or "Computer"
1. Functional requirements:
 - a. Access and display HMI applications for local control and monitoring of SAS components. Refer to HMI Application Design section for requirements.
 - b. Access, export, save and print event logs
 - c. Monitor SAS component health status and TPSS equipment status
 - d. Edit user management settings
 - e. Edit SAS component settings
 - f. Control AC and DC breakers

- g. Input to the computer shall be by a keyboard and mouse
 - h. Document viewer for doc, pdf, and dwg files
 - i. Accept and acknowledge alarms
2. Specifications, minimum:
- a. CPU: Intel i7 Processor 3.2 GHz, 12MB cache
 - b. Ethernet: 100Base-T, 1000Base-T
 - c. Memory: 8GB DDR3 RAM, ECC
 - d. Storage: SATA 128GB SSD HD
 - e. Ports: 4 USB ports, 2 serial ports
 - 1) Video: VGA port, DVI
 - f. Operating System: Windows 7 Ultimate or later
 - g. Humidity: 5 – 95 percent non-condensing
 - h. Input devices: Rackmount drawout Keyboard and mouse

C. LCD Rackmount Display

- 1. LCD Rackmount Display, or “Display”, shall be compatible with the Computer and be used as an HMI display for the SAS.
- 2. Display specifications:
 - a. Active matrix color TFT LCD
 - 1) Size: 20.1” diagonal, minimum
 - b. Response Time: 8ms
 - c. Input: Analog VGA, DVI; minimum
 - d. Resolution: 1600 x 1200 @ 60 Hz, minimum
 - e. Mount: 8U Flush mount on 19” rack
 - f. Lexan screen protection
 - g. NEMA 4X powder coated enclosure

2.7 INDUSTRIAL ETHERNET SWITCHES

A. Industrial Managed Ethernet Switches (MES)

1. Provide a redundant MES for each TPSS which automatically switches between primary and secondary devices to minimize downtime.
2. Provide patch panels and cables as necessary for a complete installation.
3. Used for interconnection of SAS components and the MBTA's Central Control SCADA network over fiber.
4. Functional Requirements:
 - a. Standards: IEEE 802.3x Flow control, IEEE 802.1Q VLAN, IEEE 802.1p Class of Service, IEEE 802.1X Authentication, SNMPv3, IEEE 1588v2 timing protocol
 - b. Configurable by a web browser
 - c. Industrial hardened to operate in the substation environment
5. Interface:
 - a. Fast Ethernet: 100Base-TX, 100Base-FX
 - b. Gigabit Ethernet: 1000Base-X
 - c. Accommodate connections required for SAS components plus spare RJ45 and fiber ports. DB Entity to propose the spare capacity to be installed for review and acceptance by the MBTA.
6. Device Requirements:
 - a. Ambient temperature: minus 40 to 85 degrees C.
 - b. Humidity: 5 – 95 percent non-condensing
 - c. Rack mountable in 19" rack

B. Industrial Unmanaged Ethernet Switches

1. Provide where interconnection between SAS component and MES via fiber is required and SAS component is without necessary fiber ports.
2. Interface:
 - a. Fast Ethernet 10/100Base-TX, 100Base-FX
3. Device Requirements:

- a. Ambient temperature: minus 40 to 85 degrees C
 - b. Humidity: 5 – 95 percent non-condensing
4. Approved Manufacturer:
- a. GarrettCom, SEL, MOXA
 - b. Substitutions: Section 00700 General Conditions.

2.8 INTELLIGENT ELECTRONIC DEVICES AND DIGITAL INPUT/OUTPUT DEVICES

A. AC Control Panel (ACCP) IED/DIO

- 1. Provide an IED/DIO for each ACCP.
- 2. Include necessary I/O, communication, and power modules for a complete installation.
- 3. Functional Requirements:
 - a. Monitor device I/O from meters, transducer, local/remote switches, control switches and other hardware within the ACCP as applicable.
 - b. Transmit control signals between the ACCP and the AC switchgear through the SAS network.
 - c. Transmit analog metering data and communicate device statuses from the ACCP to the SAS network.
 - d. Collect I/O from remote devices and AC switchgear statuses at the ACCP.
 - e. Refer to the Points List in this Section for control and monitoring points required by this Contract.
- 4. Device Requirements:
 - a. Ambient temperature: minus 40 to 85 degrees C
 - b. Humidity: 5 – 95 percent non-condensing
 - c. Inputs: AC current, AC voltage, DC transducer inputs, opto-isolated inputs
 - d. Outputs: DC and AC electromechanical outputs, and analog
 - e. Communication Ports: Ethernet 10/100BASE-T or 100BASE-FX
 - f. Protocols: DNP3, IEC 61850

B. Rectifier Transformer/Rectifier/Negative Switchboard, DC Main Circuit Breakers (72R), AC Rectifier-Transformer Circuit Breakers (52T) IED/DIOs

1. Provide an IED/DIO for each main DC circuit breaker, rectifier-transformer AC circuit breaker, rectifier transformer, rectifier and negative switchboard set. Refer also to Section 2.01.Q. The DB Entity may propose combining inputs/outputs at common locations/equipment to best utilize the equipment.
2. Include necessary I/O, communication, and power modules for a complete installation.
3. Functional Requirements:
 - a. Monitor device I/O from the rectifier transformers, rectifiers and negative switchboards.
 - b. Communicate statuses, indication, and control between IED/DIO and other SAS devices through the SAS network.
 - c. Refer to the Points List in this Section for control and monitoring points required by this Contract.
4. Device Requirements:
 - a. Ambient temperature: minus 40 to 85 degrees C
 - b. Humidity: 5 – 95 percent non-condensing
 - c. Inputs: AC current, AC voltage, DC transducer inputs, opto-isolated inputs
 - d. Time Code Input: Demodulated IRIG-B
 - e. Outputs: DC and AC electromechanical outputs, and analog
 - f. Communication Ports: Ethernet 10/100BASE-T or 100BASE-FX
 - g. Protocols: DNP3, IEC 61850

C. DC Multifunction Protective Relay (MPR)

1. Provide MPRs for each DC feeder breaker (172).
2. Functional Requirements:
 - a. Provide protective relaying functions for the DC circuit breakers. Refer to Section 16311 Rev for relay protection requirements.
 - b. Monitor device I/O from DC circuit breakers, transducers, control switches, and relays within each DC breaker cubicle.

- c. Transmit control signals from the control switch to the DC circuit breaker.
 - d. Transmit analog metering data and communicate device statuses to the MPAC/SPAC.
 - e. Collect I/O from remote devices for remote control by the HMI or SCADA.
 - f. Drive control switches used for trip and close functions of the DC circuit breakers.
 - g. Refer to the Points List in this Section for control and monitoring points required by this Contract.
3. MPR shall have its own local LCD display for viewing settings, values and statuses.
 4. All available functions of the MPR shall be preprogrammed and enabled as directed by the MBTA.
 5. Provide a four-position selector switch for each DC circuit breaker (rectifier and feeder) for selecting between the HMI, LOCAL, OFF, and SUPERVISORY for breaker control. Refer to Section 16311 Rev for requirements.
 6. Provide transducers, hardware and wiring for a complete installation.
 7. Device shall have chart recording features with PC software used for downloading and analyzing faults. Fault recording function shall capture analog and digital pre-fault and post-fault waveforms and data.
 8. Device shall be accessible for downloading events and chart recording information from the Workstation and a laptop computer via Ethernet connection to the MES.
 9. Protective Requirements:
 - a. Refer to Section 16311 Rev. In addition to the protection functions required any additional features available via the selected MPR shall be available through the SAS, installed and programmed but not enabled.
 10. Device Requirements:
 - a. Communication Ports: Ethernet
 - b. Communication Protocols: DNP 3.0, IEC 61850
 11. Approved Manufacturer/Product:
 - a. Siemens Sitras Pro, Microelectronica Scientifica UMLE or accepted equal.
 - b. Substitutions: Section 00700 General Conditions.

D. AC Intelligent Protective Relay (IPR)

1. Provide IPRs for each AC circuit breaker (52).
2. Functional Requirements:
 - a. Provide protective relaying functions for the AC circuit breakers. Refer to Section 16311 Rev for relay protection requirements.
 - b. Monitor device I/O from DC circuit breakers, transducers, control switches, and relays within each AC breaker cubicle.
 - c. Transmit control signals from the control switch to the AC circuit breaker.
 - d. Transmit analog metering data and communicate device statuses to the MPAC/SPAC.
 - e. Collect I/O from remote devices for remote control by the HMI or SCADA.
 - f. Drive control switches used for trip and close functions of the AC circuit breakers.
 - g. Incorporate logic for circuit breaker control interlocking.
 - h. Refer to the Points List in this Section for control and monitoring points required by this Contract.
3. IPR shall have its own local LCD display for viewing settings, values and statuses.
4. All available functions of the IPR shall be preprogrammed and enabled as directed by the MBTA.
5. Provide a four-position selector switch for each AC circuit breaker (rectifier and feeder) for selecting between the HMI, LOCAL, OFF, and SUPERVISORY for breaker control. Refer to Section 16311 Rev for requirements.
6. Provide transducers, hardware and wiring for a complete installation.
7. Device shall have chart recording features with PC software used for downloading and analyzing faults. Fault recording function shall capture analog and digital pre-fault and post-fault waveforms and data.
8. Device shall be accessible for downloading events and chart recording information from the Workstation and a laptop computer via Ethernet connection to the MES.
9. Protective Requirements:
 - a. Refer to Section 16311 Rev. In addition to the protection functions required any additional features available via the selected IPR shall be available through the SAS, installed and programmed but not enabled.
10. Device Requirements:

- a. Communication Ports: Ethernet
 - b. Communication Protocols: DNP 3.0, IEC 61850
11. Approved Manufacturer/Product:
- a. Siemens Sitras Pro, Microelectronica Scientifica UMLE or accepted equal.
 - b. Substitutions: Section 00700 General Conditions.
- E. Other Substation IED/DIO
- 1. Provide DIO for substation general equipment alarms, including but not limited to:
 - a. Battery system
 - b. Fire Alarm
 - c. Door intrusion system
 - d. Substation building temperature alarms
 - e. Unit substations
 - f. Substation battery monitoring system

2.9 EQUIPMENT RACK ENCLOSURE

- A. Enclosures shall house the LCMS, MPAC/SPAC, and MES at minimum
- B. Mount display at a height accepted by the MBTA.
- C. Provide cable guides, mounting rails, shelves, externally removable side panels, power strips, and other hardware required for a complete control cabinet installation.
- D. Enclosure shall be fully gasketed to protect from the intrusion of dust.
- E. Construction: 19" rack, 42U, 11 gage steel
- F. Finish: Powder-coat paint, black or grey to match the switchgear
- G. Hardware and accessories: Stainless steel
- H. Rating: 2,000 lbs
- I. Wiring: SIS 600V, 150-degrees
- J. Dimensions: 30" deep, minimum

K. Door:

1. Front: Gasketed, key lockable, clear Lexan door for clearly viewing SAS components from the exterior of the enclosure.
2. Rear: Gasketed, removable, vented steel door with reusable aluminum mesh air filter and air flow panels.

L. Ventilation:

1. Fan ventilated with a reusable aluminum mesh air filter.
2. Rack mounted digital temperature monitor and thermostatic fan controller.
3. Enclosure temperature shall be monitored by the SAS.

M. Submit rack mount layouts for approval.

2.10 GPS CLOCK (FUTURE)

A. Not used.

2.11 Technical Support Equipment (TSE)

A. Provide SAS TSE as indicated below. A set of the listed equipment shall be provided for every four substations:

1. Main Programmable Automation Controller: Quantity 2
2. LCMS Display: Quantity 2
3. LCMS Computer Workstation: Quantity 2
4. Industrial Ethernet Switch: Quantity 2 of each type
5. Intelligent Electronic Devices (IED)/Digital input/output devices (DIO): Quantity 2 of each type

B. TSE equipment shall include I/O, communication, and power supply modules necessary to make a complete unit.

C. Submit TSE list prior to delivery for review by the MBTA.

D. Delivery, Storage, and Handling

1. Schedule: Delivery of TSE shall be complete a minimum of 60 days before initial commissioning of the first TPSS.

2. Notice and Shipping List: Provide MBTA notice of delivery and a complete shipping list a minimum of 10 days before delivery. Shipping list shall include the following:
 - a. Quantity of each part
 - b. Manufacturer's part number
 - c. Serial number, if applicable
 - d. Description
 - e. Spaces for inserting date of delivery, signature of DB Entity, and signature of MBTA.
3. Authorization: TSE shall not be shipped until authorized by MBTA.
4. Location: Deliver TSE to a location in greater Boston, Massachusetts metropolitan area designated by the MBTA.
5. Packaging: Package and label TSE in moisture-proof containers suitable for shipment and storage. Attach copies of shipping list in the package and to the exterior of the package. Apply impactographs to shipments. Packages with triggered impactographs shall be replaced at no additional cost to the MBTA.
6. Unloading: Unload TSE in a manner that will prevent damage to the packages and the contents.
7. Inspection:
 - a. The DB Entity will open the packages and inspect TSE for damage. Damaged parts shall be replaced with undamaged parts and materials at no additional expense to the MBTA.
 - b. Sign shipping list with quantities verified, obtain MBTA's signature, and date. MBTA will retain the signed shipping list.

2.12 LCMS HUMAN MACHINE INTERFACE APPLICATION DESIGN

A. HMI functional requirements:

1. Used to control and monitor TPSS equipment from the local workstation.
2. Secured and Web-based accessibility to any workstation connected to the TPSS network.
3. Capable of capturing screen shots as a JPG or another image file accepted by the MBTA.

B. User Management System (UMS):

1. UMS shall provide a secure login for use of the HMI application.

2. Access to the HMI via the LCMS shall have three user levels, minimum:

User Level	Description
Level 1 (Low)	Local Read Only, No password required.
Level 2 (Maintenance)	Level 1 plus, remote access read only, download event log, acknowledge alarms, edit local/remote, control of breakers.
Level 3 (Supervisor)	Level 2 plus, control of breakers, edit settings.

3. Remote access to the HMI shall be password protected and only allow a Level 1 User Level.
 4. Selection of an object for control and modifying settings shall be password protected.
 5. Automatically display a numeric/alphanumeric QWERTY keyboard when a password must be entered to continue.
- C. Graphical User Interface:
1. Substation Control icons for transformers, rectifiers, breakers, and switches shall use electrical circuit symbols.
 2. Button icons shall be intuitively distinguishable from other status icons with graphical feedback for button presses.
 3. Mouse roll-overs shall provide button icon descriptions.
- D. Provide the following HMI Applications: Desktop, Single Line Diagram (SLD), Alarms, Event Log, Document viewer and Help Screen.
- E. Submit screen shots of the HMI design for review by the MBTA.
- F. Desktop:
1. Desktop shall be visible at all times and display the time, date, and navigation bar.
 2. Other applications shall be viewable in “windows” on the desktop.
 3. Time and Date:
 - a. Time shall be synchronized with the MPAC/SPAC.
 - b. Time format: 00:00:00
 - c. Date format: December 10, 2011
 4. Navigation Bar:

- a. Buttons for Substation Control, Annunciator, Event Log, Document Viewer, and Help applications
 - b. User shall be able to navigate to any application from any screen.
 5. Alarm Annunciation
 - a. Desktop shall have a general alarm indication visible from any application.
- G. Substation Control:
1. Display TPSS equipment and a single line diagram.
 2. Display interconnections to adjacent substations.
 3. Show equipment real time status for TPSS equipment.
 4. Real time status information to be provided in the application, minimum:
 - a. AC Line breaker: Current/Volts A, B, C, KWH, KVA, Closed/Open, Local/Remote (as applicable).
 - b. AC feeder breakers: Current/Volts A, B, C, KWH, KVA, Closed/Open, Local/Remote (as applicable)
 - c. DC feeder breakers: Current, Voltage, Closed/Open, Local/Remote
 - d. DC rectifier breakers: Current, Voltage, Closed/Open, Local/Remote
 - e. DC switches: Closed/Open (future)
 - f. Unit Substation circuit breakers: Closed/Open, Local/Remote
 5. Color Code:
 - a. Color shall indicate closed, open, or uncertain states of breakers and switches.
 - 1) Closed: Red
 - 2) Open: Green
 - 3) Fault: Yellow
 - 4) Uncertain: Grey or Blue
 6. Breaker Control:
 - a. Control functions shall be designed such that an accidental single-step selection of an object does not execute a control operation.

- b. Control operation for an object shall have its own control window.
 - c. Labels for the selection, confirmation, and execution shall be described without abbreviations. Final descriptions shall be accepted by the MBTA.
 - d. Control operations shall be automatically cancelled after 60 seconds if not executed.
 - e. Provide a cancel button for each step in the control sequence.
 - f. Control operation sequence:
 - 1) Select object on SLD, which opens up a control window
 - 2) Select operation (close/open) in control window
 - 3) Confirm operation in control window
 - 4) Execute operation in control window
7. Other Software / Monitoring Systems:
- a. SAS system shall support operation of proprietary software for other systems within the TPSS that are provided under the contract e.g. battery monitoring system software and metering software.
 - b. Each software shall be loaded on the substation computer and accessible via the HMI.

H. Alarms:

- 1. Annunciate alarms shown in Points List, at the end of this Section.
- 2. HMI shall display the Alarms screen when a critical alarm occurs.
- 3. Layout shall mimic an actual Annunciator with alarm windows.
- 4. Color Code:
 - a. Alarm: Flashing red.
 - b. Acknowledged alarm: Solid red
 - c. Alarms resolved before acknowledgment: Flashing yellow.
 - d. Default: Grey.
- 5. Alarms shall be acknowledged by selecting the flashing alarm.

I. Event Log:

1. Header: Alarm number, Date/Time, Description, Device and TPSS location
 2. Protective relay trip events shall contain electrical data information, i.e. current value that triggered an overcurrent trip.
 3. Event log shall display a minimum of 200 events with a scroll bar in event log window.
 4. Events shall be retained in memory for minimum 30 days.
 5. Events shall be downloadable to a laptop and a USB flash drive without deletion from the SAS.
 6. Log shall be in CVS or excel compatible format.
- J. Help Screen:
1. Help screen shall contain instructions for operating each application.
 2. Help content shall be indexed alphabetically by application.
 3. Provide contact information for technical support.
 4. Provide software version and date.
- K. Document Viewer:
1. Provide a document viewer application capable of viewing word documents, text files, and PDF.
 2. Viewer shall have zoom and scroll capabilities.
- L. HMI Software Approved Manufacturer:
1. SEL HMI, Wonderware with Substation Automation
 2. Substitutions: Section 00700 General Conditions.
- M. Example Screen Shots
1. The following screen shots are representative of the MBTA's existing SAS system. The DB Entity shall follow the layout, symbols, and organization per the attached screen shots. Screen configuration and requirements are subject to change based on proposed equipment and MBTA requirements.

Substation SAS Network Status

2.13 DEVELOPMENT SOFTWARE

- A. Provide a user-friendly PC/Windows based development environment suitable for SAS/HMI application software updating and modification.
- B. The environment shall be dedicated solely to creating control/monitoring software. It shall use familiar, standardized editors bundled into a single application.
- C. The environment shall include a graphics editor and online help tools to simplify the development of SAS/HMI application software.
- D. The environment shall comply with IEC 61131-2 standards for programmable logic controllers.
- E. Provide de-bug, documentation and machine startup facilities in the environment.
- F. Provide complete user training for the application of development environment.
- G. Provide complete user documentation for the environment complying with Section 01700 Contract Closeout.

2.14 FACTORY ACCEPTANCE TEST

- A. The SAS shall be factory tested prior to installation in the substation.
- B. Design test shall be used to verify proper functionality of the system and verify contract requirements. Design test shall utilize as many field devices as possible for the source controls and indications and shall prove the system end-to-end.
- C. Factory acceptance test shall be a witness test. Simulation of field devices shall be acceptable.
- D. A mock-up TPSS I/O board shall be used to simulate substation equipment I/O.
- E. Test Procedure:
 - 1. Submit a step-by-step test procedure prior to test.
 - 2. Testing shall include steps to prove the reliability and maintainability conditions of the SAS listed in this Section.
 - 3. Include specific acceptance criteria and expected results for each step.
 - 4. Include a test schedule.
 - 5. Test procedure must be accepted by the MBTA prior to testing.

6. The DB Entity shall test data polling, communications, and time synchronization for the following:
 - a. Interconnectivity between SAS components
 - b. Between SAS components and substation electrical equipment
 - c. MPAC/SPAC and the SCADA Terminal Board
 - d. The DB Entity shall test data polling and communications at the point of interface with the SCADA system. Testing software may be used to simulate the communication interface between the SAS and SCADA.
 7. The DB Entity shall perform functional tests on the LCMS including, but not limited to, the following:
 - a. Desktop
 - b. Navigation Bar
 - c. Annunciator
 - d. Event Log
 - e. Substation Control
 - f. Graphical Interface
 - g. User Management System
 8. Include copies of relevant standards and diagram required for the test.
 9. The DB Entity shall be responsible for integration of the SAS system with all equipment including SCADA.
- F. Submit test reports in accordance with Section 16495 Electrical Acceptance Tests.

2.15 POINTS LIST

- A. Provide the following points for control, monitoring, status and indication to the SAS LCMS and SCADA for each TPSS.
- B. Points shall be applied to each piece of equipment in each Category.

Category	Point Description
ACCP	AC Breaker trip/close control
	AC Breaker remote trip/close control
	AC Breaker open/closed status
	AC Breaker Local/Remote/HMI/Off status
	Current Phases A, B, C (as applicable)
	Voltage Phases A, B, C (as applicable)
	AC Breaker KW, KWH, KVA (totalizing shall be performed within the SAS)
AC Switchgear	AC Breaker trip/close control
	AC Breaker remote trip/close control
	AC Breaker open/closed status
	AC Breaker 50/51/51N Protection Operated
	AC Breaker Local/Remote/HMI/Off status
	Current Phases A, B, C (as applicable)
	Voltage Phases A, B, C (as applicable)
	AC Breaker KW, KWH, KVA (totalizing shall be performed within the SAS)
	Bus Differential Protection Operated 87B
	Bus Lockout 86B

Category	Point Description
Rectifier/Transformer Set	Rectifier/Rectifier Transformer #1 in Soak Mode
	Rectifier/Rectifier Transformer #2 in Soak Mode
DC Switchgear	DC Breaker (feeder, rectifier) trip/close control
	DC Breaker (feeder, rectifier) remote trip/close control
	DC breaker (feeder, rectifier) open/closed status
	DC breaker (feeder, rectifier) Local/Remote/HMI/Off status
	102X DC breaker load measuring
	Overvoltage
	Undervoltage
	176/176X Instantaneous Overcurrent Trip
	176F Timed Overcurrent Trip
	150FX Rate of Rise di/dt
	Loss of Control power
	DC Voltage
	DC Current
	197X Cable Alive indication
	32 Reverse Current (rectifier breaker)
	Transfer Trip (Programmed feature, not enabled)
	Transfer Trip Lockout (Programmed feature, not enabled)
	33 Access Door
164S DC Switchgear Hot Structure	
164SX DC Switchgear Grounded Structure	

Category	Point Description
Traction Power Transformers	49WT Over Temperature 1 Alarm
	49WTH Over Temperature 2 Trip
	26T Oil Over Temperature Alarm
	26TH Oil Over Temperature Trip
	63P Sudden Pressure Relay
	63MR Pressure Relief
	71T Oil Level Relay
	Temperature Monitor Status
Rectifiers	Over Temperature 1 Alarm
	Over Temperature 2 Trip
	Temp Monitor Status
	Diode Failure 1 Alarm 58A
	Diode Failure 2 Trip 58T
	Access Doors 33
	48 Incomplete Sequence Relay
	99Y Rectifier Surge Suppression Monitor
	27RA DC Auxiliary Control Under Voltage
	64R Rectifier Hot Structure
	64RX Rectifier Grounded Structure
	86 Lockout Relay
	86X Conditional Lockout Relay
	164S Rectifier Hot Structure
	164SX Rectifier Grounded Structure
Elapsed Time Meter	
Rectifier Overtemperature Trip counter

	Equipment Rack Over temperature Alarm
	ACCP IED Watchdog Alarm
	AC Switchgear IED Watchdog Alarm/IPR Watchdog
	MES Watchdog Alarm
	MPR Watchdog Alarm
	Rectifier Transformer/Rectifier IED Watchdog Alarm
	DIO Watchdog
	LCMS Watchdog Alarm

C. In addition, provide the points listed in Section 16311.

2.16 TRAINING

- A. Provide instruction to a level of detail necessary for operation, configuration, and preventive, corrective, and overhaul maintenance of SAS.
- B. Location: The training program shall be conducted at location designated by the MBTA in the Greater Boston Area.
- C. Training Format: Training shall include classroom and hands-on instruction. A minimum of fifty percent of the time shall be spent on hands-on instruction.
- D. Training Duration:
 - 1. Size of classes, time and location for the training shall be accepted in advance by the MBTA. The DB Entity shall propose the training content and expected duration.
- E. Training Instructors:

1. Provide qualified training instructors who have direct knowledge and experience in the subject matter that they will present.
 2. Instructors shall be capable of providing detailed explanations of the operation and maintenance of both systems and individual devices and answering any questions that may arise during classes.
 3. Instructors shall be fluent in English.
 4. Instructors shall be able to provide instruction that can be understood by high school graduates with no basic experience in the SAS.
- F. Training Instructor Orientation: If required, a minimum of 30 days before starting training, training instructors shall attend a 1-day orientation at the MBTA to become familiar safety regulations and facilities, and to be advised of student qualifications and expectations.
- G. Trainees: MBTA Operation and Maintenance personnel.
- H. Training Materials:
1. Submit training materials for acceptance by the MBTA.
 2. The training materials shall be high quality, professionally prepared, and support the training courses.
 3. The same training materials shall be used for each class so that each class is exposed to the same information and comments can be collected on training manuals.
 4. If the instructor modifies lesson plans or other elements of the training during actual training, update and distribute the affected training materials to trainees. Submit the revised training materials after training is complete.
 5. All training materials shall become the property of the MBTA at the completion of the training program. Replace damaged training materials before delivering to the MBTA.
- I. Document Format
1. Documents shall be MS Windows compatible files using a software format agreed upon by the MBTA.
 2. Drawings shall be in AutoCAD format.
 3. Both documents and drawings shall also be provided in PDF format.
 4. Photographic images shall be JPG files.
- J. Media
1. Provide electronic files on USB flash drives.

2. Provide final versions of hard copy training materials printed on 8-1/2 x 11 paper.
3. Provide drawings on 11 x 17 paper.
4. Binders for hard copies shall be heavy duty D-ring style.

K. Training Scope and Content

1. Training content shall include the configuration, operation and maintenance of the following SAS components:
 - a. MPAC/SPAC
 - b. LCMS
 - c. IEDs/DIOs
 - d. MPRs / IPR's
 - e. Network Switches, managed and unmanaged.
 - f. Equipment Rack
2. Training instruction shall include at a minimum the following:
 - a. Introduction to the equipment, including terminology, identification of major components, and location in the substation
 - b. Problem symptoms, troubleshooting techniques and repair procedures
 - c. Hands-on experience in troubleshooting systems with faults by artificially introducing faults in the equipment
 - d. Removal and replacement of components
 - e. Disassembly and reassembly for the purpose of component familiarity and any special processes
 - f. Instruction in the use and maintenance of all special tools and processes
 - g. Safety instruction for all maintenance activities
 - h. Overhaul procedures
 - i. Customizing the LCMS HMI screens using the developer software
 - j. PLC (MPAC) network configuration for the interface with the existing MBTA SCADA System.

PART 3 EXECUTION

3.1 ASSEMBLY

- A. SAS hardware installation shall be identical and interchangeable between substations, including wire numbering, and marking.
- B. Provide wiring, terminal blocks, and hardware in accordance with Section 16201 Basic Materials and Methods for Electrical Work for a complete SAS installation.
- C. Provide SAS accessories and peripherals necessary for a complete installation.
- D. Wiring:
 - 1. Interconnecting wiring in accordance with Section 16201 Basic Materials and Methods for Electrical Work
 - 2. Wire and cables shall be identified whenever they enter or leave a housing or enclosure, and at terminals.
 - 3. Provide labels in accordance with Section 16201 Basic Materials and Methods for Electrical Work
- E. Spare Capacity:
 - 1. Design system with a suitable spare capacity to be proposed by the DB Entity. Typical minimum spare requirement is 30%. This shall include:
 - a. Wiring terminals
 - b. Inputs and outputs of same kind per modular controller unit
 - c. Spaces for additional modules for each modular unit
- F. Workmanship:
 - 1. Install equipment, enclosures, wire, cable, conduits and wireways in a neat and secure manner, level and plumb, and in true alignment with adjoining work.
 - 2. Equipment enclosures and installation shall comply with local and national codes including, but not limited to UL 508A and NFPA 70.

3.2 FIELD ACCEPTANCE TEST (FAT)

- A. The DB Entity shall perform an FAT on substations with SAS equipment fully integrated.

- B. The FAT's shall be performed under the supervision of a qualified manufacturer's technical representative. This representative shall assist proper coordination of the SAS with the MBTA's SCADA system.
- C. The DB Entity shall perform operational tests to confirm proper control operation of TPSS through the SAS and SCADA system.
- D. SAS operational testing shall, at a minimum, include the following tests:
 - 1. Communication testing between SAS components
 - 2. Point-to-point and I/O testing between SAS components and TPSS equipment
 - 3. Logic testing of SAS components
 - 4. Verification of data communications message formats and protocol, including all I/O bit assignments for SAS equipment
- E. LCMS operational tests shall include the following:
 - 1. Alarm annunciation and acknowledgement
 - 2. Breaker trip and close
 - 3. Substation local, remote, HMI, off settings
 - 4. Desktop
 - 5. Navigation Bar
 - 6. Annunciator
 - 7. Event Log
 - 8. Substation Control
 - 9. Graphical Interface
 - 10. User Management System
 - 11. QWERTY keyboard operation
 - 12. Time/Date synchronization
 - 13. Navigation to and from each HMI application
- F. IPR and MPR operational tests shall include the following:

1. Breaker trip and close
 2. Device local, remote, HMI, off
 3. Time/Date synchronization
 4. Analog/Digital I/O testing
 5. Control Interlocking
- G. SCADA operational tests shall include the following:
1. Communication testing between SCADA and MPAC/SPAC
 2. Alarm annunciation and acknowledgement
 3. Remote breaker trip and close
 4. Substation local, remote, HMI, off positions

END OF SECTION

SECTION 16450

GROUNDING FOR THE TRACTION POWER SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work included: This Section specifies furnishing, installing, and testing of the complete grounding systems for each of the traction power substations. Also this section specifies furnishing, installing, and testing of ground cable taps and ground rods, as needed, to connect ground systems to the structural frame work, transformer grounding pads and fencing.
- B. The requirements include:
 - 1. Substation Ground Grid at each Traction Power substation.
 - 2. Ground bus within each traction power substation.
 - 3. Ground connections between ground bus and ground grid at traction power substations.
 - 4. Ground connections to equipment within traction power substations.
 - 5. Grounding to Traction power transformers and equipment installed outdoors.
 - 6. Grounding of Substation fences (around outdoor equipment).
 - 7. Connection of surge arresters to the substation ground grid.

1.2 SUBMITTALS

- A. Product submittals in accordance with Section 2.8.
- B. As-built drawings. Submit prior to final acceptance of the work, drawings showing complete layout of systems installed including physical location of ground rods to which connections were made.
- C. Field Quality Control Test Report. Submit reports complying with requirements of Part 3 "Field Quality Control" Article 3.8.

PART 2 - PRODUCTS

2.1 BARE GROUND WIRE

- A. Soft drawn copper, Class A or Class B stranded, meeting the requirements of ASTM B8; size in accordance with the NEC except where sizes specified herein are larger than those required by NEC; UL listed, Label A for lightning protection conductors. Grounding cable shall be continuous without joints or splices through its length.

2.2 INSULATED GROUND WIRE

- A. Copper, Class B Stranded, 600-Volt, 90 degree C, NEC type THWN; meeting requirements of AAR Specifications No. 535.2; sized as indicated; and UL listed.

2.3 PRODUCTS USED FOR COPPER THERMITE WELDED CONNECTIONS

- A. Use products for copper thermite welded connections which are the products of one manufacturer and are produced for the specific application for which they are used.
- B. Use materials and equipment which meet or exceed the applicable requirements of the AAR Manual, Electrical Section.
- C. Coating Materials for Thermite Welded Connections: Use black, rubber based compound coating materials, which are soft, permanently pliable, moldable, and unbacked, not less than 1/8" thick, with properties as follows:

Solids	100 percent
Density	12.0 pounds per gallon minimum
Penetration	90-130 ASTM D5
Water Absorption	0.10 percent maximum ASTM D570
Dielectric Strength	500 volts/mil ASTM D149
Volume Resistivity	2,000 megohms-inches ASTM D257 5,000 megohms-cm ASTM D257
Service Temperature	Minus 40 degrees to 160 degrees F.
Chemical Resistance	Melting point, none; flammability, slow burning (ASTM C653); resists alcohol, water, aqueous hydrochloride and sodium hydroxide; dissolved by carbon tetrachloride, naphtha gasoline, mineral spirits, ketones, and benzene.
Highly cohesive and Adhesive	Adheres strongly to metals and concrete and to itself.

2.4 BOLTED GROUNDING CONNECTORS

- A. For solderless type made of high strength electrical bronze with silicon bronze clamping bolts and hardware; designed such that bolts, nuts, lock washers and similar hardware which might nick or otherwise damage the ground wire will not directly contact the ground wire.

2.5 GROUND BUS

- A. 1/4" x 2" copper bus bar mounted on the wall of the substation (not within 6' of the rectifiers or DC switchgear); drilled and tapped to receive ground cable connections from the ground rod assembly and ground connections for equipment as required.

2.6 GROUND RODS

- A. Medium carbon steel core, copper clad by the molten weld casting process; sizes as required by the design; UL approved.

2.7 JUMPERS

- A. Jumpers shall be tin-plated copper, braided and flexible.

2.8 SURGE ARRESTERS

- A. Connect surge arresters directly to ground in accordance with the design.
- B. Unless otherwise specified connect surge arresters to ground using #2/0AWG covered copper conductors.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Perform testing as specified in Article 3.8 Field Quality Control of this Section.

3.2 GENERAL GROUNDING REQUIREMENTS

- A. General. Provide station electrical grounding complying with procedures of NEC and ANSI/IEEE Standard 80.
- B. Provide substation ground grid and all necessary connections at each traction power substation.
- C. Provide all required structural and equipment grounding.
- D. Unless otherwise indicated, all underground grounding connections shall be by exothermic welding. Unless otherwise indicated, all connections located outdoors to steel structures, fence posts or similar equipment shall be “Servit” post mechanical fittings or equal. Do not use compression or mechanical connections underground. Grounding connections shall not be soldered.
- E. Grounding conductors shall be protected from physical and environmental damage.
- F. Oxide inhibiting compound shall be used for all mechanical connections where copper to aluminum or copper to steel connections are made. The compound shall be applied to all copper, steel and aluminum parts. Aluminum contact surfaces shall be abraded after application of the inhibiting compound.
- G. Equipment Ground Conductors
 - 1. The following equipment shall be grounded:
 - a. 13.8kV AC switchgear (two ground connections to the substation ground bus)
 - b. Rectifier Transformers (two connections to grounding pads on each transformer from ground grid)
 - c. Surge arresters
 - d. All other traction power substation equipment except DC switchgear, rectifier and DC busducts.
 - e. All electrical equipment (not related to traction power) shall be grounded.
 - 2. 13.8kV cables entering the AC switchgear shall be shielded. Where applicable, the cable shields shall be grounding to the switchgear isolated ground bus.
 - 3. Each 13.8kV AC cable shall be grounded at one end only. The opposite end shall have the cable shields pulled back and isolated from ground.

4. Connect each steel conduit entering equipment with equipment ground conductor connected to the equipment ground bus, colored green.
 5. Do not ground DC traction power equipment - Rectifiers and DC switchgear and DC busducts.
- H. At Double-Ended Substations Serving Station Service Equipment – Refer to Electrical Design Specifications and Plans.
1. Connect the Double Ended Substation equipment to the traction power substations ground grid as shown in the Design Documents. The double ended substations shall have a neutral bus with isolating links and single ground between neutral bus and ground bus. The neutral bus shall be insulated from switchgear housing and conduits.
- I. As applicable, provide convenience outlets having ground fault circuit breakers, complying with Section 16201 Basic Materials and Methods for Electrical Work.

3.3 EQUIPMENT GROUNDING

- A. At each traction power substation, install one-quarter inch by 2” copper ground bus continuously around inside periphery or as shown in the Design Documents and connect to grounding electrodes at intervals as required. Ground bus shall not be installed within 6’ of the DC switchgear or rectifiers.
- B. 13.8kV AC Switchgear and Switchboards.
1. Connect continuous equipment ground bus at each end by copper ground wire to building or facility ground bus. Do not connect the isolated ground bus to the substation ground.
 2. Provide ground wire equal in size to largest conductor in line feeding equipment, but not less than No. 6 AWG, nor larger than No. 4/0 AWG.
 3. Install ground wire in rigid steel conduit bonded at both ends.
- C. Wiring, Channels, Cable Trays, Metallic Conduit, Rigid Electrical Metallic Tubing, Flexible Conduits, Metallic Boxes, Panelboards, Generator Frames and Transformer Enclosures.
1. Ground to ground bus with copper ground conductors sized as specified in the Mandatory Specifications.
- D. Motors, Lighting Fixtures and Equipment
1. Accomplish grounding with equipment ground.
 2. Provide equipment ground conductor electrically and mechanically continuous from system equipment and neutral ground connection at source of supply to equipment to be grounded.
- E. Building Type Conductors
1. Where conductors are installed in raceways, run equipment ground conductor for alternating current systems within raceways with circuit conductors.

2. Provide copper equipment ground conductor minimum one size smaller than phase conductors, except having minimum size of No. 12 and maximum size No. 4/0 AWG.
 3. Identify equipment ground conductors with colored green type THW insulation, except where green insulation is not available on larger sizes, black colored insulation shall be used and suitably identified with green tape at each junction box or device enclosure.
- F. Junction Boxes and other enclosures sized above five square inches. Securely bond equipment ground conductors to enclosures utilizing equipment ground bus or lug.
- G. At each transformer ensure two connections are made to the ground grid at the site.

3.4 FENCE GROUNDING

- A. Substation fences around the transformers shall be connected to the ground grid and shall be made electrically continuous.
- B. Substation gates shall be provided with a ground connection to the substation ground grid and the required hardware installed to allow for grounding of the gates at all times.

3.5 SUBSTATION GROUND GRID

- A. Ground Bus. Provide copper ground conductors sized as indicated, buried to minimum depths and in accordance with details as required. Note: Other specifications may reference the ground grid as the ground bus loop.
- B. Ground Electrodes
1. Space electrodes as required, and connect each electrode to ground copper conductor as indicated.
 2. Provide copper-coated, high-strength steel rods conforming to ASTM B228, Grade 40HS, sizes as indicated, having threaded bronze couplings, and driven to depths indicated. Additionally, locate top of electrodes minimum depth below grade and in accordance with details as required.
 3. Where soil conditions make it impossible to drive ground electrodes to depth required, provide three ground rods spaced maximum of 10' apart in shape of equilateral triangle and interconnected with copper ground conductor as required.
 4. Make below-grade connections by brazing or thermite welding.
 5. Bury ground rods vertically with rod top a minimum of 6" below grade. If extensive rock formation is encountered relocate ground rod or provide supplemental ground rods as directed by the MBTA.
 6. To meet maximum allowable ground resistance requirements, install additional ground rods as necessary.
- C. Steel Columns and Other Materials.
1. Connect exposed steel columns to ground grid or ground bus at intervals required. Make connections at steel columns 18" above finished floor in web of columns.
 2. Connect steel columns inside buildings to ground bus, with continuous bare copper conductor, as indicated.

- D. Where miscellaneous metal objects, including piping, vessels, and structural shapes, are within 6' of the DC switchgear or rectifier equipment do not ground the equipment but refer to the MBTA for direction.

3.6 CONVENIENCE OUTLETS

- A. Ground all convenience outlets in accordance with the NEC.

3.7 THERMITE WELDING CONNECTIONS

- A. Connect electrical wires together, to reinforcing steel or soldier piles, as indicated, by thermite welding using the manufacturer's recommended molds and size of charges for application.
- B. Prepare the material to be welded and perform thermite welding in accordance with manufacturer's instructions.
- C. Test completed thermite welds before coating by striking with two pound hammer. If cracks develop, replace welds at no additional expense to the MBTA. When required by the MBTA, test the electrical continuity of bonds.
- D. Apply coating so that it extends one inch beyond point of attachment to steel member, overlaps wire coating one inch, and provides insulation thickness equivalent to wire insulation, but not less than 1/8" in thickness. Do not apply coating material at ambient temperatures below 20 degrees F or above 125 degrees F. Maintain, by an approved method, curing temperature within above temperature range for at least four hours after application of coating. Protect coating by approved means until embedment.
- E. Where exothermic welds are made to a galvanized surface, remove the galvanizing using a grinding wheel to expose a clean surface. After welding, touch up the steel surface with zinc rich primer.

3.8 FIELD QUALITY CONTROL

- A. Testing Building Structural Grounding / Substation Ground Grid
 - 1. General. After installation of ground grid and ground electrodes, and prior to interconnection of other grounding systems perform ground resistance testing.
 - 2. Test Procedure: Submit grounding test procedures in advance of any testing.
 - 3. Test Report. Provide report giving results of testing procedures, which shall also include temperature, humidity, and condition of soil at time of tests.
 - 4. Ground Resistance Testing
 - a. Testing. Verify that resistance between ground and absolute earth for the grounding system does not exceed two ohms without benefit of chemical treatment or other artificial means, unless indicated otherwise in the Construction Specifications.
 - b. Test Equipment and Method. Perform testing using ground resistance direct-reading single test meter utilizing alternating current fall-of-potential method and two reference electrodes.
 - c. Test Procedure

1. Orient ground electrode to be tested and two reference electrodes in straight line space minimum 50" apart.
2. Drive two reference electrodes five feet deep.
- d. Test Requirement or Limits. If ground resistance exceeds two ohms, install additional ground electrodes until resistance is two ohms or less.
5. Notify MBTA prior to back filling the ground grids. Place no backfill until inspection by MBTA is completed and the grounding installation approved.

B. Testing Equipment Grounding

1. General. After installation of ground connections and ground bus, test the grounding system for continuity. Continuity testing shall be completed for each separate ground bus, ground connection, ground conductor.
2. Test Procedure: Submit grounding continuity test procedures in advance of any testing.
3. Test Report. Provide report giving results of testing procedures, which shall also include resistance of each connection in milliohms.

END OF SECTION

SECTION 16451

CORROSION CONTROL AND STRAY CURRENT MITIGATION

PART 1 - GENERAL

1.1. DESCRIPTION

- A. This section specifies the requirements for providing, installing and testing corrosion control and stray current mitigation equipment for metallic utility pipelines and transit structures.
- B. Installation of all corrosion control and stray current mitigation components shall be in accordance with this specification.
- C. The corrosion control systems include electrical continuity (joint bonding), isolation flanges, isolation unions, coatings, galvanic cathodic protection, lightning and AC current surge protection (if required) for isolation fittings, and corrosion control test facilities. The stray current mitigation systems include bonding of concrete reinforcing steel, bonding of sheet pile and soldier pile wall sections, application of waterproofing membranes (under a separate specification), installation of cables, conduits and monitoring/testing facilities.
- D. The DB Entity shall employ or retain a NACE International certificated Corrosion Specialist or Cathodic Protection Specialist to supervise and certify the work included in this section. The individual must have a minimum of five years of experience in the installation and testing of corrosion control and stray current mitigation systems for DC rail transit systems. The duties of the Corrosion Specialist or Cathodic Protection Specialist shall include but may not be limited to:
 - a. Oversee and certify installation and related testing, including pipe joint bonding, electrical continuity testing, test station installation, galvanic cathodic protection systems, and corrosion control equipment. Individual must participate in field activities to the extent required by the work. Minimum requirement for personnel performing field testing is NACE International Corrosion Technician certification.
 - b. Issue a letter of compliance indicating all corrosion control and stray current mitigation measures are satisfactorily installed and comply with contract documents. The letter of compliance shall be signed by the NACE International Corrosion/Cathodic Protection Specialist.

1.2. RELATED WORK

- A. Section 03300 Cast In Place Concrete
- B. Section 16450 Grounding for the Traction Power System

1.3. STANDARDS

- A. American Association of State Highway and Transportation Officials, HB 17, Standard Specification for Highway Bridges
- B. ASTM International A48, Standard Specification for Gray Iron Castings

- C. ASTM International B843, Standard Specification for Magnesium Alloy Anodes for Cathodic Protection
- D. ASTM International C150, Standard Specification for Portland Cement
- E. ASTM International C452, Standard Test Method for Potential Expansion of Portland-Cement Mortars Exposed To Sulfate
- F. ASTM International D257, Standard Test Methods for DC Resistance or Conductance of Insulating Materials
- G. ASTM International D512, Standard Test Methods for Chloride Ion in Water
- H. ASTM International D513, Standard Test Methods for Total and Dissolved Carbon Dioxide in Water
- I. ASTM International D1293, Standard Test Methods for pH of Water
- J. ASTM International D1452, Standard Practice for Soil Exploration and Sampling by Auger Borings
- K. ASTM International D1498, Standard Test Method for Oxidation-Reduction Potential of Water
- L. ASTM International D2000, Standard Classification System for Rubber Products in Automotive Applications
- M. ASTM International D4220, Standard Practices for Preserving and Transporting Soil Samples
- N. ASTM International D4327, Standard Test Method for Anions in Water by Suppressed Ion Chromatography
- O. ASTM International D4658, Standard Test Method for Sulfide Ion in Water
- P. ASTM International G51, Standard Test Method for Measuring pH of Soil for Use in Corrosion Testing
- Q. ASTM International G57, Standard Test Method for Field Measurement of Soil Resistivity Using the Wenner Four-Electrode Method
- R. ASTM International G165, Standard Practice for Determining Rail-to-Earth Resistance
- S. ASTM International – NACE International G193, Joint Standard, Standard Terminology and Acronyms Related to Corrosion
- T. ASTM International G200, Standard Test Method for Measurement of Oxidation-Reduction Potential (ORP) of Soil
- U. American Petroleum Institute 5L, Specification for Line Pipe

- OO. Underwriters Laboratories 508A, Standard for Industrial Control Panels

1.4. DEFINITIONS

- A. Definitions for most terms utilized in this specification are available in ASTM International – NACE International G193, Standard Terminology and Acronyms Relating to Corrosion. Definitions for relevant terms not included in the G193 standard are provided below:
1. Track-to-Earth Resistance – The electrical resistance between a defined length of track and remote earth. Typically expressed in terms of ohms normalized to 1,000' of track (2 rails).
 2. Theoretical Resistance – The calculated resistance of a structure based on the length and linear resistance characteristics of the structure, including the resistance contribution of continuity bonding materials.
 3. Test Station – An enclosure containing cables or wires connected to a structure or structures for connection of test instruments to make potential or current measurements. May also contain cables connected to permanently installed electrodes or other embedded or buried instrumentation.
 4. Drainage Cable – A cable specifically designed to conduct collected stray current from the affected structure to the source of the stray current.
 5. Thermite Welding – Also known as exothermic welding, is a welding process that employs an exothermic reaction of a thermite composition to heat the metal and create a permanent low resistant bond.

1.5. SUBMITTALS

- A. Qualifications: NACE International Corrosion Specialist or Cathodic Protection Specialist certification.
- B. Qualifications: Field testing personnel, NACE International Corrosion Technician certification.
- C. Test procedures and Test Plan: The DB Entity shall submit a detailed written description of the proposed testing schedule and procedures to the MBTA or designee for review a minimum of 2 weeks prior to the scheduled testing start date. Testing shall not commence prior to receipt of approval for the test procedures and test plan from the MBTA.
- D. Instrumentation: The DB Entity shall submit a list of instruments to be used for the testing. The list shall include the manufacturer name, model number, serial number, and calibration certificate for each instrument. The calibration certificate shall show that each instrument was calibrated by an independent testing laboratory within 12 months of the date of testing.
- E. Documentation: The Design-Build Entity shall submit all record drawings, test data and calculations in the form of a report to the MBTA or designee for each installation or required test for review and acceptance. All reports shall be accompanied by a letter of compliance signed by the NACE International Corrosion/Cathodic Protection Specialist.
- F. Product Data: The DB Entity shall submit product data demonstrating compliance with the requirements of this section. At a minimum the data shall include the manufacturer's name, model number, serial number (if applicable), chemical composition, dimensions, material properties and finish. Product data shall be submitted for the following products:
1. Magnesium anodes;

2. Silver/silver chloride reference electrode;
3. Copper/copper sulfate reference electrode;
4. Cathodic protection test stations;
5. Mastic coating;
6. Coal tar epoxy coating;
7. Isolation joint and mechanical coupling external coating;
8. Isolation joint internal coatings;
9. Flange isolation materials;
10. Structure crossing isolation material;
11. Casing spacers;
12. Casing end seals;
13. Stray current junction boxes;
14. Stray current test stations.

G. Acceptance Testing Report: An acceptance testing report shall be submitted within 15 working days of the completion of the testing. The report shall include, at a minimum, all testing procedures utilized, record drawings, tabulated test data and conclusions as to the operational status of all tested components.

PART 2 - PRODUCTS

2.1. MAGNESIUM ANODES

- A. Standard Potential Magnesium Anode. Packaged standard (ASTM B843 Grade AZ63B) type comprised of magnesium ingot, wire, and prepared backfill.
- B. Lead wire: Single-conductor insulated cable, 12 AWG minimum, factory-connected to anode with connection sealed with cast epoxy-resin encapsulation.
- C. Backfill: Anode to be packaged in permeable cloth sack containing compacted backfill of mixture with the following requirements:

MATERIAL	PERCENT
Gypsum	75
Bentonite	20
Sodium Sulfate	5

- D. Open Circuit Potential: Minimum potential of 1.5 volts referenced to copper/copper sulfate reference cell.
- E. High Potential Magnesium Anode. Packaged high potential (ASTM B843, Grade M1C) type comprised of magnesium ingot, wire, and prepared backfill.
- F. Lead wire: Single-conductor insulated cable, 12 AWG minimum, factory-connected to anode with connection sealed with cast epoxy-resin encapsulation.
- G. Backfill: Anode to be packaged in permeable cloth sack containing compacted backfill of mixture with the following requirements:

MATERIAL	PERCENT
Gypsum	75
Bentonite	20
Sodium Sulfate	5

- H. Open Circuit Potential: Minimum potential of 1.75 volts referenced to copper/copper sulfate reference cell.

2.2. ISOLATION FITTING PROTECTION

- A. Electrical isolation fittings shall be protected from lightning surges and the development of excessive AC and DC voltage across the insulating element(s). Protection of the isolation fitting shall be in compliance with NACE International SP0177.

2.3. SILVER/SILVER CHLORIDE REFERENCE ELECTRODE

- A. The silver/silver chloride reference electrode shall consist of a thermodynamically stable gelled Ag/AgCl element packaged in a cotton bag housing containing a backfill that provides good electronic and mechanical bonding to the structure through wide temperature variations. The electrode shall be provided with one #14 AWG HMWPE cable for attachment to the structure and one #22 AWG two conductor shielded cable for routing to the test station. The length of the cables shall be sufficient such that no splicing is required. The electrode shall have a minimum design life of 50 years.

2.4. COPPER/COPPER SULFATE REFERENCE ELECTRODE

- A. The copper/copper sulfate reference electrode shall consist of a gelled copper/copper sulfate element packaged in a cotton bag filled with a bentonite/gypsum mixture that retains moisture and inhibits the migration of contaminants from the surrounding soil to the electrode. The electrode shall be provided with one #12 HMWPE cable for routing to the test station. The length of the cable shall be sufficient to extend to the test station without splicing. The electrode shall have a minimum design life of 50 years and a stability of +/- 5mV or less.

2.5. CATHODIC PROTECTION TEST STATION

- A. Post Mounted Test Station. A 4.5” diameter cast aluminum body with a threaded outlet to fit a minimum 1.25” diameter rigid steel conduit. A screw on cast aluminum cover with an o-ring watertight

seal and the words TEST STATION cast into the exterior face of the cover. The test station shall contain an insulated mounting panel with a minimum of 5 terminals consisting of 0.25" diameter nickel plated brass or stainless steel hardware. All cables terminated in the junction box shall be terminated with copper compression terminals.

- B. Cast-in-Place Flush Mounted Test Station. Compression-molded fiberglass construction with a flat cover attached with stainless steel screws meeting NEMA 4X exposure rating and UL 508A flammability requirements. The cover shall be provided with a permanently attached label with the words CP TEST. The minimum letter height shall be 1". The enclosure shall be sized to accommodate a 2" diameter conduit entrance and the number and size of cables to be installed but in no case shall the dimensions of the enclosure be less than 7" x 7" x 5". The test station shall be provided with an insulated terminal board with a minimum of 5 terminals consisting of 0.25" diameter nickel-plated brass or stainless steel hardware. All cables terminated in the junction box shall be terminated with copper compression terminals.
- C. At-Grade Test Station. Heavy-duty cast iron cover and collar, exceeding ASTM A48 Class 25 (for roadway installation, AASHTO H-20 classification required). The cover shall be capable of locking to the collar and shall have CP TEST cast in the exterior face. Shaft constructed of ABS plastic exceeding ASTM D1788. The shaft shall be flared at the bottom. The test station shall contain a terminal board constructed of PVC or other insulating product that locks into the cover. The terminal board shall contain a minimum of 5 terminals constructed of 0.25" nickel plated brass or stainless steel hardware. All cables terminated in the junction box shall be terminated with copper compression terminals.

2.6. MASTIC COATING

- A. The field applied external mastic coating shall be cold applied, single component coal tar mastic meeting the requirements of SSPC Paint 33. The external coating shall be applied only where noted herein:
 - 1. Buried bolts, nuts, coupling harness tie rods, saddles, iron and steel anchors, and other connecting hardware.
 - 2. Service clamps other transition fittings between copper services and ductile iron pipe.

2.7. COAL TAR EPOXY COATING

- A. The coal tar epoxy coating shall be a polyamide coal tar epoxy meeting the requirements of SSPC Paint 16 and AWWA C210 for exterior use.

2.8. INSULATED FLANGE AND MECHANICAL COUPLING EXTERNAL COATING

- A. The external surfaces of insulated flanges and mechanical couplings shall be coated with a petrolatum tape coating system that meets the requirements of AWWA C217.

2.9. INSULATED FLANGE, MECHANICAL COUPLING AND ISOLATION JOINT INTERNAL COATING

- A. The coating for the internal surface of potable water pipelines at insulated flanges, mechanical couplings and isolation joints must meet the requirements of NSF 61 and be compatible with any internal lining within the pipeline. For pipelines that do not carry potable water, the internal surface shall be coated with a coating meeting the requirements of AWWA C210 for internal surfaces, and be compatible with

any linings and the product transported by the pipeline. The internal surface of the pipeline shall be coated for a minimum length of 2 pipe diameters on each side of the joint.

2.10. ISOLATION JOINT

- A. Monolithic joints shall be manufactured of API 5L Grade B or Grade X steel and consist of two pipe pups and a forged or pipe steel body that is assembled and welded under a compression load. Isolation shall be accomplished by means of two G-10 or G-11 rings. A double pressure-sealing system consisting of NBR or silicone rubber forming a positive pressure seal shall be incorporated within the body of the joint. A dielectric filler material shall be used between the isolating rings and in the external gap between the body and pipe pup of the joint. The joint shall be provided with a factory applied internal and external dielectric coating. For potable water use, the internal coating shall comply with NSF 61 requirements.

2.11. ISOLATION UNION

- A. Air refined malleable iron complete with brass bearing ring and molded integral one-piece nylon insulating material. The size, temperature, and pressure ratings shall be suitable for the proposed application. For underground installations on water service lines, the union and adjacent piping must be coated for a minimum distance of 3' in each direction to prevent current from traveling through the soil around the union.

2.12. PVC INSERT ISOLATION

- A. A PVC insert isolation joint shall consist of a length of plain-end AWWA C900 PVC pipe. The length of the PVC insert shall be a minimum of one pipe diameter, but in no case less than 1'. The PVC pipe shall be connected to the metallic pipe with the appropriate style mechanical coupling. A PVC insert isolation joint should not be utilized in a location where restrained joints are necessary.

2.13. MECHANICAL ISOLATION FITTING

- A. The coupling shall meet the requirements of AWWA C219. The end rings and center rings shall be cast ductile iron meeting or exceeding ASTM A536. Gaskets shall be constructed of virgin styrene butadiene rubber (SBR) and isolation boots shall be constructed of virgin ethylene propylene diene monomer (EPDM) formulated for water and sewer service in accordance with ASTM D2000. Nuts and bolts shall meet the requirements of AWWA C111. Internal and external metallic surfaces of the fitting shall be shop coated with fusion bonded epoxy.

2.14. FLANGE ISOLATION MATERIALS

- A. Flange isolation materials shall consist of a non-metallic full-face insulating gasket, flange-bolt insulating sleeves and washers that are compatible with the pressure rating of the pipeline and the product being transported. Single or double insulating washer sets shall be installed in accordance with NACE International SP0286. Flanges should not be used in direct burial locations.

2.15. STRUCTURE CROSSING ISOLATION MATERIALS

- A. Electrical isolation materials shall be installed where underground metallic pipelines cross a foreign metallic structure with a clearance of less than 12". The isolation material shall consist of a high-density polyethylene sheet with a minimum thickness of 125 mils and dimensions adequate to

effectively isolate the two structures. Alternately, a non-conductive fiberglass reinforced plastic insulation spacer that extends a minimum of 120 degrees around the pipeline and attached to the pipeline for an adequate length may be utilized for isolation.

2.16. CASING SPACERS

- A. Casing spacers shall be constructed of injection molded virgin polyethylene for pipelines up to 12" in diameter. The runner height shall be sufficient to provide a minimum 1" clearance between the pipe, couplings and hubs as well and the internal casing wall. All bolting hardware shall be stainless steel. For pipelines larger than 12" in diameter, the casing spacers shall be constructed of a stainless steel sleeve with EPDM liner and glass-filled polymer runners. The runner height shall be sufficient to provide a minimum 1" clearance between the pipe, couplings and hubs as well and the internal casing wall. All bolting hardware shall be stainless steel.

2.17. CASING END SEALS

- A. Casing end seals shall be constructed of seamless injection molded EPDM and be able to accommodate a minimum eccentricity of 3". The end seal shall be secured to the pipeline and casing with sealant adhesive and stainless steel band clamps.

2.18. STRAY CURRENT JUNCTION BOX

- A. Compression-molded fiberglass construction with a flat cover attached with stainless steel screws meeting NEMA 4X exposure rating and UL 508A flammability requirements. The cover shall be provided with a permanently attached label with the words SC TEST. The minimum letter height shall be 1". The enclosure shall be sized to accommodate two 2" diameter conduit entrances and the required number and size of cables but in no case shall the dimensions of the enclosure be less than 8" x 10" x 5". The junction box shall be provided with an insulated terminal board and mounting hardware. The mounting hardware shall be silicon bronze or nickel-plated brass. Bus bars shall be constructed of electrolytic copper with a minimum thickness of 0.125". All cables terminated in the junction box shall be terminated with copper compression terminals.

2.19. STRAY CURRENT DRAINAGE CABLES

- A. Stray current drainage collection cables shall be a minimum #1/0 AWG flexible stranded copper cable and in conformance with the specification requirements of Section 16121 Insulated Conductors.

2.20. STRAY CURRENT MONITORING TEST STATIONS

- A. Stray current monitoring test stations shall be constructed of compression-molded fiberglass with a flat cover attached with stainless steel screws meeting NEMA 4X exposure rating and UL 508A flammability requirements. The cover shall be provided with a permanently attached label with the words SC TEST. The minimum letter height shall be 1". The enclosure shall be sized to accommodate the number of 2" diameter conduit entrances and the required number and size of cables but in no case shall the dimensions of the enclosure be less than 8" x 10" x 5". The test station shall be provided with an insulated terminal board and mounting hardware. The mounting hardware shall be silicon bronze or nickel-plated brass. Bus bars shall be constructed of electrolytic copper with a minimum thickness of 0.125". All cables terminated in the junction box shall be terminated with copper compression terminals.

2.21. WIRE AND CABLE

- A. Cable for bonded joints and attachment to collector bars shall be single conductor, stranded copper with high molecular weight polyethylene (HMWPE) insulation. Wire for test stations shall be single conductor, stranded copper wire with 600-volt THWN or HMWPE insulation.

2.22. PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Mark each item with manufacturer's name, brand designation, referenced standard, type, class and rating, as applicable.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Store equipment in secure and dry storage facility that is maintained within the temperature range recommended by the product manufacturer.

PART 3 - EXECUTION

3.1. RECORD DRAWINGS

- A. General: Document installed location and configuration of each test station, junction box, stray current collection mat and isolation device with an As-Built drawing, including:
 - B. Test station or junction box number per schedule and installed station number.
 - C. Three ties between test station and permanent datum.
 - D. Distance from test station to guard post, where installed.
 - E. Wire routing, size, insulation color and termination configuration on terminal board.
 - F. Station numbers for wire attachments to pipe, stray current collection mat, retaining wall or reinforced concrete structure.
 - G. Anode locations, where installed, including pipeline station number, anode size, anode center-to-center spacing, depth and distance from pipe.
 - H. Pipeline station number and arrangement of interconnecting fittings for each insulating device, including isolation flanges, isolation joints, isolation membranes or shields, unions and mechanical couplings.

3.2. PIPE HANDLING AND STORAGE

- A. Handling of Pipe:
 - 1. At the project site, the pipe shall not be handled with metal chains, cables, unpadded tongs, forklifts or other equipment likely to cause damage to the pipe shop coating or score the pipe surface.

2. Storing of the pipe shall be on padded 12” wide (minimum) skids or select loamy or sand dirt berms, where possible. In urban areas, pipe should be suspended on padded skids. Where skid chucks are used in contact with the pipe, they should be padded with several layers of padding material. Padded chucks should be placed such that pipe is nested on the skid rather than the chuck. The pipe shall not be laid on pavement or stone surfaces without benefit of padding at contact points.
3. If cables or chains are used during transportation, they must be properly padded with approved, suitable material as required to protect the pipe surface from damage while in transit. Use of a padded horizontal separator strip between successive rows of pipe is necessary to prevent damage to the pipe surface.
4. At all times during construction of the pipeline, the DB Entity shall take every precaution to prevent damage to the protective coating and scoring of the pipe surface. No metal tools or heavy objects shall be permitted to come into contact unnecessarily with the pipe surface.
5. Casing pipe shall be handled with extreme care, in accordance with the above procedures to protect the coating.
6. All coated pipe shall be inspected and tested for coating damage prior to lowering into the pipe trench and any damage to the coating due to improper handling shall be repaired at the DB Entity’s sole expense.

3.3. THERMITE WELDING

A. Attach test wires and bond cables to piping and other structures by thermite welding.

1. General: All thermite welds shall be made in accordance with the manufacturer’s recommendations using the proper combination of equipment for the structure and wire size being welded. All welding materials and equipment shall be the product of a single manufacturer.
2. Testing: When the weld has cooled, remove the weld slag and test for mechanical strength of exothermic weld by applying three sharp blows to the side of the weld with a two-pound hammer using 15” strokes being careful not to strike the pipeline or structure. Acceptable welds shall sustain the blows without cracking the weld metal or the bond between the two connecting materials. Remove defective welds and re-weld after cleaning the area to be welded.
 - a. Documentation: Record adequacy of each bond cable and test wire weld based on the above procedure and visual inspection. Data recorded for each bond cable and test wire to include date of inspection, name of inspection personnel, pipeline station number, quantity, and gauge of wire installed, and simple statement (e.g., “satisfactory”) regarding proper installation. Provide field sketches where tabular data alone is not sufficient to document pipe alignment and bonding configuration.
3. Coating Thermite Welds: After soundness of the weld has been verified, thoroughly clean with a stiff wire brush and coat weldment and all bare metal areas around weldment with a coal tar epoxy coating in accordance with the coating manufacturer’s recommendations. The coating should overlap any existing pipe or structure coating approximately 2”. The coating must be adequately cured prior to backfilling.

- B. Bonded Joints: Install bond cables across each joint using the thermite weld process. Use a standard bond cable length of 18” where practical. Document where bond cable length deviates from the standard cable length, including the actual length of the bond cable utilized. A minimum of two bond cables are required per joint.
 - 1. Do not bond across insulating devices.
 - 2. Do not bond between new ductile iron and prestressed concrete pipe.

3.4. TEST STATIONS AND JUNCTION BOXES

- A. Test stations and junction boxes: Include underground utility test stations; reinforced concrete test stations; retaining wall stray current junction boxes and; stray current monitoring test stations. The installation includes placement of anodes, reference electrodes, attachment of test or bond wires to the structure, routing of wires to and terminating on the terminal board, mounting or embedment of the enclosure, guard posts, conduits, utility warning tape and all other materials or equipment necessary for a complete and functional unit.
- B. Test Station Schedule: Type of test station; number, size and color of wires; wire routing and termination shall be included on the Contract Drawings.
 - 1. Test stations for cathodically protected underground utilities shall be located at all insulated fittings, casings, anode installations, foreign line crossings, and intermediate locations such that the maximum spacing between test points does not exceed 500’.
 - 2. Test stations for reinforced concrete structures, retaining walls and other transit fixed facilities where bonding for stray current control is specified shall be installed at the end point of each structure, transitions between structure types, and at intermediate collector bar locations such that the maximum spacing between test stations does not exceed 500’. Intermediate test stations shall be located at expansion joints where practical.
- C. Positioning: The location of all test stations shall be shown on the Contract Drawings. Test stations for pipelines buried under pavement shall be located outside paving limits. Test stations shall be sufficiently set back from vehicle traffic lanes so that they can be accessed for maintenance without extensive traffic control or other special safety precautions. The cathodic protection test station must be rated for AASHTO H-20 loading and positioned in the center of a travel lane if it cannot be located in an area not subject to vehicular traffic. If the test stations cannot be located within 10’ of the location shown on the Contract Drawings, consult the MBTA for additional direction. For test boxes to be embedded in reinforced concrete structures for stray current bonding and monitoring install the test box and associated conduit prior to concrete placement. The test boxes shall be placed such that the test box will be flush with the surface of the concrete and the test box cover can be easily removed and replaced. The test box shall be placed at a height that is between 2 and 5’ above grade level. Test boxes shall not be placed in a location that requires a ladder or personnel lift device for access. Test boxes shall be located outside of the train envelope where practical.
- D. Wire Routing: Install test and monitoring equipment wires in non-metallic conduit. For underground pipelines the wires may be installed in a wiring harness arrangement routed along the bottom of the pipe trench where practical. Install wires leaving the pipe trench in PVC conduit when the test station is not installed over the pipeline.
- E. Utility Warning Tape: Install a maximum of 1’ below grade and directly above PVC conduit or direct buried cables.

F. Guard Post and Concrete Pad:

1. Guard Post: Provide with concrete anchor at locations that may be subject to inadvertent vehicular traffic. Coat portion not buried with two coats of polyurethane or epoxy coating (color-APWA Color Code for Underground Utilities). Surface preparation and coating application shall be in accordance with coating manufacturer's written instructions. The coating should extend a minimum of 3 inches into the concrete.
2. Concrete Pad: Provide for each flush mount test station. Concrete pad formed around test station shall be square and extend a minimum of 12-inches from the test station collar. The concrete pad shall be reinforced with 4" x 4" x 1/4" dia. welded wire mesh and the surface sloped away from the test station.

G. Magnesium Anode Lead Wire Splices, Wire Connectors and Terminations:

1. Magnesium Anode Lead to Header Cable Splices: Splice the AWG No. 12 solid copper wire supplied with the anode to an AWG No. 8 HMWPE stranded copper cable through the use of a copper compression crimp or thermite weld type connector. Center the splice connector inside the three-layer tape splice insulation. Terminate the ends of the AWG No. 8 anode header cable in the test stations.
2. Terminal Board Connectors: Crimp and solder each terminal box wire to one-hole terminal lug. Clean and dry wire and lug connector before soldering.
3. Wire Splicing: No splices are allowed in individual anode wires, reference electrode wires, corrosion rate probe wires, joint bonds or structure wires.

H. Magnesium Anodes:

1. Positioning: Horizontally or vertically to suit field conditions, with closest part of anode a minimum of 3' from the outside edge of the pipe/structure. Minimum spacing between anode centers installed in a group is 10'.
2. Installation in Rock Areas: If solid rock is encountered at a depth which will not accommodate the specified installation of the anodes, the DB Entity is to investigate the immediate proximity to determine if anode(s) can be installed at specified depth at another location in the immediate area. If a suitable location cannot be found within 25' of the original location, consult the MBTA for additional direction.
3. Backfill: Use soil free from rocks and debris. Do not use sand or clay. Compact backfill in 12" lifts. Do not pre-soak the anodes in water prior to installation.
4. Wiring: Unless noted otherwise, connect grouped anodes using an AWG No. 8 stranded copper header cable. Terminate each end of the anode header cable in designated test stations with only splicing of header cable at anode wire attachments. Anode header cables shall be buried a minimum of 2' below grade with warning tape installed above the cable or conduit containing the cable.
5. Documentation: Include location and orientation of each anode on Record Drawings.

- I. Isolation Flanges: Unless noted otherwise, install with a test station and two test wires attached to pipe on each side of flange.

1. Preparation: Clean dust, dirt, grease, oil and other contaminants from flange surfaces. Check flange face and bolt hole tolerances and verify clearances prior to installing isolation materials.
2. Internal Coating: Two coats dielectric internal pipe coating, minimum dry film thickness per coat of 10 mils, or in accordance with manufacturer's recommendations. Surface preparation, coating application and cure times shall be per manufacturer's instructions. Unless noted otherwise, apply internal coating for a minimum length equal to 2 pipe diameters from flange face in both directions. For pipelines transporting fluids with a resistivity less than 2,000 ohm-cm the minimum coating length on each side of the fitting shall be determined by the DB Entity. All internal coatings utilized for pipelines transporting potable water shall satisfy the requirements of NSF-61.
3. Installation: Install isolation flange gasket, sleeves and washers under clean and dry conditions in accordance with manufacturer's written instructions. Two isolating washers are required for each bolt (one for each side of flange) when an isolation flange is installed above ground. One isolating washer is required for each bolt (on the unprotected side) when an isolation flange is installed underground. Properly torque bolts per isolating material manufacturer's instructions to avoid damage to isolating components and otherwise ensure electrical separation between flange faces and between each bolt and each flange. Do not use conductive grease or other material to facilitate flange assembly which could compromise electrical integrity of isolating materials.
4. Initial Testing: After assembly, directly measure electrical resistance between each bolt and one flange face using an ohm meter or other approved low voltage resistance meter. Resistances less than 10 megohms are not acceptable and require isolator replacement, cleaning and drying of isolator surfaces, and/or other corrective action. If any bolt fails the 10 megohm minimum resistance requirement, all bolts must be retested after corrections are made. Tests shall also be performed across the isolating flange to assure that the gasket is providing effective isolation between the flange faces prior to application of the external coating.
5. External Coating: Coat buried isolating flanges with AWWA C217 compliant petrolatum tape. Surface preparation and coating application shall be as specified by manufacturer, including use of filler material to provide smooth contour around bolts and from transition between pipe and flange. The coating system shall include a dielectric outer wrap. The dielectric wrap material shall have a minimum dielectric strength of 2,000 V/mil. The coating shall extend a minimum of 2 diameters from each flange face for buried or submerged locations.

J. Sanitary Sewer Isolation at Manholes:

1. When proposed metallic sanitary sewer pipelines terminate at an existing or new manhole, the pipeline shall be electrically isolated from all contact with metallic components of the manhole or other appurtenances.
2. A minimum separation between the new pipeline and the manhole rebar shall be 6'. Where 6' cannot be attained, a wall sleeve shall be installed for the pipeline penetration.
3. Test station wires shall be attached to the pipeline just outside the manhole.
4. Alternate electrical isolation can be provided by using a 3' long PVC pipe spool from the manhole to the new pipeline and using a compression or bell end pipe to connect to the plastic pipe spool.

K. Fire Protection Piping Systems

1. Buried ferrous fire protection piping shall be electrically isolated from non-buried fire protection piping and/or other electrically grounded facilities, installed with bonded pipe joints and cathodically protected in accordance with this specification. Test stations shall be installed at all underground electrical isolation fitting locations.
2. Non-buried fire protection piping shall be bonded for personnel safety. Bonded fire protection pipe joints shall be tested for electrical continuity.

3.5. CLEARANCE OF PIPING TO OTHER STRUCTURES

- A. Foreign Structures: A minimum of 12” of clearance shall be maintained between the piping and other metallic structures, where possible. When 12” of clearance cannot be maintained, install non-conductive fiberglass shields or a high density flexible polyethylene solid membrane sheet, nominal thickness 0.125”, between the pipe and foreign structure.
- B. Concrete: When placing concrete in direct contact with ductile iron or steel piping, apply mastic coating to the external surface of the ductile iron piping prior to placing the concrete. The mastic coating shall extend a minimum of 6” beyond the interface of the pipe and concrete. Clean all dirt, moisture, oil, grease, and other contaminants from the piping surface. Thoroughly mix the mastic coating and apply a coat of approximately 12 mils of coating to the piping surface. Allow the coating to dry in accordance with the manufacturer’s recommendations and apply a second coat of mastic of approximately 12 mils in thickness. Allow to completely dry before placing the concrete.

3.6. STRAY CURRENT BONDING OF TRANSIT FIXED FACILITIES

- A. Reinforced Concrete Structures: Bare steel reinforcement shall be utilized in locations identified for stray current bonding.
- B. Cast-in-place reinforced concrete structures: All cast-in-place reinforced concrete structures, including: direct fixation and embedded track slabs; retaining walls; cap beams; abutments; and wing walls constructed roughly parallel to and within 30’ of the nearest electrified rail shall have all longitudinal reinforcement in both faces bonded for electrical continuity. The longitudinal reinforcement in the foundation top and bottom layers for retaining walls and abutments shall also be bonded for electrical continuity and bonded to the wall reinforcement. Stray current collector bars shall be installed at all physical breaks in the reinforcement such as expansion and contraction joints. A silver/silver chloride reference electrode shall be attached to the reinforcement and embedded in the concrete on each side of the discontinuity if the bonding cables are routed to a test station. Additional, intermediate collector bars are required at intervals not exceeding 500’ along the structure and at each end of a structure. A minimum of two cables shall be connected to each collector bar and routed to a test station. A silver/silver chloride reference electrode shall be connected to the reinforcement and embedded in the concrete with wires routed to the test station.
- C. Soldier Pile Retaining Walls with Reinforced Concrete Cap Beams: All longitudinal reinforcement in each face of the cast-in-place concrete cap beam shall be bonded for electrical continuity. Stray current collector bar assemblies shall be installed at each end of the retaining wall and at all discontinuities in the cap beam longitudinal reinforcement to create electrical continuity between the longitudinal reinforcement. At approximate 250’ intervals along the wall a physical break in the longitudinal reinforcement of the cap beam shall be installed (expansion joint type break). A collector bar assembly shall be installed on each side of the break. Two cables shall be connected to the collector bar

assemblies on each side of the break and routed to a stray current control junction box. A copper/copper sulfate reference electrode shall be installed below the subgrade at each stray current control junction box.

- D. Sheet Pile Retaining Walls with Reinforced Concrete Cap Beams: Bonding for stray current control of sheet pile retaining walls shall be installed upon completion of the sheet pile installation for the entire length of the wall. At each end of the sheet pile wall and intervals not exceeding 500' a stray current monitoring test station shall be installed. Two cables shall be exothermically welded to the sheet pile and terminated in the test station. In addition, one copper/copper sulfate reference electrode shall be installed below the subgrade on the train-side of the wall and the reference electrode test wire terminated in the test station. The test station shall be mounted on or against the sheet pile wall at a location conveniently accessible for testing and outside of the train envelope, if practical.
- E. Mechanically Stabilized Earth Walls: Mechanically stabilized earth (MSE) walls constructed where the reinforcing elements do not extend beneath the track bed do not require bonding for stray current control. Non-metallic reinforcing strips shall be utilized where practical. Where metallic reinforcing strips are necessary, the reinforcing strips and anchors shall be fusion-bond epoxy or liquid epoxy coated and the reinforcements of adjacent modules shall not be electrically interconnected. Longitudinal reinforcing steel within precast concrete parapets and cast-in-place junction slabs shall not be made electrically continuous. MSE walls constructed where the reinforcing elements extend beneath the track bed require bonding for stray current control if metallic reinforcing strips are utilized. If metallic reinforcing strips are utilized they shall be electrically continuous for the length of the strip, no splicing is permitted. The reinforcing strips of adjacent modules shall be made electrically continuous through bonding along the soil-side face of the wall. At each end of the MSE wall and intervals not exceeding 500' a stray current monitoring test station shall be installed. Two cables shall be exothermically welded to the reinforcing strip bonding elements and terminated in the test station. In addition, one copper/copper sulfate reference electrode shall be installed below the subgrade on the train-side of the wall and the reference electrode test wire terminated in the test station. The test station shall be mounted on or against the sheet pile wall at a location conveniently accessible for testing and outside of the train envelope, if practical.
- F. Soil Nail Walls: Soil nail walls constructed roughly parallel to and within 30' of the nearest electrified rail require stray current control provisions. The stray current control provisions include electrical isolation between the soil nail and the reinforcement of the wall so that electrical continuity between individual soil nails is avoided. The soil nails shall be installed in non-perforated corrugated HDPE sheaths.
- G. Tie and Ballast Concrete Viaduct: Bonding of reinforcement is not required for the concrete viaduct structure. Stray current control for the viaduct structure is provided by the application of a high dielectric strength spray applied waterproofing membrane.
- H. Tie and Ballast Steel Bridge Decks: Bonding of steel elements is not required for the bridge structures. Stray current control is provided by the application of a high dielectric strength spray applied waterproofing membrane to the ballast pan.

3.7. ACCEPTANCE TESTING

- A. General: The DB Entity shall submit a testing plan and testing procedures for all required testing in accordance with this specification. The testing plan shall include theoretical resistance calculations for all electrical continuity testing requirements. The DB Entity shall submit a list of all proposed instruments to be used for the testing in accordance with this specification.

- B. Electrical Continuity: The electrical continuity shall be tested for structures bonded for stray current and corrosion control. The structures include but may not be limited to:
1. Bonded joint utility piping: The electrical continuity of the pipe shall be tested before and after backfilling is completed. The measured resistance shall not exceed 1.10 times the calculated theoretical resistance of the pipeline and bond cables.
 2. Cast-in-place concrete reinforcement: The electrical continuity of the reinforcement shall be tested before and after concrete placement is completed. The measured resistance shall not exceed 1.20 times the calculated theoretical resistance of the longitudinal reinforcement and bond cables.
 3. Soldier pile retaining walls: The electrical continuity of the retaining shall be tested before and after backfilling is completed. The measured resistance shall not exceed 1.20 times the calculated theoretical resistance of the longitudinal reinforcement and bond cables in the reinforced concrete cap beam.
 4. Sheet pile retaining walls: The electrical continuity of the reinforcement shall be tested before and after backfilling is completed. The measured resistance shall not exceed 1.20 times the calculated theoretical resistance of the longitudinal reinforcement and bond cables in the reinforced concrete cap beam, bonding cables, or reinforcing bar utilized for bonding of the sheet pile sections.
 5. Mechanically stabilized earth retaining walls: The electrical continuity of the reinforcement strips and anchors shall be tested before and after backfilling is completed. The measured resistance after backfilling shall not exceed 1.20 times the resistance measured prior to backfilling.
 6. Electrical Isolation: Electrical isolation shall be tested for all installed isolation joints, isolation unions, isolating mechanical couplings and insulated flanges. Electrical isolation shall also be tested for all cased metallic pipeline crossings to ensure the pipeline is isolated from the casing. Acceptance criteria include a current leakage less than 2% or a combination of a native open circuit potential across the fitting greater than or equal to 0.100 volts and when applying a test current to one side of the fitting a voltage shift of zero or in the opposite polarity occurs on the other side due to the test current.
- C. Cathodic Protection: All installed cathodic protection systems shall be tested for effectiveness. Testing procedures shall be in accordance with NACE International Standard TM0497. Cathodic protection system effectiveness shall be determined in accordance with NACE International Standard SP0169.
- D. Track-to-Earth Resistance: Track-to-earth resistance shall be tested in accordance with ASTM G165. Acceptable values of track-to-earth resistance normalized to 1000' of track (2 rails) are:
1. At grade concrete or composite tie and ballast construction – 500 ohms;
 2. At grade wooden tie and ballast construction – 250 ohms;
 3. Aerial concrete or composite tie and ballast construction with electrical isolation/waterproofing membrane – 1000 ohms;
 4. Grade crossings and embedded track – 250 ohms.

3.8. DEFECTIVE OR IMPROPERLY INSTALLED COMPONENTS

- A. The repair or replacement of any defective or improperly installed component of the stray current and corrosion control systems shall be the sole responsibility of the DB Entity. Any and all repairs or replacement of defective or improperly installed components shall be performed by the DB Entity at no additional cost to the MBTA.

END OF SECTION

SECTION 16465

DRAWINGS AND RECORDS FOR THE TRACTION POWER SYSTEM

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This section specifies the production and furnishing of drawings and tracings and describes the general format of drawings, types of drawings, and the manner in which information shall be displayed for submittal drawings, working drawings and As-Built drawings.
1. Design Drawings – Drawings submitted for the development of the design for review by the MBTA for the designated representative. These will become the Design Documents.
 2. Submit Drawings (Shop Drawings) - Drawings displaying systems, subsystems, products, arrangements and layouts.
 3. Working Drawings - Drawings that have been approved for use in the installation of the Contract.
 4. As-Built Drawings - Drawings which show the actual installation of the Contract as approved and accepted.
- B. The accuracy and correction of all drawings are the responsibility of the DB Entity, and the approvals of those drawings shall be granted for format only. The Design Drawings shall show the work in general to be installed under this contract. The DB Entity shall be required to develop the drawings to fit the particular locations or conditions within the Contract Documents. In addition, the DB Entity's attention is directed toward the fact that certain locations may require special layouts. In such cases, the DB Entity shall submit the designs and/or arrangements which he proposes to use to the MBTA for acceptance.

1.2 QUALITY ASSURANCE

- A. The DB Entity shall check drawings and final tracings for both form and content prior to submittal. Points to be checked shall include the following:
1. Conformance to the Mandatory Specifications
 2. Logical grouping and arrangement of subject matter
 3. Accuracy
 4. Legibility
 5. Neatness
 6. Line Quality
 7. Lettering Quality
 8. Reproduction Quality
 9. Inclusion of contract specified interfaces with related contracts

- B. Acceptance of drawings and tracings shall be at the discretion of the MBTA. The MBTA will consider the same points enumerated above, with the basic criteria for obtaining approval being that drawings are easy to read, understand and use.
- C. Drawings shall not be crowded or cluttered, but shall be arranged for easy reading for troubleshooting and maintaining.

1.3 SUBMITTALS

- A. When submitting drawings to the MBTA for initial acceptance of a product, subsystem, or location, DB Entity shall submit all drawings pertaining to the subject at one time. This logical grouping of drawings, sufficient to completely cover the subject concerned, shall be known as a "Submittal Package". Submittals shall be made in accordance with Sections 2.7 and 2.8.
- B. DB Entity shall submit samples of the drawings prepared in AutoCAD software within 30 days after receipt of a Notice-to-Proceed.

1.4 WORKING DRAWINGS

- A. Working Drawings shall consist of the Design Drawings and the DB Entity Submittal Drawings accepted for the installation. The DB Entity shall keep a set of the Working Drawings to mark every field modification for clear indication of the actual installations during construction.

1.5 AS-BUILT DRAWINGS

- A. As-Built Drawings, including the Design Drawings and the DB Entity Submittal Drawings, shall show the actual installation after construction as approved and accepted. These drawings shall be as specified in Sections 2.7 and 2.8. Additionally, the DB Entity shall update the Drawing "INDEX SHEET" to include all DB Entity Submittal Drawings.

PART 2 – PRODUCTS

2.1 BOOKS OF DRAWINGS

- A. The DB Entity shall supply books of specific Electrical System drawings for working and as-built plans as specified herein. These books of drawings shall consist of the following components:
 - 1. Drawings assembled as specified herein.
 - 2. Protective vinylized front and back cover
 - 3. A device for binding the left-hand edges of the drawings firmly, but in such a manner that drawings may be easily added, removed, or replaced without damage to the drawings.

2.2 FINAL AS-BUILT DRAWINGS

- A. Final As-Built drawings shall be printed by automated techniques (CADD) full size and on 11"x17" paper for review prior to final acceptance by the MBTA.

- B. The DB Entity shall coordinate with the MBTA in regards to the development of the final As-Built drawings. Production of final As-Built drawings is the responsibility of the DB Entity and shall be furnished to the MBTA within 30 days of acceptance.
- C. All electronic drawings shall be compiled and placed on a CD, and provided to the MBTA. Two disks shall be provided (i) all drawings and files in pdf format, (ii) all CAD files in native electronic format (AutoCAD).
- D. The DB Entity shall provide electronic files containing all final "As-Built" Drawings prepared on latest version of AutoCAD.

PART 3 – EXECUTION

Not Used

END OF SECTION

SECTION 16806

EXCAVATION FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the furnishing of all labor, material, and equipment required for safe excavation, trenching, backfilling, tamping and grading for cable, conduits, footings, concrete pads, troughs, CIH's, and foundations for signal cases, junction cases, signals, and other facilities at various locations as indicated herein.
- B. Rock excavation, if encountered, shall be included in this Section and is defined as the removal and disposal of materials in-place that cannot be loosened or broken down by ripping, or by the use of modern construction earth excavating equipment.
- C. Materials which require special rock excavation equipment, or blasting for removal, such as boulders measuring one-half cubic yard or more, and all solid rock, masonry, and concrete pavements requiring hand power tools for fragmenting prior to removal shall also be included in this Section.
- D. Sheeting, shoring, and de-watering of excavated areas and trenches shall be included as necessary for the work described herein.
- E. Backfill materials shall consist of suitable on-site earth excavation; crushed stone, sand, and gravel borrow as specified herein.
- F. The DB Entity shall not excavate under or near track so as to adversely affect its integrity without prior approval of construction method and with the MBTA's acceptance.
- G. Work in a manner to prevent soil erosion, washouts, etc.

1.2 QUALITY ASSURANCE

- A. Backfill materials specified shall be accepted by the MBTA prior to placement. The DB Entity shall arrange for material analysis and all certifications as directed by the MBTA, at no additional cost to the MBTA.
- B. Any voids shall be backfilled again until stabilized.
- C. Backfill in a manner to prevent washouts.

1.3 SUBMITTALS

- A. In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following to the MBTA for acceptance:
 - 1. Certified compaction test reports for material required to be compacted, as specified in various Sections of these and the Mandatory Specifications. The percent compaction shall be in accordance with applicable Sections of these Mandatory Specifications.
 - 2. The type of protective covering to be used to prevent contamination of existing ballast during excavation.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Backfill materials delivered to the site and excavated materials suitable for backfill shall be stored in areas designated by the MBTA in neat piles which will not interfere with railroad system operating traffic movements or work being performed by others. Surplus excavated materials not required for backfill shall be removed from the site for disposal as soon as possible.

1.5 JOB CONDITIONS

- A. Sheeting and shoring of trenches shall be in conformance with applicable local and other governmental codes and regulations.
- B. Transportation of backfill materials and dust control on or near the work shall be in compliance with applicable environmental codes and regulations.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. General requirements pertaining to trenching and backfill materials are as follows:
 - 1. On-site materials obtained from trench and other excavation, to be used as ordinary backfill under this Contract shall have physical characteristics of soils designated as group A-1, A-2-4 or A-3 under AASHTO M-145.
 - 2. Crushed stone base for foundations and replacement of excavated ballast shall be AREA size No. 5 having the following gradation:

<u>Size of Opening</u>	<u>Percent Passing by Weight</u>
1-1/2 inches	100
1 inch	90 - 100
3/4 inch	40 - 75
1/2 inch	15 - 35
3/8 inch	0 - 15
No. 4	0 - 5

- 3. Sand for cable bedding shall consist of clean, inert, hard, durable grains of quartz or other hard durable rock, free from loam or clay, surface coatings, and deleterious materials. The allowable amount of material passing a No. 200 sieve as determined by AASHTO T11 shall not exceed 10% by weight.
- 4. Gravel backfill shall consist of inert material that is hard, durable stone and coarse sand, free from loam or clay, surface coatings, and deleterious materials.
 - a. Graduation requirements for gravel shall be determined by AASHTO T-27 and shall conform to the following:

Sieve	Percent Passing
1/2 inch	50 – 85
No. 4	40 – 75
No. 50	8 – 28
No. 200	0 - 8

- b. The maximum size of stone shall not exceed three inches.
5. The DB Entity shall furnish trench marker tape for signal cable, bright yellow, six inches wide and continuously coded in black lettering with the following legend:

CAUTION	CAUTION	CAUTION
BURIED	SIGNAL	CABLE

Tape for “electrical” or “communication” trenches shall be similar except coded within the legend corresponding to the type of cable installed with the trench.

PART 3 - EXECUTION

3.1 CONSTRUCTION

- A. Excavation work shall be conducted as follows:
- Over-excavation shall be kept to a minimum and any over-excavation below the required grades shall be replaced with backfill material meeting the specified requirements, at no additional cost to the MBTA.
 - The DB Entity shall locate, dig, and backfill the trench with minimum disturbance to drainage, electrical, or other existing systems. The DB Entity shall re-establish and/or repair any portion of the drainage system that may have been disturbed. The DB Entity shall immediately notify the MBTA of any breaks or disturbances of the existing cables. Repairs to existing systems disturbed during excavation shall be made at no additional cost to the MBTA.
 - Wherever excavation is required under or adjacent to tracks that are in service, the DB Entity shall provide such sheeting and shoring as is necessary to prevent damage to the track structure and shall complete his excavation and backfill operations within the same workday.
 - A protective covering shall be provided over track ballast to prevent contamination during excavation and backfill operations. Where it is not possible to provide a protective covering, the DB Entity shall remove the contaminated ballast and replace with crushed stone that shall be compacted as described herein.
 - Soft or unsuitable material existing below the required subgrade shall be removed and replaced with gravel, crushed stone, or other suitable material, as directed by the MBTA, and thoroughly compacted. Rock or boulders shall be removed below the subgrade to a minimum depth of one

foot below the bottom of foundations.

6. Excavation required for placement of cable trough and related systems shall be in accordance with manufacturer's recommended installation practices and with methods shown in the accepted DB Entity's submittal for cable trough installation.
7. Subgrades for conduit or cable trenches paralleling the tracks shall not be less than thirty-six inches (minimum) below finished earth or ballast unless otherwise accepted by the MBTA. When passing under tracks, trenches for conduit or cable shall be not less than thirty-six inches below the top of rail. Power cables, where run separately, shall be a minimum of one foot below the signal cable(s).
8. Where cross pipes, drains, cables, or other unforeseen obstacles are encountered or where clearances are not in conformance with national and local codes, the proposed line and grade of the cable trench or foundation may be altered after securing prior acceptance of the MBTA.

B. Sheeting and Shoring

1. When conduit and foundations are being installed in a trench or hole, the DB Entity shall furnish, install, and maintain such sheeting and shoring as may be required to support the sides of such excavations and adjacent structures. Should the DB Entity be permitted to slope the sides of such excavations so that sheeting, shoring, or bracing is not necessary to prevent cave-ins or slides along the excavation, such additional excavation and backfilling shall be done at no additional cost to the Contract.
2. Unless otherwise accepted by the MBTA, all excavation supports shall be removed upon completion of, or during backfill operations.

C. Dewatering

1. The DB Entity shall provide and maintain, at all times during construction, ample means and equipment to promptly remove and dispose of all water from every source entering the excavations or other parts of the work, to ensure dry excavations and the preservation of the lines and grades of bottoms of excavations.

D. Backfill

1. After excavation to subgrade has been completed, the specified fill shall be placed and compacted as described herein.
2. Backfill operations shall not commence without the acceptance of the excavation by the MBTA.

E. Crushed Stone

1. At all locations where pre-cast or cast-in-place concrete foundations or outdoor cable troughs are installed, a crushed stone base shall be placed and compacted on the accepted subgrade to a total depth of not less than four inches after compaction. Crushed stone shall be placed and compacted at locations where track ballast has been removed and/or fouled by the DB Entity's operations and as directed by the MBTA.

F. Sand

1. Prior to the installation of underground cables a bed of sand compacted to a depth of not less than four inches shall be placed on the accepted subgrade. Following the installation of the cables, sand backfill shall be placed and compacted with hand tools around and over the cables in four-inch to six-inch layers, to a uniform depth not less than six inches over the cables without damage to the cables.

G. Gravel

1. In the event that the on-site excavated soil materials, or any part thereof, do not conform to the soil characteristics specified in this Section, gravel material shall be placed and compacted in uniform layers not exceeding eight inches for backfilling trenches beyond the specified limits for crushed stone and sand backfill.

H. On-site Material

1. All suitable soil material, excavated by the DB Entity for cable trenches and foundations conforming to the material requirements of this Section shall be used for backfilling trenches and foundations beyond the specified limits for crushed stone backfill. Material shall be placed and compacted in uniform layers not exceeding eight inches.

I. Compaction

1. Sand, gravel and on-site backfill shall be compacted to not less than 95% of the maximum dry density of the respective materials, as determined by AASHTO Test Designation T-99. Crushed stone shall be compacted with vibratory compactors to distribute the particle sizes and to provide a compact base with free-draining characteristics.
2. All mechanical equipment for compaction of backfill shall be subject to the acceptance of the MBTA.

J. Trench Marker Tape

1. When installing backfill over direct burial cable or conduit runs, the DB Entity shall also install the polyethylene color-coded tape approximately 12 inches below the finished grade for the full length of each run.

K. Two weeks after backfilling, the DB Entity shall perform an inspection to observe settlement. Any voids shall be backfilled and checked again two weeks later until the areas of excavation have stabilized.

L. Clean-up and Disposal

1. Immediately upon completion of the work described herein, or any segments thereof, and as directed by the MBTA, the DB Entity shall remove and dispose of all debris and surplus excavated material away from the site.

M. Safety

1. All excavation areas shall be covered/protected to eliminate any possibility of a tripping or falling hazard. At the end of each work shift, any ground openings shall be safely covered and an approved barrier, snow fence as a minimum, shall be in place at all times to prevent inadvertent passage through the excavation area.

END OF SECTION

SECTION 16807

CONCRETE AND OTHER FOUNDATIONS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing precast concrete foundations, precast concrete or cast-in-place concrete foundations and cast-in-place concrete pads. Foundations to be furnished and installed shall be complete with galvanized anchor bolts, washers, nuts and associated hardware.
- B. Precast concrete shall be furnished and installed for CIHs, wayside cases, junction boxes, and snowmelter control cases.
- C. Precast concrete foundations shall be furnished and installed for ground mast signals as specified herein. At the discretion of the MBTA, approved cast-in-place foundations may be used where conditions prohibit the use of a precast foundation.
- D. All foundations shall include all fastening hardware and associated material.
- E. All general construction effort which includes items such as excavation for foundations, site clearing and restoration shall be the responsibility of the DB Entity.

1.2 QUALITY ASSURANCE

- A. Concrete for precast foundations shall be in accordance with specifications of the AREMA Manual for Railway Engineering Chapter 8, Specifications for Concrete Structures, and shall have a compressive strength of not less than 5,000 psi.
- B. A permanent record shall be kept by the precast fabricator of the date and conditions of casting of each unit.
- C. Test Specimens
 - 1. Representative test specimens of the concrete poured during the fabrication of the precast units shall be tested to determine the compressive strength of the concrete by an "Accredited Authoritative Structural Testing Laboratory" at no additional cost to the MBTA.
 - 2. Proper control of water-cement ratio, vibration frequency, protection and curing processes shall be monitored to provide the minimum strength of concrete as specified herein.

1.3 SUBMITTALS

- A. The DB Entity shall submit the following for acceptance:
 - 1. Catalog cuts and descriptive literature for all material as specified herein and as shown on the Contract Documents.
 - 2. Drawings of the cast-in-place and precast foundations proposed to be furnished and installed. These drawings shall include the following:
 - a. Physical Dimensions

- b. Type of Formwork
- c. Reinforcing
- d. Bolt spacing, size and detail of galvanized bolts, nuts and washers
- e. Depth of foundation from top of finished grade
- f. Cable entry openings
- g. Proposed location

B. Upon the MBTA's request, submit the following for acceptance:

- 1. Drawings of the precast foundations proposed to be furnished and installed. These drawings shall include the following:
 - a. Physical Dimensions
 - b. Reinforcing
 - c. Bolt spacing, size and detail of galvanized bolts, nuts and washers
 - d. Depth of foundation from top of finished grade
 - e. Cable entry opening
 - f. Certification of Compliance
 - g. Proposed location

C. Two copies of the fabricator's records showing the date and conditions relating to the manufacture of each precast unit, which shall include type of fabricator's building or enclosure, form material used, curing procedures, (steam or water), temperature ranges, air entrainment content, water-cement ratio, method of finishing the units, and all other pertinent information.

D. Four certified copies of the tests conducted by the "Accredited Authoritative Testing Laboratory" for approval and acceptance of the precast units.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage throughout delivery, storage and handling. Comply fully with the requirements of Section 16801 - BASIC TECHNICAL REQUIREMENT FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Damage to trough material, resulting from improper handling by the DB Entity shall require the DB Entity to replace all damaged material with new material at no additional cost to the MBTA.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Precast concrete foundations and piers shall be made of concrete with a compressive strength of not less than 5,000 psi. and be in accordance with the applicable AREMA Signal Manual for the type of precast foundation required.

- B. The pre-cast concrete foundations shall be specifically design for the support of the signal equipment it is supporting.
- C. Precast concrete foundations shall be steel reinforced. Reinforcing steel shall be placed not less than one inch from any outside surface.
- D. Finish and Curing of Precast Foundations. Proper control of the water-cement ratio, high frequency vibration and controlled curing shall be used. An air entraining agent shall be used to increase the resistance to weathering. All outside surfaces shall present a flat smooth and finished appearance.

2.2 BOLTS, NUTS AND HARDWARE

- A. Bolts, nuts and washers shall be galvanized. Nuts and threads shall be in accordance with AREMA Specifications for Bolts, Nuts and Threads.
- B. Plain washers shall be in accordance with AREMA Specifications for Plain and Spring Lock Washers.
 - 1. Steel shall be in accordance with AREMA Specifications for Various Types of Steel.

2.3 CAST-IN-PLACE MATERIAL

- A. Concrete Formwork
 - 1. Concrete formwork shall conform to the requirements of Section 03300 - CAST-IN-PLACE CONCRETE.
- B. Concrete Reinforcement
 - 1. Concrete reinforcement shall conform to the requirements of Section 03300 - CAST-IN-PLACE CONCRETE.
- C. Cast-In-Place Concrete
 - 1. Cast-in-place concrete shall conform to the requirements of Section 03300 - CAST-IN-PLACE CONCRETE for ASTM C150, Type 11 portland concrete cement.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Prior to placing precast concrete foundations, cast-in-place concrete foundations or pads the excavation(s) and installation of crushed stone base shall be placed and compacted as specified in Section 16806 – EXCAVATION FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Foundations and piers shall be buried to a minimum depth of 60 inches below top of finished grade, unless otherwise accepted by the MBTA. Top of final grade to top of foundation shall be as shown on the Contract Documents.
- C. When placing foundations or pads, exercise care to ensure that anchor bolts are not bent or

threads damaged. All anchor bolt threads, washers and nuts shall be protected by applying friction tape, or other approved method satisfactory to the MBTA, until the unit to be supported is installed. Anchor bolts requiring leveling nuts shall be of sufficient length.

- D. Foundation(s) and pad(s) shall be installed level and plumb.
- E. If the surfaces of all foundations exposed to view do not present a uniformly clean surface of even texture and appearance, the surface shall be treated and rubbed to obtain a satisfactory finish, subject to acceptance by the MBTA.

END OF SECTION

SECTION 16808

EXTERNAL SIGNAL CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies requirements for furnishing, installing and testing of a new external signal cable system.
- B. The DB Entity shall furnish and install new signal cables, conduits and raceways required for the complete signal cable system necessary to support the GLX Project. All cables shall be installed in conduit, cable tray, prefabricated cable trough, or aerially on messenger wire.
- C. Material and workmanship shall be of the highest quality to ensure durability for a minimum life expectancy of forty years. The cables shall be suitable for use in the environment to be encountered and shall be certified for continuous operation at 90 degrees C in wet or dry locations with no conductor failing in continuity or with loss of insulation to cross or ground less than fifty meg-ohms.
- D. Express cables are defined as those cables that run between CIH locations.
- E. Local distribution cables are defined as those cables that run from CIH's and cases to wayside equipment. Such as CIH to signal, track circuit, switch machine, main CIH to east CIH etc.
- F. Wire and cable to be furnished for this Project shall meet the requirements of the MBTA's wire and cable requirements as stated herein and as listed in the Technical Appendix A of this section.
- G. The DB Entity shall assure wire and cables are of adequate size and quantity for the system prior to installation.

1.2 QUALITY ASSURANCE

- A. Rejected Wire and Cable – Wire and Cable that does not meet the requirements of this Mandatory Specification shall be rejected. Wire and cable which shows defects or non-compliance with the requirement after delivery at destination may be rejected and the DB Entity shall, on request, advise disposition of the wire and cable in question and pay all related transportation charges for the rejected and replacement material.
- B. Approval of Signal Wire and Cable
 - 1. All wire and cable manufacturers supplying cable for this Contract must be accepted by the MBTA. The DB Entity shall provide all of the data required for the MBTA's evaluation and shall arrange for wire and cable samples, demonstrations and test, if requested.
 - 2. Approval shall be based on the following criteria:
 - a. Past performance and experience: The wire and cable manufacturer(s) must demonstrate previous successful experience in supplying wire and cable to the railroad or transit industry for use as vital signal control, communication cable and electrical. A list of such installations shall be provided for each cable manufacturer under consideration.

- b. Quality assurance program: The manufacture of wire and cables in accordance with the requirements of this Mandatory Specification shall be accomplished in compliance with a quality assurance program that meets the intent of ANSI/ASQC C1-1996 (ANSI Z1.8-1971): Specifications of General Requirements for a Quality Program. Such compliance shall promote a thoroughly tested wire and cable that will render long service life to the user. Prime concern must be focused on the necessary formal assurance requirements to insure that wire and cable failure cannot be attributed to actions or lack of actions by the manufacturer.
- c. Technical data: The DB Entity shall provide full technical data demonstrating compliance with the requirements of this Mandatory Specification for each specified wire and cable.
- d. Demonstration tests: The DB Entity shall make arrangements with the prospective cable manufacturer(s) to perform demonstration tests as required by the MBTA.
- e. Sample specimens. The DB Entity shall, if requested by the MBTA, furnish sample specimens in four-foot lengths for each type of wire and cable specified herein. Sample specimens shall remain the property of the MBTA.
- f. The manufacturer shall certify that he shall comply with the following warranty clauses:
 - 1) The manufacturer warrants that design, material and shall be of the highest quality and consistent with the established and generally accepted industry standards for wire and aerial and underground cable for vital railroad signal, communication, and power circuits; and that each such item and every part and component thereof shall comply with this specification.
 - 2) The manufacturer agrees that this warranty shall commence with the acceptance of each item of wire and cable, whether the defect be patent or latent, and shall apply for a period of two years after initial satisfactory operation or four years after acceptance, whichever is shorter.
 - 3) The warranty covering any length of wire and cable replaced by the manufacturer under the above conditions shall be reinstated for a period of two years effective the date of replacement is affected. If failure is found to be of major significance and affects other wire and cable, the reinstatement of the warranty shall then be extended to cover the item so affected as well, and shall start as of the date of such replacement. The warranty reinstatement provided for in this subparagraph (3) shall apply only to the first replacement or repair of any such item and, in the case of failure of major significance, to the first extension of the said warranty to said affected items.
 - 4) The foregoing warranties are exclusive and in lieu of all other warranties, written, oral, implied or statutory (except as to title and freedom from lien). In no event shall the Manufacturer be liable by reason of breach of warranty for special or consequential damages.
 - 5) Wire and cable furnished shall be traceable to the test data on file for each step in its manufacturing process.

3. Cable Inspections

- a. Inspection:
- b. The MBTA, or its authorized representative, shall have the right to make inspections and tests to determine if the wire and cable meets the requirements of this Mandatory

Specification. The inspector for the MBTA shall have the right to reject wire and cable that is found defective.

- c. The MBTA shall be given a ten-day advance notice of final wire and cable testing, so that the MBTA may witness the tests, if it so elects.
- d. Physical tests shall be made on samples selected at random at the place of production. Each test sample shall be taken from the accessible end of different reels. Each reel selected and the corresponding sample shall be identified. The number and lengths of samples shall be as specified under the individual tests. All applicable tests for the cable materials and cable construction specified shall be performed.
- e. The manufacturer shall provide, at the point of production, apparatus and labor for making any or all of the following tests under the supervision of the MBTA's inspector; to include:
 - 1) Conductor size and physical characteristics,
 - 2) Insulation HV and IR tests,
 - 3) Physical dimension tests,
 - 4) Special tests on materials in coverings,
 - 5) Final HV, IR, and conductor resistance tests on shipping reels.
- f. Certified electrical and physical test reports shall be furnished for the finished multiple conductor cables no later than the time of shipment. Each test document shall, in addition to the test results, indicate the date the tests were performed and the signature of the manufacturer's authorized representative.
- g. The MBTA reserves the right to conduct itself, or by its duly authorized representative, those tests it so elects to further satisfy itself that the cable is manufactured in accordance with the requirements of this Mandatory Specification.

C. Signal Wire and Cable Termination – Quality Assurance Program

1. The DB Entity shall develop a Quality Assurance program to assure that the proper procedures are followed to prepare and terminate signal cables on this contract. All work shall be performed using the highest quality of workmanship possible in a railroad signal, communications and electrical systems environment. This procedure covers supervision, training and implementation of that program.
2. An “assembly line” approach shall be used to strip the outer jackets; pothead the cables; affix eyelets to wire ends; terminate the conductors and perform megger tests. The DB Entity shall inspect and maintain documentation on the various segments of the work. Under no circumstances shall the cables be unraveled or connected prior to visually inspecting for cuts, nicks or abrasions to conductors. The DB Entity shall submit, for acceptance, Cable Termination Report Forms that shall be used to report the work and document/record inspections. These forms shall be submitted within five (5) days of an inspection. Every cable shall be inspected both prior to and after connection; the MBTA shall be notified 48 hours prior to each inspection, and reserves the right to witness the inspection.
3. Wiremen shall be pre-qualified in the use of the approved tools to perform the various functions to which they are assigned. Wiremen shall be trained on the use of proper tools. Wiremen engaged in tagging and termination shall also receive a short training on how to read cable wiring diagrams. The MBTA shall be notified 48 hours prior to each training session and reserves the right to witness and inspect the samples of work.

4. The requirements for pre-qualification are:
