As part of the Design-Builder's Quality Control system, the Design-Builder shall implement corrective action for any part of a Lot that is determined by inspection or testing to not be in conformance with the quality requirements specified in Section 450. If the results of QC inspection identify nonconforming material or workmanship within one or more Sublots, or if the evaluation of the QC testing data indicates that any Sublot is not in conformance with the applicable Quality Limits for the particular HMA Lot Category, the Design-Builder shall isolate the Sublot(s) and perform additional inspection or testing to further assess the quality of the Sublot. Selective inspection or testing should be used to determine the limits of nonconformance, followed by random inspection or testing to quantify the actual quality of the nonconforming area.

Based on the results of additional inspection or testing, the Design-Builder shall prepare a plan of corrective action for the nonconforming Sublot(s). The Corrective action plan shall be submitted to and approved by the Owner prior to initiating corrective action. All corrective action shall be performed at the Design-Builder's expense.

450.69 Quality Control Records System.

A. Quality Control Daily Diary.

The QC Manager should maintain a Quality Control Daily Diary (QC Daily Diary) to document all major activities or actions related to the Design-Builder's QC system. The QC Daily Diary serves as a summary record of key actions taken by QC personnel each day. Recommended Information which should be recorded in the QC Daily Diary includes:

- The day's weather or environmental conditions.
- A summary of production or placement activities completed.
- Any non-conforming material or workmanship identified.
- Any corrective actions recommended or taken by QC personnel.
- Discussions held with other Design-Builder personnel or Department personnel.
- Visitors to the production facility or field placement operation.

B. Quality Control Record Books.

The Design-Builder shall maintain one or more ringed binders referred to as "Quality Control Record Books" (QC Record Books) to store all required QC documents. Separate QC Record Books shall be kept at each HMA production facility and at the project field site. Either a separate QC Record Book shall be established for each HMA pavement course or the data for each pavement course may be included in a single QC Record Book provided the data is separated according to pavement course. QC data for each pavement course shall be organized into separate sections by Quality Characteristic and by Lot number.

QC documents to be stored in the QC Record Book(s) include:

- A signed copy of the current approved QC Plan.
- The original signed copies of all completed Inspection Report Forms.
- The original signed copies of all completed Random Sampling location forms.
- The original signed copies of all completed Test Report Forms.
- A current copy or printout of all Control Charts.
- A current copy or printout of all running QLA performed.
- Current summaries of all individual QC test results to date (by Lot & Sublot).
- Summary sheets of material quantities produced or placed (by Lot & Sublot).

Each required record shall be inserted into the corresponding QC Record Book within 24 hours after the document has been completed. All QC Record Books shall be maintained in a suitable location. The Engineer shall be provided access to all QC Record Books as part of the Department's monitoring of Design-Builder QC activity.

C. Quality Control Records Retention.

All Design-Builder QC records identified above shall be retained for a minimum of seven (7) years. The records shall be protected from damage or alteration. When requested by any State or Federal Agency for audit or similar purposes, the Design-Builder shall provide complete access to all QC records.

DEPARTMENT ACCEPTANCE

450.70 General.

The Department is responsible for performing all Acceptance activities and making the final acceptance determination for each HMA Lot produced and placed. The Department's Acceptance system will include monitoring the Design-Builder's QC activity, performing Acceptance inspection, sampling & testing, and determining the Quality and corresponding payment for each Lot. These activities will be performed for each HMA Lot Category (Lot Category A, B, and C) as outlined further below.

450.71 Acceptance System Approach.

A. Acceptance of Category A Lots.

The Engineer's acceptance determination for each HMA Category A Lot will be based on an evaluation of the Department's Acceptance inspection information and Acceptance testing data. The Engineer will perform Acceptance sampling and testing on a minimum of 25% of the Sublots produced and placed. Design-Builder QC test data will be included in the Department's acceptance determination for each Category A Lot provided the following requirements are met:

- Split Sample Correlation testing requirements are satisfied.
- The Design-Builder provides adequate Quality Control per the approved QC Plan.
- All QC test results included are from random samples.
- The QC test results are Validated against the Department's Acceptance test results.

B. Acceptance of Category B Lots.

The Engineer's acceptance determination for each HMA Category B Lot will also be based on an evaluation of the Department's Acceptance inspection information and Acceptance testing data. The Engineer will perform Acceptance sampling and testing on a minimum of 50% of the Sublots produced and placed, but not less than three (3) Sublots. Design-Builder QC test data will be included in the Department's acceptance determination for each Category B Lot provided the requirements outlined in paragraph A above are satisfied.

C. Acceptance of Category C Lots.

For all HMA Category C Lots, the Owner's acceptance determination will be based only on the Department's Acceptance inspection information and Acceptance testing data. The Engineer will perform Acceptance sampling and testing on 100% of the Sublots produced and placed. Design-Builder QC test data will not be included in the Department's acceptance determination for Category C Lots.

450.72 Department Monitoring of Design-Builder Quality Control.

For projects with HMA Category A Lots or Category B Lots, the Department will monitor the Design-Builder's Quality Control system to confirm that QC activities are being performed for each Lot in reasonable compliance with the approved QC Plan. Department monitoring of the Design-Builder's QC system is not intended to evaluate the Quality of the Work. The Engineer will not perform the QC responsibilities of the Design-Builder or provide constant direction to the Design-Builder on how to perform Quality Control. The Engineer's monitoring of QC activity will include the following:

- Periodic visual observation of QC inspection, sampling, and testing.
- Reviewing QC documentation and records.
- Providing feedback based on monitoring findings.

The Engineer will document all findings (positive or negative) from any monitoring of the Design-Builder's QC system on standard Monitoring Report Forms (MRFs). Copies of all MRFs will be provided to the Design-Builder on a timely basis. When deficiencies in the Design-Builder's QC system are identified and documented by the Owner, the Design-Builder shall take immediate action to address the deficiencies. If the Design-Builder fails to take appropriate action, the Design-Builder shall suspend production and placement of the corresponding Lot(s). The Department will withhold payment for the Design-Builder Quality Control Payment Item (Item No. 450.70) until the Design-Builder implements satisfactory corrective measures.

450.73 Acceptance Inspection.

The Engineer will perform Acceptance inspection of all work items addressed under Section 450 to ensure that all materials and completed work are in conformance with the contract requirements. Acceptance inspection is intended to visually assess the quality of each HMA Lot produced and placed and will address only the inspection components of Materials and Workmanship in support of the Department's final acceptance determination.

All Acceptance inspection activity by the Department will be performed independent of the Design-Builder's QC inspection at both the HMA production facility and at the site of HMA field placement. The Engineer will document the results and findings of Acceptance inspection on NETTCP Inspection Report Forms (IRFs). The Engineer will furnish a copy of all Department Acceptance inspection results to the Design-Builder within five (5) days following the inspection.

A. Acceptance Inspection of Prepared Underlying Surface.

The Department will perform Acceptance inspection of the prepared underlying surface prior to placement of HMA. The items to be inspected and minimum frequency of inspection will be in accordance with the requirements outlined in Table 450.14 and Table 450.15.

Table 450.14 - Department Acceptance Inspection of HMA Patching

Inspection Component	Items Inspected	Minimum Inspection Frequency	Point of Inspection	Inspection Method
Materials	Mixture Type + PG Binder Grade (Correct Type)	1 per Day	HMA Production Facility	Visual Check + Manufacturer COC
	Rubberized Asphalt Sealant (Correct Type)	1 per Day	At Paving Site	Check Manufacturer COC
Workmanship	Sawcut Limit Vertical Face	25% of Patched Areas	Sawcut Limits	Visual Check
	Rubberized Asphalt Sealant Application Rate	25% of Patched Areas	Sawcut Limits	Visual Check + Check Measurement
	Cross-Slope & Profile	25% of Patched Areas	Compacted HMA	Check Measurement

Table 450.15 - Department Acceptance Inspection of Tack Coat

Inspection Component	Items Inspected	Minimum Inspection Frequency	Point of Inspection	Inspection Method
Materials	Asphalt Emulsion (Correct Type)	1 per Day	At Paving Site	Check Manufacturer COC
Workmanship	Asphalt Emulsion Application Rate	Once per 5,000 lane-ft (1,500 lane-m)	Tacked Surface + Tack Distributor System	Visual Check + Check Measurement

B. Acceptance Inspection of HMA Lots.

The Department will perform Acceptance inspection at both the HMA production facility and at the site of HMA field placement. For purposes of Acceptance inspection, the total quantity of each HMA pavement course produced and placed during the same construction season will constitute a Lot. Each in-place HMA Lot will be divided into 500 lane-feet (150 lane-meters) Sublots. The items to be inspected and minimum frequency of inspection will be in accordance with the requirements outlined in Table 450.16.

(1) Wheel Path Deviations.

Each HMA Lot produced and placed will be inspected by the Owner for Wheel Path Deviations (high points or low points) using a 10 foot (3 meter) standard straightedge in accordance with the procedures outlined in Subsection 450.64B. Acceptance inspection for Wheel Path Deviations applies to all pavement courses (including bridge protective courses and bridge surface courses). The finished surface of each required pavement course will be inspected for all mainline travel lanes, auxiliary lanes, ramps, and side road travel lanes. The Sublot size and minimum frequency of Acceptance inspection for Wheel Path Deviations will be as specified in Table 450.16.

Table 450.16 - Department Acceptance Inspection of HMA Lots

Inspection Component	Items Inspected	Minimum Inspection Frequency	Point of Inspection	Inspection Method
Materials	HMA Mixture Type, Aggregates & PG Binder (Correct Type)	1 per Day	HMA Production Facility	Visual Check + Manufacturer COC
	Rubberized Asphalt Sealant (Correct Type)	1 per Day	At Paving Site	Check Manufacturer COC
Workmanship	Joint Location & Alignment	50% of Sublots, Once per Joint	At Finished Joint	Visual Check
	Sawcut Joint Vertical Face	50% of Sublots, Once per Joint	Joint Vertical Face	Visual Check
	Rubberized Asphalt Sealant Application Rate	50% of Sublots, Once per Joint	Joint Vertical Face	Visual Check + Check Measurement
	Physical Segregation	50% of Sublots, Once per Lane	Compacted HMA	Visual Check
	Cross-Slope	50% of Sublots, Once per Lane	Compacted HMA	Check Measurement
	Joint Tightness	50% of Sublots, Once per Joint	Compacted HMA	Visual Check
	Joint Surface Deviations	50% of Sublots, Once per Joint	At Finished Joint	10 foot (3 meter) standard straightedge
	Wheel Path Deviations	50% of Sublots, per Wheel Path	Wheel Path	10 foot (3 meter) standard straightedge

450.74 Acceptance Sampling & Testing.

A. Random Sampling.

The Department will utilize stratified random sampling to determine the overall quality of each HMA Lot produced and placed. Random Acceptance sample locations will be determined by the Owner in accordance with ASTM D 3665 or by electronic random number generator, as presented by the NETTCP. All random Acceptance sample locations will be documented on NETTCP Standard Test Report Form D3665.

The Design-Builder shall furnish the Owner with approved containers for all Acceptance samples. The Engineer will obtain all random Acceptance samples independent of the Design-Builder's QC samples at the frequencies outlined below.

(1) Sampling HMA Category A Lots.

The Engineer will obtain Acceptance samples from a minimum of 25% of all Sublots in each HMA Category A Lot for all Quality Characteristics specified in Table 450.17, other than PG Asphalt Binder Grading and Ride Quality. Acceptance samples For PG Asphalt Binder Grading and Ride Quality will be obtained from each Sublot as defined in Table 450.17.

(2) Sampling HMA Category B Lots.

The Engineer will obtain Acceptance samples from a minimum of 50% of all Sublots, but not less than three (3) Sublots, in each HMA Category B Lot for all Quality Characteristics specified in Table 450.17, other than PG Asphalt Binder Grading and Ride Quality. Acceptance samples For PG Asphalt Binder Grading and Ride Quality will be obtained from each Sublot as defined in Table 450.17.

(3) Sampling HMA Category C Lots.

The Engineer will obtain Acceptance samples from 100% of all Sublots in each HMA Category C Lot for all Quality Characteristics specified in Table 450.17, other than Ride Quality. Acceptance sampling and testing for Ride Quality will not be performed on Category C Lots.

B. Selective Sampling.

The Department will utilize selective sampling (i.e. non-random samples) as needed to provide supplemental information to assist in quantifying the quality of apparent nonconforming material. When the results of acceptance inspection or random sampling and testing identify material which is not in conformance with the applicable Quality Limits for the particular HMA Lot Category, the Owner will isolate the corresponding Sublot(s) and perform selective sampling to further assess the quality of the Sublot. Selective inspection or testing will be used to determine the limits of nonconformance, followed by random inspection or testing to quantify the actual quality of the nonconforming area. The test results of selective Acceptance samples will not be combined with random Acceptance sample data in the determination of Lot acceptance using Quality Level Analysis as outlined in Subsection 450.78.

C. Design-Builder Assistance in Obtaining Acceptance Samples.

The Engineer will obtain all material samples for Acceptance testing by the Department. When requested by the Department, the Design-Builder shall assist the Owner in obtaining Acceptance samples in accordance with the following requirements:

- The Acceptance sample location and time will be randomly selected by the Owner and provided to the Design-Builder immediately prior to sampling.
- The Design-Builder's qualified QC personnel will only provide the physical labor to assist the Owner in obtaining the Acceptance sample.
- The Engineer will be present to direct and monitor the taking of the sample.
- The Engineer will take immediate possession of the Acceptance sample.

Design-Builder assistance may be requested in obtaining Acceptance samples for PG Asphalt Binder Grading and for In-Place Density and Thickness (HMA cores). The Design-Builder shall provide adequate traffic control for the Department to obtain cores, regardless of whether the Design-Builder assists the Owner in obtaining the Acceptance core samples.

D. Acceptance Sample Identification System.

The Department will use a standard system for the identification of all Acceptance samples. All PG Asphalt Binder samples, HMA loose mixture samples, and core samples will be labeled by the Owner with the minimum information indicated under Subsection 450.65C. Acceptance sampling data for Ride Quality and Wheel Path Deviations will be identified by the Owner in accordance with the Department’s Standard Operating Procedures (SOPs).

E. Retention of Split Samples.

Qualified Department personnel will obtain all material samples (PGAB samples, HMA loose mix samples, and cores) for Acceptance testing. The Department will retain split samples from each PGAB sample and HMA loose mix sample and provide a split sample to the Design-Builder if requested. The Department will retain the original core samples after testing to serve as “split samples” and protect them from damage. All split samples will be stored for a period of (30) days, or until tested. These split samples will be utilized if necessary, in the Dispute Resolution process. If mutually agreed upon by the Department and the Design-Builder, the retained split samples may be discarded prior to the required thirty (30) days.

F. Acceptance Testing of HMA Lots.

The Department will perform Acceptance testing using the random samples obtained in accordance with Subsection 450.74A from the HMA production facility and at the site of HMA field placement. The specific Quality Characteristics subject to Department Acceptance testing are identified in Table 450.17. All Acceptance testing of HMA Lots will be performed by the Owner in accordance with the AASHTO, ASTM, NETTCP, or Department test methods specified in Table 450.17 and the procedures outlined below. The Engineer will furnish a copy of all Department Acceptance test results/data to the Design-Builder within five (5) days following completion of testing.

(1) PG Asphalt Binder Grading.

The Department will review the Supplier’s Certificate of Compliance (COC) and corresponding certified AASHTO M320 test results submitted by the Design-Builder for each Supplier Lot of PGAB from which the HMA Producer’s PGAB was obtained. The Engineer will also obtain and test a minimum of one random Acceptance sample of PGAB for each 12,000 ton (11,000 Mg) HMA Sublot, as defined in Table 450.17, to determine conformance with AASHTO M320. A minimum of two 1-quart (1-Liter) containers of PGAB will be obtained for each Acceptance sample from the HMA Producer’s tanks in accordance with AASHTO T40. All PGAB Acceptance samples will be split prior to testing and the un-tested portion of the sample will be retained for a minimum of 30 days.

(2) PG Asphalt Binder Content.

The Engineer will test each HMA Lot produced and placed for PG Asphalt Binder Content in accordance with either AASHTO T164 or T308. When AASHTO T164 is used, the test results will be reported prior to ash correction. The Sublot size and minimum frequency of Acceptance testing for PG Asphalt Binder Content will be as specified in Table 450.17. Each material sample for PG Asphalt Binder Content will be obtained at the HMA plant from a randomly selected quadrant from the haul vehicle in accordance with ASTM D3665 and AASHTO T168.

Table 450.17 - Department Acceptance Sampling and Testing of HMA Lots

Quality Characteristic	Test Method(s)	Sublot Size	Minimum Test Frequency	Point of Sampling	Sampling Method
PG Asphalt Binder Grading	AASHTO M320	12,000 tons (11,000 Mg) of HMA using same PG Grade	1 per Sublot	From Tank Valve at HMA Plant	Random AASHTO T40
PG Asphalt Binder Content	AASHTO T164 or AASHTO T308	600 tons (550 Mg)	1 per Sublot sampled per Subsection 450.74A ⁽¹⁾	From Haul Vehicle at HMA Plant	Random AASHTO T168
Volumetrics: Air Voids	AASHTO T245	600 tons (550 Mg)	1 per Sublot sampled per Subsection 450.74A ⁽¹⁾	From Haul Vehicle at HMA Plant	Random AASHTO T168
In-place HMA Mat Density (Cores)	AASHTO T269 AASHTO T230 AASHTO T209 AASHTO T166	600 tons (550 Mg)	1 per Sublot sampled per Subsection 450.74A ⁽¹⁾	From Compacted HMA Course	Random AASHTO T269
In-place HMA Mat Density (Bridge Courses)	ASTM D2950 or AASHTO TP68	150 tons (140 Mg)	1 per Sublot sampled per Subsection 450.74A	From Compacted HMA Course	Random ASTM D2950 or AASHTO TP68
Thickness	AASHTO T269	600 tons (550 Mg)	1 per Sublot sampled per Subsection 450.74A ⁽¹⁾	From Compacted HMA Course	Random AASHTO T269
Ride Quality (IRI)	AASHTO PP52 per Subsection 450.65F(11)	0.1 miles (160 meters) per each Wheel Path	1 Per Sublot	Each Pavement Course per Subsection 450.65F(11)	Random per Subsection 450.65F(11)

(1) In the event that the total daily HMA production is less than one Sublot but greater than 150 tons (140 Mg), a minimum of one random Acceptance sample shall be obtained for the day's production.

(3) Volumetrics (Air Voids).

The Engineer will test each HMA Lot produced and placed for Volumetrics (Air Voids) in accordance with AASHTO T245. The requirement for Volumetric testing of laboratory compacted specimens applies to HMA mixtures for all pavement courses, with the exception of Open Graded Friction Courses and Base Courses. The Sublot size and minimum frequency of Acceptance testing for Volumetrics will be as specified in Table 450.17. Each material sample for Volumetrics will be obtained at the HMA plant from a randomly selected quadrant from the haul vehicle in accordance with ASTM D3665 and AASHTO T168.

(4) In-Place HMA Mat Density.

The Engineer will test each HMA Lot produced and placed for In-place HMA Mat Density. The requirement for In-Place Density testing applies to all pavement courses, with the exception of Open Graded Friction Courses and Leveling Courses, as outlined below.

(a) Testing In-Place Density by Cores. Acceptance testing of HMA pavement courses (other than bridge courses) for In-place Density will be performed using cores in accordance with the procedures outlined in Subsection 450.65F(8)(b). The Sublot size and minimum frequency of Acceptance testing for In-place Density of HMA pavement courses by core will be as specified in Table 450.17.

(b) Testing In-Place Density by Density Gauge. Acceptance testing of all HMA Bridge Protective Courses and Bridge Surface Courses for In-place Density will be performed using a density gauge in accordance with the procedures outlined in Subsection 450.65F(8)(a). The Sublot size and minimum frequency of Acceptance testing for In-place Density of HMA bridge courses by density gauge will be as specified in Table 450.17.

(5) Thickness.

Each HMA pavement course specified to be placed at a compacted thickness of 1 inch (25mm) or greater, with the exception of the HMA pavement courses identified in Subsection 450.65F(9), will be tested by the Owner for Thickness using cores. Acceptance sampling and testing for Thickness of the applicable pavement courses shall be in accordance with AASHTO T269. The Sublot size and minimum frequency of Acceptance testing for Thickness will be as specified in Table 450.17.

(6) Ride Quality.

Department Acceptance testing for Ride Quality will be required for all projects having a posted speed equal to or greater than 40 mph (65 km/hr) with HMA Lots falling under Lot Category A or Category B. The Engineer will perform Ride Quality testing on the final HMA pavement course placed (either Surface Course or OGFC-P, when specified) for all mainline travel lanes, auxiliary lanes, ramps, and side road travel lanes using an inertial profiler in accordance with the procedures outlined in Subsection 450.65F(11). Pavement courses and surfaces that are specifically excluded from Acceptance testing for Ride Quality are as specified in Subsection 450.65F(11)(b). The Sublot size and minimum frequency of Acceptance testing for Ride Quality will be as specified in Table 450.17.

The inertial profiler equipment used to perform Acceptance testing will be certified and correlated by the Department in accordance with the requirements and procedures outlined in Subsection 450.65F(11). The Department Acceptance data and Design-Builder QC data will be correlated and normalized using statistical procedures. The normalization of data will be based on the measurement difference/bias from the Department Reference Profiling Device determined during the device correlation conducted at the Profiling Center by UMass Dartmouth. The Department will provide software and procedures to perform the data normalization. The normalized Acceptance Ride Quality data and QC Ride Quality data will be used to determine the quality level (PWL) and corresponding pay for each Lot.

450.75 Split Sample Correlation.

Split Sample Correlation is an important part of the Department acceptance system for HMA Category A Lots and Category B Lots. Split Sample Correlation shall be performed when Validated Design-Builder QC test data is to be included in the acceptance determination. The purpose of Split Sample Correlation testing is to identify and eliminate any discrepancies in testing procedures or equipment that could result in significant differences between the Design-Builder’s QC testing results and the Owner’s Acceptance testing results.

Either prior to or on the first day of production and placement of any HMA Category A Lot or Category B Lot, the Design-Builder and the Department will conduct Split Sample Correlation. The Engineer or the Design-Builder may also request that Split Sample Correlation be performed at any time during HMA Lot production and placement. Department IA personnel may also test a split of the Correlation samples.

Split Sample Correlation will be performed on split material samples for those Quality Characteristics identified in Table 450.18. Correlation samples for HMA mixture testing shall be either laboratory prepared specimens or plant produced HMA specimens. Samples for HMA Category A Lots may be obtained from the Control Strip Lot. Correlation testing of the Design-Builder’s QC ride quality testing equipment and the Department’s Acceptance ride quality testing equipment will be performed in accordance with Subsection 450.65F(11)(c).

Table 450.18 Split Sample Correlation Allowable Differences

Quality Characteristic	Allowable Difference Between Design-Builder and Department Split Samples
Maximum Theoretical Specific Gravity (Gmm)	+/- 0.020
Bulk Specific Gravity (Gmb)	+/- 0.030
PG Asphalt Binder Content	+/- 0.4%
Volumetrics - Air Voids	+/- 1.4%
In-Place HMA Mat Density	+/- 1.4%
Thickness	+/- 10 %
Ride Quality (IRI)	Per Subsection 450.65F(11)(c)

If the Design-Builder’s Split Sample Correlation results differ from the Department’s results by more than the allowable differences specified in Table 450.18, then the Design-Builder and the Department shall determine and resolve the reasons for the differences prior to the start or continuation of HMA Lot production and placement.

450.76 Lot Acceptance Determination Based on Inspection Results.

The Department's Acceptance Inspection results will be used in the final acceptance determination for all HMA Lots (Lot Category A, B, and C). Prior to final acceptance of each HMA Lot produced and placed, the Department will periodically evaluate all Acceptance inspection information for the prepared underlying surface and the Lot. The materials and product workmanship for the completed Work will be evaluated for conformance with the plans and the requirements specified in Subsections 450.53 thru 450.58.

When the Acceptance information identifies deficiencies in either material quality or product workmanship for any underlying surface location or HMA Sublot(s), the location or Sublot(s) will be isolated and further evaluated by the Owner through additional Acceptance inspection (or sampling and testing, if relevant or possible). Depending upon the findings of the additional Acceptance inspection activity, the Owner will determine the disposition of the nonconforming Work in accordance with Division I, Subsection 5.03, Conformity with Plans and Specifications.

After each HMA Lot (and corresponding prepared underlying surface) is complete, including any corrective action, the Owner will evaluate all Acceptance inspection information for the Work. The Department will accept the subject Work if the Owner's evaluation of all inspection information for the completed Lot (and underlying surface) indicates that the corresponding materials and product workmanship meet the specified requirements (provided the evaluation of all Acceptance testing data for the subject Work per Subsection 450.77 also finds the Work to be acceptable).

450.77 Lot Acceptance Determination Based on Testing Data.

A. Evaluation of Lot Category A Testing Data.

Prior to final acceptance of each HMA Category A Lot produced and placed, the Owner will periodically evaluate all available Department Acceptance testing data for the Lot.

The Design-Builder's random QC testing data for each Lot will be included with the Department's random Acceptance testing data in the acceptance determination, provided that the QC data has been Validated in accordance with paragraph (1) below. The Department's Acceptance data and all Validated Design-Builder QC data will be evaluated using the Quality Limits specified in Table 450.19 and as further outlined below.

(1) Validation of Design-Builder QC Test Results.

Validation is defined as the mathematical comparison of two independently obtained sets of data to determine whether it can be assumed they came from the same Population. The Validation of each HMA Lot will be performed through a statistical comparison of the Owner's random Acceptance testing data and the Design-Builder's random QC testing data for the Lot.

The statistical comparison of testing data will be made using the test result Variances (*F-test*) and the test result Means (*t-test*) at a significance level of 0.01 and in accordance with the procedures contained in Appendix F the *AASHTO Implementation Manual For Quality Assurance* (February 1996). The Validation worksheet in the Department's MS-Excel QA Data Spreadsheets will be used to perform the Validation of each Lot.

If the Validation results indicate that the Design-Builder's QC test results and the Department's Acceptance test results can be assumed to be from the same Population, then the Design-Builder's QC test results will be included with the Department's Acceptance test results in the final acceptance determination for each Lot.

If the Validation results indicate that the Design-Builder's QC test results and the Department's Acceptance test results cannot be assumed to be from the same Population, then the Department will endeavor to determine the reason for the difference between the two data sets. If a reason for the difference cannot be determined, then only the Department's Acceptance test results will be used in the final acceptance determination for each Lot.

(2) Conformance with Engineering Limits.

The Engineer will evaluate all Department Acceptance testing data and Validated Design-Builder QC testing data for each Category A Lot to determine conformance with the Owning Limits in Table 450.19. Each Sublot test value for the Acceptance Quality Characteristics identified in Table 450.19 shall be within the Owning Limits.

If a Sublot test result is outside of the Owning Limits, the Owner will further assess the Sublot quality to determine whether the material in the Sublot can remain in place. The Engineer will isolate the Sublot and perform selective sampling followed by additional random sampling (if possible) within the Sublot to quantify the actual quality of the Sublot. The Engineer will determine the disposition of the Sublot in accordance with Division I, Subsection 5.03, Conformity with Plans and Specifications. If the Owner's assessment determines that the material quality is sufficient to permit the Sublot to remain in place without corrective action, all random testing data for the Sublot (including the original out of Engineering Limit test result) will be included in the Quality Level Analysis for the Lot in accordance with paragraph (3) below.

When a nonconforming Sublot is corrected or replaced, the Owner will perform Acceptance testing of the Sublot and evaluate the test results for conformance with the Owning Limits. The Acceptance test data for the corrected Sublot will replace the original Acceptance test result and will be included in the Quality Level Analysis for the Lot in accordance with paragraph (3) below. Once the above requirements have been met, the Department will accept all completed Sublots, provided that the overall Lot quality is above the Acceptance Limit as further outlined below.

(3) Analysis of Lot Quality Level.

For each HMA Category A Lot, the Owner will determine the Lot Quality Level, for the applicable Quality Characteristics in Table 450.19, using the Quality Level Analysis (QLA) procedures outlined in Subsection 450.78. The QLA procedure will evaluate all Department Acceptance testing data and Validated Design-Builder QC testing data using the Specification Limits in Table 450.19. The Department's MS-Excel QA Data Spreadsheets will be used to perform the QLA for each Lot.

All random test results that are within the Owning Limits will be included in the Quality Level Analysis. Individual Sublot test results that are beyond the Owning Limits, but for which the corresponding Sublot is permitted to remain in place per paragraph (2) above, will also be included in the Quality Level Analysis.

The QLA procedure will determine the Percent Within Limits (PWL) for each Lot. The Acceptance Limit (Rejectable Quality Level) for each completed Lot is 60 PWL. Each Lot must achieve a final Quality Level of at least 60 PWL in order to be accepted by the Department.

If the final computed Lot Quality Level is at 90 PWL, the Design-Builder will receive full payment at the unit bid price for the Lot. If the Lot Quality Level is greater than 90 PWL, the Design-Builder will receive an incentive pay adjustment for the Lot in accordance with Subsection 450.92. If the Lot Quality Level is less than 90 PWL but greater than or equal to 60 PWL, the Design-Builder will receive a disincentive pay adjustment for the Lot. If the final computed Lot Quality Level is below 60 PWL, the Lot will not be accepted. Payment for the Lot will be withheld and the Design-Builder shall submit a corrective action plan within 14 days following determination of the Lot PWL. The Engineer will review the corrective action plan and render a decision within 14 days of receipt of the corrective action plan. If the Owner determines that the Lot or some of the Sublots cannot remain in place, the Design-Builder shall remove and replace

the affected Lot or Sublots. If the Owner allows the Lot to remain in place, payment will be limited to a maximum of 75% of the bid price for the item.

(4) Final Lot Acceptance Determination.

After each HMA Category A Lot is complete, including any corrective action, the Owner will perform a final evaluation of all Department Acceptance data and Validated Design-Builder QC data for the Lot. The Department will accept the subject Lot if the Owner's evaluation of all testing data for the Lot is in conformance with the applicable Quality Limits as outlined in paragraph (2) and paragraph (3) above.

Table 450.19 - Quality Limits for Acceptance of HMA Lots

Quality Characteristic	Target	Specification Limits		Engineering Limits		Acceptance Limit
		LSL	USL	LEL	UEL	
PG Asphalt Binder Grading	Per Binder Grade specified	N/A	N/A	Per AASHTO M320	Per AASHTO M320	N/A
PG Asphalt Binder Content	Per JMF	Target - 0.3 %	Target + 0.3 %	Target - 0.4 %	Target + 0.4 %	60 PWL
Volumetrics: Air Voids	4 %	2.7 %	5.3 %	2 %	6 %	60 PWL
In-Place HMA Mat Density (Cores)	95 % of G _{mm}	92.5 % of G _{mm}	97.5 % of G _{mm}	92 % of G _{mm}	98 % of G _{mm}	60 PWL
In-Place HMA Mat Density (Bridge Courses)	95 % of G _{mm}	N/A	N/A	90 % of G _{mm}	N/A	N/A
Thickness: (All Courses 1 inch (25mm) or greater)	Per Plans	-20 % of Target Thickness	+20 % of Target Thickness	-30 % of Target Thickness	+30 % of Target Thickness	60 PWL
Ride Quality: Greater than or equal to 55 mph (90 km/hr)	50 in/mile (0.79 m/km)	N/A	70 in/mile (1.10 m/km)	N/A	80 in/mile (1.26 m/km)	60 PWL
Ride Quality: 40mph (65 km/hr) to 55 mph (90 km/hr)	70 in/mile (1.10 m/km)	N/A	100 in/mile (1.58 m/km)	N/A	110 in/mile (1.74 m/km)	60 PWL
Ride Quality: Less than 40 mph (65 km/hr)	Not subject to ride testing					

B. Evaluation of Lot Category B Testing Data.

Prior to final acceptance of each HMA Category B Lot produced and placed, the Owner will periodically evaluate all available Department Acceptance testing data for the Lot.

The Design-Builder's random QC testing data for each Lot will be included with the Department's random Acceptance testing data in the acceptance determination, provided that the QC data has been Validated. The Department's Acceptance data and all Validated Design-Builder QC data will be evaluated for conformance with Engineering Limits and for Lot Quality Level in accordance with the requirements of Subsection 450.77A above using the applicable Quality Limits specified in Table 450.19.

After each HMA Category B Lot is complete, including any corrective action, the Owner will perform a final evaluation of all Department Acceptance data and Validated Design-Builder QC data for the Lot. The Department will accept the subject Lot if the Owner's evaluation of all testing data for the Lot is in conformance with the applicable Quality Limits.

C. Evaluation of Lot Category C Testing Data.

For each HMA Category C Lot produced and placed, the Owner will evaluate all Department Acceptance testing data for the Lot entered into the Department's MS-Excel QA Data Spreadsheets after all HMA Sublots are complete in-place. The Design-Builder's random QC testing data for each Lot will not be included with the Department's random Acceptance testing data in the acceptance determination. The individual Sublot test results for each HMA Category C Lot will be evaluated against the Specification Limits contained in Table 450.19 (Note: the Owning Limits are not applied since the inherent variability for Minor Lot quantities is expected to be within the Specification Limits). Work under HMA Lot Category C will not be subject to an evaluation of Lot Quality Level using QLA procedures.

If a Sublot test result is outside of the Specification Limits, the Owner will further assess the Sublot quality in accordance with the requirements of Subsection 450.77A(2). The Engineer will determine the disposition of the Sublot in accordance with Division I, Subsection 5.03, Conformity with Plans and Specifications.

After each HMA Category C Lot is complete, including any corrective action, the Owner will perform a final evaluation of all Department Acceptance data. The Department will accept the subject Lot if the Owner's evaluation of the testing data for each Sublot is in conformance with the Specification Limits.

450.78 Quality Level Analysis Procedures.

For each Quality Characteristic subject to analysis of Lot Quality Level, the Quality Level Analysis (QLA) - Standard Deviation Method will be used to determine the percentage of the Lot that is within the Specification Limits. The number of significant figures retained in each step of the QLA calculations and the rounding of all reported values will be as established in the Department's MS Excel QA Data Spreadsheets. The estimated percentage of Work that is within the Specification Limits for a given Lot will be determined as follows:

A. Step 1 – Determine Lot Mean.

The Mean (\bar{X}) will be determined for each Lot using all random Department Acceptance sample test values and all random Design-Builder QC sample test values (provided they have been Validated). The Mean is calculated using the following equation:

Where: Σ = summation of
 x = individual test value of each material sample
 n = total number of material samples tested

B. Step 2 – Determine Lot Standard Deviation.

The Standard Deviation (s) will be determined for each Lot using all random Department Acceptance sample test values and all random Design-Builder QC sample test values (provided they have been Validated). The Standard Deviation is calculated using the following equation:

Where: $\Sigma(x^2)$ = summation of the squares of individual test values
 $(\Sigma x)^2$ = summation of the individual test values squared

C. Step 3 – Determine Upper Quality Index for Lot.

The Upper Quality Index (Q_U) will be determined for each Lot using the Lot Mean and Lot Standard Deviation calculated in Step 1 and Step 2 above. The Upper Quality Index is calculated using the following equation:

Where: USL = Upper Specification Limit from Table 450.19
 \bar{X} = The Lot Mean
 s = The Lot Standard Deviation

D. Step 4 – Determine Lower Quality Index for Lot.

The Lower Quality Index (Q_L) will be determined for each Lot using the Lot Mean and Lot Standard Deviation calculated in Step 1 and Step 2 above. The Upper Quality Index is calculated using the following equation:

Where: LSL = Lower Specification Limit from Table 450.19

X = The Lot Mean

s = The Lot Standard Deviation

E. Step 5 – Determine Percentage of Lot Below Upper Specification Limit.

The estimated percentage of the Lot falling below the Upper Specification Limit (P_U) will be determined using Table 450.20. The P_U value is determined from the table by entering the column for the number of material samples (n) representing the Lot and locating the row that corresponds to the Q_U value determined in Step 3 above. If no USL is specified in Table 450.20, the P_U value is equal to 100.

F. Step 6 – Determine Percentage of Lot Above Lower Specification Limit.

The estimated percentage of the Lot falling above the Lower Specification Limit (P_L) will be determined using Table 450.20. The P_L value is determined from the table by entering the column for the number of material samples (n) representing the Lot and locating the row that corresponds to the Q_L value determined in Step 4 above. If no LSL is specified in Table 450.20, the P_L value is equal to 100.

G. Step 7 – Determine Estimated Percent Within Limits for Lot.

The Lot Quality Level will be determined by estimating the Percent Within Limits (PWL). The PWL is determined using the P_U value from Step 5 and the P_L value from Step 6 above. The Percent Within Limits is calculated using the following equation:

$$PWL = (P_U + P_L) - 100$$

Table 450.20 - Values for Estimating Percent of Lot Within Specification Limits

P _U Or P _L (%)*	Upper Quality Index (Q _U) or Lower Quality Index (Q _L)

50	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

Note: If the calculated value of Q_U or Q_L does not correspond exactly to a value in the table, use the next lower value.

If Q_U or Q_L are negative values, P_U or P_L is equal to 100 minus the table value for P_U or P_L.

* P_U or P_L = Percent Within limits for positive values of Q_U or Q_L.

DISPUTE RESOLUTION

450.80 Disputable items

The Design-Builder or the Department may dispute any of the test values that are utilized in the acceptance determination for a given Lot. The specific Quality Characteristics which may be disputed are as listed in Table 450.21 below. All disputes shall be initiated within the 30 day split sample retention time limit as specified in Subsection 450.82 below.

450.81 Basis for Dispute

Differences from one individual Design-Builder QC test value to another (or from one individual Department Acceptance test value to another) within a Lot are expected due to inherent variability. Differences are also expected between the QC test values and the Acceptance values for a given Lot as a result of inherent variability. An individual QC test value cannot be directly compared to an individual Acceptance test value since the samples are randomly obtained independent of one another. However, if one or more of the Design-Builder's random QC test values for a Lot significantly differs from the Department's Acceptance test values for the same Lot, either party may dispute the validity of an individual test value.

450.82 Dispute Resolution Samples

Samples used for Dispute Resolution testing shall be the split samples required to be retained for thirty (30) days by the Design-Builder and the Department in accordance with Subsection 450.65D and Subsection 450.74E. Original cores are to be retained and shall be protected from damage. If In-place density or thickness is disputed, then the original core, unless damaged, will be used in the Dispute Resolution process. If the original disputed core is damaged, then a new core shall be obtained from within a 2-foot (600mm) radius of the location of the original core by the party whose data is being disputed in the presence of the other party. If ride quality smoothness test data is disputed, then the disputed Sublot(s) shall be re-sampled/retested by the party whose data is being disputed in the presence of the other party.

450.83 Dispute Resolution Steps

The Design-Builder may dispute the Department's Acceptance results and the Department may dispute the Design-Builder's Quality Control results by requesting that the dispute resolution split sample be tested. Such a request, either from the Design-Builder or the Department, must be made in writing within five days after the original sample was obtained. The following shall be provided in the written request:

- Sample reference number, including Lot and Sublot
- The specific Quality Characteristic and test result(s) being disputed
- The complete NETTCP test report form containing the disputed results

A. Step 1 – Split Sample Correlation.

Immediately prior to conducting testing for Dispute Resolution, the Design-Builder's QC testing personnel, the Department's Acceptance testing personnel (from the District), and a Department Independent Assurance (IA) technician will conduct Split Sample Correlation testing as detailed in Subsection 450.75. Split Sample Correlation testing will be conducted on a separate material sample obtained independent from the original sample and the Dispute Resolution sample.

The purpose of the Split Sample Correlation testing is to determine if testing procedures or equipment utilized by the Design-Builder or the Department might be the cause of the disputed result(s).

B. Step 2 – Dispute Resolution Sample Testing.

If a Department Acceptance test value is being disputed, the Department’s Acceptance testing personnel (from the District) will test the Dispute Resolution split sample. If a Design-Builder QC test value is being disputed, the Design-Builder’s QC testing personnel will test the Dispute Resolution split sample. In either case, testing of the Dispute Resolution split sample shall be performed by the same Design-Builder QC testing personnel and Department Acceptance testing personnel that performed the split sample correlation in step 1 above. Testing of the Dispute Resolution split sample shall be performed in the presence of both the Design-Builder and the Department.

C. Step 3 – Additional Dispute Resolution Testing.

If either the Design-Builder or the Department believes that the results of the Dispute Resolution split sample testing in Step 2 above do not conclusively resolve the dispute, additional sampling and testing within the disputed Sublot may be requested. In such case, an independent AASHTO accredited laboratory will be utilized to obtain and test three (3) random samples from the disputed Sublot. The Mean of the three test results will be used as the Dispute Resolution test value.

450.84 Final Disposition.

If the difference between the original test value and the Dispute Resolution test value (as determined under either Step 2 or Step 3 above) is within the maximum test difference values listed in Table 450.21, then the original test value will be used in the acceptance determination for the Lot. If the difference between the original test value and the Dispute Resolution test value exceeds the maximum difference values in Table 450.21, then the Dispute Resolution test value will be used in the acceptance determination. In such case, the record of the original test value will be retained (with notation of the outcome of Dispute Resolution); however, it will not be used in calculating the Lot quality level.

Table 450.21 – Dispute Resolution Maximum Test Difference Values

Quality Characteristic	Maximum Test Difference
Maximum Specific Gravity (G_{mm})	+/- 0.020
Bulk Specific Gravity (G_{mm})	+/- 0.030
PG Asphalt Binder Content	+/- 0.4
Volumetrics - Air Voids	+/- 1.4
In-place HMA Mat Density	+/- 1.4
Thickness	+/- 10% of original value
Ride Quality (IRI)	+/- 10% of original value

450.90 — Method of Measurement.**A. Patching.**

HMA for Patching will be measured for payment by the ton (Megagram) and shall be the actual quantity complete, in place and accepted by the Owner.

B. Tack Coat.

Asphalt Emulsion for Tack Coat, as required by the plans or these specifications, will be measured by the gallon (liter).

C. Joint Sealer.

HMA Joint Sealant used for sealing all longitudinal joints and transverse joints in HMA pavement courses will be measured by the linear foot (linear meter).

D. Hot Mix Asphalt.

Hot Mix Asphalt pavement course mixtures will be measured by the ton (Megagram) and shall be the actual pavement course quantity complete, in place and accepted by the Owner. The quantity shall be determined only by weight slips that have been properly countersigned by the Owner at the time of delivery.

E. Design-Builder Quality Control.

The Design-Builder's Quality Control system as specified in Subsection 450.60 through Subsection 450.69 will be measured by the ton (Megagram) and shall be represented by the actual quantity of HMA for Patching and all HMA pavement courses complete, in place and accepted by the Owner.

450.91 — Basis of Payment.**A. Patching.**

HMA for Patching will be paid for at the contract unit price per ton (Megagram) of the HMA mixture type specified under Pay Item 451. Payment shall include all sawcutting, removal of existing distressed or unsound pavement, applying hot poured rubberized asphalt sealant to vertical faces, and transportation, delivery, placement, and compaction of HMA for Patching in accordance with Subsection 450.53C.

B. Tack Coat.

Asphalt Emulsion for Tack Coat will be paid for at the contract unit price per gallon (liter) of applied tack coat under Pay Item 452. Payment shall include sweeping existing surfaces and applying the tack coat to all required surfaces at the specified rate in accordance with Subsection 450.53F.

C. Joint Sealer.

HMA Joint Sealant will be paid for at the contract unit price per linear foot (linear meter) of joint sealed under Pay Item 453. Payment shall include application of the joint sealer to all longitudinal joints and transverse joints in HMA pavement courses as required and in accordance with Subsection 450.57.

D. Hot Mix Asphalt.

Each Hot Mix Asphalt pavement course will be paid for at the contract unit price per ton (Megagram) of in-place mixture under the HMA Pay Items specified (Pay Items 450.10 through 450.70). Payment shall include sweeping the underlying surface, transportation, delivery, placement (including providing a MTV when required), and compaction of each HMA pavement course in accordance with Subsection 450.54 through Subsection 450.58. All sawcutting required for transverse joints or longitudinal joints in accordance with Subsection 450.57 shall also be included in the contract unit price for each HMA pavement course.

E. Design-Builder Quality Control.

The Design-Builder's Quality Control system will be paid for at the contract unit price per ton (Megagram) under Pay Item 450.90. Payment will be full compensation for all QC activities required under Subsection 450.50 through Subsection 450.69 including; the Construction Quality Meeting, providing the field reference system, preparing and maintaining the approved Quality Control Plan, preparing all HMA mixture designs, performing QC sampling, testing and inspection (including the Control Strip when required), evaluating all QC data, and maintaining proper QC records. No separate payment will be made for any assistance provided by the Design-Builder to the Owner in obtaining Department Acceptance samples. Failure of the Design-Builder to perform adequate Quality Control in accordance with the specifications and the Design-Builder's approved QC Plan will be justification for withholding payment.

450.92 — Pay Adjustment (PA).

Payment for each HMA Category A Lot and Category B Lot will be determined based on the final Lot Quality Level (PWL) computed in accordance with the QLA procedures contained in Subsection 450.78. Pay adjustments will be determined for each of the Acceptance Quality Characteristics identified in Table 450.22. The relative pay adjustment weight assigned to each of the HMA Quality Characteristics is indicated in Table 450.22.

Table 450.22 – Pay Adjustment Weight Assigned to HMA Quality Characteristics

HMA Quality Characteristics	Pay Adjustment Weight
PG Asphalt Binder Content	10 percent
Volumetrics – Air Voids	25 percent
In Place HMA Mat Density	25 percent
Thickness	10 percent
Ride Quality (IRI)	30 percent

A. Lot Pay Factor.

A Pay Factor (PF) will be determined for each HMA Lot using the Quality Level (PWL) computed for the Lot and the equation below:

$$PayFactor(PF) = \frac{55 + 0.5(QualityLevel)}{100}$$

The Lot Pay Factor will be used to determine the pay adjustment for each Quality Characteristic as further outlined below.

B. Pay Adjustment for PG Asphalt Binder Content.

Pay adjustment for PG Asphalt Binder Content shall be applied to Pay Item 999.490 at the completion of the HMA Lot. The total Lot pay adjustment for PG Asphalt Binder Content will be determined as follows:

$$PA_{PGAB} = \sum(PF_i - 1)(Q_i)(P_i)(0.10)$$

Where: PA_{PGAB} = Pay adjustment in dollars for PG Asphalt Binder Content.

PF_i = Pay factor based on Quality Level (PWL) of PG Asphalt Binder Content for individual Lot (i).

Q_i = Quantity represented by individual Lot (i) in tons (Mg).

P_i = Contract unit price per ton (Mg) for individual Lot (i).

0.10 = Weight given to PG Asphalt Binder Content pay adjustment

C. Pay Adjustment for Volumetrics (Air Voids).

Pay adjustment for Volumetrics (Air Voids) shall be applied to Pay Item 999.491 at the completion of the HMA Lot. The total Lot pay adjustment for Volumetrics (Air Voids) will be determined as follows:

$$PA_{Air\ Voids} = \sum(PF_i - 1)(Q_i)(P_i)(0.25)$$

Where: $PA_{Air\ Voids}$ = Pay adjustment in dollars for Volumetrics (Air Voids).

PF_i = Pay factor based on Quality Level (PWL) of Volumetrics (Air Voids) for individual Lot (i).

Q_i = Quantity represented by individual Lot (i) in tons (Mg).

P_i = Contract unit price per ton (Mg) for individual Lot (i).

0.25 = Weight given to Volumetrics (Air Voids) pay adjustment

D. Pay Adjustment for In-Place HMA Mat Density.

Pay adjustment for In-Place HMA Mat Density shall be applied to Pay Item 999.492 at the completion of the HMA Lot. The total Lot pay adjustment for In-Place HMA Mat Density will be determined as follows:

$$PA_{In-Place\ Density} = \sum(PF_i - 1)(Q_i)(P_i)(0.25)$$

Where: $PA_{In-Place\ Density}$ = Pay adjustment in dollars for In-Place HMA Mat Density.

PF_i = Pay factor based on Quality Level (PWL) of In-Place HMA Mat Density for individual Lot (i).

Q_i = Quantity represented by individual Lot (i) in tons (Mg).

P_i = Contract unit price per ton (Mg) for individual Lot (i).

0.25 = Weight given to In-Place HMA Mat Density pay adjustment

E. Pay Adjustment for Thickness.

Pay adjustment for Thickness shall be applied to Pay Item 999.493 at the completion of the HMA Lot. The total Lot pay adjustment for Thickness will be determined as follows:

$$PA_{Thickness} = \sum (PF_i - 1) (Q_i)(P_i) (0.10)$$

- Where: $PA_{Thickness}$ = Pay adjustment in dollars for Thickness.
- PF_i = Pay factor based on Quality Level (PWL) of Thickness for individual Lot (i).
- Q_i = Quantity represented by individual Lot (i) in tons (Mg).
- P_i = Contract unit price per ton (Mg) for individual Lot (i).
- 0.10 = Weight given to Thickness pay adjustment.

B. Pay Adjustment for Ride Quality.

Pay adjustment for Ride Quality shall be applied to Pay Item 999.494 at the completion of all HMA Lots. Although Ride Quality Acceptance testing will be performed only on the final pavement course, the pay adjustment will be applied to the total quantity of all HMA pavement courses placed. Since each wheel path of the final pavement course represents a Lot for Ride Quality, the quantity for each Lot shall be computed by dividing the total quantity of all pavement courses placed by the number of wheel paths for all lanes tested in the final pavement course. The total Lot pay adjustment for Ride Quality will be determined as follows:

$$PA_{Ride\ Quality} = \sum (PF_i - 1) (\sum (Q_{pe})(P_{pe})) / N_{wp} (0.30)$$

- Where: $PA_{Ride\ Quality}$ = Pay adjustment in dollars for Ride Quality.
- PF_i = Pay factor based on Quality Level (PWL) of Ride Quality for individual Lot (i).
- Q_{pe} = Quantity represented by individual pavement course (pe) in tons (Mg).
- P_{pe} = Contract unit price per ton (Mg) for individual pavement course (pe).
- N_{wp} = Total number of wheel paths for all lanes tested.
- 0.30 = Weight given to Ride Quality pay adjustment.

450.93	Payment Items	Payment Unit
450.10	Open Graded Friction Course—Polymer Modified (OGFC P)	Ton (Megagram)
455.21	SUPERPAVE Surface Course—4.75 (SSC—4.75)	Ton (Megagram)

SECTION 455
SUPERPAVE HOT MIX ASPHALT PAVEMENT

Section 455 - SUPERPAVE Hot Mix Asphalt Pavement amends Section 450 - Hot Mix Asphalt Pavement. The provisions herein replace the Subsections of Section 450 as indicated.

NOTE: The Pay Adjustment provisions included in Subsection 450.92 will be applied to items under this contract.

DESCRIPTION

Delete Subsection 450.20 - General and replace with the following:

455.20 General.

This work shall consist of producing and placing Hot Mix Asphalt (HMA) pavement. All HMA mixtures shall meet the requirements of the SUPERPAVE volumetric design system. The HMA pavement shall be constructed in courses on the prepared or existing base in accordance with these specifications and in conformance with the lines, grades, compacted thickness and typical cross section as shown on the plans. Each SUPERPAVE HMA pavement course placed shall be comprised of one of the mixture types listed in Table 455.1.

Table 455.1 - SUPERPAVE HMA Pavement Courses & Mixture Types

Pavement Course	Mixture Type	Mixture Designation
Friction Course	<ul style="list-style-type: none"> • Open-Graded Friction Course - Polymer Modified 	OGFC – P
Surface Course	<ul style="list-style-type: none"> • SUPERPAVE Surface Course - 4.75 • SUPERPAVE Surface Course - 9.5 • SUPERPAVE Surface Course - 12.5 • SUPERPAVE Surface Course - 19.0 	SSC - 4.75 SSC - 9.5 SSC - 12.5 SSC - 19.0
Intermediate Course	<ul style="list-style-type: none"> • SUPERPAVE Intermediate Course - 12.5 • SUPERPAVE Intermediate Course - 19.0 	SIC - 12.5 SIC - 19.0
Base Course	<ul style="list-style-type: none"> • SUPERPAVE Base Course - 25.0 • SUPERPAVE Base Course - 37.5 	SBC - 25.0 SBC - 37.5
Leveling Course	<ul style="list-style-type: none"> • SUPERPAVE Leveling Course - 4.75 • SUPERPAVE Leveling Course - 9.5 	SLC - 4.75 SLC - 9.5
Bridge Surface Course	<ul style="list-style-type: none"> • SUPERPAVE Bridge Surface Course - 9.5 • SUPERPAVE Bridge Surface Course - 12.5 	SSC-B - 9.5 SSC-B - 12.5
Bridge Protective Course	<ul style="list-style-type: none"> • SUPERPAVE Bridge Protective Course - 9.5 • SUPERPAVE Bridge Protective Course - 12.5 	SPC-B - 9.5 SPC-B - 12.5

When a SUPERPAVE Surface Course - 19.0 (SSC - 19.0) is specified in the contract, the Laboratory Trial Mix Formula (LTMF) aggregate gradation shall provide a fine-graded HMA mixture as defined in Subsection 455.42F.

MATERIALS

Delete Subsection 450.40 - General and replace with the following:

455.40 General.

SUPERPAVE HMA mixtures shall be composed of the following: Mineral aggregate, mineral filler (if required), Performance Graded Asphalt Binder (PGAB), and as permitted, reclaimed materials (limited to Reclaimed Asphalt Pavement (RAP), Reclaimed Asphalt Shingles (RAS), and Processed Glass Aggregate (PGA)). Materials shall meet the requirements in the following Subsections of Division III, Materials and as otherwise specified herein:

Asphalt Emulsion	M3.03.0
Hot Poured Joint Sealer	M3.05.0
Asphalt Anti-Stripping Additive	M3.10.0
Mineral Aggregate	M3.11.04
Mineral Filler	M3.11.05
Plant Requirements	M3.11.07

Delete Subsection 450.42 - Hot Mix Asphalt Mix Design and replace with the following:

455.42 SUPERPAVE Hot Mix Asphalt Mixture Design.

The Design-Builder shall be responsible for development of all SUPERPAVE HMA mixture designs. All HMA surface courses, intermediate courses, base courses, leveling courses, bridge surface courses, and bridge protective courses shall be supported by volumetric mixture designs using the SUPERPAVE mixture design system. All SUPERPAVE HMA mixture designs shall be developed in accordance with the following AASHTO standards, as modified herein:

AASHTO M 323
AASHTO R 35
AASHTO T 312

Volumetric mixture designs are not required for OGFC. The aggregate gradation structure and target PG Asphalt Binder content for Open-Graded Friction Course - Polymer Modified (OGFC-P) shall conform to the master ranges in M3.11.03 – Table B.

A. Development of Laboratory Trial Mix Formula (LTMF).

The Design-Builder shall develop and submit for Department approval, a minimum of forty-five (45) days prior to the start of SUPERPAVE HMA pavement construction, a Laboratory Trial Mix Formula (LTMF) as the proposed Job Mix Formula (JMF) for each SUPERPAVE mixture type to be used on the project. Two or more JMFs per HMA mixture type may be approved for a particular plant, however, only HMA conforming to one JMF is permitted to be produced and placed on any given day.

The following is a general outline of the steps for developing an LTMF and an approved JMF:

1. Estimate Percentage of RAP to be utilized and select PG Asphalt Binder as required by the specifications (Subsection 455.42C.);
2. Evaluate aggregates (and reclaimed materials) for conformance with Consensus Properties (Subsection 455.42D.) and Source Properties (Subsection 455.42E.);
3. Develop trial aggregate blends and estimate PG Asphalt Binder content in accordance with AASHTO R 35. Compact each of the blends. Based on volumetric analysis, select the best trial blend that meets the requirements of M 323 (Subsections 455.42F and 455.42G.);
4. Determine volumetric properties of LTMF and select PG Asphalt Binder content (Subsection 455.42H.);
5. Evaluate Moisture Sensitivity of the mixture (Subsection 455.42I.);
6. LTMF to be verified in the laboratory by the Department (Subsection 455.43);
7. Through production of a Control Strip Lot, verify that LTMF can be produced through the plant. (Subsection 450.66B.). Verification of the LTMF results in an approved JMF;
8. Repeat process for all mixtures to be utilized.

B. Estimated Design Traffic.

The estimated traffic level to be used for SUPERPAVE HMA mixture designs for this contract, expressed in Equivalent Single Axle Loads (ESALs) for the design travel lane over a 20-year period, is as indicated in Part 1 GENERAL Section 1.1 DESCRIPTION OF WORK .Subsection A Paragraph 2 of this specification

C. Performance Graded Asphalt Binder.

The Asphalt Binder used for all HMA mixtures under this contract shall comply with the requirements of Subsection 450.48. The PGAB Grade selected for this Contract is as indicated in Part 1 GENERAL Section 1.1 DESCRIPTION OF WORK .Subsection A Paragraph 2 of this specification.

D. Aggregate Consensus Properties.

Aggregates utilized in SUPERPAVE HMA mixtures, including RAP if used in the mixture, shall be tested for conformance with the following Consensus Property requirements:

- Determining the Percentage of Fractured Particles in Coarse Aggregate (ASTM D 5821)
- Uncompacted Void Content of Fine Aggregate (AASHTO T 304 - Method A)
- Flat or Elongated Particles (ASTM D 4791)
- Clay Content/Sand Equivalent Test (AASHTO T 176)

The Consensus Property test results shall be submitted with the LTMF for each SUPERPAVE HMA mixture. The Design-Builder shall provide aggregate samples a minimum of forty-five (45) days prior to production for each LTMF to the Department for LTMF verification prior to SUPERPAVE HMA production. The required minimum or maximum criteria for each of the Consensus Property tests for the total aggregate blend are specified below in Table 455.2 below.

Table 455.2 - Aggregate Consensus Property Requirements

Traffic Level	Design ESALS 18-kip (80-kn)) (million)	Coarse Aggregate Angularity (1) (2) ASTM D5821 (Percent Minimum)		Fine Aggregate Angularity (1) AASHTO T 304 - Method A (Percent Minimum)		Flat or Elongated Particles (2) ASTM D4791 (Percent Maximum)	Sand Equivalent AASHTO T 176 (Percent Minimum)
		(Depth from final surface) ≤ 4 in (100 mm)	(Depth from final surface) > 4 in (100 mm)	(Depth from final surface) ≤ 4 in (100 mm)	(Depth from final surface) > 4 in (100 mm)		
-----						> # 4 (4.75 mm)	----
1	< 0.3	55/--	--/--	--	--	--	40
2	0.3 to < 3.0	75/--	50/--	40	40	10	40
3	3 to < 10	85/80	60/--	45	40	10	45
4	10 to < 30.0	95/90	80/75	45	40	10	45
5	≥ 30.0	100/100	100/100	45	45	10	50
	Design ESALS are the anticipated project traffic level expected on the design lane, projected over a 20 year period, regardless of the actual expected design life of the roadway.	Criteria presented as minimum values. 95/90 denotes that a minimum of 95% of the coarse aggregate, by mass, shall have one fractured face and that a minimum of 90% shall have two fractured faces.		Criteria presented as minimum percent air voids in loosely compacted fine aggregate passing the #8 (2.36 mm) sieve.		Criteria presented as maximum percent by mass of flat or elongated particles of materials retained on the #4 (4.75 mm) sieve, determined at 5:1 ratio.	Criteria presented as minimum values for fine aggregate passing the #4 (4.75 mm) sieve.

Notes:

(1) If less than 25% of a given layer is within 4 inches (100 mm) of the anticipated top surface, the layer may be considered to be below 4 inches (100 mm) for mixture design purposes.

(2) This criterion does not apply to #4 (4.75 mm) nominal maximum size mixtures.

E. Aggregate Source Properties.

The coarse mineral aggregate utilized in SUPERPAVE HMA mixtures shall be clean, crushed rock consisting of the angular fragments obtained by breaking and crushing shattered natural rock. It shall be free from dirt or other objectionable materials. The coarse aggregate, including RAP if used in the mixture, shall be tested for conformance with the following Source Property requirements:

- Toughness as Determined by: Los Angeles Abrasion (AASHTO T 96)
- Soundness as Determined by: Soundness (AASHTO T 104)
- Deleterious Materials as Determined by: Clay Lumps & Friable Particles (AASHTO T 112)
- Specific Gravity (AASHTO T 8)

Testing for each of the Source Properties shall be performed for each SUPERPAVE HMA mixture design developed for the project. The Source Property test results shall be submitted with the LTMF for each SUPERPAVE HMA mixture. The Design-Builder shall provide samples of each aggregate material from each stock pile, a minimum of forty-five (45) days prior to production for each LTMF to the Department for LTMF verification prior to SUPERPAVE HMA production. The requirements for each of the Source Properties are as indicated in Table 455.3 below.

Table 455.3 - Aggregate Source Property Requirements

Source Property Test	Limit
Toughness (AASHTO T 96)	Maximum Loss < 30 %
Soundness (AASHTO T 104)	Maximum Loss < 10 %
Deleterious Materials (AASHTO T 112)	Maximum Permissible < 0.5 %

F. SUPERPAVE Aggregate Gradation and Specific Gravity Requirements.

The combined aggregate blend for each SUPERPAVE HMA mixture shall conform to the Gradation Control Point requirements specified in Table 455.6 below. The results of the selected optimum Design Aggregate Structure shall be plotted on a 0.45 Power Chart and included with the LTMF.

The combined aggregate gradation shall be classified as coarse-graded when it passes below the Primary Control Sieve (PCS) control point as defined in Table 455.4. All other gradations shall be classified as fine graded.

The specific gravity of each coarse and fine aggregate component shall be determined in accordance with AASHTO T 85 and T 84 respectively, and the specific gravity of the mineral filler shall be determined in accordance with AASHTO T 100. The individual aggregate specific gravities shall be included with the LTMF. The Design-Builder shall provide samples of each aggregate material a minimum of forty-five (45) days prior to production for each LTMF to the Department for verification of the selected optimum Design Aggregate Structure and specific gravity of each stock pile.

Table 455.4 - Gradation Classification

PCS Control Point for Mixture Nominal Maximum Aggregate Size % Passing					
Nominal Maximum Aggregate Size	1-1/2"	1"	3/4"	1/2"	3/8"
	(37.5 mm)	(25.0 mm)	(19.0 mm)	(12.5 mm)	(9.5 mm)
Primary Control Sieve	3/8"	#4	#4	#8	#8
	(9.5 mm)	(4.75 mm)	(4.75 mm)	(2.36 mm)	(2.36 mm)
PCS Control point (% Passing)	47	40	47	39	47

G. Gyratory Compaction Criteria.

Each SUPERPAVE HMA mixture shall be designed and controlled during production using an approved Gyratory Compactor which meets the requirements of AASHTO T 312. Compaction shall be in accordance with the requirements of AASHTO T 312. The density of each SUPERPAVE HMA mixture shall be evaluated at the initial number of gyrations ($N_{initial}$), the design number of gyrations (N_{design}), and the maximum number of gyrations (N_{max}). The gyratory-compacted specimens for each LTMF shall meet the density requirements specified in Table 455.5 below.

H. Volumetric Design Requirements.

Each SUPERPAVE HMA mixture shall be designed in accordance with the volumetric mixture design specifications contained in AASHTO M 323 and procedures contained in AASHTO R 35, as modified herein. Each HMA mixture LTMF shall be tested for conformance with the following volumetric properties:

- Air Voids at N_{design} (V_a)
- Voids in the Mineral Aggregate at N_{design} (VMA)
- Voids Filled with Asphalt at N_{design} (VFA)
- Fines to Effective Asphalt Ratio ($P_{0.075} / P_{be}$)

The volumetric property test results shall be submitted with the LTMF for each SUPERPAVE HMA mixture. The required minimum or maximum criteria for each of the volumetric property tests are specified in Table 455.6 below.

Table 455.5 - SUPERPAVE HMA Design Requirements

Traffic Level	Design ESALs (million)	Number of Gyration by Superpave Gyrotory Compactor			Percent Density of Gmm from HMA Specimen			Voids Filled with Asphalt (VFA)* Based on Nominal Maximum Aggregate Size					
		Nini	Ndes	Nmax	Nini	Ndes	Nmax	#4 (4.75 mm)	3/8" (9.5 mm)	1/2" (12.5 mm)	3/4" (19.0 mm)	1" (25.0 mm)	1-1/2" (37.5 mm)
1	< 0.3	6	50	75	≤ 91.5	96.0	≤ 98.0	70 - 80	70 - 80	70 - 80	70 - 80	67 - 80	64 - 80
2	0.3 to < 3.0	7	75	115	≤ 90.5	96.0	≤ 98.0	65 - 78	65 - 78	65 - 78	65 - 78	65 - 78	64 - 78
3	3.0 to < 10	8	100	160	≤ 89.0	96.0	≤ 98.0	75 - 78	73 - 76	65 - 75	65 - 75	65 - 75	64 - 75
4	10 to < 30.0	8	100	160	≤ 89.0	96.0	≤ 98.0	75 - 78	73 - 76	65 - 75	65 - 75	65 - 75	64 - 75

(1) Based on the final design PG Asphalt Binder certification. (2) Dust is considered to be the percent of material passing the #200 (75 µm) sieve. The calculated effective asphalt content (Pbe) shall be used for this calculation. (3) Voids in Mineral Aggregates shall be computed as specified by AASHTO R 35. (4) If the aggregate gradation passes beneath the PCS Control Point specified in Table 455.4, the dust-to-binder ratio range may be increased from 0.6-1.2 to 0.8-1.6 at the Engineer's discretion. (5) When used as a Surface Course under OGFC the Min % for the #8 (2.36 mm) Sieve should be 40.

I. Evaluation of Moisture Sensitivity.

Each SUPERPAVE HMA mixture shall be tested by the Design-Builder for Moisture Sensitivity in accordance with the requirements of AASHTO T 283. The compacted specimens for each LTMF shall exhibit a minimum tensile strength ratio of 80% as determined by AASHTO T 283. A minimum tensile strength ratio of 80% is required. The use of approved anti-stripping agents (either liquid or mineral) can be used to meet this requirement. If an anti-strip agent is required, it shall be included in the Design-Builder’s cost.

The Moisture Sensitivity test results shall be submitted with the LTMF for each SUPERPAVE HMA mixture. The Department will perform testing of the Moisture Sensitivity prior to SUPERPAVE HMA production as part of the verification of each LTMF.

Delete Subsection 450.66A. - Laboratory Verification of HMA Mix Design and replace with the following:

455.43 Verification of Laboratory Trial Mix Formula (LTMF)

The Design-Builder shall submit a LTMF with supporting documentation, a minimum of forty-five (45) days prior to production, to the Owner with samples of blended aggregate material and PG Asphalt Binder. An adequate amount of the blended aggregate material and PG Asphalt Binder shall be supplied in order to verify the LTMF selected for production (proposed JMF).

If the Owner is unable to verify the Design-Builder’s LTMF in accordance with the LTMF Verification Limits in Table 455.7, then the Owner will work with the Design-Builder to resolve the verification issue(s). **The Design-Builder shall not proceed with production and placement of the Control Strip (Section 450.66B.) until the LTMF is verified by the Owner.**

Table 455.7 - SUPERPAVE HMA LTMF Verification Limits

Properties	LTMF Verification Limit
Asphalt Binder Content (P_b)	Target \pm 0.3 percent
Gradation Passing #4 (4.75 mm) and Larger Sieves	Target \pm 6.0 percent
Gradation Passing #8 (2.36 mm) Sieve	Target \pm 5.0 percent
Gradation Passing #16 (1.18 mm) to #50 (0.30 mm) Sieve	Target \pm 3.0 percent
Gradation Passing #100 (0.15 mm) Sieve	Target \pm 2.0 percent
Gradation Passing #200 (75 μ m) Sieve	Target \pm 1.0 percent
Max. Theo. Specific Gravity (G_{mm})	Target \pm 0.02
Air Voids (V_a)	Target \pm 1.0 percent
Voids in Mineral Aggregate (VMA)	Target \pm 1.0 percent
Voids Filled With Asphalt (VFA)	Target \pm 5.0 percent
Bulk Specific Gravity (G_{mb})	Target \pm 0.022

CONSTRUCTION PROCEDURES

Delete Subsection 450.53F. - Tack Coat and replace with the following:

G. Tack Coat.

A tack coat of asphalt emulsion, grade RS-1 shall be uniformly applied to existing or new pavement surfaces prior to placing pavement courses as specified below. The existing surface shall be swept clean of all foreign matter and loose material using a mechanical sweeper and shall be dry before the tack coat is applied.

(1) Tack Distributor System.

A pressure distributor shall be used to apply the tack coat. The tack distributor system shall be equipped with the following to control and monitor the application:

- (f) System for heating the asphalt emulsion uniformly to specified temperature.
- (g) Thermometer for measuring the asphalt emulsion temperature.
- (h) Adjustable full circulation spray bar.
- (i) Positive controls including tachometer, pressure gauge, and volume measuring device.

(2) Tack Application Requirements.

The tack coat material shall be applied by a pressure distributor. All nozzles on the distributor shall be open and functioning. All nozzles shall be turned at the same angle to the spray bar. Proper nozzle angle shall be as determined by the manufacturer of the distributor spray bar. The spray bar shall be adjusted so that it is at the proper height above the pavement surface to provide a double overlap spray for a uniform coverage of the pavement surface. A double lap application requires that the nozzle spray patterns overlap one another such that every portion of the pavement receives spray from exactly two nozzles.

When an HMA pavement course is placed on an existing tight smooth pavement surface, a tack coat shall be applied at the rate of 1/20 gal/s.y. (0.20 liters/square meter). All existing surfaces subjected to milling shall receive a tack coat at the rate of 1/15 gal/s.y. (0.28 liters/square meter). Tack coat shall be applied to cover approximately 90% of the pavement surface.

Any new HMA pavement course that has been open to traffic, or that was placed 30 days prior to placement of the subsequent pavement course, shall receive a tack coat at an application rate of 1/20 gal/s.y. (0.20 liters/square meter).

When the surface of a new HMA pavement course is in a condition which in the Owner's judgment is unsatisfactory for the direct placement of the subsequent pavement course, a tack coat shall be applied at the applicable rate specified above for the particular pavement surface condition.

In addition to the requirements above, all vertical surfaces of curbs, edging, utilities, and drainage structures shall receive a thorough tack coat application immediately prior to placing each HMA pavement course.

(3) Tack Inspection.

The asphalt emulsion temperature and application rate shall be periodically measured and properly recorded by the Design-Builder on NETTCP Inspection Report Forms. If the temperature or application rate is determined to not be in conformance with the specification requirements above, the Design-Builder shall make appropriate adjustments to the tack application operations.

COMPENSATION

The Pay Adjustment provisions included in Subsection 450.92 – Pay Adjustment shall be applied to items under this contract.

Delete Subsection 450.91D. – Hot Mix Asphalt and replace with the following:

D. Hot Mix Asphalt.

Each Hot Mix Asphalt pavement course will be paid for at the contract unit price per ton (Megagram) of in-place mixture under the HMA Pay Items specified in Subsection 455.93. Payment shall include sweeping the underlying surface, transportation, delivery, placement including providing a Material Transfer Vehicle (MTV), and compaction of each HMA pavement course in accordance with Subsection 450.54 through Subsection 450.58.

All sawcutting required for transverse joints or longitudinal joints in accordance with Subsection 450.57 shall also be included in the contract unit price for each HMA pavement course.

Delete Subsection 450.93 – Payment Items and replace with the following:

455.93	Payment Items	Payment Unit
450.10	Open Graded Friction Course – Polymer Modified (OGFC – P)	Ton (Megagram)
455.21	SUPERPAVE Surface Course – 4.75 (SSC – 4.75)	Ton (Megagram)
455.22	SUPERPAVE Surface Course – 9.5 (SSC – 9.5)	Ton (Megagram)
455.23	SUPERPAVE Surface Course – 12.5 (SSC – 12.5)	Ton (Megagram)
455.24	SUPERPAVE Surface Course – 19.0 (SSC – 19.0)	Ton (Megagram)
455.31	SUPERPAVE Intermediate Course – 12.5 (SIC – 12.5)	Ton (Megagram)
455.32	SUPERPAVE Intermediate Course – 19.0 (SIC – 19.0)	Ton (Megagram)
455.41	SUPERPAVE Base Course – 25.0 (SBC – 25.0)	Ton (Megagram)
455.42	SUPERPAVE Base Course – 37.5 (SBC – 37.5)	Ton (Megagram)
455.51	SUPERPAVE Leveling Course – 4.75 (SLC – 4.75)	Ton (Megagram)
455.52	SUPERPAVE Leveling Course – 9.5 (SLC – 9.5)	Ton (Megagram)
455.60	SUPERPAVE Bridge Surface Course – 9.5 (SSC B – 9.5)	Ton (Megagram)
455.61	SUPERPAVE Bridge Surface Course – 12.5 (SSC B – 12.5)	Ton (Megagram)
455.70	SUPERPAVE Bridge Protective Course – 9.5 (SPC B – 9.5)	Ton (Megagram)
455.71	SUPERPAVE Bridge Protective Course – 12.5 (SPC B – 12.5)	Ton (Megagram)
450.90	Design Builder Quality Control	Ton (Megagram)
451	HMA for Patching	Ton (Megagram)
452	Asphalt Emulsion for Tack Coat	Gallon (Liter)
453	HMA Joint Sealant	Linear Foot (Meter)

END OF SECTION

SECTION 02524

CURBS, GUTTERS AND

WALKS PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the construction of Portland cement concrete curbs, gutters, and walks.
- B. Related Work:
 - 1. Section 02300 – EARTHWORK
 - 2. Section 02525 – GRANITE CURBS
 - 3. Section 02509 – PAVEMENT BASE COURSES
 - 4. Section 02513 – BITUMINOUS CONCRETE PAVEMENT
 - 5. Section 02526 – DETECTABLE WARNING STRIPS
 - 6. Section 03300 - CAST-IN-PLACE CONCRETE; for concrete, reinforcement, and incidentals pertaining thereto.

1.2 QUALITY ASSURANCE

- A. Installer Qualifications: Engage an experienced installer who has completed type of work similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- B. Source Limitations: Obtain each variety of material from a single source with resources to provide materials of consistent quality in appearance and physical properties without delaying the work.
- C. Unless otherwise indicated, materials and construction shall conform to applicable portions of the following:
 - 1. MassDOT Specification Section 500, “Curb and Edging”.
 - 2. MassDOT Specification Section 701, “Sidewalks, Wheelchair Ramps, and Driveways”.
- D. Curb Layout: After staking and laying out the curb work, and before beginning curb installation, obtain the MBTA’s approval of layout. Design-Builder shall make minor adjustments as determined by the MBTA.
- E. The Design-Builder and his Subcontractors shall inspect all sub-bases for unstable, unsuitable or improperly prepared areas. Do not begin work over unacceptable areas. Beginning work means the Design-Builder and his Subcontractors accept the sub-base, previous work and conditions and shall be held responsible for any corrections required to properly implement the Construction Documents.
- F. Tolerances. Construct cement concrete surfaces within 1/4 inch of the indicated elevation, and deviating not more than 1/8 inch from a ten-foot straightedge placed anywhere on the surface.
- G. Walks shall be constructed to meet MassDOT, ADA requirements, and within the City of Cambridge the City of Cambridge requirements.

- H. Provide strict compliance with requirements for air entrainment and curing of cement concrete.

1.3 SUBMITTALS

- A. Product Data: For each material and manufactured product specified.
 - 1. Manufacturer's standard product literature.
 - 2. Data on physical properties required by referenced ASTM standards.
- B. Shop Drawings: Supply shop drawings at an approved scale for location, installation and erection of all parts of the work under this section including but not limited to the following items:
 - 1. Cast In Place Concrete Curb

1.4 PROJECT CONDITIONS

- A. Protection: The Design-Builder shall use all means necessary to protect the materials of this Section before, during and after installation. In the event of damage, make all repairs and replacements necessary to approval of the MBTA and at no additional cost to the MBTA. All work shall be executed in such a manner as to prevent any damage to existing streets, curbs, paving to remain, existing plant materials, and adjoining properties.
- B. The Design-Builder shall remove all debris, construction equipment and waste material from within the limit of work prior to inspection for acceptance.
- C. The Drawings indicate, in general, the alignment and finished grade elevations. The MBTA however, may make minor adjustments in grades and alignment as are found necessary.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Cement Concrete: (4000 psi, ¾", 610) MassDOT M4.02
- B. Preformed Expansion Joint Filler: AASHTO M153.
- C. Hot-Poured Joint Sealer: AASHTO M173.
- D. Gravel Borrow: MassDOT M1.03.0, (Type b).

PART 3 - EXECUTION

3.1 PREPARATION

- A. Excavate for and prepare the subgrade as specified in Section 02300 - EARTHWORK, true to the indicated grade and cross section.
- B. Place and compact a foundation of gravel borrow to the indicated thickness upon the prepared subgrade.
- C. Test completed gravel foundation with a template supported on the side forms, prior to concreting.

3.2 JOINTS

- A. Expansion Joints and Contraction (Control) Joints shall be installed to meet all municipal, MassDOT standard requirements.

3.3 FINISHES

- A. Pedestrian and Wheelchair Accessible Ramps: Non-slip finish with a Tactile Warning Surface tile as defined in Specification Section 02526.
- B. All Other: Broom finish.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02525

GRANITE CURBS

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing granite curb, granite curb transitions and sloped granite edging, as indicated on the Contract Plans and in accordance with these Specifications or as a replacement for existing curb which is damaged or removed during the course of the work.
- B. The work under this section also includes removing and resetting, and removing and discarding existing curbing, as indicated on the contract plans and/or as directed by the MBTA.
- C. Related Work:
 - 1. Section 02300 - EARTHWORK
 - 2. Section 02524 – CURBS, GUTTERS AND WALKS
 - 3. Section 03300 - CAST-IN-PLACE CONCRETE

1.2 QUALITY CONTROL

- A. Tolerances. Place curbing within ¼ inch of the indicated elevations or dimensions, deviating not more than ¼ inch from a ten-foot straight-edge placed anywhere on the surface.

1.3 SUBMITTALS

- A. Product Data:
 - 1. Manufacturer’s standard product literature.
 - 2. Data on physical properties required by referenced standards.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. All curbing work shall be in accordance with the Commonwealth of Massachusetts, Department of Transportation (MassDOT) "Standard Specifications for Highways and Bridges," Section 500. Curb and Edging, and Materials Section M9.04.1, Granite Curb, Type VA 4.
- B. All curbing to be removed and reset shall be in accordance with the Commonwealth of Massachusetts, Massachusetts (MassDOT) "Standard Specifications for Highways and Bridges," Section 580, and shall be reused with the MBTA’s approval.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Excavate for and prepare the subgrade as specified in Section 02300 – EARTHWORK, true to the indicated grade and cross section.
- B. Place and compact a foundation to the indicated material and thickness upon the prepared subgrade.
- C. Test the complete foundation with a template supported on the side forms, prior to placing the curbing.
- D. Install High-Early strength concrete setting bed as indicated on the contract plans and/or as directed by the MBTA.
- E. All transition curbing shall be cut at the end adjoining adjacent curbing so that ends are vertically flush.
- F. The corner curbs shall be cut so they are constructed with flush joints.
- G. Transition curbing at ramps, as shown on the Contract Drawings.
- H. Curbing which is to be removed and reset, will be installed as indicated above.
- I. Curbing which is removed and stacked and not wanted by the MBTA shall be satisfactorily disposed of by the Design-Builder.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02526

DETECTABLE WARNING STRIPS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work under this section shall consist of furnishing and installing detectable warning strips as indicated on the plans or as directed by the MBTA.
- B. The detectable warning strips shall be placed at all new or modified wheel chair ramps throughout the project.
- C. Related Work:
 - 1. Section 02524 – CURBS, GUTTERS AND WALKS
 - 2. Section 03300 - CAST-IN-PLACE CONCRETE
 - 3. Section 09360 – MODULAR TACTILE SURFACES

1.2 SUBMITTALS

- A. Product Data: For each material and manufactured product specified.
 - 1. Manufacturer's catalog cuts, material specifications, installation and maintenance instructions, and other data pertinent to the work of this Section.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. The detectable warning panels shall comply with MassDOT Engineering Directive E-12-005 and MassDOT Standard Drawings E 107.6.5R and M/E 107.6.5R dated March, 2012.
- B. Color shall be homogeneous throughout the composite. Color shall conform to the applicable City of Medford, City of Cambridge, or City of Somerville, MBTA, or DCR standard specification.

PART 3 - EXECUTION

3.1 PERFORMANCE

- A. All work shall be performed in accordance with the applicable requirements of Section 700 of the MassDOT Standard Specifications and the Manual on Uniform Traffic Control Devices. Detectable warning panels shall be installed at all wheelchair ramp locations and median cut-throughs

in accordance with ADA requirements, the MassDOT Construction Standards, and the details shown on the plans.

- B. Design-Builder will not be allowed to install Tactile Warning Surface Product until all submittals have been reviewed and approved by the MBTA.
- C. Tactile warning surface product shall be installed per manufacturer's instructions.
- D. To the maximum extent possible, the tactile Warning Surface Units shall be oriented such that the rows of in-line truncated domes are parallel with the direction of the ramp. When multiple tactile Warning Surface Units regardless of size are used, the truncated domes shall be aligned between the tactile Warning Surface Units and throughout the entire tactile warning surface installation.
- E. In accordance with the latest Draft Guidelines for Accessible Public the tactile warning surface product shall be located so that the edge nearest the curb line is 6" minimum and 8" maximum from the curb line.
- F. The tactile Warning Surface Units shall be tamped or vibrated into the fresh concrete to ensure that there are no voids or air pockets, and the field level of the tactile warning surface unit is flush to the adjacent concrete surface or as the Drawings indicate to permit proper water drainage and eliminate tripping hazards between adjacent finishes.

3.2 CLEANING AND PROTECTION

- A. Protect tactile warning surface unit against damage during construction period to comply with tactile warning surface unit manufacturer's Specifications.
- B. During and after the tactile warning surface unit installation and the concrete curing stage, it is imperative that there are no walking, leaning or external forces placed on the tactile warning surface unit to rock the tactile warning surface unit, causing a void between the underside of the tactile warning surface unit and the concrete substrate.
- C. Prohibit construction vehicle traffic from riding on newly tiled surfaces. Do not place or store construction equipment or tools directly on tiled surfaces.
- D. Provide snow removal as required using equipment that will not damage tile.
- E. If requested by the Project Manager, clean tactile Warning Surface Units not more than four (4) days prior to date scheduled for inspection intended to establish date of substantial completion in each area of project. Clean tactile warning surface unit by method specified by tactile warning surface manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02577

PAVEMENT MARKING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the furnishing and application of reflectorized pavement markings.
- B. All work shall be in accordance with the relevant provisions of Section 860 of the MassDOT Standard Specifications.
- C. Related Work:
 - 1. Section 02052 – MAINTENANCE OF TRAFFIC THROUGH WORK AREAS
 - 2. Section 02296 – TRAFFIC DECKING
 - 3. Section 02298 – TEMPORARY PEDESTRIAN FACILITIES

1.2 SUBMITTALS

- A. Submit a schedule of pavement marking operations to the MBTA, for approval, not less than ten business days prior to the proposed date of application of any pavement marking.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Thermoplastic Striping: Design-Builders shall comply with MassDOT requirements. Pavement striping material shall be applied to the pavement in a molten state by mechanical means with a surface application of glass spheres.
 - 1. White Color: Composition by weight:

Binder:	22 % minimum
Glass Beads:	30-40 %
Titanium Dioxide:	10% minimum
Calcium Carbonate and Filler:	38 % maximum
 - 2. Yellow Color: Composition by weight:

Binder:	22 % minimum
Glass Beads:	30-40 %
Titanium Dioxide:	10% minimum Yellow Pigment
Calcium Carbonate and Filler:	To be determined by manufacturer.

3. Glass Beads: Beads shall be transparent, clean, colorless glass, smooth and properly shaped, and contain no pits or bubbles, and meeting the following gradation:

Sieve	Percent Passing
No. 20	100
No. 30	75 - 95
No. 50	15 - 35
No. 80	0 - 5

- a. When tested by the liquid immersion method, the beads shall have a minimum refraction of 1.50.
- B. Acrylic Striping: Comply with MassDOT requirements. Pavement striping material shall be an acrylic type, low VOC, water based paint.

1. White Color: Composition by weight:

Pigment:	58 percent minimum
Total Solids:	76 percent minimum
Titanium Dioxide:	1 pound/gallon minimum

2. Yellow Color: Composition by weight:

Pigment:	56 percent minimum
Total Solids:	75 percent minimum
Titanium Dioxide:	0.3 pounds/gallon minimum

PART 3 - EXECUTION

3.1 EQUIPMENT

- A. Use standard commercial-quality equipment of the type normally required for application of pavement markings. Operate the equipment in accordance with the manufacturers' instructions. Truck-mounted equipment is approved for the application of pavement marking except where in the MBTA's judgment travel will be unreasonably delayed or the quality of the work performed by the equipment is unsatisfactory.

3.2 LAYOUT OF WORK

- A. The Design-Builder shall provide a line of reference on the roadway for use in establishing the location of markings to be approved by the MBTA prior to applying to any pavement markings. This line of reference shall be at a maximum of 50-foot intervals by means deemed satisfactory by the MBTA. Follow this line of reference without deviation. Reapply any line deviating from the establishing control or of incorrect width, as directed by the MBTA.

3.3 APPLICATION OF MARKINGS

A. Apply pavement markings as follows:

MATERIAL	MATERIAL APPLICATION TEMPERATURE DEGREES F	LINE THICKNESS MILS	REFLECTORIZED BEAD APPLICATION
M7.01.08	180-195	15	6 LBS/GAL
M7.01.09	180-195	15	6 LBS/GAL
M7.01.10	40-120	15	6 LBS/GAL
M7.01.11	40-120	15	6 LBS/GAL
M7.01.03	400-425	6-188	1 LB/20 SF DROP ON
M7.01.04	400-425	5-188	1 LB/20 SF DROP ON

- B. Use no thinners for the above-listed pavement marking applications except in accordance with the manufacturer's specifications and at the direction of the MBTA.
- C. Heat no paint or pavement marking material above the temperature marked on the container.
- D. Apply markings only in seasonable weather and in accordance with good painting practices. The surface shall be dry and free of sand, grease, oil, or other foreign substances prior to the application. Prepare the surface to accept the application as part of the work of this section. The MBTA will make the final determination for all of the foregoing.
- E. Bituminous concrete pavements shall have been in place for 48 hours prior to the application of pavement markings. When it is necessary to expedite the flow of traffic, the MBTA may reduce the waiting period as is deemed necessary.
- F. The ambient (air) temperature for thermoplastic application is to be a minimum of 45 Degrees F and rising at the time of marking operations. If work has started and air temperatures fall below 45 Degrees F and continuous cooling is indicated, work shall be stopped. In cool weather conditions, temporary drops down to 40 Degrees F will be tolerated providing temperatures also vary upwards. Sustained striping (greater than one hour) at 40 Degrees F shall not be allowed. Starting work at air temperatures lower than 45 Degrees F shall not be allowed. Design-Builder shall remove and replace thermoplastic applications made at below 40 Degrees F at no expense to the MBTA.
- G. If for any reason material is spilled or tracked on the roadway, or any markings applied by the Design-Builder, in the MBTA's judgment, are of incorrect width or pattern or fail to conform to the established line of reference, remove such material by a method that is not injurious to the roadway surface and is acceptable to the MBTA, clean the roadway surface, prepare the surface for a reapplication of markings, and reapply the markings as directed without additional compensation for any of the foregoing corrective operations.

3.4 PROTECTION OF MARKINGS

- A. Protect markings until sufficiently dry to bear traffic on roadways that are open to traffic. Protect markings by traffic cones not less than 18 inches in height except in the case of markings which cure to a no-track condition in 180 seconds or less. In the latter case, protection may be provided by a convoy of vehicles with suitable warning devices to warn overtaking or on-coming traffic that the pavement marking operation is in progress.
- B. Broken Lines. On tangents and on curves of 1,000 foot radius or greater place at least one cone on every other bar. On curves of less than 1,000 foot radius place one cone on every bar unless otherwise directed by the MBTA.
- C. Solid Lines. On tangents and on curves space cones not over 50 feet unless otherwise directed by the MBTA. On edge lines adjacent to the median, wider spacing may be used as directed by the MBTA. In order to control the proper positioning of the cones during the drying period, assign sufficient personnel as determined by the MBTA. Such control is dependent on traffic density, cone widths, and other factors.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02615

DUCTILE IRON PIPE AND FITTINGS FOR STORMWATER PUMP STATIONS

PART 1 - GENERAL

1.1 DESCRIPTION

- A. Provide and test ductile iron pipe, fittings and appurtenances as indicated and in compliance with Contract Documents.
- B. Options:
 - 1. For buried exterior pipelines provide push-on joint pipe.
 - a. Provide restrained push-on pipe as specified.
 - b. Provide either restrained push-on joint fittings as specified and indicated or provide mechanical joint fittings with restraint system as specified herein.
 - 2. For piping exposed as in buildings and galleries, provide flanged or rigid-joint, grooved-coupled pipe and fittings.
 - 3. Cast iron pipe and fittings are not acceptable.
- C. Construction of the Red Bridge and Washington street pump stations (RPS and WSP, respectively) was initiated under IGMP-03, a previous GLX construction contract. That work was advanced to near completion of the basic structure. The pumps, variable frequency motor controllers, communication programmable logic controllers, piping and pump station controls were not (or may not have been) completed, however certain items of that equipment were procured by the Owner and will be provided to the Design-Builder. The Design-Builder shall complete the construction of these two pump stations in full compliance with the specifications. The Design-Builders shall complete all work within this Section and all related work, to provide complete operable pump station facilities.
- D. The specifications relative to the WPS and RPS pump stations, including all operating parameters, control logic and other parameters, shall not be modified in any way.
- E. The Design-Builder may elect to adapt these specifications, if appropriate, to any pump station it may propose at Gilman Square.
- F. Certain work under this Section was, or may have been, completed by the previous GLX contractor. The Design-Builder shall be responsible for making its own assessments and evaluations as to the exact scope and limits of the completed and the uncompleted work. The Design-Builder shall complete any and all work associated with this Section and all Related Sections, including any and all uncompleted and/or partially completed work. The Design-Builder shall coordinate all related work, to provide complete and operable stormwater pumping facilities.
- G. The use of the word "Contractor" has been retained in this Section; however, it shall be interpreted to mean the Design-Builder for any and all work remaining to be completed. Likewise, the word "Engineer" has been retained; however, it shall be interpreted to mean the Owner for any and all work remaining to be completed.

- H. The specifications relative to the pipe layouts and design and other parameters, shall not be modified in any way.
- I. The Design-Builder may elect to adapt these specifications, if appropriate, to any pump station it may propose at Gilman Square.

1.3 SUBMITTALS

- A. Submit the following in accordance with Section 01300 – SUBMITTALS.
1. Pipe manufacturer’s technical specification and product data.
 2. Certified shop and erection drawings. Contractor shall submit electronic files of the piping layout including the following.
 - a. Pipe layouts in full detail.
 - b. Location of hangers and supports.
 - c. Location and type of anchors.
 - d. Location of couplings and expansion joints.
 - e. 1/2-inch = 1 foot-0 inch scale details of all wall penetrations and special fittings.
 - f. Schedules of pipe, fittings, special castings, couplings, expansion joints and other appurtenances.
 3. Certificates: Sworn certificates in duplicate showing compliance with material used and shop tests performed.
 4. Catalog cuts and technical data for expansion joints, couplings, gaskets, pipe supports and other accessories.
 5. Brochures and technical data on coatings and linings and proposed method of application.
 6. Manufacturer's descriptive literature and technical data on insulation and proposed method of installation.
- B. Material Certification:
1. Provide certification from the pipe and fittings manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
 2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.
- C. A copy of the contract mechanical process, civil and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.
1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
 2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

- a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
- b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.4 QUALITY ASSURANCE

- A. Provide in accordance with Section 01400 – QUALITY ASSURANCE and as specified.
- B. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.
- C. Inspect and test at foundry according to applicable standard specifications.
- D. Owner reserves right to inspect and test by independent service at manufacturer's plant or elsewhere at his own expense.
- E. Visually inspect before installation.
- F. Job Conditions:
 1. Coordinate dimensions and drillings of flanges with flanges for valves, pumps and equipment to be installed in the piping systems.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01600 – MATERIALS AND EQUIPMENT.
- B. During loading, transportation and unloading, prevent damage to pipes and fittings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by CMGC. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation.

PART 2 - PRODUCTS

2.1 PIPE

- A. Ductile Iron:
 1. Design conforming to AWWA A21.50.
 2. Manufacture conforming to AWWA A21.15 or AWWA A21.51.
 3. Thickness class, unless otherwise indicated or specified:
 - a. Minimum Thickness Class 52.
 - b. Minimum thickness Class 53 for use with threaded flanges.

- c. Minimum thickness Class 53 for use with flanged pipe.
- d. Minimum thickness for use with grooved couplings conforming to AWWA C606.

2.2 PIPE FOR USE WITH COUPLINGS

- A. As specified above except ends shall be plain.
- B. With bolted split sleeve couplings, ends cast or machined at right angles to axis.
- C. With grooved type coupling:
 - 1. Ductile-Iron of thickness class specified above.
 - 2. Grooved End dimensions conforming to AWWA C606 for flexible or rigid joints to suit joint requirements.

2.3 FITTINGS

- A. Provide fittings conforming to AWWA A21.10 or AWWA A21.53, at least Class 150 and match piping class.
- B. Provide all bell push-on or mechanical-joint fittings unless otherwise indicated or specified.
- C. Face and drill flanged fittings conforming to AWWA A21.10 except special drilling or tapping for correct alignment and bolting.
- D. If flanged fittings are not available under AWWA A21.10 provide fittings conforming to ASME B16.1 in 125 lb. pressure class.
- E. Provide standard base fittings where indicated.
- F. Provide grooved-end fittings ductile-iron conforming to AWWA A21.10 for center-to-face dimensions.
 - 1. End preparation for grooved-ends conforming to AWWA C606 for flexible or rigid joints as required by type of joint.

2.4 NONSTANDARD FITTINGS

- A. Acceptable design.
- B. Same diameter and thickness as standard fittings.
- C. Manufactured to meet requirements of same specifications as standard fittings except for laying length and types of ends.

2.5 WALL CASTINGS

- A. Provide size and type indicated and specified.
 - 1. Piping 24-inches and Smaller: Mechanical Joint with specified restraint or Restrained Push-On.

2. Piping 30-inches and Larger: Restrained Push-On.

- B. Wall Castings: Conform to requirements of AWWA A21.10 or fabricate of Class 53 ductile iron pipe with screwed on flanges and welded on waterstop. Screwed on mechanical or push-on joints are not acceptable.
- C. Provide water stop centered in wall. Weld water stops on in factory under controlled conditions to ensure adequate strength to permit waterstop to absorb thrust up to the pressure rating of the pipe.

Wall Castings with annealed ductile iron water stops	
Pipe Size	Waterstop thickness, in
4 inch-12 inch (100-300 mm)	0.50 (13 mm)
14 inch-24 inch (350 -600 mm)	0.75 (19 mm)
30 inch-36 inch (750-900 mm)	1.00 (25 mm)
42 inch-48 inch (1100-1200 mm)	1.25 (32 mm)

Wall Castings with fabricated steel water stops	
Pipe Size	Waterstop thickness, in
4 inch-16 inch (100-400 mm)	0.25 (6 mm)
18 inch-24 inch (450 -600 mm)	0.38 (0 mm)
30 inch-36 inch (750-900 mm)	0.50 (13 mm)
42 inch-48 inch (1100-1200 mm)	0.75 (19 mm)
54 inch-64 inch (1100-1200 mm)	1.00 (25 mm)

- D. On flanged wall castings, provide space between the wall and flange to permit mounting the nuts on the flange bolts.
- E. Flanged wall castings located with the flange flush with the wall are not acceptable.
- F. Locate push-on joint wall castings with space between the bell and the wall to insert the follower bolts.
- G. Testing: Factory pressure test all wall castings to pipe and joint pressure rating for a minimum of 5 minutes. No visible leakage is acceptable.

2.6 ADAPTERS

- A. Furnish and install for joining pipe of different types, unless solid sleeves indicated.
 - 1. Provide ends conforming to above specifications for the correct type of joint, to receive adjoining pipe.
 - 2. Joining two classes of pipe may be of lighter class provided annular space in bell-and-spigot type joints sufficient for jointing.

2.7 JOINTS

- A. Provide push-on joint and mechanical joint pipe with necessary accessories, conforming to AWWA A21.11.
 - 1. Provide gasket composition designed for exposure to liquid within pipe.

- B. Provide pipe flanges and accessories conforming to AWWA A21.15.
 - 1. Provide flat faced flanges.
 - 2. Provide 1/8-inch thick, full faced gaskets designed for exposure to liquid within pipe.
- C. Provide restrained joint on pipe and fittings where indicated. Provide restrained joint which is:
 - 1. Boltless
 - 2. Capable of being deflected after assembly
 - 3. Designs using set screws or requiring field welding are not acceptable.
 - 4. Manufacturers:
 - a. American Cast Iron Pipe Co. Flex-Ring.
 - b. U.S. Pipe TR FLEX.
 - c. Clow Super-Lock.

2.8 MECHANICAL JOINT FITTINGS – RESTRAINT SYSTEM

- A. Provide restraint devices for pipe consisting of multiple gripping wedges incorporated into a follower gland meeting requirements of AWWA A21.10.
 - 1. Mechanical joint restraint shall require conventional tools and installation procedures per AWWA C600, retaining full mechanical joint deflection during assembly and allowing joint deflection after assembly.
 - 2. Provide actuation of the gripping wedges ensured with torque limiting twist off nuts.
 - 3. Provide restraint devices Listed by Underwriters Laboratories (3 inch through 24 inch) and Designed by Factory Mutual (3 inch through 12 inch size).
 - 4. Gland body, wedges and wedge actuating components must be domestic manufacture (USA).
- B. Working Pressure Rating:
 - 1. 16-inch and Smaller: 350 psi.
 - 2. 18-inch and Larger: 250 psi
 - 3. Minimum safety factor of 2 to 1.
- C. Materials:
 - 1. Gland body, wedges and wedge actuating components: Grade 65-45-12 ductile iron in accordance with ASTM A536.
 - 2. Ductile iron gripping wedges: Heat treated, 370 to 470 BHN.
 - 3. Provide three (3) test bars incrementally poured per production shift as per Underwriter’s Laboratory (U.L.) specifications and ASTM A536. Testing for tensile, yield and elongation in accordance with ASTM E8.

4. Provide chemical and nodularity tests performed as recommended by the Ductile Iron Society, on a per ladle basis.
5. Provide an identification number consisting of year, day, plant and shift (YYDDD)(plant designation)(Shift number) cast into each gland body.
6. Record all physical and chemical test results such that they can be accessed via the identification number on the casting. Provide the Material Traceability Records (MTRs) available, in hard copy.
7. Provide coating for restraint devices consisting of the following:
 - a. Process all wedge assemblies and related parts through a phosphate wash, rinse and drying operation prior to coating application.
 - b. Coating: A minimum of two coats of liquid thermoset epoxy coating with heat cure to follow each coat.
 - c. Surface pretreat all casting bodies with a phosphate wash, rinse and sealer before drying.
The coating shall be electrostatically applied and heat cured. Coating: Polyester based powder to provide corrosion, impact and UV resistance.
 - d. Coating system: MEGA-BOND by EBAA Iron, Inc.

D. Manufacturer:

1. EBAA Iron MegaLug Series 1100

2.9 FLANGE ADAPTORS

- A. Provide restrained flange adaptors for pipe consisting of multiple individual gripping wedges incorporated into a follower gland meeting requirements of AWWA A21.10.
 1. Provide actuation of the gripping wedges ensured with torque limiting twist off nuts.
 2. Provide restraint devices Listed by Underwriters Laboratories (3-inch through 12 inch size) and Designed by Factory Mutual (4-inch through 12-inch size).
 3. Gland body, wedges and wedge actuating components must be domestic manufacture (USA).
- B. Joint Deflection capability:
 1. 3-inch thru 8-inch: 5 degrees
 2. 10-inch and 12-inch: 3 degrees
 3. 14-inch and 16-inch: 2 degrees
 4. 18-inch and 20-inch: 1.5 degrees
 5. 20-inch, 42-inch and 48-inch: 1 degrees
 6. 30-inch and 36-inch: 3 degrees
- C. Provide flange adaptor to maintain seal with and 0.6 inch gap between end of pipe and mating flange.

D. Working Pressure Rating:

1. 16-inch and Smaller: 350 psi
2. 18-inch: 300 psi
3. 20-inch: 250 psi
4. 24-inch: 200 psi
5. 30-inch thru 48-inch: 150 psi
6. Minimum safety factor of 2 to 1.

E. Materials:

1. Gland body, wedges and wedge actuating components: Grade 65-45-12 ductile iron in accordance with ASTM A536.
2. Ductile iron gripping wedges: Heat treated, 370 to 470 BHN.
3. Provide three (3) test bars incrementally poured per production shift as per Underwriter's Laboratory (U.L.) specifications and ASTM A536. Testing for tensile, yield and elongation in accordance with ASTM E8.
4. Provide chemical and nodularity tests performed as recommended by the Ductile Iron Society, on a per ladle basis.
5. Provide an identification number consisting of year, day, plant and shift (YYDDD)(plant designation)(Shift number) cast into each gland body.
6. Record all physical and chemical test results such that they can be accessed via the identification number on the casting. Provide the Material Traceability Records (MTRs) available, in hard copy.
7. Provide coating for restraint devices consisting of the following:
 - a. Process all wedge assemblies and related parts through a phosphate wash, rinse and drying operation prior to coating application.
 - b. Coating: A minimum of two coats of liquid thermoset epoxy coating with heat cure to follow each coat.
 - c. Surface pretreat all casting bodies with a phosphate wash, rinse and sealer before drying.
The coating shall be electrostatically applied and heat cured. Coating: Polyester based powder to provide corrosion, impact and UV resistance.
 - d. Coating system: MEGA-BOND by EBAA Iron, Inc.

F. Manufacturer:

1. EBAA Iron Mega-Flange Series 2100

2.10 FLEXIBLE CONNECTIONS

A. Use as specified or indicated:

1. Bolted split sleeve couplings
2. Grooved couplings

2.11 BOLTED SPLIT SLEEVE COUPLINGS

- A. Provide in accordance with Section 15103 – PROCESS PIPING AND APPURTENANCES.
- B. Pressure rating at least equal to that of related pipeline.
- C. Provide with gaskets of composition designed for exposure to liquid within pipe.

2.12 GROOVED COUPLINGS

- A. Conform to AWWA C606.
- B. Minimum pipe wall thickness specified under "Pipe For Use With Couplings."
- C. Where grooved couplings are indicated to provide for expansion or flexibility, cut pipe grooves to provide necessary expansion or flexibility.
- D. Where grooved couplings are used instead of flanged joints, joint to be of rigid type with pipe grooves cut to bring pipe ends together. Beam strength of joint shall be equal to or greater than that of flanged joint.

2.13 FILLING RINGS

- A. Provide where necessary.
- B. Materials, workmanship, facing, and drilling, conforming to 125-lb. ANSI.
- C. Suitable length with nonparallel faces and corresponding drilling, if necessary, for correct assembly of adjoining piping or equipment.

2.14 CONNECTIONS – TAPPED

- A. Provide service saddles for all taps for lines 24-inch and smaller.
 - 1. Body: Ductile iron ASTM A395 or Bronze.
 - 2. Straps and Hardware: Type 316 stainless steel.
- B. For 30-inch and larger provide watertight joint with adequate strength against pullout. Use only tapered thread taps.
 - 1. Maximum size of taps in pipe or fittings without bosses not to exceed that listed in table of Appendix to AWWA A21.51 based on: 2 full threads Where size of connection exceeds that given above for pipe, provide boss on pipe barrel or use tapping saddle. Make tap in flat part of intersection of run and branch of tee or cross, or connect by means of tapped tee, branch fitting and tapped plug or reducing flange, or tapping tee and tapping valve, or permitted.
 - 2. Provide taps and piping for gauges and pressure sensing instruments in accordance with ANSI/HI standards so that there are no erroneous readings.

2.14 PIPE COATING

- A. Outside of pipe and fittings within structures: Clean and apply one shop coat with a 3 to 5 mil DFT of moisture cured urethane.
- B. Outside surfaces of castings to be encased in concrete: No coating.
- C. Machined surfaces cleaned and coated with rust-preventative compound at shop.
- D. Outside of buried pipe and fittings: Standard bituminous coating conforming to AN Standard.

2.15 CEMENT LINING

- A. Inside of pipe and fittings: Provide double thickness cement lining and bituminous seal coat conforming to AWWA A21.4.

2.16 GASKETS, BOLTS, AND NUTS

- A. Provide ring or full face synthetic rubber gaskets for flanged joints and neoprene faced phenolic for insulating gaskets in accordance with AWWA A21.11 and ASME B16.21.
 - 1. 1/8 inch thick
- B. Make flanged joints with:
 - 1. Bolts
 - 2. Bolt studs with nut on each end
 - 3. Studs with nuts where flange is tapped
 - 4. Plastic bolt sleeves and washers for insulating joints.
- C. Number and size of bolts conform to same ANS as flanges.
- D. Provide Type 316 stainless steel bolts, washers and nuts for all services.

PART 3 - EXECUTION

3.1 HANDLING AND CUTTING

- A. Mark pipe and fittings "Rejected" and remove from site when cracked or has received a severe blow.
- B. If permitted, cut on sound barrel at a point at least 12 inch from visible limit of crack, at Contractor's expense.
- C. Machine cut with milling type cutters, knives, or saws. Snap cutters, torch, or hammer and chisel NOT ALLOWED. Examine for possible cracks.
- D. Chamfer cut ends if used for push-on joints.

3.2 INSTALLATION

- A. Visually inspect before installation.
- B. Ensure pipelines parallel to building walls wherever possible. Install piping to accurate lines and grades. Where temporary supports are used, ensure rigidity to prevent shifting or distortion of pipe. Provide for expansion where necessary.
- C. Pitch piping toward low points. Provide for draining low points.
- D. Before assembly, remove dirt and chips from inside pipe and fittings.
- E. Piping Support: Provide in accordance with Section 15105 – PIPE SUPPORTS FOR PROCESS PIPING.
- F. Pipe and Fittings:
 - 1. Remove and replace defective pieces.
 - 2. Clear of all debris and dirt before installing and keep clean until accepted.
 - 3. Lay accurately to lines and grades indicated or required. Provide accurate alignment, both horizontally and vertically.
 - 4. Provide firm bearing along entire length of buried pipelines.
 - 5. Do not allow deflection of alignment at joints to exceed permissible deflection as specified below:

PIPE DEFLECTION ALLOWANCES

Maximum permissible deflection, in.* (mm)		
Size of pipe, in (mm)	Push-on joint	Mechanical joint
4 (100)	19 (482)	31 (787)
6 (150)	19 (482)	27 (685)
8 (200)	19 (482)	20 (508)
10 (250)	19 (482)	20 (508)
12 (300)	19 (482)	20 (508)
14 (350)	11 (279)	13-1/2 (343)
16 (400)	11 (279)	13-1/2 (343)
18 (450)	11 (279)	11 (279)
20 (500)	11 (279)	11 (279)
24 (600)	11 (279)	9 (228)
30 (750)	11 (279)	9 (228)
36 (900)	11 (279)	8 (203)
42 (1100)	7-1/2 (190)	7-1/2 (190)
48 (1200)	7-1/2 (190)	7-1/2 (190)
54 (1400)	7-1/2 (190)	0 (0)

* Maximum permissible deflection for 20-foot (6 meters) lengths; for other lengths in proportion of such lengths to 20-foot (6 meters).

- a. For push-on joint or similar pipe, clean bell of excess tar or other obstruction and wipe out before inserting next pipe spigot. Shove new pipe into place until properly seated and hold securely until joint completed.
- b. Set castings to be encased in concrete accurately with bolt holes, if any, carefully aligned. Clean off rust and scale before setting.

- G. Temporary Plugs: When pipe laying not in progress, close open ends of pipe with temporary watertight plugs. If water in trench, do not remove plug until danger of water entering pipe passed.
- H. Appurtenances: Set valves, fittings and appurtenances as indicated.

3.3 JOINTS AND COUPLINGS

A. Push-on Joints:

1. Insert gasket into groove bell. Apply thin film of nontoxic gasket lubricant over inner surface of gasket in contact with spigot end.
2. Insert chamfered end into gasket. Force pipe past it until it seats against socket bottom.

B. Flanged Joint:

1. Make up tight.
2. Do not put strain on nozzles, valves, and other equipment.
3. Bolt threads must fully engage the nuts. At a minimum the bolt must be flush with the nut and no more than 1/2-inch excess thread protruding from the nut.

C. Mechanical Joints:

1. Wire brush surfaces in contact with gasket and clean gasket.
2. Lubricate gasket, bell, and spigot with soapy water.
3. Slip gland and gasket over spigot, and insert spigot into bell until seated.
4. Seat gasket and press gland firmly against gasket.
5. After bolts inserted and nuts made finger-tight, tighten diametrically opposite nuts progressively and uniformly around joint by torque wrench. Torque bolts to values recommended by manufacturer.

D. Grooved Couplings:

1. Clean grooves and other parts.
2. Coat ends of pipe and outside of gasket with soft soap or silicone and slip gasket over one pipe end.
3. Bring pipes to correct position and center gasket over pipe ends with lips against pipe.
4. Place housing sections, insert bolts and tighten nuts until housing sections in metal-to-metal contact.
5. After assembly and inspection and before backfilling, coat exterior surfaces of buried couplings, including bolts and nuts, with heavy-bodied bituminous mastic.

E. Tapped Connection:

1. Drill and tap normal to longitudinal axis.

2. Drilled by skilled mechanics using proper tools.
3. Use only tapered threads.

3.4 FIELD TESTING

- A. Provide in accordance with Section 15103 – PROCESS PIPING AND APPURTENANCES.
- B. Clean of all dirt, dust, oil, grease and other foreign material, before conducting pressure and leakage tests.
- C. Pressure and Leakage Tests:
 1. Conduct combined pressure and leakage test in pipelines.
 2. Furnish and install temporary testing plugs or caps; pressure pumps, pipe connections, meters, gages, equipment, and labor.
 3. Test when desired and comply with specifications.
 4. Test pipelines in excavation or embedded in concrete before backfill or placing of concrete and test exposed piping before field painting.
 5. Fill section of pipe with water and expel air. If hydrants or blow offs are not available at high points for releasing air, make necessary taps and plug after test completion.
 6. Maintain section full of water for 24 hours before conducting combined pressure and leakage test.
 7. Conduct pressure and leakage test consisting of first raising water pressure (based on elevation of lowest point of section under test and corrected to gage location) to pressure in psi numerically equal to pipe pressure rating, but not more than 150 psi.
 - a. No visible leakage in joints.
 8. If section fails pressure and leakage test, locate, uncover, and repair or replace defective pipe, fitting, or joint, at no additional expense and without time extension. Conduct additional tests and repairs until section passes test.
 9. Modify test procedure only if permitted by Owner’s Representative.

3.5 FIELD PAINTING

- A. Provide in accordance with Section 09900 - PAINTING.

3.6 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – CONTRACT CLOSEOUT.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02632

STORMWATER BYPASS PUMPING SYSTEMS

PART 1 - GENERAL

1.1 SCOPE OF WORK

- A. The work of this section consists of furnishing all labor, materials, tools and equipment required to temporarily bypass stormwater flows around various work zones of the project, thus enabling other project work to proceed.
- B. The Design-Builder shall be responsible for maintaining all stormwater flows through the project area for the duration of the project, without surcharging upstream or downstream portions of the existing systems, such work being at no additional cost to the MBTA.
- C. The Project includes the construction of new drainage systems and relocation of existing drainage systems throughout the project corridor. The Project work also includes the CCTV inspections and lining of existing storm drain piping and structures as shown or as noted on the Contract Documents.
- D. Project work includes new and relocated gravity drainage conduits, track underdrains, stormwater pump stations with associated force mains and stormwater storage systems, including an open detention basin and a twin 90-inch diameter underground pipe storage system. In order to construct various elements of the Project, including the above referenced drainage improvements, certain portions of the existing drainage system will have to be temporarily removed from service to allow other Project work to proceed and all flow to that location must be temporarily bypassed around the work site
- E. A major existing gravity drainage system that will be impacted by the work generally follows the Fitchburg Commuter Rail corridor starting at a point west of the Red Bridge area near Medford Street and flows easterly to an existing outlet structure at the Millers River. A number of lateral drainage systems, including systems from surrounding neighborhoods, connect into this main trunk drain.
- F. The design, installation and operation of temporary bypass systems, including pumping systems, shall be the Design-Builder's responsibility. The Design-Builder may employ the services of a vendor who can demonstrate to the MBTA that it specializes in the design and operation of temporary bypass pumping systems.
- G. The Design-Builder shall provide bypass systems for all storm drainage systems that may be encountered on the project, whether shown on the plans or not.
- H. The bypass system and its operation shall meet the requirements of all local, state and federal codes and regulatory agencies having jurisdiction.

1.2 RELATED WORK

- A. Related Work:
 - 1. Section 02060 – EROSION AND SEDIMENTATION CONTROL
 - 2. Section 02283 – HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER
 - 3. Section 02400 – DRAINAGE AND SEWER SYSTEMS
 - 4. Section 02756 – STORM DRAIN LINING

1.3 SUBMITTALS

- A. Submittals shall be provided under the provisions of Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
- B. The Design-Builder shall prepare a specific, detailed description of all proposed temporary bypass pumping systems and submit them for review and approval.
- C. The submittal shall include detailed plans and descriptions outlining all provisions and precautions to be taken by the Design-Builder regarding the handling of existing drainage. This plan must be specific and complete, including such items as schedules, locations, sketches, elevations, capacities of equipment, materials and all other incidental items required to insure proper protection of the facilities, including protection of the access and bypass pumping locations from damage due to widely varying flows and site conditions.
- D. The plan shall include but not limited to details of the following:
 - 1. Conduit plugging method and types of plugs.
 - 2. Plan indicating location of pump(s), check valves and other valves; type and size of all piping and method of pipe coupling; layout of suction and discharge piping including access points and all associated appurtenances. Aluminum “irrigation” type piping and glued PVC pipe shall not be used under any circumstance.
 - 3. Bypass pump(s) sizes, capacity, and power requirements, including standby power.
 - 4. Method of noise control for each location.
 - 5. Proposed phasing of temporary bypass systems, as required.
 - 6. Contingency plan to be implemented during extreme flow condition (i.e., conditions that exceed the capacity of the temporary bypass system). This shall include a description of standby equipment.

1.4 DESIGN CRITERIA AND FLOWS

- A. Flows in the various drainage systems are anticipated to be highly variable. Historical and/or estimated information regarding flows, if available and used, will require the Design-Builders judgment.
- B. Bypass systems shall be capable of bypassing stormwater flows around the work area without increasing flooding or ponding, including flooding or ponding off-site, that would have occurred otherwise if Project construction was not underway, all as determined by the MBTA.
- C. The work covered by this specification shall be in accordance with the best practice of the industry. The specifications call attention to certain features but do not purport to cover all details entering into the required work.

- D. The temporary bypass systems shall be designed to prevent flows from surcharging within the upstream and downstream conduits to an unacceptable or unsafe condition. The surcharge shall not exceed the hydraulic grade line, either upstream or downstream, that would occur in the drainage system if the bypass system were not there, all as determined by the MBTA.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All temporary plugs, pumps, piping, valves and other appurtenant products used to conduct the work shall be supplied by the Design-Builder and retained by the Design-Builder at the completion of the work.
- B. All products shall be in good serviceable condition and suitable for the intended use as determined by the MBTA and meet all applicable codes and regulatory requirements.

PART 3 - EXECUTION

3.1 GENERAL

- A. When the depth of flow in the drain line is above the maximum allowable for the type of work being performed in the applicable section(s) of these specifications, one or more of the following methods of flow control shall be used:
 - 1. Plugging or Blocking
 - a. A drain line plug shall be inserted into the drain line(s) at a location upstream from the section in which the work is to be performed.
 - b. The plug shall be so designed that all or any portion of the flow can be released.
 - c. All temporary devices placed or installed in the drainage system shall be adequately secured to prevent sudden release due to unanticipated pressure build-up behind the device.
 - d. Plugging or blocking of the drain line(s) shall be performed during dry weather only and shall be removed at the end of each workday if practicable, unless otherwise allowed by the MBTA. No plugs shall be left in place unattended, unless conditions are monitored by the Design-Builder at a maximum of 6-hour intervals during non-working hours or as otherwise approved by the MBTA. If rain is forecast, monitoring shall be conducted at 2-hour intervals unless otherwise permitted by the MBTA.
 - e. During wet weather conditions the Design-Builder shall closely monitor the impacts of the plug(s) on the system and implement appropriate corrective action, including actions as directed by the MBTA.

- f. All temporary devices placed or installed in the drainage system shall be removed when no longer required and the downstream system has been cleared of all personnel and equipment. Removal shall be completed in a manner that will not result in a surge or major disturbance downstream.
- g. Design-Builder shall evaluate the surcharge capacity on a per location basis.

2. Pumping and Bypassing

- a. When pumping/bypassing is required, the Design-Builder shall supply the pumps, conduits and other equipment to divert the flow in the drainage system around the missing section of the system where other work is being performed. The Design-Builder shall be responsible for furnishing the labor and supervision to set up, operate and maintain the temporary pumping and bypassing system.
 - b. Bypass pumping shall normally be operated 24 hours per day (or installed and available to be put into service) until the bypass is no longer required and work requiring the bypass has been completed. The bypass pumping system shall be attended by qualified worker(s) whenever in operation and until flows recede and pumping is not required.
 - c. When pumping systems are not in service, the Design-Builder shall monitor flow conditions at each bypass location and, based on actual flow conditions and compliance with these specifications, activate and operate the pumping equipment already installed by the Design-Builder and available at each site. Conditions shall normally be monitored by visiting each bypass site on a 6-hour frequency unless otherwise allowed by the MBTA.
 - d. No leaking bypass piping shall be allowed. Any leaking or damaged pumps and piping shall be immediately repaired or replaced. All work shall be stopped until the leaking or damaged pumps and piping is repaired or replaced.
 - e. At no time shall flow from the drainage system be discharged into a sanitary sewer or combined sewer system, either by pumping or by gravity flow. If such an incident were to occur, whether intentional or unintentional, the Design-Builder shall be responsible for all costs associated with damages to those other systems and any impacted water courses and water bodies, whether within the Project site or not, to the complete satisfaction of the MBTA and at no additional cost to the MBTA.
 - f. Prior to activation of the pumping system(s), the Design-Builder shall conduct field tests to demonstrate the adequacy of each temporary pumping system as required by the MBTA. MBTA shall be notified two (2) days in advance of field testing.
- B. The Design-Builder shall conduct his work so as to not cause excessive surcharging of the drainage system as defined in this Section and shall not cause damage to the drainage system, its connections and/or apparatus. Any damage caused by the Design-Builder's operations shall be repaired to the complete satisfaction of the MBTA and at no additional cost to the MBTA.
- C. Flow bypassing and control may be required at multiple locations at the same time. The Design-Builder shall have adequate equipment available to meet the project demands.
- D. At no time shall stormwater be discharged onto the ground, the tracks or private property. Stormwater bypass systems shall not foul the track.
- E. Measures shall be taken to protect water resources, wetlands and other natural resources.

3.2 CLEAN-UP

- A. The Design-Builder shall be responsible for the legal disposal of excess material and general clean-up of the work area which will be subject to the approval of the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02633

WASTEWATER BYPASS PUMPING SYSTEMS

PART 1 - GENERAL

1.1 SCOPE OF WORK

- A. The work of this section consists of furnishing all labor, materials, tools and equipment required to temporarily bypass sewage (wastewater) and/or combined sewage flows around various work zones of the project, thus enabling other project work to proceed.
- B. The work under this Section includes control of flow in combined sewer overflow (CSO) systems as described below. The terms sewer, sewage and wastewater as used herein shall include sanitary sewage, combined sewage and combined sewer overflow systems.
- C. The Design-Builder shall be responsible for maintaining all sanitary sewer and combined sewer flows through the project area for the duration of the project, without surcharging upstream or downstream portions of the existing systems, such work being at no additional cost to the MBTA.
- D. The design, installation and operation of temporary bypass systems, including pumping systems, shall be the Design-Builder's responsibility. The Design-Builder may employ the services of a vendor who can demonstrate to the MBTA that it specializes in the design and operation of temporary bypass pumping systems.
- E. The Design-Builder shall provide bypass systems for all sanitary sewer and combined sewer overflow systems that may be encountered on the project, whether shown on the plans or not. Customers have sewer connections along the sanitary sewer and combined sewer overflow systems that shall not be impacted by the sewer and/or combined sewer bypassing work, unless otherwise allowed by the MBTA.
- F. Any service connections encountered shall remain in continuous service unless otherwise allowed by the MBTA.
- G. The bypass system and its operation shall meet the requirements of all local, state and federal codes and regulatory agencies having jurisdiction.

1.2 RELATED WORK

- A. The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 02060 – EROSION AND SEDIMENTATION CONTROL
 - 2. Section 02400 – DRAINAGE AND SEWER SYSTEMS
 - 3. Section 02240 – DEWATERING
 - 4. Section 02283 – HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER

1.3 SUBMITTALS

- A. Submittals shall be provided under the provisions of Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
- B. The Design-Builder shall prepare a specific, detailed description of all proposed temporary bypass pumping systems and submit them for review and approval.
- C. The submittal shall include detailed plans and descriptions outlining all provisions and precautions to be taken by the Design-Builder regarding the handling of existing sewage (wastewater) and combined sewage flows. This plan must be specific and complete, including such items as schedules, locations, sketches, elevations, capacities of equipment, materials and all other incidental items required to insure proper protection of the facilities, including protection of the access and bypass pumping locations from damage due to widely varying flows and site conditions.
- D. The plan shall include but not limited to details of the following:
 - 1. Conduit plugging method and types of plugs.
 - 2. Plan indicating location of pump(s), check valves and other valves; type and size of all piping and method of pipe coupling; layout of suction and discharge piping including access points and all associated appurtenances. Aluminum “irrigation” type piping and glued PVC pipe shall not be used under any circumstance.
 - 3. Bypass pump(s) sizes, capacity, and power requirements, including standby power.
 - 4. Method of noise control for each location.
 - 5. Proposed phasing of temporary bypass systems, as required.
 - 6. Contingency plan to be implemented during extreme flow condition (i.e., conditions that exceed the capacity of the temporary bypass system). This shall include a description of standby equipment.
- E. Other submittals as may be required by the system owner, including the BWSC.

1.4 DESIGN CRITERIA AND FLOWS

- A. The work covered by this specification shall be in accordance with the best practices of the industry. The specifications call attention to certain features but do not purport to cover all details entering into the required work.
- B. The temporary bypass systems shall be designed to prevent flows from surcharging within the upstream and downstream conduits to an unacceptable or unsafe condition. The surcharge shall not exceed the hydraulic grade line, either upstream or downstream, that would occur in the system if the bypass system were not there, all as determined by the MBTA.
- C. Bypass systems shall be capable of bypassing all flows around the work area without increasing flooding or ponding, including flooding or ponding off-site, that would have occurred otherwise if Project construction was not underway, all as determined by the MBTA.
- D. Flows in the various sewer and combined sewer systems are anticipated to be highly variable. Historical and/or estimated information regarding flows, if available and used, will require the Design-Builder's judgment.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All temporary plugs, pumps, piping, valves and other appurtenant products used to conduct the work shall be supplied by the Design-Builder and retained by the Design-Builder at the completion of the work.
- B. All products shall be in good serviceable condition as determined by the MBTA and meet all applicable codes and regulatory requirements.

PART 3 - EXECUTION

3.1 GENERAL

- A. When the depth of flow in the sewer line is above the maximum allowable for the type of work being performed in the applicable section(s) of these specifications, one or more of the following methods of flow control shall be used:
 - 1. Plugging or Blocking
 - a. A sewer line plug shall be inserted into the sewer line(s) at a location upstream from the section in which the work is to be performed.
 - b. The plug shall be so designed that all or any portion of the sewage flow can be released.
 - c. All temporary devices placed or installed in the sewer system shall be adequately secured to prevent sudden release due to unanticipated pressure build-up behind the device.
 - d. Plugging or blocking of the drain line(s) shall be performed during dry weather only and shall be removed at the end of each workday if practicable, unless otherwise allowed by the MBTA. No plugs shall be left in place unattended, unless conditions are monitored by the Design-Builder at a maximum of 6-hour intervals during non-working hours or as otherwise approved by the MBTA. If rain is forecast, monitoring shall be conducted at 2-hour intervals unless otherwise permitted by the MBTA.
 - e. During wet weather conditions the Design-Builder shall closely monitor the impacts of the plug(s) on the system and implement appropriate corrective action, including actions as directed by the MBTA.
 - f. All temporary devices placed or installed in the sewer and/or combined sewer system shall be removed when no longer required and the downstream system has been cleared of all personnel and equipment. Removal shall be completed in a manner that will not result in a surge or major disturbance downstream.
 - g. Design-Builder shall evaluate the surcharge capacity on a per location basis.
 - 2. Pumping and Bypassing
 - a. When pumping/bypassing is required, the Design-Builder shall supply the pumps, conduits and other equipment to divert the flow of sewage or combined sewage flow around the missing section of the system where other work is being performed. The

Design-Builder shall be responsible for furnishing the labor and supervision to set up, operate and maintain the temporary pumping and bypassing system.

- b. Bypass pumping shall normally be operated 24 hours per day (or installed and available to be put into service) until the bypass is no longer required and work requiring the bypass has been completed. The bypass pumping system shall be attended by qualified worker(s) whenever in operation and until flows recede and pumping is not required.
- c. When pumping systems are not in service, the Design-Builder shall monitor flow conditions at each bypass location and, based on actual flow conditions and compliance with these specifications, activate and operate the pumping equipment already installed by the Design-Builder and available at each site. Conditions shall normally be monitored by visiting each bypass site on a 6-hour frequency unless otherwise allowed by the MBTA.
- d. No leaking bypass piping shall be allowed. Any leaking or damaged pumps and piping shall be immediately repaired or replaced. All work shall be stopped until the leaking or damaged pumps and piping is repaired or replaced.
- e. At no time shall flow from the CSO system or sanitary sewer be discharged into a storm drain system, either by pumping or by gravity flow. If such an incident were to occur, whether intentional or unintentional, the Design-Builder shall be responsible for all costs associated with cleanup of the site and impacted water courses and water bodies, whether within the Project site or not, to the complete satisfaction of the MBTA and at no additional cost to the MBTA.
- f. Prior to activation of the pumping system(s), the Design-Builder shall conduct field tests to demonstrate the adequacy of each temporary pumping system as required by the MBTA. The MBTA shall be notified two (2) days in advance of field testing.

- B. The Design-Builder shall conduct his work so as to not cause excessive surcharging of the sewerage system as defined in this Section and shall not cause damage to the sewerage system, its connections and/or apparatus. Any damage caused by the Design-Builder's operations shall be repaired to the complete satisfaction of the MBTA and at no additional cost to the MBTA.
- C. Flow bypassing and control may be required at multiple locations at the same time. The Design-Builder shall have adequate equipment available to meet the project demands.
- D. At no time shall flow be discharged onto the ground, the tracks or private property. Bypass systems shall not foul the track.
- E. Measures shall be taken to protect water resources, wetlands and other natural resources.

3.2 CLEAN-UP

- A. The Design-Builder shall be responsible for the legal disposal of excess material and general clean-up of the work area which will be subject to the approval of the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02650

EXISTING SITE UTILITIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the maintenance, support, protection, relocation, reconstruction and adjustment-to-grade, restoration, and abandonment of existing utilities affected by the construction work.
- B. For the purpose of this Section, utility means any public or private service, such as electric light and power systems; gas distribution systems; telephone, telegraph, cable television and other communication services; water distribution; storm drain and sanitary sewer services; police and fire communication systems; street lighting and traffic signs and signals; parking meters; and steam distribution systems.
- C. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 01020 – ALLOWANCES
 - 2. Section 02100 – SITE PREPARATION
 - 3. Section 02221 – DEMOLITION
 - 4. Section 02240 – DEWATERING
 - 5. Section 02283 – HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER
 - 6. Section 02300 – EARTHWORK
 - 7. Section 02369 – DRILLED MINI-PILES
 - 8. Section 02400 – DRAINAGE AND SEWER SYSTEMS
 - 9. Section 02713 – EXTERIOR WATER DISTRIBUTION SYSTEMS
 - 10. Section 02800 – EXTERIOR CONDUIT SYSTEMS

1.2 GENERAL

- A. The location of existing underground pipes, cables, conduits, and structures as shown have been collected from the best available sources and the Authority together with its agents does not imply or guarantee the data and information in connection with the underground pipes, cables, conduits, structures and other parts as to their completeness nor their locations indicated. The Design-Builder shall contact utility owners and request marking location of all their lines in the work areas. The Design-Builder shall assume there are existing water, gas, electric and other utility connections to every building and structure, whether they appear on the Drawings or not. Any expense and/or damage to these shall be the responsibility of the Design-Builder.
- B. Foundations and lines for services, police and fire alarm boxes, street and pedestrian lights, and traffic signals may not be shown on the Drawings. The appropriate utility companies and/or agencies shall be contacted and consulted for locations of the above.

- C. All utility companies, public and private, shall be notified, including those in control of utilities not shown on the Drawings (see Chapter 370, Acts of 1963, Massachusetts) prior to designing, excavating, blasting, installing, backfilling, grading, or restoring pavement. The Design-Builder shall
 Premark the area of excavation or work and notify the Dig Safe Center (1-888-DIG-SAFE) at least three business days prior to any excavation or work. In addition, notification shall be given to all affected private and/or public utilities to permit street marking of their lines.
- D. Some unknown utilities may exist in the areas to be excavated. The Design-Builder shall take the necessary precautions when excavating in areas of potential utility conflict. Precautions may include, but are not limited to, soil vacuum excavation, hand digging, or other non-destructive means. The Design-Builder shall further be prepared to pre-excavate or pre-trench to locate potential utility conflicts prior to performing such activities as, but not limited to, jacking, tunneling, installing temporary excavation support, etc.
- E. Interruptions of utilities shall not be permitted without written consent of the utility owner. The Design-Builder shall coordinate with all utilities and provide all temporary utilities and connections to avoid interruptions.

1.3 SUBMITTALS

- A. Submit working drawings and, if applicable, shop drawings showing the details, procedures, and scheduling for performance of the existing utility work. Show actual location of existing utility facilities; interferences which these facilities present to the new work; location of settlement markers; method proposed to proceed with the construction; details of proposed support systems; and, if applicable, method of testing and procedure for restoration.
- B. Submit written evidence of affected utility owners' approval of the details, procedure, and scheduling.
- C. Provide as much written notice as possible, well in advance of the intended date to commence operations, to affected utility owners and parties having surface, subsurface or overhead structures in the construction area. Design-Builder to verify the notice procedures of each affected utility owner and party and shall properly notify them based on their requirements. Furnish the Owner copies of all notices.
- D. If a settlement or movement monitoring system is required, submit copies of readings to the Owner and affected utility owner within 24 hours of the reading.
- E. Submit to the Owner, certifications from the respective suppliers that the products to be incorporated in the work are in conformance with applicable requirements.

1.4 NOTIFICATION

- A. Notify the appropriate utility agencies and the Owner at least 72 hours prior to starting any work involving or adjacent to utility service facilities. The Design-Builder is responsible for providing sufficient notice to the utility companies. The Design-Builder is responsible for any delays due to insufficient advance notice to the utility companies.
- B. Where an existing utility facility is encountered that is not indicated or that is determined to be a different utility facility than that indicated, promptly notify the Owner. The Design-Builder is

responsible for determining the owner of the facility and the disposition of the facility.

- C. For proposed waterline and stormwater upgrades located with the City of Boston, Design-Builder to coordinate installation schedule with Boston Water and Sewer Commission (BWSC) inspectors.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products and materials shall conform to the specifications of the affected utility owners.

2.2 SALVAGE MATERIAL

- A. Reuse materials designated to be salvaged, provided they are inspected and approved by the respective utility owner and the Owner. Salvaged material not designated for reuse or returned to the owner shall become the property of the Design-Builder and removed from the site.
- B. Maintain and have available for inspection by the Owner a detailed record, including signed vouchers and receipts, of new and salvaged materials received from, used, or returned to the various utility owners.

PART 3 - EXECUTION

3.1 GENERAL

- A. Conform to the specifications and standard practices of the affected utility owners. Coordinate with utility owners which work shall be done by the Design-Builder and which work shall be done by utility owner. Ensure continuity of all existing utility services to all users except when the utility owner determines that temporary interruption is required.
- B. Unless otherwise indicated or authorized in writing by the Owner, maintain all utility facilities complete in place.
- C. Abandoned Facilities
 - 1. Demolish and remove abandoned utility facilities in conflict with work.
 - 2. Do not undertake demolition or removal of the service until written approval for such work has been obtained from the utility owner.
 - 3. When abandoned facilities are indicated to be left in place, plug, or cap or bulkhead the ends of
 - 4. conduits and pipes, as indicated. Bulkheads for pipes greater than 15-in in diameter shall be constructed of solid concrete masonry bricks or solid concrete masonry blocks with full mortar joints. The bulkhead shall be watertight. Recess the bulkhead 1/2-in and seal with non-shrink grout.
- D. Provide, install, and maintain all temporary facilities required providing interim utility service when a utility facility is to be relocated and when a utility facility to be replaced is abandoned prior to replacement.

- E. Where an existing utility facility is encountered which is not indicated, or which is determined to be a different utility service than that indicated, promptly notify the Owner. The Design-Builder shall determine the owner of the facility and the disposition of the facility.
- F. If, upon exposure, the condition or location of a facility to be supported complete-in-place is found by the Owner to be unsafe for support or for maintenance of service, replace or reconstruct the facility as required, with prior approval of the Owner and the utility owner.

3.2 SETTLEMENT OR MOVEMENT

- A. Provide suitable settlement or movement monitoring systems where indicated or required by the affected utility owner.
- B. In case of settlement or other movement which might cause damage, take immediate remedial measures to correct the conditions and damages caused by the settlement.

3.3 RECONSTRUCTION AND ADJUSTMENT-TO-GRADE

- A. Relay, reset, or otherwise reconstruct miscellaneous structures and facilities as indicated.
- B. Adjust-to-grade manholes and inlets as indicated, by raising or lowering the upper portion thereof. As necessary, adjust-to-grade all manhole and inlet castings, valve boxes, electric and communication boxes, and all other similar existing structures.
- C. Backfill under utilities supported or exposed using controlled density fill to allow for the proper support and compaction under the utility. Design-Builder shall coordinate with the utility owner to determine the acceptability of the use and type of controlled density fill and shall work with the Owner to develop alternate means to ensure the proper backfill and compaction under the utility.

3.4 AS-BUILT UTILITY LOCATION AND CONDITION SURVEY

- A. For each new or relocated utility installed, including those installed or relocated by others in the Project Area, perform an as-built location survey by coordinates prior to backfilling the excavation.
- B. The survey data shall be obtained by Global Positioning Survey (GPS) and certified by a Professional Land Surveyor registered in Massachusetts.
- C. A complete digital base plan shall be provided in AutoCAD DWG format Release 2012 or later on a Compact Disk (CD), properly referenced to the coordinate system established in the contract. The following standards shall be applicable:
 - 1. Text: Text shall be drawn using a STYLE of "L100-XX" (where XX refers to the plotted scale) and a font file of "ARIAL" as defined in the AutoCAD survey template provided by the Owner. The style shall be defined as a "fixed height" style, and have a height of 0.125 and width factor of 0.85 times the drawing plotted annotated text scale (i.e. 4.0 for 40 scale plan, 2.0 for 20 scale etc.).
 - 2. Precision and Accuracy:

- a. Horizontal Survey:
 - 1. Precision: Horizontal control and surveyed points shall maintain a minimum precision of 1:10,000.
 - 2. Accuracy: No more than 10% of the survey points shall be in error by more than 1/100 inch or 0.25 mm when viewed at the requested scale.
- b. Vertical Survey:
 - 1. Precision: Vertical Control shall have a maximum error of closure no greater than .075 feet or .02 meters.
 - 2. Accuracy: No more than 10% of elevations when interpolated from a Surface shall be in error of more than 1/2 a contour interval.
- 3. Surface Data: The data format shall conform to AutoCAD Civil 3D 2012 files. If the Design-Builder uses a different software product to create a surface, then the surface must be represented as a TIN (Triangulated Irregular Network) of 3D lines on a separate, distinct layer within the AutoCAD drawing file. 3D faces or 2 dimensional lines are NOT acceptable.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02713

EXTERIOR WATER DISTRIBUTION SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies furnishing, installing, testing, and disinfecting permanent water supply and fire protection mains and distribution piping.
- B. Related Work:
 - 1. Section 02300 - EARTHWORK
 - 2. Section 02240 - DEWATERING
 - 3. Section 02283 - HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER
 - 4. Section 02650 - EXISTING SITE UTILITIES
 - 5. Section 03300 - CAST-IN-PLACE CONCRETE

1.2 SUBMITTALS

- A. Submit to the MBTA shop drawings showing the details, procedures, and scheduling for water utility installation. Coordinate with the water utility Owner when the MBTA's main is ready for connection to utility Owner's meter or piping. Shop drawings shall include the maximum anticipated working pressure in each main and branch, the proposed pressure test pressure, and the fittings material class.
- B. Submit to both the MBTA and the water utility Owner detailed hydrostatic test and disinfection plans, including all proposed materials, concentrations, equipment, temporary piping, valving, connections, flow rates, equipment, methods of metering and measuring, and method of flushing and disposal.
- C. Submit to both the MBTA and the water utility Owner for acceptance all manufacturer's and independent laboratory certified test reports as specified above and in cited standards.
- D. Certifications that all wetted surface metals in contact with potable water comply with the 2014 Safe Drinking Water Act Lead Reduction law and comply with NSF 372.
- E. Submit to the MBTA shop drawings, catalogue cuts and other product literature for all pipe, fittings, joints and accessories, valves, hydrants, couplings, specials, insulation, and service materials.

1.3 QUALITY ASSURANCE

- A. Lining Toxicity Test
 - 1. Procedure: FDA Method of Testing for Toxicity of Coating Material Intended for Use in Transporting or Holding Food or Potable Water.

2. Requirements: Certified test results by pipe manufacturer; no more than 18 mg. per square inch exposed surface and no more than 50 ppm by weight of the water capacity of the test container, of chloroform-soluble extractives, corrected for zinc extractives such as zinc oleate.
- B. Field Pressure and Leakage Tests
1. Ductile Iron: AWWA C 600
 2. Steel: AWWA C 600
- C. Chlorine Residual Test
1. Test Method
 - a. During Disinfection: AWWA Manual M12, APHA/AWWA Standard methods drop dilution, Method E.
 - b. At End of Retention Period: APHA/AWWA Standard methods OTA or Amperometric Titration, Method D or F.
 - c. After Post-Disinfection Flush: APHA/AWWA Standard Methods Amperometric Titration, Method F.
 2. Requirements
 - a. Test to be performed by approved independent testing laboratory. Certified test results to meet requirements of AWWA C 651 and water utility Owner.
 - b. In lieu of independent testing laboratory, Design-Builder may subcontract for water utility Owner to conduct residual chlorine testing at Design-Builder's expense.
- D. Bacteriologic Tests
1. Procedure: AWWA C 651 and APHA/AWWA Standard Methods.
 2. Requirements: Zero coliform organisms, and meet requirements of water utility Owner and public health authority. Certified tests by approved independent testing laboratory or by public health authority at Design-Builder's expense.

1.4 JOB CONDITIONS

- A. Relations with Utility Owner
1. Establish through the MBTA a direct and continuous contact with the water utility Owner to which the MBTA's new distribution piping will be connected.
 2. In all cases, verify from the utility Owner the maximum working pressure than can be encountered at point of interface with utility Owner's piping, and indicate this pressure on the shop drawings.
 3. Do not cut into utility Owner mains or piping. The utility Owner will schedule and conduct interruption of utility services, perform cutting-in, and provide service meter at each point where new Authority piping is to be connected to the utility Owner mains and piping, at the expense of the Design-Builder.

4. Do not connect to utility Owner meter or piping without written authorization from the utility Owner. Connection shall be made by the Design-Builder or utility Owner as indicated.
 5. If agreed to by the utility Owner, the Design-Builder may, at his own expense, elect to have all or any part of the disinfection work performed by the utility Owner.
 6. Design-Builder to coordinate installation service with the utility owner to ensure proper inspection by representatives of the utility owner.
- B. Cross-Connections: Do not connect or cross-connect MBTA fire water distribution piping with other MBTA water piping. Fire distribution piping to be disinfected separately from metered water distribution piping to eliminate need for cross connections.
- C. Disinfection: Disinfect both domestic and service water piping and fire water piping.

PART 2 - PRODUCTS

2.1 PIPE

- A. Ductile Iron Pipe: AWWA C 151 thickness class as indicated; double-thickness cement-mortar lined; with push-on or mechanical joints except where flanges are indicated.
- B. Steel Pipe: AWWA C 200, type, grade, and thickness as indicated, lined, coated, wrapped and jacketed in accordance with AWWA C 203 with Type A primer, Type 2 enamel, standard wrap and kraft jacket, plain ends for mechanical couplings, 8 inch band each end free of external coating and wrap.

2.2 FITTINGS

- A. For Ductile Iron Pipe, and all Transitions: AWWA C 110; ductile iron; 150 psi minimum rating (350 psi minimum rating within the City of Boston); cement-mortar lined; with mechanical joints except where flanges are indicated.
- B. For Steel Pipe: ANSI B16.5; class as indicated; lined, coated, and wrapped as specified for steel pipe.
- C. Couplings for Steel Pipe: Flexible mechanical couplings, primed with AWWA C 203 Type A Primer; with steel bolts bituminous coated.

2.3 FLANGES

- A. For Ductile Iron Pipe: AWWA C 115, coated and lined as specified for iron pipe.
- B. For Steel Pipe: Welded slip-on type flanges, ASTM A 181 or ANSI B16.5 150-pound standard flanged mechanical coupling adaptor, bituminous lined inside and AWWA Type A bituminous primed outside in accordance with AWWA C 203 requirements, flange to mate with AWWA C207, ANSI B16.1, or ANSI B16.5 flange as required; bituminous coated steel bolts.
- C. Flange Gaskets: ANSI B16.21 neoprene, 1/8 inch thick.

2.4 VALVES

- A. For Fire Service and Domestic Water: Type and size as indicated, conforming to the following:
 - 1. Yard Faucets and Miscellaneous through 2-1/2 inches: Approved MSS Standard globe and angle valves, malleable iron or cast bronze.
 - 2. Gate, three inch and larger: AWWA C 509; AWWA C515 also acceptable within the City of Boston.
 - 3. Butterfly, three inch and larger; AWWA C 504.
 - 4. Check: AWWA C 510 double or approved commercial single.
- B. For Fire Water: Type and size as indicated, Class as required, U.L. listed.
- C. Valve Boxes: ASTM A48, 30B minimum, screw type adjustable length, stay-put type removable cover with the word WATER or FIRE as applicable.
- D. Precast Vaults: ASTM C 858, air-entrained, and Section 03300 - CAST-IN-PLACE CONCRETE.
- E. Cast-In-Place Vaults: Section 03300 - CAST-IN-PLACE CONCRETE, Class 4000-3/4.
- F. Iron Castings: ASTM A48, 30B minimum, with lettering as indicated.

2.5 FIRE HYDRANTS

- A. Hydrants shall conform to the "standard for Dry-Barrel Fire Hydrants" ANSI/AWWA C 502-85. Hydrants shall be designed for 150 psi service and for installation in a trench with 5 foot cover (5-1/2 feet bury hydrant). Hydrant barrel extensions shall be furnished and installed as necessary to achieve correct bury depth. The length of the hydrant barrel shall be such that when installed with the proper depth of cover on the branch pipeline, the hydrant will be set with the normal ground line of the barrel within 3-inches of the actual ground grade surface elevation.
- B. Hydrants shall be fabricated to manufacturer's standard pattern and size and shall have one 4-1/2 inch pumper nozzle and two 2-1/2 inch hose nozzles all with National Standard Thread (NST). Hydrant inlet opening on shoe shall have mechanical joints for accepting 6-inch ductile or cast iron pipe.
- C. Hydrants shall open clockwise and shall be marked with an arrow and word "OPEN" to indicate the direction of turn of the stem to open the hydrant.
- D. Hydrants shall have a compression type main valve, opening against and closing with water pressure. The main valve opening at the base of the hydrant shall have a minimum area of 39 square inches (5-inch minimum diameter circle). Each hydrant shall have "traffic" type ground line construction (breakaway bolts not acceptable) and permit 360-degree movement of the upper barrel to allow for any alignment without shutting down service and/or removing flange bolts and nuts. Hydrant operating nut shall be 1-1/2 inches, flat to point, pentagonal. Connecting pipe and pipe nipples between the main line tee and hydrant shall be 6-inch ductile iron conforming to the requirements for ductile iron pipe.
- E. Hydrants shall be hydrostatically tested as specified in AWWA C 502.

- F. Hydrant tees shall be anchor type. The branch shall have a plain end with an integral gland and rotating mechanical joint restraints. Every hydrant shall be equipped with a 6-inch shut-off valve, bolted or anchored to the hydrant tee.

2.6 SERVICE CONNECTIONS

- A. As required by the municipality involved or as specified in the Construction Specifications.

2.7 COUPLINGS

- A. Pressure rating at least equal to that of related pipeline with a minimum rating of 150 psi.
- B. Couplings shall meet the standard requirements of the municipality and MWRA. Couplings shall be provided with plain, Grade 27, rubber gaskets and with black steel, track-head bolts with nuts. Couplings shall be manufactured in the United States of America.

2.8 JOINTS

- A. Provide mechanical joint or push-on joint pipe with necessary accessories, conforming to AWWA A21.11.
 - 1. Provide gasket composition suitable for exposure to liquid within pipe.
 - 2. Provide gasket composition suitable for exposure to potable water.
 - 3. Provide mechanical joint gaskets with copper tips to provide electrical continuity.
 - 4. Provide serrated brass wedges for push-on joints to provide electrical continuity; two per joint for pipe 12-in. and smaller and four per joint for larger pipe.
- B. Restrained joints shall be furnished for installation on all fittings, sleeves, hydrants and valves. Restraints for mechanical and push on joints shall meet the standard requirements of the municipality and MWRA.
- C. Restraint systems for push-on pipe utilizing steel-wedge gaskets will be acceptable.

2.9 INSULATION

- A. Insulation shall meet the standard requirements of the municipality and MWRA. Insulation shall be factory formed-in-place polyurethane foam insulation having nominal thickness of 3", with an in-place density of 2.5 pcf, and a "K" factor of 0.14 BUT/in./hr/deg. F/sq. ft. Straight joints between insulated pipe lengths, and the end section of non-insulated pipe shall be 20-gauge corrugated aluminum performed to be fastened with stainless steel screws and bands. Jackets shall have expansion joints at 25-foot intervals. Sections of jacket shall have 2-inch minimum at all seams.
- B. Jacket shall have one layer of one mil polyethylene film with a protective coat of 40-lb. virgin draft paper to act as a moisture and galvanic corrosion barrier.

2.10 SERVICES

- A. All services shall be Type K Copper Tubing.

2.11 CORPORATIONS, CURB STOPS, AND SADDLES

- A. The corporation stops shall meet the most recent revision of the AWWA standard "Threads for Underground Service Line Fittings" (AWWA C 800). Corporation stops shall be designed for 175 psi pressure and have full keyway and rigid liners.
- B. Curb stops shall include a drain suitable for use with polyethylene. Stops shall have integral checks, O-ring seal and shall be furnished with rigid liners.
- C. Curb stop boxes shall be cast iron Buffalo type with recessed lid with pentagon bolt, adjustable sliding type.
- D. Surface saddles for 2 inch taps shall be double strap with bodies of ductile iron. The straps shall be electrogalvanized carbon steel. Units shall be complete with Buna N gaskets.

2.12 TAPPING SLEEVES AND VALVES

- A. Tapping sleeves shall be mechanical joint type.
- B. Tapping valves shall meet the requirements of AWWA C 500. The valves shall be flanged by mechanical joint outlet with non-rising stem and designed for vertical burial. Tapping valves shall be rated at 200 psi working pressure and shop tested at 300 psi. Bolts on bonnet and stuffing box shall be stainless steel (316 stainless steel); stuffing boxes shall be "O" ring type. The operating nut shall be 2-inches square. The valve shall be provided with oversized seat to permit use of full size cutters. Gaskets shall cover the entire flange surface. Valves shall open right (clockwise).
- C. Valves shall be Mueller H-667 or approved equal.
- D. Valve boxes shall be provided for each gate valve and tapping sleeve and valve.

PART 3 - EXECUTION

3.1 EXCAVATIONS

- A. Conform to the requirements of Section 02300 - EARTHWORK and the AWWA Standards and Manual cited herein.
- B. Dewater as required and disinfect excavation in accordance with AWWA C 651 where required.

3.2 INSTALLATION

- A. Vaults: Install vaults as indicated. Provide six inches of backfill sand bedding for precast vaults. Construct cast-in-place vaults generally as specified for manholes, Section 02400 - DRAINAGE AND SEWER SYSTEMS. Provide pervious backfill subdrains and drainage as indicated or required for proper drainage.

B. Pipe Laying:

1. Install ductile iron pipe, fittings, and valves in accordance with AWWA C 600. Install steel pipe, fittings, and valves in accordance with AWWA C 200 and AWWA Manual M11.
2. Inspect all pipe, fittings and valves for soundness and for imperfections of coatings, wrappings and linings prior to installation.
3. Deflection at joints shall not exceed the maximum recommended by the pipe or coupling manufacturer for each type of coupling and each size of pipe.
4. Blocking will be permitted only where indicated.
5. Field welding will be permitted only where specifically authorized. Pipe may be cut in the field by approved means. After welding or cutting, repair damage to linings and coatings and prime and inspect the cut surface as specified in AWWA C 203, Section 2.14. Repair damaged cement linings in accordance with AWWA C 602 Section 16, or discard the pipe.
6. Prime steel pipe couplings and exposed pipe ends before installation, but do not enamel or wrap until after hydrostatic leak test.
7. Install all temporary piping, valving, meters, gages, and equipment required for hydrostatic testing and disinfection in accordance with approved shop drawings.
8. For installations within the City of Boston, minimum pipe cover for water mains shall be 5-ft 6-inch.

C. Anchorages and Buttresses

1. Construct concrete anchorages and buttresses where indicated. The soil bearing area shall not be less than indicated.
2. Harness all valves and fittings not provided with an anchor, buttress or restrained joint with steel rods and rod socket pipe clamps or by steel rods and rod connectors connected to mechanical joint bolts as indicated.

D. Fittings and valves shall be restrained for the minimum lengths listed on the following table:

MINIMUM RESTRAINED LENGTHS	
FITTING	RESTRAINT LENGTH
12" – 45° Bend	13-feet in each Direction
8" – 45° Bend	9-feet in each Direction
6" - 45° Bend	7-feet in each Direction
12" – 22-1/2° Bend	6-feet in each Direction
10" - 45° Bend	11-feet in each Direction
8" - 90° Bend	23-feet in each Direction
8" – 22-1/2° Bend	4-feet in each Direction
8" – 11-1/4° Bend	2-feet in each Direction
6" – 22-1/2° Bend	3-feet in each Direction
6" – 11-1/4° Bend	2-feet in each Direction
12" – 11-1/4° Bend	3-feet in each Direction
12" Vertical Offset	
Upper 45° Bend	27-feet in each Direction
Lower 45° Bend	12-feet in each Direction
8" Vertical Offset	
Upper 45° Bend	19-feet in each Direction

MINIMUM RESTRAINED LENGTHS	
FITTING	RESTRAINT LENGTH
Lower 45° Bend	8-feet in each Direction
6" Vertical Offset	
Upper 45° Bend	14-feet in each Direction
Lower 45° Bend	6-feet in each Direction
12" x 12" x 12" Tee	42-feet in Branch
12" x 12" x 10" Tee	29-feet in Branch
12" x 12" x 8" Tee	16-feet in Branch
12" x 12" x 6" Tee	1-foot in Branch
8" x 8" x 8" Tee	25-feet in Branch
8" x 8" x 6" Tee	10-feet in Branch
8" x 8" x 4" Tee	1-foot in Branch
6" x 6" x 6" Tee	15-feet in Branch
6" x 6" x 4" Tee	1-foot in Branch
16" x 12" Reducer	32-feet Larger Direction only
12" x 10" Reducer	28-feet Larger Direction only
12" x 8" Reducer	31-feet Larger Direction only
12" x 6" Reducer	42-feet Larger Direction only
8" x 6" Reducer	17-feet Larger Direction only
8" x 4" Reducer	29-feet Larger Direction only
6" x 4" Reducer	16-feet Larger Direction only
12" Valve or Dead-end	58-feet in each Direction
10" Valve or Dead-end	49-feet in each Direction
8" Valve or Dead-end	41-feet in each Direction
6" Valve or Dead end	31-feet in each Direction
4" Valve or Dead-end	22-feet in each Direction
2" Valve or Dead-end	18-feet in each Direction

- Lengths shown are based on 150 psi test pressure, 4-1/2-foot bury, soil type GP, trench Type 3, and 2:1 safety factor. Changes in conditions will require revision in lengths.

3.3 TESTING AND DISINFECTING

A. Hydrostatic Tests

1. Conduct both pressure test and leakage test by the open trench method as specified in AWWA C 600. Conduct leakage test as soon as practicable after completion of the pressure test.
 2. Conduct all hydrostatic tests in the presence of the Owner, and prior to coating joints and disinfecting. Do not conduct any hydrostatic tests until after all associated concrete work has cured for a minimum of 7 days for standard concrete and at least 36 hours for high early strength concrete.
 3. As soon as practicable after completion of hydrostatic tests, drain lines in an approved manner, and disconnect and remove temporary test piping and equipment which will no longer be required.
- B. Field Coating. After completion of hydrostatic tests and before disinfecting, prime or reprime as required and coat all uncoated metal components of the piping system, including joints, harnesses and tie rods, generally as specified in AWWA C 201 for mechanical couplings, except that exposed ends of steel pipe up to the coupling shall be wrapped with hot applied coal tar tape. Inspect field-applied bituminous coatings for holidays as specified in AWWA C 203.
- C. Disinfection. Disinfect and test all lines in accordance with the requirements of AWWA C 651 and as specified herein. Disinfect before final backfill around hydrants and valves. Remove disinfection equipment and temporary piping after approval of the disinfection tests.
- D. Operating Tests. Following approval of the disinfection, conduct operating tests in the presence of the Owner to verify that each valve and hydrant is in proper working condition. Whenever practicable, conduct operating tests during flushing of chlorine from the line.

3.4 BACKFILLING

- A. Conform to the requirements of Section 02300 - EARTHWORK and the AWWA standards and Manuals cited herein.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02714

RELOCATED MWRA WATER MAIN

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies furnishing, installing, testing, and disinfecting permanent Massachusetts Water Resources Authority (MWRA) relocated water supply piping. All construction for MWRA system waterworks and appurtenant facilities shall at a minimum comply with the MWRA published procedures, material and installation requirements, issued permit conditions, and as specified in this Section. For other waterworks requirements not covered by this Section, Section 02713 EXTERIOR WATER DISTRIBUTION SYSTEMS, shall be applicable.

The work of this Section specifically pertains to the relocation a section of MWRA 24-inch water main in Medford, between the Winchester St. / Newbern Ave. intersection and just north of the Boston Ave. / Broadway intersection.

- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
1. Section 01010 - SUMMARY OF THE WORK
 2. Section 01300 - SUBMITTALS
 3. Section 02300 - EARTHWORK
 4. Section 02650 - EXISTING SITE UTILITIES
 5. Section 02713 - EXTERIOR WATER DISTRIBUTION SYSTEMS
 6. Section 03300 - CAST-IN-PLACE CONCRETE

1.2 SUMMARY

- A. Ductile Iron Pipe
1. Section Includes:
 - a. Furnishing and installing ductile iron pipe, fittings, jointing material, restrained joints, and piping accessories.
 - b. Preparing QA/QC Plan
- B. Valves and Appurtenances
1. Section Includes:
 - a. Furnishing and installing AWWA butterfly and gate valves for water service.
 - b. Furnishing and installing valves for blow off gate valves and line valves.
 - c. Removing existing and furnishing and installing new air release valves.

- d. Furnishing and installing corporation stops.
- e. Furnishing and installing miscellaneous fittings and appurtenances.
- f. Furnishing and installing insertion valves.

C. Precast Structures

1. Section Includes:

- a. Furnishing and installing pre-cast meter vaults, manholes, air valve chambers, blowoff chambers, and adjusting rings.

D. Pipeline Pressure Testing and Testing

1. Section Includes:

- a. Field hydrostatic pressure and leakage testing of new permanent and temporary pipes.

E. Disinfection of Water Mains

1. Section Includes:

- a. Flushing and disinfection of all new and existing pipelines indicated on the Drawings.

1.3 REFERENCES

A. General

- 1. All materials, methods, procedures, details, and workmanship shall comply with:
 - a. MWRA's Standard Operating Procedures for Performing Construction Work on Pipelines
 - b. MWRA's Policy and Procedures for Chlorination / Disinfection of Pipelines

B. Ductile Iron Pipe

- 1. ANSI/AWWA C151/A21.51 Ductile-Iron Pipe, Centrifugally Cast in Metal Molds or Sand-Lined Molds, for Water or Other Liquids.
- 2. ANSI/AWWA C153/A21.53 Ductile-Iron Compact Fittings 3 Inch through 24 Inch.
- 3. ANSI/AWWA C110/A21.10 Ductile-Iron and Gray-Iron Fittings, 30 Inch through 48 Inch, for Water and Other Liquids.
- 4. ANSI/AWWA C111/A21.11 Rubber-Gasket Joints for Ductile-Iron and Gray-Iron Pressure Pipe and Fittings.
- 5. ANSI/AWWA C115/A21.15 Flanged Ductile-Iron and Gray-Iron Pipe with Threaded Flanges.
- 6. ANSI/AWWA C104/A21.4 Cement-Mortar Lining for Ductile-Iron and Gray-Iron Pipe and Fittings for Water.
- 7. ANSI/AWWA C105/A21.5 Polyethylene Encasement for Ductile-Iron Piping for Water and Other Liquids.
- 8. ANSI/AWWA C219 Bolted, Sleeve-Type Couplings for Plain End Pipe.
- 9. ANSI B16.1 Cast Iron Pipe Flanges and Flanged Fittings Class 25, 125, and 250.

10. ANSI B18.22.1 Plain Washers.
11. ANSI/ASME B1.20.1 Pipe Threads, General Purpose (one inch).
12. ASTM D1248 Standard Specification for Polyethylene Plastics Molding and Extrusion Materials.

C. Valves and Appurtenances

1. ANSI/AWWA C111/A21.11 Rubber Gasket Joints for Ductile Iron and Gray Iron Pressure Pipe and Fittings.
2. ANSI/AWWA C115/A21.15 Flanged Ductile-Iron and Gray-Iron Pipe with Threaded Flanges.
3. ANSI/AWWA C207 Steel Pipe Flanges for Waterworks Service - Sizes 4 In. Through 144 In.
4. ANSI/AWWA C508 Swing-Check Valves for Waterworks Service, 2 inches through 24 inches.
5. AWWA C219 Standard for Fusion -Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines.
6. AWWA C504 Rubber-Seated Butterfly Valves.
7. AWWA C509 Resilient Seated Gate Valves.
8. AWWA C515 Reduced Wall, Resilient Seated Gate Valves for Water Supply Service.
9. AWWA C550 Protective Epoxy Interior Coatings for Valves and Hydrants.
10. AWWA C800 Underground Service Line Valves and Fittings.
11. ANSI B16.1 Cast Iron Pipe Flanges and Flanged Fittings Class 25, 125, and 250.
12. ANSI B16.5 Pipe Flanges and Flanged Fittings.
13. ANSI/NFPA 1963 Standard Specifications for National (American) Fire Hose Coupling Screw Threads.
14. ASTM A48 Standard Specification for Gray Iron Castings.
15. ASTM A564 Standard Specification for Hot-Rolled and Cold-Finished Age-Hardening Stainless Steel Bars and Shapes.
16. Federal Specification TT C 494 Asphalt Varnish.
17. Federal Specification TT-P-86 Paint, Red-Lead-Base, Ready-Mix.
18. Federal Specification TT-P-636 Primer Coating, Alkyd, Wood and Ferrous Metal.

D. Precast Structures

1. ASTM A48 Specification for Gray Iron Castings.
2. ASTM A536 Specification for Ductile Iron Castings.
3. ASTM A615 Specification for Deformed and Plain Billet - Steel Bars for Concrete Reinforcement.
4. ASTM B221 Aluminum Extruded Bars and Shapes.
5. ASTM C150 Specification for Portland Cement.
6. ASTM C260 Specification for Air-Entraining Admixtures for Concrete.
7. ASTM C478 Specification for Pre-cast Reinforced Concrete Manhole Sections.

8. ASTM C881 Specification for Epoxy-Resin-Base Bonding systems for Concrete
 9. ASTM C923 Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures and Pipes.
 10. ASTM D2240 Test Method for Rubber Property Durometer Hardness.
 11. ASTM D3034 Specification for Type PSM Polyvinyl Chloride (PVC) Sewer Pipe and Fittings.
 12. Federal Specification SS S 210 Sealing Compound, Preformed Plastic for Expansion Joints and Pipe Joints.
 13. Commonwealth of Massachusetts Department of Public Works Standard Specifications for Highways and Bridges.
 14. AASHTO Standard Specification for Highway Bridges.
 15. Federal Specification TT C-494 Asphalt Varnish.
- E. Pipeline Pressure And Leakage Testing
1. AWWA C600
- F. Disinfection of Water Mains
1. American Water Works Association (AWWA)
 - a. AWWA B300 Standard for Hypochlorites.
 - b. AWWA B301 Standard for Liquid Chlorine.
 - c. AWWA C651 Disinfecting Water Mains.
 2. MWRA:
 - a. Standard Operating Procedures for Performing Construction Work on Pipelines
 - b. Policy and Procedures for the Chlorination / Disinfection of Pipelines

1.4 SUBMITTALS

- A. Ductile Iron Pipe
1. Product Data:
 - a. Specifications for all ductile iron pipe, fittings, jointing material, thrust anchors, and piping accessories.
 2. Shop Drawings:
 - a. Complete layout drawings and details for ductile iron pipe.
 - b. Tabulated layout schedule as follows:
 1. Order of installation and closures.
 2. Pipe invert station and elevation at each change of grade and alignment.
 3. Elements of curves and bends, both in horizontal and vertical alignment, including elements of the resultant true angular deflections in cases of combined curvature.
 4. Limits of each reach of pipe thickness class and of restrained joints.

5. Limits of each reach of concrete encasement.
 6. Locations of closures for length adjustment.
 7. Locations of valves and other mechanical equipment.
 8. Methods and locations of supports.
- c. Details of fittings.
3. Quality Control Submittals:
 - a. QA/QC Plan.
 4. All physical and chemical test results along with the identification number for each mechanical joint restraint device.
- B. Valves and Appurtenances
1. Product Data:
 - a. Complete specifications, data, and catalog cuts.
 2. Quality Control Submittals:
 - a. Test Reports:
 1. Manufacturer certified copies of valve test results, in conformance with AWWA C504, AWWA C509, and AWWA C515 before valves are shipped.
 - b. Certificates:
 1. An affidavit of compliance with AWWA C504, AWWA C509, and/or AWWA C515 from manufacturer before valves are shipped.
 2. Valve Installation Checklist
 - a. Do not install valves until Checklist included in MWRA's Standard Operating Procedures for Performing Construction Work on Pipelines has been submitted.
 3. Qualifications:
 - a. Evidence of qualifications specified in Paragraph 1.6.A.1.a.
- C. Precast Structures
1. Product Data for pre-cast concrete chambers, manholes, concrete sections, castings, frames and covers.
 2. Shop Drawings:
 - a. Complete drawings and details of all pre-cast concrete chambers, manholes, concrete sections, castings, frames and covers.
 3. Precast concrete meter vault:
 - a. Sectional plan(s) and elevations shall be signed by a Licensed Professional Engineer registered in the Commonwealth of Massachusetts showing dimensions and reinforcing steel placement.

- b. Structural calculations including all engineering assumptions signed by a Licensed Professional Engineer registered in the Commonwealth of Massachusetts.
- c. Concrete design mix.
- d. Concrete test cylinder reports from independent testing laboratory certifying conformance with Contract Documents.
- e. Pipe-to-structure connectors.
- f. Concrete meter vault fixed ladder and ladder safety post.

D. Pipeline Pressure and Leakage Testing

1. Shop Drawings:

a. Leakage and Pressure Testing Plan:

- 1. Testing schedule and test procedure shall be submitted concurrently with the disinfection plan 90 days prior to the scheduled start date of testing.
- 2. Indicate proposed time and sequence of testing on schedule.
- 3. Test procedure requirements as follows:
 - a. Limits of each pipeline tested.
 - b. Position of all valves during testing.
 - c. Location of temporary bulkheads.

2. Quality Control Submittals:

- a. Certified copy of all pipeline pressure testing results not more than 14 days after completion of testing on each section of pipeline.

3. Evidence of qualifications of persons performing the work as specified in Paragraph 1.6.B.1 within 30 days after the Notice to Proceed

E. Disinfection of Water Mains

1. Disinfection Plan complying with the MWRA's Policy and Procedures for Chlorination / Disinfection of Pipelines and the MWRA's Standard Operating Procedures for Performing Construction Work on Pipelines and including:

- a. A description supplemented with sketches and accompanied by supporting calculations, of proposed methods for disinfection, dechlorination and pH adjustment, and for measuring chlorine concentrations.
- b. Proposed schedule and sequence for disinfection, including monitoring of chlorine residual.
- c. A list of equipment that will be used for disinfection, dechlorination and pH adjustment and for measuring chlorine residual concentrations.
- d. A procedure for testing chlorine residuals greater than 8 mg/l.
- e. Proposed method of filling the pipelines and written calculations to show that the rate at which each pipeline is filled with water does not exceed venting capacity of installed air vent valves and devices.
- f. A plan showing the location of chlorine monitoring equipment and chlorine sample sites.

- g. Proposed methods for storing and handling all chemicals.
 - h. Proposed method for dechlorination and pH adjustment of the discharged water.
 - i. All dimensions, temporary pipe connections, temporary electrical connections, itemized list of pumps and motors, horsepower pump capacities and horsepower requirements.
 - j. Checklist of valves indicating whether valves shall be open or closed during each phase of testing.
2. Disposal Plan: A detailed plan for disposal of flushing, testing and disinfection water, including explanation of dechlorination and neutralization and how those measures will be assessed and documented. Include in that plan the following:
- a. Detection limits of the chlorine residual and pH monitoring devices proposed for use. Verify the monitoring instrumentation has detection limits for chlorine residual less than 0.019 mg/1 and pH range between 5.0 and 10.0.
 - b. Calculations for the dosage of dechlorination agent (such as sodium bisulfite) expected based on the discharge rates anticipated to remove the residual chlorine to below 0.01 mg/1.
 - c. Size and location of dechlorination agent and neutralization agent storage tank(s) to be on site for dechlorination and neutralization of flushing, testing, and disinfection water. Identify the spill containment requirements to be implemented in accordance with the SWPPP.
 - d. Information on the metering and sample pumps proposed for use (pumping capacity, catalog information).
 - e. Information on the pH and chlorine chart recorders proposed for use (locations of the recorders, recording range, catalog information).
 - f. Contingencies should the discharge water not meet the discharge limitations stipulated.
3. Evidence of qualifications of supervisor as specified in Paragraph 1.6.C.1. and including:
- a. Project name and location
 - b. Project owner, name of the owner's representative, and representative's telephone number
 - c. Description of the project including length, diameter and type of pipe
 - d. Method of disinfection
 - e. Name of operator, license number and a copy of the license
4. Evidence of qualifications of individual who will be obtaining and analyzing water samples as specified in Paragraph 1.6.C.2.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Ductile Iron Pipe

1. Packing and Shipping:
- a. Ship pipe to site with wood lagging between pipes to prevent contact of pipe surfaces and coating.
 - b. Pack fittings, jointing materials and piping accessories in containers.

- c. Prevent entry of foreign matter into pipe and fittings during shipping.
 - d. Pack and ship coated pipe and fittings in accordance with recommendations of coating manufacturer and applicator.
 2. Acceptance at Site:
 - a. Examine pipe and related materials delivered to site for defects and compliance with Contract Documents.
 - b. Reject all pipe, fittings, and materials not in compliance with Contract Documents, remove from the site and replace at no additional cost to the Contract.
 3. Storage and Protection:
 - a. Unload and store pipe, fittings, and accessories to prevent damage and weathering before installation.
 - b. Do not handle pipe and fittings by hooks inserted in ends.
 - c. Replace pipe and fittings in which lining has been damaged at no additional cost to the Contract.
 - d. Repair damaged exterior coatings before installation of pipe, fitting, special or appurtenance at no additional cost to the Contract.
 - e. Store joint lubricant in closed containers and keep clean.
- B. Valves and Appurtenances
 1. Protect threads and seats from corrosion and damage. Rising stems and exposed stem valves shall be coated with a protective oil film which shall be maintained until time of installation.
 2. Furnish covers for all openings.
 - a. All valves shall be shipped and stored until time of use with wood or plywood covers on each valve end.
 3. Store equipment in a manner that provides access for inspection and identification. Inspect valves on delivery, and if valves do not meet Contract Documents remove from the site and replace at no additional cost to the Contract.
 4. At delivery, all debris and foreign material is to be cleaned out of valve openings. All nuts and bolts on each valve shall be checked for tightness, all operating mechanisms on each valve shall be operated to verify functioning, and valves shall be checked for defects in workmanship or materials.
 5. Store all equipment in covered storage off the ground.
- C. Precast Structures
 1. Packing and Shipping:
 - a. Check each unit for compliance with tolerances specified in Paragraph 2.3.C.1.a before shipment to site and repair.
 - b. Where surface repairs are required, repaired surfaces shall match adjacent surfaces. Precast manholes which require surface repairs to more than 25 percent of interior or exterior surfaces shall not be delivered to site.

- c. Pre-cast structures with any crack which is greater than 1/16 inch wide and 12 inches in length shall not be delivered to the site.
 - 2. Acceptance at Site:
 - a. Inspect pre-cast concrete sections when delivered.
 - 1. Reject structures which do not meet the requirements of the Contract Documents and repair or remove from site and replace at the sole option of the Owner and at no additional cost to the Contract.
 - 3. Storage and Protection:
 - a. Do not damage pre-cast concrete sections when handling.
 - b. Do not bump or drop.
 - c. Do not allow hooks to come in contact with joint surfaces.
- D. Disinfection of Water Mains
 - 1. Hypochlorite:
 - a. Store and handle in accordance with AWWA B300.

1.6 QUALITY ASSURANCE

A. Valves and Appurtenances

- 1. Manufacturer's Qualifications:
 - a. Valves and appurtenances provided under this Section shall be the standard product in regular production by manufacturers whose products have been used in similar service for at least the last five years as verified in the product data submittal.
 - b. All units of the same type shall be product of one manufacturer.
- 2. Criteria
 - a. All valves and appurtenances shall be new and in working condition. Valves shall be designed for continuous use without exceeding the manufacturer's rated limits for stress, strain or vibration.
- 3. Source Quality Control
 - a. A hydrostatic test shall be performed on valves at the factory prior to shipment. The valve shall be tested to two (2) times the working pressure. The valve performance and hydrostatic tests may be witnessed by the Owner and/or the MWRA.

B. Pipeline Pressure and Leakage Testing

- 1. Testing shall be conducted by an independent testing agency in accordance with AWWA C600 Sec. 5.2 and the MWRA's Standard Operating Procedures for Performing Construction Work on Pipelines.

- a. Persons performing testing of water mains shall have a Grade D4 Water Distribution Operator's License or Grade 4 Water Treatment Operators License.
 - 2. Leakage is defined as total amount of make-up water (gallons per hour) introduced into pipeline during test to maintain test pressure within 5 psi.
- C. Disinfection of Water Mains
- 1. The Supervisor for all disinfection operations shall:
 - a. Have successfully completed disinfection of potable water pipelines or systems, 24-inches in diameter or larger, using the methods described in AWWA 651, on 2 projects within the last 5 years.
 - b. Shall be a licensed Water Supply Grade 4 Distribution Operator or Grade 4 Water Treatment Operators.
 - 2. The individuals who will be obtaining and analyzing water samples shall:
 - a. Have successfully obtained and analyzed water samples of potable water pipelines or systems, 24-inches in diameter or larger, using the methods described in AWWA 651, on 2 projects within the last 5 years.
 - 3. Pipeline disinfection shall be performed in conjunction with dewatering, testing, flushing and discharge of water with chlorine, prior to placing new water main in service:
 - a. Prepare a plan for pipe disinfection and dechlorination including method(s) of filling, chlorine introduction, discharge location(s), testing/monitoring locations and method(s) of dechlorination (both free and combined chlorine) including pH adjustments for chloramines.

1.7 MISCELLANEOUS SYSTEM REQUIREMENTS

- A. Precast Structures
 - 1. All pre-cast structures shall be designed for AASHTO HS-25 load conditions.
- B. Pipeline Pressure and Leakage Testing
 - 1. Perform pressure and leakage tests for pipe that has been installed under this contract.
 - 2. Perform bidirectional pressure testing on all valves installed.
- C. Disinfection of Water Mains
 - 1. Disinfection limits are as indicated on the Contract Drawings.
 - 2. The location of the existing water main line, new water mains, air release and blow-off valves are shown on the Contract Drawings.
 - 3. Pipes that were not dewatered but were out of service for more than 5 days shall be flushed as specified in Paragraph 3.4.B.2.
 - 4. Pipe that was not dewatered but was out of service for 3 weeks or more shall be disinfected.

5. All flushing water shall be discharged in accordance with local, state, and federal regulations and the MWRA's Standard Operating Procedures for Performing Construction Work on Pipelines.

1.8 SEQUENCING AND SCHEDULING

A. Precast Structures

1. Do not deliver pre-cast concrete sections until representative concrete control cylinders have attained a strength of at least 80 percent of minimum specified herein.

B. Pipeline Pressure and Leakage Testing

1. Complete pressure and leakage testing of water main pipes prior to final cleaning, disinfection and connecting to existing water mains. The MWRA shall be present during all testing.
 - a. At each connection to existing water main, install temporary mechanical joint pipe with a restrained cap, for use during pressure testing of all new piping installed. After completion of pressure testing, temporary pipe and restrained cap shall be removed and the closure piece and coupling shall be installed, and all joints shall be visually inspected for leaks at normal working pressure prior to backfilling.
 - b. Notify the Owner and the MWRA of time and place of testing at least 3 working days prior to commencement of work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Ductile Iron Pipe

1. Pipe, fittings, and accessories:
 - a. American Cast Iron Pipe Company
Birmingham, Alabama
 - b. U.S. Pipe and Foundry Company
Birmingham, Alabama
 - c. Griffin Pipe Products Company
Florence, New Jersey
 - d. Or equal
2. Mechanical couplings:
 - a. Smith-Blair
 - b. Dresser
 - c. Romac
 - d. Or equal

3. Prestressed Concrete Cylinder Pipe (PCCP) to DI Adapters:
 - a. Hanson Pressure Pipe
 - b. Vianini Pipe, Inc.
 - c. Ameron International
 - d. Or equal

- B. Valves and Appurtenances
 1. Butterfly Valves:
 - a. American-Darling
 - b. DeZurik
 - c. Mueller
 - d. Pratt
 - e. Or equal

 2. Resilient Seat Gate Valves:
 - a. American - Darling
 - b. Mueller
 - c. U.S. Pipe
 - d. Or equal

 3. Corporation Stops:
 - a. The Ford Meter Box Co., Inc. Model F 400
 - b. Mueller Company Figure H-10003 except for 1½" air valves, use Mueller Company Figure H-9968
 - c. Powell Figure 4224T
 - d. Or equal

 4. Air Release Valves:
 - a. Cla-Val
 - b. Crispin Multiplex Mfg. Co.
 - c. Valve & Primer Corp.
 - d. Or equal

 5. Valve Box Covers:
 - a. Clay & Bailey "No. 2193"
 - b. Tyler "Series 6890 A"
 - c. Opelika Foundry "No. 6017"
 - d. Or equal

6. Overtorque Protector:
 - a. Aunspach, St. Louis, MO.
 1. This is a proprietary item. Substitution of products from other manufacturers will not be permitted.
 7. Insertion Valves
 - a. Hydro-Stop, Inc.
 - b. Romac Industries, Inc.
 - c. Advanced Valve Technologies, L.L.C.
 - d. Or equal
 8. Pressure Reducing Valves:
 - a. Cla-Val
 - b. Flomatic Valves
 - c. Tyco
 - d. Or equal
- C. Precast Structures
1. Pre-cast Concrete:
 - a. Rotondo & Sons, Inc., Rehoboth, MA
 - b. Chase Pre-cast Corporation, North Brookfield, MA
 - c. Ray Pre-cast Company, Marshfield, MA
 - d. Or equal
 2. Standard MWRA Manhole Frames and Covers:
 - a. East Jordan Iron Works, East Jordan, MI
 - b. Neenah Foundry, Neenah, WI
 - c. Ethridge Foundry, Portland, ME
 - d. Quality Water Products, Inc., South Barre, MA
 - e. Or equal
 3. Standard MWRA Watertight and Locking Manhole Frames and Covers:
 - a. East Jordan Iron Works, East Jordan, MI
 - b. Syracuse Castings, Cicero, NY
 - c. Olympic Foundry, Burlington, IA
 - d. Or equal
 4. Municipal Manhole Frames and Covers
 - a. East Jordan Iron Works, East Jordan, MI

- b. Neenah Foundry, Neenah, WI
 - c. Ethridge Foundry, Portland, ME
 - d. Or equal
5. Non-shrinking Grout:
- a. L&M Concrete Forms, Inc., Omaha, NE - "Crystex"
 - b. Sauereisen Cements Co., Pittsburgh, PA - "F-IDO Level Fill Grout"
 - c. U.S. Grout Corporation, Fairfield, CT - "Five Star Grout"
 - d. Or equal
6. Coal Tar Coating:
- a. Koppers - "Bitumastic Super Service Black"
 - b. Tnemec - "46-465 Heavy Duty Black"
 - c. Valspar Corp. - "35-J-10"
 - d. Or equal
7. Insulation:
- a. Pittsburgh Corning - "Foam Glass"
 - b. Upjohn Manufacturing - "Urethane"
 - c. Dow Chemical - "Styrofoam"
 - d. Or equal
8. Entrance Safety Device:
- a. Bilco Co. Ladder Up Safety Post
 - b. North Safety Products Saf-T-Notch Removable Ladder Extension
 - c. McMaster-Carr Ladder Safety Extension Post
 - d. Or equal

2.2 MATERIALS

A. Ductile Iron Pipe

- 1. Pipe:
 - a. Ductile iron conforming to ANSI/AWWA C151/A21.51.
 - b. Minimum pipe thickness class:
 - 1. For new water main with diameter less than or equal to 48 inches:
 - a. Thickness Class 52 for push-on, flanged or mechanical joint pipe.
 - c. Supply pipe in lengths not exceeding 20 feet.
 - d. Buried pipe:

1. Restrained Rubber-ring type push-on or mechanical joints with mechanical restraint joint devices unless otherwise indicated on Drawings.
2. Insulating flanges with wax tape coating.
- e. Provide restrained joints where indicated on the Drawings.
- f. Exposed pipe:
 1. Flanged joints.
2. Fittings:
 - a. Ductile iron conforming to ANSI/AWWA C110/A21.10.
 - b. Minimum pressure rating:
 1. Push-on and mechanical joint:
 - a. 350 psi for 24 inch and smaller
 - b. 250 psi for 30 inch and larger
 2. Flanged joint:
 - a. 250 psi
 - c. All fittings shall be manufactured and fabricated in the United States.
3. Shop coating and lining for pipe and fittings:
 - a. Cement mortar lining for water mains: ANSI/AWWA C104/A21.4.
 - b. Exterior primer for exposed pipe with diameter less than 48 inches: Cook "391-N-167 Barrier Coat", Koppers" No. 10 Inhibitive Primer", Tnemec "77 Chem-Prime", Valspar "13-R-28 Chromox Primer", or equal.
 - c. Asphaltic coating for buried pipe with diameter less than 48 inches: Manufacturer's standard.
 - d. Rust-preventive compound for flange faces: Houghton "Rust Veto 344", Rust-Oleum "R-9", Devoe Paint "Devrin 201", or equal.
4. Field coating:
 - a. Coal tar coating for buried steel anchors: Thixotropic coal tar, MIL-C-18480; Koppers "Bitumastic No. 50", Tnemec "46-450 Heavy Tnemecol", Devoe Paint "Devtar 5A", or equal.
 - b. Polyethylene tube for buried ductile iron water main: ANSI/AWWA C105/A21.5, seamless.
 1. Remove lumps of clay, mud and cinders from outside surface of pipe prior to installation.
5. Joints:
 - a. Push-on and mechanical joints: ANSI/AWWA C111/A21.11.
 1. Gaskets: Oil-resistant synthetic rubber.
 2. Natural rubber gaskets are not acceptable.

- b. Restrained push-on joints: American "Flex-Ring", "Lok-Fast", or "Lok-Ring"; Clow "Super-Lock"; U.S. Pipe "TR Flex"; Griffin "Snap-Lok"; or equal.
 - c. Flanged joints: ANSI/AWWA C115/A21.15
 - 1. Flanges: Ductile iron, flat faced
 - 2. Bolts: ASTM A307, chamfered or rounded ends projecting 1/4 to 1/2 inch beyond outer face of nut.
 - 3. Nuts: ASTM A307, hexagonal, ANSI B18.2.2, heavy semifinished pattern.
 - 4. Gaskets: ASTM D1330, Grade I rubber, full face type, 1/8 inch thick, except that gaskets for buried flanges other than insulating flanges shall be oil-resistant synthetic rubber.
 - d. Mechanical joints with tie rods:
 - 1. Tie rods: ASTM A307.
 - 2. Steel pipe: ASTM A53, Schedule 40.
 - 3. Washers: ANSI B18.22.1, plain steel.
 - e. Threaded connections for tapping of pipe wall: ANSI/ASME B1.20.1, NPT.
 - 1. Threaded connections shall only be permitted where wall thickness minus foundry tolerance is equal to or greater than that required for 4-thread engagement as set forth in ANSI/AWWA C151/A21.51. Otherwise, provide boss or tapping saddle.
 - f. Mechanical Joint Restraint Device:
 - 1. The device shall impart multiple wedging action against the pipe increasing its resistance as the pressure increases.
 - 2. Ductile iron heat treated to a minimum hardness of 370 BHN.
 - 3. Working pressure of at least 250 psi with a minimum safety factor of 2:1.
 - 4. Flexibility of the joint shall be maintained after burial.
 - 5. Retainer Glands: Ductile iron conforming to ASTM A536-80. Dimensions which permit use with mechanical joint bell and tee head bolts conforming to ANSI/AWWA A21.11 and ANSI/AWWA C153/A21.53 latest revision.
 - 6. Twist off nuts shall be installed and result in actuating of the restraining device.
6. Mechanical Couplings:
- a. Insulating Type
 - b. Gaskets: Oil-resistant synthetic rubber
 - c. ANSI/AWWA C219
 - d. Minimum pressure rating: 250 psi
7. Flanged coupling adapters:
- a. Smith-Blair "Type 913", Dresser "Style 128", Baker "Series 604", or equal.
8. Tapping saddles:
- a. Ductile iron with steel straps and rubber sealing gasket.

- b. Minimum pressure rating: 250 psi

B. Valves and Appurtenances

1. Butterfly Valves:

a. Valve shafts:

- 1. Valve shafts from high tensile stainless steel ASTM 564, Type 630.

b. Valve seats:

- 1. ANSI Type 304 stainless steel, monel, or plasma applied nickel chrome overlay for all seating surfaces mating with rubber.

c. Valve discs:

- 1. ASTM A48 cast iron.

d. Shaft seals:

- 1. Chevron or O ring type shaft seals.

e. Valve body:

- 1. Ductile iron.

2. Gate Valves:

- a. Rubber Seats: shall be new, natural or synthetic, acceptable for water service application per ASTM D429.

b. Valve Body:

- 1. Gate Valves up to and including 12": cast iron
- 2. 24" Gate Valves: ductile iron

c. Stem:

- 1. Bronze

d. Wedge:

- 1. Gate Valves up to and including 12": cast iron
- 2. 24" Gate Valves: ductile iron

3. Extension stems:

- a. As indicated on the Drawings.

4. Extension guides:

- a. Guides from steel.

5. Valve boxes:

- a. Boxes, bases, covers, and shafts from cast iron.

6. Asphalt Varnish:

- a. Federal Specification TT C-494.

7. Corporation Stops:

- a. Corporation stops shall conform to AWWA C800, not less than 1-inch in diameter and shall be installed where indicated on the Contract Drawings.
 - b. All corporation stops shall be certified to be NSF 61 compliant in accordance with the "Safe Drinking Water Act" requirements for low lead in potable (human consumption - drinking and cooking) and non-potable water applications (non-human consumption).
8. Push on and mechanical joints: ANSI/AWWA C111/A21.11.
9. Shop painting:
- a. Coating for unfinished surfaces:
 1. Interior surfaces:
 - a. Fusion bonded epoxy coating meeting requirements of AWWA C550.
 2. Exterior surfaces of valves below ground line.
 - a. Asphalt varnish conforming to Federal Specification TT C-494.
 - b. Coal tar: Koppers "Bitumastic Super Service Black", Tnemec "46 465 Heavy Duty Black", Valspar "35 J 10 Hi Build Bituminous Coating", or equal.

C. Precast Structures

1. Concrete sections:
 - a. Pre-cast concrete vaults, manholes and chambers:
 1. General:
 - a. Sections and reinforcement shall conform to ASTM C478 for circular sections and ASTM C858 for rectangular sections.
 - b. Minimum wall thickness: 1/12 of inside diameter, plus one inch.
 2. Riser and base sections:
 - a. Circular Sections shall have uniform outside diameter.
 - b. Rectangular sections shall have square corners and true sides.
 3. Minimum compressive strength shall be 5,000 psi at 28 days.
 4. Top slabs shall support their own weight, weight of soil at 130 pcf and a live load equal to AASHTO HS-25 psf applied to top slab.
 5. Cast base slab and walls together to form a monolithic base section.
 6. Structure walls shall withstand a water pressure of 90 psf. Originate pressure diagram at finished ground surface. Include lateral pressure from vehicles in accordance with AASHTO.
 7. Provide additional reinforcing around openings to prevent cracking. Frame openings to carry full design loads to support walls.
 8. Prevent flotation, with ground water level at finished ground surface, by dead weight of structure and soil load above structure. Do not account for skin friction,

- soil friction, or weight of equipment in structure. Factor of safety for resisting flotation shall be 1.10.
9. Provide wall castings to the precast concrete manufacturer for inclusion in the manufacture of the structure.
2. Precast Structure Joint Gaskets:
 - a. Butyl Rubber Sealant
 1. AASHTO Specification M-198, Type B.
 2. Use cross sectional area as recommended by structure manufacturer.
 3. Castings:
 - a. General:
 1. Cast Iron - ASTM A48, Class 30B or better.
 2. Ductile Iron - ASTM 536-77
 - a. Frames and covers shall be for heavy duty use and able to withstand HS-25 loads.
 - b. MWRA Manhole frames and covers:
 1. Cast Iron:
 - a. 24 inch MH frame and cover as indicated on the drawings.
 2. Ductile Iron:
 - a. Watertight and locking manhole frame and covers shall be made of ductile iron and include one polyethylene ring for load transmission and one rubber gasket for air and water tightness. The watertight and locking frame and covers shall be airtight and watertight up to 15 psi external pressure.
 - b. Watertight and locking manhole frame and covers shall be secured with iron cams and stainless steel bolts equally spaced around the cover. Internal threads for bolts shall be located entirely in blind holes of frame to prevent sticking or corrosion.
 - c. Cover shall weigh no more than 150 pounds.
 - d. Furnish one (1) set of spare parts for each watertight and locking manhole frame and cover. Furnish two (2) sets of tools suitable for locking/unlocking ductile iron covers.
 4. Miscellaneous materials:
 - a. Pre-cast concrete adjusting rings.
 - b. Circular rings with shear keys.
 - c. Non-shrinking grout.
 - d. Mastic fill:
 1. Butyl rubber compatible with resilient connector material.
 - e. Insulation:

1. Exterior 2- inch thick insulation.
 2. "R value" shall be at least 17.0.
 3. Insulation adhesive and coating as recommended by insulation manufacturer.
 4. DO not damage coating and insulation during placement and compaction of back-fill.
- f. Asphalt Varnish: Federal Specification TT C-494.
- g. Expandable plugs: rubber, air tight to 8 psi with wing nut type expansion mechanism.
- h. Connector between sewer manhole and pipe: rubber seal system meeting the requirements of ASTM C923 and recommended by the manhole manufacturer for the type of connection.
- i. Protective Epoxy Coating: shall be an epoxy-resin-based product providing high bond strength to concrete and steel surfaces conforming to ASTM C881.
- j. Sump Cover Grating:
1. Cover shall be removable fiberglass reinforced plastic grating, thermal cured with smooth mold surface.
 2. Grate shall match outside diameter of sump and be mounted flush with chamber floor.
 3. Grate shall have a maximum mesh opening of 1½"x 1½" with a minimum thickness of 1".
 4. Grate shall be high impact, slip and fire resistant.
 5. Grate shall be electrically non-conductive.
- k. Water-Based Masonry Sealer:
1. Apply DRYLOK Masonry waterproofer by United Gilsonite Laboratories, Thompson's Water Seal Concrete Care Sealer by the Thompson's Company, Memphis, TN; Conspec Weather Seal WB, Dayton Superior, Kansas City, KS; Crete-Trete 350 Water Repellent, Cresset Chemical Co., Weston, OH; or equal to all interior and exterior surfaces of meter vaults.
- l. Hydraulic Cement:
1. Seal all vault penetrations, except penetrations for water piping, both inside and outside structure with quick-setting Portland cement, Type 2, conforming with ASTM C150.
 2. Use concrete bonding adhesives or acrylic fortifiers as recommended by manufacturer for preparing surfaces to be sealed.
- m. Mechanical Penetration Seal and Wall Sleeve:
1. Seals around water pipe penetrations through precast concrete meter vaults.
 2. Penetration Seal shall be a modular, mechanical seal consisting of rubber links shaped to continuously fill the annular space between the pipe and wall opening. Hardware shall be steel with a 60,000 psi minimum tensile strength.
 3. Wall sleeve shall be a molded sleeve with an integral hollow, molded water-stop ring and in accordance with manufacturer's recommendations.
 4. Nuts and bolts shall be ANSI type 316 stainless steel.

- n. Ladder Extension Post:
 - 1. Extension post shall be fabricated from high strength steel with black enamel finish.
 - 2. Extension post shall be completely assembled and adjustable for installation with structure fixed ladder.
- o. Fixed Ladder:
 - 1. Ladder shall be high strength steel with black enamel coating.
 - 2. Rung diameter shall be 1-inch minimum with 12 inches between rungs and minimum 18 inches between side bars.
 - 3. Fixed ladder shall be compatible for use with ladder extension post specified in Paragraph 2.2.C.4.n.
 - 4. Attach to structure at three (3) attachment points with Type 316 stainless steel bolts and anchors.

D. Disinfection of Water Mains

- 1. Calcium hypochlorite shall conform to AWWA B300.
 - a. Granules with 70 percent available chlorine.
- 2. Liquid sodium hypochlorite shall conform to AWWA B300.
- 3. Dechlorination and pH adjustment agents shall conform to the MWRA's Policy and Procedures for Chlorination / Disinfection of Pipelines.

2.3 FABRICATION

A. Ductile Iron Pipe

- 1. Flange by mechanical joint pieces:
 - a. Mark top for horizontal pieces and side for vertical pieces at foundry.
- 2. Push-on joint pipe:
 - a. Bevel each spigot end.
- 3. Flanged joint pipe:
 - a. Extend pipe completely through screwed-on flanges.
 - b. Machine finish the pipe end and flange face in a single operation.
 - c. Fabricate flange faces flat and perpendicular to the pipe center line.
- 4. Mechanical Joint Restraint Device:
 - a. An identification number consisting of year, day, plant and shift (YYDDD)(plant designation)(Shift number), shall be cast into each gland body.
 - 1. All physical and chemical test results shall be recorded with the identification number on the casting.

2. Production pieces that are too small to accommodate individual numbering, such as fasteners and wedges, shall be controlled in segregated inventory until such time as all quality control tests are passed. These component parts may then be released to a general inventory for final assembly and packaging.
 - b. The coating system shall consist of two coats of liquid fluoropolymer coating with heat curing to follow each coating.
 1. All wedge assemblies and related parts shall be processed through a phosphate wash, rinse and drying operation prior to coating application.
 2. All casting bodies shall be surface pretreated with a phosphate wash, rinse and sealer before drying.
 3. The coating shall be electrostatically applied and heat cured.
 4. The coating shall be a polyester based powder and provide corrosion, impact and UV resistance.
5. Flanged coupling adapters and mechanical couplings:
 - a. Prepare inner and exterior surfaces of couplings for painting in accordance with the recommendations of paint manufacturer.
 - b. Paint with liquid epoxy in accordance with AWWA C210.
 - c. Clean and shop prime other surfaces with the standard rust-inhibitive primer of the manufacturer.
 - d. Do not paint flange mating surfaces on flanged coupling adapters.
 - e. Flanged coupling adapters shall have anchor studs.
6. Outlets:
 - a. Furnish factory welded-on boss under following conditions:
 1. Branch outlet is 12 inch or smaller.
 2. Diameter of pipe is at least twice diameter of branch.
 3. Either tee or tapping saddle are not used.
 4. Working pressure 250 psi.
7. Reducers:
 - a. Furnish concentric pattern reducers.
8. Gaskets:
 - a. Gasket for portable water service shall be certified as suitable for chlorinated potable water (NSF 61), compatible with joint specified herein and the specified field test pressure service conditions and provided by pipe manufacturer.

B. Valves and Appurtenances

1. Butterfly Valves:
 - a. General:
 1. All butterfly valves, including operators, shall conform to AWWA C504.

b. Valves:

1. Fabricate valves in accordance with the following schedule:

Size, (inches)	Service	Type of Installation	AWWA Class ⁽¹⁾	Type of Operator	Min. Operator Torque Capability ^(2,3) , (inch-pounds)	Minimum Turn Count
36	Water	Buried	250B-MJ	Wrench Nut	90,000	108
48	Water	Buried	250B-FL	Wrench Nut	190,000	144
54	Water	Buried	250B-FL	Wrench Nut	190,000	168

- (1) Suffix letter defines valve ends as follows: FL – Flanged Joint; MJ – Mechanical Joint
- (2) Manufacturer's rated torque capacity for each butterfly valve operator shall be at least equal to minimum specified operator torque capability.
- (3) Valve operators (actuators) shall withstand an input torque of 450 ft-pounds.

c. Valve bodies:

1. The valve body shall contain an adjustable stop, fastened to the valve body at a location 90 degrees from the valve shaft orientation, to prevent the valve disc from moving past its closing point. The stop and all fastening materials shall be Type 316 Stainless Steel.
2. Flanged Joints:
 - a. AWWA C115.
3. Short-body type.

d. Valve discs:

1. Secure discs to shafts by means of solid, smooth sided, stainless steel or monel taper pins or dowel pins having circular cross section.
2. Each taper pin or dowel pin shall extend through the shaft and shall be mechanically secured in place.
3. Do not use bolts, setscrews, knurled or fluted dowel pins, expansion pins, roll pins, tension pins, spring pins, or other devices in lieu of specified pins.

e. Valve seats:

1. Do not use valve seat configurations which rely on mating pipe flange to hold seat in position.

f. Valve coating:

1. All interior and exterior ferrous metal surfaces, except bearing surfaces and stainless steel components, shall be shop coated with a fusion-bonded epoxy coating in accordance with AWWA C550. Machined surfaces shall have a protective coating of rust inhibitive compound: Houghton "Rust Veto 344", Rust-Oleum "R-9", Devco Paint "Devrin 201", or equal.

g. Thrust bearings:

1. Provide each valve with one or more bronze thrust bearings.

2. Do not use thrust bearings which are directly exposed to line liquid and which consist of metal bearing surface in rubbing contact with opposing metal bearing surface.
 - h. Overtorque Protectors (This is a proprietary item, see Paragraph 2.1.B.6):
 1. Provide an overtorque protector on each butterfly valve.
 2. Overtorque protectors will be factory set to slip at 350 ft.-lbs.
 3. Overtorque protectors will be designed to fit over 1-3/4" by 1-3/4" nut and will be equipped with 1-3/4" by 1-3/4" top nut.
 - i. Position Indicators:
 1. Provide each butterfly valve operator with a position indicator to display position of disc in range from fully open to fully closed.
2. Gate Valves:
- a. Sizes up to and including 12-inch gate valves:
 1. Gate valves, including operators, shall conform to AWWA C509.
 2. Valve Construction:
 - a. Resilient-seated gate valves shall be rated 250 working pressure, iron body, nonrising stem, and shall conform to AWWA C509.
 3. Flanges:
 - a. Finish flanges to true plane surfaces within tolerance limit of 0.005 inch.
 - b. Flanges shall be flat faced. Finished face shall be normal to longitudinal valve axis within a maximum angular variation tolerance of 0.002 inch per foot of flange diameter.
 - c. Flange diameter and drilling shall conform to ANSI B16.1 Class 125 or ANSI B16.5 Class 150.
 4. Bonnet Thrust Plate:
 - a. The bonnet shall have a removable thrust plate which permits the removal and replacement of the valve stem and O-ring seal while the valve is in service.
 5. The gate shall have resilient rubber, urethane rubber, Buna N or SBR rubber, minimum thickness 3/8 inch, bonded to or mechanically attached to one side or both sides of the wedge type gate, with no sliding or shear, on the resilient seat, when compressed to a driptight shutoff.
 - b. Sizes equal to or greater than 24-inch:
 1. Gate valves, including operators, shall conform to AWWA C515.
 2. Valves shall be rated 250 working pressure, ductile iron body.
 3. Valves shall be specifically designed for horizontal installation and equipped with beveled gearing.
 4. Wedge type gate shall be ductile iron, encapsulated with EPDM or SBR rubber.
 5. Vertical and horizontal resilient seated valves shall be equipped with rollers and scrapers.

- c. Valve Coating:
 - 1. All interior and exterior ferrous metal surfaces, except bearing surfaces and stainless steel components, shall be shop coated with a fusion-bonded epoxy coating in accordance with AWWA C550. Machine surfaces shall have a protective coating of rust inhibitive compound: Houghton "Rust Veto 344", Rust-Oleum "R-9", Devoe Paint "Devrin 201", or equal.
- d. Mechanical Joints:
 - 1. AWWA C111.
- e. Stem Seals:
 - 1. All valves shall be provided with stem seals of the O ring inserted above the thrust collar.
- f. Stainless Steel Bolts and Nuts:
 - 1. The bolts and nuts that fasten the bonnet to the valve body and bonnet thrust plate to the bonnet shall be ANSI Type 316 stainless steel.
- g. In accordance with following schedule:

Size (inches)	Location	Max. Pressure Differential Across Valve (psi)	Ends	Type of Stem	Operator	Minimum Turn Count
8	Buried	250	MJ	NRS	WN	24
8	Vault	250	FL	NRS	WN	24
12	Buried	250	MJ	NRS	WN	36
12	Vault	250	FL	NRS	WN	36
24	Buried	250	MJ	NRS	WN	60

Abbreviations in gate valve schedule as follows:

- FL - Flanged ends
- MJ - Mechanical joint ends
- NRS - Nonrising stem
- WN - Wrench nut

- 1. Number plate shall include number of turns to operate valve from fully closed to fully open position.
- 3. Wrench nuts:
 - a. Provide wrench nuts on all buried valves and on all valves enclosed in vaults as indicated on drawings.
 - b. All wrench nuts shall be 1-3/4" by 1-3/4".
 - c. Design valve and operator so that shaft leakage cannot enter operator housing.
 - d. Direction of rotation of wrench nut to open valve shall be to the right (clockwise).
 - 1. Cast word "Open" and an arrow indicating direction to open on each valve body or operator.
- 4. Extension stems:

- a. As indicated on the Drawings.
5. Extension stem guides:
- a. Stem guides shall be cast iron, bronze bushed, and adjustable in two directions.
 - b. Stem guide spacing shall not exceed 100 times the stem diameter or 10 feet, whichever is smaller.
 - c. The extension stem shall have a collar; the collar shall be pinned to the stem and shall bear against the stem thrust guide.
 - d. At least two stem guides shall be furnished with each valve.
 - e. The top stem guide shall be designed to carry the weight of the extension stem.
6. Insertion Valves:
- a. General
 - 1. Insertion Valves shall conform to the requirements specified in this Section for Gate Valves, except as specified below:
 - a. Valves shall be constructed of a two (2) piece ductile iron casting, pieces to be bolted together using ductile iron bolts with zinc alloy anodes manufactured to comply with ASTM A536 65-45-12.
 - b. Ductile Iron Gate shall have a resilient rubber seal 360 degrees around the gate which is expandable to the inside diameter of the pipe.
 - c. The valve assembly design shall enable the valve assembly to be rotated 120 degrees, perpendicular across the top of the pipe, while riding on two SBR rubber gaskets construed of SBR, by using a perpendicular rotary feed mechanism, driven by a chain.
7. Valve boxes:
- a. General:
 - 1. Shop coat all parts of valve boxes, bases, and covers by dipping in asphalt varnish.
 - b. Boxes for valves buried or enclosed to a depth of 4 feet or less:
 - 1. Shall be slide type.
 - 2. Shall be cast iron, extension sleeve type and shall be built to withstand depth of cover indicated by Drawings.
 - 3. Do not use more than one extension for each slide type valve box.
 - 4. Shall not be less than 5 inch inside diameter nor less than 3/16 inch thick at any point.
 - 5. Shall have cast iron bases and covers.
 - c. Boxes for valves buried or enclosed to a depth greater than 4 feet:
 - 1. Shall have cast iron cover and 6 inch cast iron pipe section.
 - 2. Pipe shaft to extend from valve to 5 inches within valve box cover.
8. Air Release Valves:
- a. Automatic

1. Air release valves shall be equipped with cast iron body and cover, Buna-N seat bronze linkage and stainless steel float.
 2. Valves shall be suitable for average working water pressure at 300 psi.
- b. Manual Air Release Valves
1. Shall be assembled as shown in the Drawings.

C. Precast Structures

1. Concrete sections:

- a. Cast and finish to following tolerances:
 1. Overall length - $\pm 1/4$ inch
 2. Overall height - $\pm 1/4$ inch
 3. Overall width - $\pm 1/4$ inch
 4. Wall, floor, and roof thickness - $+1/4$ inch, - $1/8$ inch
 5. Position of handling devices - $\pm 1/2$ inch
 6. Squareness of ends (vertical and horizontal alignment) - $\pm 1/4$ inch
 7. Face width of joint - $\pm 3/16$ inch
 8. Anchors and inserts - $\pm 1/4$ inch
- b. If boxouts for grouting are used, groove or roughen surfaces.
- c. Provide lifting notches on inside faces of pre-cast section walls for handling.
 1. Do not make notches more than 3 inches deep.
 2. Do not extend hole through wall.
- d. Dampproof pre-cast units in shop.
 1. Apply one coat of coal tar coating to outside surfaces of each section.

2. Castings:

- a. Standard dimensions for manhole frames and covers as indicated on the Drawings.
- b. The bearing surfaces of frames and covers and frames and grates against each other shall be machined to give continuous contact throughout their entire perimeter.
- c. All iron castings shall be cleaned at foundry.
- d. The castings shall be free from all defects including scale, lumps, blisters, sandholes.

2.4 EQUIPMENT

A. Pipeline Pressure and Leakage Testing

1. Provide test equipment as follows:
 - a. Piping connections between pipeline tested and water source.
 - b. Pumping equipment
 - c. Water meter

- d. Pressure gauges
- e. Sectionalizing devices:
 - 1. Flanges
 - 2. Valves
 - 3. Bulkheads
 - 4. Bracing
 - 5. Blocking

2.5 SOURCE QUALITY CONTROL

A. Valves and Appurtenances

- 1. Tests:
 - a. Test all butterfly valves in accordance with AWWA C504.
 - b. Test all gate valves in accordance with AWWA C509 or C515, as applicable.
- 2. Inspection:
 - a. The protective fusion-bonded epoxy coating on interior surfaces of each valve shall be holiday tested in accordance with AWWA C550 and shall be electrically void free.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Ductile Iron Pipe

- 1. Alignment:
 - a. Lay piping to lines and grades indicated on the Drawings. Transfer all lines and grades from basic survey control points.
 - b. Deflections from straight line or grade shall not exceed values stipulated in Table 4 or Table 5 of AWWA C600.
 - c. Install either shorter pipe sections or fittings to conform to alignment or grade indicated on the Drawings.
- 2. Laying pipe:
 - a. Protect pipe from lateral displacement by placing granular embedment material.
 - b. Lay pipe with bell ends facing direction of laying.
- 3. Cutting pipe:
 - a. Cut pipe without damage to pipe or lining.
 - b. Provide smooth, straight cuts at right angles to pipe axis.
 - c. Remove all roughness and sharp edges from cut end of pipe.

- d. Bevel cut ends of push-on joint pipe.
 - e. Do not cut pipe with hydraulic squeeze type cutters, portable guillotine saw, or oxyacetylene torch.
 - f. Do not cut tapping holes with an oxyacetylene torch.
4. Cleaning:
- a. Clean all foreign material from interior of pipe and fittings before installation.
 - b. Wipe clean all joint contact surfaces before jointing pipe and fittings.
 - c. Prevent all material from entering pipe or joints during installation.
 - d. Seal open end of pipe with watertight plug when pipe laying is stopped.
 - e. Keep interior of installed pipe clean until the pipeline is placed into service.
5. Inspection:
- a. Examine pipe and fittings for cracks and other defects immediately before installation.
 - b. Examine the spigot ends of pipe.
 - c. Remove and replace all cracked or defective pipe and fittings at no additional cost to the Contract.
6. Field Joints:
- a. Use flanged joints in all other locations unless otherwise indicated on the Drawings.
 - b. Assemble field joints in accordance with the recommendations of the manufacturer.
 - c. Mechanical Joints:
 - 1. If mechanical joint fails to seal, disassemble, clean, and reassemble joint at no additional cost to the Contract.
 - 2. Tighten bolts to torque values listed in ANSI/AWWA C111/A21.11.
 - 3. Do not over tighten bolts.
 - 4. Align holes in harnessed mechanical joints with tie rods to permit installation of tie rods.
 - 5. When installing flange and mechanical joint pieces, align holes in mechanical joint bell and flange to straddle top center line for horizontal piping and side centerline for vertical piping.
 - d. Push-On Joints:
 - 1. Lubricate all joint surfaces before joint is made with lubricant certified to meet NSF 61 for potable water service.
 - 2. Install restrained joint pipe in accordance with recommendations of pipe manufacturer.
 - e. Flanged Joints:
 - 1. Do not restrain opposite end of pipe or fitting in any direction when tightening flange bolts.
 - 2. Tighten bolts gradually and at uniform rate to provide uniform compression of gasket.

3. Do not over stress flanges.
 4. Allow one flange to move in any direction while tightening flange bolts.
 5. Insulate flanges shown on Drawings.
- f. Flanged Coupling Adapters:
1. Determine location of holes for anchor studs after the pipe is in place and adapter is bolted tight.
 2. Field drill pipe for anchor studs.
 3. Drill holes for anchor studs completely through pipe wall.
 4. Use hole diameter not more than 1/8 inch larger than diameter of stud projection.
- g. Couplings:
1. Provide space of 1/4 inch to one inch between pipe ends.
 2. Clean and remove foreign material from pipe and coupling surfaces which contact gaskets during assembly.
 3. Install coupling with all parts square and symmetrical with the pipe.
 4. Uniformly tighten assembly bolts so coupling is free from leaks.
 5. Couplings shall be installed with heat shrinkable sleeve for corrosion protection.
7. Polyethylene Tube Protection:
- a. Provide all buried ductile iron pipe and fittings used for water mains with a diameter of 48 inches or less with polyethylene tube protection.
 1. Install tube in accordance with AWWA C105, Method A.
8. Field Repair of Protective Coatings and Linings:
- a. Entry into pipe for application of interior linings to unlined ends shall be from open ends or through access manholes.
 - b. Field Repair of Shop-Applied Coatings and Linings:
 1. For Flanged Joints: Extend cement mortar lining to ends of pipe.
 2. For Push-On and Restrained Joints:
 - a. Cement Mortar: Line to end of pipe on spigot end. Hold back lining in bells one inch beyond the point of nominal full joint engagement. Field repair in accordance with AWWA C104.
 3. For Coupled Joints:
 - a. Interior Linings: Cement Mortar Lining shall extend to end of pipe.
 - b. Exterior Coatings: Repair damaged areas of shop coatings on pipe and coupling after installation at no additional cost to the Contract.
9. Reducers:
- a. All reducers shall be concentric pattern, unless indicated on the Drawings.
10. Concrete Encasement:

- a. Install concrete encasement as indicated on the Drawings.
 - b. Provide concrete and reinforcing steel as specified in Section 03300.
 - c. Support, block, and anchor all pipe to be encased to prevent flotation.
11. Reaction Anchorage:
- a. Anchor all pipe, fittings, and valves subject to internal pressure to prevent separation of joints.
 - b. Provide joint anchors on all push-on and mechanical joint tees, Wye branches, bends, plugs, and valves.
 - c. Provide restrained joints on pipes as indicated on Drawings.
 - d. Provide mechanical joints with tie rods for joint anchorage, as indicated on Drawings.
12. PCCP to DI Adapters:
- a. Install in accordance with AWWA C301 and as indicated on the drawings.
 - b. Welding: AWS D1.1.
- B. Valves and Appurtenances
1. Valves:
 - a. Install butterfly valve in accordance with recommendations set forth in AWWA C504 and recommendations of manufacturer.
 - b. Install gate valves in accordance with recommendations set forth in AWWA C509 or C515, as applicable, and recommendations of manufacturer.
 - c. Repair damaged coatings in accordance with manufacturer's recommended procedure at no additional cost to the Contract.
 - d. Gate valves in chambers shall have flanged ends. Buried gate valves shall have mechanical joint ends unless otherwise indicated on the drawings.
 2. Extension stems:
 - a. Install extension stems for buried valves and for valves enclosed in vaults as indicated on drawings.
 - b. Install stems with extension guides as indicated on drawings.
 3. Valve boxes:
 - a. Set valves and valve boxes plumb.
 - b. Place valve box directly over valve and bring top of box flush with finished grade.
 - c. After box is in final position, place earth fill or bituminous pavement around valve box and tamp on each side of box.
 4. Air release valves:
 - a. Install each valve assembly complete with appurtenant piping and valves as indicated on drawings.
 - b. Install a shutoff valve in bypass piping of each valve assembly as indicated on the drawings.

5. Valve Actuators:
 - a. Valve actuators shall be provided, installed, and adjusted by the valve manufacturer. Actuator mounting arrangements shall be as indicated on the drawings.
 6. Number Plates:
 - a. Install on valve body.
- C. Precast Structures
1. Bases:
 - a. Construct structures with pre-cast concrete bases.
 1. Excavate subgrade materials to undisturbed earth and uniform elevation allowing installation and dynamic compaction of at least 12 inches of structural fill.
 - b. Grade surface of granular material and set base section so connecting pipes will be on line and grade.
 - c. Adjust elevation of granular material until grade and alignment of base section is attained.
 - d. Do not wedge or block under pre-cast concrete bases.
 2. Riser Sections for Manholes:
 - a. Provide circular pre-cast sections with mastic gasket to seal joints between sections.
 1. Only use mastic gaskets at temperature recommended by manufacturer.
 - b. Fill lifting notches in manhole walls with non-shrinking grout.
 3. Connecting Piping for Manholes:
 - a. Drains: fill space between connecting pipes and wall of pre-cast sections with non-shrinking grout.
 - b. Sewer and Water: use rubber seal system in accordance with ASTM C923.
 4. Dampproofing:
 - a. Field applied:
 1. If shop applied dampproofing has been damaged, paint outside surface of structure with one coat of coal tar paint before backfilling.
 5. Waterproofing:
 - a. Field apply masonry sealer to all exterior surfaces of meter vault in accordance with manufacturer's instructions.
 6. Castings:
 - a. Frames shall be set in full mortar beds. All voids beneath the bottom flange shall be completely filled and result in a watertight fit.
 7. Core Drilling:
 - a. When core drilling is completed, clean the exposed concrete surface and ends of reinforcing steel and apply two (2) coats of protective epoxy coating for a total dry film thickness

of 10-15 mils. Allow first coat to cure before applying second coat. Allow second coat to cure before installing component requiring the concrete penetration.

8. Painting:
 - a. Castings shall be furnished unpainted.
9. Sealing:
 - a. Seal concrete manhole, chamber and vault penetrations, except penetrations for water pipe, on both inside/outside surfaces with hydraulic cement in accordance with manufacturer's instructions.
 - b. Seal water pipe concrete vault penetrations with mechanical penetration seal and wall sleeve in accordance with manufacturer's instructions.

3.2 GPS SURVEY

- A. Collect and provide the Owner and the MWRA as-built global positioning survey (GPS) points for the pipelines installed under this contract. GPS survey points shall be performed by a Licensed Professional Land Surveyor registered in the Commonwealth of Massachusetts.
 1. GPS locations shall be collected at the following locations:
 - a. Every 100 feet along straight segments and at every joint with a deflection of 2 degrees or higher.
 - b. All Fittings
 - c. All couplings and flange adapters
 - d. At all changes in direction
 - e. All valves
 2. The GPS locations shall be surveyed prior to backfilling the pipe, fittings and valves.

3.3 PIPELINE PRESSURE AND LEAKAGE TESTING

- A. Preparation:
 1. Protection:
 - a. Provide and install blocks, anchors, and supports for pipeline before test pressure is applied.
- B. Installation:
 1. Water:
 - a. Furnish water for testing.
 - b. Do not allow water to enter other parts of pipeline.
 - c. Dispose of test water in accordance with prepared disposal plan and regulatory requirements.
 2. Venting:

- a. Air release valves and other venting devices shall be installed as specified in Paragraph 3.1.B and shall be placed in open position when filling pipeline with water.
 - b. Provide vents in test bulkheads to expel air from pipeline.
 - c. Do not close hand operated vent valves until water flows in an uninterrupted stream from each valve.
3. Gauge Connections:
- a. Do not drill and tap pipe.
 - b. Use the existing pipe access points including:
 - 1. Air release valve openings.
 - 2. 1-inch corporations at butterfly valve chambers.
 - 3. 1-inch corporations at blow offs.
 - c. Provide adapter fittings for use at the specified access points.
- C. Field Quality Control:
1. Tests:
- a. Pressure Testing:
 - 1. Calibrate water meter and pressure gauges prior to pressure testing.
 - 2. Apply and maintain test pressure by force pump, without interruption, for a minimum of 2 hours after tested pipeline has been filled with water.
 - 3. Test pressure:
 - a. Subject new water mains to hydrostatic test pressure of at least 1.5 times the design working pressure of the main, but not less than 150 psi.
 - b. Leakage Testing:
 - 1. For at least 2 hours.
 - 2. Joints in piping shall be watertight and free from visible leaks during leakage test. Repair any visible leakage at no additional cost to the Contract.
 - 3. Leakage Test Pressure:
 - a. Maintain hydrostatic pressure within plus or minus 5 percent during entire time of leakage measurements.
 - 4. Leakage Measurement:
 - a. Do not measure leakage until trapped air has been vented and constant test pressure has been established.
 - b. Measure leakage with a water meter installed in the pressure supply piping on the pipeline side of the force pump.
 - 5. Allowable Leakage:
 - a. Leakage rate for each pipeline reach tested shall not exceed:
 - 1. For pipe with welded or mechanically coupled joints, Allowable leakage as defined in AWWA C219 shall be zero.

2. Calculate allowable leakage with following formula for pipes with other types of joints:

$Q = 0.0075 DLN$, where:

Q = allowable leakage in gallons per hour

D = nominal diameter of pipe in inches

L = length of section tested in thousands of feet

N = square root of average test pressure in psi

3. Calculate allowable leakage separately for each diameter and add resulting allowable leakage rates to obtain total allowable leakage for entire pipeline.

2. Inspection:
 - a. Locate leaking joints and pipe materials during pressure testing.
 - b. If test indicates pipeline leakage rate exceeding allowable leakage rate, repair leaking joints to reduce pipeline leakage to allowable rate specified at no additional cost.

3.4 DISINFECTION OF WATER MAINS

A. General:

1. Furnish the chlorine product for disinfection at rate and dose required in AWWA standards.
2. Furnish and install pipeline taps for dosing and testing of chlorinated water.
3. Install and remove bulkheads for testing.
4. Dispense the dose chlorine at points and rates in accordance with AWWA standards.
5. Operate new mainline valves, air release valves, and blowoff valves.
6. Dechlorinate and pH adjust water prior to discharge.

B. Preparation:

1. Disinfection:
 - a. Perform disinfection in accordance with the latest version in effect at bid of AWWA C651 and MWRA's Policy and Procedures for the Chlorination / Disinfection of Pipelines.
 - b. Disinfection shall be performed under the direct supervision of MWRA personnel and in accordance with the plan and regulatory requirements.
 - c. Monitor all valves within the isolation limits indicated on the Drawings to verify they are in the position indicated on the prepared disinfection plan, and for any discharges or leakage at the valves. The MWRA will monitor valves outside the isolation limits.
 - d. MWRA Operation Support personnel will perform water quality tests to verify that disinfection has been accomplished according to MWRA Water Quality Assurance Standards that include:

1. Coliform = 0
 2. Iron < 0.3 mg/L
 3. HPC <500 CFU/ml.
 4. A pH ranging from 8.7 to 9.3.
 5. Total Chlorine Residual between 1.7 ppm and 2.0 ppm
 6. Turbidity < 1.0 NTU
 7. Color <20 Color Units
2. Flushing:
- a. Perform flushing in accordance with the latest at bid version in effect at bid of AWWA C651 and MWRA's Policy and Procedures for the Chlorination / Disinfection of Pipelines.
 - b. Flush pipelines immediately prior to disinfection.
 - c. The minimum flushing velocity shall be greater than 2.5 feet per second.
 - d. Flushing shall be performed in accordance with regulatory requirements.
3. Discharge:
- a. Following disinfection, water with chlorine shall be dechlorinated prior to being discharged.
 - b. Water with chlorine to be discharged as in a legal manner.
- C. Installation:
1. Calcium Hypochlorite:
 - a. Use only as a solution.
 - b. Pump into pipeline with a chemical feed pump that is compatible with the chemical nature of the disinfectant.
- D. Application:
1. Special Techniques:
 - a. Disinfect pipelines by continuous feed method as follows:
 1. At a point not more than 10 feet downstream from the beginning of the new pipes, water entering the new pipe shall receive a dose of hypochlorite solution fed at a constant rate such that the water in the pipes will have not less than 25 mg/l free available chlorine. To assure that this concentration is achieved, measure chlorine concentration at regular intervals along the pipes, using chlorine test kits, or as otherwise described in the current edition of AWWA M12 - Simplified Procedures for Water Examination.
 2. Apply chlorine continuously until entire pipeline is filled with chlorine solution.
 3. Retain treated water in pipeline for at least 24 hours.
 4. Free chlorine residual at end of test shall be at least 10 mg/l.
 - b. Blow-offs, air release valves and gate valves shall be fully disinfected.

E. Field Quality Control:

1. Tests:

a. Bacteriological Tests

1. Notify the Owner and the MWRA 48 hours prior to flushing pipeline. The MWRA will collect samples and test for bacteriological quality after chlorine solution has been flushed out of pipeline.
2. Repeat disinfection at no additional cost to the Contract if bacteriological tests indicate that pipeline is not disinfected in accordance with Contract Documents.

b. Measure the chlorine concentration and pH every 60 minutes at the monitoring and flushing discharge locations. The monitoring shall start prior to the anticipated time the chlorine will reach the monitoring point and shall continue through the entire disinfection process until the measured chlorine concentration is less than 2.75 mg/L.

1. Measurements of chlorine concentration shall be obtained using the DPD Drop Dilution Method as described in AWWA C651. The use of test strips for measuring chlorine concentration will not be allowed.
2. Provide graphs showing time versus chlorine residual and pH value at each sampling, monitoring, and discharge location.

F. Protection:

1. The following equipment shall be on site within the isolation limits at all times during disinfection and flushing operations:

- a. Means of communication
- b. Operating tools
- c. Maintenance tools
- d. Chemicals required for chlorine neutralization

3.5 FIELD QUALITY CONTROL

A. Castings:

1. Install a new gasket for each watertight and locking manhole frame and cover within seven (7) days prior to Substantial Completion.

B. Clean and dewater all manholes prior to final walkthrough.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02756

STORM DRAIN LINING

PART 1 - GENERAL

1.1 DESCRIPTION

- A. Work Included: Provide all equipment necessary for the lining of existing storm drain piping by the cured-in-place-pipe (CIPP) method. Provide all equipment necessary for the lining of storm drain structures by the cured-in-place manhole (CIPM) liner method. The extent of this lining work is described in Section 02400, Paragraph 2.1 A. and as shown on the Contract Plans. If the Design Builder intends to use existing drainage it also includes the track corridor drain piping and associated structures from Cross Street to Washington Street, including the 42 inch main collector drain and its lateral pipe connections and their structures, and the 20-inch double-barrel siphon crossing Washington Street.

Work Included: Furnish all necessary labor, materials, supervision and equipment to satisfactorily inspect existing gravity siphon storm drains and structures that are to be lined, as required by the Contract Documents by means of a closed circuit television system (CCTV). The work shall include a combination of pre-drain pipe lining CCTV and post- drain pipe lining CCTV inspections of each of the pipes to be lined. CCTV work shall be completed and delivered per the National Association of Sewer Service Companies (NASSCO) Pipeline Assessment and Certification Program (PACP) standards.

- B. Related Work:
1. Section 02400 – Drainage and Sewer Systems
 2. Section 02632 - Stormwater Bypass Pumping Systems

1.2 QUALITY ASSURANCE

- A. Standards:
1. Cured-in-place-pipe (CIPP) shall meet all the requirements of ASTM F1216 and ASTM F1743.
 2. Cured-in-place liners for drain structures shall comply with the applicable system provisions of the Performance Specification Guideline for Manhole Rehabilitation, December, 2013, by the National Association of Sewer Service Companies (NASSCO). Other systems may be considered by the Owner, however the Design-Builder shall furnish all documentation required to prove the alternate system provides all the performance requirements specified and is compatible for use with the existing system. Alternate systems are subject to the review and approval of the Project LSP.
- B. Acceptable Contractor:

1. The Design-Builder or his subcontractor shall have a minimum of 5 years experience in sewer or storm pipe lining.

1.3 SUBMITTALS

- A. The Design-Builder shall submit to the MBTA complete design calculations for the pipe liner that meet the requirements of ASTM F1216. Calculations shall be approved and stamped by a Massachusetts licensed Professional Engineer. The design shall be based on the following physical conditions of the existing pipe to be rehabilitated:
 1. All pipes shall be considered fully deteriorated.
 2. All pipes are subjected to a soil load of 120 lbs/cf with capacity to support the greater of HS-20 live traffic load or a Cooper E-80 train loading with a 1.5 impact factor.
 3. The water table is assumed to be 3 feet below the ground surface.
 4. Pipe lengths and depths are as shown on the Contact Plans.
 5. The maximum pipe ovality is 2%.
 6. The minimum wall thickness for CIPP liner is 6 mm.
- B. Design-Builder to submit materials and installation procedures for review by the MBTA.
 1. Product data submittals required for all liner system shall include:
 2. Liner material type and manufacturer to be used, including: catalog data sheets, ASTM references, material composition, manufacturers recommended specifications, component physical properties and chemical resistance.
 3. Manufacturer's detailed description of the recommended procedures for handling and storing materials including a proposed method for monitoring temperatures of the storage location, if applicable to the specific liner material.
 4. Manufacturers detailed description of the recommended material installation/application process including mixing, additives, set time, cure time (return to service) and all equipment required for quality product delivery.
 5. Technical data sheet describing each rehabilitation component to be applied/installed, stating the expected longevity of the component in a stormwater environment. Data shall be based on independent third party tests.
 6. Manufacturer's detailed description of all required field testing processes and procedures.
- C. A detailed description of the Design-Builder's proposed procedures for cleaning and preparing the manhole structure, prior to applying/installing the liner shall be submitted.
- D. Design-Builder to submit video recording of CCTV inspections, pre-lining and post-lining, as required.

- E. Design-Builder to submit documentation relative to the qualifications, training and experience of the installers.

2.1 PIPE LINER

- A. The liner shall be fabricated from a vinyl ester resin material that is chemically resistant to exposure to chlorinated volatile organic compounds (CVOC).
- B. The liner shall be continuous, seamless, and jointless from manhole to manhole.
- C. Liner shall be sized to provide a tight fit to the host pipe.
- D. Liner material shall meet the requirements of ASTM F1216 and ASTM F1743.

2.2 STRUCTURE LINER

- A. The liner shall be fabricated from a vinyl ester resin material that is chemically resistant to exposure to chlorinated volatile organic compounds (CVOC).
- B. The liner shall be a pre-made system custom fabricated for each manhole shape and size.
- C. Liner shall be sized to provide a tight fit to the host structure.
- D. At a minimum, the manhole liner system shall be composed of a multiple layered composite consisting of felt, an impervious membrane, and fiberglass as required. The fibrous layer will be impregnated with a polymer resin. Add fiberglass and resin, for additional liner thickness.

2.2 CCTV

- A. The cameras shall be designed and constructed for storm drain piping inspection work. The mechanical design of the lens shall allow it to turn and rotate 360 degrees to provide a close up view of pipe walls. The camera shall be designed to maintain proper orientation of the picture while the lens is turning and rotating.
- B. The cameras shall be operative in 100% humidity conditions.
- C. The lighting for the cameras shall be suitable to allow a clear picture of the entire periphery of the drain pipe, such that joints, root intrusions, cracks, offset joints, deposits, etc. can be seen and identified by the Owner.
- D. The lens focus and rotational capabilities and the light intensity will be remotely controlled from an above ground television "studio".
- E. The cameras shall produce a continuous, full color picture with a quality acceptable to the Owner.

3.1 INSTALLATION

- A. All work shall be done in compliance with all current OSHA safety regulations. The Design-Builder shall conform to all work safety requirements of pertinent regulatory agencies, and shall

secure the site for working conditions in compliance with the same. The Design-Builder shall erect such signs and other devices as are necessary for the safety of the work site.

- B. Prior to lining the storm drains, the piping shall be cleaned and inspected with CCTV equipment. Design-Builder shall verify that the conditions of the drain pipes are acceptable for the method of liner installation specified.
- C. Prior to lining the drain structures, clean interior surfaces of manhole of debris, dirt, oil, grease, remains of old coating materials, and any other extraneous materials. Pressure wash manhole walls to remove loose mortar, concrete and debris. Pressure washing levels, used for cleaning, shall be as recommended by the manufacturer. Properly dispose of debris and residue from cleaning and other construction operations in a manner satisfactory to Owner and regulatory authorities.
- D. Design-Builder to control existing flow and bypass pump as required.
- E. The Design-Builder shall install the pipe liner per the method recommended by the liner manufacturer and as submitted in the shop drawing.
- F. Steam curing shall only be allowed for pipe sizes of 18-inch diameter and smaller, unless written permission from the MBTA is granted.
- G. Water used for installation shall be provided by the Design-Builder. The water shall be disposed of in a legal manner, as required by regulatory agencies.
 - 1. If the residents complain about the potential odors from the curing process, the MBTA may require the following actions to minimize the impacts of the odors:
 - a. The length of pipe that can be lined at one time may be limited, and/or
 - b. The curing water may only be able to be released during certain times of the day.
- H. Leakage testing shall be performed on the liner according to the requirements of ASTM F1216.
- I. Provide a watertight seal at the insertion and termination points in the manholes. Seal any space between the liner and host pipe in the manholes and provide for smooth merging of flows from other pipelines entering the manhole. Sealing material shall be chemically resistant to exposure to CVOC compounds.
- J. After completion of the work, perform CCTV inspection of the completed liner.
- K. The Design-Builder shall furnish all materials, equipment, tools, and labor as required for the CIPM lining of the manholes designated.
 - 1. The installation of the selected liner system shall be in strict accordance with the manufacturer's instructions. This shall include the preparation, installation, inflation, curing, and finishing, required for the complete installation of the CIPM liner. Custom fabricate liner to individual manhole dimensions.
 - 2. Line bench area with material placed in the bottom of the manhole and extending a minimum of 6 inches up the manhole wall.

3. Saturate liner with resin, place into manhole, pressurize with air or water and cure with hot water, steam or hot air following manufacturer's recommendations.
 4. When finished, liner shall form a monolithic structure from the manhole frame to the bench.
 5. The Design-Builder shall observe all safety rules, regulations, applicable laws and insurance requirements for storing, handling, use and application of the liner materials, resins and any solvents.
- L. During the Design-Builder's one-year warranty period, any defects which will affect the integrity or the strength of the liner shall be repaired at the expense of the Design-Builder.

3.2 CCTV INSPECTIONS AND DOCUMENTATION

A. Flow Control:

1. A minimum of 75% of the periphery of the storm drain shall be visible at all times.
2. CCTV inspections shall be conducted during dry weather when there are no storm flows in the piping. The MBTA may require that the piping be plugged and existing flows bypassed so that the entire periphery can be inspected.

B. Operation:

1. Perform inspection of storm drains after piping has been suitably cleaned. The Design-Builder shall clean piping just prior to CCTV inspections. The Design-Builder shall legally transport and dispose of all materials.
2. Drains shall be suitably isolated from the remainder of the storm piping as required.
3. Move the cameras through the piping in either direction at a uniform rate as directed by the MBTA.
4. The MBTA may require Design-Builder to pull cameras back to get a second view of a section of the pipe.
5. Use manual winches, power winches, television cable reel powered rewinds, high-pressure hose and reels on jet-cleaning trucks, or a flexible pole, to move the camera through the storm drains.
6. The screen monitor and winch operators shall be in full communication at all times.
7. Remove all wires, screens, sand bags, etc. used in the television inspection process from the piping at the completion of inspection of each drain section.

C. Measurement:

1. Measurement for location of defects, etc., shall be accurate to two tenths (0.2) of a foot over the length of the section being inspected.

D. Records:

1. Printed records shall be provided reflecting location of defects, etc., and shall be recorded per PACP standards and stored to a NASSCO-certified digital reporting software:
 - a. Keep records and supply to the MBTA when the work has been completed.
 - b. Show the exact location in relation to adjacent manholes, of each defect and infiltration point observed by the television camera.
 - c. Show locations of unusual conditions, roots, lateral storm drain connections, collapsed sections, presence of scale and corrosion, and other discernible features.
2. Video / Photographs:

Two copies of each set of videos shall be provided to the MBTA in DVD format, downloaded or output from a NASSCO certified software.

The video shall be digitally recorded, indexed by pipe section (labeled by manhole number or other means acceptable to MBTA) and allow for printing of still photographs.

Photographs shall be printed at MBTA's request and shall be identified on the back as follows:

Date of Photograph _____

Section, MH# _____ to MH# _____

Diameter of Pipe _____

Distance from MH# _____ is _____

Description of item photographed _____

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02800

EXTERIOR CONDUIT SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies exterior electrical distribution and communications facilities including concrete-encased underground duct banks, conduits, exposed conduits on bridges and other structures and associated manholes, handboxes, vaults, covers, and appurtenances.
- B. Exterior conduits and duct banks include, but not limited to, telephone, electric, fire alarm, police signal, traffic signal, cable, communications and lighting.
- C. Related Work:
 - 1. Volume 2 Technical Provisions Exhibit 21 "Additional Project Requirements".
 - 2. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
 - 3. Section 02300 – EARTHWORK
 - 4. Section 02650 – EXISTING SITE UTILITIES
 - 5. Section 03300 – CAST-IN-PLACE CONCRETE
 - 6. Section 05420 – TEMPORARY STEEL UTILITY BRIDGES

1.2 SUBMITTALS

- A. Submit to both the MBTA and affected utility company for approval, detailed plan and schedule for proceeding with the work. Submit to the MBTA written evidence of utility company's approval of proposed procedure, schedules, and materials.
- B. Certificates of compliance for conduits and appurtenances.
- C. Brochures and catalog cuts.
- D. Conduit location working drawings.
- E. Samples of all units along with certified engineering data. Upon approval of samples and test data, delivery of the units shall be made. No changes or modifications, with the exception of minor changes not affecting operation or appearance, will be allowed.
- F. Detail working drawings and design documentation for support spacing (maximum $\frac{5}{8}$ -inch mid-span deflection) and expansion / deflection systems for conduit installed on bridges and other structures.

1.3 JOB CONDITIONS

- A. Establish through the MBTA direct and continuous liaison with utility companies who are involved in the indicated work. Verify or determine interface with utility company, and work to be performed and materials to be furnished by utility company.
- B. The Design-Builder shall be responsible for necessary coordination and project engineering with the private utility companies and public agencies.

1.4 QUALITY ASSURANCE

- A. Inspection of the work will be made by the respective utility company involved and the Design-Builder.
- B. Notification Point – In the event that the supplier makes a modification or change to the specified unit, or development of a new unit to replace the specified unit, written notification shall be provided to the MBTA. It shall be the MBTA's option to accept delivery of the modified or new unit, or to request the specified unit. In no case shall the delivery of any new or modified unit result in any additional increase in cost to the MBTA.

1.5 GUARANTEES/WARRANTIES

- A. All manufacturers' guarantees against defects in the materials and workmanship shall be transferable to any authorized agency of the local authority or private utility company who shall be responsible for maintenance. Structural defects in the unit shall be cause for complete replacement of the unit. Defects in any component part of the unit, which is covered by the guarantee, may be replaced on an individual basis at the discretion of the MBTA. The cost of such replacement shall be borne by the Design-Builder. Any defective unit or compound thereof, returned within the guarantee period, shall be replaced by the Design-Builder who shall make arrangements to return any unit or components thereof, to the manufacturer at the Design-Builder's expense.
- B. The warranties that the Design-Builder receives from each manufacturer of equipment and materials pertinent to the complete and satisfactory operation of each unit included in the Section shall be turned over to the MBTA at the time of acceptance of the project, at no cost to the MBTA. Each warranty so furnished shall indicate its expiration date and be in effect for a minimum period of one (1) year from the date the units were placed in continuous operation. Warranties shall be transferable to any agency designated by the MBTA.
- C. If, within one (1) year from the date the units are placed in continuous operation, the equipment and materials do not meet the warrants specified above and the MBTA notifies the Design-Builder or his authorized representative promptly, the Design-Builder or his authorized representative thereupon, shall correct any defects either by repairing or replacing any defective part or parts, at no expense to the MBTA.

PART 2 - PRODUCTS

2.1 HANDHOLE AND/OR PULLBOXES

- A. Handhole and pullboxes influenced by the track live load shall meet Cooper E-80 load conditions.

- B. All handhole and pullboxes shall meet the requirements of the governing agency relative to installation location (MBTA, MassDOT, private utility company, etc.)

2.2 CONDUIT AND FITTINGS

- A. PTS 77 (C Plastic) or Schedule 40: with the following specific requirements

Nominal Size, Inches	4.0
Minimum Sweep	3 feet – 90 degrees radius
Maximum No. 90 degree Bends	2
3/8” Minimum polypropylene pull line or equivalent strength Polyester Woven Mule Tape must be installed in terminated conduit end to end	
Leave a minimum of 3’ of secured rope in box	

- B. 4” Hot Dip Galvanized Rigid Steel (0.25” wall): ANSI C80.1
- C. Reinforced thermosetting resin conduit (RTRC) or fiberglass reinforced epoxy (FRE), iron pipe size (IPS) of the sizes shown or noted on the Plans for conduit installed on bridges and other structures. The conduit shall be filament wound fiberglass reinforced epoxy as manufactured to comply with specifications outlined in NEMA TC-14. Conduit shall be free from defects including, but not limited to, delaminations and foreign inclusions. Conduit shall be uniform in color, density and physical properties. It shall be straight with ends cut square to inside diameter. Conduit shall be pigmented black and be supplied with an ultraviolet inhibitor. Conduit shall be supplied with all fittings, expansion joints, adapters and bends (sweeps) manufactured from the same materials as the conduit. All required underbridge anchors, hangers and support elements shall be supplied by the manufacturer of the fiberglass conduit. Hangers shall be comprised of fiberglass reinforced plastic tube and plate components and galvanized steel hanger rods, washers, bolts and related attachment accessories. Conduit jointing method shall be as approved by the respective utility.
- D. Conduit influenced by the track live load shall meet Cooper E-80 load conditions.

PART 3 - EXECUTION

3.1 EXCAVATING AND BACKFILLING

- A. Section 02300 - EARTHWORK.

3.2 PLACING DUCTS

- A. Completely encase underground duct banks in concrete where indicated. Do not use earth forms. Comply with the requirements of ANSI C2, Sections 31 and 32, NFPA 70, and Section 03300 - CAST-IN-PLACE CONCRETE.
- B. Lay the bottom tier of ducts, using the type of chairs and spacers recommended by the utility company.

- C. Make tight joints in the duct lines complying with the recommendations of the manufacturer of the jointing compound or coupling. Install rigid metal stub-ups, as indicated, adapted by suitable fittings to individual ducts for stub-up from duct bank to connection to equipment and lighting above grade. Cap stub-up to prevent water, dirt, or debris from entering stub-ups.
- D. Hold Point - Obtain the MBTA's approval of the installed duct prior to placing the concrete encasement.

3.3 PLACING CONDUIT

- A. Place conduit for direct burial without encasement only where so indicated. Provide four inch minimum clean sand bedding under conduit and 12 inch minimum sand cover over the conduit.
- B. Prove the conduit clear by:
 - 1. Rodding and pulling an approved test mandrel from structure to structure; or
 - 2. Blowing an approved device from structure to structure with compressed air.
- C. Leave a nylon or polyester pull-line in each conduit and cap open ends.
- D. For fiberglass conduit on bridges and other structures, expansion / deflection fittings shall be installed as recommended by the manufacturer.

3.4 CONSTRUCTION OF MANHOLES, HANDBOXES, AND VAULTS

- A. Comply with all requirements of NEC and NESC.
- B. Communication manholes/vaults shall conform to the respective utility company's requirements, or approved equal.
- C. Structures influenced by the track live load shall meet Cooper E-80 load conditions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith shall be included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02852

TRACKWAY DEMOLITION AND SALVAGE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work specified under this Section includes demolition work and track removal and disposition, as identified on the Contract Documents and identified as follows:
 - 1. Salvaging items for reuse by the MBTA.
 - 2. Removal of track material and its disposition.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
 - 2. Section 02856 – COMMUTER RAIL TRACK CONSTRUCTION.
 - 3. Section 02300 – EARTHWORK.

1.2 DEFINITIONS

- A. Demolish: Completely remove and legally dispose of off-site.
- B. Salvage: Carefully detach from existing construction, in a manner to prevent damage, and deliver to MBTA ready for reuse. Include fasteners or brackets needed for reattachment elsewhere.
- C. Hazardous Material: included but is not limited to asbestos and materials regulated under TSCA, RCRA (310CMR 30.00) and the Massachusetts Contingency Plan (MCP) (310 CMR 40.00) and building construction material defined by OSHA. Where applicable, consideration shall be given to MSDS in determining if a material could be potentially hazardous.

1.3 MATERIALS MBTASHIP

- A. Unless otherwise indicated, demolition waste becomes property of Design-Builder.
- B. All turnouts, crossovers, rail and other track materials shall be designated as salvage material and delivered to the MBTA as specified in Article 3.10 of this Section.
- C. All timber ties and switch timber removed shall be removed from the MBTA's property and disposed as specified in Article 3.10 of this Section.
- D. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to MBTA that may be uncovered during demolition remain the property of MBTA.

1. Carefully salvage in a manner to prevent damage and promptly return to MBTA.

1.4 SUBMITTALS

- A. Proposed Protection Measures: Submit informational report in accordance with OSHA Part 1926 procedures, including drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, for dust control and for noise control. Indicate proposed locations and construction of barriers.
- B. Indicate the following:
 1. Adjacent trackwork and systems equipment: Detail special measures proposed to protect adjacent trackwork and systems equipment to remain.
 2. Detailed sequence of demolition work, with starting and ending dates for each activity.
 3. Temporary interruption of utility services.
 4. Inventory: Submit a list of items to be removed and salvaged and delivered to MBTA prior to start of demolition.
 5. Pre-demolition Photographs or Video: Show existing conditions of adjoining construction and site improvements, including finish surfaces that might be misconstrued as damage caused by building demolition operations. Comply with Volumes 1 and 2. Submit before the Work begins.
 6. Hazardous material remediation plan. Included in the plan are landfill records indicating receipt and acceptance of hazardous wastes by a landfill facility licensed to accept hazardous wastes.
- C. All submissions shall be approved before work may proceed

1.5 QUALITY ASSURANCE

- A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.
- B. Standards: Comply with ANSI A10.6 and NFPA 241.
- C. Prepare a hazardous material remediation plan and submit to MBTA for approval.

1.6 PROJECT CONDITIONS

- A. Buildings immediately adjacent to demolition area may be occupied. Conduct demolition so operations of occupied buildings will not be disrupted.
 1. Provide not less than 72 hours notice of activities that will affect operations of adjacent occupied buildings.
 2. Maintain access to existing walkways, exits, and other facilities used by occupants of adjacent buildings.

- a. Do not close or obstruct walkways, exits, or other facilities used by occupants of adjacent buildings without written permission from authorities having jurisdiction.
- B. The MBTA assumes no responsibility for trackwork and systems equipment to be demolished.
 - 1. Conditions existing at time of inspection for bidding purpose will be maintained by MBTA as far as practical.
- C. Hazardous Materials: Hazardous materials may be present in signal instrument houses to be demolished. A report on the presence of hazardous materials is on file at the MBTA for review and use. Examine report to become aware of locations where asbestos, lead paint or other hazardous materials are present. Do not disturb hazardous materials or items suspected of containing hazardous materials except under procedures specified or required by a licensed professional and/or agency having jurisdiction.
- D. On-site storage or sale of removed items or materials is not permitted.
- E. Construction Access and Staging
 - 1. Special attention shall be given to sequence demolition staging work so the MBTA Commuter Rail operations are not affected with respect to safety, operation and schedule.
 - 2. All materials removed as part of this demolition shall become the property of the Design-Builder and are to be disposed of properly according to applicable local, State and Federal regulations, unless otherwise specified by the MBTA.

1.7 COORDINATION

- A. Arrange demolition schedule so as not to interfere with MBTA's operations and operations of adjacent occupied buildings.
- B. Demolition shall proceed in sections. The demolition work shall be performed in conjunction with the approved sequence of construction plans.
- C. A minimum of one track shall be in operation at all times. This track will be active during all demolition activities. Design-Builder shall take steps to ensure that his operations will not impact rail service.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that utilities have been disconnected and capped before starting demolition operations.
- B. Review Project Record Documents of existing construction provided by MBTA. MBTA does not guarantee that existing conditions are same as those indicated in Project Record Documents.

- C. Inventory and record the condition of items to be removed and salvaged. Provide photographs or video of conditions that might be misconstrued as damage caused by salvage operations.
- D. Verify that hazardous materials have been remediated before proceeding with trackwork or systems equipment demolition operations.

3.2 PREPARATION

- A. Existing Utilities: Refer to Section 02650 – EXISTING SITE UTILITIES for shutting off, disconnecting, removing, and sealing or capping utilities. Do not start demolition work until utility disconnecting and sealing have been completed and verified in writing.
- B. Salvaged Items: Comply with the following:
 - 1. Clean salvaged items of dirt and demolition debris.
 - 2. Pack or crate items after cleaning. Identify contents of containers.
 - 3. Store items in a secure area until delivery to MBTA.
 - 4. Transport items to storage area designated by MBTA.
 - 5. Protect items from damage during transport and storage.

3.3 PROTECTION

- A. Existing Facilities: Protect adjacent active tracks and walkways during demolition operations.
- B. Existing Utilities: Maintain utility services to remain and protect from damage during demolition operations.
 - 1. Do not interrupt existing utilities serving adjacent occupied or operating facilities unless authorized in writing by MBTA and authorities having jurisdiction.
 - 2. Provide temporary services during interruptions to existing utilities, as acceptable to MBTA and authorities having jurisdiction.
 - a. Provide at least 72 hours notice to occupants of affected businesses or buildings if shutdown of service is required during changeover.
- C. Temporary Protection: Erect temporary protection, such as walks, fences, railings, canopies, and covered passageways, where required by authorities having jurisdiction and as indicated. Comply with requirements in Volumes 1 and 2.
 - 1. Protect existing site improvements, appurtenances, and landscaping to remain.
 - 2. Provide protection to ensure safe passage of people around demolition areas and to and from occupied portions of adjacent businesses and structures.
- D. Remove temporary barriers and protections where hazards no longer exist. Where open excavations or other hazardous conditions remain, leave temporary barriers and protections in place.

3.4 DEMOLITION, GENERAL

- A. General: Demolish indicated existing signal systems equipment and site improvements completely.
Use methods required to complete the Work within limitations of governing regulations and as follows:
 - 1. Do not use cutting torches until work area is cleared of flammable materials. Maintain portable fire-suppression devices during flame-cutting operations.
 - 2. Maintain fire watch during and for at least four hours after flame cutting operations.
 - 3. Maintain adequate ventilation when using cutting torches.
- B. Engineering Surveys: During demolition, perform surveys to detect hazards that may result from signal systems equipment demolition activities.
- C. Site Access and Temporary Controls: Conduct signal systems equipment demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.
 - 1. Do not close or obstruct streets, walks, walkways, or other adjacent occupied or used facilities without permission from MBTA and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
 - 2. Use water mist and other suitable methods to limit spread of dust and dirt. Comply with governing environmental-protection regulations. Do not use water when it may damage adjacent construction or create hazardous or objectionable conditions, such as ice, flooding, and pollution.
- D. Explosives: Use of explosives is not permitted.

3.5 SALVAGE

- A. Salvage indicated material or material determined by the MBTA to be suitable for reuse, including: turnouts, rail, joint bars, and tie plates shall be delivered to the MBTA.
- B. Protect metallic coatings on salvaged items. Remove adhering concrete from salvaged items where required for disposal or directed by the MBTA.
- C. Repair, or replace with new material, salvaged material damaged or destroyed due to the Design-Builder's negligence.
- D. All items designated as "remove" and not relocated as part of this project, and determined to be in salvageable condition by the MBTA, shall be delivered to the MBTA Railroad Operations material yard in Charlestown, MA, unless otherwise directed by the MBTA. No delivery will be greater than 50 miles, one way. Such delivery of materials shall be coordinated with the MBTA prior to delivery.

3.6 SITE RESTORATION

- A. Below-Grade Areas: Rough grade below-grade areas ready for further excavation or new construction.
- B. Site Grading: Uniformly rough grade area of demolished construction to a smooth surface, free from irregular surface changes. Provide a smooth transition between adjacent existing grades and new grades.

3.7 REPAIRS

- A. Promptly repair damage to adjacent buildings, utilities, fences, or track caused by demolition operations.

3.8 DISPOSAL OF DEMOLISHED MATERIALS

- A. Remove demolition waste materials from Project site and legally dispose of them in an EPA-approved landfill acceptable to authorities having jurisdiction.
 - 1. Do not allow demolished materials to accumulate on-site.
 - 2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
- B. Do not burn demolished materials on site.

3.9 CLEANING

- A. Clean adjacent structures and improvements of dust, dirt, and debris caused by trackwork or systems equipment demolition operations.

3.10 TRACK AND TURNOUT REMOVAL AND DISPOSITION OF MATERIALS

- A. Prior to track construction the existing track and turnouts shall be dismantled and removed to the limits shown on the approved drawings.
- B. Rail, joint bars and tie plates shall be salvaged and returned to the MBTA as specified in paragraph G.
- D. Track bolts, nuts, washers, spikes, anchors and lags shall become the property of the Design-Builder and shall be disposed of off of the MBTA's property.
- E. Track and turnout dismantling shall be done using equipment and procedures that will not damage salvaged material or make it unfit for future use. If a torch is used to remove bolts from joints care shall be taken so as not to damage joint bar.
- F. All salvaged turnout material shall be packaged as a unit and delivered to designated MBTA material yard(s) in Somerville or elsewhere within 50 miles of the Project, and shall be unloaded and stockpiled as directed by yard personnel.
- G. All salvaged rail and other track materials shall be delivered to designated MBTA material yard(s) in Somerville or elsewhere within 50 miles of the Project. Materials shall be separated, not mixed together, by class, type and weight and stockpiled as directed by yard personnel.

- H. Crossties and Switch Timber - All existing crossties and switch timber removed shall become the property of the Design-Builder, removed from the ROW and disposed of as indicated in paragraphs I through M below.
- I. Disposal shall be accomplished through incineration of ties, tie butts and switch timbers and bridge timbers at an approved facility.
- J. The processing and disposal facility/facilities shall be fully licensed and permitted for handling, processing, storage and incineration of treated wood waste.
- K. Bottom ash, fly ash, and other by-product residues from the combustion process shall be disposed of at a fully licensed land fill.
- L. Identified combustion facilities shall be approved by the MBTA's Project Manager prior to the commencement of burning of disposed ties and timbers.
- M. Design-Builder shall provide the MBTA with a copy of a certified weight slip for each quantity shipped, unloaded, and properly disposed of at the licensed facility.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith shall be included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02866

DIRECT FIXATION TRACK CONSTRUCTION

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This section specifies direct fixation track construction for Light Rail Track.
1. Requirements for installation of direct fixation track containing continuous welded rail (CWR) on aerial structure deck, at-grade slabs, and transition between aerial and at-grade track.
 2. The requirements of this Section supplement the requirements of Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
 3. The Work includes all ancillary activities as may be required to complete a direct fixation track system.
- B. Section Includes:
1. Site Examination
 2. Preparation
 3. Demonstration Section
 4. Track Alignment, Profile, and Geometry
 5. Concrete Plinth Construction
 6. Direct Fixation Rail Fastener Installation
 7. Distributing Continuous Welded Rail
 8. Rail Gap
 9. Rail Temperature
 10. Rail Installation
 11. Bonded Insulated Joints
 12. Traction Electrification and Signal Bonding
 13. Tolerances
 14. Field Quality Control
- C. Related Work Specified Elsewhere:
1. Section 02850 – LIGHT RAIL TRACK CONSTRUCTION
 2. Section 02851 – RAILROAD RUNNING RAIL

3. Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION
4. Section 02854 – TRACK SURFACING AND ALIGNMENT
5. Section 02865 – TRACK APPURTENANCES
6. Section 02868 – DIRECT FIXATION FASTENERS
7. Section 02877 – THERMITE WELDING
8. Section 03300 – CAST-IN-PLACE CONCRETE
9. Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE
10. Section 16060 – GROUNDING AND BONDING
11. Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION

1.2 APPLICABLE STANDARDS

- A. The following Codes, Regulations, Reference Standards and Specifications apply to work included in this Section:
1. MBTA Track Maintenance Standards.
 2. MBTA Book of Standard Trackwork Drawings
 3. American Railway Engineering and Maintenance of Way Association, (AREMA):
 - a. Manual for Railway Engineering
 - b. Portfolio of Trackwork Plans
 4. ASTM International (ASTM):
 - a. ASTM A775/A775M Specification for Epoxy-Coated Reinforcing Steel Bars
 - b. ASTM C881 Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete.

1.3 SUBMITTALS

- A. General: Submittal procedures for all submittals, including but not limited to Shop Drawings, Product Data, Samples, shall comply with Section 01300 – SUBMITTALS.
1. Relevant submittals as indicated in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
 2. Work plan in accordance with Article 3.2A herein.

3. Survey of existing bridge decks and track slabs upon which direct fixation tracks will be constructed indicating as-built conditions and deviations from requirements.
4. Product Data:
 - a. Concrete
 - b. Concrete Reinforcement
 - c. Epoxy grout
5. Shop Drawings:
 - a. Concrete reinforcement details.
 - b. Concrete plinths. Provide drawings indicating the layout of all direct fixation plinths detailing their relationship to the as-built concrete surfaces upon which they will be constructed. Show gaps between plinths as necessary to avoid joints, promote drainage, facilitate the work of other trades who shall position cables beneath the rails, and other physical conditions. Show locations of inserts for individual direct fixation rail fasteners and other attachments.
 - c. Details showing interfaces with the work of other trades.
 - d. HDPE pads.
6. Working Drawings: Configuration and formwork for concrete plinths.
7. Procedures:
 - a. Procedure for resetting removed anchor bolt inserts in concrete plinths in accordance with Article 3.5.C.3 herein.
8. Test Results: Insert tests in accordance with Article 3.14 herein.
9. Miscellaneous: Submit product data and shop drawings for any materials provided as part of the Work of this Section that do not have requirements for such submittals specified in other Sections.

1.4 QUALITY ASSURANCE

- A. General: Comply with the requirements of Section 01400 – QUALITY ASSURANCE.
- B. Quality Plan:
 1. Comply with the requirements of Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
 2. Incorporate the following:
 - a. Surface preparation measurements.

- b. Environmental measurements such as temperature, dew point, relative humidity, rainfall, and similar items.
 - c. Mixing, applying, and curing measurements such as component materials viscosity and density, mixing ratios, and material hardness at various cure times.
 - d. Provisions addressing test failure and retesting procedures.
- C. Demonstration Section: Construct a demonstration section of direct fixation track as indicated in Article 3.3 herein. Do not employ construction methods that have not been proven and accepted based on the demonstration section.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Handle all trackwork materials in accordance with Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.

PART 2-PRODUCTS

2.1 TRACK MATERIALS

- A. Furnish all materials required to construct the direct fixation trackwork, including but not limited to the following:
- B. Concrete:
 - 1. Provide concrete meeting the requirements of Section 03300 – CAST-IN-PLACE CONCRETE
 - 2. Concrete strength: 4,000 psi minimum
- C. Concrete Reinforcement: Provide coated steel reinforcement bars in accordance with Section 03300 – CAST-IN-PLACE CONCRETE, the approved drawings, and ASTM A775.
 - 1. Epoxy Coating: Submit catalog cuts on epoxy coating used to repair damage to epoxy coated rebar. Use coating to touch up “chipped or cut” existing stirrups or new rebar to provide a complete insulating cover.
 - 2. All reinforcement shall be securely fastened to the underside of the attaching members as shown on the approved drawings.
 - 3. Special Hook Tie Bars: In superelevated track sections provide a series of reinforcing hook tie bars to generate the stepped-up installation shown on the approved drawings with spacer thimbles at low rail plinths.
 - 4. Tie Wires: For reinforcement bar, connection shall be an insulating material.
- D. Direct Fixation Fastener Insulating Shims:
 - 1. Place a minimum of one High-Density Polyethylene (HDPE) insulating shim directly beneath each direct fixation rail fastener to provide an additional electrical isolation barrier between

the rails and ground. All direct fixation fasteners shall have at least one HDPE shim directly beneath the fastener body.

2. HDPE Vertical Adjustment Shims:

- a. One 3/16-inch shim is provided per fastener under Section 02868 – DIRECT FIXATION FASTENERS. Provide additional shims as specified herein and as needed to correct track profile and cross-level to within specified tolerances.
- b. Conform to the requirements for insulating pads in Section 02868 – DIRECT FIXATION FASTENERS.
- c. Provide shims in graduated thicknesses so that no more than two shims will be required for all increments of 1/16-inch thickness from 1/16 inch to 3/8 inch.

E. Epoxy Grout:

1. Provide epoxy grout for securing replacement embedded fastener anchor inserts that require repositioning due to alignment errors.
2. Grout material: Provide material that complies to ASTM C881, Type 4.

F. Temporary Rail Clips: Furnish temporary threaded rail hold down clips for direct fixation fasteners, to be used during the installation/construction phase as described in Article 3.6 herein. The temporary clips shall be painted yellow for recognition.

H. Provide all other materials incidental to the construction of direct fixation trackwork that are necessary to provide a complete and acceptable track installation providing the function, appearance, and electrical isolation, as specified and necessary.

2.2 EQUIPMENT

A. Comply with the equipment requirements specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.

PART 3 -EXECUTION

3.1 SITE EXAMINATION

- A. Perform an as-built survey of the concrete surfaces upon which the direct fixation track will be constructed. Thoroughly inspect the existing stirrups, inserts and other attachment devices that are in place on at-grade slabs and determine if they are a suitable anchorage points for the direct fixation trackwork.
- B. Determine if existing work conforms to the requirements of the specifications to which it was built including but not limited to Section 03300 – CAST-IN-PLACE CONCRETE.
- C. Note all defects, including out of tolerance locations, and prepare a comprehensive survey and report. Arrange to have deficiencies corrected by the responsible party prior to commencing direct fixation track installation.

3.2 PREPARATION

- A. Work Plan: Prior to beginning the Work specified in this Section, submit a detailed work plan describing the installation procedures required for the Work, including but not limited to the following:
1. All applicable requirements as stipulated in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
 2. Specific preparation and installation procedures for transporting and placing CWR in direct fixation track. Include listing of transporting and working equipment required.
 3. Describe the methods proposed for construction/installation of plinths, direct fixation rail fasteners and rails. Two methods are generally expected as detailed below. The Design-Builder may employ either method or, if appropriate, utilize both methods at different locations on the work site:
 - a. Top-down construction: This method uses track gauge jigs for supporting skeleton track (rails and direct fixation rail fasteners) in proper horizontal and vertical alignment. Temporary steel shims are employed in lieu of the permanent HDPE shims so as to avoid damage to the latter. Concrete forms and reinforcing steel are installed in the conventional manner. Concrete is then poured beneath the suspended direct fixation rail fasteners.
 - b. Bottom-up construction: Concrete forms and reinforcing steel are installed in the conventional manner. Jigs are positioned to hold the embedded female anchor inserts in proper position. After concrete curing, the direct fixation rail fasteners and rails are installed.
 4. Include details and shop drawings pertaining to the components to be used, methods, templates, fixtures, temporary clips, and method to protect concrete plinths from thermal expansion during the concrete plinth curing period.
- B. Roughen the structure floor by waterblasting, a light jack hammer process or other acceptable means of providing a good surface for bond between the floor concrete and the plinth concrete. Remove all loose laitance and debris from the floor surface that will be in contact with the concrete plinth.

3.3 DEMONSTRATION SECTION

- A. To confirm the proposed procedure for the construction of direct fixation track, construct a demonstration section not less than 100 track feet in length. Demonstration section shall be a continuous segment of track.
- B. Demonstration section shall become a segment of the final track subject to final acceptance. Propose the specific track segment where it is planned to construct the demonstration section and how that particular segment will illustrate the construction methods proposed.

- C. If the demonstration section (or portion thereof) is unsatisfactory, it shall be demolished, a revised construction procedure proposed, and a new demonstration section constructed.
- D. Production construction of direct fixation track will not be permitted until the designated demonstration section has been accepted.
- E. Once the demonstration section has been accepted, construction methods other than those used to build the accepted section shall not be employed unless verified through construction of a new demonstration section.

3.4 TRACK ALIGNMENT, PROFILE, AND GEOMETRY

- A. Provide track alignment, profile, and geometry in accordance with the requirements specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
- B. Construct track conforming to the alignment and profile data shown on the approved drawings.

3.5 CONCRETE PLINTH CONSTRUCTION

- A. Construct concrete plinths in conformance with the requirements of Section 03300 – CAST-IN-PLACE CONCRETE, and with the following:
 - 1. Use non-conductive plastic tie bands to secure epoxy coated reinforcing bar cage assembly.
 - 2. Inspect all reinforcing bar installation for cut ends, chipped, or uncoated conditions and repair with an approved epoxy coating material similar to and compatible with the factory-applied coating on the reinforcing bars.
 - 3. Inspect plinth stirrups and reinforcing bar cage for tight contact with slab or deck stirrups. Cage shall be securely fastened down with no upward movement possible.
- B. Construct the concrete plinth in the direct fixation fastener bearing seat area, which includes the concrete surface area covered by the direct fixation fastener insulating shim, with a uniform steel-trowel cement mortar finish to provide a smooth and uniform bearing surface capable of providing full contact with the HDPE insulating shim. Comply with criteria cited in Article 3.14 herein.
- C. Cast anchor bolt inserts into the concrete plinths for the direct fixation fasteners as shown on the approved drawings, the accepted work plan and associated working drawings, and in accordance with the following:
 - 1. Furnish and install anchor inserts that are free of loose scale, grease, or other foreign matter.
 - 2. Use either top-down skeleton track with suspended direct fixation fasteners or bottom-up installation with gages to accurately locate anchor inserts, and positively secure the inserts against displacement during concrete placement.
 - a. In both installation methods, do not use final installation direct fixation fastener clips during the procedure. Use a temporary threaded clip to not disturb inserts embedded

in green concrete at the time of release of rail or gages during concrete curing and finishing.

- b. Install inserts flush with top of the concrete to plus 0 inches above or minus 1/8 inch below.
3. Carefully remove displaced or misaligned inserts in a manner that will prevent spalling or compromising the structural integrity of surrounding plinth concrete by core drilling or other approved means.
 - a. Submit a procedure for resetting removed anchor bolt inserts in concrete plinths for the direct fixation fasteners, including epoxy grout materials for setting the insert and the alignment method.
 - b. Reset all displaced or misaligned inserts at no additional cost to the MBTA.

D. Repairs to Concrete Plinth Surface:

1. Repair voids in top surface of concrete plinth by troweling in cementitious mortar to smooth the surface. Prepare surface in compliance with rail fastener manufacturer's recommendations. An unacceptable number or volume of voids shall be cause for rejection of the concrete pour.
2. Do not use cementitious mortar to correct second pour concrete that is not within the required vertical tolerances. Grinding of second pour concrete surfaces to bring concrete flush with rail anchorage inserts, or to achieve proper elevation or flatness tolerances, is allowable only with the approval of the MBTA. Low concrete may be corrected by using shims beneath the fasteners, subject to the limitations on shimming that are stated elsewhere in this Section.

3.6 DIRECT FIXATION RAIL FASTENER INSTALLATION

- A. Once the plinth concrete has attained its initial set, release the temporary rail clips on fasteners, jigs, or templates used during the concrete pour.
 1. If using the top-down construction method, remove the temporary threaded clips used in the direct fixation rail fasteners so the anchor insert setting is not disturbed.
 2. The intent of releasing the rail installation from the fastener before final concrete cure is to relieve stress in the concrete plinths caused by thermal expansion and contraction in either the rail or concrete plinth, both of which could lead to concrete cracks in the plinths, originating at the anchor insert locations. Development of hairline cracks originating at anchor inserts will be grounds for removal and replacement of concrete plinth.
 3. Permanently connect/anchor the rail and the direct fixation fasteners only after the plinth concrete has attained at least 70% of its specified 28-day strength.
- B. If concrete surface grinding is required to achieve uniform bearing or to correct the vertical plinth height, do not grind the concrete lower than the top of the anchor insert collar unless the procedure and limits of grinding are established in writing, approved by the insert manufacturer and submitted to the MBTA.

- C. Thoroughly blow stone dust and extraneous materials off the surface of each concrete plinth to prevent damage to the direct fixation fastener HDPE insulating shim.
- D. Install one direct fixation fastener insulating shim for each fastener on the concrete plinth.
- E. Install elevation correction shims between the direct fixation fastener-insulating shim and the concrete plinth, as required, to ensure proper rail line and grade.
 - 1. Total number of HDPE shims per fastener: one minimum, three maximum.
- F. Direct fixation rail fasteners include a lateral adjustment feature for moving the fastener relative to the rail. This adjustment capability is primarily for future maintenance so as to adjust for lateral wear on the rail, and shall not be all used by the constructor for aligning the track. Design-Builder's accuracy in positioning anchor inserts shall leave not less than 3/8 inch of residual lateral adjustment in both directions after final aligning and gauging of the track. If this minimum cannot be met, replace as many anchor inserts as may be necessary to make it possible to position rail fasteners with the specified minimum residual adjustment.
- G. Remove misaligned inserts by core drilling or other method that prevents spalling or structural damage to the surrounding concrete. Use power tool, or other device as accepted by the MBTA, to roughen sides of cored hole. Wire brush inside of hole to loosen dust and loose material from hole, and then blow out hole with compressed air. Provide filter on compressed air system to ensure that air jet is free of any oil residue. Set anchor bolt insert with epoxy grout in accordance with manufacturer's instructions. Do not use previously installed anchor inserts that have been damaged during coring operations.

3.7 DISTRIBUTING CONTINUOUSLY WELDED RAIL

- A. Distribute continuously welded rail in accordance with the requirements specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.

3.8 RAIL GAP

- A. Determine the allowable rail gap when welding CWR strings together by using the rail gap equation in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.

3.9 RAIL TEMPERATURE

- A. The zero thermal stress temperature at final closure and fastening for CWR direct fixation track is as noted in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.

3.10 RAIL INSTALLATION

- A. Lay, clamp, fasten, and weld CWR in direct fixation track according to the procedure specified in Section 02853 – CONTINUOUS WELDED RAIL INSTALLATION.
- B. Install running rail and pre-curved running rail in conformance with Section 02851 – RAILROAD RUNNING RAIL.

- C. Electric welding shall comply with Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
- D. Thermite welding shall comply with Section 02877 – THERMITE WELDING.

3.11 BONDED INSULATED JOINTS

- A. Locate bonded insulated rail joints where shown on the approved drawings.
 - 1. Locate bonded insulated joints by centering between adjacent fasteners.
 - 2. Stagger the location of bonded insulated joints on the opposite rail by the distance of one fastener spacing from the opposite insulated joint position.
- B. Install and test bonded insulated joints in accordance with Section 02865 – TRACK APPURTENANCES.

3.12 TRACTION ELECTRIFICATION AND SIGNAL BONDING

- A. Install traction power and signal bonds as shown on the approved drawings and in conformance with requirements of Section 16060 – GROUNDING AND BONDING.

3.13 TOLERANCES

- A. Conform to the track construction tolerances as specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION. Longitudinal fastener spacing tolerance shall be $\pm 3/8$ inch from specified dimensions.
- B. Fastener spacing:
 - 1. Ordinary installations: Plus 1 inch or minus 3 inches from specified dimension.
- C. Concrete cover over rebar:
 - 1. Minimum concrete cover over all rebar: 1-1/2 inches.
 - 2. Maximum concrete cover between top rebar layer and top surface of plinth: 3 inches.
- D. Rail Anchorage Insert Placement: Perpendicularity of insert to top surface of concrete: maximum deviation 3 degrees.

3.14 FIELD QUALITY CONTROL

- A. Anchor Bolt Insert Tests:
 - 1. During the construction period, intermittently conduct the restrained pull-out test, unrestrained pull-out test, and torsion test as described below:
 - a. Inserts to be tested:

- 1) A minimum of 10 inserts spaced out within each concrete pour. For purposes of this Article, a concrete pour is defined as a series of plinths poured in a continuous operation over a time not to exceed 4 hours.
 - 2) At least 15 inserts per 300 direct fixation fastener inserts cast in place.
 - 3) 100% of inserts that have been reset in epoxy grout.
- b. Randomly select inserts, other than reset inserts, unless otherwise directed by the MBTA.
 - c. Notify the MBTA 24 hours in advance of the location and time of insert testing.
 - d. Submit the test results of insert tests to the MBTA, unless otherwise directed. Retain copies for submission with project record documents.
2. Restrained Pull-Out Test:
 - a. Test Method:
 - 1) Place a 5-inch by 5-inch by 1/2-inch steel plate with a hole in the center 1/4 inch larger in diameter than the insert top collar over the insert and clear of the collar.
 - 2) Install an anchor bolt in the insert and apply an upward vertical load of 20,000 pounds bearing against the steel plate.
 - 3) Hold the load for 1 minute, and then release the load.
 - b. Acceptance Criteria: No evidence of slippage or cracking of concrete or failure of the bond between the insert and plinth concrete or epoxy grout.
 3. Unrestrained Pull-Out Test:
 - a. Test Method:
 - 1) Install an anchor bolt in the insert and apply an upward vertical load of 10,000 pounds to the bolt in such a manner that no vertical load is applied to the plinth concrete within a radius of 6 inches from the centerline of the insert.
 - 2) Hold the load for 1 minute, and then release the load.
 - b. Acceptance Criteria: No evidence of slippage or cracking of concrete or failure of bond between the insert and plinth concrete or epoxy grout.
 4. Torsion Test:
 - a. Test Method: Apply 500-foot-pounds of torque to an anchor bolt installed with at least 1-inch thread engagement in the insert but not threaded to the bottom of the insert.
 - b. Acceptance Criteria: No evidence of failure of the bond between the insert and surrounding plinth concrete or epoxy grout.
 5. Shall inserts fail to pass the specified tests, test four additional inserts from the same concrete pour or 300-insert lot.
 - a. Failure of additional inserts to pass the tests shows that the installation procedure is defective and 100 % of the remaining lot will be rejected.

- b. Perform additional tests as specified above and other tests as required on concrete and other materials associated with insert installation to determine the limits and cause of the defective installation.
- c. Do not proceed with further insert installation until the causes of failure have been determined and a modified procedure ensuring satisfactory installation has been established.
- d. Investigate failure of a reset insert prior to remedial work and do not reset additional inserts without the MBTA's approval.
 - 1) Submit revised procedures and materials for resetting inserts for the MBTA's approval.

B. Plinth Concrete:

- 1. Do not place concrete that is delivered without the required batch documentation in accordance with Section 03300 – CAST-IN-PLACE CONCRETE. Missing or incomplete concrete test data will be construed as noncompliance.
- 2. Remove and replace plinth concrete batches failing to comply with the requirements of both this Section and Section 03300 – CAST-IN-PLACE CONCRETE, at no additional expense to the MBTA.
- 3. Concrete plinth surface finish: Direct fixation continuous bearing surface shall be within a tolerance of plus or minus 3/8 inch in 10 feet of the correct longitudinal slope and plus or minus 1/8 inch in 3 feet in cross slope.
- 4. Rail fastener bearing areas finish:
 - a. Voids: Prior to their being filled with cementitious grout, any surface voids in freshly poured concrete beneath direct fixation fasteners shall not exceed 10 % of concrete surface area under the fastener. Maximum size of any single void: 1/2-inch diameter by 3/8 inch deep.
 - b. Uniformity:
 - 1) Compliance with the requirement for a uniform bearing surface will be determined after rail is installed to final alignment with all welds, rail clips, anchor bolts, and associated components installed and all threaded elements such as anchor bolts fully torqued.
 - 2) Surface bearing acceptance criteria:
 - a) Do not allow gaps more than 1/16 inch, as determined by a 1/16-inch thick by 1-inch wide feeler gage, over 90 % of the projected rail base area immediately under the projected rail base, between the rail base and fastener rail seat, between the fastener bottom and the concrete surface or a shim, between shims, and between the bottom shim and the concrete surface.
 - b) Do not allow gaps more than 1/16 inch, as determined by a 1/16-inch thick by 1-inch wide feeler gage, over 70 % of the area outside the projected rail base area between the fastener, shim, and concrete.
 - c) When additional vertical adjustment shims are present, do not allow the sum of gaps to add up to more than 1/16 inch over the

respective area percentages for the projected rail base in Article 3.14 B.4.b.2) a) herein, and outside the projected rail base in Article 3.14 B.4.b.2).b) herein.

- C. Track Inspection: Perform track inspection in accordance with the requirements specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
- D. Track-to-Earth Resistance Testing:
 - 1. Conduct track-to-earth resistance acceptance tests of each section of track installed, in accordance with Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION.
 - 2. Test tracks in sections between insulated joints, except that test section lengths shall not exceed 2,000 feet in length.
 - 3. Complete resistance testing before field welding adjoining CWR strings, so that rail joints may be disassembled to isolate rail sections testing and to assist in locating areas of low-resistance conditions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith shall be included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02868
DIRECT FIXATION FASTENERS

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This section specifies:
1. Requirements for furnishing, fabricating, and delivering direct fixation (DF) fasteners.
 2. Furnish all labor, materials, and equipment for the manufacture, fabrication, and delivery of “off-the-shelf” DF fasteners, which are defined as currently available fasteners designed to meet or exceed the requirements of these Specifications, for installation on the Contract.
 3. Provide the material fabrication, testing, shipping, delivery, unloading, and storage of DF fasteners.
- B. Section Includes:
1. Materials
 2. Components
 3. Source Quality Control
 4. Static Tests
 5. Electrical Tests
 6. Dynamic Tests
 7. Anchorage Assembly Test

1.2 RELATED SECTIONS

- A. Other specification sections that relate to the work include, but are not limited to, the following:
1. Section 02866 – DIRECT FIXATION TRACK CONSTRUCTION

1.3 APPLICABLE STANDARDS

- A. American Institute of Steel Construction (AISC):
1. AISC ASD Manual of Steel Construction
- B. ASTM International (ASTM):
1. ASTM A36/A36M Standard Specification for Carbon Structural Steel
 2. ASTM A148/A148M Standard Specification for Steel Castings, High Strength, for Structural Purposes
 3. ASTM A449 Standard Specification for Hex Cap Screws, Bolts and Studs, Steel, Heat Treated, 120/105/90 ksi Minimum Tensile Strength, General Use
 4. ASTM A536 Standard Specifications for Ductile Iron Castings

5. ASTM A668 Standard Specification for Steel Forgings, Carbon and Alloy, for General Industrial Use
6. ASTM B117 Standard Test Method for Salt Spray (Fog) Testing
7. ASTM D256 Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics
8. ASTM D257 Standard Test Methods for DC Resistance or Conductance of Insulating Materials
9. ASTM D395 Standard Test Methods for Rubber Property – Compression Set
10. ASTM D412 Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers—Tension
11. ASTM D429 Standard Test Methods for Rubber Property – Adhesion to Rigid Substrates
12. ASTM D471 Standard Test Method for Rubber Property – Effect of Liquids
13. ASTM D570 Standard Test Method for Water Absorption of Plastics
14. ASTM D573 Standard Test Method for Rubber – Deterioration in an Air Oven
15. ASTM D624 Standard Test Method for Tear Strength of Conventional Vulcanized Rubber and Thermoplastic Elastomers
16. ASTM D638 Standard Test Method for Tensile Properties of Plastics
17. ASTM D648 Standard Test Method for Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position
18. ASTM D695 Standard Test Method for Compressive Properties of Rigid Plastics
19. ASTM D746 Standard Test Method for Brittleness Temperature of Plastics and Elastomers by Impact
20. ASTM D785 Standard Test Method for Rockwell Hardness of Plastics and Electrical Insulating Materials
21. ASTM D1149 Standard Test Methods for Rubber Deterioration-Cracking in an Ozone Controlled Environment
22. ASTM D1248 Standard Specification for Polyethylene Plastics Molding and Extrusion Materials for Wire and Cable
23. ASTM D1505 Standard Test Method for Density of Plastics by the Density-Gradient Technique
24. ASTM D1525 Standard Test Method for Vicat Softening Temperature of Plastics
25. ASTM D1693 Standard Test Method for Environmental Stress-Cracking of Ethylene Plastics
26. ASTM D2240 Standard Test Method for Rubber Property – Durometer Hardness
27. ASTM E23 Standard Test Methods for Notched Bar Impact Testing of Metallic Materials

- 28. ASTM G101 Standard Guide for Estimating the Atmospheric Corrosion Resistance of Low Alloy Steels
- C. National Research Council of the National Institute of Standards and Technology (NIST):
 - 1. NIST Publication Calibration Standards
- D. SSPC: The Society for Protective Coatings (formerly Steel Structures Painting Council):
 - 1. SSPC Vis 1 Guide to Pictorial Surface Preparation Standards for Painting Steel Surfaces

1.4 DESIGN REQUIREMENTS

- A. Furnish “off the shelf” DF fasteners designed to meet or exceed the requirements of these Specifications.
- B. Provide fastener of a design in continuous daily service for at least 5 years with a proven record of successful performance.
 - 1. Provide complete and detailed shop drawings.
 - a. Submit existing shop drawings and other data, including existing design calculations, required by these Specifications or that are necessary to adequately perform the Work.
 - b. Provide shop drawings showing the general arrangement and such details as are necessary to provide a comprehensive description of the Work to be performed.
 - c. Furnish shop drawings in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
 - 2. Furnish product data, design calculations, and other required data on standard 8-1/2-by-11-inch sheets, printed on one side only.
 - a. Provide the title block information required by Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”, Product Data, and Samples, on each sheet.
 - 3. Unless otherwise indicated, submit not less than two identical samples of the DF fastener.
 - a. Label each sample in accordance with Section Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
 - b. Enclose a copy of a transmittal letter for each shipment of samples with a block for an approval stamp in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
 - 4. Submit all drawings, data, and schedules in accordance with the time requirements specified in Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
- C. Type of Fastener:
 - 1. Furnish fasteners with one-piece body designed for use on the 115 RE (5 1/2-inch base width) rail section.

2. Furnish standard rail fasteners having a longitudinal restraint between 1,600 and 3,000 pounds.
3. Furnish rail fasteners having a spring rate of between 94,000 pounds per inch and 120,000 pounds per inch for vertical loads between 4,500 pounds and 12,000 pounds.
4. Furnish rail fasteners that bond the elastomeric component of the rail fastener on its bottom surface to a base plate not less than 1/4-inch thick and bond the elastomeric component of the rail fastener's top surface to a plate.
 - a. Furnish plates of the same plan dimensions and configurations as the elastomer.
5. Form the rail hold down assembly of the rail fasteners from spring clip type elements (Pandrol "e" clip non-threaded components).
6. Furnish rail fasteners comprised of as few components as is economically and technically feasible for ease of assembly, disassembly, and maintenance.
7. Furnish rail fasteners designed to permit installation and replacement of the entire assembly or its components by one worker using standard, conventional hand tools.

D. Properties in Installed Position:

1. Design the assembled fastener with a tapered shape to provide 40 to 1 inward rail cant when installed on a level plinth or aerial structure deck.
2. Do not furnish fasteners having projections into leveling pads, aerial structure deck, or plinth concrete.
3. Bonding of the rail fastener to the plinth concrete, aerial structure deck or leveling pads will not be permitted.

E. Dampening of Forces:

1. Furnish rail fasteners designed to provide damping of lateral and vertical forces transferred to anchor bolts.
2. Furnish fastener plates having full bearing on the elastomer in all positions of lateral adjustment and having a means of preventing displacement of the elastomer under operating conditions.
3. Furnish rail fasteners with stability in directions not solely dependent upon the strength of bonding of the elastomer to metal.

F. Anchorage Assemblies:

1. Furnish rail fasteners each providing two complete anchorage assemblies for securing the rail fastener to the concrete track bed.
2. Use embedded female threaded anchor inserts with 7/8-inch anchor bolts to anchor or secure the rail fastener to the concrete track bed.
3. Provide high-strength anchorage connections that provide lateral restraint through clamping of the fastener to the plinth or deck. Systems that rely on spring washers of any kind for resisting uplift or maintaining anchor bolt tension will not be acceptable.

G. Restraint Properties and Rail Release:

1. Indicate the restraint properties of the rail fastener in both longitudinal directions and in both lateral directions.
2. Furnish rail fasteners providing a positive means of preventing more than a total of 1/8-inch total lateral movement of the rail base relative to the fastener on each side of the rail base in the event of failure or loosening of one or both rail hold-down spring clip elements.
3. Furnish rail fasteners permitting the release of the rail hold-down spring clip elements so that the rail may be removed by lifting it vertically until it is completely free of the fastener without disturbing the horizontal or vertical alignment of the fastener body.

H. Rail Hold-Down:

1. Include one-piece elastic spring clip type elements in the rail hold-down assembly.
 - a. No lateral adjustment is permitted in the rail hold-down.
2. Neither the rail hold-down assembly nor the means of preventing lateral movement of the rail shall make point contact against the rail.
 - a. If contact is made in the static or dynamic state, it shall not be less than 0.125 inch in any dimension and not less than 0.15 square inch in area.
3. Furnish rail hold-down not dependent upon elastomer components in torsion.
4. Design the rail hold-down elastic spring clips so longitudinal rail movements does not cause denting, carving, scoring, or other damage to the rail base or the rail hold-down assembly.
5. Furnish rail hold-downs that do not incorporate design configurations that permit denting, carving, scoring, or other damage to the rail caused by either the method of installation or the rail hold-down configuration.
6. Install the spring clip into a fixed shaller.
 - a. The fixed shaller shall be an integral part of the fastener top plate.

I. Dimensional and Shape Requirements:

1. Furnish fasteners that are generally rectangular in shape.
 - a. Include keying, peg and socket, or turned up plate edges in the bottom plate and top plate so that loss of elastomer bond does not result in complete loss of the fastener's ability to hold track line and gauge.
2. Height:
 - a. The overall distance between the top surface of the underlying direct fixation concrete track bed (concrete plinths) and the base of the rail with the rail fastener in the installed position shall be between 1-3/4 inches and 2-1/16 inches, inclusive of a 3/16 inch thick HDPE shim beneath the fastener body.
 - b. No part of the rail fastener assembly shall project more than 3 inches above the rail base in the installed position.

3. Length and Width:
 - a. The overall dimensions of the fastener, including the elastomer, shall not be less than 7 inches or more than 8-1/2 inches in length measured parallel to the rail and shall not be less than 14-1/2 inches or more than 16-3/4 inches in width measured perpendicular to the rail centerline.
4. Anchor Bolts:
 - a. Furnish rail fastener anchor bolts complying with Article 2.2A herein, and located 5-1/4 inches from the centerline of rail in the installed position, and 1-3/4 inches from the centerline of the rail fastener taken perpendicular to the rail centerline as detailed in Figure 02868-1 (See Appendix A for figures).
 - b. Symmetrically locate the anchor bolts with respect to the fastener centerline taken perpendicular to the rail.
5. Anchor Inserts (female):
 - a. Furnish rail fastener female anchor inserts complying with Article 2.2B herein.
 - b. Calculate the minimum bolt insertion length into the insert to provide anchorage strength meeting the requirements of this Section.
 - c. Submit drawings, at a minimum scale of 1:1, that demonstrate that the proposed anchor bolt and insert combination will accommodate the full range of vertical adjustment specified in this Section. Illustrate in these drawings the length of anchor bolt insertion into the insert under both the maximum and minimum shim conditions. Decrease bolt insertion length by an additional 1/16 inch under the maximum shimming condition, to allow for cases where the top of insert is recessed 1/16 inch below the top of concrete.
6. Minimum manufacturing tolerances for rail fasteners:
 - a. Length and width: Plus or minus 1/16 inch
 - b. Thickness: Plus or minus 0.030 inch
 - c. Squareness: Plus or minus 1 degree
 - d. Centering of holes: Plus or minus 1/32 inch
 - e. Diameter of holes: Plus or minus 1/32 inch

J. Adjustment Requirements:

1. Lateral Adjustment:
 - a. Furnish rail fasteners providing a minimum of plus or minus 1/2-inch rail lateral adjustment in 1/8-inch increments.
 - 1) All lateral adjustment shall be provided at the anchor bolts mountings.
 - b. Do not use friction as a means for adjustment or for preventing lateral movement.
 - c. If lateral adjustment employs serrations on components, each serrated interface shall have at least three engaged serrations on the assembly.
 - 1) Provide a minimum of 3 linear inches of serration engagement for each fastener.
 - 2) Machine or cast serrations to a minimum depth of 1/16 inch.

- 3) If cap plates are used, they shall cover the opening to any ground potential in every position of adjustment and form a reasonable seal to prevent the intrusion of dirt, metallic particles, and other material.
 - d. Furnish each rail fastener with all components required for all specified increments of lateral adjustment.
 - 1) Do not replace or add components to the basic configuration of the rail fastener in order to laterally adjust the rail.
 2. Vertical Adjustment:
 - a. Vertical rail adjustment capability shall be a maximum of 9/16 inch in 1/16-inch increments, provided by a maximum of two shims per fastener.
- K. Electrical Isolation:
 1. Furnish fasteners providing an electrical surface leakage distance of not less than 1-1/2 inches measured from the grounded portion of the fastener to the charged portion by the most direct path that does not pass through an insulating material, and not less than 1/4 inch when measured passing through an insulation material.
 2. Meet the insulation requirements within the body of the fastener.
 - a. Separate or detachable insulating components such as rail base pads or spring clip insulators are not allowed.
 3. No surface cut-outs, gaps, edge voids, or edge cut-outs are allowed that could permit an accumulation of dirt, metallic particles, or other material, which could eventually provide electrical leakage to ground.
- L. Markings:
 1. Develop and submit a lot and fastener numbering system for marking each fastener. Permanently and clearly mold on the top of each fastener the lot number, a daily production identification number, and the Fabricator's name or trademark so that they are readily visible when the complete assembly is in the installed position. Indentations in the elastomer or metal components will not be allowed.
 2. Mark the field side of the canted fastener body in letters not less than 1/2 inch high.

1.5 SUBMITTALS

- A. General: Refer to Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements", for submittal requirements and procedures.
- B. Submit the following:
 1. Product Data
 2. Shop Drawings
 3. Samples

4. Quality Program: In accordance with Article 1.6A herein
5. Test Results:
 - a. Six hardcopies and a pdf file of a formal report with qualification test results from tests performed within the last 24 months (alternatively, qualification tests run specifically for this contract) for acceptance in accordance with Article 2.3A herein.
 - b. Six hardcopies and a pdf file of the results of all production tests for acceptance in accordance with Article 2.3B herein.
6. Manuals: Compile consolidated manuals incorporating all relevant manufacturers' data for the DF fasteners and their components, including the anchorage and rail hold down assemblies. Include in this manual instructions for installation, maintenance, adjustment and removal of fasteners.

1.6 QUALITY ASSURANCE

- A. Develop and maintain a Quality Assurance Program as required by General Requirements, Volume 1 DB Contract Terms and Conditions Section 4 "Quality Control and Quality Assurance" and Volume 2 Technical Provisions Subsection 2.5 "Quality Management" regulating methods, procedures, and processes to ensure compliance with standards of quality.
 1. Include in the Quality Assurance Program an Inspection and Testing Plan (ITP), subject to review by the MBTA. Submit the detailed ITP within 30 days of Notice of Award and include therein the following information for each identified inspection and test:
 - a. List of inspections and tests to be performed.
 - b. Identify the Specification paragraph containing the inspection or test requirements.
 - c. Identify who is responsible for each test: Design-Builder or sub-supplier.
 - d. Schedule of inspections and tests.
 - e. Identification of independent test laboratories if any are to be used.
 - f. Identify the characteristics to be inspected, examined, and tested at each activity point.
 - g. Specify inspection and test procedures and acceptance criteria to be used.
 - h. Identify inspection checklists and test reports.
 - i. Identify hold points as described herein below.
 2. Do not commence any inspection or test until the ITP has been reviewed and accepted by the MBTA. During the life of the Contract, update the ITP to reflect any changes in the inspection or test requirements.
 3. Implementation of Quality Assurance Program:
 - a. Provide adequate staff and resources to perform all quality activities and to ensure Contract compliance, whether the Work is performed at the Design-Builder's own facility, provided by a sub-supplier, or on location at the project.
 - b. Supplier Control: Perform source inspections and audits at major supplier's facilities to assess compliance with the requirements of the Quality Assurance Plan and the Contract Documents.

- c. Control of Measuring and Testing Equipment:
 - 1) Describe in the Quality Assurance Plan the methods for ensuring that equipment used for measuring and testing is calibrated as applicable to provide accurate test and inspection results. At intervals established to ensure continued validity, verify or calibrated measuring and testing devices against certified national standards that are traceable to National Institute of Standards and Technology (NIST).
 - 2) Establish methods to ensure proper handling, storage, and care of measuring and test equipment to maintain the required accuracy of such equipment. Material and test equipment that is considered out-of-calibration or that has been subjected to possible damage shall be identified as non-conforming and shall be removed from service, replaced, or repaired according to the manufacturer's instructions. Review all inspections or tests accepted by the use of the nonconforming measuring and test equipment since its last valid calibration date, to ensure acceptability.
 - 3) Ensure that all measuring and testing equipment selected for measurements, tests, or calibration is of the proper range, type, and is controlled, adjusted, and maintained at specified intervals identified in the Quality Assurance Plan or before use to assure conformance to the established requirements or predetermined accuracy.
 - 4) Affix labels or tags to measuring and testing equipment that:
 - a) Attest to the current calibration status
 - b) Indicate the name of the individual responsible for the last calibration
 - c) Show the date (or other basis) that inspection or recalibration is next required

d. Preventive Action and Control of Non-Conforming Conditions:

- 1) Include in the Quality Assurance Plan provisions for implementing preventive and corrective actions and identifying, recording, controlling, and correcting non-conforming items.
- 2) Include provisions for reinspecting and retesting of repaired and reworked items to the original requirements.

B. Technical Support: Provide the services of a manufacturer's technical representative for consultation to resolve issues concerning the DF fastener.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Deliver and place material into storage at the Design-Builder's material storage area.
- B. Load, transport, unload, store, and handle DF fasteners and components to prevent damage or loss from handling and the elements, including adverse weather conditions.
 - 1. Pack and ship fasteners to prevent a load on a fastener from exceeding 1,000 pounds.
 - 2. Package fasteners to permit long-term outdoor storage in a secured area.
 - a. Palletize and band fastener bodies.

- b. Package rail hold-down assemblies, spring clips, fastener anchor bolts and inserts, insulating shim, and other loose items by component type in secure shipping kegs, wood boxes, or steel containers and clearly identify each content.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Metal Plate Components:

1. Make metal plate components from rolled, forged cast steel or ductile iron.
 - a. Provide ASTM A36/A36M rolled steel with the addition of not less than 0.20 % copper, or other steel having the equivalent or greater strength and corrosion resistance.
 - b. Provide ASTM A148/A148M cast steel, Grade 80-40 or equal.
 - c. Provide ASTM A668 forged steel, Grade C or equal.
 - d. Provide ASTM A536 ductile iron, Grade 65-45-12 or equal.
2. Calculate a Corrosion Resistance Index for all rolled steel products and other steel with a chemical content within the composition range listed in ASTM G101 and containing less than 1.0 % manganese.
 - a. The minimum Corrosion Resistance Index is 4.0.
3. Perform the following Charpy Impact Test on metal plate components, which shall perform as specified below.
 - a. Test Method: Prepare three Charpy Impact Test specimens in accordance with ASTM E23 from the same metal used for the top and base elements of the fastener body. If different grades of steel or iron are used for the two elements, prepare three specimens of each. Conduct a Charpy Impact Test on each specimen at a temperature of 21°Celsius in accordance with ASTM E23. The test report shall include the information required by ASTM E23.
 - 1) Acceptance Criteria: The fracture energy shall be greater than three foot-pounds for iron and 15 foot-pounds for steel.
 - b. In lieu of the above, submit previous test data demonstrating that the type of material being proposed clearly meets the above criteria. The MBTA may review the data and determine whether additional testing is required.

B. Elastomer:

1. Fabricate the elastomer using a minimum of 51 % natural rubber.
2. Provide a natural rubber design based on a Durometer Shore A measurement of 70 plus or minus 10, as measured in accordance with ASTM D2240 Test Method for Rubber Property – Durometer Hardness.
3. Do not allow the compressive strain of the elastomer to exceed 25 % of its uncompressed thickness for a load of 14,000 pounds applied vertically to the rail for a single fully assembled fastener.
 - a. Include pre-compression of elastomer in fasteners in the installed position in determining the total compressive strain.

4. The elastomer shall perform as specified when tested in accordance with the following test methods:
- a. Tensile Properties: ASTM D412.
 - 1) Tensile Strength (natural rubber): Minimum 2,500 psi.
 - 2) Ultimate Elongation: Minimum 350 %.
 - b. Resistance to Compression Set: ASTM D395.
 - 1) Test Condition (natural rubber): 22 hours at 70 degrees Celsius.
 - 2) Maximum Set (natural rubber): 25 %.
 - c. Resistance to Aging in Air: ASTM D573.
 - 1) Test Condition: 72 hours at 70 degrees Celsius.
 - 2) Retention of Tensile Strength (natural rubber): Minimum 75 %.
 - 3) Retention of Ultimate Elongation: Minimum 75 %.
 - 4) Change in Hardness: Maximum 10 points Durometer Shore A.
 - d. Resistance to Ozone Cracking: ASTM D1149.
 - 1) Test Condition: Test specimens prepared in accordance with ASTM D1149 at a temperature of 40 degrees Celsius and an ozone concentration of 50 ppm.
 - 2) Acceptance Criteria: The elastomer shall not exhibit cracking when examined in accordance with ASTM D1149 at the end of a 100-hour exposure.
 - e. Adhesion to Metal: ASTM D429, Method B.
 - 1) Test Condition: Test specimen shall duplicate actual rail fastener fabrication in respect to type of steel, preparation of steel, bonding agents, and elastomer.
 - 2) Acceptance Criteria: The failure of the elastomer shall be type R failure, i.e., elastomer tears before bond fails.
 - f. Resistance to Oil: ASTM D471.
 - 1) Test Condition: 70 hours at 23 degrees Celsius in ASTM Number 1 oil.
 - 2) Acceptance Criteria: Volume change shall not exceed minus 10 % or plus 20 %.
 - g. Tear Resistance Test: ASTM D624:
 - 1) Test Method: Test using Die C specimens.
 - 2) Acceptance Criteria: Resistance to tearing to be not less than 150 pounds per inch.
 - h. Water Absorption Test: ASTM D570:
 - 1) Test Method: Immerse specimens in distilled water for 24 hours at 23°Celsius.
 - 2) Acceptance Criteria: Elastomer to have a maximum increase in weight of 1 %.
 - i. Electrical Resistivity Test: ASTM D257:
 - 1) Test Condition: Twenty-four hours in a clean, dry environment with ambient conditions of 16 to 27 degrees Celsius and 50 to 70 % relative humidity. Apply 100 volts (minimum) DC for 3 minutes.
 - 2) Acceptance Criteria: Minimum volume resistivity of 10¹² ohm-cm.

C. Assembly:

1. Anchor bolts shall not pre-compress the elastomer in their installed position.

2.2 COMPONENTS

A. Anchor Bolts and Other Threaded Elements:

1. Furnish all threaded elements of high-strength steel conforming to the chemical and mechanical requirements of ASTM A449, SAE Grade 5, and having Class 2A and 2B thread fit.
 - a. Thread length may vary from that specified for structural bolts.
2. Furnish 7/8-inch diameter anchor bolts of sufficient length to provide an acceptable length of insert thread engagement with 9/16 inch of vertical shims under the rail fastener.
3. All threaded elements in the fastener shall include a positive means of preventing the loosening of the element due to in-service vibrations.
4. Threaded element installation data shall include, but not be limited to, the bolt torque range in foot-pounds.
 - a. The torque range shall provide the minimum tension as specified by the AISC ASD Manual of Steel Construction.
5. Coat all bolts with a water-resistant coating as thread protection against rusting prior to installation.

B. Anchor Inserts:

1. Furnish LB Foster epoxy-coated 7/8 inch concrete anchor inserts or approved equal.
2. Furnish inserts with an installed plug of metal or plastic material to preclude the entrapment of moisture, concrete, or other foreign materials.
 - a. Use plugs designed to be removed by using a socket wrench or other common device.
 - b. Furnish plugs capable of reinsertion, and if reinserted, still capable of excluding concrete and other materials from entry.

C. Insulating Pads and Vertical Adjustment Shims:

1. Provide 3/16-inch thick high-density polyethylene (HDPE) pads, matt finish, to provide an additional insulating surface between the base of the fastener and the concrete surface.
 - a. The shape, size, and configuration of the pads shall conform in general to the overall configuration of the DF fastener and consider lateral adjustment.
 - b. Insulating pads shall have circular holes for anchor bolts, no larger than 1 inch in diameter.
 - c. Size the pads so that they project out from under the fastener by 3/8-inch, minimum, on all sides, under all positions of fastener lateral adjustment.

2. Design the pads so that installation requires the removal of the fastener body.
 - a. Incorporate a positive means of preventing the pads from displacement under operating conditions in the design.
3. Furnish pads of high-density polyethylene (HDPE) meeting the requirements of ASTM D1248, Types III or IV, Grades W8 or W9; and conforming to the physical properties listed in Table 02868-1.

Table 02868-1

High Density Polyethylene Tests

Property	Units	Test Methods (ASTM)	Acceptance Criteria
Color			Blue
Density	Grams/cm ³	D1505	0.941 to 0.965
Environmental Stress Cracking		D1693	<1 to >1000
Vicat Softening Temperature	Degrees Fahrenheit	D1525	235 to 260
Brittleness Temperature	Degrees Fahrenheit	D746	<-180 to -100
Impact Strength	Ft.-Lbs Inch Notch	D256	0.8 to 14
Tensile Strength			
20 Inches/Minute	psi	D638	2,600 and 4,800
2 Inches/Minute	psi	D638	3,500 and 4,700
Elongation			
20 Inches/Minute	%	D638	12 to 700
2 Inches/Minute	%	D638	128 to 860
Heat Distortion Temperature at 66 psi	Degrees Fahrenheit	D648	160 to 170
Coefficient of Linear Expansion	Inches/Inch/Degree Celsius	D695	1.3 X 10 ⁻⁴
Hardness	Shore D Scale	D2240	55 to 70
Modulus of Elasticity	psi	D638	60m to 150m
Compressive Stress at 1 % Offset	psi	D695	3,200 to 3,600
Dielectric Constant			
100 kc		D1531	2.32
1 mc			2.32
Dissipation Factor			
100 kc		D1531	<0.0001
1 mc			<0.0001
Dielectric Strength, 1/8-Inch Thick	Volts/mil	D149	500
Volume Resistivity	Ohm-cm	D257	>6 X 10 ¹⁵

D. Rail Fastening System:

1. The rail fastening system shall include the rail fastening spring clips and the shallers by which they are attached to the DF fastener.
 - a. Furnish shallers that are an integral part of the top plate.

2. Furnish rail fastenings that are resilient, threadless, and detachable.
 - a. Use component part shapes that are easily recognizable and are difficult to install incorrectly.
 - b. Furnish fastenings comprised of as few components as economically and technically feasible for ease of assembly, disassembly, and maintenance.
 - c. Construct fastenings so that the rail clips can be installed from the right side or replaced in the field by one man using hand tools.
 - d. Construct fastenings so that when the rail clips are removed, the rail may be lifted vertically until it is completely free of the fastening shaller without disturbing the horizontal or vertical alignment of the shaller or the adjacent restraining rail and fastener.
 - e. On both sides of the rail base, provide fastenings with a positive means of preventing more than 1/8-inch total lateral movement of the rail base relative to the shallers in case of failure or loosening of one or both rail clips.
 - 1) Provide positive means of restraint extending at least 3/8 inch, but not higher than 1-3/4 inches above the base of rail in the installed position.
3. Rail Fastening Spring Clips:
 - a. Furnish rail clips not dependent on elastomeric components in torsion.
 - b. Use one identical clip design on the field and gauge sides of the rail at the railseat.
 - c. Furnish identical clips for concrete crossties, concrete road crossing ties, concrete turnout ties, special trackwork switch and frog plates, and DF fasteners.
 - d. Furnish clips designed to be reusable after repeated removals without effects on the operating performance of the system.
 - e. No part of the clip shall protrude below the plinth surface.
 - f. The clip shall not make point contact.
 - 1) Furnish clips designed so that lateral rail movements within the confines of the shallers will not produce transverse denting, carving, or scoring of the rail base.
 - 2) Furnish clips designed so that longitudinal rail slippage will not produce overstressing, ending, twisting, or other damage to the clips, and will not damage the rail.
 - g. Rail clips used on rail insulated joint bars need not to be identical in design to those used on a standard rail.
 - 1) Furnish special modified clips that clear the joint bar, have similar performance characteristics, are made by the same manufacturer, and are installed into identical shallers as the standard rail clip.

2.3 SOURCE QUALITY CONTROL

A. Qualification Testing:

1. Testing may be performed at any testing facility, including such facilities at the Design-Builder's plant.
 - a. Use only testing equipment in good repair, of adequate capacity, and that is verified or calibrated against certified standards that have a known traceable relationship to the National Research Council of the National Institute of Standards and Technology (NIST).
 - b. Provide notification not less than 14 days in advance of dates scheduled for tests.
2. Perform the following rail fastener testing at no additional cost to the MBTA using the test procedures as prescribed in Articles 2.4, 2.5, and 2.6 herein.
 - a. Static Tests: Perform all tests on a two-fastener assembly.
 - 1) Loads, as described in the tests, are per fastener and shall be doubled during performance of each test.
 - 2) Vertical Load Test: Perform testing in accordance with Article 2.4A herein.
 - 3) Lateral Load Test: Perform testing in accordance with Article 2.4B herein.
 - 4) Longitudinal Restraint Test: Perform testing in accordance with Article 2.4C herein.
 - 5) Lateral Restraint Test: Perform testing in accordance with Article 2.4D herein.
 - 6) Vertical Uplift Test: Perform testing in accordance with Article 2.4E herein.
 - b. Electric Tests: Perform all tests on single fasteners.
 - 1) Voltage Withstand Test: Perform testing in accordance with Article 2.5A herein.
 - 2) Electrical Resistance and Impedance Tests: Perform testing in accordance with Article 2.5B herein.
 - c. Dynamic Tests: Use a separate fastener for each test.
 - 1) Dynamic to Static Stiffness Ration Test: Perform testing in accordance with Article 2.6A herein.
 - 2) Loads, as described in the tests, are per fastener and shall be doubled during performance of each test.
 - 3) Vertical and Lateral Repeated Load Test: Perform testing in accordance with Article 2.6B herein.
 - d. Post Fatigue Tests: Repeat the tests listed above in Articles 2.3A.3.a through 2.3A.3.c, on the fastener that was subjected to the Vertical and Lateral Repeated Load Test.

3. Submit six copies of the results of all qualification tests. Commencement of fastener production before the qualification tests have been approved shall be at the Design-Builder's sole risk.
4. In addition to the rail fastener tests, subject all components of the fasteners to full or partial testing for compliance with these Specifications.
 - a. Perform all such additional testing of components that do not comply with these Specifications or portion thereof at no additional cost to the MBTA.

B. Production Testing:

1. Select two DF fasteners from each 5,000 production fasteners or portion thereof produced thereafter for production testing.
 - a. Shall the fasteners fail to meet the test requirements, test two additional fasteners from the same production lot.
 - b. In the event either of the two additional fasteners fail, either reject or test 100 % of the lot, and only those fasteners successfully passing all tests will be accepted.
2. Not less than 7 days prior to each shipment of fasteners from the Design-Builder's facility, submit certified statements that each lot of fasteners being shipped has passed the production testing specified herein.
 - a. In the event that any batch fails any one of the production tests, provide full test results for that batch to the MBTA and a statement as to whether the batch will be reworked or scrapped.
 - b. Retain all production test results in an organized fashion for a period of 10 years after delivery of the final fastener to the MBTA. During that period, provide the MBTA representatives access to all production test records upon 5 days' notice.
3. Perform the following production testing and certification requirements as prescribed in Articles 2.4, 2.5, and 2.6 herein.
 - a. Static Tests: Perform tests on a two-fastener assembly in compliance with Article 2.3A.3.a herein.
 - 1) Vertical Load Test
 - 2) Lateral Load Test
 - 3) Longitudinal Restraint Test
 - 4) Lateral Restraint Test
 - 5) Vertical Uplift Test
 - b. Electrical Tests: Perform each test on a single fastener assembly.
 - 1) Voltage Withstand Test
 - 2) Electrical Resistance Tests
 - c. Dynamic Tests: Perform each test on a two- fastener test assembly. The loads as specified in the reference articles are test loads for a two-fastener assembly.
 - 1) Dynamic to Static Stiffness Ratio Test

- 2) Vertical and Lateral Repeated Load Test: As specified in Article 2.6.B herein except that test shall extend for only 500,000 cycles.
- d. Elastomer Tests: Provide certification that each elastomer batch used complies with the requirements specified in Article 2.1B herein.

2.4 STATIC TESTS

A. Vertical Load Test:

1. Procedure:

- a. Apply a vertical load downward at the center of the rail head at the centerline of the fastener normal to the rail.
- b. Increase the load in increments of 1,000 pounds to a maximum load of 14,000 pounds at a rate not less than 500 pounds per minute and not more than 2,000 pounds per minute.
- c. For each increment of load, measure the vertical deflection of the rail head to the nearest 0.001 inch.
- d. Remove the load and measure and record the final position of the rail head.
 - 1) Plot the recorded values for vertical loads versus deflection on a graph, as shown in Figure 02868-2. (See Appendix A for figures)
- e. Pre-cycle the fasteners by loading from 0 to 14,000 pounds two times prior to measuring deflections.

2. Acceptance Criteria:

- a. The load versus deflection curve shall lie within the envelope shown in Figure 02868-2 (See Appendix A for figures) for loads in the range from 4,500 pounds to 12,000 pounds.
 - 1) The spring rate of the fastener (slope of the load-deflection curve) shall not be less than 94,000 pounds per inch or more than 200,000 pounds per inch for all loads between 4,500 pounds and 12,000 pounds.
 - 2) Calculate the spring rate by applying the least-squares linear regression method to the recorded data to obtain a straight-line load-deflection relationship.
 - 3) Each recorded deflection shall be within 10 % of the deflection calculated from the straight-line relationship over the loading range, from 4,500 pounds to 12,000 pounds.
 - 4) After removal of the maximum load, the fastener shall return to within 0.005 inch of its original position within one minute.
- b. At no time during the test shall fastener components exhibit signs of failure by slippage, yielding, or fracture.
 - 1) Slippage is defined herein to mean any movement of the fastener components relative to their initial position not attributed to deflection or yielding.
 - 2) Use the deflection measured at 14,000 pounds divided by the design thickness of the elastomer component to establish the fastener's compliance with the requirement for a maximum vertical deflection not to exceed 25 % of the

elastomer thickness. The values obtained when this test is repeated on the same fastener shall be within 20 % of the initial test values.

B. Lateral Load Test:

1. Procedure:

- a. While applying a vertical load of 12,000 pounds downward, offset 3/4 inch from the center of the rail head towards the gauge at the centerline of the fastener normal to the rail, apply a lateral load horizontally to the rail head at a point 0.625 inch below the top of the rail along the centerline of the fastener in a direction normal to the rail.
- b. Increase the lateral load in increments of 1,000 pounds to a maximum load of 8,000 pounds at a rate of not less than 500 pounds per minute and not more than 1,500 pounds per minute.
- c. For each load increment, measure the lateral deflection of the rail head at a point 0.625 inch below the top of the rail to the nearest 0.001 inch and record.
- d. Remove the lateral load and measure and record the final position of the rail head.
- e. Plot the recorded values for lateral loads versus deflection on a graph as shown in Figure 02868-4. (See Appendix A for figures)

2. Acceptance Criteria:

- a. The lateral deflection of the rail head for a lateral load of 4,000 pounds shall not exceed 0.10 inch.
- b. The lateral deflection due to the maximum load shall not exceed 0.37 inch.
- c. The difference between the original and final positions of the rail head shall not exceed 0.03 inch.
- d. At no time during the test shall fastener components exhibit signs of failure by slippage, yielding, or fracture.

C. Longitudinal Restraint Test:

1. Procedure:

- a. During this test, support the rail end on a roller or other low friction support properly elevated to prevent the longitudinal load from binding the rail in the fastener.
- b. Apply a load longitudinally to the rail at its base.
 - 1) Increase the load in increments of 500 pounds at a rate not less than 500 pounds per minute and not more than 1,500 pounds per minute to a maximum load of 8,000 pounds or until the rail moves 2 inches from the initial position.
 - 2) Maintain each load increment until the longitudinal movement of the rail ceases before increasing the load to the next increment.
 - 3) For each load, measure the longitudinal movement of the rail in relation to the top plate of the rail fastener to the nearest 0.01 inch and record.
 - 4) Remove the longitudinal load at slippage and measure and record the final position of the rail in relation to the top plate of the rail fastener.

- 5) Plot the recorded values for longitudinal load versus movement on a graph as shown in Figure 02868-3 (See Appendix A for figures) and identify it as “Initial Test.”
 - c. Without altering test set-up, apply the load then to the opposite end of the test rail and rerun the test in its entirety.
 - 1) Plot the recorded values for longitudinal load versus movement on a graph as shown in Figure 02868-3 and identify it as “Reverse Test.”
 2. Acceptance Criteria:
 - a. The longitudinal load versus deflection curve, when plotted on Figure 02868-3 (See Appendix A for figures), shall lie entirely within the limits defined by limit lines A and B.
 - b. The difference between the original (before initial test) and final (after reverse test) position of the rail shall not exceed the total rail slippage plus 0.24 inch.
 - c. At no time during the test shall fastener components exhibit signs of failure by slippage, yielding, or fracture, except that slippage that may occur between the rail hold-down assembly and the rail.
 - d. The rail hold-down shall maintain a uniform longitudinal restraint that when plotted shall be a constant, uniform, and unbroken curve which falls within the envelope shown in Figure 02868-3. (See Appendix A for figures)
- D. Lateral Restraint Test:
1. Procedure:
 - a. Apply two lateral loads at the base of the rail in the same direction normal to the centerline of the rail and symmetrically on each side of the fastener centerline.
 - b. Increase both loads simultaneously in increments of 500 pounds from zero pounds to 2,500 pounds.
 - c. Measure and record the lateral deflection of the rail at the intersection of the centerline of the fastener and the gage line of the rail to the nearest 0.001 inch after each increment of loading.
 2. Acceptance Criteria:
 - a. At no time during the test shall components show signs of slippage, yielding, or fracture.
 - b. The difference between the original and final positions of the gage line shall not exceed 0.062 inch.
 - c. The lateral deflection of the rail, when fully loaded, shall not exceed 0.125 inch from the original gage line of the rail.
- E. Vertical Uplift Test:
1. Procedure:
 - a. Apply and secure a vertical load to the center of the rail head at the centerline of the fastener in a direction normal to the rail, alternating continually from a vertical downward load to a vertical upward load.

- b. Increase the upper and lower peaks per cycle in increments of 200 pounds to a maximum of 3,600 pounds downward and upward.
 - c. Continually measure the loads and deflections to the nearest 0.001 inch and immediately record on a load-versus-time graph and deflection-versus-time graph, respectively.
 - d. Remove the load and measure and record the final position of the rail head.
 - e. Apply the reaction force to the uplift load by only securing the test block on which the fastener is mounted.
2. Acceptance Criteria:
- a. The vertical deflection of the fastener for lifting load of 2,000 pounds shall be within 105 % to 205 % of the deflection for a 2,000-pound downward vertical load as determined using the format the vertical load test.
 - b. When the vertical load is continuously varied from vertical downward loads to vertical uplift loads, the load-deflection curve shall be continuous; and there shall be no other indication of backlash or free play at times when the load or the deflection changes direction.
 - c. After removal of the maximum load, the rail shall immediately return to within 0.005 inch of its original position within one minute.
 - d. At no time during the test shall fastener components, including the fastener anchorage to the test block, exhibit signs of failure by slippage, yielding, or fracture.

F. Corrosion Test:

- 1. Test Method: The DF rail fastener system, including the fastener body, the rail hold down assemblies, and the anchorage assemblies, with the exception of the female inserts, shall be exposed to a 5 % chloride solution in accordance with ASTM B117 for 1,000 hours. Spring steel elements shall be placed in the test chamber under load to be at their maximum service duty deflection during the test. Solution shall be a 50-50 combination of sodium chloride and calcium chloride.
- 2. Acceptance Criteria: Acceptance shall be based upon visual comparison between actual metal surface condition after completion of the test and the pictorial surface preparation standards presented in SSPC-Vis 1. The condition of the coated, including galvanized, metal surfaces shall match or be superior to Rust Grade B, wherein there is no more than light surface rust, mill scale has only begun to flake and there is no pitting. There shall be no evidence of adhesion loss of adhesive coating. Areas of ductile iron components which only have an adhesive coating are not required to meet the above condition, but when cleaned shall not exhibit section loss of more than 5 % and shall not exhibit pitting depths greater than 1/32 inch.

2.5 ELECTRICAL TESTS

A. Voltage Withstand Test:

- 1. Procedure:
 - a. Place a ground plate below the elastomer of a complete, fully assembled fastener configured as specified.
 - b. Apply a DC potential of 10 kV to the rail head for 1 minute.
 - c. In the event of breakdown, record the breakdown voltage.

2. Acceptance Criteria:
 - a. The elastomer shall not show visible damage such as splits, cracks, pinholes, or fractures at the completion of the test.
 - b. Perform all other electrical tests on the fastener.

B. Electrical Resistance Test:

1. Procedure:
 - a. Test a complete, fully assembled fastener for electrical resistance, using both the wet and dry conditions procedures as specified herein.
 - b. Before assembly, metal parts, anchoring devices, rail clips, elastomer surfaces, and all other ancillary parts associated with the fastener shall be clean and dry.
 - c. Assemble the fastener with a section of 115-pound RE rail, not less than 1 foot in length.
 - d. Mount the test fastener on a 1/4-inch thick metallic ground plate sized to extend 1.2 inches beyond all edges of the fastener.
 - e. Use anchorage assemblies supplied, or similar to those for use in actual field installation, to mount the fastener to the ground plate.
 - f. Use the same number of bolts (or other device) that will be used to anchor the fastener in-service.
 - g. Verify that improper assembly and other causes do not make the parts that are in electrical contact exhibit excessive contact resistance; including, but not necessarily limited to, the following contact points:
 - 1) Rail-to-rail plate interface.
 - 2) Rail hold-down assembly (clip) and rail.
 - 3) Anchor bolts and bottom fastener plate (if present).
 - 4) Anchor bolts and ground plate.
 - h. Dry Conditions Test:
 - 1) Procedure:
 - a) Twenty-four hours prior to testing, store the assembled fastener(s) in a clean, dry environment with ambient conditions of 60 degrees Fahrenheit to 80 degrees Fahrenheit and 50 to 70 % relative humidity.
 - b) Apply 100 volts (minimum) DC between the rail head and the ground plate for 3 minutes.
 - c) Measure the applied voltage and resulting current flow, or directly measure the resistance with an accuracy flow, or directly measure the resistance with an accuracy of plus or minus 2 %.
 - i. Use instrumentation for direct measurement that has a minimum 100-volt output capacity.
 - 2) Acceptance Criteria: The minimum resistance for 100 volts DC is 10 megohms.
 - i. Wet Conditions Test:
 - 1) Procedure:

- a) Perform this test on the same fastener(s) that passed the dry electrical resistance tests specified in Article 2.5B.1.h herein.
- b) Place the assembled fastener in a nonmetallic trough or other suitable container.
 - a. Size the container such that there is a minimum of 2 inches between the sides and bottom of the fastener/ground plate assembly and the sides and bottom of the container.
 - b. In the event more than one fastener is placed in the same container, maintain a 2-inch clearance between the edges of the ground plates on adjacent fasteners and the clearances cited above.
- c) Pour water into the container to a level midway up the rail web covering all surfaces of the fastener.
- d) Maintain this level of immersion for 72 hours.
- e) Ambient temperature of fastener surfaces (prior to immersion), water, and air shall be 60 to 80 degrees Fahrenheit.
- f) Relative humidity shall be 50 to 70 %.
- g) Water resistivity shall be 1,000 to 1,500 ohm-cm (use potable water and adjust resistivity by addition of sodium chloride).
- h) Drain water from trough to a level at least 1/2 inch below the ground plate. Without drying or otherwise disturbing the fastener or creating a condition that causes the fastener surface to dry, apply a 100 volt (DC) potential as described above and record the current flow at the following times:
 - i. Initial measurement at 15 seconds
 - ii. Repeat the resistance measurement every 5 minutes for the first hour and every 10 minutes for the second hour. Record data to establish the wet resistance versus time characteristics of the fastener. Submit all resistance measurements as part of the test report.
- i) Continue tests for at least 2 hours after draining.
- 2) Acceptance Criteria: The minimum resistance for 100 volts DC shall be as follows:
 - j. The average of three consecutive resistance readings taken within 2 hours after draining shall be a minimum of 700,000 ohms.
 - k. The variance among the three readings shall not exceed 10 % of the average of the three readings.

C. Electrical Impedance Test:

- 1. Test method: Test a complete, dry, fully assembled fastener, as specified, for electrical impedance. Apply a potential of 50 V (ac) RMS to the rail head for 3 minutes for each increment of measurement for frequencies from 20 Hz to 10 kHz, in increments of 20 Hz up to 100 Hz, 200 Hz up to 1 kHz, and 2 kHz up to 10 kHz. Measure the impedance after 3 minutes with an accuracy of plus or minus 2 % and record for each frequency. Electrical resistance may be calculated by measuring current flow, and impedance may be calculated from the measurements of resistance and capacitance using the impedance equation that applies to a resistance and capacitance in parallel.

2. Acceptance Criteria: Minimum impedance for any frequency between 20 Hz and 10 kHz with 50 V (ac) RMS: 10 kilohms.

2.6 DYNAMIC TESTS

A. Dynamic to Static Stiffness Ratio Test:

1. Procedure:

- a. Apply a dynamic vertical (compression) load to the rail head over the centerline of the fastener assembly.
- b. Apply a load varying sinusoidally over the range of 5,000 pounds to 10,000 pounds and at a rate of 10 cycles per second.
- c. After a minimum of 1,000 cycles, measure and record the dynamic deflection of the fastener at 5,000 pounds and 10,000 pounds.
- d. Immediately after completing the dynamic deflection measurements, but only after the fastener deflection has stabilized, measure the static deflection at compression loads from 5,000 pounds to 10,000 pounds in 1,000-pound increments at a rate not exceeding 1,000 pounds per minute.
- e. Measure the deflections to an accuracy of within 0.001 inch.

2. Acceptance Criteria:

- a. Calculate the dynamic stiffness by dividing the difference between the recorded maximum and minimum load value (the dynamic load) by the difference between the recorded maximum and minimum deflection (the dynamic deflection).
- b. Calculate the static stiffness by applying the least-squares linear regression method to the recorded data to obtain a straight line and determining the slope of the static load-deflection curve.
- c. The ratio shall not exceed 1.5.

B. Vertical and Lateral Repeated Load Test:

1. Procedure:

- a. Apply loads to the rail head producing a vertical downward load of 12,000 pounds, and lateral loads along the centerline of the fastener normal to the rail of 3,900 pounds to the gauge side of the rail head and 2,700 pounds to the field side of the rail head.
- b. Apply the vertical load to the rail head and apply the lateral loads 0.625 inch below top of rail along the centerline of each fastener normal to the rail.
- c. Alternate the application of the lateral loads, each combined with alternate application and release of the vertical load.
 - I. Application of the field side load and vertical load and then the gauge side load and vertical load constitutes one cycle.
- d. Regulate the frequency to prevent the temperature of the components from exceeding 160 degrees Fahrenheit.
- e. Re-torquing threaded elements is not permitted without written approval.

2. Acceptance Criteria:

- a. The fastener shall withstand 3,000,000 cycles of load application with no evidence of failure for the qualification test and 500,000 cycles of load application with no evidence of failure for the production test.
- b. Disassemble the fastener assembly and upon visual inspection, no component of the fastener shall exhibit evidence of failure by slippage, yielding, abrasion, or fracture during the test.
- c. The rail shall exhibit no evidence of wear or grooving that would contribute to a failure of the rail.
- d. The concrete test block at the anchorage shall exhibit no evidence of failure as a result of the dynamic test.

C. Uplift Repeated Load Test:

1. Test Method:

- a. Apply alternately a vertical downward load of 12,000 pounds and a vertical upward load of 2,400 pounds a load to a fully assembled fastener. Apply the loads at the rail head. Apply the loads alternately for a total of 1,500,000 complete cycles. Regulate the frequency to prevent component temperature reaching 120 degrees Fahrenheit. Do not reposition rail clips or retorque the threaded elements.
 - b. During the final 500,000 cycles, a longitudinal load shall be applied to the rail at its centroid. Increase the load in increments of 100 pounds up to 600 pounds at intervals of at least one increment per 100 cycles of vertical loading. For each load increment, measure and record the longitudinal deflection of the rail to the nearest 0.001 inch. Then remove the longitudinal load and measure and record the longitudinal position of the rail. Plot the recorded values for the longitudinal load versus deflection on a graph.
2. Acceptance Criteria: The fastener shall withstand 1,500,000 cycles of load application with no evidence of failure. Upon visual inspection, no component of the fastener shall exhibit evidence of failure by yielding, abrasion, slippage or fracture. The rail shall indicate no evidence of wear or grooving that could contribute to its failure. The plot of the load versus deflection curve shall indicate the elastic deformation and the residual deflection. The residual deflection shall not exceed 0.005.

2.7 ANCHORAGE ASSEMBLY TESTS

A. Test Preparation:

3. Provide six anchor assemblies identical in design to those specified for supply with the fasteners to perform the following tests. Use two separate anchorage assemblies for each of the three tests. For the acceptance of anchorage design, each anchor assembly shall satisfy the test requirements. Test results shall not be averaged.
4. Embed anchor inserts in a reinforced concrete test block at least 4 feet long and 7-1/2 inches high. The sides shall be vertical and the top and bottom shall be horizontal. Position inserts for three fasteners 16 inches apart measured parallel to the rail. Inserts shall be vertical, with the top face flush with the concrete surface. Set the insert in the concrete before placing the concrete. Post-drilling and placing of inserts with resins or grouts is permitted only if this is the intended method of installing track.
5. Concrete test block: Cast test block using concrete meeting the requirements for concrete specified in Section 02866 – DIRECT FIXATION TRACK CONSTRUCTION. Cast an adequate number of test cylinders to develop a detailed profile of concrete strength gain over time. When one

cylinder test indicates that the concrete strength is within plus or minus 200 psi of the minimum strength required by Section 02866 – DIRECT FIXATION TRACK CONSTRUCTION, test a second cylinder for confirmation. If the second test also falls within the plus or minus 200 psi range, conduct all anchorage assembly tests that day.

6. Thread the anchor bolts into the inserts to the minimum permissible thread engagement, as required in Section 1.4.I.5 herein, plus or minus 1/16 inch, before load application. Place a stack of flat washers under the bolt head so that full torque can be applied for the torsion test with the bolt partially inserted.
7. The test apparatus working drawings shall be submitted to the MBTA.

B. Restrained Pullout Test:

8. Test Method: Place a 3-1/2 inch by 3-1/2 inch by 1/2inch thick steel plate with a 1-1/8 inch diameter hole in its center, over an anchor bolt. Apply an upward vertical load of 40,000 pounds to the anchor bolt with the reaction force bearing against the steel plate. Hold the load for three minutes. Repeat the test on one other anchor bolt.
9. Acceptance Criteria: No evidence of vertical bolt movement or deformation of threads in either the bolt or the insert, in either of the two anchor bolts tested. No slippage, cracking of concrete, or failure of bond between the inserts and concrete.

C. Unrestrained Pullout Test:

10. Test Method: Apply a vertical pullout load on an anchor bolt through a cylindrical loading frame so that no restraining load is applied to the concrete within a radius of 6 inches from the center of the bolt. Apply a load of 20,000 pounds and hold it for at least 3 minutes. Repeat the test on one other anchor bolt.
11. Acceptance Criteria: No evidence of concrete cracking or failure of bond between either of the two bolts or inserts and concrete.

D. Torsion Test:

12. Test Method: Subject an anchor bolt to a torque of 600 foot-pounds. Hold the load for three minutes and release. Repeat test on one other anchor bolt.
13. Acceptance Criteria: No evidence of failure of the bond between inserts and concrete on either of the two anchor bolts.

PART 3 – EXECUTION

NOT USED

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith shall be included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

APPENDIX A – FIGURES

Figure 02868-1

FASTENER DETAILS

BILL OF MATERIALS PER ASSEMBLY		
ITEM	DESCRIPTION	QUANTITY/FASTENER
1	FASTENER BODY	1 EACH
2	7/8" DIA. ANCHOR BOLT AND LOCKING DEVICES	2 EACH
3	RAIL HOLD-DOWN ASSEMBLY, COMPLETE	2 EACH
4	THREADED ANCHOR INSERT	2 EACH
5	HDP INSULATING PADS (3/16" THICKNESS)	1 EACH

Figure 02868-2

VERTICAL DEFLECTION LIMITS

NOTES:

1. MAXIMUM DEFLECTION AT 14,000 LBS. SHALL NOT EXCEED 25% OF THE UNCOMPRESSED THICKNESS OF ELASTOMER PAD.
2. FASTENER SPRING RATE MUST BE BETWEEN 94,000 LBS./IN. AND 200,000 LBS./IN. FOR ALL LOADS BETWEEN 4,500 LBS. AND 12,000 LBS.

LATERAL LOAD TEST

SECTION 02889

ASPHALTIC UNDERLAYMENTS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This section specifies requirements for the installation of asphaltic underlayment at areas of LRT turnouts and special track work.
- B. Underlayment locations will be in accordance with the contractor drawings and MBTA Commuter Rail Book of Standard Plans Dwg. No. 1030 and Section 02513 – BITUMINOUS CONCRETE PAVEMENT.

1.2 SUBMITTALS

- A. The following submittals shall be made to the Engineer for review and approval prior to procuring any material or performing any work required under this Section:
 - 1. Submit mix design and product data for the material furnished together with certification that the material meets the requirements of this specification.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. **Bituminous Emulsions**
 - 1. Asphaltic Emulsions: AASHTO M140, grade RS-1 for prime coat or tack coat.

2.2 CLASS I BITUMINOUS CONCRETE MIXES

- A. Furnish Hot Mix Asphalt (HMA) underlayment mix conforming to Article 2.2 in Section 02513 – BITUMINOUS CONCRETE PAVEMENT.

PART 3 - EXECUTION

3.1 SPREADING AND FINISHING

- A. **General**
 - 1. HMA can be placed only after the subgrade is prepared as specified in Section 02850 – LIGHT RAIL TRACK CONSTRUCTION.
 - 2. HMA mix shall be laid in one course depositing sufficient materials to provide a finished compacted mat 5 inches thick.

3. The mixture shall be placed and compacted only at such times that allow for proper inspection and checking by the independent testing agency hired by the design-builder.
4. The mixture shall be placed only upon approved surfaces that are clean and dry and only when weather conditions are suitable.

B. Machine Spreading

1. Deposit mixtures in the approved mechanical spreader, spread immediately, and strike off in a uniform layer to the full width required and to such depth that each course, when compacted, shall have the required thickness and shall conform to the indicated grade and cross section contour.
2. Deposit mixture in the center of the hoppers, exercising care to avoid overloading and spilling. Operate the pavers, while the mixture is being spread, at a speed which will produce a uniform surface texture.
3. Immediately after each course is screeded and before roller compaction is started, check the surface, adjust any irregularities, remove accumulation from the screed by rake or lute, and remove and replace any unsatisfactory spots in the course. Correct irregularities in line and grade along outside edges by addition or removal of material before the edge is rolled. Indiscriminate casting of mix on the new screeded surface, where irregularities are not evident, will not be permitted.
4. All edges shall be true and uniform.

C. Compaction Procedures

1. Roll the mixture longitudinally, diagonally, and transversely as may be necessary to produce the required contour of the surface. Start longitudinal rolling at the side and proceed toward the center of the pavement, except on superelevated curves start at the low side and progress to the high side, overlapping on successive trips by at least 12 inches.
2. Continue the rolling so that all roller marks, ridges, porous spots, and impressions are eliminated and the surface has the required contour and grade. Maintain the motion of the rollers at all times slow enough to avoid any displacement of the hot mixture. Correct any displacement or marring of the surface resulting from reversing the direction of the roller or from any other cause.
3. To prevent adhesion with the mixture, keep the wheels of steel rollers lightly moistened with water. Excess water or oil for this purpose will not be permitted.
4. To prevent "rolloff" of the pavement edges and longitudinal joints on deep lift paving, leave the outer eight inches of the deep lift mixture unrolled until the temperature of the mix ranges between 150 and 180 degrees F., whereupon compact it with a steel roller.
5. Along curbs, structures, and all places not accessible with a roller, compact the surface thoroughly with mechanical tamping devices, smooth and true to established line, grade, and contour.

6. The densities of compacted bituminous concrete shall not be less than 95% of the density obtained from laboratory compaction of a mixture composed of the same material in like proportions or 92% maximum theoretical density of said mixture. The independent testing agency hired by the Design-Builder shall conduct confirmatory testing.

3.2 PREPARATION OF MIXTURES

- A. Prepare, transport and deliver mixtures in accordance with Section 02513 – BITUMINOUS CONCRETE PAVEMENT.

3.3 PLACING INITIAL LAYER OF BALLAST

- A. No loads shall be permitted on the newly completed pavement until adequate stability has been attained and the material has cooled sufficiently to prevent distortion or loss of fines.
- B. After laying HMA refer to Section 02850 – LIGHT RAIL TRACK CONSTRUCTION for the requirement of placing ballast.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02890

TRAFFIC SIGNAL SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work under this section shall consist of the installation of traffic control systems complete and ready for operation at various intersections throughout the Green Line Extension project.
- B. The traffic control signals shall be in operation during the appropriate construction phases as specified on the plans. This work shall include furnishing, installing, and maintaining traffic control equipment including controller and cabinet, mast arms and foundations, pedestrian signal poles and foundations, signal heads, and pedestrian push buttons until the system is operational and has been accepted.
- C. Work shall include mobilization and set-up of boring equipment, the drilling of hollow stem auger borings, drive sample borings, and rock core borings, the retrieval of soil samples, the visual classification of the soil, the recording of boring logs and samples, and the dismantling and transporting of the equipment to and from each site, as required for the mast arm foundation design.
- D. Work shall include furnishing and installing a service connection, and all materials and equipment necessary for a video detection system including video cameras, video detection processor, wire and cable, and all incidental materials and labor necessary for operating and controlling a traffic control signal at this location, as shown on the plans and as specified herein, all in accordance with the applicable provisions of the Traffic Control Devices Specification (Section 800), the NEMA Specification, the Manual of Traffic Control Devices (Current Edition), and the MassDOT Standard Specifications for Highways and Bridges (Latest Edition).
- E. The work under this section shall include the removal and stacking of all existing traffic signal equipment (if necessary) upon the completion of the project or when determined by the Owner to no longer be required. If the local municipality maintains ownership, and prefers to retain the existing equipment, the Design-Builder shall provide all necessary manpower and equipment to load, transport and unload the equipment to a location designated by the municipality. Otherwise, the Design-Builder shall retain ownership of all equipment, and transport and dispose of the equipment in a manner that meets all applicable local, state and federal requirements.
- F. **Related Work:** The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 02300 – EARTHWORK
 - 2. Section 02577 – PAVEMENT MARKINGS
 - 3. Section 02800 – EXTERIOR CONDUIT SYSTEMS
 - 4. Section 03300 – CAST IN PLACE CONCRETE

1.2 SUBMITTALS

A. Borings

1. Upon completion of all borings, the Design-Builder shall submit two copies of the typewritten boring logs to the Owner.
2. Supplemental Samples
 - a. The Design-Builder shall submit to the Owner quart jar samples which shall have positive identification of the contents by typewritten glued-on labels. The following information shall be shown:
 1. Name and address of boring contractor
 2. Date sample was taken
 3. Location and name of project
 4. Location of borehole by station and offset or identifying number of borehole, if so identified on the plan
 5. Depth below ground surface at which sample was obtained and recorded blow counts of 6 inches of penetration of the sampler

B. Shop Drawings and brochures shall be submitted for all Traffic Signal items to be furnished.

C. Submittals required under this section include, but are not limited to, the following:

1. Traffic Signal Equipment
2. Signal Supports
3. A list of equipment
4. Manufacturer's Equipment Specifications

1.3 GUARANTEE

- A. The Design-Builder shall diagnose (troubleshoot) the complete traffic control system and, at his own expense, replace any part of the traffic signal control equipment found to be defective in the workmanship, material or manner of functioning during its required operation until the final acceptance of the system.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. A list of the major traffic signal items required at each location is included on the Sequence and Timing Plans.
- B. All materials incorporated into the traffic control system shall be without flaws or defects. Only those materials included in the latest MassDOT "Approved Equipment List" shall be approved for use in the project.

- C. All materials incorporated into the traffic control system shall be durable, tamper resistant, and vandal resistant.

2.2 SERVICE CONNECTION

- A. The service connection shall be made at the closest above ground location to the traffic signal controller cabinet. The Design-Builder shall determine the exact location from the servicing utility, arrange with them to complete the service connections, and be responsible for all charges incidental thereto.

2.3 CONTROLLER AND CABINET

- A. Work shall include furnishing and installing a TS 2, Type 1 or TS 1 controller and cabinet as shown on the plans. The controller and all other ancillary traffic signal control components included in the traffic control cabinet shall comply with the latest National Electrical Manufacturers Association (NEMA) standards. The controller and cabinet assemblies shall be supplied in an 8 phase TS 2 or TS 1 configuration.
- B. New cabinets shall be made of aluminum and painted aluminum and shall comply with Section 7 of the specifications set forth in NEMA TS-2, 1998. Controller cabinets shall be mounted on a concrete foundation. The controller cabinet shall also be supplied with a Manual Police Button to manually control the operations of the traffic signal via the Police Door Access Panel.
- C. Controller cabinet and foundation shall not obstruct a sidewalk or crosswalk so that passage by physically challenged persons would be impaired (36-inch min.).

2.4 SIGNAL HEADS

- A. All signal heads shall be equipped with 12” red/yellow/green ball or red/yellow/green arrow light emitting diode (LED) traffic module.

2.5 LED VEHICLE SIGNAL MODULE

- A. All LED Vehicle Signal Modules used on the project shall conform to the following:
 1. The LED signal module shall conform to “Interim LED Purchase Specification of the Institute of Transportation Engineers, Vehicle Traffic Control Signal Heads – Part 2: Light Emitting Diode (LED) Vehicle Traffic Signal Modules”, July, 1998, or most current version, Institute of Transportation Engineers (ITE), 525 School St., S.W., Suite 410, Washington, DC 20024-2797, Telephone: (202) 554-8050, FAX: (202) 863-5486, and shall conform to the following: (In the case of a conflict, the following special provision shall overrule.)
 2. An independent laboratory shall certify that the LED signal module complies with Section 6 Quality Assurance of the above state ITE LED Purchase Specification.
 3. LED signal modules must be type-testing and approved by MassDOT according to the requirements of Subsection 815.21 of the Standard Specifications.
 4. The LED signal module will be replaced or repaired by the manufacturer if it exhibits a failure due to workmanship or material defects during the field operation.

2.6 MAST ARMS

- A. The mast arm structures and foundations shall be fabricated and constructed in conformance with the MassDOT Highway Division standard drawings. The location of the traffic signal poles shown on the plans is a relative location. The poles may need to be relocated to accommodate field conditions, construction activity and utility conflicts. Any additional pole(s) required to be relocated shall be done at no additional cost.
- B. Mast arm base foundations shall not obstruct a sidewalk or crosswalk so that passage by physically challenged persons would be impaired (36-inch min.).
- C. The mast arm foundation sizes and depths shall be selected from the Foundation Design charts for the calculated moment at existing ground. The Design-Builder should assume wet sandy soils, unless directed by the Owner who is present during the auguring for the foundation and determines otherwise based on the soils encountered.
- D. The mast arm foundation sizes and depths shall be selected from the MassDOT Foundation Design charts for the calculated moment at existing ground. All measurements to determine the exact dimensions and clearances between the mast arm structures and existing overhead utility lines shall be made in the field by the Design-Builder in the presence of the Owner for incorporation into the erection plans and shop drawings which are submitted for approval.

2.7 POST AND BASES

- A. Signal posts shall have aluminum shafts, 8 feet or 10 feet in height, with transformer bases. Signal base foundations shall not obstruct sidewalks or crosswalks so that passage by physically challenged persons would be impaired (36-inch min.).

2.8 PEDESTRIAN SIGNAL HEADS

- A. The pedestrian signal head indications shall be illuminated LED type displaying the graphical symbols of a walking person and/or upraised hand and countdown timers. The countdown timers shall be beneath of the overlaid of the walking person and upraised hand symbols. All pedestrian signal heads shall be equipped with cap visors.

2.9 PEDESTRIAN PUSH BUTTONS

- A. Pedestrian push button controls shall be raised from or flush with their housings and shall be a minimum of 2" in the smallest dimension. The force required to activate the controls shall be no greater than 5 Pound Force.
- B. Location of pedestrian push buttons shall comply with the current editions of the Manual of Traffic Control Devices), Americans with Disability Act Accessibility Guideline for Buildings and Facilities (ADAAG), and the Massachusetts Architectural Access Board Regulations .
- C. Mounting height shall be approximately 42" but no more than 48" above the finish sidewalk grade for the pedestrian push buttons.

2.10 ELECTRICAL WIRE

- A. Electrical wire and cable shall be as specified in Section 813 of the MassDOT Standard Specifications.

2.11 VIDEO DETECTION SYSTEM

- A. Work shall include the installation of a video detection system, as shown on the plans, specified below or an approved equal.
 - 1. General
 - a. This specification sets forth the minimum requirements for a system that detects vehicles on a roadway using only video images of vehicle traffic.
- B. System Hardware
 - 1. The video detection system shall consist of a single integrated camera on each mast arm as shown on the plans with video detection processor (VDP), a cabinet interface (ICC) which mounts in a standard detector rack or as a stand-alone shelf mount unit, and a pointing device.
- C. System Software
 - 1. The system shall include software that detects vehicles in multiple lanes using only the video image. Detection zones shall be defined using only an on board video menu and a pointing device to place the zones on a video image. Up to 6 detection zones per system shall be available. A separate computer shall not be required to program the detection zones.
- D. Functional Capabilities
 - 1. The VDP shall process video from the integrated camera. The video shall be in NTSC composite video format and shall be digitized and analyzed in real time.
 - 2. The VDP shall detect the presence of vehicles in up to 6 detection zones per system. A detection zone shall be approximately the width and length of one car.
 - 3. Detection zones shall be programmed via an on-board menu displayed on a video monitor and a pointing device connected to the ICC. The menu shall facilitate placement of detection zones and setting of zone parameters or to view system parameters. A separate computer shall not be required for programming detection zones or to view system operation.
 - 4. The VDP shall store up to three different detection zone patterns. The VDP can switch to any one of the three different detection patterns within 1 second of user request via menu selection with the pointing device. Each configuration can be uniquely labeled for identification and the current configuration identifier is displayed on the monitor.
 - 5. The VDP shall detect vehicles in real time as they travel across each detector zone.
 - 6. The ICC shall have an RS232 port for communications with an external computer for diagnostic and remote management applications.

7. The VDP shall accept new detector patterns from an external computer through the RS-232 port on the ICC when the external computer uses the correct communications protocol for downloading detector patterns. A Windows™ based software designed for local or remote connection and providing video capture, real-time detection indication and detection zone modification capability shall be provided with the system.
8. The VDP shall send its detection patterns to an external computer through the RS-232 port on the ICC upon request when the external computer uses the appropriate communications protocol for uploading detector patterns.
9. A shelf mount version of the ICC shall be available to avoid the need of rewiring the detector rack for high voltage input, by enabling the user to plug power into the front of the module from a standard plug arrangement. The shelf mount ICC module's output shall be connected to the cabinet circuitry by an 8-wire cable.
10. VDP and ICC communications shall be accommodated by methods using differential signals to reject electrically coupled noise.
11. The VDP shall be able to transmit the composite video signal, with minimal signal degradation, up to 1000 feet under ideal conditions.
12. The associated VDP shall default to a safe condition, such as a constant call on each active detection channel, in the event of loss of video signal.
13. The system shall be capable of automatically detecting a low-visibility condition such as fog and respond by placing all defined detection zones in a constant call mode. The system shall automatically revert to normal detection mode when the low-visibility condition no longer exists.

E. Vehicle Detection

1. Six detection zones shall be supported and each detection zone shall be user definable in size and shape to suit the site and the desired vehicle detection region.
2. A single detection zone shall be able to replace multiple inductive loops and the detection zones shall be OR'ed as the default or may be AND'ed together to indicate vehicle presence on a single phase of traffic movement.
3. Placement of detection zones shall be done by using only a pointing device, and a graphical interface built into the VDP and displayed on a video monitor, to draw the detection zones on the video image from the video camera. No separate computer shall be required to program the detection zones. Detection zones shall be drawn on live video from the video camera.
4. A minimum of 3 detection zone patterns shall be saved within the VDP memory. The VDP's memory shall be non-volatile to prevent data loss during power outages. The VDP shall continue to operate (e.g. detect vehicles) using the existing zone configurations even when the operator is defining/modifying a zone pattern. The new zone configuration shall not go into effect until the configuration is saved by the operator.
5. The selection of the detection zone pattern for current use shall be done through a local menu selection or remote computer via RS-232 port on the ICC. When a new configuration pattern is selected it becomes active within 1 second.

6. When a vehicle is detected crossing a detection zone, confirmation of detection is with a distinct visual indication on the video overlay.
7. Detection shall be at least 98% accurate in good weather conditions and at least 96% accurate under adverse weather conditions (rain, snow, or fog) with optimal installation.
8. The VDP shall provide 2 channels of vehicle presence detection per system through a standard detector rack edge connector or cable interface from the shelf mounted version of ICC.
9. The VDP shall provide dynamic zone reconfiguration (DZR) to enable normal detector operation of existing channels except the one where a zone is being added or modified during the setup process. The VDP shall output a constant call on any detection channel corresponding to a zone being modified.
10. Up to six detection zones shall be capable to count the number of vehicles detected. The count value shall be internally stored for later retrieval through the RS-232 port on the ICC. The data collection interval shall be user definable in periods of 10 or 20 seconds or 1, 5, 15, 30 or 60 minutes.

F. ICC Module

1. The ICC shall be specifically designed to mount in a standard NEMA TS-1, TS-2, 2070 ATC, 170 type detector rack, using the edge connector or AC power input on front to obtain power and provide contact closure outputs. Detector rack rewiring shall not be required or shall be minimized.
2. The ICC shall operate in a temperature range from -35°F to +165°F and a humidity range from 0% to 95% relative humidity, non-condensing.
3. The ICC shall be powered by 100 to 240 volts 50 or 60Hz. This module shall automatically compensate for the different input voltages/frequencies.
4. System power consumption shall not exceed 25watts within the specified input voltage range.
5. The VDP shall utilize non-volatile memory technology to enable the loading of modified or enhanced software through the RS232 port on the ICC without modifying the VDP hardware.
6. The ICC shall include detector output pin out compatibility with industry standard detector racks.
7. The front of the ICC shall include detection indications, such as LED's, for each channel of detection that display detector outputs in real time when the system is operational.
8. The front of the ICC shall include one BNC video output providing real time video output that can be routed to other devices. A RCA type connector/jack for video output is not allowed.
9. The front panel of the ICC shall have a detector test switch to allow the user to place calls on each channel. The test switch shall be able to place either a constant call or a momentary call depending on the position of the switch.

G. Video Detection Processor Module

1. The camera shall produce a useable video image of the bodies of vehicles under all roadway lighting conditions, regardless of time of day. The minimum range of scene luminance over which the camera shall produce a useable video image shall be the minimum range from nighttime to daytime, but not less than the range 1.0 lux to 10,000 lux.
2. The imager luminance signal to noise ratio (S/N) shall be more than 50 dB.
3. The VDP electronics shall include automatic gain control (AGC) to produce a satisfactory image at night.
4. The VDP shall be housed in a weather-tight sealed enclosure. The enclosure shall be made of 6061 anodized aluminum. The housing shall be field rotatable to allow proper alignment between the VDP and the traveled road surface.
5. The VDP enclosure shall be equipped with a sunshield. The sunshield shall include a provision for water diversion to prevent water from flowing in the camera's field of view. The camera enclosure with sunshield shall be less than 5" diameter, less than 18" long, and shall weigh less than 5 pounds.
6. The VDP enclosure shall include a proportionally controlled heater, where the output power of the heater varies with temperature, to assure proper operation of the lens functions at low temperatures and prevent moisture condensation on the optical faceplate of the enclosure.
7. The front of the enclosure shall be made from glass and shall have an anti-reflective coating to minimize light and image reflections. The front of the enclosure shall not be made from any thermoplastic or synthetic polymer (PVC, Acrylic, Polythene or similar).
8. When mounted outdoors in the enclosure, the VDP shall operate satisfactorily in a temperature range from -31°F to +140°F and a humidity range from 0% RH to 100% RH.
9. The VDP enclosure shall be equipped with a single, weather-tight connector.

H. Installation

1. The cable to be used between the VDP and the ICC in the traffic cabinet shall be three (3) twisted pairs. Various styles including IMSA 39-2 are suitable for correct operation. The cable shall be a continuous unbroken run from the VDP to the ICC. This cable shall be suitable for installation in conduit or overhead with appropriate span wire. Pluggable connectors supplied should be used at both the VDP and ICC ends. The cable, and installation tools shall be approved by the supplier of the video detection system, and the manufacturer's instructions must be followed to ensure proper connection.
2. The video detection system shall be installed as recommended by the supplier and documented in installation materials provided by the supplier. Proof of factory certification shall be provided.

I. Railroad Preemption

1. The existing railroad preemption shall remain operational and function as shown on the plans during the traffic signal system operation.

2.12 PULLBOXES

- A. Work shall conform to the relevant provisions Section 801 of the MassDOT Standard Specification.

PART 3 - EXECUTION

3.1 EXCAVATING AND BACKFILLING

- A. Section 02300 - EARTHWORK.

3.2 BORINGS

- A. Hollow stem auger borings shall be taken at the locations of the proposed traffic signal foundations as shown on the plans and as directed by the Owner. The Owner shall be notified a minimum of seventy-two hours before borings are taken.
- B. Two types of samples will be required in vertical soil borings:
 - 1. Standard Sample.
 - a. A standard penetration test using a split spoon sampler shall be made at the ground surface and at every change in soil stratum, but the sampling intervals shall not exceed 5 feet in a continuous stratum. The auger hole shall terminate at the required bottom elevation and a split spoon sample shall be taken at the bottom of the hole.
 - 2. Supplemental Sample.
 - a. A volume sample shall be taken at 5-foot intervals in order to classify the subsurface soils with respect to grain size and visual classification as required. Each sample shall consist of the remainder of the spoon sample and shall be contained in quart jars appropriately labeled. The purpose of this method along with its sampling procedure is to determine the visual properties, arrangement, and thickness of the various soil strata as they exist in the ground. The elevations/depths at which any change in stratification occurs shall be located and recorded on the log by the driller. Detection of stratum changes should be made by careful observation of the soil as it exists in the augured hole and by the rate of penetration of the auger during drilling. The auger casing I.D. shall be a minimum of 2- 3/4 inches for all holes in which split spoon samples are required. The O.D. shall be a maximum of 7 inches to limit the size of the resulting hole.
- C. Obstructions
 - 1. Obstructions, other than ledge, shall be considered in accordance with Section 190.60E of the MassDOT Standard Specifications. The actual location of the additional boring will be specified by the Owner. When ledge is encountered a rock core boring shall be made in accordance with Section 190.63 of the Standard Specifications.
- D. Rock Core

1. If rock is encountered at an elevation above the specified highest bottom elevation, then a rock core boring shall be made in accordance with Section 190.63 of the Standard Specifications. The core hole shall be large enough to accommodate the required auger casing so that sampling may be continued past the rock obstruction. The minimum cored depth shall be 10 feet.

E. Practical Refusal

1. Practical refusal of the sample spoon or “refusal” is as defined by Section 190.60F of the MassDOT Standard Specifications.
2. Due to the size of the resulting auger hole, it is particularly important that upon completion, all borings shall be backfilled with clean, well-graded sand and tamped to fill all voids created during the augering procedure.

F. Advancing the Boring for Soil Sampling

1. As the boring is advanced, care shall be taken to note and record the depth where wet soil is encountered if this should occur.
2. If groundwater is encountered, then the water level in the hollow stem shall be maintained at the top of the casing at all times during the sampling operation to avoid unequal hydrostatic pressure that could result in blow-in of fine-granular soils and inaccurate blow counts.
3. In each boring, the driller shall record the water level prior to backfilling and whenever possible, prior to the start of each day’s work.
4. Each boring shall be advanced by using a hollow stem auger with cutting head and center rod and plug assembly. The hollow stem auger will advance and case the hole simultaneously to the required sampling levels. The center rod and plug assembly is held in place by the cap and inside drill rod connecting the auger and its assembly to the rotating spindle on the drilling machine to prevent soil from entering the mouth of the auger. Upon reaching the sampling level, the plug is to be retreated by withdrawing the center rod to permit lowering of the sampler through the auger.
5. The sample shall be obtained by driving the sampler 18 inches into the undisturbed material below the bottom of the auger. The sampling and handling procedure shall be as specified under Section 190.61 of the Standard Specifications.
6. After the sampling operations are completed and the sampler has been retracted, the plug is re-inserted and held in place by the center rod; another auger section is connected to the first, together with one additional center rod section to secure the plug to the cap and the hole is advanced.
7. This procedure shall be repeated until the required bottom elevation is reached. The auger shall be stopped at any depth level to allow normal sampling practices upon request by the Owner.
8. If, in the judgment of the Owner, the borehole cannot be advanced by the hollow stem auger method due to the material encountered (with the exception of bedrock) and every attempt has been made by the driller to complete the boring using the conventionally cased, drive

sample, wash boring method as specified in Section 190 of the Standard Specifications, then the borehole shall be cored.

3.3 PERFORMANCE

- A. All work on the traffic signal shall be performed in accordance with the applicable requirements of Section 800 of the MassDOT Standard Specifications. NEMA Standards, the Manual on Uniform Traffic Control Devices and the following:
 - 1. Timing, sequence, and operation shall be as shown on the Sequence and Timing chart included in the Contract Drawings.
- B. The work shall include provision and connection of proposed controller to service connection as specified under Section 813. of the MassDOT Standard Specifications. The Design-Builder shall make all necessary arrangements with the Electric Company in connection with the performance of this work and bear all charges incurred thereby.

3.4 FLASHING OPERATION

- A. Changes from automatic flashing to stop-and-go operation and from stop-and-go to automatic flashing operation shall occur as set forth in Section 4D.29 of the current MUTCD.

3.5 FINE TUNING AND ADJUSTMENT PERIOD

- A. Included in this Section shall be all time for a signal technician and/or electrician to modify and adjust the timing and phasing as required by the Owner.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02891

TRAFFIC SIGNS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The work under this section shall include furnishing and erecting warning clusters and signs, overhead and roadside guide signs, warning and regulatory signs, route and project markers, street name signs, delineators, sign supports, and all necessary hardware, concrete, and excavation. Concrete for sign foundations shall conform to the applicable requirements of Section 03300 - CAST-IN-PLACE CONCRETE.
- B. The work under this section shall also include the dismantling, removal, transporting, and resetting of the existing signs at the location shown on the plans. The work also includes the removal and disposal of the existing sign supports determined by the Engineer to be unusable and the removal and disposal of the existing foundations. Signs removed and reset shall be reset on new posts as specified. The Contractor shall backfill with compacted gravel all holes resulting from the removal of the existing signs and their foundations and restore the area to match the existing conditions of adjacent areas.
- C. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 02052 – MAINTENANCE OF TRAFFIC THROUGH WORK AREAS
 - 2. Section 10440 – SITE SIGNAGE

PART 2 - PRODUCTS

2.1 MATERIALS

- A. A list of the major traffic sign items required at this location is included on the Sign Plans.
- B. Signs shall be fabricated in conformance with the current editions of the Manual on Uniform Traffic Control Devices, the Massachusetts Amendments to the 2009 Manual on Uniform Traffic Control Devices, and the Standard Municipal Traffic Code, Section 828 of the MassDOT Standard Specifications and Supplemental Specifications.

2.2 SIGN SUPPORTS

- A. Sign Supports shall conform to the relevant provisions of Section 840 of the current MassDOT Standard Specifications and Supplemental Specifications. Steel posts shall be used for the permanent signs and timber posts for temporary signs. The location of the permanent and temporary posts (if needed) shown on the plans is a suggested location. The posts may need to be relocated to accommodate field conditions, construction activity, utility conflicts, and requests by local authorities. Any post(s) required to be relocated shall be relocated at no additional cost.

PART 3 - EXECUTION

3.1 PERFORMANCE

- A. All work on the traffic signs shall be performed in accordance with the applicable requirements of Section 800 of the Standard Specifications and Supplemental Specifications, the Manual on Uniform Traffic Control Devices, and the following:
 - 1. Locations and installation of all signs shall be as shown on the construction plans in the Contract Drawings.
 - 2. Sign horizontal and vertical clearances shall meet the requirements set for in the MUTCD.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02910

EXTERIOR STORAGE FACILITIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies furnishing and installing Station Storage Facilities as described herein, complete, with components in conformity with the Contract Documents, manufacturer's specifications, and located to the lines and grades shown on the Contract Documents.
- B. Related Work:
 - 1. Section 02100 – SITE PREPARATION
 - 2. Section 03300 – CAST-IN-PLACE CONCRETE
 - 3. Section 09900 – PAINTING
 - 4. Section 16050 – BASIC MATERIALS AND METHODS FOR ELECTRICAL WORK

1.2 QUALITY CONTROL

- A. Design of the station storage facility shed shall meet all applicable requirements as provided in the current edition of the Commonwealth of Massachusetts State Building Code, as noted on the Contract Documents, and as specified below:
 - 1. Basic Snow Load, Zone 2, shall be a minimum of 30 psf, modified for specialized roof characteristics as appropriate.
 - 2. Wind Load, Exposure C, Zone 3, shall be a minimum of 21 psf, applied where and as required.
 - 3. Special Impact Load, 200 lbs., applied at location to cause maximum effect.
 - 4. No Earthquake Load required.

1.3 SUBMITTALS

- A. The following shall be submitted for review:
 - 1. Manufacturer's literature, brochures and/or specifications for all material as specified herein and as shown on the Contract Documents.

1.4 PROCUREMENT, DELIVERY, STORAGE AND HANDLING

- A. Procure, store and deliver work under this Section in a manner to prevent damage to components during transit and/or from the elements.
- B. Deliver storage facilities and set in locations as shown on the Contract Documents.

- C. Each storage facility shed shall be protected from scratches, gouges, or rough handling which may mar the surface finish during installation.
- D. Damaged items shall be replaced without additional cost.

PART 2 - PRODUCTS

2.1 STORAGE FACILITIES

- A. The size of each storage facility shall be a minimum of 20'-0" long by 8'-0" wide by 8'-6" high, out- to-out dimensions.
- B. Storage facilities shall be a 'Conex' type steel portable storage container, as manufactured by Genstar Container Corporation; a precast modular building, Model Micro 1012, as manufactured by Concrete Systems, Inc., Londonderry, NH; or similar products manufactured by Mobile Mini, Inc.; Williams Scotsman, In.; or equal.
- C. Storage facilities shall be constructed of either 16 gauge sheet steel or of an equivalent design in precast concrete. Roof ventilation openings shall be provided as required for the size of the shelter. Lifting bars shall be provided to facilitate the movement of the storage facility. All embedded structural and sheet steel shall be hot dipped galvanized.
- D. Storage facilities shall be provided with a double front door of vandal resistant design. In each door, there shall be a minimum of two ventilation openings, covered with fine mesh stainless steel, copper, or brass screening. The exterior of the ventilation opening shall be hooded to minimize the entrance of precipitation. The interior of the ventilation opening shall be equipped with a sliding plate to allow the adjustment of airflow. The doors shall be hinged and provide a weatherproof seal design employing a water shedding gasket. Steel doors shall be provided with cast iron handles, welded to a three-point locking device which will ensure that the door cannot be locked until it is in the fully closed position. Other materials shall have an equivalent design. Doors shall be provided with a two-position retaining device to secure the door when open.
- E. Hinges shall be separate castings welded to the housing and door. The hinges shall be equipped with manufacturer's standard hinges and pins and shall be lubricated by the manufacturer before the storage facility is shipped.
- F. Anchoring hardware shall be galvanized steel, in sizes and configurations recommended by the manufacturer. Where anchor bolts are located inside the shed, removable covers shall be provided for access to the foundation bolts. Where anchors, bolts or fasteners are exposed, they shall be configured or secured in such a way as to prevent their casual removal by use of vandal-proof heads or fastenings.
- G. Exterior of storage facilities shall be painted a color selected by the MBTA. Painting shall conform to the requirements of Section 09900, Painting.
- H. Utilities:
 - 1. Branch Circuit Panel Boards
 - a. The storage facilities shall be provided with one branch circuit panel board for power supply conforming to the requirements of Section 16050.

- b. Power supply shall be brought into each storage facility through the floor of the building through the cable entrance pipes located below the branch circuit panel board.
- 2. Lighting
 - a. Each shed shall be provided with (cold weather rated ballast) fluorescent fixtures. The fluorescent fixture shall provide complete illumination of 30 foot candles minimum in all areas of the building. Lights shall be operated from wall mounted switches conveniently placed near each door
- 3. Convenience Outlets (Receptacles)
 - a. Three convenience outlets shall be furnished and installed along the interior of the perimeter walls, four feet above the floor. All receptacles shall have Ground Fault Circuit Interrupted (GFCI) protection.
- 4. Branch Circuit Wiring
 - a. Wiring for lights, and convenience outlets shall be minimum #14 AWG, flexible, THHN wire installed in Electrical Metallic Tubing (EMT).

PART 3 - EXECUTION

3.1 GENERAL

- A. Locate and install the storage facility as shown on the Contract Drawings. The facility shall be set plumb and level, true to line and grade. The installation shall be coordinated with the concrete pad and ramp installation.
- B. Concrete pad and ramp placement, curing, testing, reinforcing and protection, and form work shall be as specified in Section 03300, Cast-In-Place Concrete, and shown on the Contract Drawings. The size of the concrete pad shall in no instance extend beyond the sides of the storage facility shed.
- C. Anchoring of the storage facility shall comply with the manufacturer's recommendations, applicable code or regulation, and best construction practices for the work to be performed.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02920

SEEDING

PART 1 – GENERAL

1.1 GENERAL

- A. The Work shall be performed in accordance with the following documents as issued by the Massachusetts Bay Transportation Authority:
 - 1. The Contract Specifications, which include Volume 1 DB Contract Terms and Conditions; Volume 2 Technical Provisions; and applicable Sections of Divisions 2 through 16.

1.2 SUMMARY

- A. This Section specifies design and construction performance requirements for Seeding:
 - 1. Seeding.
 - 2. Watering, fertilizing, mowing and maintenance of seeded areas.
- B. Other Specification sections that relate to the work include, but are not limited to, the following:
 - 1. VOLUME 2 TECHNICAL PROVISIONS, EXHIBIT 21, “ADDITIONAL. PROJECT REQUIREMENTS
 - 2. Section 02060 – EROSION AND SEDIMENTATION CONTROL
 - 3. Section 02300 – EARTHWORK
 - 4. Section 02930 – PLANTING
 - 5. Section 02932 – PLANTING SOILS
 - 6. Section 02970 – LANDSCAPE MAINTENANCE

1.3 REFERENCE STANDARDS

- A. Comply with applicable requirements of:
 - 1. Commonwealth of Massachusetts, Standard Specifications for Highways and Bridges, Department of Public Works, latest edition, Boston, Massachusetts.
 - 2. American Association of Nurserymen, American Standards for Nursery Stock, (ANSI Z60.1), latest edition, published by the American Association of Nurserymen, 1250 I Street, N.W., Suite 500 Washington, D.C. 20005.
 - 3. ASTM: American Society of Testing Materials.
 - 4. ANSI: American National Standards Institute.
 - 5. AOAC: Association of Official Agricultural Chemists.
 - 6. USDA: United States Department of Agriculture.

1.4 SUBMITTALS

- A. Submittals: in accordance with Volume 2 Technical Provisions, Subsection 2.7, “Design Submittal Review Management” and Subsection 2.8, “Construction Submittal Requirements”.
- B. Product Data: Submit manufacturer's information for:
 - 1. Maintenance Fertilizer
 - 2. Seed Mixtures
 - 3. Protective fencing materials.
 - 4. Erosion control blanket.
- C. Certificates: Submit:
 - 1. Submit manufacturer's certificates of compliance with each shipment of each seed type. Certificate from seed supplier shall indicate seed is true to variety indicated on packaging. Certificates shall include guaranteed percentages of purity, weed content and germination of seed, net weight and date of shipment. No seed may be sown until certificates have been submitted.

1.5 QUALITY ASSURANCE

- A. Qualifications: Design-Builder shall have minimum five years-experience in seed installation.
 - 1. Submit written project list and references for other seed installation project work.
- B. Regulatory Requirements
 - 1. Secure permits, licenses, and pay fees including traffic control.
 - 2. Comply with laws, regulations, and quarantines for agricultural and horticultural products.

1.6 PROJECT CONDITIONS

- A. Environmental Requirements: do not deliver, handle or place soils when dry, wet, or frozen.
 - 1. Field Test
 - a. Form soil in palm of hand, if soil retains shape and crumbles upon touching, the soil may be worked.
 - b. If soil will not retain shape it is too dry and shall not be worked.
 - c. If soil retains shape and will not crumble, it is too wet and shall not be worked.

1.7 SEQUENCING AND SCHEDULING

- A. Perform seeding work only after planting and other work affecting ground surface has been completed.

1.8 SUBSTANTIAL COMPLETION

- A. Upon completion of seed installation, request the MBTA's review to determine if work is substantially complete. Submit request a minimum of five days prior to the anticipated inspection date. If work is substantially complete, the MBTA will issue a Substantial Completion letter identifying commencement of 90 day Maintenance Period.
 - 1. If work is not substantially complete, the MBTA will issue a written list of outstanding work to be done on a timely schedule agreed upon by Design-Builder and the MBTA.
 - 2. Design-Builder shall notify the MBTA when outstanding work is completed and ready for review. When outstanding work is complete, as determined by the MBTA, a letter of Substantial Completion will be issued.

1.9 90 DAY MAINTENANCE PERIOD

- A. Maintain seeded areas until Final Acceptance.

1.10 FINAL ACCEPTANCE

- A. After the 90 day maintenance period seeded areas will be reviewed for final acceptance.
- B. Conditions of Final Acceptance
 - 1. Seeded areas acceptance shall be given for entire area. No partial acceptance shall be given.
 - 2. Seeded areas shall exhibit uniform, thick, well-developed stand of grass. Lawn areas shall have no bare spots in excess of four inches in diameter and bare spots shall comprise no more than two % of total area of lawn.
 - 3. No seeded areas shall exhibit signs of damage from erosion, washouts, gullies, or other causes.
 - 4. Pavement surfaces and site improvements adjacent to seeded areas shall be clean and free of spills from placing or handling of lawn soil and seeding operations.
- C. Inspection and Final Acceptance
 - 1. Upon completion of 90 Day Maintenance Period, request the MBTA's review to determine if work is acceptable. Submit request a minimum of five days prior to the anticipated inspection date. If work is acceptable, the MBTA will issue a Final Acceptance letter. From this date forward, lawn maintenance will be the responsibility of the MBTA. Following acceptance of seeded areas, the MBTA will be given access to lawn areas for maintenance work.
 - a. If work is not accepted, the MBTA will issue a written list of outstanding work. Maintenance period to be extended until completion of work.
 - b. Design-Builder shall notify the MBTA when outstanding work is completed and ready for review. When work is complete, as determined by the MBTA, a letter of Final Acceptance will be issued.

PART 2 - PRODUCTS

2.1 LANDSCAPE SOILS AND AMENDMENTS

- A. See Section 02932 – PLANTING SOILS

2.2 MAINTENANCE FERTILIZER

- A. Maintenance Fertilizer to be mixed with soil:

1. Complete, fertilizer made from all-natural ingredients complying with State and Federal fertilizer laws. Fertilizer shall contain the following available plant food by weight, unless soils test indicate a need for different composition:

<u>Nitrogen</u>	<u>Phosphorus</u>	<u>Potash</u>
5%	3%	4%

2. Fertilizer: Pro Gro 5-3-4 manufactured by North Country Organics, Bradford, Vermont 05033, (802)222-4277, or approved equal.
3. Fertilizer to be delivered in original unopened standard size bags showing weigh, analysis ingredients and manufacturer's name.

2.3 SEED MIXTURES

- A. Seed mixtures: fresh, clean, new crop seed. Seed can be mixed by an approved method on site or can be mixed by dealer. If seed is mixed on site, each variety shall be delivered in original containers bearing dealer's guaranteed analysis. If seed is mixed by dealer, Design-Builder shall furnish to the MBTA, the dealer's guaranteed statement of composition of mixture and percentage of purity and germination of each variety.

- B. Lawn Mix:

1. Smart Seed Pro Tall Fescue and Kentucky Bluegrass Mix (turf-type tall fescue) by Pennington Seed, Inc., P.O. Box 290, Madison, GA 30650, Phone: 1-800-285-7333, or approved equal.

	<u>Proportion of mix after purity</u>	<u>Minimum germination</u>
Rebel Xtreme Tall Fescue	30% +/-	85%
Penn RK4 Tall Fescue	30% +/-	85%
Rebel XLR Tall Fescue	30% +/-	85%
Ridgeline Kentucky Bluegrass	10% +/-	85%

2. Application Rates: 350 lbs. / Acre or 8.05 lbs. / 1,000 SF, and as manufacture's recommendation.

- C. Erosion Control / Restoration Mix:

1. New England Erosion Control/Restoration Mix for Dry Sites, as supplied by New England Wetland Plants, Inc., 820 West Street, Amherst, MA 01002. Phone: (413) 518-8000. Website: www.newp.com, or approved equal, and include the following species:

- a. Creeping Red Fescue, (*Festuca rubra*), Canada Wild Rye, (*Elymus Canadensis*), Annual Ryegrass, (*Lolium multiflorum*), Perennial Ryegrass, (*Lolium perenne*), Little Bluestem, (*Schizachyrium scoparium*), Indian Grass, (*Sorghastrum nutans*), Rough Bentgrass/Ticklegrass, (*Agrostis scabra*), Upland Bentgrass, (*Agrostis perennans*).
2. Application Rates: 35 lbs. / Acre or 1 lb. / 1,250 SF
- D. Meadow Mix:
- 1. New England Wildflower Mix, as supplied by New England Wetland Plants, Inc., 820 West Street, Amherst, MA 01002. Phone: (413) 518-8000. Website: www.newp.com, or approved equal, and include the following species:
 - a. Little Bluestem, (*Schizachyrium scoparium*), Creeping Red Fescue, (*Festuca rubra*), Indian Grass, (*Sorghastrum nutans*), Canada Wild Rye, (*Elymus Canadensis*), Virginia Wild Rye, (*Elymus virginicus*), Partridge Pea, (*Chamaecrista fasciculata*), Showy Tick Trefoil, (*Desmodium canadense*), Blue Vervain, (*Verbena hastata*), Black Eyed Susan, (*Rudbeckia hirta*), Beard Tongue, (*Penstemon digitalis*), Wild Bergamot, (*Monarda fistulosa*), Common Milkweed, (*Asclepias syriaca*), Smooth Blue Aster, (*Symphotrichum laeve*), New England Aster, (*Symphotrichum novae-angliae*), Spotted Joe Pye Weed, (*Eutrochium maculatum*), Joe Pye Weed, (*Eupatorium fistulosum*), New York Ironweed, (*Vernonia noveboracensis*), Golden Alexanders, (*Zizia aurea*), Starved/Calico Aster, (*Aster lateriflorus*), Flat-top Goldentop, (*Euthamia graminifolia*), Early Goldenrod, (*Solidago juncea*).
 - 2. Application Rates: 23 lbs. / Acre or 1 lb. / 1,900 SF

2.4 WATER

- A. Water: furnished by Design-Builder, suitable for irrigation and free from ingredients harmful to plant life. Hose and other watering equipment furnished by Design-Builder.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verification of Conditions: in the event field conditions are not in conformance with Contract Documents, notify the MBTA in writing.
 - 1. Spot and Invert Elevations: verify that field elevations of the existing site conditions such as drainage and utility fixtures, pavements, existing plantings, and subsurface piping conform to the Existing Conditions Plan.
 - 2. Finish Grades: verify with the MBTA that final grades and contours are acceptable.

3.2 PREPARATION AND PLACEMENT OF PLANTING SOIL

- A. See Section 02932 – PLANTING SOILS.

3.3 PREPARATION FOR NEW SEEDED AREAS

A. Protection:

1. Dust Control: upon acceptance of finish grade provide dust control.
2. Erosion Control: upon acceptance of finish grade provide erosion control.
3. Agricultural Chemicals: protect site improvements from contact with agricultural chemicals, soil amendments, and fertilizers.

B. Surface Preparation:

1. Clean new lawn bed, pavement or other site improvements prior to installation.

3.4 SOIL PREPARATION

A. See Section 02932 – PLANTING SOILS.

B. Thoroughly irrigate areas to receive seed.

C. Scarification: cross rake areas to receive seed, so surface of soil will be receptive to holding seed.

D. Grade lawn areas smooth, free draining and even surface with a loose, uniformly fine texture. Roll and rake; remove ridges and fill depressions as required to drain.

E. Restore prepared areas if eroded, settled, or otherwise disturbed after fine grading and prior to seeding.

3.5 APPLICATION OF PRE PLANTING FERTILIZER

A. Pre-plant Fertilizer application: As specified in Section 02932 – PLANTING SOILS.

3.6 MAINTENANCE

A. Maintenance begins immediately after seed is installed and continues until Final Acceptance as follows:

1. a uniform, thick, well-developed stand of grass is established.
2. Mow seeded areas at seven-day intervals.
 - a. First mowing: when grass has grown to 3” height. Cut grass to 2 ½” height.
 - b. Subsequent Mowings: cut grass to 3” height.
 - c. Mow in Autumn until growth of grass ceases, and resume in Spring when grass grows to 3 1/2” height.
3. Mow sloped areas a minimum of once during maintenance period. 90 day maintenance period shall be extended to include required cutting.

4. Apply uniform application of maintenance fertilizer (5-3-4) at rate of 20 per 1000 square feet 30 days after new lawn has been installed.
5. Continue watering as described above.
6. After grass has started, areas failing to show uniform, thick, well-developed stand of grass shall be immediately re-seeded until areas are covered with satisfactory growth of grass as determined by the MBTA.
7. Repair damage from erosion, gullies, washouts, or other causes immediately by filling with loam borrow, tamping, re-fertilizing and re-seeding.

3.7 CLEANING

- A. Wash and sweep clean paving, site improvements and building surfaces. Clean spills and over-sprays immediately. Remove and dispose off-site excess planting mixture, soil and debris.
- B. Following Final Acceptance of lawn areas, remove materials and equipment not required for other planting or maintenance work. Materials and equipment remaining on site shall be stored in locations that do not interfere with the MBTA's maintenance of accepted seeded areas or other construction operations.

3.8 PROTECTION

- A. Protect lawn areas until Final Acceptance.

PART 4 – MEAUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02930

PLANTING

PART 1 – GENERAL

1.1 GENERAL

- A. The Work shall be performed in accordance with the following documents as issued by the Massachusetts Bay Transportation Authority:
1. The Contract Specifications, which include Volume 1 DB Contract Terms and Conditions; Volume 2 Technical Provisions; and applicable Sections of Divisions 2 through 16.

1.2 SUMMARY

- A. This Section specifies design and construction performance requirements for Lawns:
1. Planting trees, shrubs, groundcovers, and other woody and herbaceous plant materials.
 2. Tree stabilization.
 3. Incorporating of planting additives, bio-stimulants, pruning, mulching, fertilizing and watering plantings.
- B. Related Sections include the following:
1. VOLUME 2 TECHNICAL PROVISIONS, EXHIBIT 21, “ADDITIONAL. PROJECT REQUIREMENTS
 2. Section 02300 – EARTHWORK
 3. Section 02310 – FINE GRADING
 4. Section 02920 – SEEDING
 5. Section 02932 – PLANTING SOILS
 6. Section 02970 – LANDSCAPE MAINTENANCE

1.3 REFERENCE STANDARDS

- A. Comply with applicable requirements of:
1. Commonwealth of Massachusetts, Standard Specifications for Highways and Bridges, Department of Public Works, latest edition.
 2. ASTM: American Society of Testing Materials.
 3. AAN: American Association of Nurserymen.
 4. ISA: International Society of Arboriculture.
 5. ANSI: American National Standards Institute.
 6. AOAC: Association of Official Agricultural Chemists.
 7. USDA: United States Department of Agriculture.

1.4 DEFINITIONS

- A. Balled and Burlapped Stock: Exterior plants dug with firm, natural balls of earth in which they are grown, with ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of tree or shrub required; wrapped, tied, rigidly supported, and drum-laced as recommended by ANSI Z60.1.
- B. Container-Grown Stock: Healthy, vigorous, well-rooted exterior plants grown in a container with well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized in accordance with the provisions of the American Standard for Nursery Stock, ANSI Z60.1 - latest edition, for kind, type, and size of exterior plant required.
- C. Finish Grade: Elevation of finished surface of planting soil.
- D. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing planting soil.

1.5 SUBMITTALS

- A. Submittals: in accordance with Volume 2 Technical Provisions, Subsection 2.7, “Design Submittal Review Management” and Subsection 2.8, “Construction Submittal Requirements”.
- B. Product Data: Submit most recent printed information from manufacturers for:
 - 1. Antidesiccant
 - 2. Liquid Seaweed Concentrate
 - 3. Plant Growth Biostimulant
 - 4. Mycorrhizae Granules
 - 5. Tree Staples for staking
 - 6. Non-biodegradable flagging tape for marking Tree Staples.
- C. Samples: Submit samples of:
 - 1. Bark Mulch: Submit one cubic foot sample and manufacturer/supplier's name.
 - 2. Crushed Bluestone Mulch: Submit one cubic foot sample and manufacturer/supplier's name
 - 3. Tree Stabilization System.
- D. Certificates:
 - 1. Submit manufacturer's certificates of compliance listing analysis for:
 - a. Bulb Booster
 - 2. Submit certification of Massachusetts state arborist.
- E. Landscape Design-Builder:

1. Submit in writing information and qualifications for the planting Design-Builder, including name, address, telephone number, experience on projects of a similar size and complexity, a minimum of three references and supervisor for planting Design-Builder.

F. Plant List:

1. Within 30 days of award of Contract, submit plant list for review by the MBTA which includes:
 - a. plant materials proposed for project and corresponding nursery source where plants are to be selected.
 - b. for plants indicating names of plants in accordance with American Joint Committee on Horticultural Nomenclature.
2. Schedule for review at nursery source by the MBTA with Design-Builder present.
3. Substitutions: plant list shall indicate unavailable materials and document a thorough search for materials. For unavailable materials list sources contacted with telephone number, date and person's name at source.

1.6 QUALITY ASSURANCE

- A. Planting shall be performed by a certified landscape Design-Builder with a minimum of five years planting work experience on projects of a similar size and complexity and under full time supervision of a qualified supervisor.
- B. Pruning shall be performed by a Massachusetts certified and/or an International Society of Arboriculture certified arborist. Pruning shall comply with ANSI A300 pruning standards.

1.7 PRE-CONSTRUCTION MEETING

- A. At the project pre-construction meeting, the following items relating to the work of this Item shall be specifically discussed:
 1. Nursery sources for plant materials.
 2. Schedule of plant tagging, delivery and installation.
 3. Review benchmark dates at which time the MBTA shall make site visits.

1.8 SELECTION AND INSPECTION OF PLANTS

- A. Plants shall be selected by the MBTA at place of growth for conformity to specification requirements as to quality, size and variety prior to purchase and planting. Such approval shall not impair right of inspection and rejection upon delivery at site or during progress of work. Cost of replacement shall be borne by Design-Builder.
- B. Source Limitations:
 1. Plants shall have been grown under climatic conditions similar to those in the locality of the project for at least the previous two years. Unless approved by the MBTA, plants shall have been grown at a latitude of not more than 325 km (200 miles) north or south of the latitude of

the project unless the provenance of the plant can be documented to be compatible with the latitude and cold hardiness zone of the planting location.

2. B&B plants shall have been freshly dug (during the most recent favorable harvest season).
3. Color photographs of representative plant material shall be submitted for initial review of alternate nursery sources. Photographs are to include a scale rod or other measuring device and be taken from an angle that depicts the size and condition of the typical plant to be furnished. Photographs shall show actual plant material available for selection at that time.

C. Plant Selection / Coordination

1. For trees, within 90 days of the Notice to Proceed, submit tree sources and schedule selection and tagging of trees so the MBTA can tag trees for project at place of growth. The MBTA will perform on trip to the nursery(s) to select and tag trees and a second trip to the nursery(s) review and confirm the acceptability of the trees immediately prior to digging for delivery to the site. Source information shall state the place of growth and the approximate quantity of trees available for inspection. The MBTA may refuse inspection at this time if, in his or her judgment, sufficient quantities of plants are not available for inspection.
2. For shrubs and other plants, submit plant sources by January 1 of the planting year for Spring plantings, and July 1 for Fall plantings, schedule selection and tagging of shrubs so the MBTA can tag representative shrubs for project at place of growth. Source information shall state the place of growth and the approximate quantity of trees available for inspection. The MBTA may refuse inspection at this time if, in his or her judgment, sufficient quantities of plants are not available for inspection.
3. Inform the MBTA of selection schedule a minimum of one month (30 day minimum) in advance of selection/tagging dates so the MBTA can make proper travel arrangements. If Design-Builder fails to provide one month (30 day minimum) notice, any additional travel expenses shall be back-charged to Design-Builder. If the MBTA has to make additional trips to select/tag plants in the event that inadequate, insufficient or unacceptable plant material was available at the inspection location, then additional travel expenses to be backcharged to Design-Builder.
4. If nurseries and/or stock submitted for review are not acceptable to the MBTA, submit alternate sources within seven (7) business days.
5. If Design-Builder cannot locate appropriate plant material, Design-Builder shall enlist a plant broker to locate the material. Submit a report from the plant broker describing alternate sources.
 - a. Trips to nurseries shall be efficiently arranged to allow the MBTA to maximize his/her viewing time. Only undug trees (trees that are in the ground) shall be considered for approval. The MBTA may choose to attach their seal to each plant, or representative samples. Each tree may have a specific location and orientation on the proposed plan that the Design-Builder shall follow closely during installation.
 - b. Plant material that has been selected and sealed shall be secured by Design-Builder within ten (10) business days of the MBTA having reviewed or sealed the material.
 - c. The MBTA's seals shall not be removed until final plantings have been approved by the MBTA. Removal of seals prior to the MBTA's review of plantings shall be considered grounds for rejection of plant material.

D. Expenses

1. Design-Builder to pay for the MBTA's travel expenses: air fare, car rental, automobile mileage and tolls; meals and overnight accommodations if necessary, for the MBTA during time period required to select and tag plant material. Planting Design-Builder shall provide representative to travel with the MBTA while tagging plant material.

E. Plant Shipment to Site/ On Site Review

1. Notify the MBTA a minimum of five business days prior to each shipment of proposed arrival of plant material on site.
2. Layout tree locations, bed outlines and individual planting on site for inspection by the MBTA prior to planting. Arrange for adequate manpower and equipment on site at time of plant material inspection and installation to provide complete staked layout and to unload, open and handle plant material during inspection.

1.9 DELIVERY, STORAGE AND HANDLING OF PLANTS

- A. Plants during shipping and delivery and plants requiring storage on site shall be properly wrapped and covered to prevent wind drying and desiccation of branches, leaves, or buds. Plant balls shall be firmly bound, unbroken, and reasonably moist to indicate watering prior to delivery and during storage. Trees shall be free from fresh scars and damage in handling. Root masses of container grown plants shall be kept moist and containers screened from direct sun.
- B. Wrap tree trunks at nursery prior to shipping then unwrap for inspection by the MBTA prior to installation. Report damaged plants to the MBTA.
- C. Apply anti-desiccant to plants before digging at nursery and/or as directed by the MBTA once plants are delivered to site.

1.10 PROJECT/SITE CONDITIONS

- A. Environmental Requirements: do not deliver or handle soils when dry, wet, or frozen.
 1. Field Test
 - a. Form soil in palm of hand, if soil retains shape and crumbles upon touching, the soil may be worked.
 - b. If the soil will not retain shape it is too dry and shall not be worked.
 - c. If the soil retains shape and will not crumble, it is too wet and shall not be worked.
- B. Planting Season: planting seasons shall be those indicated below. Plants planted out-of-season shall receive special attention as directed. Out-of-season planting and or transplanting shall be at Design-Builder's risk and expense. No planting shall be done in frozen or muddy ground or when snow covers ground, or soil is otherwise in an unsatisfactory condition for planting.

1. Seasons for Planting:

Spring: Deciduous Materials – April 1 to June 15
Evergreen Materials – April 1 to June 15

Fall: Deciduous Materials – September 1 - October 15
Evergreen Materials – September 1 - October 15

2. Variance: If special conditions exist that warrant a variance in the above planting dates, a written request shall be submitted to the MBTA a minimum of 4 weeks prior to the scheduled planting date stating the special conditions and the proposed variance. Permission for the variance will be given if warranted in the opinion of the MBTA and upon condition that the Guarantee Period be extended for an additional period of up to 24 months at no additional cost to the MBTA.

1.11 SUBSTANTIAL COMPLETION

- A. See Section 02970 – LANDSCAPE MAINTENANCE.

1.12 MAINTENANCE

- A. See Section 02970 – LANDSCAPE MAINTENANCE.

1.13 ACCEPTANCE

- A. See Section 02970 – LANDSCAPE MAINTENANCE.

1.14 GUARANTY

- A. Start of Guaranty Period: when the MBTA issues Letter of Acceptance.
- B. Term: One year for plants.
- C. Requirements: plant material to be alive and in healthy, vigorous condition.
1. Quarterly reviews will be made with Design-Builder and the MBTA during guaranty period. Reviews will assess condition of installed plant materials.
2. Replace plants that are dead or, as determined by the MBTA, are in an unhealthy or unsightly condition, and have lost their natural shape due to dead branches, or other causes.
- D. End of Guaranty Period: when the MBTA issues letter of Final Acceptance, two years from date of substantial completion.
- E. If a Planting Season Variance is granted, the Guarantee Period for the affected plant materials shall extend through the spring (June 30) of the 12-month period following the initial Guarantee Period, without further cost to the City.

1.15 FINAL ACCEPTANCE

- A. The MBTA reviews work and finds it complete and in accordance with the Specifications.

- B. The MBTA will issue a letter of Final Acceptance, at which time project becomes responsibility of the MBTA.

PART 2 - PRODUCTS

2.1 PLANTS

- A. Plant Identification and Standards: Nomenclature conforms to current edition of Standardized Plant Names, published by American Joint Committee on Horticultural Nomenclature. Plants conform to varieties and sizes specified in plant list, and to code of standards set forth by AmericanHort, in the American Standard for Nursery Stock, ANSI Z60.1 - latest edition. Substitutions shall not be permitted without consent of the MBTA. Plants shall be properly identified with plant labels securely attached to plants, in order to identify plants on site. Information regarding sources of plant material shall be furnished to the MBTA.
- B. General Plants: Unless specified otherwise, plants shall be nursery grown under climatic conditions similar to those in locality of project and shall have been previously been transplanted or root pruned at least once in last three years. Plants shall possess a normal balance between height and spread. Plants shall be typical of their species and variety with a normal habit of growth, densely foliated when in leaf, and a well-developed branch structure with a fibrous, healthy root system with no girdling roots. Plants shall be sound and healthy, free from dead wood, defects, disfiguring knots, sun scald, injuries or abrasions of roots or bark. Plants shall be freshly dug. No heeled-in plants or plants from cold storage shall be used. Parts of plant shall be moist and show active green cambium when cut. Plants shall be free of plant diseases, insects, pests, eggs, larvae, and forms of infestations.
- C. Plant relationship between Root Flare and Finished Grade: nursery source shall properly plant, maintain and dig plants to maintain the natural relationship of the plants root flare, slightly above the soil of the root ball. Plants which have or show signs of previously having soil placed over their root flares from planting too deep when initially lined out, maintenance practices that turn over and mound up the soil to keep down weeds and or placing excavated soils over original root flare and root ball soil level will be rejected.
- D. Balled and Burlapped Plants: "B&B" plants shall be dug with root systems as solid units. Diameter and depth of balls of soil shall be sufficient to encompass fibrous and feeding root system necessary for healthy development of plants. Balls shall be wrapped firmly with biodegradable material, and bound carefully with twine or cord. Tree balls may also be placed in a wire basket of diameter suitable for the size of the root ball. No plant shall be accepted when ball of earth surrounding roots has been badly cracked or broken, either before or during process of planting, or after burlap and ropes, required for transplanting have been unfastened. Plants and root balls shall remain intact as a unit during operations. Plants that cannot be planted at once shall be protected and watered.
- E. Bare Root Plants: "BR" plants shall be dug while dormant. Bare root plants shall be maintained in a healthy condition during storage, transportation, and operations.
- F. Container-Grown Plants: Container grown plants shall have been acclimatized for one growing season in container. Container plants shall be well established in container, and shall have sufficient roots to hold earth intact after removal, without being in a root-bound condition. Plants shall remain in container until planted.
- G. Trees:

1. Tree branching height to begin at 7' above finished grade without adversely impacting the overall appearance of the tree.
 2. Tree canopies, except when a clump form is designated shall be straight and symmetrical with a crown having a persistent single, main leader, tapered trunk free of co-dominant stems and growing from a single, unmutated crown of roots, and typical of the species or cultivar. No part of trunk shall be conspicuously crooked as compared with normal trees of same variety. Crown shall be free of large voids and not be significantly deformed by wind, pruning practices, pests, or other factors. Live crown ratio (distance which supports healthy foliage from bottom of canopy to the top/tree height) shall be at least 60%.
 3. Trunk shall be free of wounds (except for properly-healed pruning wounds), damaged bark or branches, abrasions, disfiguring knots, sunscald, conks, bleeding, galls, signs of insects or disease, and girdling ties, sunscald, frost cracks, or wounds resulting from abrasions, fire, or other causes. No pruning wounds shall be present having diameter of more than two inches (2") and wounds shall show vigorous bark on edges. Pruning wounds over 3/4 inch in diameter shall be completely calloused over.
 4. Trees shall stand erect without a supporting stake.
 5. Main scaffold branches shall be less than 2/3 the trunk diameter, free of bark inclusions (places where bark is embedded within the crotch preventing the formation of a normal branch bark ridge), and well-spaced. They shall be distributed radially around and vertically along the trunk, forming a generally symmetrical crown typical for the species.
 6. Evergreen trees shall be branched to within one foot of the ground. Height of trees, measured from crown of roots to top of top branch, and caliper, measured as specified herein.
 7. Take caliper measurements 6 in. above ground on trees up to and including 4 in. caliper, and at 12 in. above ground for larger sizes.
- I. Shrubs and Small Plants: Shrubs and small plants, unless otherwise designated, shall be well-formed and bushy with well-spaced side branches, and shall have a crown and stem(s) typical of species and variety. Plants shall be well-branched to ground. Measurements for height are to be taken from ground level to average height of top of shrub and not to longest branch. Thickness of each shrub shall correspond to trade classification "No. 1". Single stemmed or thin plants will not be accepted.
 - J. Plants larger than required may be used if approved by the MBTA, but use of such plants shall not increase the Contract Price. If use of larger plants is approved, spread of roots or ball of earth shall be increased in proportion to size of plant.

2.2 PLANTING ADDITIVES

- A. Liquid Seaweed Concentrate: Dry, water soluble seaweed extract powder from *Ascophym nodosum*. Stress-X as manufactured by North Country Organics, Bradford, Vermont 05033, ph# 802.222.4277, or equal.
- B. Plant Growth Biostimulant: Dry, water soluble plant growth biostimulant made from beneficial bacteria humic extracts, cold water sea kelp extract, essential amino acids, vitamins, root growth factors and sugars. Bio- Magic as manufactured by North Country Organics, Bradford, Vermont 05033, ph# 802.222.4277, or equal.

- C. Mycorrhizae granules: transplant granules for inoculating plants with beneficial mycorrhizal fungi prior to planting. Myco-Magic as manufactured by North Country Organics, Bradford, Vermont 05033, ph# 802.222.4277, or equal.

2.3 BARK MULCH

- A. Bark mulch: shredded granular outer bark of evergreen trees and minimum of hardwood bark and shall be aged for period of at least 6 months and not longer than two years. Bark mulch shall not have be subjected to anaerobic conditions and shall be partially decomposed and dark brown in color, Bark chunks shall average 1/2 inch to 2 inches in length and no chunks three inches or more in size and thicker than 1/4 inch shall be left on site. Moisture content shall be 40 % or more, retained with normal watering and/or rainfall. Mulch shall be free of dirt, leaves, twigs, and other materials deleterious to plant life. Mulch shall not contain chipped construction materials.

2.4 POST PLANTING FERTILIZER

- A. Post Planting Fertilizer:
 - 1. Complete, fertilizer made from all-natural ingredients complying with State and Federal fertilizer laws. Fertilizer shall contain the following available plant food by weight, unless soils test indicate a need for different composition
 - 2. Pro Start 5-3-4 manufactured by North Country Organics, Bradford, Vermont 05033, ph# 802.222.4277, or approved equal.
 - 3. Fertilizer to be delivered in original unopened standard size bags showing weigh, analysis ingredients and manufacturer's name.

2.5 WATER

- A. Water: furnished by Design-Builder, unless otherwise specified, and suitable for irrigation and free from ingredients harmful to plant life. Hose and other watering equipment required for work shall be furnished by Design-Builder.

2.6 TREE STABILIZATION MATERIALS

- A. Tree Stabilization: Below grade root ball anchoring system shall be DUCKBILL Root Ball Kit as manufactured by Foresight Products, 6430 East 49th Drive, Commerce City, CO 80022. Phone: (800) 325-5360. Email: sales@duckbill.com, or approved equal.
 - 1. For tree sizes up to 3": Model 68 RBK Kit
 - 2. For tree sizes up to 6": Model 88 RBK Kit
 - 3. Maintain planting in plumb condition and in order to withstand the environmental conditions of the site.

2.7 ANTIDESSICANT

- A. Antidesiccants: emulsions or materials which provide a protective film over plant surfaces permeable enough to permit transpiration and specifically manufactured for that purpose. Antidesiccant shall be delivered in manufacturer's containers and used according to manufacturer's instructions.

2.8 CHEMICALS, HERBICIDES, FUNGICIDES AND INSECTICIDES

- A. Provide chemicals, herbicides, fungicides and insecticides, as needed, for fungus or pest control. Chemicals and insecticides shall be approved by Massachusetts Department of Environmental Protection for intended use and application rates. No pesticides shall be used on site without knowledge and approval of the MBTA. Pesticides shall be handled by State licensed operators only.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verification of Conditions: in the event field conditions are not in conformance with Contract Documents, notify the MBTA in writing.
 - 1. Spot and Invert Elevations: verify that field elevations of all existing site conditions, such as drainage and utility fixtures, pavements, existing plantings, and subsurface piping conform to Existing Conditions Plan.
 - 2. Finish Grade: Finish Grades: verify with the MBTA that final grades and contours are acceptable.

3.2 PREPARATION

- A. Protection:
 - 1. Contact "Dig Safe" prior to doing excavation on site. If work is to be done around underground utilities, appropriate authority of utility shall be notified of impending work. Hand excavate areas adjacent to utilities. Design-Builder shall be responsible for damages done by himself or his personnel to existing utilities, which shall be repaired or paid for by Design-Builder.
 - 2. Dust Control: provide dust control.
 - 3. Erosion Control: provide erosion control.
 - 4. Agricultural Chemicals: protect site improvements from contact with agricultural chemicals, soil amendments, and fertilizers.

3.3 DIGGING, HANDLING, AND PROTECTION OF PLANTS

- A. Dig balled and burlapped (B&B) plants with firm natural balls of earth, of sufficient diameter and depth to include fibrous roots and conforming to The American Standard for Nursery Stock ANSI Z60.1 – latest addition, as provided by AmericanHort. No synthetic burlap will be accepted. No plant moved with a ball will be accepted if ball is cracked or broken before or during planting operations.

- B. Protect roots or balls of plants from sun and drying winds.
- C. For balled and burlapped plants which cannot be planted immediately upon delivery, set plants on ground in shady location and protect with soil, bark mulch, or other acceptable materials,. Water stored plants and regularly verify rootballs are moist. The MBTA will reject stored plants found with dried rootballs.
- D. Open bundles of plants immediately and plants and separate before roots are covered. Care shall be taken to prevent air pockets among roots. During planting operations, bare roots shall be covered with canvas, hay or other suitable material. No plant shall be bound with wire or rope as to damage the bark or break branches.

3.4 OBSTRUCTIONS BELOW GROUND

- A. If rock, underground construction work, or other obstructions are encountered in plant pit excavation work, alternate locations may be selected by the MBTA at no additional cost to the MBTA.
- B. Where locations cannot be changed, obstruction shall be removed, subject to the MBTA's approval, to a depth of not less than three feet (3') below grade and no less than six inches (6") below bottom of ball or roots when plant is properly set at required grade.
- C. Removal of rock and underground obstructions encountered as specified in Section 02300 – Earthwork.

3.5 PREPARATION AND PLACEMENT OF PLANTING MEDIUMS AND UNDERDRAINAGE COMPONENTS

- A. See Section 02932 – PLANTING SOILS.

3.6 FINE GRADING

- A. See Section 02310 – FINE GRADING.

3.7 PLANTING OPERATIONS

- A. Stake out locations of plants and secure the MBTA's approval before excavating plant pits.
- B. Excavating
 1. Place tree next to tree pit excavation and remove burlap from top of root ball. If trunk flair is not visible gently loosen and remove soil with a blunt tool or air spade until trunk flair and large horizontal lateral roots are located. Use care not to damage root system. Following removal of excess soil over root ball measure depth of root ball to determine depth of tree pit excavation.
 2. Dig tree pits and plant pits by hand and take care not to disturb utilities. If utilities are disturbed during planting operation, Design-Builder shall repair damage at Design-Builder's expense.
 3. Excavate plant pits with sloping sides so planting hole is saucer shaped. Plant pit shall be no deeper than root ball.
 4. Tree pits shall be four times diameter of soil ball in width.

C. Setting, Backfilling and Fertilizing

1. In the event trees are containerize in wire baskets, lay tree on its side and cut the bottom of the cage off, roll the tree into the hole and remove the sides of the wire basket.
2. Solar Orientation: Trees marked on the north side of the trunk while growing at the Nursery shall be planted with the same orientation as they originally grew to reduce trunk damage due to sun-scald, wherever feasible.
3. Set plants in center of pits plumb, straight and at an elevation where after settlement the root flare and lateral roots of plant will be at surrounding finished grade. Root ball shall not be broken. When trees are set, compact base material under the root balls to fill voids and support plants at proper height. Remove burlap and rope from upper two thirds of balls and have the MBTA inspect removal prior to backfilling.
4. Remove groundcovers and perennials from containers immediately before planting. Handle plants carefully to prevent damaging roots. Groundcover plants may be planted after bark mulch is placed.
5. Following removal of top 1/3 of burlap in accordance with manufacturer's recommendations, sprinkle mycorrhizal granules continuously around perimeter of root ball as well as incorporating granules into top of rootball.
6. Mix liquid seaweed concentrate or plant growth bio-stimulant with water at a rate of 3 grams of liquid seaweed concentrate powder per gallon of water or 1 teaspoon of plant growth biostimulant per gallon of water.
7. Before backfilling around root balls and with the burlap removed, roughen the surface of the nursery ball sides. This action will serve to break and score any glazing of the nursery soil which frequently occurs through digging and handling. The micro-fissures so created help to decrease hydraulic barriers between these soils.
8. Backfill hole around plants to two-thirds full, sprinkle mycorrhizal granules continuously around perimeter of root ball and on top of rootball, firm soil, flood with water mixed with additives, after water has drained away backfill to finished grade without additional firming. Immediately after plant pit is backfilled, a shallow basin slightly larger than pit shall be formed with ridge of soil to facilitate and contain water. After planting, cultivate soil in shrub beds between shrub pits, rake smooth and outline beds neatly.

3.8 DRAINAGE TEST

- A. Perform drainage test on trees and in representative shrub beds.
 1. After excavation, fill pit twice successively with water.
 2. Water shall drain out of plant pit minimum 2 inches per hour.
 3. Plant pits draining slower than 2 inches per hour will require provision for drainage.
- B. Documentation: note on the planting plan, pits that pass drainage test and plants that fail drainage test.

3.9 FIELD QUALITY CONTROL

A. Observation:

1. The MBTA to review plant pit excavation and planting.

3.10 TREE STABILIZATION

- A. Install below grade root ball anchoring system as per manufacturer's recommendations
- B. Maintain trees in upright, vertical position, as determined by the MBTA.

3.11 PRUNING

- A. Pruning shall be performed by a Massachusetts certified and/or an International Society of Arboriculture certified arborist. Pruning cuts to correct injury, damage or branching structure shall comply with the provisions of Tree, Shrub and Other Woody Plant Management - Standard Practices – Part 1 – Pruning (ANSI A300), latest edition. Pruning to preserve natural character of plant and as directed by the MBTA. No leaders shall be cut.
- B. Prune trees and shrubs only with approval of the MBTA to remove limbs that are below 7' above finished grade to maintain pedestrian clearance, dead, broken and crossing branches. Plants shall not be heavily pruned at the time of planting. In no case shall more than one-quarter of the branching structure be removed.
- C. Pruning is required at planting time to correct defects in the tree structure, including removal of injured branches, double leaders, waterspouts, suckers, and interfering branches. Healthy lower branches and interior small twigs shall not be removed except as necessary to clear walks and roads. Retain the normal or natural shape of the plant.
- D. Prune with clean, sharp tools. Dead wood or suckers and broken or badly bruised branches shall be removed back to live bud, branch, or stem.
- E. Pruning above head height shall be done from a hydraulic man-lift or using other mechanisms such that it is not necessary to climb the tree.

3.12 PLACEMENT OF BARK MULCH

- A. Immediately after planting operations are completed, cover tree and shrub pits and planting beds with a two inch layer of specified mulch. Taper depth of mulch to be two inches at mulched perimeter and decreasing in depth toward trunk to be flush where trunk or stem meets root ball. Do not place bark mulch against trunk or stem. Cover tree, shrub and groundcover planting beds with bark mulch.

3.13 WATERING

- A. Flood plants with water twice within first 24 hours of time of planting, and water plants during the maintenance period at least twice per week. At each watering thoroughly saturate the soil around each tree or shrub. If sufficient moisture is retained in soil, as determined by the MBTA, required watering may be reduced. Each tree will require a minimum of ten gallons of water.

3.14 POST PLANTING FERTILIZER

- A. Apply uniform application of Post Planting Fertilizer (5-3-4) at rate of 5 lbs. per 1000 square feet, 30 days after planting.

3.15 CLEANING

- A. Wash and sweep clean paving, site improvements and building surfaces. Clean spills and over-sprays immediately. Remove and dispose off-site excess planting mixture, soil and debris.
- B. Following Acceptance at the end of 90 Maintenance Period of planting areas, remove materials and equipment not required for other planting or maintenance work. Materials and equipment remaining on site shall be stored in locations which do not interfere with the MBTA's maintenance of accepted lawns or other construction operations.

3.16 LANDSCAPE MAINTENANCE

- A. Landscape Maintenance and Aftercare: in accordance with Section 02970 – LANDSCAPE MAINTENANCE.

PART 4 – MEAUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02932

PLANTING SOILS

PART 1 - GENERAL

1.1 GENERAL

- A. The Work shall be performed in accordance with the following documents as issued by the Massachusetts Bay Transportation Authority:
 - 1. The Contract Specifications, which include Volume 1 DB Contract Terms and Conditions; Volume 2 Technical Provisions; and applicable Sections of Divisions 2 through 16.

1.2 DESCRIPTION OF WORK

- A. This Section specifies administrative and procedural requirements for manufactured planting mediums including, but not limited, to the following:
 - 1. Evaluation of rough subgrade water infiltration.
 - 2. Planting soil material acquisition
 - 3. Testing and analysis for specification conformance.
 - 4. Inspection and testing of subgrade for preparation of subgrade.
 - 5. Preparation of soil mediums and testing for conformance.
 - 6. Installation and placement of soils.
 - 7. De-compaction of soils.
 - 8. Final in-place testing of soils.
 - 9. Coordination.
 - 10. Clean-up.
- B. Related Sections include the following:
 - 1. VOLUME 2 TECHNICAL PROVISIONS, EXHIBIT 21, "ADDITIONAL. PROJECT REQUIREMENTS 2. Section 02300 – EARTHWORK
 - 2. Section 02310 – FINE GRADING
 - 3. Section 02930 – PLANTING
 - 4. Section 02920 – SEEDING
 - 5. Section 02970 – LANDSCAPE MAINTENANCE

1.3 REFERENCES

- A. Comply with applicable requirements of:
 - 1. Commonwealth of Massachusetts, Standard Specifications for Highways and Bridges, Department of Public Works, latest edition.
 - 2. American Association of Nurserymen, American Standards for Nursery Stock, (ANSI Z60.1), latest edition, published by the American Association of Nurserymen, 1250 I Street, N.W., Suite 500 Washington, D.C. 20005.

3. ASTM: American Society of Testing Materials.
4. ANSI: American National Standards Institute.
5. AOAC: Association of Official Agricultural Chemists.
6. USDA: United States Department of Agriculture.

1.4 SUBMITTALS

- A. Submittals: in accordance with Volume 2 Technical Provisions, Subsection 2.7, “Design Submittal Review Management” and Subsection 2.8, “Construction Submittal Requirements” and the source approval, sample provision and material testing requirements of Specification SECTION 02300 – EARTHWORK, Subsection 1.5, “Submittals”.
- B. Product Data: provide most recent printed information from manufacturer.
 1. Fertilizers
 2. Ground Limestone
 3. Superphosphate
- C. Samples
 1. Existing Base Topsoil
 2. Imported Base Topsoil
 3. Organic Amendment Materials
- D. Test Reports for each of the above samples: Submit sample from each proposed source for testing and approval. Deliver samples to testing laboratory and pay costs. Send testing report directly to the MBTA.
 1. Inform testing agency soil test is for both tree and shrub planting.
 2. Mechanical and chemical analysis shall be conducted by a public extension service agency or a certified private testing laboratory in accordance with the current “standards” of the Association of Official Agriculture Chemists.
 3. Test soil for agricultural suitability analysis including:
 - a. particle size and characteristics
 - b. soil pH by water pH and buffer (smp) pH tests.
 - c. percentage organic content
 - d. nitrate nitrogen
 - e. ammonium nitrogen
 - f. phosphorus
 - g. potassium
 - h. calcium
 - i. aluminum
 - j. magnesium
 - k. manganese

- l Micronutrients
 - m. Toxins including but not limited to lead, cadmium, arsenic and mercury.
4. Tests shall be by combined hydrometer and wet sieving in compliance with ASTM D422 after destruction of organic matter by ignition.
5. Test results: test data and recommendations for soil amendments including but not limited to: nitrogen, phosphorus, potassium and limestone.

1.5 QUALITY ASSURANCE

- A. Soils Testing Laboratory: to be approved by the MBTA. Lab shall have ability to make tests and provide soil recommendations.
- B. Qualifications: Design-Builder shall have minimum five years-experience in soil preparation work.
- C. Regulatory Requirements
 - 1. Comply with laws, regulations, and quarantines for agricultural and horticultural products.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Packing and Shipping: deliver materials in unopened containers bearing manufacturer's name and guaranteed statement of analysis. Transport materials without damage. Protect finishes from abrasion, dirt, oils, grease, and chemicals. Pack materials to protect from weather.
- B. Acceptance at Site: verify in writing that delivered materials conform to specifications and approved submittals.
- C. Storage and Protection:
 - 1. Materials shall be uniform in composition, dry and free flowing. Store materials in dry place, on pallets, off the ground; protect from sun. Store materials in a manner which does not diminish their usability and effectiveness.
 - 2. Protect materials from theft, damage, weather, dirt, oils, grease, and construction.

1.7 PROJECT/SITE CONDITIONS

- A. Environmental Requirements: do not deliver or handle soils when dry, wet, or frozen.
 - 1. Field Test
 - a. Form soil in palm of hand, if soil retains shape and crumbles upon touching, the soil may be worked.
 - b. If the soil will not retain shape it is too dry and shall not be worked.
 - c. If the soil retains shape and will not crumble, it is too wet and shall not be worked.

PART 2 - MATERIALS

2.1 BASE TOPSOIL

- A. Base topsoil shall be existing topsoil and imported soil as may be required.
 - 1. Existing Base Topsoil, stripped and stockpiled, shall be sampled and tested for grains size distribution and organic content according to tests as specified. Test results shall be reported to the Soil Scientist who may make minor adjustments to specified approximate mixing ratios and mix requirements for each mix type.
 - 2. Imported Base Topsoil, as may be required to meet project requirements, shall be taken from a well-drained, arable site, and shall be free of subsoil, large stones, earth clods, sticks, stumps, clay lumps, roots or other objectionable, extraneous matter or debris. Base Topsoil shall also be free of quack-grass rhizomes, Agropyron Repens, and the nut-like tubers of nutgrass, Cyperus Esculentus, and all other primary noxious weeds. Imported Base Topsoil shall not be delivered or used for planting while in a frozen or muddy condition. Imported Topsoil shall conform to the following grain size distribution for material passing a Number 10 Sieve and following additional requirements:
- B. Base Topsoil shall conform to the following grain size distribution for material passing the #10 sieve:

U.S. Sieve No.	% Passing by Weight	
	Minimum	Maximum
10	100	-
18	85	100
35	70	95
60	50	85
140	36	53
270	30	42
0.002 mm	3	6

- C. Maximum size shall be one-inch largest dimension. The maximum retained on the #10 sieve shall be 20% by weight of the total sample.
- D. The ratio of the particle size for 80% passing (D80) to the particle size for 40% passing (D40) shall be 5.0 or less. (D80/D40 < 5.0)
- E. The organic content shall be between 4.0 and 8.0 %.

2.2 ORGANIC AMENDMENT MATERIALS (COMPOST):

- A. Compost for amending base loam shall be a stable, humus-like material produced from the aerobic decomposition of organic residues. The residues, if biosolids, shall consist of compost meeting MA DEP Type 1 requirements or approved equal. The compost shall be a dark brown to black color and be capable of supporting plant growth with appropriate management practices in conjunction with addition of fertilizer and other amendments as applicable, with no visible free water or dust, with no unpleasant odor, and meeting the following criteria as reported by the producer.

- B. The ratio of carbon to nitrogen shall be in the range of 10:1 to 25:1.
- C. Stability shall be assessed by either a CO₂ evolution test or a re-heating test or Solivita procedure. Protocols for each are specified by the coalition of Northeastern Governors Source Reduction Task Force (CONEG) in their 1966 report, "Model Procurement Specifications for Source Separated Compost" and the Solivita manual (version 3.5). For the CO₂ test, the compost respiration shall be no more than 6 mg CO₂-C/gBVS day. For re-heating using the Dewar self-heating test, the maximum heat rise shall be no greater than 9 degrees C above room temperature (20 to 25 degree C). For the Solivita test, the compost shall achieve a maturity index of 6 or more. Stability tests shall be conducted by Wood End Research Laboratory, Mt Vernon, Maine.
- D. Pathogens/Metals/Vector Attraction reduction shall meet 40 CFR Part 503 rule, Table 3, page 9392, Vol. 58 No. 32, and Commonwealth of Massachusetts 310 CMR 32.00 (for applications to soils with human activity).
- E. Organic Content: Shall be at least 40 % (dry weight). 100 % of the material shall pass a 3/8-inch (or smaller) screen. Debris such as metal, glass, plastic, wood (other than residual chips), asphalt or masonry shall not be visible and shall not exceed one % dry weight. Organic content shall be determined by weight loss on ignition for particles passing a number 10 sieve according to procedures performed by the testing laboratory as follows:
1. A 50 cc sub-sample of the screened and mixed compost is ground to pass the number 60 sieve.
 2. 2 to 3 grams (+ 0.001g) of ground sample, dried to a constant weight at 105 degrees C is placed into a muffle furnace.
 3. The temperature is slowly raised (5C/minute) to 300C.
 4. The sample is removed to oven to equilibrate at 105C and the weight is taken.
 5. Organic matter is calculated as loss on ignition.
- F. pH: The pH shall be between 5.5 to 8.0 as determined from a 1:1 soil-distilled water suspension using a glass electrode pH meter American Society of Agronomy Methods of Soil Analysis, Part 2, 1986.
- G. Salinity: Soluble salts shall not exceed 2.0 mmhos/cm (dS/m).
- H. The compost shall be screened to 3/8 inch maximum particle size and shall contain not more than 3% material finer than 0.002mm as determined by hydrometer test on ashed material. The compost shall have a texture suitable for incorporation without causing loss of hydraulic conductivity of the soil mix.
- I. Nutrient content shall be determined by the University of Massachusetts Soil Testing Laboratory or equivalent laboratory and utilized to evaluate soil required amendments for the mixed soils. Chemical analysis shall be undertaken for Nitrate Nitrogen, Ammonium Nitrogen, Phosphorus, Potassium, Calcium, Aluminum, Magnesium, Iron, Manganese, Lead, Soluble Salts, Cation Exchange Capacity, soil reaction (pH) and buffer pH.

2.3 SAND

- A. Sand shall be uniformly graded coarse sand consisting of clean, inert, rounded grains of quartz or other durable rock free from loam or clay, surface coatings, mica or other deleterious materials with the following gradation:

U.S. Sieve Size Number	% Passing by Weight	
	Minimum	Maximum
10	100	-
18	60	80
35	25	45
60	8	20
140	0	8
270	0	3
0.002mm	0	0.5

- B. Maximum size shall be one-inch largest dimension. The maximum retained on the #10 sieve shall be 15% by weight of the total sample.
- C. The ratio of the particle size for 70% passing (D70) to the particle size for 20% passing (D20) shall be 3.0 or less. ($D70/D20 < 3.0$).
- D. Tests shall be by combined hydrometer and wet sieving in compliance with ASTM D422 after destruction of organic matter by ignition.

2.4 PLANTING MIXTURE

- A. Planting Mixture shall consist of a blend of approximately equal parts by volume of Base Topsoil, Sand and Organic Amendment. Blending of the components shall be carried out with earth moving equipment prior to placement. Components shall be blended to create a uniform mixture as determined by the MBTA. The final mix shall have the properties specified below.

- B. Gradation for material passing a Number 10 sieve:

U.S. Sieve No.	% Passing by Weight	
	Minimum	Maximum
10	100	-
18	73	93
35	55	83
60	28	55
140	20	35
270	16	23
0.002 mm	1	4

- C. Maximum size shall be one-inch largest dimension. The maximum retained on the #10 sieve shall be 20% by weight of the total sample.
- D. The ratio of the particle size for 80% passing (D80) to the particle size for 30% passing (D30) shall be 4.5 or less. ($D80/D20 < 4.5$).
- E. Organic content shall be between 5 and 8 %.

- F. Tests shall be by combined hydrometer and wet sieving in compliance with ASTM D422 after destruction of organic matter by ignition.

2.5 PRE-PLANT FERTILIZER

- A. Complete, fertilizer made from all-natural ingredients complying with State and Federal fertilizer laws. Fertilizer shall contain the following available plant food by weight, unless soils test indicate a need for different composition:

	Nitrogen	Phosphorus	Potash
Deciduous Trees and Shrubs	2%	3%	3%
Evergreen Trees and Shrubs	2%	3%	3%

- B. Fertilizer: Pro Start 2-3-3 manufactured by North Country Organics, Bradford, Vermont 05033, ph# 802.222.4277.
- C. Fertilizer to be delivered in original unopened standard size bags showing weight, analysis ingredients and manufacturer’s name.

2.6 SOIL AMENDMENTS

- A. Follow soil report recommendations for soil additives for landscape soils.
- B. Superphosphate: finely ground phosphate rock, commonly used for agricultural purposes and shall contain not less than 20 % available phosphoric acid.
- C. Ground Limestone: dolomitic limestone and contain not less than 50 % of total carbonates and 25 % total magnesium with a neutralizing value of at least 100 %. Material shall be ground to such fineness that 40 % will pass 100 mesh U.S. standard sieve and 98 % will pass through 20 mesh U.S. standard sieve.

2.7 EQUIPMENT

- A. Chisel Plow or disk harrow or bucket of backhoe: for subsoil cultivation.
- B. Rotovator or disk harrow: for planting mixture/soil cultivation.

2.8 WATER

- A. Water: furnished by Design-Builder, unless otherwise specified, and suitable for irrigation and free from ingredients harmful to plant life. Hose and other watering equipment furnished by Design-Builder.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verification of Conditions: in the event field conditions are not in conformance with Contract Documents, notify the MBTA in writing.
 - 1. Spot and Invert Elevations: verify that field elevations of all existing site conditions, such as drainage and utility fixtures, pavements, existing plantings, and subsurface piping conform to Existing Conditions Plan.
 - 2. Finish Grade: Finish Grades: verify with the MBTA that final grades and contours are acceptable.

3.2 PREPARATION

- A. Protection:
 - 1. Design-Builder required to contact "Dig Safe" prior to doing excavation on site. If work is to be done around underground utilities, appropriate authority of utility shall be notified of impending work. Hand excavate areas adjacent to utilities. Design-Builder shall be responsible for damages done by himself or his personnel to existing utilities, which shall be repaired or paid for by Design-Builder.
 - 2. Prior to installation field locate and protect from damage site improvements such as drainage and utility fixtures, pavements, and existing plantings.
 - 3. Dust Control: upon acceptance of finish grade provide dust control.
 - 4. Erosion Control: upon acceptance of finish grade provide erosion control.
 - 5. Agricultural Chemicals: protect site improvements from contact with agricultural chemicals, soil amendments, and fertilizers.

3.3 PREPARATION OF PLANTING MIXTURE

- A. Correct deficiencies in soil as directed by soil test results. Thoroughly incorporate amendments into planting mixture to ensure even distribution.
- B. Incorporate pre plant fertilizer at a rate of 30 pounds per cubic yard of planting mixture. Amendment rate will be 6 times square foot application rate per cubic yard of planting mixture.

3.4 PLACEMENT OF PLANTING MIXTURE

- A. After subgrade levels have been reached, and immediately prior to placing Planting Mixture, the entire subgrade area shall be loosened to a minimum depth of two inches utilizing the teeth on the bucket of a backhoe or equivalent equipment.

- B. After loosening, the area shall be recompactd by tamping or with the tracks of a small bulldozer. No vibratory compaction of the subgrade shall take place. After the soils have been loosened, recompressed and inspected, Planting Mixture shall then be spread in lifts not greater than eight inches and compacted to a density between 76 and 80 % Standard Proctor Maximum Dry Density. Surface area of each lift shall be scarified by raking prior to placing next lift.
- C. Place and spread planting mixture and soil to a depth greater than required such that after settlement, finished grade blends smoothly with existing slope of land. Ensure proper drainage in an uninterrupted pattern free of hollows and pockets.
- D. Remove stiff clods, lumps, brush, roots, stumps, litter and other foreign material and stones over one inch in diameter and dispose of legally off site.

3.5 CLEANING

- A. Clean up debris generated under work of this section.
- B. Site Improvements
 - 1. Wash and sweep clean site improvements such as drainage and utility fixtures, pavements, existing plantings, and site furnishings.
 - 2. Clean site furnishings of grout, adhesives, concrete, and other debris.

3.6 PROTECTION

- A. Protect work of this section until Final Acceptance.
- B. Protect prepared soils from compaction by construction traffic and from contamination by

PART 4 – MEAUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02970

LANDSCAPE MAINTENANCE

PART 1 - GENERAL

1.1 GENERAL

- A. The Work shall be performed in accordance with the following documents as issued by the Massachusetts Bay Transportation Authority:
 - 1. The Contract Specifications, which include Volume 1 DB Contract Terms and Conditions; Volume 2 Technical Provisions; and applicable Sections of Divisions 2 through 16.

1.2 DESCRIPTION OF WORK

- A. This Section contains the following:
 - 1. Post Planting Tree Care, Pruning, Monitoring and Aftercare
 - 2. Guaranty and replacement of unacceptable plants.
 - 3. Maintenance Manual.
- B. Related Sections include the following:
 - 1. Section 02310 – FINE GRADING
 - 2. Section 02930 – PLANTING
 - 3. Section 02932 – PLANTING SOILS

1.3 REFERENCES/STANDARDS

- A. Comply with applicable requirements of:
 - 1. Commonwealth of Massachusetts, Standard Specifications for Highways and Bridges, Department of Public Works, latest edition.
 - 2. American Association of Nurserymen, American Standards for Nursery Stock, (ANSI Z60.1), latest edition, published by the American Association of Nurserymen, 1250 I Street, N.W., Suite 500 Washington, D.C. 20005.
 - 3. Best Management Practices: Tree Planting. International Society of Arboriculture, P.O. Box 3129, Champaign, IL 61826-3129. 2005.
 - 4. American Standard for Pruning, ANSI A300-2001. American National Standards Institute, Inc. 1819 L Street, NW, Sixth Floor, Washington, DC 20036.

1.4 DEFINITIONS

- A. Maintenance: consists of keeping plants in healthy growing condition including watering, weeding, cultivating, re-mulching, tightening and repairing of guys, removal and replacement of dead plant material, resetting plants to proper grades or upright positions and maintaining saucer.

1.5 SUBMITTALS

- A. Submittals: in accordance with Volume 2 Technical Provisions, Subsection 2.7, “Design Submittal Review Management” and Subsection 2.8, “Construction Submittal Requirements”.
- B. Materials List: provide list of materials to be used in maintenance; materials shall be the same as approved in related sections:
 - 1. Fertilizers, soil amendments, testing see Section 02932 – PLANTING SOILS.
 - 2. Plant materials, mulch, and related materials, see Section 02930 - PLANTING.
- C. Maintenance Manual
 - 1. Submit a Maintenance Manual to the MBTA describing schedule and operations for on-going upkeep of the installed plants for the entire Guaranty Period. The manual shall address itself to:
 - a. Post Planting Plant Materials Care, Pruning, Monitoring and Aftercare including addressing care and long-term maintenance of the specified plants.
 - b. Guaranty and replacement of unacceptable plants.
 - 2. Provide specific information on the following items:
 - a. Post Planting Tree Care Monitoring and Aftercare including addressing care and long-term maintenance of the specified plants.
 - b. Fertilization: Fertilizing seasons; analysis for fertilizer selection; application rates and methods; preparation and conditions; application times; application equipment; post-application operations and care; precautions for fertilizer use.
 - c. Liming: Liming season; analysis for liming; application rate; method and equipment for application.
 - d. Pruning: Pruning goals and purposes; methods and techniques (relate to species); equipment; season; cleanup and disposal; precautions.
 - e. Miscellaneous plant maintenance: Weeding and weed control; pest and disease control; leaf and litter removal; professional assistance for plant care;
 - f. Replacement of unacceptable plants.
 - 3. Include a month-by-month calendar of maintenance procedures, indicating operations listed above.
 - 4. Submit a copy of maintenance manual to the MBTA for approval. Submit prior to planting completion. The MBTA may request revisions to manual to meet intent of project design.
 - 5. Submit three copies of manual to the MBTA at acceptance meeting for planting work. Acceptance shall not be granted until manual has been submitted and approved.

1.6 QUALITY ASSURANCE

- A. Qualifications: Design-Builder shall have minimum five years experience in landscape maintenance.
- B. Regulatory Requirements
 - 1. Secure permits, licenses, and pay fees including traffic control.
 - 2. Comply with laws, regulations, and quarantines for agricultural and horticultural products.

1.7 DELIVERY, STORAGE AND HANDLING

- A. Packing and Shipping: deliver materials in unopened containers bearing the manufacturer's name. Transport materials without damage. Protect finishes from abrasion, dirt, oils, grease, and chemicals. Pack materials to protect from weather.
- B. Acceptance at Site: verify in writing that delivered materials conform to specifications and approved submittals.
- C. Storage and Protection:
 - 1. Store materials in dry place, on pallets, off the ground; protect from sun.
 - 2. Protect materials from theft, damage, weather, dirt, oils, grease, and construction.

1.8 PROJECT/SITE CONDITIONS

- A. Environmental Requirements: do not work soils when dry, wet, or frozen.
 - 1. Field Test
 - a. Form soil in palm of hand, if soil retains shape and crumbles upon touching, the soil may be worked.
 - b. If soil will not retain shape it is too dry and shall not be worked.
 - c. If soil retains shape and will not crumble, it is too wet and shall not be worked.
- B. Planting Seasons: see Section 02930 – PLANTING.

1.9 SUBSTANTIAL COMPLETION

- A. Upon completion of planting, request the MBTA's review to determine if work is Substantially Complete. If work is determined to be Substantially Complete, the MBTA will issue a Letter of Substantial Completion that establishes the effective date of the start of the 90-day Maintenance Period and one year Guaranty Period.
 - 1. If work is not substantially complete, the MBTA will make a list of outstanding work to be done on a timely schedule agreed upon by Design-Builder and the MBTA.
 - 2. Design-Builder shall notify the MBTA when outstanding work is accomplished and ready for review. When outstanding work is complete, in the judgment of the MBTA, a Letter of Substantial Completion will be issued.

1.10 90-DAY MAINTENANCE PERIOD/PRELIMINARY ACCEPTANCE

- A. Maintain planting until the end of 90-day maintenance period and until the receipt of the Letter of Preliminary Acceptance. After the 90-day Maintenance Period, work will be reviewed for completeness.
- B. Plantings shall be in thriving and vigorous condition at the time of review for Preliminary Acceptance.
 - 1. If plantings are acceptable, the MBTA will issue a Letter of Preliminary Acceptance establishing the effective date of the one-year Guaranty Period.
 - 2. Replace plants that are dead or, as determined by the MBTA, are in an unhealthy or unsightly condition, and have lost their natural shape due to dead branches, or other causes.
 - 3. Replacement work shall be done immediately and in accordance with related work of other sections.
 - 4. At the conclusion of remedial work, the MBTA will review work and extend the Maintenance Period another 90 days to incorporate new plantings.

1.11 FINAL ACCEPTANCE

- A. Start of Guaranty Period: when the MBTA issues letter of Preliminary Acceptance.
- B. Quarterly reviews will be made with Design-Builder and the MBTA during guaranty period. Reviews will assess condition of installed plant materials.
- C. Plant material to be alive and in healthy, vigorous condition.
- D. Replace plants that are dead or, as determined by the MBTA, are in an unhealthy or unsightly condition, and have lost their natural shape due to dead branches, or other causes.
- E. End of Guaranty Period: one year from date of Preliminary Acceptance, the MBTA will review plantings. If plantings are acceptable, the MBTA will issue a letter of Final Acceptance. If plantings are unacceptable, plantings shall be replaced until condition of plantings are acceptable as determined by the MBTA.
- F. Upon receipt of letter of Final Acceptance, the project becomes responsibility of the the MBTA.

PART 2 - MATERIALS

2.1 POST PLANTING TREE CARE, PRUNING, MONITORING AND AFTERCARE

- A. Materials for Planting Maintenance
 - 1. Materials utilized during the maintenance period shall be the same specified in the work of the related sections:
 - a. Fertilizers, soil amendments, testing, see Section 02932 – PLANTING SOILS.
 - b. Plants and related materials, see Section 02930 - PLANTING.

- B. Biological, Herbicidal and Other Pest Control
 - 1. Materials and Specifications shall be by a licensed pest control operator, with authority to purchase, utilize, and specify agricultural chemicals and agricultural products.
 - 2. Use the least hazardous, least intrusive materials and methods.

2.2 EQUIPMENT

- A. Vehicles: in good working order so oil and grease does not stain pavements and poison plantings. Signs identifying the vehicles shall be clearly displayed.
- B. Machinery: in good working order so oil and grease does not stain pavements and poison plantings.

2.3 WATER

- A. Water: Furnished by Design-Builder, suitable for irrigation and free from ingredients harmful to plant life.
- B. Hose and other watering equipment: furnished by Design-Builder.

PART 3 - EXECUTION

3.1 PROTECTION FROM AGRICULTURAL CHEMICALS

- A. Protect site improvements from contact with agricultural chemicals, soil amendments, and fertilizers.

3.2 PLANTS

- A. Maintain plants in vigorous condition throughout the Maintenance and Guaranty Periods.
- B. Replace plants that are missing, dead, not true to name or size as specified, or not in satisfactory growth, as determined by the MBTA. Replace plants found unacceptable within one month or in first month of next growing season, whichever comes first.
- C. Plants shall show a minimum of 75% healthy head with obvious growth since planting. Signs of disease, injury, or damage shall have been successfully treated or plant shall be rejected as determined by the MBTA.
- D. Replacements plants shall be same kind and size as specified in plant list. Furnish and plant. Cost of replacement borne by Design-Builder except where it can be shown loss resulted from vandalism, fire, theft, or other causes beyond Design-Builder's control. Restore areas damaged or disturbed by replacement operations to their original condition.

3.3 SOIL DRAINAGE

- A. Observe drainage in plant soil areas with hand soil augur.
- B. Verify plant soil areas are draining; plant soils that are not draining shall be identified on the plan and brought to the attention of the MBTA.

3.4 PRUNING

- A. Pruning to be performed in accordance with American Nurserymen's Association Standards and will be overseen by an MCLP or certified Arborist. Pruning to preserve natural character of plant and as directed by the MBTA. No leaders shall be cut.
- B. Prune trees and shrubs only with approval of the MBTA to remove limbs that are below 7' above finished grade to maintain pedestrian clearance, remove dead, broken and crossing branches. Plants shall not be heavily pruned at the time of planting. In no case shall more than one-quarter of the branching structure be removed.
- C. Pruning is required at planting time to correct defects in the tree structure, including removal of injured branches, double leaders, waterspouts, suckers, and interfering branches. Healthy lower branches and interior small twigs shall not be removed except as necessary to clear walks and roads. Retain the normal or natural shape of the plant.
- D. Prune with clean, sharp tools. Dead wood or suckers and broken or badly bruised branches shall be removed back to live bud, branch, or stem.
- E. Pruning above head height shall be done from a hydraulic man-lift or using other mechanisms such that it is not necessary to climb the tree.

3.5 TREE STABILIZATION SYSTEM

- A. Trees: maintain plumb; adjust flexible ties.
- B. Each tree shall be stabilized with a subsurface stabilization system approved by the MBTA immediately following planting. Plants shall stand be maintained plumb.

3.6 FINISH GRADE

- A. Maintain finish grades around plantings, at pavement edges, and at irrigation fixtures.

3.7 FIELD QUALITY CONTROL

- A. Post Plant Soil Tests: see Section 02930 - PLANTING

3.8 ADJUSTING

- A. Re-set settled plants to proper grade and position.
- B. Restore planting saucer and adjacent material.

3.9 CLEANING

- A. Clean up, remove and dispose off-site excess planting mixture, soil and debris generated under work of this section.
- B. Remove and dispose of stakes, guys and other accessories at end of Guaranty Period.
- C. Wash and sweep clean site improvements and building surfaces. Clean spills and oversprays immediately.

- D. Repair damage caused by maintenance operations.

3.10 PROTECTION

- A. Protect work of this section until Final Acceptance.
- B. Protect planted areas and soils from compaction by construction traffic and from contamination by construction materials.

PART 4 – MEAUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 03371

SHOTCRETE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies shotcrete applied by a dry-mix or wet-mix process.
- B. Shotcrete may be used for placing the concrete facing on steel sheet pile walls and for other uses throughout the project.

1.2 RELATED SECTIONS

- A. Section 01800 – SUSTAINABILITY REQUIREMENTS
- B. Section 03300 – CAST-IN-PLACE CONCRETE
- C. Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS

1.3 DEFINITIONS

- A. Shotcrete: A prepackaged, single-component, shrinkage-compensated, microsilica enhanced, cement concrete with non-metallic fibers, applied by the wet or dry process, from a spray nozzle by means of compressed air.
- B. Dry-Mix Process: Shotcrete which is applied by the addition of water at the spray nozzle located on the end of the delivery hose.
- C. Wet-Mix process: Shotcrete which is applied with its ingredients mixed prior to introduction into a delivery hose.
- D. Rebound: Dry shotcrete that is rebounded from the wall, and treated as waste.
- E. Waste: Shotcrete that is used for charging the hoses, is mixed or sprayed, and is not applied to the walls as part of the work.

1.4 SUBMITTALS

- A. Product Data: For manufactured materials and products including reinforcement and forming accessories, shotcrete materials, admixtures, and curing compounds.
- B. Shop Drawings: For details of fabricating, bending, and placing reinforcement. Include support and anchor details, number and location of splices, and special reinforcement required for openings through shotcrete structures.
- C. Samples: Approximately 24 inches by 24 inches by 2 inches thick, to illustrate quality of finishes, colors, and textures of exposed surfaces of shotcrete.
- D. Design Mixes: For each shotcrete mix.
- E. Qualification Data: For Installer and testing agency.

- F. Material Test Reports: For shotcrete materials.
- G. Field quality-control test reports.

1.5 QUALITY ASSURANCE

- A. Manufacturer's Technical Representative: Furnish and pay for the services of a technical field representative during project startup to insure the proper application of the shotcrete system.
- B. Installer Qualifications:
 - 1. The Installer shall have a minimum of four years in the application of wet process shotcrete for concrete restoration. The contractor must have a minimum of 5 years of experience in similar types of work.
 - 2. Nozzlemen before employment on the work shall be a qualified Nozzleman as specified in ACI 506.2. In addition, the Foremen, Nozzlemen, and Crewmen shall satisfy the MBTA that each has done satisfactory work in similar capacities elsewhere for a sufficient period of time to be fully qualified to properly perform the work in accordance with the requirements indicated. Foremen shall have had at least three years' experience as nozzlemen and at least two years' experience on similar work. Nozzlemen shall be qualified workmen, having had at least three years' experience in similar work.
 - 3. Hold Point - Each shotcreting crew will be required to fabricate one acceptable test panel for each shooting position which the crew will encounter in the work, prior to application of shotcrete in the work, using the exact type of equipment intended to be used by the crew as identified by this specification.
 - 4. Should the results of control testing indicate that deficient shotcrete application is being produced by a crew, the crew may be required to be requalified for the shooting position in question.
- C. Testing Agency Qualifications: An independent agency qualified according to ASTM C 1077 and ASTM E 329 for testing indicated, and acceptable to authorities having jurisdiction.
- D. Comply with provisions of the following, unless more stringent requirements are indicated:
 - 1. ACI 301 "Specifications for Structural Concrete".
 - 2. ACI 506.2 "Specification for Shotcrete".
- E. Preconstruction Testing Service: Contractor shall engage a qualified independent testing agency to perform preconstruction testing and inspections indicated below:
 - 1. Produce test panels before shotcrete placement according to requirements in ACI 506.2 and ASTM C 1140 for each design mix, shooting orientation, and nozzle operator. Produce test panels with dimensions of 24 by 24 inches minimum and of average thickness of shotcrete, but not less than 5 inches. From each test panel, testing agency will obtain six test specimens: one set of three specimens unreinforced and one set of three specimens reinforced. Agency will perform the following:
 - a. Test each set of unreinforced specimens for compressive strength according to ASTM C42.
 - b. Visually inspect each set of reinforced shotcrete cores taken from test panels and determine mean core grades according to ACI 506.2.
- F. Sample Area: Apply a prepackaged single component, microsilica enhanced, cement shotcrete on a

sample area not less than ten square feet in size. When approved, the sample area shall serve as a standard of acceptance for all subsequent application of products specified hereinafter.

G. Determination of Shotcrete Proportions and Placement Procedures:

1. Notification Point - Not less than 30 days in advance of the shotcrete placement, notify the MBTA in writing as to the intended sources of shotcrete materials. Appropriate samples of shotcrete materials will be obtained by the contractor. Forward such samples to the MBTA for testing and acceptance.
2. At a time and place mutually agreeable to the Contractor and MBTA, provide the following for use in determination of shotcrete proportions and placement procedures, in sufficient quantities to perform the testing herein specified:
 - a. Shotcrete materials as accepted
 - b. Plywood back forms, each two feet square
 - c. Reinforcement of the types, sizes, and configurations to be used in the shotcrete, sufficient to place in one half of each test panel
 - d. Equipment of the exact type proposed for use in applying shotcrete
 - e. Personnel for operation of the shotcreting equipment
3. For the prepackaged shotcrete mix, fabricate test panels for each shooting position (i.e. slab, vertical, overhead) to be encountered in the work. Use trial mixes as designated by the Engineer, and modify as directed by the Engineer to produce satisfactory test panels. Test panels shall have reinforcement installed over one half of the panel in the sizes and configurations to be installed in the work.
4. Satisfactory test panels shall consist of a minimum 5 inch thickness of dense, uniform shotcrete without rebound inclusions, segregation, voids, or weakness of bond between layers. For each satisfactory test panel produced, record the water content and details of the placement procedure such as nozzle distance, rate and angle of application, thickness of layers, time lapse between layers, time lapse between mixing and application, and the like. Cure satisfactory test panels in accordance with ASTM C31.
5. Satisfactory test panels will be tested by the MBTA to determine conformance of the shotcrete to the specified requirements. Where the results of tests are unacceptable, fabricate additional satisfactory test panels using materials, mixing and application equipment, or application procedures, until acceptable test panels are achieved.
6. Hold Point - Do not apply any shotcrete in the work until the prepackaged mix and placement equipment and procedures have been accepted as specified herein. Approved mockups may become part of the completed Work if undamaged at time of Substantial Completion. Damaged panels must be removed and replaced at no additional cost to the MBTA.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to the site in original packages or containers bearing the manufacturer's labels and identification. Liquid admixtures if used must never experience temperatures below their recommended minimum temperature. Shotcrete installer must supply shipping records attesting to this fact. Materials experiencing temperatures below their minimum temperature will be rejected and shall not be used in the work. Materials shall be replaced at no additional cost to the MBTA.
- B. Store and handle materials to prevent inclusion of foreign matter and water and store at manufacturer's recommended temperatures and humidity. The shipping and storage temperature for the material shall be between 50 and 90 degrees F, unless indicated otherwise.

- C. Protection:
 - 1. Protect the railroad tracks, platforms, catenary system and ancillary systems from overspray and buildup of shotcrete, using plywood shields or other methods approved by the MBTA.
 - 2. Protect electrical equipment, tunnel and railroad systems, including but not limited to CCTV, signal, telephone, track, and electrical cables, from overspray.

1.7 PROJECT CONDITIONS

- A. Cold-Weather Shotcreting: Protect shotcrete work from physical damage or reduced strength caused by frost, freezing, or low temperatures according to ACI 306.1 and as follows:
 - 1. Discontinue shotcreting when ambient temperature is 40 deg F and falling. Uniformly heat water and aggregates before mixing to obtain a shotcrete shooting temperature of not less than 50 deg F and not more than 90 deg F.
 - 2. Do not use frozen materials or materials containing ice or snow.
 - 3. Do not place shotcrete on frozen surfaces or surfaces containing frozen materials.
 - 4. Do not use calcium chloride, salt, or other materials containing antifreeze agents.
- B. Hot-Weather Shotcreting: Mix, place, and protect shotcrete according to ACI 305R when hot-weather conditions and high temperatures would seriously impair the quality and strength of shotcrete, and as follows:
 - 1. Cool ingredients before mixing to maintain shotcrete temperature at time of placement below 100 deg F for dry mix or 90 deg F for wet mix.
 - 2. Reduce temperature of reinforcing steel and receiving surfaces below 100 deg F before shotcreting.

PART 2 - PRODUCTS

2.1 FORM MATERIALS

- A. Forms: Form-facing panels that will provide continuous, straight, smooth, concrete surfaces. Furnish panels in largest practicable sizes to minimize number of joints.

2.2 REINFORCING MATERIALS

- A. Reinforcing Bars: ASTM A 615/A 615M, Grade 60, deformed.
- B. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M, deformed.
- C. Galvanized Reinforcing Bars: ASTM A 767/A 767M, Class II, zinc coated, hot-dip galvanized after fabrication and bending, as follows:
 - 1. Steel Reinforcement: ASTM A 615/A 615M, Grade 60, deformed.
- D. Plain-Steel Wire: ASTM A 82, galvanized after fabrication.
- E. Plain-Steel-Welded Wire Fabric: ASTM A 185, fabricated from galvanized steel wire into flat sheets.
- F. Deformed-Steel-Welded Wire Fabric: ASTM A 497, flat sheet.
- G. Supports: Bolsters, chairs, spacers, ties, and other devices for spacing, supporting, and fastening

reinforcing steel in place according to CRSI's "Manual of Standard Practice" and as follows:

1. For uncoated reinforcement, use CRSI Class 1, plastic-protected bar supports.
 2. For zinc-coated reinforcement, use galvanized wire or dielectric-polymer-coated wirebar supports.
- H. Reinforcing Anchors: ASTM A 36/A 36M, unheaded rods or ASTM A 307, Grade A, hex-head bolts; carbon steel; and carbon-steel nuts.
1. Finish: Hot-dip zinc coating, ASTM A 153/A 153M, Class C.
- I. Headed welded studs shall conform to Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.

2.3 SHOTCRETE MATERIALS

- A. Portland Cement: ASTM C 150, Type I or II. Use only one brand and type of cement for Project.
1. Fly Ash: ASTM C 618, Class F only.
 2. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
- B. Silica Fume: ASTM C 1240, amorphous silica.
- C. Normal-Weight Aggregates: ASTM C 33, from a single source, and as follows:
1. Aggregate Gradation: ACI 506R, Gradation No. 1 with 100 percent passing 3/8-inch sieve.
- D. Lightweight Aggregates: ASTM C 330.
1. Aggregate Gradation: ACI 506R, Gradation No. 1 with 100 percent passing 3/8-inch sieve.
- E. Water: Potable, complying with ASTM C 94/C 94M, free from deleterious materials that may affect color stability, setting, or strength of shotcrete.
- F. Synthetic Fiber: Fibrillated polypropylene fibers engineered and designed for use in shotcrete, complying with ASTM C 1116, Type III, not less than 3/4 inch long.
- G. Ground Wire: Provide one of the following:
1. High-strength steel wire, 0.8 to 1 mm in diameter.
 2. Stainless steel thickness pins, 0.8 to 1 mm in diameter.
- H. Joint Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber, ASTM D 1752, cork or self-expanding cork, or ASTM D 7174, closed-cell polyolefin.

2.4 CHEMICAL ADMIXTURES

- A. General: ASTM C 1141, Class A or B, but limited to the following admixture materials. Provide admixtures for shotcrete that contains not more than 0.1 percent chloride ions. Certify compatibility of admixtures with each other and with other cementitious materials.
1. Air-Entraining Admixture: ASTM C 260.

2. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
3. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
4. Water-Reducing and Accelerating Admixture: ASTM C 494/C 494M, Type E.
5. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
6. Accelerating Admixture: ASTM C 494/C 494M, Type C.

2.5 CURING MATERIALS

- A. Water: Potable.
- B. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, as recommended by the shotcrete manufacturer.

2.6 SHOTCRETE MIXTURES (WET AND DRY)

- A. General Intent: It is the intent that the prepackaged materials used for this work shall be adequate with a demonstrated successful track record, for the purpose intended and under the conditions normally expected in work of this type. All materials for the shotcrete shall be provided by the same manufacturer.
- B. Mixes: Provide a prepackaged single component, specially formulated combination of shrinkaged compensated microsilica and fibers along with processed cement and carefully graded aggregate resulting in a high build, low absorption, machine applied mortar. The low water cement ratio will insure high early and ultimate strengths. The combination of microsilica and fibers shall result in a shotcrete with tremendous adhesion to the substrate concrete with extremely low rebound and excellent freeze-thaw resistance.

Property	Conditions	Requirement
Coefficient of Thermal Expansion		6.0 X 10 ⁻⁶ deg. C max
Compressive Strength ASTM C-109	@ 1 day	3,000 psi min
-	@ 7 days	6,000 psi min
-	@ 28 days	7,500 psi min
Flexural Strength ASTM C-348	@ 28 days	1,500 psi min
Splitting Tensile Strength ASTM C-882	@ 28 days	650 psi min
Slant Shear Strength ASTM C-88	@ 28 days	2,250 psi min
Water Absorption ASTM C-140		1% absorb max
Freeze-Thaw Resistance MSMT-725, MDDOT	@ 28 days	-0.162% max
Setting time		
Working Time		45 minutes max
Initial Set	@ 75°F 50% RH	2 hours max
Final Set	@ 75°F 50% RH	3 hours max
Shrinkage ASTM C-157	@ 28 days	0.04% max
Wet Density		130 lb/cf (min.)

2.7 SHOTCRETE EQUIPMENT

- A. Mixing Equipment: Capable of thoroughly mixing shotcrete materials in sufficient quantities to maintain continuous placement, as recommended by the shotcrete manufacturer.
- B. Dry-Mix Delivery Equipment: Capable of discharging aggregate-cement mixture into delivery hose under close control and maintaining continuous stream of uniformly mixed materials at required velocity to discharge nozzle. Equip discharge nozzle with manually operated water-injection system for directing even distribution of water to aggregate-cement mixture.
 - 1. Provide uniform, steady supply of clean, compressed air rated to deliver air at 350-750 CFM to maintain constant nozzle velocity while simultaneously operating blow pipe for cleaning away rebound.
 - 2. Use a rotary pot-type shotcrete machine with a Browning-type nozzle. Provide hoses of sufficient size to allow rapid delivery of the dry mix shotcrete to the nozzle.
 - 3. Provide water supply with uniform pressure at discharge nozzle to ensure uniform mixing with aggregate-cement mix. Provide water pump to system if line water pressure is inadequate.
 - 4. Provide a premoistener at the dry mix pump for minimizing dust for work within the tunnels, or as directed by the MBTA.
- C. Wet-Mix Delivery Equipment: Capable of discharging aggregate-cement-water mixture accurately, uniformly, and continuously.
 - 1. Use a rotary stator pump capable of introducing materials to the delivery hose at a uniform rate, with ejection from the nozzle at velocities that will afford adherence of material to the surface to be treated with a minimum rebound and maximum adherence and density. Swing tube shotcrete pumps will not be allowed.
 - 2. The air compressor shall be rated between 350 - 750 cubic feet per minute and capable of 100 - 125 psi pressure. Gunning is performed at 50 - 85 psi or as recommended by the product manufacturer.
 - 3. The nozzle shall be a center feed nozzle, Thompson type, or approved equal.
 - 4. Hoses shall be made for wet-process shotcrete with pure gum rubber tube, good flexibility and high resistance to kinking. The contractor shall submit for approval by the Engineer a suitable method of ducting through the fresh air flues. Hose length is limited to a maximum of 100 feet from pump to nozzle and must be no larger than 2 inches in diameter.

2.8 BATCHING AND MIXING

- A. Dry-Mix Process: Measure mix proportions by weight batching according to ASTM C 94/C 94M or by volume batching complying with ASTM C 685/C 685M requirements, or as recommended by the shotcrete manufacturer.
 - 1. In volume batching, adjust fine-aggregate volume for bulking. Test fine-aggregate moisture content at least once daily to determine extent of bulking.
 - 2. Prepackaged shotcrete materials may be used at Contractor's option. Predampen prepackaged shotcrete materials and mix before use.

- B. Wet-Mix Process: Measure, batch, mix, and deliver shotcrete according to ASTM C 94/C 94M and furnish batch ticket information.
 - 1. Comply with ASTM C 685/C 685M when shotcrete ingredients are delivered dry and proportioned and mixed on-site.

PART 3 - EXECUTION

3.1 PREPARATION

- A. General Inspection: Prior to installation of materials, inspect the substrate and report any unsatisfactorily conditions. Commencement of work shall constitute Contractor's acceptance of substrate.
- B. Concrete :
 - 1. Areas to be patched or resurfaced shall be clean, sound and free of standing or flowing water.

The concrete surface and exposed reinforcing steel, shall be waterblasted at a pressure in excess of 2,500 psi to remove all contaminants and rust. Only areas that can be successfully shotcreted in one shift shall be cleaned and have shotcrete applied. If cleaned areas are not shotcreted during the same shift, cleaning that area shall be rewashed by the contractor at no expense to the owner.
 - 2. The demolition of the existing shotcrete shall be performed by using chipping hammers, Pavement breakers and robotic demolition equipment will not be allowed. The Chipping Hammer must not exceed 30 pounds with the bit removed. Aluminum chipping hammers will not be allowed.
 - 3. Where reinforcing steel is encountered with insufficient concrete cover, less than 2 inches, the concrete around and under the bar(s) shall be chipped out to a depth where the bar(s) covered with at least 1 in. of shotcrete. Any reinforcing that has been exposed shall be realigned, if required, to ensure proper concrete cover. Embedded steel that has been completely exposed shall be cleaned of loose scale and corrosion prior to shotcrete repair application.
 - 4. The contractor shall replace missing or deteriorated reinforcing steel as directed.
 - 5. Abrasive blast or hydroblast existing surfaces that do not require chipping to remove paint, oil, grease, or other contaminants and to provide roughened surface for proper shotcrete bonding.
- C. Earth: Compact and trim to line and grade before placing shotcrete. Do not place shotcrete on frozen surfaces. Dampen surfaces before shotcreting.
- D. Rock: Clean rock surfaces of loose materials, mud, and other foreign matter that might weaken shotcrete bonding.
- E. Steel: Clean steel surfaces by abrasive blasting according to SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning".

3.2 FORMS

- A. General: Design, erect, support, brace, and maintain forms, according to ACI 301, to support shotcrete and construction loads and to facilitate shotcreting. Construct forms so shotcrete members

and structures are secured to prevent excessive vibration or deflection during shotcreting.

1. Fabricate forms to be readily removable without impact, shock, or damage to shotcrete surfaces and adjacent materials.
 2. Construct forms to required sizes, shapes, lines, and dimensions using ground wires and depth gages to obtain accurate alignment, location, and grades in finished structures. Construct forms to prevent mortar leakage but permit escape of air and rebound during shotcreting. Provide for openings, offsets, blocking, screeds, anchorages, inserts, and other features required in the Work.
- B. Form openings, chases, recesses, bulkheads, keyways, and screeds in formwork. Determine sizes and locations from trades providing such items. Accurately place and securely support items built into forms.

3.3 STEEL REINFORCEMENT

- A. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
- B. Clean reinforcement of loose rust and mill scale, earth, ice, and other materials that weaken shotcrete bonding.
- C. Securely embed reinforcing anchors into existing substrates, located as required.
- D. Accurately position, support, and rigidly secure reinforcement against displacement by formwork, construction, or shotcreting. Locate and support reinforcement by metal chairs, runners, bolsters, spacers, and hangers, as required.
- E. Place reinforcement to obtain minimum coverage for shotcrete protection. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during shotcreting. Set wire ties with ends directed into shotcrete, not toward exposed shotcrete surfaces.
- F. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
- G. Welded wire fabric shall be cut to fit the shape of the patch and fastened securely in place. Use approved spacers and tie wire at 16 inch intervals in both directions. Install fasteners around the perimeter of the welded wire fabric at a 16 inch interval. Wire fabric shall not be placed and secured until the abrasive blasting is completed.

3.4 JOINTS

- A. Construction Joints: Locate and install construction joints tapered to a 1:1 slope where joint is not subject to compression loads and square where joint is perpendicular to main reinforcement. Continue reinforcement through construction joints, unless otherwise indicated.
- B. Contraction Joints: Construct contraction joints in shotcrete using saw cuts 1/8-inch-wide-by-1/3 slab depth or joint-filler strips 1/4-inch-wide-by-1/3 shotcrete depth, unless otherwise indicated.
1. After shotcrete has cured, remove strip inserts and clean groove of loose debris.
 2. Space joints at centers indicated horizontally and vertically.

3. Tool edges round on each side of strip inserts if floated or troweled finishes are required.

3.5 ALIGNMENT CONTROL

- A. Ground Wires: Install ground wires to establish thickness and planes of shotcrete surfaces. Install ground wires at corners and offsets not established by forms. Pull ground wires taut and position adjustment devices to permit additional tightening.
 1. Stainless steel thickness pins may be used as a substitute for ground wires.

3.6 EMBEDDED ITEMS

- A. Place and secure anchorage devices and other embedded items required for adjoining work that is attached to or supported by shotcrete. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

3.7 APPLICATION

- A. Apply temporary protective coverings and protect adjacent surfaces against deposit of rebound and overspray or impact from nozzle stream.
- B. Moisten wood forms immediately before placing shotcrete where form coatings are not used.
- C. Apply shotcrete according to ACI 506.2.
- D. Apply dry-mix shotcrete materials within 45 minutes after predampening and wet-mix shotcrete materials within 90 minutes after batching.
- E. Deposit shotcrete continuously in multiple passes, to required thickness, without shadowing, cold joints, or laminations developing. Place shotcrete with nozzle held perpendicular to receiving surface. Begin shotcreting in corners and recesses. Remove and dispose of rebound and overspray materials during shotcreting to maintain clean surfaces and to prevent rebound entrapment.
- F. Maintain reinforcement in position during shotcreting. Place shotcrete to completely encase reinforcement and other embedded items. Maintain steel reinforcement free of overspray and prevent buildup against front face during shotcreting.
- G. Do not place subsequent lifts until previous lift of shotcrete is capable of supporting new shotcrete.
- H. Do not permit shotcrete to sag, slough, or dislodge.
- I. Remove hardened overspray, rebound, and laitance from shotcrete surfaces to receive additional layers of shotcrete; dampen surfaces before shotcreting.
- J. Do not disturb shotcrete surfaces before beginning finishing operations.
- K. Remove ground wires or other alignment control devices after shotcrete placement.
- L. Shotcrete Core Grade: Apply shotcrete to achieve mean core grades not exceeding 2.5 according to ACI 506.2, with no single core grade exceeding 3.0.
- M. Installation Tolerances: Place shotcrete without exceeding installation tolerances permitted by ACI 117R, increased by a factor of 2.

3.8 SURFACE FINISHES

- A. General: Finish shotcrete according to descriptions in ACI 506R for the following finishes:
- B. Natural Finish:
 - 1. Gun Finish: Natural undisturbed finish.
 - 2. Finish-Coat Finish: After screeding and rodding surface, apply shotcrete finish coat, 1/4 to 1 inch thick, using ACI 506R, Gradation No. 1, fine-screened sand modified with maximum aggregate size not exceeding No. 4 sieve to provide a finish of uniform texture and appearance.
 - 3. Wood Float: After screeding surface, finish the shotcrete using a wood float.
 - 4. Steel Trowel: Finish the shotcrete using a steel trowel, in locations where a smooth finish is required.

3.9 CURING

- A. Protect freshly placed shotcrete from premature drying and excessive cold or hot temperatures.
- B. Start initial curing as soon as free water has disappeared from shotcrete surface after placing and finishing.
- C. Curing Exposed Surfaces: Cure shotcrete by one of the following methods:
 - 1. Moisture Curing: Keep surfaces continuously moist for at least five days with water, continuous water-fog spray, water-saturated absorptive covers, or moisture-retaining covers. Lap and seal sides and ends of covers.
 - 2. Curing Compound: Apply curing compound uniformly in continuous operation by power spray according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period. Apply curing compound to natural or gun-finished shotcrete at rate of 1 gal./100 sq. ft.
- D. Curing Formed Surfaces: Cure formed shotcrete surfaces by moist curing with forms in place for full curing period or until forms are removed. If forms are removed, continue curing by methods specified above, as applicable.

3.10 FORM REMOVAL

- A. Forms not supporting weight of shotcrete may be removed after curing at not less than 50 deg F for 24 consecutive hours after gunning, provided shotcrete is hard enough not to be damaged by form-removal operations and provided curing and protecting operations are maintained.
 - 1. Leave forms supporting weight of shotcrete in place until shotcrete has attained design compressive strength. Determine compressive strength of in-place shotcrete by testing representative field-cured specimens of shotcrete.
 - 2. Remove forms only if shores have been arranged to permit removal of forms without loosening or disturbing shores.

- B. Clean and repair surfaces of forms to be reused in the Work. Split, frayed, delaminated, or otherwise damaged form-facing materials are unacceptable for exposed surfaces. Apply new form-coating compound as specified for new formwork.

3.11 FIELD QUALITY CONTROL

- A. Contractor shall engage a qualified independent testing agency to sample materials, visually grade cores, perform tests, and submit reports during shotcreting.
- B. Shotcrete Temperature: ASTM C 1064/C 1064M; 1 test hourly when air temperature is 40 deg F and below and when 80 deg F and above, and 1 test for each set of compressive-strength specimens.
- C. Test Panels: Make a test panel, reinforced as in structure, for each shotcrete mix and for each workday or for every 50 cu. yd. of shotcrete placed; whichever is less. Produce test panels with dimensions of 24 by 24 inches minimum and of average thickness of shotcrete, but not less than 4-1/2 inches. From each test panel, testing agency will obtain six test specimens: one set of three specimens unreinforced and one set of three specimens reinforced.
 - 1. Test each set of unreinforced specimens for compressive strength according to ASTM C 1140 and construction testing requirements in ACI 506.2.
 - 2. Visually inspect each set of reinforced shotcrete cores taken from test panels and determine mean core grades according to ACI 506.2.
- D. In-Place Shotcrete: Take a set of 3 unreinforced cores for each mix and for each workday or for every 50 cu. yd. of shotcrete placed; whichever is less. Test cores for compressive strength according to ACI 506.2 and ASTM C 42. Do not cut steel reinforcement.
- E. Strength of shotcrete will be considered satisfactory when mean compressive strength of each set of 3 unreinforced cores equals or exceeds 85 percent of specified compressive strength, with no individual core less than 75 percent of specified compressive strength.
 - 1. Mean compressive strength of each set of 3 unreinforced cubes shall equal or exceed design compressive strength with no individual cube less than 88 percent of specified compressive strength.

3.12 REPAIRS

- A. Remove and replace shotcrete that is delaminated or exhibits laminations, voids, or sand/rock pockets exceeding limits for specified core grade of shotcrete.
 - 1. Remove unsound or loose materials and contaminants that may inhibit bond of shotcrete repairs.
Chip or scarify areas to be repaired to extent necessary to provide sound substrate. Cut edges square and 1/2 inch deep at perimeter of work, tapering remaining shoulder at 1:1 slope into cavity to eliminate square shoulders. Dampen surfaces and apply new shotcrete.
- B. Repair core holes from in-place testing according to repair provisions in ACI 301 and match adjacent finish, texture, and color.

3.13 CLEANING

- A. Immediately Remove and dispose of rebound and overspray materials from final shotcrete surfaces and areas not intended for shotcrete placement.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 03410

PLANT-PRECAST STRUCTURAL CONCRETE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies plant-precast structural concrete units.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. SUSTAINABILITY REQUIREMENTS - Volume 2 Technical Provisions Exhibit 2I "Additional Project Requirements"
 - 2. Section 02202 – MECHANICALLY STABILIZED EARTH RETAINING WALLS
 - 3. Section 02356 – SOLDIER PILE AND LAGGING RETAINING WALLS
 - 4. Section 02358 – SOIL NAIL RETAINING WALLS
 - 5. Section 02359 – MODULAR PRECAST BLOCK RETAINING WALLS
 - 6. Section 03300 – CAST-IN-PLACE CONCRETE
 - 7. Section 07842 – FIRE-RESISTIVE JOINT SYSTEMS; joint filler materials for fire-resistance-rated construction.
 - 8. Section 07920 – JOINT SEALANTS; elastomeric joint sealants and sealant backings.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Design Mixes: For each precast concrete mix. Include compressive strength and water absorption tests.
- C. Shop Drawings: Detail fabrication and installation of precast structural concrete units. Indicate member locations, plans, elevations, dimensions, shapes, cross sections, openings, support conditions and types of reinforcement, including special reinforcement.
 - 1. Indicate welded connections by AWS standard symbols. Detail loose and cast-in hardware, inserts, connections, and joints, including accessories.
 - 2. Indicate locations and details of anchorage devices to be embedded in other construction.
 - 3. Indicate location of each precast unit by same identification mark placed on unit.
 - 4. Indicate estimated camber for slabs with concrete toppings.
 - 5. Include and locate openings larger than 10 inches.
 - 6. Indicate location of lifting points and or embedded lifting devices.
- D. Samples: For each type of finish indicated on exposed surfaces of precast structural concrete units, in sets of 3, illustrating quality of finishes, colors, and textures; approximately 12 inches by 12 inches by 2 inches.
- E. Samples of bearing pads.

- F. Welding Qualifications: Copies of qualifications for welding procedures and personnel.
- G. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
- H. Material Certificates: Signed by manufacturers certifying that each of the following items complies with requirements:
 - 1. Concrete materials.
 - 2. Reinforcing materials and prestressing tendons.
 - 3. Admixtures.
 - 4. Bearing pads.
- I. Inspection and test reports from independent testing agency.
- J. Design calculations: Shall be prepared by a Professional Engineer, registered in the Commonwealth of Massachusetts, hired by the Design-Builder, indicating the handling, transportation and erection stresses of the precast and prestressed concrete units. In addition, the design calculations shall include the sizing of all lifting devices that are to be embedded in the units. Calculations shall be submitted for review and approval prior to fabrication.

1.3 QUALITY CONTROL/QUALITY ASSURANCE

- A. Quality Control shall be in accordance with relevant portion of Section 03300 CAST-IN-PLACE CONCRETE.
- B. Installer Qualifications: An experienced installer who has completed precast structural concrete work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- C. Fabricator Qualifications: A firm that has plant certification by the Precast Concrete Institute and is experienced in manufacturing precast structural concrete units similar to those indicated for this Project and with a record of successful in-service performance. The plant is subject to inspection by the MBTA.
- D. Testing Agency Qualifications: An independent testing agency, acceptable to the MBTA, qualified according to ASTM C 1077 and ASTM E 329 to conduct the testing indicated, as documented according to ASTM E 548.
- E. Design Standards: Comply with ACI 318 and the design recommendations of PCI MNL 120, "PCI Design Handbook--Precast and Prestressed Concrete".
- F. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and camber and dimensional tolerances for types of units required, comply with PCI MNL 116, "Manual for Quality Control for Plants and Production of Precast and Prestressed Concrete Products".
- G. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel"; and AWS D1.4, "Structural Welding Code--Reinforcing Steel".

- H. Calculated Fire Resistance: Where indicated, provide precast structural concrete units whose fire resistance has been calculated according to PCI MNL 124, "Design for Fire Resistance of Precast Prestressed Concrete", or ACI 216.1/TMS 0216.1, "Standard Method for Determining Fire Resistance of Concrete and Masonry Construction Assemblies", and is acceptable to the MBTA.
- I. Fire-Test-Response Characteristics: Provide precast structural concrete units that comply with the following requirements:
 - 1. Fire-response testing performed by UL, ITS or another testing and inspecting agency that is acceptable to the MBTA and that performs testing and follow-up services.
 - 2. Fire-resistance-rated assemblies, which are indicated by design designations from UL's "Fire Resistance Directory", from ITS's "Directory of Listed Products" or from the listings of another testing and inspecting agency, are identical in materials and construction to those tested per ASTM E 119.
 - 3. Products are identified with appropriate markings of applicable testing and inspecting agency.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Deliver precast structural concrete units to Project site in such quantities and at such times to ensure continuity of installation. Store units at Project site to prevent cracking, distorting, warping, staining, or other physical damage, and so identification markings are visible and units can be inspected.
- B. Lift and support units only at designated lifting and supporting points as shown on Shop Drawings.
- C. Handle and transport units in a position in order to avoid excessive stresses that would cause cracking or damage.

1.5 SEQUENCING

- A. Furnish anchorage items to be embedded in other construction without delaying the Work. Provide setting diagrams, templates, instructions, and directions, as required, for installation.

PART 2 - PRODUCTS

2.1 MOLD MATERIALS

- A. Molds: Provide molds and, where required, form-facing materials of metal, plastic, wood, or another material that is nonreactive with concrete and dimensionally stable to produce continuous and true precast concrete surfaces within fabrication tolerances and suitable for required finishes.

2.2 REINFORCING MATERIALS

- A. Reinforcing Bars: ASTM A 615/A 615M, Grade 60, deformed.
- B. Epoxy Coating for Reinforcing Bars: Shall conform to ASTM A 775/A 775M.
- C. Deformed Steel Welded Wire Reinforcement: ASTM A 497/A 497M, flat sheet.
- D. Supports: Manufacturer's bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire fabric in place according to CRSI's "Manual of Standard Practice", PCI MNL 116, and as follows:
 - 1. For uncoated reinforcement, use CRSI Class 1 plastic-protected bar supports.

2. For zinc-coated reinforcement, use galvanized wire or dielectric-polymer-coated wire bar supports.

2.3 PRESTRESSING REINFORCEMENT

- A. High Strength Steel Wire: ASTM A 421
- B. High Strength Steel Bars: ASTM A 722, Grade 150, uncoated, deformed.
- C. Prestressing Strand: ASTM A 416/A 416M, Grade 250 or 270 as indicated, uncoated, 7-wire, low-relaxation strand.

2.4 CONCRETE MATERIALS

- A. Precast concrete shall have a minimum specified compressive strength of 5,000 psi at 28 days in accordance with the relevant provisions of Section 03300 Cast-in-Place Concrete.
- B. Concrete for prestressed members shall have a minimum compressive strength of 6,500 psi at 28 days, and a minimum compressive strength at time of initial prestress of 4,000 psi.
- C. Portland Cement: ASTM C 150, Type III cement mitigated with a pozzolan to prevent alkali-silica reactivity.
- D. Normal-Weight Aggregates: Except as modified by PCI MNL 116, ASTM C 33.
- E. Lightweight Aggregates: Except as modified by PCI MNL 116, ASTM C 330.
- F. Water: Potable, free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 116.
- G. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.
- H. Fly Ash Admixture: ASTM C 618, Class F only.
- I. Silica Fume Admixture: ASTM C 1240.

2.5 STEEL CONNECTION MATERIALS

- A. Carbon-Steel Shapes and Plates: ASTM A 36/A 36M.
- B. Carbon-Steel Headed Studs: ASTM A 108, AISI 1018 through AISI 1020, cold finished; AWS D1.1, Type A or B, with arc shields.
- C. Malleable Steel Castings: ASTM A 47.
- D. Deformed-Steel Wire or Bar Anchors: ASTM A 496 or ASTM A 706/A 706M.
- E. Carbon-Steel Bolts and Studs: ASTM A 307, Grade A; carbon-steel, hex-head bolts and studs; carbon-steel nuts; and flat, unhardened steel washers.

- F. Finish: For exterior steel items, steel in exterior walls, and items indicated for galvanizing, apply zinc coating by hot-dip process according to ASTM A 123/A 123M, after fabrication, and ASTM A 153/A 153M, as applicable.
 - 1. Galvanizing Repair Paint: High-zinc-dust-content paint with dry film containing not less than 94% zinc dust by weight, and complying with DOD-P-21035A or SSPC-Paint 20.
- G. Welding Electrodes: Comply with AWS standards.
- H. Accessories: Provide clips, hangers, plastic or steel shims, and other accessories required to install precast structural concrete units.
 - 1. All steel accessories shall be Hot Dip Galvanized.

2.6 STAINLESS-STEEL CONNECTION MATERIALS

- A. Stainless-Steel Plate: ASTM A 666, Type 304, of grade suitable for application.
- B. Stainless-Steel Bolts and Studs: ASTM F 593, alloy 304 or 316, hex-head bolts and studs; stainless-steel nuts; and flat, stainless steel washers. Lubricate threaded parts of stainless steel bolts with an antiseize thread lubricant during assembly.
- C. Stainless-Steel Headed Studs: ASTM A 276.

2.7 BEARING PADS

- A. Provide bearing pads for precast structural concrete units as follows:
 - 1. Elastomeric Pads: AASHTO M 251, plain, vulcanized, 100% polychloroprene (neoprene) elastomer, molded to size or cut from a molded sheet, 50 to 70 Shore A durometer, minimum tensile strength 2250 psi per ASTM D 412.
 - 2. Frictionless Pads: Tetrafluoroethylene, glass-fiber reinforced, bonded to mild-steel plate, of type required for in-service stress.

2.8 GROUT MATERIALS

- A. Sand-Cement Grout: Portland cement, ASTM C 150, Type I or II, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.
- B. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, Portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C 1107, of consistency suitable for application.

2.9 CONCRETE MIXES

- A. Prepare design mixes for each type of precast concrete required.
 - 1. Limit use of fly ash and silica fume to not exceed, in aggregate, 25% of Portland cement by weight.
- B. Design mixes shall be prepared by a qualified independent testing agency or by qualified precast plant personnel at precast structural concrete fabricator's option.

- C. Limit water-soluble chloride ions to the maximum percentage by weight of cement permitted by ACI 318.
- D. Normal-Weight Concrete: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:
 - 1. Compressive Strength (28 Days): 5,000 psi or 6,500 psi as indicated.
 - 2. Maximum Water-Cementitious Materials Ratio: 0.40.
 - 3. Slump: 4 inches maximum.
 - 4. Units subject to freeze-thawing shall be air-entrained. Add air-entraining admixture at manufacturer's prescribed rate to result in normal-weight concrete at point of placement having an air content as follows, with a tolerance of plus or minus 1-1/2%:
 - a. Air Content: 3% to 6%.
- E. Lightweight Concrete: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.2, with materials to be used on Project, to provide lightweight concrete with the following properties:
 - 1. Compressive Strength (28 Days): 5,000 psi or 6,500 psi as indicated.
 - 2. Unit Weight: Calculated equilibrium unit weight of 115 lb/cu. ft., plus or minus 3 lb/cu. ft. (48 kg/cu. m), according to ASTM C 567.
 - 3. Add air-entraining admixture at manufacturer's prescribed rate to result in lightweight concrete at point of placement having an air content as follows:
 - a. Air Content: 4% to 6% for 3/4-inch-nominal maximum aggregate size.
- F. Other Admixtures: Use water-reducing, high-range water-reducing, water-reducing and accelerating, or water-reducing, corrosion inhibitor and retarding admixtures according to manufacturer's written instructions.
 - 1. Corrosion Inhibitor: Provide minimum of 3 Gallon per cubic yard of Calcium Nitrate Corrosion inhibitor (DCI or approved equal) when used.
- G. Concrete Mix Adjustments: Concrete mix design adjustments may be proposed if characteristics of materials, Project conditions, weather, test results, or other circumstances warrant.

2.10 FABRICATION

- A. Formwork: Accurately construct forms, mortar tight, of sufficient strength to withstand pressures due to concrete-placement operations and temperature changes and for pretensioning and detensioning operations. Maintain formwork to provide completed precast concrete units of shapes, lines, and dimensions indicated, within fabrication tolerances.
 - 1. Coat surfaces of forms with bond-breaking compound before reinforcement is placed. Provide commercial-formula, form-coating compounds that will not bond with, stain, or adversely affect concrete surfaces and that will not impair subsequent treatments of concrete surfaces requiring bond or adhesion. Apply in compliance with manufacturer's written instructions.
 - 2. Unless forms for precast, prestressed concrete units are stripped before detensioning, design forms so stresses are not induced in precast concrete units because of deformation or movement of concrete during detensioning.

- B. Built-in Anchorages: Accurately position built-in anchorage devices and secure to formwork. Locate anchorages where they do not affect position of main reinforcement or concrete placement. Do not relocate bearing plates in units unless approved by MBTA.
- C. Lift Devices, and Accessories: Provide concrete inserts, reglets, anchors, brackets, and fasteners as indicated or required for fabrication and installation of the work. Locate Lifting Device as required by design. All items shall be zinc-coated or galvanized in accordance with ASTM A153 or ASTM A123, as applicable. Design-Builder shall select the lift devices, and shall be responsible for their performance and for any damage resulting from the use of faulty or inferior devices. Lift devices shall not be visible on exposed faces of precast members. Provide a minimum four for each unit. Lifting devices shall be removable from units after erection, all holes and recesses shall be cleaned and filled with a cementitious repair mortar that matches the color and texture of the base precast or prestressed unit. Surface of the repair mortar shall be level with the surrounding surface of the precast or prestressed units.
- D. Cast-in openings larger than 10 inches in diameter or 10 inches square according to Shop Drawings. Smaller holes may be field cut by trades requiring them, as approved by MBTA.
- E. Reinforcement: Comply with recommendations in Concrete Reinforcing Steel Institute's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
 - 1. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete.
 - 2. Accurately position, support, and secure reinforcement against displacement by formwork, construction, or concrete-placement operations. Locate and support reinforcement by metal chairs, runners, bolsters, spacers, and hangers, as required.
 - 3. Place reinforcement to obtain at least the minimum coverage for concrete protection. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Set wire ties so ends are directed into concrete, not toward exposed concrete surfaces.
 - 4. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
- F. Prestress tendons for precast structural concrete units by either pretensioning or posttensioning methods. Comply with Precast Concrete Institute MNL 116.
 - 1. Delay detensioning until concrete has reached at least 70% of its compressive strength as established by test cylinders cured under the same conditions as concrete.
 - 2. If concrete has been heat cured, detension while concrete is still warm and moist to avoid dimensional changes that may cause cracking or undesirable stresses.
 - 3. Detension pretensioned tendons either by gradually releasing tensioning jacks or by heat-cutting tendons, using a sequence and pattern to prevent shock or unbalanced loading.
- G. Mix concrete according to PCI MNL 116 and requirements in this Section. After concrete batching, no additional water may be added.
- H. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units. Comply with requirements in PCI MNL 116 for measuring, mixing, transporting, and placing concrete.

- I. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items. Use equipment and procedures complying with PCI MNL 116.
- J. Comply with ACI 306.1 procedures for cold-weather concrete placement.
- K. Comply with ACI 305R recommendations for hot-weather concrete placement.
- L. Identify pickup points of precast concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint casting date on each precast concrete unit on a surface that will not show in finished structure.
- M. Cure concrete, according to requirements in PCI MNL 116, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture.
- N. Product Tolerances: Fabricate precast structural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished unit complies with PCI MNL 116 product tolerances.
- O. Finish formed surfaces of precast structural concrete as indicated for each type of unit, and as follows:
 - 1. Commercial Finish: Remove fins and large protrusions and fill large holes. Rub or grind ragged edges. Faces are to be true, well-defined surfaces.
- P. Screed finish unformed surfaces. Strike off and consolidate concrete with vibrating screeds to a uniform finish. Hand screed at projections.
 - 1. Apply scratch finish to precast concrete units that will receive concrete topping after installation. After initial strikeoff, transversely scarify surface to provide ridges approximately 1/4 inch deep.
- Q. Recess prestressing tendons a minimum of 1/2 inch, fill recesses with grout, and apply a sack finish to vertical ends of precast concrete units.

2.11 HOLLOW-CORE SLAB UNITS

- A. Type: Precast, prestressed concrete units with open, hollow cores running the full length of the slab units.
- B. Furnish units free of voids and honeycombs.
- C. Provide standard finish to precast concrete units.
- D. Reinforce units to resist transportation and erection stresses.
- E. Coordinate with other trades for installation of cast-in items.
- F. Include cast-in weld plates where required.
- G. Provide solid, monolithic, precast concrete slab units forming an integral part of hollow-core slab unit system. Design and fabricate solid units to dimensions and details indicated for hollow-core slab units.

- H. Provide headers of cast-in-place concrete or structural-steel shapes for openings larger than one slab width according to hollow-core slab unit fabricator's written recommendations.

2.12 LONG-SPAN UNITS

- A. Type: Plant-fabricated, precast, prestressed concrete long-span units.
- B. Furnish units free of voids and honeycombs.
- C. Provide standard finish to precast concrete units, unless otherwise indicated.
 - 1. If designed as composite members, broom or rake top finish of precast concrete units for bonding with concrete floor topping.
 - 2. If used as roof members, provide smooth, float top finish to precast concrete units.
- D. Reinforce units to resist transportation and erection stresses.
- E. Include cast-in weld plates where required.
- F. Coordinate with other trades for installation of cast-in items.

2.13 STRUCTURAL FRAMING UNITS

- A. Type: Precast, prestressed structural concrete framing units.
- B. Furnish units free of voids and honeycombs.
- C. Provide standard finish to precast concrete units.
- D. Reinforce units to resist transportation and erection stresses.
- E. Include cast-in weld plates where required.
- F. Coordinate with other trades for installation of cast-in items.

2.14 SOURCE QUALITY CONTROL

- A. Design-Builder shall engage an independent testing agency to evaluate precast structural concrete fabricator's quality-control and testing methods.
 - 1. Allow testing agency access to material storage areas, concrete production equipment, concrete placement, and curing facilities. Cooperate with testing agency and provide samples of materials and concrete mixes as may be requested for additional testing and evaluation.
 - 2. Notification Point - Notify MBTA at least 3 days in advance of testing. Testing may be witnessed by the MBTA.
- B. Quality-Control Testing: Test and inspect precast concrete according to PCI MNL 116 requirements.
- C. Strength of precast concrete units will be considered deficient if units fail to comply with PCI MNL 116 requirements, including the following:
 - 1. Units fail to comply with compressive-strength test requirements.
 - 2. Reinforcement and prestressed tendons of units do not comply with fabrication requirements.

3. Concrete curing and protection of units against extremes in temperature fail to comply with requirements.
 4. Units are damaged during handling and erecting.
- D. Testing: If there is evidence that the strength of precast concrete units may be deficient or may not comply with PCI MNL 116 requirements, Design-Builder shall employ an independent testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C 42.
1. A minimum of three representative cores will be taken from units of suspect strength, from locations directed by MBTA.
 2. Cores will be tested, after immersion in water, in a wet condition per ACI 301.
 3. Strength of concrete for each series of 3 cores will be considered satisfactory if the average compressive strength is equal to at least 85% of the 28-day design compressive strength and no single core is less than 75% of the 28-day design compressive strength.
 4. Test results will be made in writing on the same day that tests are performed, with copies to MBTA, Design-Builder, and precast concrete fabricator. Test reports will include the following:
 - a. Project identification name and number.
 - b. Date when tests were performed.
 - c. Name of precast concrete fabricator.
 - d. Name of concrete testing agency.
 - e. Identification letter, name, and type of precast concrete unit or units represented by core tests; design compressive strength; type of break; compressive strength at break, corrected for length-diameter ratio; and direction of applied load to core in relation to horizontal plane of concrete as placed.
- E. Patching: If core test results are satisfactory and precast concrete units comply with requirements, clean and dampen core holes and solidly fill with precast concrete mix that has no coarse aggregate, and finish to match adjacent precast concrete surfaces.
- F. Dimensional Tolerances: Units with dimensions smaller or larger than required and not complying with tolerance limits may be subject to additional testing.
1. Precast concrete units with dimensions larger than required will be rejected if the appearance or function of the structure is adversely affected or if larger dimensions interfere with other construction. Repair or remove and replace rejected units, as required, to comply with construction conditions.
- G. Defective Work: Precast concrete units that do not comply with requirements, including strength, manufacturing tolerances, and finishes, are unacceptable. Replace with precast concrete units that comply with requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Bearing Pads: Install bearing pads as precast concrete units are being erected. Set pads on true, level, and uniform bearing surfaces and maintain in correct position until precast concrete units are placed.
- B. Install precast structural concrete. Shore and brace precast concrete units to maintain location, stability, and alignment until permanent connections are installed.
- C. Welding: Perform welding in compliance with AWS D1.1 and AWS D1.4, with qualified welders using qualified welding procedures.
 - 1. Protect precast concrete units and bearing pads from damage by field welding or cutting operations and provide noncombustible shields as required.
 - 2. Repair damaged metal surfaces by cleaning and applying a coat of galvanized repair paint to galvanized surfaces.
 - 3. Repair damaged metal surfaces by cleaning and repriming damaged painted surfaces.
 - 4. Steel shims shall be tack welded to supporting bearing plates.
- D. Fasteners: Do not use drilled or powder-actuated fasteners for attaching accessory items to precast, prestressed concrete units unless approved by MBTA.
- E. Erection Tolerances: Install precast concrete units level, plumb, square, and true, without exceeding the recommended erection tolerances in PCI MNL 127, "Recommended Practice for Erection of Precast Concrete".
- F. Grouting Connections and Joints: After precast concrete units have been placed and secured, grout open spaces at keyways, connections, and joints as follows:
 - 1. Provide forms or other approved method to retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are completely filled. Place grout to finish smooth, level, and plumb with adjacent concrete surfaces. Keep grouted joints damp for not less than 24 hours after initial set. Promptly remove grout material from exposed surfaces before it hardens.
- G. Adhesive Anchors: The use of Adhesive/Epoxy Anchors Systems (including but not limited to bolts, rebar dowels) is prohibited by the MBTA.

3.3 FIELD QUALITY CONTROL

- A. Testing: Design-Builder shall engage a qualified independent testing and inspecting agency to perform field tests and inspections.
- B. Notification Point - Field welds and connections using high-strength bolts will be subject to tests and inspections. Notify the MBTA 24 hours in advance of high-strength bolting.
- C. Testing agency will report test results promptly and in writing to Design-Builder and MBTA.
- D. Remove and replace work that does not comply with specified requirements.
- E. Additional testing and inspection, at Design-Builder's expense, will be performed to determine compliance of corrected work with specified requirements.

3.4 CLEANING

- A. Clean exposed surfaces of precast concrete units after erection to remove weld marks, other markings, dirt, and stains.
 - 1. Wash and rinse according to precast concrete fabricator's written recommendations. Protect other work from staining or damage due to cleaning operations.
 - 2. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 03460

NOISE BARRIER ASSEMBLIES

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies the furnishing and installation of pre-fabricated absorptive acoustic barrier panels and attachment system. The Noise Barriers will resemble a Massachusetts Department of Transportation standard item. The Noise Barriers will be freestanding or mounted on retaining walls. They will typically involve Cast-in-Place Concrete Foundations (for freestanding noise barriers), Steel Columns, Base Plates, Anchor Bolts, Pre-fabricated Panels, Spray-On Applications to the Panel Surfaces for various Sound Absorption Materials, Transparent Panels of Acrylic Materials for the upper sections of walls, and other related items.

1.2 RELATED SECTIONS

- A. Other specification sections that relate to the work include, but are not limited to, the following:
1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 2. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 3. Section 03300 – CAST-IN-PLACE CONCRETE
 4. Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE
 5. Section 03600 – NON-SHRINK CONSTRUCTION GROUT
 6. Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS
 7. Section 05500 – MISCELLANEOUS METALS
 8. Section 10443 – NOISE PANELS

1.3 REFERENCED DOCUMENTS

- A. The following Codes, Regulations, Referenced Standards, and Specifications apply to work included in this Section:
1. Codes and Standards:
 - a. ASTM E-90: Standard Test method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions.
 - b. ASTM C423: Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
 - c. ASTM E413: Classification for Rating Sound Insulation
 2. Acoustical Performance:
 - a. The acoustical panel manufacturer will be required to submit acoustical performance data in the form of up-to-date test reports from an independent testing laboratory indicating the panel system to be provided will have the required Sound Transmission

Class Rating. Tests shall be performed in accordance with ASTM E90 and ASTM E413.

- b. The acoustical panel manufacturer will be required to submit acoustical performance data in the form of up-to-date test reports from an independent testing laboratory indicating the panel system to be provided will have the required Sound Absorption Coefficients. Tests shall be performed in accordance with ASTM C423.

1.4 SUBMITTALS

- A. Submit the following for approval in compliance with Section 01300 - SUBMITTALS, and with the additional requirements as specified for each:
 1. Shop Drawings: Submit shop drawings and calculations showing layout, profiles, and product components, including precast concrete panels, acrylic panels, anchorage, accessories, finish colors, patterns and textures.
 - a. Shop drawings and calculations shall be performed, stamped, and sealed by a Professional Structural Engineer registered in the Commonwealth of Massachusetts.
 2. Pre-fabricated Panels (Units and Support) Manufacturer's specifications and other data: Indicate type of barrier, location, length, top elevation, bottom of footer elevation, cross-sections, foundation, and quantities. Show the complete layout plans and fabrication details for barrier units, and step-by-step erection instructions. Indicate unit locations, architectural details, support items, dimensions, openings, and relationship to adjacent materials. Barrier panels are designed per AASHTO Guide Specifications for Structural Design of Sound Barriers – 1989 with Interims through 2003.
 - a. Manufacturer's specifications and other data are needed to prove compliance with these specifications. Include specifications, standard details, certified product test results, installation instructions and general recommendations as applicable to materials and finishes for each component and for the total panel system.
 3. Samples: Submit selection and verification samples for finishes, colors, and textures. Sample materials minimum 4" x 12". Include any panel accessories as required.
 4. Quality Assurance Submittals: Submit the following:
 - a. Certificates: Product certificates and literature signed by the manufacturer certifying materials comply with specified performance characteristics and criteria, and physical requirements.
 - b. Manufacturer's Instructions: Manufacturer's printed installation and handling instructions.
 - c. Field Reports: Manufacturer's field reports supporting specified application.
 5. Closeout Submittals: Submit the following:
 - a. Operation and Maintenance Data: Include methods for maintaining installed products and precautions against cleaning materials and methods detrimental to finishes and performance.
 - b. Warranty documents as further specified.

- B. Submit Plan of Actions to be implemented in the event any Response Value for deformation, as specified in Table 03460-1, is reached.

**TABLE 03460-1
RESPONSE VALUES**

Monitoring Type	Value
<u>Lateral Deflection of Noise Barriers Supported by Earth</u>	
Top of column	1%
Mid-Point of exposed column	0.5%
<u>Vertical Deflection of Noise Barriers Supported by Earth</u>	
Top of column	1/2 inch
<u>Ground Surface Settlement</u>	
Top of Rail	1/4 inch

- C. Means and methods to advance through obstructions. In this case, as in all cases, review and approval of submittal by Engineer or MBTA does not relieve the Design Builder in any way from the responsibility to complete the construction.

1.5 PROJECT CONDITIONS

- A. Visit the site to review all details of the work and working conditions affecting Work under this Section and to verify dimensions in the field including potential interference from adjacent structures. Notify the Engineer in writing of any discrepancy before performing any work. The Design Builder is hereby notified that the job site is located adjacent to the active railroad and existing buildings.
- B. The Design Builder shall be responsible for implementing all necessary traffic control measures, which may include but not be limited to traffic cones, barriers, barrels, signs, flagmen, and police details.
- C. Provisions for Contingencies
1. Monitor the performance of components of the stand alone noise barrier, both for vertical and horizontal movement, at intervals specified herein.
 2. Implement contingency plans if Response Values specified in Table 03460-1 are reached.
 3. Have materials and equipment available to implement the accepted Plan of Action.
- D. Consult official records of existing utilities, both surface and subsurface, and their connections to be fully informed on all existing conditions and limitations as they apply to this work and its relation to other construction work. Proceed with caution in areas of utility facilities. Expose them by hand excavation or by other methods acceptable to the utility MBTA. Protect existing utilities to remain within and adjacent to the work area in accordance with the requirements of authorities having jurisdiction over same. The Design Builder is responsible for any damage to utilities caused by the

Design Builder's operations and shall restore them to equal or better operation at no additional cost to the MBTA.

1.6 WARRANTY

- A. Warrant pre-fabricated panels to be free from defective workmanship for one (1) year from date of Substantial Completion.
- B. Warrant factory applied finishes to be free from fading, chalking, or cracking for ten (10) years from date of Substantial Completion.

1.7 SUBSURFACE DATA

- A. Logs of subsurface explorations performed at the site are shown on the Contract Documents. Approximate locations of these subsurface explorations are shown on the Contract Plans.
- B. The aforementioned data is for general information and is accurate only at the particular locations and times the subsurface explorations were made. It is the Design Builder's responsibility to make interpretations and draw conclusions based on the character of materials to be encountered and the impact on his work based on his expert knowledge of the area and of earthwork techniques. The Design Builder shall review test pit and boring logs and locations and other pertinent data for the site. The Design Builder, at his own expense, may conduct additional subsurface explorations for his own information after obtaining the MBTA's permission.

1.8 QUALITY ASSURANCE

- A. The Design Builder shall provide written certification indicating that the equipment used for monitoring of deformation monitoring points (DMP) (as specified in Paragraph 3.2 herein) has been calibrated and maintained in accordance with the test equipment manufacturer's calibration requirements. The accuracy/precision of horizontal and vertical survey monitoring shall be to the nearest 0.01 feet.
- B. Full length temporary casing drilled to the elevation shown on the Design Builder's Approved Drawings may be required for all predrilled holes for noise barrier posts.

1.9 QUALIFICATIONS OF DESIGN BUILDER'S INSTRUMENTATION PERSONNEL

- A. The Design Builder shall have on his staff, or on the staff of a specialist instrumentation subcontractor, instrumentation/survey personnel who are responsible for furnishing, installing, and maintaining instrumentation/survey equipment, as well as obtaining and interpreting data from the instrumentation/survey equipment.
- B. The Design Builder's instrumentation/survey personnel shall have the following qualifications:
 - 1. A minimum of a Bachelor of Science Degree in Civil Engineering or related discipline.
 - 2. A minimum of 2 years' experience in the installation, monitoring, and interpretation of data from the types of monitoring equipment used to monitor deformation-monitoring points (as specified in Paragraph 3.2 herein).
- C. The Design Builder's instrumentation personnel shall:
 - 1. Be on site and supervise or perform installation of each monitoring point.

2. Perform deformation monitoring in accordance with the Project Specifications.
3. Interpret deformation-monitoring data.
4. Ensure that deformation-monitoring data is tabulated accurately and in a format consistent with the Project Specifications.
5. Forward monitoring data to the designated review parties in a timely manner.

PART 2 – PRODUCTS

2.1 GENERAL

- A. The Design Builder shall make his own arrangements to purchase the materials covered by this section of the specifications, including all necessary incidentals. The Design Builder, or the supplier as his agent, shall furnish the Engineer a Certificate of Compliance certifying that the applicable materials comply with this section of the specifications. Materials not conforming to this section of the specifications shall not be used without the written consent of the MBTA.

2.2 NOISE BARRIER PANELS

- A. Panels: Panels shall conform to Section 10443 – NOISE PANELS.
- B. Structural Design: Loadings for noise barrier walls are based on a design life of not less than 50 years and in accordance with AASHTO Guide Specifications for Structural Design of Sound Barriers – 1989 with Interims through 2003.

2.3 NOISE BARRIER POSTS

- A. Post Spacing: Posts should be spaced as shown on the Design Builder's Approved Drawings. See Section 05126 - STRUCTURAL STEEL FOR RETAINING WALLS for post assembly materials.
- B. Anchorages: See Section 03600 – NON-SHRINK CONSTRUCTION GROUT for grout under baseplates and Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS for baseplate and anchorage specifications.

2.4 PERFORMANCE

- A. Acoustical Performance and Durability shall conform to Section 10443 – NOISE PANELS
- B. Panels: Panels shall conform to Section 10443 – NOISE PANELS.
- C. Structural Requirements: Design of panels and system for this installation will withstand wind loading of 40 psf as required by AASHTO Guide Specifications for Structural Design of Sound Barriers – 1989 with Interims through 2003.

2.5 PANEL FABRICATION

- A. Panel Lifting Components shall be placed at the neutral axis of the completed panel to provide a vertical placement when setting the panel.

PART 3 – EXECUTION

3.1 GENERAL REQUIREMENTS

- A. Install the wall in accordance with the accepted working drawings, and in such a manner as to prevent movement, settlement, loss of ground, removal of fines from the adjacent ground, and damage to or movement of adjacent structures and utilities.
- B. Perform work from track side of the proposed wall unless temporary easements have been granted to minimize adjacent property impacts. Heavy equipment shall be placed on the track side of the proposed wall.
- C. Perform field welding by certified welders in accordance with American Welding Society Standards AWS D 1.1, "Structural Welding Code - Steel."
- D. Implement the Plan of Actions as submitted under Paragraph 1.4B, if Response Values as specified in Table 03460-1 are reached.
- E. Borings indicate below ground obstructions may be encountered. Such obstructions may include, but are not necessarily limited to, boulders, and various other demolition and construction debris. Noise barriers shall be installed through all material encountered to the depth required by the Design Builder's Approved Drawings. Installation equipment shall be capable of drilling through boulders, and any other obstructions, encountered during installation at no additional cost to MBTA.
- F. Temporary casings used for pre-drilling holes for noise barrier posts shall be installed where specified on the Design Builder's Approved Drawings to top weathered bedrock, as a minimum, using rotary drilling techniques over their full depth to limit potential vibration damage to adjacent structures and facilities. Potential vibration damage could result if the piles or casing were installed using driving or vibratory methods.
- G. Protection of Existing Adjacent Structures
 - 1. The Design Builder shall repair all damage to adjacent properties and restore the surfaces and finishes to the original state.
 - 2. If in the opinion of the Engineer the integrity of the adjacent railroad tracks, bridge, buildings, structures, or paved areas are jeopardized due to movement, the Design Builder shall immediately discontinue further excavation in the affected area and implement accepted Plan of Action to mitigate further movement. Mitigating measures shall remain in effect until such time that the Engineer evaluates the impact on the structure and may direct the Design Builder to perform any remedial work. The Design Builder shall submit proposed remedial measures to the Geotechnical Engineer for review and approval. Submittals shall include methods and names of subcontractors. The Design Builder shall proceed with remedial work upon acceptance by the Engineer. Mitigating measures shall be at no additional cost to the MBTA.

3.2 MONITORING OF EXCAVATION

- A. Monitoring Track Movement
 - 1. Before the start of excavation and wall installation, establish elevations along Top of Rail of nearest track spaced approximately every 20 feet along the walls.

2. Perform two baseline elevation surveys of the Top of Rail before the start of excavation/wall installation. Survey both vertical and lateral (into excavation) positions.
 3. Perform weekly survey of settlement monitoring points from the beginning of excavation until the structure is completely in place and fully backfilled.
- B. The Design Builder shall submit the results of the settlement point readings to the Engineer in draft form at the end of each working day. All monitoring data for track shall be reported to the MBTA and Engineer within twenty-four (24) hours of measurement in tabular format, allowing comparison of current data to previous data, including baseline, and showing a complete history of movement versus time.

3.3 INSTALLATION

- A. Install work in accordance with reviewed shop drawings and these specifications using only factory-trained personnel as required by the manufacturer and approved by the Engineer.
1. Ensure panel orientation of noise absorptive surface is toward noise source and right side up.
 2. Be sure panels are properly seated before installing next panel. Ensure that lower panels do not move horizontally when installing follow on panels.
- B. Special care shall be exercised to protect the sound absorptive wall components from damage during fabrication, shipment, handling, storage, and installation such that permanently exposed surfaces of any panel is not chipped, gouged or marred. Handle and erect units carefully so as to avoid damage to units. If surface defects occur to any permanently exposed surface it will be at the discretion of the Engineer weather to replace the panel. Any such panel that cannot be repaired to the satisfaction of the Engineer shall be replaced at no additional cost to MBTA. Replace any members damaged to the extent where their aesthetics or structural integrity is compromised.
- C. The installer shall identify any underground utility or overhead obstruction that could affect job site safety. The installer is responsible to correct any site conditions that would compromise site safety and cause an accident.
- D. Install panels to the elevations shown in the Design Builder's Approved Drawings. Use lifting devices or rigging designed to safely lift and position panels. No lifting devices shall be placed such that it would be visible in the permanent position of the panel. Lift and lower panels into the post flanges making sure the panel's absorptive side is facing the noise source if only one side is absorptive. Set, level, and center the bottom panel to the planned elevation using elastomeric bearing pads. Set and level intermediate panels using elastomeric bearing pads, making sure all panels are centered between posts and the panel-to-panel pattern is misaligned. Continue stacking panels up to the elevation specified in the Design Builder's Approved Drawings. If key ways are used do not place the top of the uppermost panel nor the bottom of the lowermost panel with a key.
- E. Connections between the panel and the posts should account for movement and expansion and contraction of the panels.
- F. Where transparent panels are to be placed on top of concrete panels, ensure that the panels fit together in a manner acceptable to the manufacturer of each piece. No top panel or acrylic panel shall be placed until a compatible connection is approved by the manufacture of each panel and by the Engineer.

3.4 ACCEPTANCE CRITERIA FOR NOISE WALLS

A. Vertical

1. Maximum variation from elevation shall be 1/2”.
2. Maximum variation from plumb shall be 1%.

B. Horizontal

There shall be no more than 1” out of plane tolerance along the wall measured at any 20 foot increment.

3.5 ACRYLIC PANEL PROTECTION

- A. Acrylic panels shall be unpackaged as close to the location of installation as possible.
- B. Protective coverings shall remain in place until the time of acceptance.
- C. Acrylic panels which are damaged shall be repaired by the manufacturer or replaced to the satisfaction of the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 03600

NON-SHRINK CONSTRUCTION GROUT

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

- A. Attention is directed to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS, AND GENERAL REQUIREMENTS, which are hereby made a part of this Specification Section.
- B. Related Work: Examine all documents and all Sections of the Specifications for requirements and provisions affecting the work of this Section.

1.2 WORK INCLUDED

- A. The work to be performed under this Section consists of:
 - 1. Furnishing, constructing, and installation of non-shrink construction grout as required for the construction activities.

1.3 SUBMITTALS

- A. The Design-Builder shall submit, to the MBTA the following:
 - 1. Materials data and certificate of compliance attesting to conformance of products to the requirements of this Section.
- B. Submit manufacturer's instructions for use of the proposed grout. Include mix proportions, consistency, temperature range, and working time for each grout mix to be used.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials in original, tightly sealed bags, clearly labeled with manufacturer's name, brand name and number, batch number of the material, and other product marking as required by ASTM C11 07, Section 15.
- B. Store and handle material according to manufacturer's recommendations.

PART 2 - MATERIALS

2.1 NON-SHRINK GROUT

- A. Provide grout that complies with ASTM C1107, Grade A, B or C.
- B. Provide grout with suitable consistency, working time, and temperature range for the working conditions.
- C. Unless otherwise required by design, the grout shall have a compressive strength of at least 3,500 psi in 7 days when tested in accordance with AASHTO T106, and a minimum of 8,000 psi at 28 days. Design-Builder shall coordinate between trades, so that appropriate grout strengths are supplied and used for the proposed work.

PART 3 - CONSTRUCTION METHODS

3.1 PREPARATION

- A. Remove substances such as dust, laitance, grease, curing compounds, impregnations, waxes, foreign particles, and disintegrated materials from surfaces where non-shrink grout is to be applied.
 - 1. Use mechanical abrasion on structural steel and reinforcing steel to remove loose material and expose sound metal.
 - 2. Clean coatings from concrete surfaces using a degreasing and etching chemical applied in accordance with the manufacturer's written instructions for the particular application.
- B. Construct appropriate forms to contain grout at the fluidity level at which it will be used. Saturate foundations and forms with water for a minimum of 24 hours prior to grouting. Remove all standing water and puddles prior to application of grout. Take special care to eliminate water from bolt holes and other cavities.

3.2 MIXING

- A. Mix with potable water according to manufacturer's printed instructions.

3.3 PLACEMENT

- A. Follow manufacturer's placement instructions and recommendations for the particular application.
- B. Place grout only from one side to avoid entrapping air. Provide adequate air vent holes in large placements. Work or flow grout into place, filling all cavities. Inspect vent holes to ensure proper filling.
- C. Place grout within time limit specified by manufacturer after addition of water to the batch.
- D. Cure the grout after placement as for concrete, using appropriate methods as specified in Section 03300, CAST-IN-PLACE CONCRETE.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 03601

POST INSTALLED ANCHORS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Provide post-installed anchors as required for the design, as specified herein, and as needed for a complete and proper installation.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 03300 – CAST-IN-PLACE CONCRETE
 - 2. Section 03371 – SHOTCRETE
 - 3. Section 03410 – PLANT PRECAST STRUCTURAL CONCRETE
 - 4. Section 03460 – NOISE BARRIER ASSEMBLIES
 - 5. Section 03600 – NON-SHRINK CONSTRUCTION GROUT
 - 6. Section 03930 – CONCRETE REHABILITATION AND REPAIR

1.2 SUBMITTALS

- A. Provide manufacturers product data with recommended design values and physical characteristics for all post-installed anchors to be used in this project.
- B. The Design-Builder shall submit to the MBTA for review and approval, the methods and procedures for anchor bolt installation including drilling, installing and anchor bolt testing, including equipment and materials proposed for the work. The method and equipment used to drill the anchor bolt holes and the diameter of the drilled hole shall, at a minimum, conform to the recommendations of the manufacturer and shall also be submitted to the MBTA for approval.

1.3 QUALITY ASSURANCE

- A. General: Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.
- B. Single source responsibility: To ensure consistent quality of anchorage, obtain anchors from a single manufacturer.
- C. Installer Qualifications: Post-installed anchors shall be installed by the Design-Builder utilizing personnel and suppliers with a minimum of five years' experience performing similar installations.
- D. Installer Training: Conduct thorough training with the manufacturer or the manufacturer's representative for the installer. Training shall consist of a review of the complete installation process for post-installed anchors including the following:
 - 1. Hole drilling procedure.

2. Hole preparation and cleaning technique.
 3. Adhesive injection technique and dispenser training/maintenance.
 4. Anchor element type, material, diameter, and length.
 5. Proof loading/torqueing.
 6. Other procedures and techniques as necessary.
- E. Certifications: Unless otherwise authorized by the MBTA, anchors shall have one of the following certifications:
1. ACI 355.2 Evaluation Report.
 2. ICC-ES Evaluation Report indicating conformance with applicable ICC-ES AC193 or ICC-ES AC308.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. General: Deliver, store and handle anchors in accordance with manufacturer's recommendation.
- B. Deliver products in original, unopened packages with manufacturer's labels identifying products legible and intact.
- C. Store materials inside, under cover and in a manner to keep them dry, protected from the weather, surface contamination, and corrosion damage.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Fasteners and Anchors:
 1. Bolts and Studs: ASTM A307; ASTM A449 where "high strength" is required by design.
 2. Carbon and Alloy Steel Nuts: ASTM A563.
 3. Carbon Steel Washers: ASTM F436.
 4. Carbon Steel Threaded Rod: ASTM A36; or ASTM A193 Grade B7; or ISO 898 Class 5.8.
 5. Wedge Anchors: ASTM A510; or ASTM A108.
 6. Stainless Steel Bolts, Hex Cap Screws, and Studs: ASTM F593.
 7. Stainless Steel Nuts: ASTM F594.
 8. Zinc Plating: ASTM B633.
 9. Hot-Dip Galvanizing: ASTM A153.
 10. Metric Anchor Bolts, Screws, and Studs: ISO 898 Part 1.
 11. Metric Anchor Nuts: EN 24033.
 12. Metric Anchor Stainless Steel Bolts, Screws, and Studs: ISO 3506 Part 1.
 13. Metric Anchor Stainless Steel Nuts: ISO 3506 Part 2.

14. Reinforcing Dowels: ASTM A615
- B. Wedge Anchors: Wedge type, torque-controlled, with impact section to prevent thread damage complete with required nuts and washers. Provide anchors with length identification markings conforming to ICC ES AC01 or ICC ES AC193. Type and size as indicated on Drawings.
1. Exterior Use: As required by design, provide stainless steel anchors. Stainless steel anchors shall be AISI [Type 304] [and] [Type 316] stainless steel provided with stainless steel nuts and washers of matching alloy group and minimum proof stress equal to or greater than the specified minimum full-size tensile strength of the externally threaded fastener. Stainless steel nuts shall conform to ASTM F594 unless otherwise specified. Avoid installing stainless steel anchors in contact with galvanically dissimilar metals.
 2. Where anchor manufacturer is not indicated, subject to compliance with requirements and acceptance by the MBTA, provide the following:
 - a. Hilti Kwik Bolt 3, ICC ESR-1385.
 - b. Hilti Kwik Bolt TZ, ICC ESR-1917 (carbon steel and AISI Type 304 Stainless Steel).
- C. Heavy Duty Metric Sleeve Anchors: Torque-controlled, exhibiting follow-up expansion under load, with provision for rotation prevention during installation. Type and size as indicated on Drawings.
1. Exterior Use: As required by design, provide stainless steel anchors. Stainless steel anchors shall be manufactured from materials conforming to ISO 3506 Part 1 and having corrosion resistance equivalent to AISI [Type 304] [and] [Type 316] stainless steel. Stainless steel anchors shall be provided with stainless steel nuts and washers of matching alloy group and minimum proof stress equal to or greater than the specified minimum full-size tensile strength of the externally threaded fastener. All nuts shall conform to ISO 3506 Part 2 unless otherwise specified. Avoid installing stainless steel anchors in contact with galvanically dissimilar metals.
 2. Where anchor manufacturer is not indicated, subject to compliance with requirements and acceptance by the MBTA, provide the following:
 - a. Hilti HSL, HSLG, or HSLB, ICBO ER-3987.
 - b. Hilti HSL-3, HSL-3-G, or HSL-3-B, ICC ESR-1545 (carbon steel).
- D. Heavy Duty Metric Undercut Anchors: Bearing-type. Installed anchor shall have a minimum tension bearing area in the concrete, measured as the horizontal projection of the bearing surface, not less than two times the net tensile area of the anchor bolt. The installed anchor shall exhibit a form fit between the bearing elements and the undercut in the concrete. Type and size as indicated on Drawings.
1. Exterior Use: As required by design, provide sherardized or stainless steel anchors. Sherardized anchors shall be manufactured from materials conforming to ISO 898 Part 1 and having corrosion resistance equivalent to ASTM A153 with sherardized dry diffusion zinc coating (50 μ m min.). Stainless steel anchors shall be manufactured from materials conforming to ISO 3506 Part 1 and having corrosion resistance equivalent to AISI [Type 316] stainless steel. Stainless steel anchors shall be provided with stainless steel nuts and washers of matching alloy group and minimum proof stress equal to or greater than the specified minimum full-size tensile strength of the externally threaded fastener. All nuts shall conform to ISO 3506 Part 2 unless otherwise specified. Avoid installing stainless steel

anchors in contact with galvanically dissimilar metals.

2. Where anchor manufacturer is not indicated, subject to compliance with requirements and acceptance by the MBTA, provide the following:
 - a. Hilti HDA, ICC ER-5608 and ICC ESR-1546.
- E. Cartridge Injection Adhesive Anchors: Threaded steel rod, inserts or reinforcing dowels, complete with nuts, washers, polymer or hybrid mortar adhesive injection system, and manufacturer's installation instructions. Type and size as indicated on Drawings.
1. Exterior Use: As required by design, provide stainless steel anchors. Stainless steel anchors shall be AISI [Type 304] [and] [Type 316] stainless steel provided with stainless steel nuts and washers of matching alloy group and minimum proof stress equal to or greater than the specified minimum full-size tensile strength of the externally threaded fastener. All nuts shall conform to ASTM F594 unless otherwise specified. Avoid installing stainless steel anchors in contact with galvanically dissimilar metals.
 2. Reinforcing dowels shall be A615 Grade 60.
 3. Where anchor manufacturer is not indicated, subject to compliance with requirements and acceptance by the MBTA, provide the following:
 - a. Hilti HAS threaded rods or HIT-TZ rods with HIT HY-150 / HIT ICE Adhesive Anchorage System for anchorage to concrete or grouted masonry, ICC ER-5193, ICC ESR-1562.
 - b. Hilti HAS threaded rods with RE 500 Injection Adhesive Anchoring System for anchorage to concrete, ICC ESR-1682.
- F. Capsule Anchors: Threaded steel rod, inserts and reinforcing dowels with 45 degree chisel point, complete with nuts, washers, glass or foil capsule anchor system containing polyvinyl or urethane methacrylate-based resin and accelerator, and manufacturer's installation instructions. Type and size as indicated on Drawings.
1. Exterior Use: As required by design, provide chisel-pointed stainless steel anchors. Stainless steel anchors shall be AISI [Type 304] [and] [Type 316] stainless steel provided with stainless steel nuts and washers of matching alloy group and minimum proof stress equal to or greater than the specified minimum full-size tensile strength of the externally threaded fastener. All nuts shall conform to ASTM F594 unless otherwise specified. Avoid installing stainless steel anchors in contact with galvanically dissimilar metals.
 2. Reinforcing dowels shall be A615 Grade 60, with 45-degree chisel-points at embedded end.
 3. Where anchor manufacturer is not indicated, subject to compliance with requirements and acceptance by the MBTA, provide the following:
 - a. Hilti HVA Adhesive System with HVU capsules, ICC ER-5369.

PART 3 - EXECUTION

3.1 SURFACE CONDITIONS

- A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the Work. Do not proceed until unsatisfactory conditions are corrected.
- B. Remove and replace misplaced or malfunctioning anchors. Fill empty anchor holes and patch failed anchor locations with high-strength non-shrink, nonmetallic grout. Anchors that fail to meet proof load or installation torque requirements shall be regarded as malfunctioning.

3.2 INSTALLATION

A. Drilled-In Anchors:

1. Drill holes with rotary impact hammer drills using carbide-tipped bits and core drills using diamond core bits. Drill bits shall be of diameters as specified by the anchor manufacturer. Unless otherwise shown on the Drawings, all holes shall be drilled perpendicular to the concrete surface.
 - a. Cored Holes: Where anchors are to be installed in cored holes, use core bits with matched tolerances as specified by the manufacturer. HIT HY-150 and HIT ICE shall not be installed in core drilled holes.
 - b. Embedded Items: Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Exercise care in coring or drilling to avoid damaging existing reinforcing or embedded items. Notify the MBTA if reinforcing steel or other embedded items are encountered during drilling. Take precautions as necessary to avoid damaging prestressing tendons, electrical and telecommunications conduit, and gas lines.
 - c. Base Material Strength: Unless otherwise specified, do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
2. Perform anchor installation in accordance with manufacturer instructions.
3. Wedge Anchors, Heavy-Duty Sleeve Anchors, and Undercut Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in part to be fastened. Set anchors to manufacturer's recommended torque, using a torque wrench. Following attainment of 10% of the specified torque, 100% of the specified torque shall be reached within 7 or fewer complete turns of the nut. If the specified torque is not achieved within the required number of turns, the anchor shall be removed and replaced unless otherwise directed by the MBTA.
4. Cartridge Injection Adhesive Anchors: Clean all holes per manufacturer instructions to remove loose material and drilling dust prior to installation of adhesive. Holes do not need to be cleaned for HIT-TZ Rods with HY-150 in accordance with ICC ESR-1562. Holes may be dry, damp or wet. Inject adhesive into holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive. Follow manufacturer recommendations to ensure proper mixing of adhesive components. Sufficient adhesive shall be injected in the hole to ensure that the annular gap is filled to the surface. Remove excess adhesive from the surface. Shim anchors with suitable device to center the anchor in the hole. Do not disturb or load anchors before manufacturer specified cure time has elapsed.

5. Capsule Anchors: Perform drilling and setting operations in accordance with manufacturer instructions. Clean all holes to remove loose material and drilling dust prior to installation of adhesive. Remove water from drilled holes in such a manner as to achieve a surface dry condition. Capsule anchors shall be installed with equipment conforming to manufacturer recommendations. Do not disturb or load anchors before manufacturer specified cure time has elapsed.
6. Observe manufacturer recommendations with respect to installation temperatures for cartridge injection adhesive anchors and capsule anchors.

3.3 TESTING

- A. Perform job testing as specified herein. Proof load 30% of each type and size of post installed anchor required on this project by an independent testing laboratory. Adhesive anchors and capsule anchors shall not be torque tested unless otherwise directed by the MBTA.
- B. Minimum anchor embedment, proof load and torque shall be as shown on the Drawings.
 1. All tests shall be performed in the presence of the inspector of record.
 2. Test anchors, as follows:
 - a. 10% of Sill plate bolts
 - b. 50% of equipment anchorage bolts
 - c. 100% of all other structural anchors
 - d. If any anchor fails to achieve the specified torque or proof load, all anchors of the same category not previously tested shall be tested until 20 consecutive anchors pass the test requirements. The initial testing frequency shall then be resumed. The cost of additional testing shall be borne by the Design-Builder.
 3. Apply proof test load to Wedge and Sleeve anchors without removing the nut if possible. If not, remove nut and install a threaded coupling to the same tightness of the original nut using a torque wrench and apply the test load.
 4. Reaction loads from test fixtures may be applied close to the anchor being tested, provided the anchor is restrained from withdrawing by the fixture(s).
 5. Test equipment (including torque wrenches) is to be calibrated by an approved testing laboratory in accordance with standard recognized procedures.
 6. Alternate torques test procedures and test values for shell type anchors may be submitted to the enforcement agency for review and approval on a case by case basis when test procedures are submitted and approved by the enforcement agency.
 7. The following criteria apply for the acceptance of installed anchors:
 - a. **HYDRAULIC RAM METHOD:** The anchor shall have no observable movement at the applicable test load. For Wedge type anchors, a practical way to determine movement is that the washer under the nut becomes loose.
 - b. **TORQUE WRENCH METHOD:** The applicable test torque shall be reached within one- half (1/2) turn of the nut.
 8. If the Manufacturer's recommended installation torque is less than the test torque noted in the table, the manufacturer's recommended installation torque shall be used in lieu of the tabulated values.
 9. Use the post-installed anchors only where shown on drawings.

10. Post-installed anchors shall be listed in a current evaluation report issued by ICC including, but not limited to, the following:
 - a. HILTI KB-TZ(ESR 1917)
 - b. SIMPSON STRONG-BOLT (ESR-1771)
 - c. SIMPSON TITEN HD (ESR-1056)

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 03930

CONCRETE REHABILITATION AND REPAIR

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Removal of deteriorated concrete and reinforcement and subsequent replacement and patching.
 - 2. Epoxy crack injection.
 - 3. Cleaning and restoration of existing (old) concrete surfaces.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 07190 – WATER REPELLENTS; clear penetrating and film-forming water repellents applied to concrete.
 - 2. Section 03300 – CAST-IN-PLACE CONCRETE
 - 3. Section 03371 - SHOTCRETE

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated. Include material descriptions, chemical composition, physical properties, test data, and mixing, preparation, and application instructions.
- B. Formwork and Shoring Drawings: Prepared by or under the supervision of a qualified professional engineer working for the Design-Builder, detailing formwork and temporary shoring and supports. Include schedule and sequence for erection and removal relative to removal of deteriorated concrete and reinforcement and subsequent repair and reinforcement.
- C. Samples: Cured Samples of patching materials.
- D. Qualification Data: For installers.
- E. Material Certificates: For each type of product indicated, signed by manufacturers.
- F. Rehabilitation Program: For each phase of rehabilitation process, including protection of surrounding materials and Project site during operations. Describe in detail materials, methods, equipment, and sequence of operations to be used for each phase of the Work.
 - 1. If alternative materials and methods to those indicated are proposed for any phase of rehabilitation work, submit substitution request and provide a written description of proposed materials and methods, including evidence of successful use on other comparable projects, and a testing program to demonstrate their effectiveness for this Project.

1.3 QUALITY ASSURANCE

- A. Installer Qualifications: Installer that employs workers trained and approved by manufacturer.

- B. **Manufacturer Qualifications:** Manufacturer that employs factory-trained representatives who are available for consultation and Project-site inspection.
- C. **Source Limitations:** Obtain each type of material through one source from a single manufacturer.
- D. **Hold Point - Mockups:** Build mockups for concrete removal and patching, floor joint repair and epoxy crack injection to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to Project site in manufacturer's original and unopened containers, labeled with type and name of products and manufacturers.
- B. Comply with manufacturer's written instructions for minimum and maximum temperature requirements and other conditions for storage.
- C. Store cementitious materials off the ground, under cover, and in a dry location.
- D. Store aggregates, covered and in a dry location, where grading and other required characteristics can be maintained and contamination avoided.

1.5 PROJECT CONDITIONS

- A. **Environmental Limitations for Epoxies:** Do not apply when air and substrate temperatures are outside limits permitted by manufacturer. During hot weather, cool epoxy components before mixing, store mixed products in shade, and cool unused mixed products to retard setting. Do not apply to wet substrates unless approved by manufacturer.
 - 1. Use only Class A epoxies when substrate temperatures are below or are expected to go below 40 deg F within 8 hours.
 - 2. Use only Class A or B epoxies when substrate temperatures are below or are expected to go below 60 deg F within 8 hours.
 - 3. Use only Class C epoxies when substrate temperatures are above and are expected to stay above 60 deg F for 8 hours.
- B. **Cold-Weather Requirements for Cementitious Materials:** Comply with the following procedures:
 - 1. When air temperature is below 40 deg F, heat patching material ingredients and existing concrete to produce temperatures between 40 and 90 deg F.
 - 2. When mean daily air temperature is between 25 and 40 deg F, cover completed Work with weather-resistant insulating blankets for 48 hours after repair or provide enclosure and heat to maintain temperatures above 32 deg F within the enclosure for 48 hours after repair.
 - 3. When mean daily air temperature is below 25 deg F, provide enclosure and heat to maintain temperatures above 32 deg F within the enclosure for 48 hours after repair.

- C. Hot-Weather Requirements for Cementitious Materials: Protect repair work when temperature and humidity conditions produce excessive evaporation of water from patching materials. Provide artificial shade and wind breaks, and use cooled materials as required. Do not apply to substrates with temperatures of 90 deg F and above.

PART 2 -PRODUCTS

2.1 BONDING AGENTS

- A. Epoxy-Modified, Cementitious Bonding and Anticorrosion Agent: Product that consists of water-insensitive epoxy adhesive, Portland Cement, and water-based solution of corrosion-inhibiting chemicals that forms a protective film on steel reinforcement.
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Euclid Chemical Company (The); Corr-Bond.
 - b. Sika Corporation; Armatec 110 EpoCem.
 - c. Sonneborn, Div. of ChemRex; Sonoprep.
 - d. Tamms Industries, Inc.; Duralprep A.C.
- B. Epoxy Bonding Agent: ASTM C 881/C 881M, Type II.
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Anti-Hydro International, Inc.; Poly-Epoxy Bonding #100.
 - b. Euclid Chemical Company (The); Euco #452 Epoxy System.
 - c. Sika Corporation; Sikadur 35, Hi-Mod LV.
 - d. Sonneborn, Div. of ChemRex; Epogel or Epogrip.
 - e. Tamms Industries, Inc.; Duralbond.
 - f. ThoRoc, Div. of ChemRex; Epoxy Adhesive 24LPL.
- C. Mortar Scrub-Coat: One part Portland Cement complying with ASTM C 150, Type I, II, or III and one part fine aggregate complying with ASTM C 144, except 100% passing a No. 16 sieve.

2.2 PATCHING MORTAR

- A. Patching Mortar, General:
 - 1. Unless otherwise indicated, use any of the products specified in this Article.
 - 2. Overhead Patching Mortar: For overhead repairs, use patching mortar recommended by manufacturer for overhead use and as specified in this Article.
 - 3. Coarse Aggregate for Adding to Patching Mortar: Washed aggregate complying with ASTM C 33, Size No. 8, Class 5S. Add only as permitted by patching mortar manufacturer.
- B. Cementitious Patching Mortar: Packaged, dry mix complying with ASTM C 928.
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:

- a. Cementitious Patching Mortar:
 - 1. Sika Corporation; Sikarepair 223.
 - 2. Sonneborn, Div. of ChemRex; Deep Pour Mortar.
 - 3. ThoRoc, Div. of ChemRex; LA Repair Mortar.
- b. Cementitious Patching Mortar, Rapid Setting:
 - 1. Meadows, W. R. Inc.; Sealtight Meadow-Patch 20.
 - 2. Sika Corporation; Sikaset Roadway Patch.
 - 3. Sonneborn, Div. of ChemRex; Road Patch.
 - 4. Tamms Industries, Inc.; Speed Crete 2028.
 - 5. ThoRoc, Div. of ChemRex; 10-61 Rapid Mortar.

2.3 CONCRETE

- A. Concrete Materials and Admixtures: Comply with Division 3 Section 03300 "CAST-IN-PLACE CONCRETE".
- B. Steel and Fiber Reinforcement and Reinforcement Accessories: Comply with Division 3 Section 03300 "CAST-IN-PLACE CONCRETE".
- C. Form-Facing Materials: Comply with Division 3 Section 03300 "CAST-IN-PLACE CONCRETE".
- D. Shotcrete: Comply with Division 3 Section 03371 "SHOTCRETE".
- E. Preplaced Aggregate: Washed aggregate complying with ASTM C 33, Class 5S, with 100% passing a 1-1/2-inch sieve, 95% to 100% passing a 1-inch sieve, 40% to 80% passing a 3/4- inch sieve, 0% to 15% passing a 1/2-inch sieve, and 0% to 2% passing a 3/8-inch sieve.
- F. Fine Aggregate for Grout Used with Preplaced Aggregate: Fine aggregate complying with ASTM C 33, but with 100% passing a No. 8 sieve, 95% to 100% passing a No. 16 sieve, 55% to 80% passing a No. 30 sieve, 30% to 55% passing a No. 50 sieve, 10% to 30% passing a No. 100 sieve, 0% to 10% passing a No. 200 sieve, and having a fineness modulus of 1.30 to 2.10.
- G. Grout Fluidifier for Grout Used with Preplaced Aggregate: ASTM C 937.
- H. Portland Cement for Grout Used with Preplaced Aggregate: ASTM C 150.
- I. Pozzolans for Grout Used with Preplaced Aggregate: ASTM C 618.

2.4 MISCELLANEOUS MATERIALS

- A. Epoxy Joint Filler: 2-component, semirigid, 100% solids, epoxy resin with a Type A Shore durometer hardness of at least 80 per ASTM D 2240.
- B. Epoxy Crack Injection Adhesive: ASTM C 881/C 881M.
Capping Adhesive: Product manufactured for use with crack injection adhesive by same manufacturer.

- C. Corrosion-Inhibiting Treatment Materials: Water-based solution of alkaline corrosion-inhibiting chemicals that penetrates concrete by diffusion and forms a protective film on steel reinforcement.
- D. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
 - 1. After fabricating, prepare surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning".
 - 2. After preparation, apply two-coat high-performance coating system consisting of organic zinc-rich primer, complying with SSPC-Paint 20 or SSPC-Paint 29 and topcoat of high-build, urethane or epoxy coating recommended by manufacturer for application over specified zinc-rich primer. Comply with coating manufacturer's written directions and with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel", for shop painting.
- E. Bolts, Nuts, and Washers: Carbon steel; ASTM A 307, Grade A, for bolts; ASTM A 563, Grade A, for nuts; and ASTM F 436 for washers; hot-dip or mechanically zinc coated.
- F. Postinstalled Anchors: Chemical or expansion anchors, made from stainless-steel components complying with ASTM F 593 and ASTM F 594, Alloy Group 1 or 2 for bolts and nuts; ASTM A 666 or ASTM A 276, Type 304 or 316, for anchors, with capability to sustain, without failure, a load equal to four times the load imposed, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.

2.5 MIXES

- A. Mix products, in clean containers, according to manufacturer's written instructions.
 - 1. Add clean silica sand and coarse aggregates to products only as recommended by manufacturer.
 - 2. Do not add water, thinners, or additives unless recommended by manufacturer.
 - 3. When practical, use manufacturer's premeasured packages to ensure that materials are mixed in proper proportions. When premeasured packages are not used, measure ingredients using graduated measuring containers; do not estimate quantities or use shovel or trowel as unit of measure. Only use full, unopened bags.
 - 4. Do not mix more materials than can be used within recommended open time. Discard materials that have begun to set.
- B. Mortar Scrub-Coat: Mix with enough water to provide consistency of thick cream.
- C. Dry-Pack Mortar: Mix with just enough liquid to form damp cohesive mixture that can be squeezed by hand into a ball but is not plastic.
- D. Concrete: Comply with Division 3 Section 03300 "CAST-IN-PLACE CONCRETE".
- E. Shotcrete: Comply with Division 3 Section 03371 "SHOTCRETE".
- F. Grout for Use with Preplaced Aggregate: Proportion according to ASTM C 938. Add grout fluidifier to mixing water followed by cementitious materials and then fine aggregate.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Notify MBTA seven days in advance of dates when areas of deteriorated or delaminated concrete and deteriorated reinforcing bars will be located.
- B. Locate areas of deteriorated or delaminated concrete using hammer or chain drag sounding and mark boundaries. Mark areas for removal by simplifying and squaring off boundaries as directed by MBTA. At columns and walls make boundaries level and plumb, unless otherwise indicated.
- C. Locate at least three reinforcing bars using a pachometer, and drill test holes to determine depth of cover. Calibrate pachometer, using depth of cover measurements, and verify depth of cover in removal areas using pachometer.
- D. All deteriorated concrete areas shown on the contract plans shall be sounded. The deteriorated areas shall be marked and work shall not proceed until approval is given by the MBTA.

3.2 PREPARATION

- A. Protect people, motor vehicles, equipment, surrounding construction, Project site, plants, trees, shrubs, other vegetation and surrounding buildings from injury resulting from concrete rehabilitation work.
 - 1. Erect and maintain temporary protective covers over pedestrian walkways and at points of entrance and exit for people and vehicles, unless such areas are made inaccessible during the course of concrete rehabilitation work. Construct covers of tightly fitted, 3/4-inch exterior-grade plywood supported at 16 inches o.c. and covered with asphalt roll roofing.
 - 2. Protect adjacent equipment and surfaces by covering them with heavy polyethylene film and waterproof masking tape or a liquid strippable masking agent. If practical, remove items, store, and reinstall after potentially damaging operations are complete.
 - 3. Neutralize and collect alkaline and acid wastes according to requirements of the MBTA, and dispose of by legal means off MBTA's property.
 - 4. Dispose of runoff from wet operations by legal means and in a manner that prevents soil erosion, undermining of paving and foundations, damage to landscaping, and water penetration into building interiors.
- B. Shoring: Install temporary supports as required before beginning concrete removal.
- C. Concrete Removal:
 - 1. Saw-cut perimeter of areas indicated for removal to a depth of at least 1/2 inch. Make cuts perpendicular to concrete surfaces and no deeper than cover on reinforcement.
 - 2. Remove deteriorated and delaminated concrete by breaking up and dislodging from reinforcement.
 - 3. Remove additional concrete, if necessary, to provide a depth of removal of at least 1/2 inch over entire removal area.
 - 4. Where half or more of the perimeter of reinforcing bar is exposed, bond between reinforcing bar and surrounding concrete is broken, or reinforcing bar is corroded, remove concrete from entire perimeter of bar and to provide at least a 3/4-inch clearance around bar.
 - 5. Test areas where concrete has been removed by tapping with hammer, and remove additional

concrete until unsound and disbonded concrete is completely removed.

6. Provide fractured aggregate surfaces with a profile of at least 1/8 inch that is approximately perpendicular or parallel to original concrete surfaces. At columns and walls, make top and bottom surfaces level, unless otherwise directed.
 7. Thoroughly clean removal areas of loose concrete, dust, and debris.
- D. Reinforcing Bar Preparation: Remove loose and flaking rust from reinforcing bars by abrasive blast cleaning until only tightly bonded light rust remains.
1. Where section loss of reinforcing bar is more than 25%, or 20% in 2 or more adjacent bars, cut bars and remove and replace as directed by MBTA. Remove additional concrete as necessary to provide at least 3/4-inch clearance at existing and replacement bars. Splice replacement bars to existing bars according to ACI 318, by lapping, welding, or using mechanical couplings.
- E. Surface Preparation for Corrosion-Inhibiting Treatment: Clean concrete by low-pressure water cleaning, detergent scrubbing or sand blasting to remove dirt, oils, films, and other materials detrimental to treatment application. Allow surface to dry before applying corrosion-inhibiting treatment.

3.3 APPLICATION

- A. General: Comply with manufacturer's written instructions and recommendations for application of products, including surface preparation.
- B. Epoxy-Modified, Cementitious Bonding and Anticorrosion Agent: Apply to reinforcing bars and concrete by stiff brush or hopper spray according to manufacturer's written instructions. Apply to reinforcing bars in two coats, allowing first coat to dry two to three hours before applying second coat. Allow to dry before placing patching mortar or concrete.
- C. Epoxy Bonding Agent: Apply to reinforcing bars and concrete by brush, roller, or spray according to manufacturer's written instructions, leaving no pinholes or other uncoated areas. Apply to reinforcing bars in at least two coats, allowing first coat to dry before applying second coat. Apply patching mortar or concrete while epoxy is still tacky. If epoxy dries, recoat before placing patching mortar or concrete.
- D. Latex Bonding Agent, Type II: Mix with Portland Cement and scrub into concrete surface according to manufacturer's written instructions. Apply patching mortar or concrete while bonding agent is still wet. If bonding agent dries, recoat before placing patching mortar or concrete.
- E. Latex Bonding Agent, Type I: Apply to concrete by brush roller or spray. Allow to dry before placing patching mortar or concrete.
- F. Mortar Scrub-Coat: Dampen repair area and surrounding concrete 6 inches beyond repair area. Remove standing water and apply scrub-coat with a brush, scrubbing it into surface and thoroughly coating repair area. If scrub-coat dries, recoat before applying patching mortar or concrete.
- G. Patching Mortar: Unless otherwise recommended by manufacturer, apply as follows:
1. Wet substrate thoroughly and then remove standing water. Scrub a slurry of neat patching mortar mixed with latex bonding agent into substrate, filling pores and voids.

2. Place patching mortar by troweling toward edges of patch to force intimate contact with edge surfaces. For large patches, fill edges first and then work toward center, always troweling toward edges of patch. At fully exposed reinforcing bars, force patching mortar to fill space behind bars by compacting with trowel from sides of bars.
 3. For vertical patching, place material in lifts of not more than 2 inches nor less than 1/8inch. Do not feather edge.
 4. For overhead patching, place material in lifts of not more than 1-1/2 inches nor less than 1/8 inch. Do not feather edge.
 5. After each lift is placed, consolidate material and screed surface.
 6. Where multiple lifts are used, score surface of lifts to provide a rough surface for application of subsequent lifts. Allow each lift to reach final set before placing subsequent lifts.
 7. Allow surfaces of lifts that are to remain exposed to become firm and then finish to a smooth surface with a broom or burlap drag.
 8. Wet-cure cementitious patching materials, including polymer-modified, cementitious patching materials, for not less than seven days by water-fog spray or water-saturated absorptive cover.
- H. Dry-Pack Mortar: Use for deep cavities and where indicated. Unless otherwise recommended by manufacturer, apply as follows:
1. Provide forms where necessary to confine patch to required shape.
 2. Wet substrate and forms thoroughly and then remove standing water.
 3. Place dry-pack mortar into cavity by hand, and compact into place with a hardwood drive stick and mallet or hammer. Do not place more material at a time than can be properly compacted.
Continue placing and compacting until patch is approximately level with surrounding surface.
 4. After cavity is filled and patch is compacted, trowel surface to match profile and finish of surrounding concrete. A thin coat of patching mortar may be troweled into the surface of patch to help obtain required finish.
 5. Wet-cure patch for not less than seven days by water-fog spray or water-saturated absorptive cover.
- I. Concrete: Place according to Division 3 Section 03300 "CAST-IN-PLACE CONCRETE" and as follows:
1. Apply bonding agent to reinforcement and concrete substrate.
 2. Use vibrators to consolidate concrete as it is placed.
 3. At unformed surfaces, screed concrete to produce a surface that when finished with patching mortar will match required profile and surrounding concrete.
 4. Where indicated place concrete by form and pump method.
 - a. Design and construct forms to resist pumping pressure in addition to weight of wet concrete. Seal joints and seams in forms and junctions of forms with existing concrete.
 - b. Pump concrete into place, releasing air from forms as concrete is introduced. When formed space is full, close air vents and pressurize to 14 psi.
 5. Wet-cure concrete for not less than seven days by leaving forms in place or keeping surfaces

continuously wet by water-fog spray or water-saturated absorptive cover.

6. Fill placement cavities with dry-pack mortar and repair voids with patching mortar. Finish to match surrounding concrete.
- J. Shotcrete: Place according to Division 3 Section 03371 "SHOTCRETE" and as follows:
1. Apply bonding agent to reinforcement and concrete substrate.
 2. Screed and finish shotcrete to produce a surface matching required profile and surrounding concrete.
- K. Grouted Preplaced Aggregate Concrete: Use for column and wall repairs. Place as follows:
1. Design and construct forms to resist pumping pressure in addition to weight of wet grout. Seal joints and seams in forms and junctions of forms with existing concrete.
 2. Apply bonding agent to reinforcement and concrete substrate.
 3. Place aggregate in forms, consolidating aggregate as it is placed. Pack aggregate into upper areas of forms to achieve intimate contact with concrete surfaces.
 4. Fill forms with water to thoroughly dampen aggregate and substrates. Drain water from forms before placing grout.
 5. Pump grout into place at bottom of preplaced aggregate, forcing grout upward. Release air from forms at top as grout is introduced. When formed space is full and grout flows from air vents, close vents and pressurize to 14 psi.
 6. Wet-cure concrete for not less than seven days by leaving forms in place or keeping surfaces continuously wet by water-fog spray or water-saturated absorptive cover.
 7. Repair voids with patching mortar and finish to match surrounding concrete.
- L. Epoxy Crack Injection: Comply with manufacturer's written instructions and the following:
1. Clean areas to receive capping adhesive of oil, dirt, and other substances that would interfere with bond, and clean cracks with oil-free compressed air or low-pressure water to remove loose particles.
 2. Place injection ports as recommended by epoxy manufacturer, spacing no farther apart than thickness of member being injected. Seal injection ports in place with capping adhesive.
 3. Seal cracks at exposed surfaces with a ribbon of capping adhesive at least 1/4 inch thick by 1 inch wider than crack.
 4. Inject cracks wider than 0.003 inch to a depth of 8 inches or to a width of less than 0.003 inch, whichever is less.
 5. Inject epoxy adhesive, beginning at widest part of crack and working toward narrower parts. Inject adhesive into ports to refusal, capping adjacent ports when they extrude epoxy. Cap injected ports and inject through adjacent ports until crack is filled.
 6. After epoxy adhesive has set, remove injection ports and grind surfaces smooth.
- M. Corrosion-Inhibiting Treatment: Apply by brush, roller, or airless spray in two coats at manufacturer's recommended application rate. Remove film of excess treatment by high-pressure washing before patching treated concrete.

3.4 FIELD QUALITY CONTROL

- A. Testing Agency: Design-Builder shall engage a qualified testing agency to sample materials and perform tests as follows:
1. Patching Mortar, Packaged Mixes: Randomly selected samples tested according to ASTM C 928.
 2. Concrete: As specified in Division 3 Section "CAST-IN-PLACE CONCRETE".
 3. Shotcrete: As specified in Division 3 Section "SHOTCRETE".
 4. Grouted Preplaced Aggregate: Tested for compressive strength of grout according to ASTM C 942.
 - a. Testing Frequency: One sample for each 25 cu. yd. of grout or fraction thereof, but not less than one sample for each day's work.
 5. Joint Filler: Core drilled samples to verify proper installation.
 - a. Testing Frequency: One sample for each 100 feet of joint filled.
 - b. Where samples are taken, fill holes with joint filler.
 6. Epoxy Crack Injection: Core drilled samples to verify proper installation.
 - a. Testing Frequency: 3 samples from mockup and 1 sample for each 100 feet of crack injected.
 - b. Where samples are taken, fill holes with epoxy mortar.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 04800

MASONRY

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
1. Concrete masonry units.
 2. Architectural Precast Concrete Trim units.
 3. Mortar and grout.
 4. Reinforcing steel, masonry joint reinforcement, ties and anchors
 5. Masonry-cell insulation.
 6. Furnish dovetail slots for masonry anchors to concrete trade for installation.
 7. Installation of items furnished by others for installation in masonry including but not limited to lintels, miscellaneous metal and iron sleeves, anchors and plate to be built into masonry walls, through-wall flashings, built-in flashings, anchors and inserts for signage, elevator rail bracket inserts, access doors in masonry openings, grilles in interior masonry walls, pipe and duct sleeves for placement into masonry openings.
- B. Related Work:
1. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 2. Section 07920 - JOINT SEALANTS; sealing control and expansion joints in unit masonry.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For the following:
1. Masonry Units: Show sizes, profiles, coursing, and locations of special shapes.
 2. Precast Concrete Trim Units: Show sizes, profiles, and locations of each trim unit required.
 3. Reinforcing Steel: Detail bending and placement of unit masonry reinforcing bars. Comply with ACI 315, "Details and Detailing of Concrete Reinforcement."
- C. Samples for Verification: For each type and color of the following:
1. Exposed concrete masonry units.
 2. Precast Concrete Trim Units
 3. Pigmented mortar. Make Samples using same sand and mortar ingredients to be used on Project. Label Samples to indicate types and amounts of pigments used.
 4. Weep holes/vents.
 5. Accessories embedded in masonry.
- D. Qualification Data: For testing agency.

- E. Material Certificates: Include statements of material properties indicating compliance with requirements including compliance with standards and type designations within standards. Provide for each type and size of the following:
 - 1. Masonry units.
 - a. Include material test reports substantiating compliance with requirements.
 - b. For masonry units used in structural masonry, include data and calculations establishing average net-area compressive strength of units.
 - 2. Cementitious materials. Include brand, type, and name of manufacturer.
 - 3. Preblended, dry mortar mixes. Include description of type and proportions of ingredients.
 - 4. Grout mixes. Include description of type and proportions of ingredients.
 - 5. Reinforcing bars.
 - 6. Joint reinforcement.
 - 7. Anchors, ties, and metal accessories.
- F. Mix Designs: For each type of mortar and grout. Include description of type and proportions of ingredients.
 - 1. Include test reports, per ASTM C 780 for mortar mixes required to comply with property specification.
 - 2. Include test reports, per ASTM C 1019 for grout mixes required to comply with compressive strength requirement.
- G. Tests Results: For each type of test including mortar, grout and prism tests, for approval by the Engineer.
- H. Cold-Weather Procedures: Detailed description of methods, materials, and equipment to be used to comply with cold-weather requirements.
- I. UL Certificate of Compliance for fire rated concrete masonry units.

1.3 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent agency qualified according to ASTM C 1093 for testing indicated, as documented according to ASTM E 548.
- B. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, through one source from a single manufacturer for each product required.
- C. Source Limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from a single manufacturer for each cementitious component and from one source or producer for each aggregate.
- D. Preconstruction Testing Service: The Contractor will engage a qualified independent testing agency to perform preconstruction testing indicated below. Payment for these services will be made by the

Contractor. Retesting of materials that fail to meet specified requirements shall be done at Contractor's expense.

1. Prism Test: For each type of construction required, per ASTM C 1314; strength as specified.
- E. Fire-Resistance Ratings: Where indicated, provide materials and construction identical to those of assemblies with fire-resistance ratings determined per ASTM E 119 by a testing and inspecting agency, by equivalent concrete masonry thickness, or by other means, as acceptable to authorities having jurisdiction. All fire rated Concrete Masonry Units shall meet the requirements of UL-618, Standards of Concrete Masonry Units. Concrete Masonry Units to be used for the construction of 2-Hour, 3-Hour and 4-Hour Fire Rated Walls shall be clearly marked by manufacturer. The manufacturer shall clearly mark all concrete masonry units in each cube with the appropriated UL designation of 2-Hour, 3-Hour or 4-Hour.
- F. Hold Point - Sample Panels: Build sample panels to verify selections made under sample submittals and to demonstrate aesthetic effects.
1. Build sample panels for typical exterior and interior walls in sizes approximately 48 inches long by 48 inches high by full thickness.
 2. Clean one-half of exposed faces of panels with masonry cleaner indicated.
 3. Protect approved sample panels from the elements with weather-resistant membrane.
 4. Approval of sample panels is for color, texture, and blending of masonry units; relationship of mortar and sealant colors to masonry unit colors; tooling of joints; aesthetic qualities of workmanship; and other material and construction qualities specifically approved by Architect in writing.
 - a. Approval of sample panels does not constitute approval of deviations from the Contract Documents contained in sample panels unless such deviations are specifically approved by Architect in writing.
 - b. The standard for the work during construction shall be the same as demonstrated on approved panels.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Store masonry units on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied. If units become wet, do not install until they are dry.
- B. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.
- C. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.
- D. Deliver preblended, dry mortar mix in moisture-resistant containers designed for lifting and emptying into dispensing silo. Store preblended, dry mortar mix in delivery containers on elevated platforms, under cover, and in a dry location or in a metal dispensing silo with weatherproof cover.
- E. Store masonry accessories, including metal items, to prevent corrosion and accumulation of dirt

1.5 PROJECT CONDITIONS

- A. Protection of Masonry: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.
1. Extend cover a minimum of 24 inches down both sides and hold cover securely in place.
 2. Where 1 wythe of multiwythe masonry walls is completed in advance of other wythes, secure cover a minimum of 24 inches down face next to unconstructed wythe and hold cover in place.
- B. Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least 3 days after building masonry walls or columns.
- C. Stain Prevention: Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Immediately remove grout, mortar, and soil that come in contact with such masonry.
1. Protect base of walls from rain-splashed mud and from mortar splatter by spreading coverings on ground and over wall surface.
 2. Protect sills, ledges, and projections from mortar droppings.
 3. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes, from mortar droppings.
 4. Turn scaffold boards near the wall on edge at the end of each day to prevent rain from splashing mortar and dirt onto completed masonry.
- D. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost or by freezing conditions. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.
1. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F and above and will remain so until masonry has dried, but not less than 7 days after completing cleaning.
- E. Hot-Weather Requirements: Comply with hot-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.

PART 2 -PRODUCTS

2.1 CONCRETE MASONRY UNITS (CMUs)

- A. Concrete Masonry Units: ASTM C 90, normal weight unless indicated otherwise manufactured to dimensions 3/8 inch less than nominal dimensions.
- B. Shapes: Provide standard shapes indicated and as required for building configuration. Provide special shapes for lintels, corners, jambs, sashes, movement joints, headers, bonding, and other special conditions.

1. Integral Water Repellent: Provide units made with integral water repellent for units exposed to the exterior Integral Water Repellent: Liquid polymeric, integral water-repellent admixture that does not reduce flexural bond strength. Units made with integral water repellent, when tested as a wall assembly made with mortar containing integral water-repellent manufacturer's mortar additive according to ASTM E 514, with test period extended to 24 hours, show no visible water or leaks on the back of test specimen. Available products include:
 - a. Addiment Incorporated; Block Plus W-10.
 - b. Grace Construction Products, a unit of W. R. Grace & Co. - Conn.; Dry-Block.
 - c. Master Builders, Inc.; Rheopel.
 - d. Or approved equal.
- C. Decorative CMUs: ASTM C 90, normal weight.
1. Pattern and Texture:
 - a. Standard pattern, polished ground-face finish.
 2. Colors: As selected by Architect from manufacturer's full range.

2.2 PRECAST CONCRETE TRIM UNITS

- A. Precast concrete trim locations include but are not limited to:
1. at masonry construction exterior walls: window sills, base course and parapet caps
 2. at elevator hoistways: curbs
- B. Aggregate: ASTM C33, fine and coarse, type of stone selected to achieve desired finish and texture.
- C. Reinforcement: ASTM C615, Grade 40 or 60, new billet steel bars with min. 2 in. cover when placed.
- D. Cast with suitable wash on exposed top surfaces, raised fillet at back of sills, drips on lower outer edge of projecting pieces.
- E. Tests: ACI 704 for average 3 specimens per test.
- F. Compressive Strength: Min. 2500 psi.
- G. Anchors: Type 302 or 304 stainless-steel.

2.3 MORTAR AND GROUT MATERIALS

- A. Portland Cement: ASTM C 150, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce mortar color indicated.
- B. Hydrated Lime: ASTM C 207, Type S.
- C. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes. Use only pigments with a record of satisfactory performance in masonry mortar.

1. Available Products:
 - a. Bayer Corporation, Industrial Chemicals Div.; Bayferrox Iron Oxide Pigments.
 - b. Davis Colors; True Tone Mortar Colors.
 - c. Solomon Grind-Chem Services, Inc.; SGS Mortar Colors.
 - d. Or approved equal.
- D. Aggregate for Mortar: ASTM C 144. For mortar that is exposed to view, use washed aggregate consisting of natural sand or crushed stone.
- E. Aggregate for Grout: ASTM C 404.
- F. Water: Potable.

2.4 REINFORCEMENT

- A. Uncoated Steel Reinforcing Bars: ASTM A 615/A 615M or ASTM A 996/A 996M, Grade 60.
- B. Masonry Joint Reinforcement, General: ASTM A 951.
 1. Interior Walls: Mill-galvanized, carbon steel.
 2. Exterior Walls: Hot-dip galvanized, carbon steel.
 3. Wire Size and Spacing: As required by Code.
 4. Provide in lengths of not less than 10 feet, with prefabricated corner and tee units.
- C. Masonry Joint Reinforcement for Multiwythe Masonry:
 1. Ladder type with 1 side rod at each face shell of hollow masonry units more than 4 inches in width, plus 1 side rod at each wythe of masonry 4 inches or less in width.

2.5 TIES AND ANCHORS

- A. Materials: Provide ties and anchors specified in subsequent paragraphs that are made from materials that comply with subparagraphs below, unless otherwise indicated.
 1. Mill-Galvanized, Carbon-Steel Wire: ASTM A 82; with ASTM A 641/A 641M, Class 1 coating.
 2. Hot-Dip Galvanized, Carbon-Steel Wire: ASTM A 82; with ASTM A 153/A 153M, Class B-2 coating.
 3. Stainless-Steel Wire: ASTM A 580/A 580M, Type 316.
 4. Galvanized Steel Sheet: ASTM A 653/A 653M, Commercial Steel, G60 zinc coating.
 5. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
- B. Stainless Steel bars: ASTM A 276 or ASTM A 666, Type 304.

- C. Adjustable Anchors for Connecting to Structure: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.
 - 1. Anchor Section for Welding to Steel Frame: Crimped 1/4-inch-diameter, hot-dip galvanized steel. Mill-galvanized wire may be used at interior walls, unless otherwise indicated.
- D. Partition Top Anchors: 0.097-inch-thick metal plate with 3/8-inch-diameter metal rod 6 inches long welded to plate and with closed-end plastic tube fitted over rod that allows rod to move in and out of tube. Fabricate from steel, hot-dip galvanized after fabrication.
- E. Adjustable Masonry-Veneer Anchors:
 - 1. General: Provide anchors that allow vertical adjustment but resist tension and compression forces perpendicular to plane of wall, for attachment over sheathing to wood or metal studs, with structural performance capable of withstanding a 100-lb of load in both tension and compression without deforming or developing play in excess of 0.05 inch. Flat metal anchors are not acceptable.
 - 2. Contractor's Option: Unless otherwise indicated, provide any of the following types of anchors.
 - 3. Screw-Attached, Masonry-Veneer Anchors: Units consisting of a wire tie and a metal anchor section.
 - a. Anchor Section: Zinc-alloy barrel section with flanged head with eye and corrosion-resistant, self-drilling screw. Eye designed to receive wire tie and to serve as head for drilling fastener into framing. Barrel length to suit sheathing thickness, allowing screw to seat directly against framing with flanged head covering hole in sheathing.
 - b. Wire Ties: Triangular-, rectangular-, or T-shaped wire ties fabricated from 0.188-inch-diameter, hot-dip galvanized steel wire.

2.6 MISCELLANEOUS ANCHORS

- A. Anchor Bolts: L-shaped steel bolts complying with ASTM A 307, Grade A; with ASTM A 563 hex nuts and, where indicated, flat washers; hot-dip galvanized to comply with ASTM A 153/A 153M, Class C; of dimensions indicated.

2.7 EMBEDDED FLASHING MATERIALS

- A. Metal Flashings: Furnished under Section 07620.

2.8 MISCELLANEOUS MASONRY ACCESSORIES

- A. Compressible Filler: Premolded filler strips complying with ASTM D 1056, Grade 2A1; compressible up to 35 percent; of width and thickness indicated; formulated from neoprene.
- B. Preformed Control-Joint Gaskets: Made from styrene-butadiene-rubber compound, complying with ASTM D 2000, Designation M2AA-805 designed to fit standard sash block and to maintain lateral stability in masonry wall; size and configuration as indicated.
- C. Bond-Breaker Strips: Asphalt-saturated, organic roofing felt complying with ASTM D 226, Type I (No. 15 asphalt felt).
- D. Weep/Vent Products: Free-draining mesh; made from polyethylene strands, full height and width of

head joint and depth 1/8 inch less than depth of outer wythe; in color selected from manufacturer's standard.

- E. Cavity Drainage Material: Free-draining mesh, made from polymer strands that will not degrade within the wall cavity. Provide strips, full-depth of cavity and 10 inches wide, with dovetail shaped notches 7 inches deep that prevent mesh from being clogged with mortar droppings or equivalent. Available products:

1. Advanced Building Products Inc.; Mortar Break II.
2. Archovations, Inc.; CavClear Masonry Mat.
3. Dayton Superior Corporation, Dur-O-Wal Division; Polytite MortarStop.
4. Mortar Net USA, Ltd.; Mortar Net.
5. Or approved equal.

2.9 MASONRY CLEANERS

- A. Proprietary Acidic Cleaner: Manufacturer's standard-strength cleaner designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry without discoloring or damaging masonry surfaces. Use product expressly approved for intended use by cleaner manufacturer and manufacturer of masonry units being cleaned.

1. Available Manufacturers:
 - a. Diedrich Technologies, Inc.
 - b. EaCo Chem, Inc.
 - c. ProSoCo, Inc.
 - d. Or approved equal.

2.10 MORTAR AND GROUT MIXES

- A. General: Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.

1. Do not use calcium chloride in mortar or grout.
2. Limit cementitious materials in mortar to Portland cement [mortar cement] and lime.

- B. Mortar for Unit Masonry: Comply with ASTM C 270, Proportion Specification. Provide the following types of mortar for applications stated unless another type is indicated or needed to provide required compressive strength of masonry.

1. For masonry below grade or in contact with earth, use Type M, minimum strength 2,500 psi.
2. For reinforced masonry and all glass block, use Type S, minimum strength 1,800 psi.
3. For exterior, above-grade, load-bearing and non-load-bearing walls and parapet walls; for interior load-bearing walls; for interior non-load-bearing partitions; and for other applications where another type is not indicated, use Type N, minimum strength 75 psi.

- C. Pigmented Mortar: Use colored cement product. Pigments shall not exceed 10 percent of Portland cement by weight.
- D. Grout for Unit Masonry: Comply with ASTM C 476.
 - 1. Use grout of type indicated or, if not otherwise indicated, of type (fine or coarse) that will comply with Table 1.15.1 in ACI 530.1/ASCE 6/TMS 602 for dimensions of grout spaces and pour height.
 - 2. Provide grout with a slump of 8 to 11 inches as measured according to ASTM C 143/C 143M.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
 - 1. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
 - 2. Verify that foundations are within tolerances specified.
- B. Before installation, examine rough-in and built-in construction for piping systems to verify actual locations of piping connections.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

- A. Thickness: Build cavity and composite walls and other masonry construction to full thickness shown. Build single-wythe walls to actual widths of masonry units, using units of widths indicated.
- B. Build chases and recesses to accommodate items specified in this and other Sections.
- C. Leave openings for equipment to be installed before completing masonry. After installing equipment, complete masonry to match the construction immediately adjacent to opening.
- D. Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed. Do not use units cut to less than one-half size.
- E. Do not install concrete masonry units with more than 5 percent damage to the face.
- F. Select and arrange units for exposed unit masonry to produce a uniform blend of colors and textures. Mix units from several pallets or cubes as they are placed.
- G. Comply with construction tolerances in ACI 530.1/ASCE 6/TMS 602 and with the following:
 - 1. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion

and control joints, do not vary from plumb by more than 1/8 inch in 10 feet, 1/4 inch in 20 feet, and 1/2 inch maximum over entire height.

2. For vertical alignment of exposed head joints, do not vary from plumb by more than 1/4 inch in 10 feet, and 1/2 inch maximum over entire height.
 3. For conspicuous horizontal lines, such as lintels, sills, parapets, and reveals, do not vary from level by more than 1/8 inch in 10 feet, 1/4 inch in 20 feet, and 1/2 inch maximum over entire length.
 4. For exposed bed joints, do not vary from thickness indicated by more than plus or minus 1/8 inch, with a maximum thickness limited to 1/2 inch. Do not vary from bed-joint thickness of adjacent courses by more than 1/8 inch.
 5. For exposed head joints, do not vary from thickness indicated by more than plus or minus 1/8 inch. Do not vary from adjacent bed-joint and head-joint thicknesses by more than 1/8 inch.
 6. For faces of adjacent exposed masonry units, do not vary from flush alignment by more than 1/16 inch except due to warpage of masonry units within tolerances specified for warpage of units.
- H. Do not retemper mortar.
- I. Masonry Cell Insulation: Loose-fill Perlite complying with ASTM C 549, Type II (surface treated for water repellency and limited moisture absorption) or Type IV (surface treated for water repellency and to limit dust generation)

3.3 LAYING MASONRY WALLS

- A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.
- B. Bond Pattern for Exposed Masonry: Unless otherwise indicated, lay exposed masonry in bond pattern indicated on Drawings; do not use units with less than nominal 4-inch horizontal face dimensions at corners or jambs. Prior to installation review bond pattern with Engineer.
- C. Stopping and Resuming Work: Stop work by racking back units in each course from those in course below; do not tooth. When resuming work, clean masonry surfaces that are to receive mortar, remove loose masonry units and mortar, and wet brick if required before laying fresh masonry.
- D. Built-in Work: As construction progresses, build in items specified in this and other Sections. Fill in solidly with masonry around built-in items.
- E. Fill space between steel frames and masonry solidly with mortar, unless otherwise indicated.
- F. Fill cores in hollow concrete masonry units with grout 24 inches under bearing plates, beams, lintels, posts, and similar items, unless otherwise indicated.
- G. Build non-load-bearing interior partitions full height of story to underside of solid floor or roof structure above, unless otherwise indicated.

1. Install compressible filler in joint between top of partition and underside of structure above.
2. Fasten partition top anchors to structure above and build into top of partition. Grout cells of CMUs solidly around plastic tubes of anchors and push tubes down into grout to provide 1/2-inch clearance between end of anchor rod and end of tube. Space anchors 48 inches o.c., unless otherwise indicated.
3. Wedge non-load-bearing partitions against structure above with small pieces of tile, slate, or metal. Fill joint with mortar after dead-load deflection of structure above approaches final position.
4. At fire-rated partitions, treat joint between top of partition and underside of structure above to comply with Division 7 Section "Firestopping".

3.4 MORTAR BEDDING AND JOINTING

- A. Lay hollow concrete masonry units as follows:
 1. With face shells fully bedded in mortar and with head joints of depth equal to bed joints.
 2. With webs fully bedded in mortar in all courses of piers, columns, and pilasters.
 3. With webs fully bedded in mortar in grouted masonry, including starting course on footings.
 4. With entire units, including areas under cells, fully bedded in mortar at starting course on footings where cells are not grouted.
- B. Lay solid masonry units with completely filled bed and head joints; butter ends with sufficient mortar to fill head joints and shove into place. Do not deeply furrow bed joints or slush head joints.
- C. Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness, unless otherwise indicated.
 1. At repurposed granite ashlar veneer retaining walls, horizontal joints shall be racked and vertical joints shall be flush.
- D. Cut joints flush for masonry walls to receive plaster or other direct-applied finishes (other than paint), unless otherwise indicated.

3.5 INSTALLING GLASS BLOCK WITH MORTAR

- A. Apply a heavy coat of asphalt emulsion to sill and adhere expansion strips to jambs and heads with asphalt emulsion. Allow asphalt emulsion to dry before placing mortar. Trim expansion strips to width required to fit glass block and to full lengths of heads and jambs.
- B. Set glass block with completely filled bed and head joints, with no furrowing, accurately spaced and coordinated with other construction. Maintain 1/4-inch exposed joint widths unless otherwise indicated.
- C. Install panel reinforcement in horizontal joints at spacing indicated and continuously from end to end of panels; comply with the following requirements:
 1. Vertical Spacing of Panel Reinforcement for Exterior Panels: Every other course but not more than 16 inches o.c., starting with first course above sill.
 2. Vertical Spacing of Panel Reinforcement for Interior Panels: Not more than 16 inches o.c.
 3. Do not bridge expansion joints with panel reinforcement.

4. Place panel reinforcement in joints immediately above and below all openings within glass unit masonry assemblies.
 5. Lap panel reinforcement not less than 6 inches if more than one length is necessary.
 6. Embed panel reinforcement in mortar bed by placing lower half of mortar bed first, pressing panel reinforcement into place and covering with upper half of mortar bed.
- D. Install panel anchors at locations indicated and in same horizontal joints where panel reinforcement occurs. Extend panel anchors at least 12 inches into joints, and bend within expansion joints at edges of panels and across the head. Attach panel anchors as indicated.
1. For in-place unit masonry assemblies and concrete, attach panel anchors with 1/4-inch- diameter bolt-size, postinstalled anchors, two per panel anchor.
- E. Use rubber mallet to tap units into position. Do not use steel tools, and do not allow units to come into contact with metal accessories and frames.
- F. Use plastic spacers or temporary wedges in mortar joints to produce uniform joint widths and to prevent mortar from being squeezed out of joints.
- G. Keep expansion joints free of mortar.
- H. Rake out joints indicated to be pointed to a uniform depth sufficient to accommodate pointing material, but not less than joint width.
1. Point joints at both faces of exterior panels with mortar.
- I. Point joints with mortar by filling raked joints and voids. Place and compact pointing mortar in layers not more than 3/8 inch thick. Compact each layer thoroughly and allow to become thumbprint hard before applying next layer.
1. Tool exposed joints slightly concave when pointing mortar is thumbprint hard. Use a smooth plastic jointer larger than joint width.
- J. Install sealant at jambs, heads, mullions and other locations indicated. Prepare joints, including installation of primer and bond-breaker tape or cylindrical sealant backing, and apply elastomeric sealants to comply with requirements in Section 07920 - JOINT SEALANTS.
- K. Construction Tolerances: Set glass block to comply with the following tolerances:
1. Variation from Plumb: For vertical lines and surfaces, do not exceed 1/4 inch in 10 feet or more.
 2. Variation from Level: For bed joints, and other conspicuous lines, do not exceed 1/8 inch in 10 feet, or more.
 3. Variation of Location in Plan: For location of elements in plan do not vary from that indicated by more than plus or minus 1/4 inch.
 4. Variation in Mortar-Joint Thickness: Do not vary from joint thickness indicated by more than plus or minus 1/16 inch.
 5. For faces of adjacent exposed units, do not vary from flush alignment by more than 1/16 inch.

3.6 CAVITY WALLS

- A. Bond wythes of cavity walls together using one of the following methods:
 - 1. Masonry Joint Reinforcement: Installed in horizontal mortar joints. Where one wythe is of clay masonry and the other of concrete masonry, use adjustable (two-piece) type reinforcement with continuous horizontal wire in facing wythe attached to ties to allow for differential movement regardless of whether bed joints align.
 - 2. Masonry Veneer Anchors: Comply with requirements for anchoring masonry veneers.
- B. Bond wythes of cavity walls together using bonding system indicated on Drawings.
- C. Keep cavities clean of mortar droppings and other materials during construction. Bevel beds away from cavity, to minimize mortar protrusions into cavity. Do not attempt to trowel or remove mortar fins protruding into cavity.
- D. Coordinate and allow access for air and vapor barrier membrane and insulation installed in cavity under Section 07190 - Air and Vapor Barrier System.

3.7 MASONRY JOINT REINFORCEMENT

- A. General: Install entire length of longitudinal side rods in mortar with a minimum cover of 5/8 inch on exterior side of walls, 1/2 inch elsewhere. Lap reinforcement a minimum of 6 inches. Space reinforcement not more than 16 inches o.c.
- B. Interrupt joint reinforcement at control and expansion joints, unless otherwise indicated.
- C. Provide continuity at wall intersections by using prefabricated T-shaped units.
- D. Provide continuity at corners by using prefabricated L-shaped units.

3.8 ANCHORING MASONRY TO STRUCTURAL MEMBERS

- A. Anchor masonry to structural members where masonry abuts or faces structural members to comply with the following:
 - 1. Provide an open space not less than 1 inch in width between masonry and structural member, unless otherwise indicated. Keep open space free of mortar and other rigid materials.
 - 2. Anchor masonry to structural members with anchors embedded in masonry joints and attached to structure.
 - 3. Space anchors as indicated, but not more than 24 inches o.c. vertically and 36 inches o.c. horizontally.

3.9 ANCHORING MASONRY VENEERS

- A. Anchor masonry veneers with masonry-veneer anchors to comply with the following requirements:
 - 1. Fasten screw-attached anchors through insulation and sheathing to wall framing and to concrete and masonry backup as applicable with metal fasteners of type indicated.
 - 2. Embed tie sections in masonry joints. Provide air space indicated on the Drawings between back of masonry veneer and face of insulation.

3. Locate anchor sections to allow maximum vertical differential movement of ties up and down.
4. Space anchors as required by Code.

3.10 CONTROL AND EXPANSION JOINTS

- A. General: Install control and expansion joint materials in unit masonry as masonry progresses. Do not allow materials to span control and expansion joints without provision to allow for in-plane wall or partition movement.
- B. Form control joints in concrete masonry using one of the following methods:
 1. Fit bond-breaker strips into hollow contour in ends of concrete masonry units on one side of control joint. Fill resultant core with grout and rake out joints in exposed faces for application of sealant.
 2. Install preformed control-joint gaskets designed to fit standard sash block.
 3. Install interlocking units designed for control joints. Install bond-breaker strips at joint. Keep head joints free and clear of mortar or rake out joint for application of sealant.
 4. Install temporary foam-plastic filler in head joints and remove filler when unit masonry is complete for application of sealant.
- C. Provide horizontal, pressure-relieving joints by either leaving an air space or inserting a compressible filler of width required for installing sealant and backer rod specified in Division 7 Section "Joint Sealants", but not less than 3/8 inch.
 1. Locate horizontal, pressure-relieving joints beneath shelf angles supporting masonry.

3.11 LINTELS

- A. Install steel lintels where indicated.
- B. Lintels shall comply with the Specification.
- C. Provide minimum bearing of 8 inches at each jamb, unless otherwise indicated.

3.12 FLASHING, WEEP HOLES, CAVITY DRAINAGE, AND VENTS

- A. General: Install embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to downward flow of water in wall, and where indicated.
- B. Install flashing as follows, unless otherwise indicated:
 1. Prepare masonry surfaces so they are smooth and free from projections that could puncture flashing. Where flashing is within mortar joint, place through-wall flashing on sloping bed of mortar and cover with mortar. Before covering with mortar, seal penetrations in flashing with adhesive, sealant, or tape as recommended by flashing manufacturer.
 2. At multiwythe masonry walls, including cavity walls, extend flashing through outer Wythe, turned up a minimum of 8 inches, and 1-1/2 inches into the inner wythe. Form 1/4-inch hook in edge of flashing embedded in inner wythe.

3. At masonry-veneer walls, extend flashing through veneer, across air space behind veneer, and up face of sheathing at least 8 inches; with upper edge covered with elastomeric membrane, lapping at least 4 inches.
 4. At lintels and shelf angles, extend flashing a minimum of 6 inches into masonry at each end. At heads and sills, extend flashing 6 inches at ends and turn up not less than 2 inches to form end dams.
- C. Install reglets and nailers for flashing and other related construction where they are shown to be built into masonry.
- D. Install weep holes in head joints in exterior wythes of first course of masonry immediately above embedded flashing and as follows:
1. Use open head joints to form weep holes.
 2. Space weep holes 24 inches o.c., unless otherwise indicated.
- E. Place cavity drainage material in cavities to comply with configuration requirements for cavity drainage material in Part 2 "Miscellaneous Masonry Accessories" Article.
- F. Install vents in head joints in exterior wythes at spacing indicated.

3.13 MASONRY CELL INSULATION

- A. Pour loose-fill insulation into cavities to fill void spaces. Maintain inspection ports to show presence of fill at extremities of each pour area. Close the ports after filling has been confirmed. Limit the fall of fill to one story high, but not more than 20 feet.

3.14 REINFORCED UNIT MASONRY INSTALLATION

- A. Temporary Formwork and Shores: Construct formwork and shores as needed to support reinforced masonry elements during construction.
1. Construct formwork to provide shape, line, and dimensions of completed masonry as indicated.
Make forms sufficiently tight to prevent leakage of mortar and grout. Brace, tie, and support forms to maintain position and shape during construction and curing of reinforced masonry.
 2. Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and other temporary loads that may be placed on them during construction.
- B. Placing Reinforcement: Comply with requirements in ACI 530.1/ASCE 6/TMS 602.
- C. Grouting: Do not place grout until entire height of masonry to be grouted has attained enough strength to resist grout pressure. Comply with requirements in ACI 530.1/ASCE 6/TMS 602 for cleanouts and for grout placement, including minimum grout space and maximum pour height.

3.15 FIELD QUALITY CONTROL

- A. Inspectors: The Contractor shall engage qualified independent inspectors to perform inspections and prepare reports. Allow inspectors access to scaffolding and work areas, as needed to perform

inspections. Place grout only after inspectors have verified compliance of grout spaces and grades, sizes, and locations of reinforcement.

- B. Testing Agency: The Contractor shall engage a qualified independent testing and inspecting agency to perform field tests and inspections indicated below and prepare test reports. Retesting of materials failing to comply with specified requirements shall be done at Contractor's expense.
- C. Testing Frequency: One set of tests for each 5000 sq. ft. of wall area or portion thereof. Test types as determined by the independent testing and inspection agency.

3.16 REPAIRING, POINTING, AND CLEANING

- A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Install new units to match adjoining units; install in fresh mortar, pointed to eliminate evidence of replacement.
- B. Pointing: During the tooling of joints, enlarge voids and holes, except weep holes, and completely fill with mortar. Point up joints, including corners, openings, and adjacent construction, to provide a neat, uniform appearance. Prepare joints for sealant application, where indicated.
- C. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.
- D. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry as follows:
 - 1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
 - 2. Test cleaning methods on sample wall panel; leave one-half of panel uncleaned for comparison purposes. Obtain Engineer's approval of sample cleaning before proceeding with cleaning of masonry.
 - 3. Protect adjacent stone and nonmasonry surfaces from contact with cleaner by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape.
 - 4. Wet wall surfaces with water before applying cleaners; remove cleaners promptly by rinsing surfaces thoroughly with clear water.
 - 5. Clean concrete masonry by cleaning method indicated in NCMA TEK 8-2A applicable to type of stain on exposed surfaces.

3.17 MASONRY WASTE DISPOSAL

- A. Salvageable Materials: Unless otherwise indicated, excess masonry materials are Contractor's property. At completion of unit masonry work, remove from Project site.
- B. Waste Disposal as Fill Material: Dispose of clean masonry waste, including excess or soil-contaminated sand, waste mortar, and broken masonry units, by crushing and mixing with fill material as fill is placed.
 - 1. Crush masonry waste to less than 4 inches in each dimension.
 - 2. Mix masonry waste with at least two parts of specified fill material for each part of masonry waste. Fill material is specified in Division 2 Section "Earthwork".
 - 3. Do not dispose of masonry waste as fill within 18 inches of finished grade.

- C. Excess Masonry Waste: Remove excess clean masonry waste that cannot be used as fill, as described above, and other masonry waste, and legally dispose of off the Site.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05041

HOT-DIP GALVANIZING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items:
1. Hot-dip galvanizing for all station structural and station miscellaneous steel items shown on the Contract Plans and/or designated in the specification to be galvanized.
 2. Hot-dip galvanizing and painting for all station structural steel and all station galvanized steel items.
- B. Related Work:
1. Section 03300 – CAST-IN-PLACE CONCRETE
 2. Section 05120 – STRUCTURAL STEEL FOR STATIONS AND BUILDINGS
 3. Section 05310 – STEEL DECK
 4. Section 05500 – MISCELLANEOUS METALS
 5. Section 05511 – METAL STAIRS
 6. Section 05700 – DECORATIVE METAL
 7. Section 05720 – METAL RAILINGS AND GATES
 8. Section 09900 – PAINTING for field painting of items that are not hot-dip galvanized.

1.2 QUALITY ASSURANCE

- A. Definitions:
1. Hot-Dip Galvanizing: The dipping of steel members and assemblies into an alloy of molten zinc and nickel for lasting long-term protection.
- B. Reference Standard:
1. American Galvanizers Association Inc. (AGA): Publication entitled "Inspection Of Hot-Dip Galvanized Steel Products."
 2. American Society for Testing and Materials (ASTM):
 - A123 Zinc (Hot Dip Galvanized) Coatings on Products Fabricated from Rolled and Forged Steel Shapes and Hardware
 - A153 Zinc Coating (Hot-Dip) on Iron and Steel Hardware
 - A143 Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and Procedures for Detecting Embrittlement

- A384 Safeguarding Against Warpage and Distortion During Hot-Dip Galvanizing of Steel Assemblies
- A385 Providing High Quality Zinc Coatings (Hot-Dip)
- A767 Standard Spec for Zinc Coating (Hot-Dip) Steel Bars for Concrete Reinforcement
- A780 Repair of Damaged Hot-Dip Galvanized Coating
- D6386 Standard practice for preparation of zinc (hot dip galvanized) coated iron and steel products and hardware surfaces for painting.

- C. Galvanizer shall have a minimum of 15 years experience performing hot dip galvanizing and painting fabricated iron and steel assemblies of similar scope and complexity.
- D. Mock Up: Refer to Specification Section 01420 - Mock-Ups and Section 05120 – Structural Steel.
 - 1. Contractor shall provide galvanized, primed and finish painted steel mockup from galvanizing plant using galvanizing process and painting procedures. Mockup shall contain both a mechanical connection and welded connection to demonstrate in field patch process. Mockup shall be damaged and repaired using galvanizer's repair process and ASTM procedures. The mockup shall require the approval of both the Architect and the Engineer. In regard to the approval of the mock up and for all galvanized finishes, for matters of aesthetics and finishes, the Architect shall have authority. For structural matters, the Engineer shall have final authority. The mockup can be incorporated into the final work with the approval of both the Engineer and Architect.

1.3 SUBMITTAL

A. Certification

- 1. Furnish Notarized Certificate of Compliance with ASTM Standard and specifications herein listed. Each Certificate will be signed by the Galvanizer. The certificate will provide a detailed description of all material. Certification shall state the steel materials that have been coated and that the total coating system is in conformance with these Specifications.
- 2. Submit Manufacturer's literature for zinc-rich repair compound.
- 3. Coordination Drawings: To safeguard against warpage or distortion, Contractor shall furnish, to the galvanizer, steel fabricator's shop drawings of non-standard fabrications, tubular fabrications, fabrications involving any dimension which exceeds the size of the galvanizer's kettle, and fabrications involving materials of different thickness.

1.4 PRE-AWARD INSPECTION

- A. Contractor's galvanizing plant shall be inspected by Architect, Engineer and/or an independent third party inspection service including shop environmental controls, shop layout, equipment and coating procedure to ensure compliance with specifications. The Contractor shall verify by site visit that the galvanizer's coating and painting facility complies with the environmental conditions required by the above performance standards.

1.5 PRE-APPLICATION CONFERENCE

- A. Arrange a pre-construction conference meeting to be attended by interested parties including MBTA, Galvanizer Contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

1.6 GALVANIZER'S STAMP

- A. All galvanized material, shall be marked with a galvanizer's stamp indicating the name of the galvanizer, the weight or thickness of the galvanizing and the applicable ASTM specification numbers. Locate stamp where not visible to public view.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Steel:
 - 1. Steel for Galvanizing: Geometrically suitable for galvanizing as specified in ASTM A384 and A385.
 - 2. Chemical Suitability Galvanizing: Steel should contain carbon below 0.25 percent, phosphorous below 0.05 percent, and manganese below 1.35 percent.
- B. Nickel-Zinc for Galvanizing: Conform to ASTM B6 as specified in ASTM A123, using special high grade zinc, with the addition to the bath of a predetermined amount of nickel, minimum 0.05 percent by weight, to reduce the effect of high silicon steel.
- C. Paint:
 - 1. Polyamide epoxy primer. Sherwin Williams – or approved equal.
 - 2. Finish coat: Hi-Solids Polyurethane. Sherwin Williams – or approved equal. Basis of bid price shall assume a minimum of 15 paint colors to be identified by architect during submittal process.
 - 3. Clear coat: Diamond Clad Polyurethane. Sherwin Williams – or approved equal.

PART 3 - EXECUTION

3.1 GALVANIZING

- A. All metal items shown on the Contract Plans and designated in the specifications shall be hot-dip galvanized after fabrication in accordance with ASTM A123, A153, A767 or A385 as the case may be, to a thickness equivalent to two (2) ounces per square foot minimum.
- B. Safeguard against embrittlement in conformance with ASTM A143.
- C. Warpage or Distortion prevention:

1. To safeguard against warpage or distortion of steel member, in conformance with ASTM A384, Contractor shall submit shop drawings of non-standard fabrications, all tubular fabrications, all fabrications involving at dimension which exceed the size of the galvanizer's kettle, and any fabrication involving materials of different thicknesses.
 2. Engineer shall provide these drawings to the galvanizer before fabrication to determine the suitability of the material for galvanizing.
- D. Galvanize bolts, nuts, washers, iron and steel hardware components in accordance with ASTM A 153.
- E. Fabrication shall include all shop operations such as shearing, punching bending, forming and welding. Units shall be fabricated complete or in the largest practical sections before galvanizing.

3.2 REPAIR OF DAMAGED SURFACES

- A. Repair damaged galvanized surface in accordance with ASTM A780.
- B. Dry Film thickness: Min. 6 mils of organic zinc-rich repair compound.
- C. If steel requires re-priming and painting, steel final finish shall be indistinguishable from surrounding steel, and other similarly finished units. Finish approval by the Architect.

3.3 PAINTING OF GALVANIZED SURFACES

- A. All steel exposed to public view shall be painted except retaining wall soldier pile steel.
- B. Do not quench or apply post galvanizing treatment that may interfere with paint adhesion.
- C. Apply primer, at the galvanizer's plant, within twelve hours of galvanizing.
- D. Prepare all galvanized surfaces to be primed by abrasion, to achieve maximum paint adherence.
1. Deform, but do not remove, the outermost zinc layer.
 2. Prepare HDG for painting, following ASTM D 6386, using either sweep blasting or power tool.
- E. Apply primer.
1. Temperature of the steel to be primed shall be 70 degrees.
 2. Relative humidity of the room used for applying primer shall be 50%.
 3. Primer shall meet or exceed the following performance criteria:
 - a. Abrasion: ASTM D 4060, CS17 wheel, 1000 gram load <200 mg loss.
 - b. Adhesion: ASTM D 4541, 1050 psi.
 - c. Humidity resistance: ASTM D 4585, 2000 hours passes, no cracking or delamination.
 - d. Salt Spray (fog): ASTM B 117, 5600 hours passes, no cracking or delamination.
- F. Apply Finish Coat:
1. Finish coat shall meet or exceed the following performance criteria:
 - a. Abrasion: ASTM D 4060, CS17 Wheel, 1,000 gram load, <87.1 mg loss.

- b. Adhesion: ASTM D 4541, 1050 psi.
- c. Corrosion Weathering: ASTM D 5894, 21 cycles, rating 10 per ASTM D714 for blistering rating 9, per ASTM D610 for rusting.
- d. Surface burning Characteristics: ASTM E 84, Flame Spread Index 0, Smoke Development Index 0.
- e. Salt Spray (Fog): ASTM B 117, 9000 hours rating 10 per ASTM D714 for blistering rating 9, per ASTM D610 for rusting.

G. Apply Clearcoat over finish coat:

- 1. Clearcoat shall meet or exceed the following performance criteria:
 - a. Abrasion: ASTM D 4060, CS17 Wheel, 1,000 gram load <55 mg loss.
 - b. Adhesion: ASTM D 4541, 1050 psi.
 - c. Graffiti Resistance: After drying for seven days, no staining from acrylic, epoxy, epoxyester and alkyd spray paints, ballpoint pen, crayons, magic marker, black shoe polish, and lipstick.
 - d. Corrosion Weathering: ASTM D 5894, 9 cycles, passes, no blistering, cracking, rusting, or delamination..
 - e. Exterior Exposure: 5 years at 45 degrees South, no blistering, cracking, or chalking; 85% gloss retention <4 MacAdam unit color change.
 - f. Salt Spray (Fog): ASTM B 117, 3000 hours passes, no cracking or delamination.
 - g. Flexibility: ASTM D 522, 180 degree bend, 1/8 inch cylindrical mandrel, passes.
 - h. Hardness: ASTM D 3363 (Pencil) HB.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05120

STRUCTURAL STEEL FOR STATIONS AND BUILDINGS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Structural steel.
- B. Items To Be Installed Only: Install the following items as furnished by the designated Sections:
 - 1. Section 04800 - MASONRY: Anchor sections of adjustable masonry anchors for connecting to structural frame.
- C. Items To Be Furnished Only: Furnish the following items for installation by the designated Sections
 - 1. Section 03300 - CAST-IN-PLACE CONCRETE: Lintels, sleeves, anchors, inserts, embedded wall plates, loose leveling plates and similar items.
- D. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 03600 – NON-SHRINK CONSTRUCTION GROUT
 - 3. Section 05041 – HOT DIP GALVANIZING
 - 4. Section 05122 – STRUCTURAL STEEL FOR RAIL STRUCTURES
 - 5. Section 05123 – STRUCTURAL STEEL FOR ROADWAY BRIDGES
 - 6. Section 05210 – STEEL JOISTS
 - 7. Section 05310 – STEEL DECK
 - 8. Section 05500 – MISCELLANEOUS METALS
 - 9. Section 16125 – CATENARY POLES
 - 10. Section 09900 – PAINTING

1.2 DEFINITIONS

- A. Structural Steel: Elements of structural-steel frame, as classified by AISC's "Code of Standard Practice for Steel Buildings and Bridges", that support design loads.
- B. Exposed Steel: All steel exposed to view or within public spaces. Steel hidden by ceilings within public spaces is not considered exposed steel.

1.3 PERFORMANCE REQUIREMENTS

- A. Connections: Provide details of connections required by the Contract Documents to be selected or completed by the structural-steel fabricator to withstand loads indicated and comply with other information and restrictions indicated.

1. Select and complete connections using the American Institute of Steel Construction's (AISC) "Manual of Steel Construction, Load and Resistance Factor Design", Part 9.
2. Engineering Responsibility: Fabricator's responsibilities include using a qualified Professional Engineer registered in the Commonwealth of Massachusetts to prepare structural analysis data for structural-steel connections.
3. All field connections shall be bolted connections, unless noted otherwise.
4. All welded steel shall comply with the American Welding Society (AWS) D1.1, "Structural Welding Code--Steel", unless noted otherwise.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Submit shop and erection drawings showing location and fabrication of structural-steel components.
 1. Include details of cuts, connections, splices, camber, holes, and other pertinent data.
 2. Include embedment drawings.
 3. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length and type of each weld.
 4. Indicate welding sequences as required by AWS.
 5. Indicate type, size and length of bolts, distinguishing between shop and field bolts, and bolts with threads excluded from shear plane. Identify pre-tensioned and slip-critical high-strength bolted connections.
 6. For structural-steel connections indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation. Refer to structural drawings for connection design requirements.
- C. Welding Certificates: Certificate from AWS indicating certification in type of welding required for each welder and welding operator.
- D. Welding Records and Data:
 1. Before welding, submit the procedure which will be used for qualifying welders and welding procedures. For procedures other than those pre-qualified in accordance with AWS D1.1, submit a copy of procedure qualification test records.
 2. Submit certified copy of qualification test records for each welder, welding operator, and tacker who will be employed in the work.
 3. Where field welding has been required for specific connections, submit descriptive data for field welding equipment.
 4. Submit all Non-Destructive Examination (NDE) records (radiographs, ultrasonic, magnetic particle) and visual inspection reports upon completion or when otherwise requested by the Engineer.
- E. Qualification Data: For installer, fabricator, professional engineer, testing agency, welding inspectors, NDE inspectors and galvanizer. Submit two weeks prior to starting work.

- F. Mill Test Reports: Signed by manufacturers certifying that the following products comply with requirements:
1. Structural steel including chemical and physical properties.
 2. Bolts, nuts, and washers including mechanical properties and chemical analysis.
 3. Direct-tension indicators.
 4. Tension-control, high-strength bolt-nut-washer assemblies.
 5. Shear stud connectors.
- G. Calculations: Submit "Job Standards" for each connection type. The "Job Standards" shall show by calculation the design capacities of each connection. Moment connection calculations shall include calculations for providing stiffener plates and web doubler plates for the columns in accordance with the drawings. Submitting such calculations does not relieve the engineer producing calculations in any way as to the accuracy or compliance to codes of the submitted calculations. Calculations shall be stamped by a professional structural engineer registered in the Commonwealth of Massachusetts.

1.5 QUALITY ASSURANCE

- A. Fabricator Qualifications: A qualified fabricator who participates in the AISC Quality Certification Program and is certified for: Steel Building Structures (STD); or Simple Steel Bridge Structures (SBD); or Major Steel Bridges (CBR) as applicable
- B. Installer Qualifications: A qualified installer with previous experience in installing structural steel.
- C. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel"
- D. Comply with applicable provisions of the following specifications and documents:
1. AISC's "Code of Standard Practice for Steel Buildings and Bridges"
 2. AISC's "Seismic Provisions for Structural Steel Buildings" and "Supplement No. 2"
 3. AISC's "Specification for Structural Steel Buildings--Allowable Stress Design and Plastic Design" and "Load and Resistance Factor Design Specification for Structural Steel Buildings"
 4. AISC's "Specification for the Design of Steel Hollow Structural Sections"
 5. AISC's "Specification for Allowable Stress Design of Single-Angle Members" and "Specification for Load and Resistance Factor Design of Single-Angle Members"
 6. RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts"
- E. Tests and Inspection
1. The Contractor will test and inspect high-strength bolted connections and welded connections and prepare test reports. Specialty tests shall be performed at no expense to the Authority by an independent testing laboratory approved by the Engineer. Costs of specialty tests shall be borne by the Contractor. Test reports shall be submitted to the Engineer for approval.
 2. The Engineer reserves the right to inspect high-strength bolted connections and weld connections. Provide access to places where structural steel work is being fabricated or erected so that required inspection and testing can be accomplished at no change in Contract Price. At times, inspection may require moving or handling of steel to permit proper inspection. Notify Materials Testing Laboratory not less than 48 hours prior to start of fabrication.

3. The Engineer may inspect structural steel at the plant before shipment; however, the Engineer reserves the right, at any time before final acceptance, to reject material not complying with specified requirements.
 4. All waterproof welds shall be performed by welders experienced and qualified in waterproof welding procedures. Waterproof welds shall be subject to inspection, nondestructive examination, and documentation.
 5. Correct deficiencies in structural steel work that inspections and laboratory test reports have indicated to be not in compliance with requirements at the Contractor's expense. Perform additional tests, at no expense to the Authority, as may be necessary to reconfirm any non-compliance of the original work, and as may be necessary to show compliance of corrected work.
 6. Specialty Tests: Nondestructive examination of welds in accordance with provisions of AWS D1.1 and ASTM Standards noted shall be made in accordance with the following schedule:
 - a. Ultrasonic Examination, per ASTM E164: Complete joint penetration groove butt welds not accessible for radiographic examination shall be subjected to ultrasonic testing. The extent shall be the same as noted for radiographic examination. Ultrasonic examination shall be made 48 to 72 hours after welding at locations on weldments or welded joints subject to high restraint as indicated in order to check for lamellar tearing. 100% of complete joint penetration welds shall be tested.
 - b. Magnetic Particle Examination, per ASTM E709, field and shop:
 - 1) 100% of partial penetration groove welds shall be tested.
 - c. Penetrant Examination, per ASTM E165: Shall be used for detecting discontinuities that are open to the surface use as appropriate.
 7. Visual Examination: All welds whether otherwise examined or not shall be visually examined and faulty joints shall be marked for correction.
 8. When any testing, examination or inspection reveals faulty welds, all joints of the same type shall be checked at no expense to the Authority until the integrity of the weld is assured before resuming examination.
 9. After faulty welds have been corrected or repaired, they shall each be re-examined at no expense to the Authority in the manner specified for the original joint.
 10. It is intended that inspections shall be performed to permit an orderly flow of completed material from the shop. Work with the Engineer to establish a schedule that will permit this.
 11. Test result information shall be forwarded to the Engineer immediately after test results are available stating the acceptance or rejection of fabricated pieces in order that the repairs and re-inspection may be made as soon as possible.
- F. Pre-Installation Conference: Contractor shall schedule a meeting to be attended by Contractor, Engineer, fabricator and galvanizer. Agenda shall include the following: Project schedule, source for each fabrication, coordination between fabricator and galvanizer and adjacent Work, finish of surfaces, application of coatings, submittals, and approvals.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Store materials to permit easy access for inspection and identification. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers. Protect steel members and packaged materials from erosion and deterioration.
 - 1. Store fasteners in a protected place. Clean and re-lubricate bolts and nuts that become dry before use.
 - 2. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures. Repair or replace damaged materials or structures as directed.
 - 3. Do not handle structural steel until paint has thoroughly dried.

1.7 COORDINATION

- A. Furnish anchorage items to be embedded in or attached to other construction without delaying the Work. Provide setting diagrams, sheet metal templates, instructions and directions for installation.

1.8 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 STRUCTURAL-STEEL MATERIALS

- A. Channels, M-Shapes, S-Shapes, W-Shapes: ASTM A 572, Grade 50.
- B. Angles: ASTM A 36
- C. Plate and Bar: ASTM A 572/A 572M, Grade 50.
- D. Cold-Formed Hollow Structural Sections: ASTM A 500, Grade B, structural tubing.
- E. Steel Pipe: ASTM A 53, Type E or S, Grade B.
- F. Medium-Strength Steel Castings: ASTM A 27, Grade 65-35 carbon steel.
- G. High-Strength Steel Castings: ASTM A 148, Grade 80-50, carbon or alloy steel.
- H. Welding Electrodes: Comply with AWS requirements.

2.2 COATINGS

- A. All steel except steel to receive fireproofing shall be galvanized and painted. Refer to section 05041 "Hot-Dipped Galvanizing."

2.3 BOLTS, CONNECTORS, AND ANCHORS

- A. High-Strength Bolts, Nuts, and Washers: ASTM A 325, Type 1, heavy hex steel structural bolts; ASTM A 563, Grade C, heavy hex carbon-steel nuts; and ASTM F 436 hardened carbon-steel washers.
 - 1. Finish: Hot-dip zinc coating, ASTM A 153, Class C. Field paint to match steel member. Refer to Section 09900- Painting.
- B. Tension-Control, High-Strength Bolt-Nut-Washer Assemblies: ASTM F 1852, Type 1, steel structural bolts with splined ends; ASTM A 563 heavy hex carbon-steel nuts; and ASTM F 436 hardened carbon-steel washers. Finish, mechanically deposited zinc coating, ASTM B 695, Class 50.
- C. Anchor Rods: ASTM F 1554, grade as applicable, hot-dip zinc coating, ASTM A 153, Class C.
- D. Threaded Rods: ASTM A 193, grade as applicable, hot-dip zinc coating, ASTM A 153, Class C.
- E. Eye Bolts and Nuts: ASTM A 108, Grade 1030, cold-finished carbon steel.
- F. Sleeve Nuts: ASTM A 108, Grade 1018, cold-finished carbon steel.

2.4 MISCELLANEOUS MATERIALS

- A. Galvanizing Repair Paint: Coatings meeting requirements of ASTM A 780.
- B. Paint: Primer, Intermediate and Finish Coat. Refer to Section 09900 – PAINTING.
- C. Nonmetallic, Shrinkage-Resistant Grout: ASTM C 1107, factory-packaged, nonmetallic aggregate grout, noncorrosive, nonstaining, mixed with water to consistency suitable for application and a 30-minute working time.

2.5 FABRICATION

- A. Structural Steel: Fabricate and assemble in shop to greatest extent possible. Detail assemblies to minimize handling and to expedite erection. Fabricate according to AISC's "Code of Standard Practice for Steel Buildings and Bridges" except as modified herein and AISC's "Specification for Structural Steel Buildings--Allowable Stress Design and Plastic Design".
 - 1. Camber structural-steel members where indicated.
 - 2. Identify high-strength structural steel according to ASTM A 6/ A 6M and maintain markings until structural steel has been erected unless noted otherwise.
 - 3. Mark and match-mark materials for field assembly unless noted otherwise.
 - 4. Complete structural-steel assemblies, including welding of units, before starting shop-priming operations.
 - 5. Cap hollow structural sections with 3/8-inch cap plates, unless noted otherwise. For hollow structural sections to be hot dip galvanized provide vent holes and plastic plugs to match finish paint to the greatest extent possible.
- B. Thermal Cutting: Perform thermal cutting by machine to greatest extent possible. Plane thermally cut edges to be welded to comply with requirements in AWS D1.1.

- C. Bolt Holes: Cut, drill, or punch standard bolt holes perpendicular to metal surfaces not more than 1/16" larger than the connector diameter. Finishing: Accurately finish ends of columns and other members transmitting bearing loads.
- D. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1 and manufacturer's written instructions.
- E. Holes: Provide holes required for securing other work to structural steel and for passage of other work through steel framing members.
 - 1. Cut, drill, or punch holes perpendicular to steel surfaces. Do not thermally cut bolt holes or enlarge holes by burning.
 - 2. Base-Plate Holes: Cut, drill, mechanically thermal cut, or punch holes perpendicular to steel surfaces.
 - 3. Weld threaded nuts to framing and other specialty items indicated to receive other work.
- F. Curved Members: Fabricate indicated members to curved shape by rolling to final shape in fabrication shop.
 - 1. Distortion of webs, stems, outstanding flanges, and legs of angles shall not be visible from a distance of 20 feet (6 m) under any lighting conditions.
 - 2. Tolerances for walls of hollow steel sections after rolling shall be approximately 1/2 inch (13 mm).

2.6 CONNECTIONS

- A. High-Strength Bolts: Install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts" for type of bolt and type of joint specified.
- B. Weld Connections: Comply with AWS D1.1 for welding procedure specifications, tolerances, appearance, and quality of welds and for methods used in correcting welding work. Complete welds in accordance with the Contract Drawings.
 - 1. Comply with AISC's "Code of Standard Practice for Steel Buildings and Bridges" for bearing, adequacy of temporary connections, alignment, and removal of paint on surfaces adjacent to field welds.
 - 2. Remove backing bars or runoff tabs, back gouge, and grind steel smooth.
 - 3. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances of AISC's "Code of Standard Practice for Steel Buildings and Bridges" for mill material
 - 4. Insufficient welds shall be rejected and corrected until required profiles are met.
 - 5. Verify that weld sizes, fabrication sequence, and equipment used for exposed structural steel will limit distortions to allowable tolerances. Prevent weld show-through on exposed steel surfaces.
 - a. Grind butt welds flush.
 - b. Grind or fill exposed fillet welds to smooth profile. Dress exposed welds.
 - c. Re-profile all steel surfaces (using needle guns or other profiling methods) that have been welded and ground smooth to assure proper adhesion of primers and topcoats.

- d. Prime with a zinc-rich primer as required in 2.6.B, and apply finish coat and clear top coat as required in section 05041 Hot-Dip Galvanizing. The color of finish coat shall match that of the shop-applied finish coat.
- 6. No intermittent welds will be permitted for steel connections to be coated, unless noted otherwise.
- C. Minimum connections shall comply with appropriate tables headed "Framed Beam Connections" shown in the AISC "Manual of Steel Construction". Seated connection may be used only when they do not interfere with architectural features.
- D. For non-composite beams, the connections used shall be adequate to provide for the reaction due to the maximum uniformly distributed load that the beam is capable of carrying for its span, based on the allowable unit stresses, except where higher reactions are shown.
- E. For composite beams, connections shall be adequate to provide for reactions shown on the drawings. Where reactions are not indicated on drawings, the following criteria for connections shall be followed: For composite beams the shear connection shall be adequate to provide for twice the reaction due to the maximum uniformly distributed load that the non-composite beam section is capable of carrying for its span, and for composite girders the connection capacity shall be 1.5 times the reaction due to the maximum uniformly distributed load that the non-composite girder section is capable of carrying for its span.
- F. For ordinary moment frames, the connection shall be adequate to provide for the values of the moments as shown on drawings, in addition to the shear connections as specified above. If the value of the moment is not indicated on the drawings, the connection shall be adequate to resist the moment capacity of the framing beams for ordinary moment frames. Stiffener plates and web doubler plates for columns shall be provided for the above mentioned criteria. For ductile moment resisting frames, as shown on the drawings, comply with all AISC Seismic Provisions and the Commonwealth of Massachusetts State Building Code.

2.7 STEEL PRIMERS AND FINISHES

- A. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for The Society for Protective Coatings (SSPC) surface preparation specifications and environmental exposure conditions of installed metal fabrications:
 - 1. Exteriors (SSPC Zone 1B) and Items Indicated to Receive Zinc-Rich Primer: SSPC-SP 10/NACE No. 2, "Near White Metal Blast Cleaning"
 - 2. Interiors (SSPC Zone 1A): SSPC-SP 6, "Commercial Blast Cleaning"
 - 3. Apply shop primer to uncoated surfaces of metal fabrications, except those with galvanized finishes and those to be field welded, embedded in concrete or masonry, unless otherwise indicated. Extend priming of partially embedded members to a depth of 2 inches.
 - 4. Comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel" for shop painting.
 - 5. Comply with SSPC-PA 2, "Measurement of Dry Coating Thickness with magnetic Gages"
- B. Zinc-Rich Primer: Urethane zinc rich primer compatible with topcoat Specified in Section 09900. Provide primer with a VOC content of 340 g/L (2.8 lb/gal.) or less per OTC ozone standards. Provide Tnemec Series 394 or Ameron 5105 or equal by DuPont or Carboline for exposed steel to be fireproofed, or Tnemec Series 901K97 Series or 90-97 or Ameron 68HS or equal by DuPont or Carboline for exposed steel to be finish painted at 3.0 mils DFT.

- C. Primer for Exposed Steel to Receive Multi-Coat Shop-Applied Coating: Tnemec Series 901K97 or 90-97 urethane zinc rich primer at 3.0 to 3.5 mils DFT, topcoated in shop with Tnemec Series V73 Endura-Shield, or use Ameron Series 68HS Primer at 3.0 to 5.0 mils DFT topcoated in shop with Ameron's Amercoat 450H, or use or equal primers and finish coats from DuPont or Carboline.
- D. Galvanizing: All Steel, except steel to be fireproofed shall be Hot-dip galvanized & painted, see section 05041- Hot-Dip Galvanizing. All steel to be Hot-dip galvanized & painted shall be primed and/or painted by the galvanizer in his own facility within 12 hours of galvanizing and force cured in a booth capable of maintaining 130° F.
- E. Steel erected in the field that requires repainting shall use touch up kit provided by the galvanizing shop and in accordance with the project specifications. Finish shall match exactly the shop finish and shall be approved by the Architect.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify elevations of concrete- and masonry-bearing surfaces and locations of anchor rods, bearing plates, and other embedments, with steel erector present, for compliance with requirements. Elevations shall be verified by a surveyor licensed in the Commonwealth of Massachusetts.
- B. Proceed with installation of rejected pieces only after unsatisfactory conditions have been corrected to Architect's satisfaction.

3.2 PREPARATION

- A. Provide temporary shores, guys, braces, and other supports during erection to keep structural steel secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads. Protect painted surfaces from abrasions. Remove temporary supports when permanent structural steel, connections, and bracing are in place, unless otherwise indicated. Do not remove temporary shoring supporting composite deck construction until cast-in-place concrete has attained its design compressive strength.

3.3 ERECTION

- A. Set structural steel accurately in locations and to elevations indicated and according to AISC's "Code of Standard Practice for Steel Buildings and Bridges".
- B. Base and Bearing Plates: Clean concrete- and masonry-bearing surfaces of bond-reducing materials, and roughen surfaces prior to setting base and bearing plates. Clean bottom surface of base and bearing plates.
 - 1. Set base and bearing plates for structural members on wedges, shims, or setting nuts as required.
 - 2. Weld plate washers to top of base plate.
 - 3. Snug-tighten or pretension anchor rods as applicable after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of base or bearing plate before packing with grout.
 - 4. Promptly pack grout solidly between bearing surfaces and base or bearing plates so no voids remain. Neatly finish exposed surfaces; protect grout and allow to cure. Comply with manufacturer's written installation instructions for shrinkage-resistant grouts.

- C. Maintain erection tolerances of structural steel within AISC's "Code of Standard Practice for Steel Buildings and Bridges"
- D. Align and adjust various members forming part of complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact with members. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
 - 1. Level and plumb individual members of structure.
 - 2. Make allowances for difference between temperature at time of erection and mean temperature when structure is completed and in service.
- E. Splice members only where indicated.
- F. Remove erection bolts on welded exposed structural steel; fill holes with plug welds; and grind smooth at exposed surfaces.
- G. Do not use thermal cutting during erection unless approved by Engineer. Finish thermally cut sections within smoothness limits in AWS D1.1 and to Architect's satisfaction in the case of Exposed Steel.
- H. Do not enlarge unfair holes in members by burning or using drift pins. Ream holes that must be enlarged to admit bolts after getting approval from Engineer.
- I. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1 and manufacturer's written instructions.

3.4 FIELD CONNECTIONS

- A. Connections shall comply with requirements specified in Part 2 – Products

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified independent testing and inspecting agency to inspect field welds and high-strength bolted connections.
- B. Bolted Connections: All bolted connections shall be inspected in accordance with RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts". When using bolted connections prime with "slip critical class B" primer as specified in this Section. All surfaces of bolted or bearing connections may be primed. When welding, hold back primer a minimum of 2 inches each side of weld.
- C. Welded Connections: Field welds will be visually inspected according to AWS D1.1. In addition to visual inspection, specialty tests will be performed in accordance with AWS D1.1 and at the frequency stated in Article 1.5.E.5
- D. In addition to visual inspection, test and inspect field-welded shear connectors according to requirements in AWS D1.1 for stud welding and as follows:
 - 1. Perform bend tests if visual inspections reveal either a less-than- continuous 360-degree flash or welding repairs to any shear connector.
 - 2. Conduct tests on additional shear connectors if weld fracture occurs on shear connectors already tested, according to requirements in AWS D1.1.

- E. Correct deficiencies in Work that test reports and inspections indicate do not comply with the Contract Documents.
- F. Architect will examine Exposed Steel in place to determine acceptability relating to aesthetic effect. The Architect will have final approval of installed structural Exposed Steel to view.

3.6 REPAIRS AND PROTECTION

- A. Avoid bending, twisting, marking or otherwise distorting the Structural Steel during fabrication or erection.
- B. Remove welded tabs that were used for attaching temporary bracing and safety cabling and that are exposed to view in the completed Work. Grind steel smooth.
- C. Repair damaged galvanized coatings on galvanized items with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.
- D. Touchup Painting: Comply with Hot Dip Galvanizing Specification Section 05041. Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with zinc rich primer, and with the same finish coat and clear-coat as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces. Touchup Painting shall be invisible from surrounding steel as approved by Architect.
 - 1. Clean and prepare surfaces by SSPC-SP 2 hand-tool cleaning or SSPC-SP 3 power-tool cleaning.
 - 2. Apply a compatible primer of same type as shop primer used on adjacent surfaces.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05123

STRUCTURAL STEEL FOR ROADWAY BRIDGES

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving the following items:
1. The furnishing and installation of Structural Steel for Roadway Bridges.
 2. Structural Steel Elements will be used at Roadway Bridges for Girders, Diaphragms and Cross Frames, Utility Supports and Hangers, and other related uses.
- B. Related Work:
1. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 2. Section 05124 – BRIDGE RAILS.
 3. Section 05125 – BRIDGE BEARINGS.
 4. Section 05420 – TEMPORARY STEEL UTILITY BRIDGES.
 5. Section 05810 – EXPANSION JOINT COVER ASSEMBLIES.
 6. Section 07911 – EXPANSION JOINT ASSEMBLIES.
- C. For all Structural Steel requirements regarding General Information, Products, and Execution, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 960.
1. For Roadway Bridge Structural Steel submittal requirements, including, but not limited to shop drawings, working drawings, Requests For Information, Non Conformance and testing reports, refer to Section 01300 – SUBMITTALS of the Contract Specifications.
 2. Per Division 1 of the Contract Specifications, the Contractor is responsible for all sampling and testing as outlined in their approved Quality Management Plan and Testing Plan. The Contractor is also responsible for all costs related to the sampling, testing, and related work.
 3. Replace all references to Measurement and Payment with Sub-section 4.1 below.

PART 2 – PRODUCTS

- A. Not used.

PART 3 – EXECUTION

3.1 STAFFING OF OFFICE AND INSPECTION OF WORK

- A. The Contractor shall hire an independent testing agency (ITA) responsible for maintaining an office staffed with personnel adequate in number, training and experience to perform the work required under this contract. The office shall also be staffed with a full-time, qualified technical

representative who shall be responsible for the proper management, control and performance of the operational functioning of this Contract throughout the period of time covered by the Contract.

- B. Prior to the beginning of work, the ITA shall submit the names, resumes and geographic locations of all personnel to be assigned to do the work. The ITA shall provide at each and every inspection location sufficient personnel to carry out the work. The Engineer shall be the sole judge of what constitutes sufficient personnel to carry out the work.
- C. Only approved inspectors may work on assignments for the ITA.
- D. The services stipulated by the Contract shall be duly performed by the ITA's own employees and/or approved sub consultants.
- E. It shall be the responsibility of the ITA to provide each Inspector with the applicable tools, specifications of AASHTO, AWS, ASTM and any other Specification and/or Code necessary for the proper inspection of the work. The Department will furnish the ITA with such additional plans, detailed drawings, and any additional directions that may be necessary for the proper prosecution of the work.

3.2 QUALIFICATIONS OF PERSONNEL

- A. The minimum qualifications required of the personnel who will be serving as shop or field inspectors will be as follows:

- 1. Individuals shall possess experience in the inspection of structural steel and miscellaneous metals used in the fabrication of bridge components. This experience shall include work performed for State agencies and authorities. The following minimum years of experience in fabrication is required:

Project Type	Min. Years' Experience
Miscellaneous (incl. Joints, lighting and sign supports)	1
Rolled Beam Bridges	1
Welded Girders (I- and Box- section)	2
Complex Structures (i.e., trusses)	3
Fracture Critical Members	3

- B. Individuals shall be knowledgeable in all aspects of fabrication including welding, bolting, painting and nondestructive test methods.
- C. Individuals shall be certified welding inspectors in accordance with the American Welding Society's Standard for Qualification and Certification of Welding Inspectors (AWS QC1).
- D. Individuals involved in paint inspection shall have as a minimum NACE Session I certification, completed FHWA Bridge Coating Inspection Course No.130079 or received other formal training subject to the approval of the E.
- E. Individuals involved in timber inspection shall have at a minimum 5 years of timber inspection experience.
- F. Individuals shall have a working knowledge of the various codes and standards used in fabrication including the AASHTO/AWS D1.5 Bridge Welding Code, AWS D1.1 Structural Welding Code, and AASHTO LRFD Bridge Design Specifications and AASHTO LRFD Bridge

Construction Specifications.

- G. For initial plant audits, the individual shall have a minimum of 10 years' experience in the above-mentioned qualifications. The individual shall also be a registered Professional Engineer or approved by the MassDOT Department to perform the audits.
- H. The minimum qualifications required of the personnel who will be performing nondestructive testing will be as follows:
 - 1. Individuals shall, at a minimum be certified as a Level II technician by the American Society for Nondestructive Testing, Recommended Practice SNT-TC-1A. These individuals shall be certified by a Level III technician who shall have attained certification by examination. In addition to meeting the requirements above, those individuals performing ultrasonic testing shall be qualified by a written examination and performance test administered by the Engineer. The Engineer at his/her discretion may accept other properly documented certifications and tests.
- I. The laboratory that will be performing the chemical and physical tests shall be nationally accredited.
- J. The Engineer shall be the sole judge of the competency of each inspector, and any employee of the ITA deemed to be incompetent or unsatisfactory shall be replaced when so directed.

3.3 DOCUMENTATION

- A. Familiarization with Requirements
 - 1. Become familiar with applicable portions of the Contract documents covering the work to be inspected. Study the documents and specifications before fabrication commences to provide ample opportunity to coordinate with the Engineer.
 - 2. Have thorough knowledge of the following references:
 - a. Applicable current standard specifications, supplements, special provisions, and addenda,
 - b. Approved shop drawings. Checking of shop drawings for accuracy or error is not a requirement of the inspection contract. However, if the Inspector notes errors or inaccuracies in the shop drawings, he/she should immediately notify the Engineer.
 - c. Applicable provisions of the *AREMA Manual for Railway Engineering*, if required for the project,
 - d. AASHTO/AWS D1.5, *Bridge Welding Code*,
 - e. Fabricator's QCP.
 - 3. Be familiar with the following references:
 - a. AWS D1.1, *Structural Welding Code*,
 - b. AWS A2.4, *Symbols for Welding and Nondestructive Testing*,
 - c. AWS A3.0, *Standard Welding Terms and Definitions*,
 - d. Applicable ASTM or AASHTO specifications,
 - e. Applicable coating test methods,
 - f. Applicable SSPC Specifications,

- g. Prefabrication meeting minutes, if any.

B. Required Documents

1. Acquire the following documents:
 - a. MTRs for material used in fabrication,
 - b. List of qualified welders, welding operators, and tack welders,
 - c. Approved WPSs,
 - d. Approved PQRs,
 - e. Copy of approved nondestructive testing procedures,
 - f. List of qualified NDE technicians for the project,
 - g. NDE reports for all work on this project that have been inspected and accepted by NDE.

C. Mill Test Reports (MTRs)

1. Verify use of proper materials by checking a copy of the MTRs when the material arrives and by monitoring heat numbers during fabrication until the material is joined into a piece-marked item. Identify by heat numbers the material proposed to be used. Certified Mill Analysis Reports shall be checked for conformance to the Standard Specifications and Project Special Provisions. Initial all test reports that have been checked and identified. Witness the transfer of all heat numbers by the Fabricator to pieces that are cut from material that will become a main member or member component.
2. Prior to any fabrication, the Inspector shall have at hand certified copies of mill tests and shall check the following:
 - a. Product description (specifications, grade, H or P testing frequency),
 - b. Chemistry,
 - c. Physical test results, including Charpy V-Notch when applicable,
 - d. Applicable “Buy America” certification requirements,
 - e. Heat number,
 - f. Certification signature (Quality Control Department and Notary, when required)
3. Do not accept material if the Fabricator cannot furnish appropriate certifications to establish compliance with the required material properties and “Buy America” requirements, if required in the Contract.
4. Verify that the fabricator is maintaining a record of heat number for identification for main members.
5. Accept structural steel based on MTRs. Miscellaneous hardware or other associated products may be accepted based on certifications of compliance.

3.4 SHOP INSPECTION

- A. The QAI must verify that fabricated steel bridge members meet Contract requirements by performing the functions listed in this section.

B. Inspection of Raw Materials

1. Steel bridge material specifications require conformance with applicable requirements of AASHTO M 160 (ASTM A 6). These specifications cover common requirements for hot-rolled plates, shapes, sheet piling and bars, and are also used for material acceptance inspection and repairing certain surface defects.
2. Check materials for surface defects and discontinuities, both initially and as material is being worked. Check rolled sections and steel castings for dimensions, straightness, twist, fins, scabs, and rolling defects, prior to fabrication. Monitor steel plate during cutting for internal defects or other problems.
3. No material shall be accepted from shop stock without permission of the Engineer, and where such stock material is permitted to be used, quality must be checked by reliable test records (properly identified). Material must be free from rust, pitting or other surface defects.

C. Inspection of Fabricated Members

1. During fabrication the QAI should monitor and spot-check that the work performed by the fabricator meets the contract requirements, including, as a minimum, the following:
 - a. Straightness. No unauthorized corrections made by welding or manual thermal cutting,
 - b. Camber operations. Check and record the camber and the length, center to center of bearings, of all beams and girders. When it is necessary to straighten or camber by heating, the Inspector shall be present. The procedure for heat straightening or cambering shall have prior approval of the Engineer,
 - c. Size and quality of punches and dies,
 - d. Proper setup and securing of drilling or reaming templates,
 - e. Bolt hole location, edge distance, and diameter,
 - f. Cylindrical and perpendicular bolt holes,
 - g. Absence of burrs, tears, and chips in bolt holes,
 - h. Thickness of plates, clearances, fitup accuracy, alignment of holes, and proper size of sections at field connections,
 - i. Shop assembly of girders or other parts required for reaming or drilling of field splice holes: positioning, securing, match marking members and splice plates, splice plate orientation (flange splice plates rolling direction parallel to flanges), fills in assembly, and all plies in contact when assembled,
 - j. Flatness of flanges at bearing areas,
 - k. Bearing plates and bearing assemblies, including rockers and shoes for structural steel and expansion joints,
 - l. Proper surface finish and protection of machined surfaces,
 - m. Contact condition of milled bearing surfaces,
 - n. Camber blocking during girder assembly, prior to drilling and QAI acceptance for disassembly records of final sweep or camber,
 - o. Inspection and installation of fasteners in the shop,
 - p. Location of stiffeners and connection plates,
 - q. Match-marking of assembled members,
 - r. Preparation of match-mark diagrams,
 - s. Control and use of heat and/or pressure to obtain or correct sweep and camber in accordance with shop's QCP, and avoidance of buckles, twists, kinks or other defects,

- t. Legibility and position of erection and shipping marks,
- u. No unacceptable twists, bends, kinks, or sweep in finished members,
- v. Proper number of pieces,
- w. Small parts properly packaged or otherwise secured against loss or damage in transit,
- x. Loose pieces fastened in place for shipment,
- y. Application of rust-preventive material when required, and covering to prevent contamination of painted surfaces.

D. Assembly

- 1. Periodically observe laydowns and shop assembly.
- 2. Verify the Fabricator's geometry control methods and measurements. For full or partial shop assemblies, receive the QCI's signed reports of measurements for the Owner's records. For full assemblies, photographs should also be included in the QAI's report.

E. Welding

- 1. Monitor these criteria prior to welding:
 - a. Appropriate equipment in acceptable condition and periodically calibrated per QCP,
 - b. Proper functioning of drying and baking ovens,
 - c. Qualified welders, welding operators, and tack welders,
 - d. Appropriate, approved WPS for detailed joint,
 - e. Joint details, including root face and opening, bevel angle, and alignment of parts within appropriate welding code tolerances,
 - f. Proper application of extension tabs (run-on and run-off),
 - g. Cleanliness of surfaces to be welded,
 - h. Proper condition and storage of welding consumables,
 - i. Size, quality and location of tack welds.
- 2. Monitor these consumable-handling criteria:
 - a. Storage, condition, and exposure times of welding consumables,
 - b. Re-drying and recycling limits.
- 3. Monitor these criteria during welding:
 - a. Following approved WPSs: amperage, voltage, speed of travel, electrode extension, shielding gas flowrate, and preheat, interpass, and/or post-heat temperatures within applicable welding code and WPS tolerances,
 - b. Workmanship of individual welders,
 - c. Use of proper repair procedures for fabrication errors, including, when required, the Engineer's approval,
 - d. Weld starts and stops, securing and removing run-on and run-off tabs, stopping short of snipes or plate edges, and ending without craters.
- 4. Monitor these final weld quality criteria:
 - a. Size, profile, and contour of fillet and groove welds,

- b. No defects in welds or parent metal,
 - c. Accurate interpretation by QCIs for the acceptance or rejection of welds,
 - d. Cleaning and backgouging of welds, including thorough removal of unsound metal and gouging contamination (copper, carbon).
5. Use of Approved Welding Consumables: Review the consumable manufacturer's certificate of conformance maintained by the Fabricator for all consumables used.
6. Nondestructive Evaluation (NDE)
- a. Review and approve the qualification documentation of those performing NDE for the Fabricator.
 - b. Verify that reports are complete and legible and affix his/her signature to those reports that indicate acceptable tested material.
 - c. For radiographic testing (RT), conduct the following activities:
 - 1. Witness inspection by this procedure during the entire period of testing.
 - 2. Interpret test results in accordance with Contract requirements,
 - 3. Verify that final edges may be properly interpreted. (If the plate will be cut after RT, the final edge may be within the plate on the RT film).
 - 4. Verify proper application of edge blocks (plate edge is final edge in structure).
 - 5. Verify that each radiograph represents a unique section or piece by comparing punch marks or other approved methods of marking the work and corresponding marks on the film.
 - 6. Submit report which shall show the following: date radiographs examined; source of radiation including type and size; distance; density; sensitivity; penetrometer size; shim; edge blocks; film including size, type and exposure time; name of radiographer; name of interpreter; name of Inspector; and name of shop representative examining radiographs. It shall indicate the number of radiographs found satisfactory and list those radiographs declared unacceptable.
 - 7. A diagrammatic sketch of radiograph locations shall be submitted with the report.
Such sketches shall show the heat numbers of each plate of major components and identification shall be such that the sketch may be readily oriented to the contract drawings.
 - 8. Deliver all radiographs including unsatisfactory radiographs, to the Bridge Section of MassDOT. All radiographs shall be delivered in suitable containers that are clearly marked to identify the project and the relative inspection reports. Each radiograph shall be wrapped in a suitable manner and marked to indicate radiograph number, beam or girder number and exact location on the beam or girder. A separate summary report as required by the Engineer shall be submitted with each transmittal or radiograph.
 - d. Witness inspection by ultrasonic testing (UT) for the entire test period. Ascertain that the equipment, procedure and technique are in conformance with the Massachusetts Department of Transportation, Highway Division Standards and all pertinent reference documents.
 - e. For magnetic particle testing (MT), conduct the following activities:

1. Be present and witness inspection by the procedure during the entire period of testing.
 2. Submit fabricators certification that the magnetic particle inspection was carried out on and completed satisfactorily in the presence of the MASSDOT Inspector. Submit report of their evaluation and corrective measures ordered. Re-examination, after re-welding, is required if welds are not satisfactory.
 3. A final separate summary report of Magnetic Particle Inspection shall be submitted. The report shall be signed by the fabricator and the inspector and shall contain sufficient information to identify the weld or base metal inspected.
- f. For liquid penetrant (PT), observe technique and interpret results. Submit a summary report of liquid penetrant inspection. The report shall contain sufficient information to identify the extent of the weld or base metal inspected.
7. Coatings
- a. When sampling:
 1. Witness sampling, including mixing or stirring if required for uniformity.
 2. Ensure that the required samples are delivered to MassDOT and conform to the current Massachusetts Department of Transportation, Highway Division Standard Specifications for Highways and Bridges and the Construction Contract Special Provisions.
 - b. Check to ensure that the paint system to be used is acceptable and on the NEPCOAT approved list.
 - c. If the coating samples are obtained directly from the manufacturer, and the batches are approved prior to shipment to the Fabricator or jobsite, verify that the batch numbers received are approved.
 - d. Prior to coating application, verify the following:
 1. Coating containers are properly marked with a batch number,
 2. Batches have been properly strained and mixed (note when pot life initiates),
 3. Check air temperature, humidity and dew point.
 - e. Report manufacturer, name and lot number of paint.
 - f. For coating application inspection, verify the following:
 1. Proper cleaning and surface preparation of base metal prior to coating,
 2. Application of coating in accordance with manufacturer and/or Contract requirements,
 3. Adequate curing of each coat,
 4. Thickness of coating, wet or dry, as specified for each system and type,
 5. Sufficient drying of coating prior to loading for shipment,
 6. Absence of dry spray, runs, sags and other defects,
 7. Proper coating of inaccessible and limited access areas,
 8. Proper treatment of faying surfaces.
8. Bolting

- a. Ensure bolting is in accordance with AASHTO and all MassDOT Specifications.
- b. Ensure faying surfaces are clean.
- c. Ensure the solid seating of all parts.
- d. Inspect for over reaming, burning and other defects.
- e. Verify proper calibration of wrenches and skidmore machines.
- f. Verify that all fasteners are properly stored, segregated and in good condition.
- g. Ensure that installation and verification testing procedures are properly followed.
- h. Witness the rotational capacity and verification testing.
- i. Review bolt certifications.

9. Final Inspection and Loading for Shipment

- a. When all work is complete, conduct a final visual examination of every member against the drawings for section, dimensions, connection locations, details, workmanship and coating.
- b. The QCI will provide copies of reports covering the materials to be shipped. Verify that all data is correct. The reports shall include the name and address of the Fabrication plant, the name of the co-signee, and the location of the project and date shipped, letters and numbers of cars or of trucks, the number of pieces in the load with lengths or dimensions and weights, together with other pertinent information as may be necessary.
- c. Randomly observe handling and loading of the work to verify that the methods and supports used will prevent significant damage during shipping.
- d. The Inspector shall verify that all members are identified and that these shop marks are in accordance with the shop drawings and are legible.
- e. A mark signifying the member has been inspected and accepted shall be plainly, legibly and indelibly placed at the fabricating shop near the erection mark on each member. The identification mark shall include the name or initials of the Inspection Agency and the inspector's identification number, placed in a manner to insure their preservation up to the time of erection.
- f. The inspector shall reject all assemblies that are not in strict conformance with the Contract documents and specifications.

3.5 INSPECTOR RECORDS AND REPORTS

- A. The ITA shall report to the Engineer such information as the Engineer may require in connection with the manufacture, handling, and shipment of the materials inspected. The information furnished shall include the location where the material is being fabricated, the municipality and roadway where the project is located, the Bridge Number, the MassDOT contract number of the project, daily summary of work done, and statements that the said materials conform to particular pertinent specifications as noted. If any of the above items are not included, the report will be returned for corrections. Payment will not be made until a corrected report is received.
- B. Maintain a narrative report for each project, as directed by the Owner. The report shall be maintained in an electronic log with automatic date and time recording. Record the Fabricator's activity on the work inspected, including both positive and negative comments, suggestions given to the Fabricator, and any agreements made. Make entries as soon possible after the events or conversations.
- C. Reports shall be made daily and submitted weekly. Include information about the status of the work performed, shop activities, and other events of interest to the Engineer. Examples of

attachments include: girder fabrication status records, NDT reports, paint thickness readings and camber reports. Number the reports consecutively until completion of the work, with the last report noted "final".

1. Make notes, emails, letters, faxes, reports, and memoranda clear and brief, and keep them on file.
 2. Do not make or release photographs or digital images without the Fabricator's approval.
 3. Documentation is not a substitute for appropriate dialogue with the Fabricator, but should provide a record of important discussions.
- D. Reports and associated documentation shall be stored and transmitted electronically. Selected firms will be required to supply inspection personnel with the appropriate technology (hardware and software) capable of storing and transmitting documents in the pdf format.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05124

BRIDGE RAILS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving the following items:
1. Metal Bridge Railings and Barriers to be used for permanent edge protection at Roadway Bridges, the Washington Street Railroad Bridge, including:
 - a. Type S3-TL4 Bridge Rail
 - b. Type 1 Protective Screen
 - c. Modified Type 1 Protective Screen
 - d. Type BR-2 Bridge Mounted Barrier
 2. Metal Bridge Railings and Barriers to be used for permanent edge protection at Green Line Viaducts, Structures, and Equipment Platform Structures.
 - a. Galvanized Metal Pipe Handrail / Guardrail.
- B. Related Work:
1. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 2. Section 03300 – CAST-IN-PLACE CONCRETE.
 3. Section 03301 – CAST-IN-PLACE CONCRETE FOR ROADWAY BRIDGES.
 4. Section 03601 – POST INSTALLED ANCHORS.
 5. Section 05041 – HOT DIP GALVANIZING.
- C. For all Roadway Bridges and Washington Street Railroad Bridge, Bridge Rail requirements regarding General Information, Products, and Execution, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 975.
1. For Roadway Bridges, Bridge Rail submittal requirements, including, but not limited to shop drawings, working drawings, Requests For Information, Non Conformance and testing reports, refer to Section 01300 – SUBMITTALS of the Contract Specifications.
 2. Per Division 1 of the Contract Specifications, the Contractor is responsible for all sampling and testing as outlined in their approved Quality Management Plan and Testing Plan. The Contractor is also responsible for all costs related to the sampling, testing, and related work.
 3. Replace all references to Measurement and Payment with the Sub-section 4.1 below.
- D. Performance requirements for Green Line Viaduct Structures:

1. General: In engineering handrails and guardrails to withstand structural loads indicated, determine allowable design working stresses of handrail and railing materials based on the following:
 - a. Metal Pipe Handrail/Guardrail Steel: AISC 360, "Specification for Structural Steel Buildings"
2. Structural Performance of Handrails and Guardrails: Provide handrails and guardrails capable of withstanding the following structural loads without exceeding allowable design working stresses of materials for handrails, railings, anchors, and connections:
 - a. Top Rail of Handrails/Guardrails: Capable of withstanding the following loads applied as indicated:
 1. Concentrated load of 200 lbf applied at any point and in any direction.
 2. Uniform load of 50 lbf/ft. applied horizontally and concurrently with uniform load of 100 lbf/ft. applied vertically downward.
 3. Concentrated and uniform loads above need not be assumed to act concurrently.
 - b. Intermediate Rails of Handrails/Guardrails Not Serving As Top Rails: Capable of withstanding the following loads applied as indicated:
 1. Concentrated load of 200 lbf applied at any point and in any direction.
 2. Uniform load of 50 lbf/ft vertically downward and concurrently with a uniform load of 50 lbf/ft. horizontally.
 3. Concentrated and uniform loads above need not be assumed to act concurrently.
 - c. Infill Area of Rails/Guards: Capable of withstanding a horizontal concentrated load of 200 lbf applied to 1 sq. ft. at any point in system, including panels, intermediate rails, balusters, or other elements composing infill area.
 1. Load above need not be assumed to act concurrently with loads on top rails in determining stress on Rails/guards.
 - d. Posts of Handrails/Guardrails shall be designed for a minimum single concentrated load of 200 lb. applied horizontally or vertically at any point along the post.
3. Submittals:
 - a. Shop Drawings: Show fabrication and installation of handrails and guardrails. Include plans, elevations, sections, component details, and attachments to other Work.
 - b. For installed handrails and guardrails indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer, registered in the Commonwealth of Massachusetts, responsible for their preparation.
 - c. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects

with project names and addresses, names and addresses of architects and owners, and other information specified.

- d. Product Test Reports: From a qualified testing agency indicating products comply with requirements, based on comprehensive testing of current products.
4. Storage:
 - a. Store handrails and guardrails in a dry, well-ventilated, weather tight place.
 5. Quality Assurance:
 - a. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in the Commonwealth of Massachusetts and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of handrails and guardrails that are similar to those indicated for this Project in material, design, and extent.
 - b. Testing Agency Qualifications: An independent testing agency with the experience and capability to conduct the testing indicated, as documented according to ASTM E 548.
 - c. Source Limitations: Obtain each type of handrail and guardrail through one source from a single manufacturer.
 6. Coordination:
 - a. Coordinate installation of anchorages for handrails and guardrails. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
 - b. Schedule installation so handrails and guardrails are mounted only on completed structures. Do not support temporarily by any means that does not satisfy structural performance requirements.
 7. Project Conditions:
 - a. Field Measurements: Verify handrail and guardrail dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating handrails and guardrails without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

PART 2 – PRODUCTS

2.1 BRIDGE RAILS FOR WASHINGTON STREET BRIDGE

A. Not used.

2.2 BRIDGE RAILS AND BARRIERS FOR VIADUCTS AND OTHER GREEN LINE STRUCTURES

A. METALS

1. General: Provide metal free from pitting, seam marks, roller marks, stains, discolorations, and other imperfections where exposed to view on finished units.
2. Steel and Iron: Provide steel and iron in the form indicated, complying with the following requirements:
 - a. Steel Pipe: ASTM A 53; finish, type, and weight class as follows: Type F, or Type S, Grade A, standard weight (Schedule 40), unless another grade and weight are required by structural loads.
 - b. Steel Tubing: Cold-formed steel tubing, ASTM A 500, Grade A, unless another grade is required by structural loads.
 - c. Steel Plates, Shapes, and Bars: ASTM A 36.
 - d. Iron Castings: Malleable iron complying with ASTM A 47, Grade 32510.
 - e. Iron Castings: Gray iron complying with ASTM A 48, Class 30.
3. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails, unless otherwise indicated.

B. WELDING, MATERIALS, FASTENERS, AND ANCHORS

1. Welding Electrodes and Filler Metal: Provide type and alloy of filler metal and electrodes as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.
2. Fasteners for Anchoring Handrails and Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring handrails and railings to other types of construction indicated and capable of withstanding design loads.
3. Fasteners for Interconnecting Handrail and Guardrail Components: Use fasteners fabricated from same basic metal as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or incompatible with materials joined.
 - a. Provide concealed fasteners for interconnecting handrail and guardrail components and for attaching them to other work, unless exposed fasteners are unavoidable or are the standard fastening method for handrails and railings indicated.
 - b. Provide Phillips flat-head machine screws for exposed fasteners, unless otherwise indicated.
4. Post-installed Anchors: Comply with the requirements of Specification SECTION 03601

– POST INSTALLED ANCHORS. Use epoxy anchors for all attachments to structural items.

C. FINISH

1. Galvanize all steel handrail and guardrail components in accordance with ASTM A123, after fabrication is completed.

D. FABRICATION

1. General: Fabricate handrails and guardrails to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.
2. Assemble handrails and guardrails in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
3. Form changes in direction of railing members as follows:
 - a. By flush radius bends unless otherwise indicated.
4. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail and railing components.
5. Welded Connections: Fabricate handrails and guardrails for connecting members by welding.

Cope components at perpendicular and skew connections to provide close fit, or use fittings designed for this purpose. Weld connections continuously to comply with the following.

 - a. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals at each location. The configuration and dimensions of anchoring devices shall be appropriate for the configuration, dimensions, and materials of the supporting structure.
 - b. Obtain fusion without undercut or overlap.
 - c. Remove flux immediately.
 - d. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
6. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect handrail and railing members to other work, unless otherwise indicated.
7. Provide inserts and other anchorage devices for connecting handrails and guardrails to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads

imposed by handrails and railings.

8. Shear and punch metals cleanly and accurately. Remove burrs from exposed cut edges.
9. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.
10. Cut, reinforce, drill, and tap components, as indicated, to receive finish hardware, screws, and similar items.
11. Provide weep holes or another means to drain entrapped water in hollow sections of handrail and railing members that are exposed to exterior or to moisture from condensation or other sources.
12. Close exposed ends of handrail and guardrails members with prefabricated end fittings.
13. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated. Close ends of returns at all locations.
14. Toe Boards: Where indicated, provide toe boards at handrails and guardrails around openings and at edge of open-sided platforms. Fabricate to dimensions and details indicated.

2.3 ACCEPTANCE SAMPLING AND DOCUMENTATION REQUIREMENTS FOR MASSDOT ROADWAY BRIDGES

- A. The following samples and documents must be submitted to the Program Manager per MassDOT Research and Materials assurance requirements:
 1. Sampling Frequency: A minimum of one from each source per bridge project.

PART 3 – EXECUTION

3.1 TESTING, INSTALLATION, AND INSPECTION OF BRIDGE RAILS FOR WASHINGTON STREET BRIDGE

Not used.

3.2 TESTING, INSTALLATION, AND INSPECTION OF BRIDGE RAILS FOR VIADUCTS AND OTHER GREEN LINE STRUCTURES

A. EXAMINATION

1. Examine concrete and steel surfaces to that are to receive anchors for support of the Handrail/Guardrail assemblies, to verify that locations of concealed reinforcements have been clearly marked for Installer. Locate reinforcements and mark locations if not already done.

B. INSTALLATION, GENERAL

1. Fit exposed connections together to form tight, hairline joints.

2. Perform cutting, drilling, and fitting required to install handrails and guardrails. Set handrails and guardrails accurately in location, alignment, and elevation; measured from established lines and levels and free from rack.
 - a. Do not weld, cut, or abrade surfaces of handrail and guardrail components that have been coated after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
 - b. Set posts plumb within a tolerance of 1/16 inch in 3 feet.
 - c. Align rails so variations from level for horizontal members and from parallel do not exceed 1/4 inch in 12 feet.
3. Adjust handrails and railings before anchoring to ensure matching alignment at abutting joints.
Space posts at interval indicated, but not less than that required by structural loads.
4. Fastening to In-Place Construction: Use epoxy anchorage devices and fasteners where necessary for securing handrails and guardrails and for properly transferring loads to in-place construction.

C. RAILING CONNECTIONS

1. Welded Shop Connections: Use fully welded shop joints for permanently connecting railing components, prior to galvanizing. Comply with requirements for welded connections in "Fabrication" Article.
2. Bolted Field Connections: Use mechanical means to make connections in the field, so as not to damage the galvanized coating.
3. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. At a minimum, expansion joints shall be installed at all bridge deck joint locations. Provide slip-joint internal sleeve extending 6 inches beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches of post.

D. ANCHORING POSTS

1. Anchor post to concrete surfaces with surface mounted circular or oval base plate. Base plate shall be shop welded to the post prior to galvanizing. Use post installed epoxy anchors as required to resist the design loads.
2. Anchor posts to metal surfaces with surface mounted circular or oval base plates. Base plate shall be shop welded to the post prior to galvanizing, and field bolted to supporting steel surfaces.

E. CLEANING

1. Immediately after erection, clean bolted connections, abraded areas, and exposed areas with same material showing through. Apply Engineer approved cold galvanizing compound to repair surfaces.

F. PROTECTION

1. Protect finishes of handrails and guardrails from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at the time of Substantial Completion.
2. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units. The Engineer will be the sole judge of whether material can be restored or must be replaced.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05125

BRIDGE BEARINGS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving the following items:
1. The furnishing and installation of elastomeric bearings for Roadway Bridges.
 2. The furnishing and installation of disc and elastomeric bearings for the Washington Street Railroad Bridge.
 3. The furnishing and installation of bearings for Viaduct Structures.
- B. Related Work:
1. Section 03301 – CAST-IN-PLACE CONCRETE FOR ROADWAY BRIDGES.
- C. For all Roadway Bridge bearing requirements regarding General Information, Products, and Execution, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section M9.14.5. The number and location of each type of bearing shall match the DB Entity's approved drawings. According to M9.14.5, MassDOT requires one bearing pad of each size and type for destructive testing in addition to those identified on the Design Documents.
1. For Bridge Bearing submittal requirements, including, but not limited to shop drawings, working drawings, Requests For Information, Non Conformance and testing reports, see Volume 2.
 2. The DB Entity is responsible for all sampling and testing as outlined in their approved Quality Management Plan and Testing Plan. The DB Entity is also responsible for all costs related to the sampling, testing, and related work.
- D. The following information pertains to the requirements for bearings of the Viaduct Structures:
1. Definition:
 - a. Load Range: A load range is a range of load capacities in which the highest capacity is no more than 2.0 times as large as the lowest.
 - b. Lot: A lot is a group of no more than 25 bearings of the same type (e.g. Elastomeric or Disc Bearings, and fixed, guided or floating), in the same load range.
 - c. Batch: A batch is a body of material in which the ingredients are uniformly blended together at one time.
 - d. Sample: A sample is a piece of material or a complete bearing which is tested in order to infer the properties of the batch of material or group of bearing elements from which it is taken. A sample shall consist of at least one bearing chosen randomly from each lot and material batch and shall comprise at least 10% of the lot.

E. Submittals for Washington Street Railroad Bridge and Viaduct Structures:

1. The DB Entity shall submit to the MBTA shop drawings and design calculations which are sufficiently detailed to permit proper review of the bearings. The drawings shall show all details of the bearings and of the materials proposed for use and must be approved by the MBTA before fabrication of the bearings begins. Such approval shall not relieve the DB Entity of any responsibility under the contract for the successful completion of the work. The drawings shall include, but not be limited to the following information:
 - a. Plan, elevations and sections including all nominal dimensions and material designations.
 - b. Vertical and horizontal load capacities, horizontal movement capacities and rotation capacities about two horizontal axes and one vertical axis.
 - c. Design calculations for all items designed by the bearing manufacturer.
 - d. Material designations and specifications.
 - e. A schedule of bearing offsets.
 - f. Shop coating requirements.
 - g. Any special installation requirements by the manufacturer.
2. Each bearing shall be marked in indelible ink or flexible paint. The marking shall consist of the location, orientation, order number, lot number, bearing identification number, and elastomer type and grade number, unless otherwise indicated. The marking shall be on a face which is visible after erection of the bridge.

F. Certification: the DB Entity/manufacturer shall supply certification data for all materials used. This shall consist of at least test reports for the bearing performance tests and for any forgings, castings or hardened material, mill certificates for all other steels used, and a certificate of compliance for the bearing as a whole, dowels or other accessories. If the manufacturer designed the bearing, he shall certify that each bearing satisfies the Contract Documents' requirements.

PART 2 – PRODUCTS

2.1 DISC AND ELASTOMERIC BEARINGS FOR RAILROAD BRIDGES

- A. The following information pertains to bearings for the Washington Street Railroad Bridge.
1. Description: Both Multi Rotational Disc bearings and Steel Reinforced Elastomeric bearings are to be provided for the Railroad Structure. Disc bearings both fixed and expansion shall be designed to the loads, rotations and displacements as indicated on the contract documents. Additionally, Disc and Steel Reinforced Elastomeric bearings shall be fabricated to the sizes and shapes as indicated in the details on the contract drawings, unless otherwise approved by the Engineer. Bearings of each type, either Disc or Elastomeric shall be supplied only by one manufacturer.

Fixed Multi Rotational Disc Bearings shall allow rotation but no longitudinal movement. Allowable transverse movement shall vary by girder by the amount shown on the Contract Documents.

Expansion (Guided) Multi Rotational Disc Bearings shall allow rotation and longitudinal movement in the bearing plane; allowable transverse movement shall vary by girder by the amount shown on the Contract Documents. To allow longitudinal movement, the upper steel bearing plate shall be faced with polytetrafluoroethylene (PTFE) sheet and support a sliding steel top bearing plate. The mating surface of the sliding steel top bearing plate shall be faced with polished stainless steel. Transverse movement in excess of the allowable amount shall be restricted with either a guide bar or keyway.

Fixed Steel Reinforced Elastomeric Bearings shall allow rotation but no longitudinal or transverse movement.

Expansion Steel Reinforced Elastomeric Bearings shall allow rotation and longitudinal movement in the bearing plane; transverse movement shall be restricted. To allow longitudinal movement, bearings are sized for the required shear deformation.

2. Materials

- a. Steel: All steel, except steel for guide bars and shear-restriction pins and sleeves shall conform to ASTM A709, Grade 50. Guide bars and shear-restriction devices shall be as detailed by the manufacturer, unless otherwise specified.

Stainless steel sliding surfaces shall conform to ASTM A167 or A240 Type 304, with portions in contact with PTFE polished to a No. 8 mirror finish. The minimum thickness of the stainless steel shall be shall be 0.050 inches. Welded stainless steel overlay produced using Type 309L electrodes.

- b. Elastomeric Disc (Disc Bearings): The elastomeric disc for disc bearings shall be Polyether Urethane conforming to the requirements of the Table below:

Physical Property	ASTM Test Method		Requirement	
Durometer Hardness - Shore D	D2240	45	55	65
Tensile Strength				
@ 100% Elongation	D412	1,500 psi	1,900 psi	2,300 psi
@ 200% Elongation	D412	2,800 psi	3,400 psi	4,000 psi
Tensile Strength	D412	4,000 psi	5,000 psi	6,000 psi
Ultimate Elongation (min.)	D412	350%	285%	220%
Compression Set	D395	40%	40%	40%

- c. Polytetrafluoroethylene (PTFE): PTFE sliding surfaces shall be virgin PTFE resin filled or unfilled PTFE sheets or PTFE fabric. PTFE resin shall be virgin material

(not reprocessed) meeting the requirements of ASTM D1457. Filler material, when used, shall be milled glass fibers, carbon or other inert filler materials.

Unfilled PTFE sheet shall be made of virgin PTFE resin and shall be in accordance with ASTM D3293, Type III, Grade I, Class C.

Filled PTFE sheet shall be made from virgin PTFE resin uniformly blended with inert filler material conforming to the following requirements:

Property	ASTM Method	15% Glass Fibers	25% Carbon
Tensile Strength (minimum)	D638M	2,000 psi	1,300 psi
Elongation (minimum)	D638M	150%	75%
Specific Gravity (minimum)	D792	2.20 ± 0.03	2.10 ± 0.03

Where the PTFE is to be epoxy bonded, the PTFE shall be etched by the sodium naphthalene or sodium ammonia etching process.

- d. Non-Shrink Grout: The non-shrink grout shall conform to the requirements of M.03.01- 12, and shall be flowable type capable of being pumped with a positive displacement pump through an opening 1/8” in diameter.
- e. Elastomeric (Steel Reinforced Elastomeric Bearings): The elastomeric compound shall be composed of 100% low temperature Grade 3 virgin crystallization resistant polychloroprene (neoprene), or cast polyurethane meeting the requirements of AREMA, Table 15-10-3. Material with a nominal hardness greater than 60 durometer shall not be used in reinforced bearings. Dimensions and design compressive load are indicated on the DB Entity’s approved drawings. All expansion bearings are subject to shear deformation. Shear Modulus, at 73 degrees Fahrenheit, shall fall between 130 psi and 200 psi, and have a maximum creep deflection at 25 years of 35%. Shear modulus tests shall be carried out using the apparatus and procedure described in annex A of ASTM D 4014. The vulcanized bond between reinforcement steel laminated bearings shall develop a minimum peel strength of 40 pound per inch. Peel strength tests shall be performed by ASTM D 429 Method B.
- f. Paint: Paint shall conform to the requirements indicate in the specifications and as provided on the DB Entity’s approved drawings for Structural Steel. All elements painted shall be shop painted.

3. Construction Methods

- a. Plans: Design calculations and detailed fabrication working drawings for the bearings shall include, but not be limited to, the following:
 - 1. Plan view and section elevations, providing all fabrication dimensions and required surface finishes.
 - 2. All ASTM, AREMA, and other material designations.
 - 3. Vertical and horizontal load capacity; rotation and movement capacity.

4. A schedule of all bearing offsets if required by the project.
5. Shop paint or coating requirements.

The design calculations shall be complete; verifying conformance of the bearing to provisions of this specification.

- b. Design Parameters – Notations: The symbols defined in the following notations are used in bearing design requirements presented subsequently in this Section:

DEFINITIONS

C	= exterior vertical clearance in inches between stationary and moving bearing parts.
D_d	= diameter in inches of elastomeric disc; disc bearing.
D_p	= diameter in inches of elastomeric disc; inside diameter in inches of pot.
D_s	= projected diameter in inches of loaded spherical segment.
G	= depth of pot bearing pot cavity in inches.
k	= depth of chamfer in inches on pot bearing piston.
L_h	= horizontal design load, in kips, on bearing.
L_v	= vertical design load in kips, on bearing.
R_s	= maximum design rotation of structure in radians, specified on the DB Entity's approved drawings, but not less than 0.02 radians.
R_c	= maximum construction tolerance rotation 0.005 radians unless otherwise specified on the DB Entity's approved drawings.
R_b	= minimum design rotation capacity of bearing in spherical surfaces.
R_{max}	= maximum radius in inches to prevent the unseating of spherical surfaces.
OD	= outside diameter in inches of the round pot base or the round disc base.
S	= side (outside dimension) in inches of a square pot base or square disc base.
t	= thickness in inches of elastomeric disc.
theta	= $\arctan(L_h \text{ max}/L_v \text{ min})$ radians.
W	= piston face width in inches of pot bearing.
Delta C	= compression deflection of elastomeric disc.
Bearing Proper	= The components of the bearing that are between the girder flange and the bearing base.

- c. General Requirements: Multi-rotational disc bearings shall be designed to accommodate the loads, forces and movements specified in the bearing schedule. Particular care shall be taken that all components of the bearings provide adequately for the horizontal loads and forces specified.

Maximum design stresses for all bearing components shall not exceed the allowable design stresses of the applicable issue of the AREMA Manual for Railway Engineering and the applicable sections of this specification.

Minimum rotation capacity (R_b) shall be the sum of $R_s + R_c$.

Minimum horizontal load capacity for fixed and guided bearings shall be as specified on the DB Entity's approved drawings but in no case less than 10% of the vertical dead load shown on the approved drawings. Expansion bearings shall be designed for additional movement capacity, in each direction, beyond the design movement indicated on the approved drawings. The additional movement capacity shall be 10% of the design movement or one inch, whichever is greater. Spacing between the guides of the bearing does not require this additional movement capacity.

An auxiliary plate shall be provided for all bearings as noted in the specification herein. The auxiliary plate shall be designed to fit between the bearing proper and the masonry plate. The auxiliary plate shall be engaged with the bearing proper by means of a properly designed shop weld, or by a "saucer-like" machined recess to snugly fit the base of the bearing. The purpose of the auxiliary plate is the following:

To provide a means of field installation adjustment and sufficient horizontal restraint for the base of the bearing proper without a field weld directly to the bearing where access is often difficult;

To simplify the future removal and replacement of the bearing assembly in the event maintenance is required;

To reduce the possibility of heat damage to critical bearing components during field welding installation.

Bearings shall be designed so that all rotational and sliding elements can be replaced with a minimum lifting not to exceed 1/2".

All specified machined surface finish tolerances shall be verified using a calibrated profilometer provided by the DB Entity and approved by the MBTA.

Overall bearing height if different from that shown on the DB Entity's approved drawings shall be accompanied by the necessary adjustment in the bearing pad elevation. Overall bearing height shall be not more than 3/16" greater than, nor zero (0) inch less than, detail dimension provided on the fabrication working drawings.

All finished bearing components shall be shop painted except for the following materials and surfaces: urethane, stainless steel, PTFE, inside surfaces of disc bearing in contact with urethane.

Welding shall conform to the requirements of AWS D1.1 Structural Welding Code.

1. Disc Bearings: Urethane disc: Urethane discs shall be of minimum thickness (t), where:

a. $t = [\Delta C + (R_s + R_c) \times D_d \times 0.5] \times e_{max}$

b. c = deflection due to total compressive load

- c. e_{max} = strain due to all effects except long term creep at maximum vertical stress, and shall be less than 15%.
 - d. The area of the disc shall be designed for an average stress not to exceed:
 - 1. 4000 psi for Polyether Urethane - 45 Durometer
 - 2. 5000 psi for Polyether Urethane - 55 Durometer
 - 3. 6000 psi for Polyether Urethane - 65 Durometer
 - e. Recesses in plates for discs shall have a tolerance of ± 0.030 " for all diameters. Inside surfaces facing disc shall be commercial shot blast finished in accordance with SSPC SP-6.
 - f. Limiting Ring: A limiting ring shall be provided by a welded ring, by machining a recess in the bearing plate, or by other limiting means. The depth of the limiting ring shall be equal to or greater than $D_d \times 0.014$. The inside diameter of the limiting ring shall be equal to $D_d \times 1.05$.
 - g. Plate Beneath Disc: The section thickness of the plate beneath the disc shall be:
 - 1. $D_d \times 0.06$ for bearings directly on concrete,
 - 2. $D_d \times 0.045$ for bearings directly on steel masonry plates,
 - 3. But in no case less than $\frac{3}{4}$ " on concrete and $\frac{1}{2}$ " on steel.
 - h. Vertical Clearance: Design of disc bearings shall provide vertical clearance, between rotating and non-rotating bearing parts no less than $\frac{1}{8}$ " at maximum rotation as follows:
 - 1. Bearings square in plan, $C = (R_b \times 0.7 \times S) + 0.12" + 2 \times \Delta C$
 - 2. Bearings round in plan, $C = (R_b \times OD/2) + 0.12" + 2 \times \Delta C$
 - i. Shear Mechanism: The shear restriction mechanism shall be designed to allow free rotation and withstand the specified horizontal forces. The mechanism shall be designed to withstand the design forces on the bearing without exceeding allowable shear of $0.33F_y$, bending stress of $0.55F_y$ and maximum bearing stress of $0.8F_y$. Shear resistance of the disc shall not be included. The shear mechanism shall be connected to the bearing plates by welding, machining out of the solid unless otherwise approved by the MBTA.
2. Non-Rotational Bearing Elements:
- a. PTFE: Sheet PTFE primary sliding surfaces, filled or unfilled, shall be designed for an average stress not to exceed 3,500 psi. The maximum edge stress shall be 5,000 psi at maximum combined rotation, vertical, and horizontal load. The stresses on the PTFE for Disc Bearings shall not exceed 75% of these values.

Sheet PTFE sliding surfaces shall be bonded by the bearing manufacturer under controlled conditions and in accordance with the requirements of the manufacturer of the approved adhesive system. After completion of bonding, the PTFE surface shall be smooth and free from bubbles. Filled PTFE surfaces shall be polished after bonding until smooth.

Sheet PTFE shall be a minimum of 1/8" thick, epoxy- bonded into a square-edge recess equal in depth to one half the thickness of the PTFE.

The maximum coefficient of friction for PTFE sheet shall be equal to or less than the following:

<u>PTFE Compressive Stress</u>	<u>Coefficient of Friction</u>
500 psi or less	0.08
500 to 2,000 psi	0.06
2,000 or more	0.04

- b. **Stainless Steel:** The stainless steel surface shall cover the mating surface in all operating positions plus one inch in each direction of movement.

Sheet stainless steel shall be 13 to 16 gage in thickness. It shall be connected to the substrate by a continuous weld around the entire perimeter. The sheet shall be in full contact with the substrate. Stainless steel sliding surfaces shall, preferably, be face down.

Stainless steel welded overlay shall be a minimum of 3/32" thick after welding, grinding and polishing and be produced using Type 309L electrodes.

Stainless steel sheet shall be seal-welded around the entire perimeter using techniques which ensure it remains in contact with the backing plate.

- c. **Guide Bars and Guide Keys:** Central Guide keys may be made integral by machining from the solid. Where a separate key or guide bar is used they shall be fitted in a keyway slot machined to give a press fit and bolted or welded to resist overturning. Guide bars may be made integral by machining from the solid or fabricated from bars welded, bolted and or recessed at the manufacturing option.

Guide bars and central guide keys shall be designed for the specified horizontal forces, but not for less than 10% of the vertical capacity of the bearing.

The sum of clearances between guided surfaces shall not exceed 1/8". Net contact area between guiding surfaces must remain constant throughout all operating positions.

All guide bars and guide keys shall be self-aligning. (i.e., guides in pot bearings must bear against piston components; guides in spherical bearings must bear against unfixed spherical components).

Guiding directly between fixed bearing components shall not be permitted. Stainless steel and PTFE are required on guiding surfaces. The compressive stress on PTFE shall not exceed the following average bearing stresses:

<u>Unfilled PTFE</u>	<u>Filled PTFE</u>
----------------------	--------------------

All loads except seismic loads	3,500 psi	3,500 psi
--------------------------------------	-----------	-------	-----------

(PTFE on guiding surfaces need not be designed for seismic loading).

Edge load pressure due to all loads and rotation (except seismic) shall not exceed 5,000 psi for filled or unfilled PTFE.

PTFE on guiding surfaces shall be 3/16" minimum thickness, epoxy bonded into a square edged recess 3/32" deep in the substrate. In addition, the PTFE shall be mechanically fastened by a minimum of two screws into the substrate, located at a distance equal to twice the nominal screw diameter from the end of the PTFE strip. The top of the screws shall be recessed an amount not less than the minimum of one half the PTFE relief.

- d. Travel Stops: Travel stops if detailed on the approved drawings shall be capable of resisting the horizontal forces specified. The stops shall be set a 150% of the longitudinal movement or as directed on the approved drawings.
- e. Top Plate, Masonry Plate, and Auxiliary Plate: Where top plates and masonry plates bear on concrete the concrete bearing stress on the loaded area shall not exceed the limits specified in AREMA, Volume 2, Chapter 8.

Special consideration shall be given to the design of top plates (or plate to which sliding elements are attached) to assure that any bending forces imparted during field installation do not deflect the sliding surfaces. (The top plate, for example, may be subject to extreme bending forces during a retrofit installation as a result of vertical load conditions prior to the completion of field welding).

The auxiliary plate shall be located between the bearing proper and the masonry plate. The auxiliary plate shall be shop welded to the bearing proper, or shall have a "saucer-like" recess which shall snugly fit and restrain the bearing, and have adequate capacity to resist all required design forces. All field welds required for the anchoring of the lower bearing unit shall be limited to the interface between the masonry plate and auxiliary plate.

The auxiliary plate shall be designed for all required shear and bending forces. The auxiliary plate shall be adequately designed for all bending forces imparted by vertical design loads, discounting any contribution of the field weld between it and the masonry plate. The recess machined for the pot (or lower spherical element) shall be not less than ½" in depth. The recessed surface on which the bearing proper will bear shall be machined to a tolerance equal to 0.0005 x the diameter or width or recess. The minimum thickness of the auxiliary plate after machining of the recess shall be one (1) inch. Unless otherwise approved by the Engineer, the auxiliary plate shall extend a minimum of four (4) inches beyond the plan limit of the pot (or lower spherical element) in all plan directions, but not less than one (1) inch beyond the horizontal plan limits of bearing travel stops, if required, and other bearing components if any which limit access to required field welds.

- d. Fabrication Tolerances: The classes of tolerances are defined as follows:
1. Class A: 0.001 x nominal dimensions
 2. Class B: 0.002 x nominal dimensions
 3. Class C: 0.005 x nominal dimensions

Fabrication tolerances shall be in conformance with the following table:

Item	Thickness Tolerance (in.)	Dimension Tolerance (in.)	Flatness or out-of-round tolerance (in.)	Surface finish micro-in. (ms.)
Disc Bearings				
Overall dimensions	-0.0, +1/4	-0.0, +0.125	---	---
Shear-restricting element	---	-0.0, +0.005	Class A	63
Other machined parts	-0.0, +1/16	-0.0, +0.060	Class B	125
Urethane disc	-0.0, +1/16	-0.0, +0.125	Class B	125
Guides				
Contact surface	---	-0.0, +0.125	Class A	63
Distance between guides	---	-0.0, +0.030	---	---
Parallelism of guides (radians)	---	+0.005	---	---
Load Plates				
Overall dimensions	-1/16,+1/16	-1/4, +1/4	Class A	250
Bevel slope (radians)	+0.002	---	---	---

Load plate overall dimensions for flatness tolerance and surface finish shall apply only to the surfaces in contact with the bearing.

4. Basis of Design: D.S. Brown Versiflex HLMR Disc Bearing Assemblies.
 - a. Versiflex HLMR Disc Bearing Assemblies Fixed DF Series – 30%.
 - b. Versiflex HLMR Disc Bearing Assemblies Uni-Directional DMG Series – 10%.

2.2 BEARINGS FOR VIADUCT STRUCTURES

A. General:

1. Both Multi Rotational Disc bearings and Steel Reinforced Elastomeric bearings are to be provided for the Viaduct Structure. Disc bearings both fixed and expansion shall be design to the loads, rotations and displacements as indicated on the Contract Documents.

Additionally, Disc and Steel Reinforced Elastomeric bearings shall be fabricated to the sizes and shapes as indicated in the details on the contract drawings, unless otherwise approved by the Engineer. Bearings of each type, either Disc or Elastomeric shall be supplied by only one manufacturer.

2. Bearings shall be designed and constructed in accordance with the requirements of Division I, Section 14 Bearings and Division II, Section 18 Bearings, of the American Association of State Highway and Transportation Officials (AASHTO), Standard Specification for Highway Bridges 17th Edition. Steel Reinforced Elastomeric bearings have been designed in accordance with Method B of the AASHTO Standard.
3. Fixed Multi Rotational Disc Bearings shall allow rotation but no longitudinal or transverse movement.
4. Expansion (Guided) Multi Rotational Disc Bearings shall allow rotation and longitudinal movement in the bearing plane; transverse movement shall be restricted. To allow longitudinal movement, the upper steel bearing plate shall be faced with polytetrafluoroethylene (PTFE) sheet and support a sliding steel top bearing plate. The mating surface of the sliding steel top bearing plate shall be faced with polished stainless steel. Transverse movement shall be restricted with either a guide bar or keyway.
5. Fixed Steel Reinforced Elastomeric Bearings shall allow rotation but no longitudinal or transverse movement.
6. Expansion Steel Reinforced Elastomeric Bearings shall allow rotation and longitudinal movement in the bearing plane; transverse movement shall be restricted. To allow longitudinal movement, bearing are sized for the required shear deformation.

B. Materials – Viaduct Structure and Multi Rotational Bearings and Steel Reinforced Elastomeric Bearings.

1. Steel: All steel, shall conform to ASTM A709, Grade 50. Multi Rotational Disc Bearing Guide bars, load plates, uplift restraints and shear-restriction devices shall be as detailed by the manufacturer, unless otherwise specified or indicated. Steel for laminates of Elastomeric Bearings shall conform to ASTM A36.
2. Stainless steel sliding surfaces shall conform to ASTM A167 or A240 Type 304, with portions in contact with PTFE polished to a No. 8 mirror finish. The minimum thickness of the stainless steel shall be 0.050". Welded stainless steel overlay produced using Type 309L electrodes.
3. Elastomeric Disc (Disc Bearings): The rotational element of the disc bearing shall be made from an elastomeric compound with a hardness which lies between 45 and 65 on the Shore D scale. The elastomeric disc for disc bearings shall be Polyether Urethane conforming to the requirements of the AASHTO Table 18.4.7.1-1.
4. Polytetrafluoroethylene (PTFE): PTFE sliding surfaces shall be 100% new material and shall comply with ASTM D 4894 or D 4895. It shall satisfy the requirements of AASHTO Table 18.4.3.1-1. No reclaimed material shall be used. Finished PTFE sheet, strip and fabric shall be resistant to acids, alkalis, and petroleum products, stable at temperatures from - 360°F to + 500°F, nonflammable, and nonabsorbent of water.

- a. Filler material, when used in PTFE, shall be milled glass fiber, carbon fiber or other approved fiber. The filler shall not react chemically with the PTFE but shall adhere to it so that the two act compositely.
 - b. Finished PTFE sheet shall be made from virgin PTFE resin or virgin PTFE resin uniformly blended with approved filler. The maximum filler content shall be 15% for fiberglass and 25% for carbon fibers. The PTFE sheet shall satisfy the requirements of AASHTO Table 18.4.3.1-1. Values for intermediate filler contents may be obtained by interpolation.
 - c. Adhesive used for bonding sheet PTFE shall be an epoxy material satisfying the requirements of federal specification MMM-A-134, FEP film or equal, as approved by the MBTA.
 - d. Lubricant, if used, shall consist of a combination of solids which does not react chemically or electrolytically with the PTFE and its mating surface and shall remain stable in the environmental conditions expected at the bridge site.
5. Elastomeric (Steel Reinforced Elastomeric Bearings): The elastomeric compound shall be composed of 100% low temperature Grade 3 virgin crystallization resistant polychloroprene (neoprene) meeting the requirements of AASHTO M 251 and Division II, Section 18 of the AASHTO Standard Specifications for Highway Bridges, Table 18.4.5.1-1A. All bearings shall consist of 60 Shore A Durometer hardness, dimensions, design compressive load are indicated on the approved drawings. All expansion bearings are subject to shear deformation. Shear Modulus, at 73 degrees Fahrenheit, shall fall between 130 psi and 200 psi, and have a maximum creep deflection at 25 years of 35%. Shear modulus tests shall be carried out using the apparatus and procedure described in annex A of ASTM D 4014. The vulcanized bond between reinforcement steel laminated bearings shall develop a minimum peel strength of 40 pound per inch. Peel strength tests shall be performed by ASTM D 429 Method B.
 6. Bedding materials below bearing assemblies when indicated shall consist of common desilverized sheet lead, conforming to ASTM B 29. The sheets shall be of uniform thickness and shall be free from cracks, seams, slivers, scale, and other defects. Unless otherwise specified, lead sheet thickness shall be 1/8" plus or minus 0.03".

PART 3 – EXECUTION

3.1 TESTING, INSTALLATION, AND INSPECTION OF DISC AND ELASTOMERIC BEARINGS FOR RAILROAD BRIDGES

A. Testing

1. General: Tests shall be performed on test bearings as specified below to ensure the requirements of the specification have been met. Testing is to be performed at the manufacturer's plant.
Bearing with capabilities that exceed the manufacturer's testing capacity shall be tested at an approved testing laboratory. If suitable test equipment is not available in the United States, alternative testing/inspection procedures will be agreed between the Department and the manufacturer.

2. Sampling: Tests shall be performed on randomly selected samples from the production bearings. One bearing per "lot" shall be tested. A lot shall be defined as the smallest number of bearings as determined by the following criteria:
 - a. One lot shall not exceed a single contract or project quantity. One lot shall not exceed 25 bearings.
 - b. A lot shall consist of those bearings of the same type within a "Load Category". Bearing types shall be fixed type bearings or expansion type bearings. Guided and non-guided expansion bearings will be considered a single type.
 - c. One load category shall consist of bearings of differing vertical load capacity within a load range as outlined below:
 1. For bearings less than or equal to 1,000 kips capacity, the Load Category shall be based on a range of 500 kips.
 2. For bearings greater than 1,000 kips capacity but less than or equal to 3,000 kips capacity, the Load Category shall be based on range of 1,000 kips.
 3. For bearings in excess of 3,000 kips capacity the Load Category shall be based on a range of 2,000 kips.
3. Friction Test: A sample from each lot of expansion bearings shall be tested. Specially made bearings shall not be used; only actual bearings to be used in the project shall be tested.

The test method and equipment shall be approved by the MBTA and include the following requirements:

- a. The test must be arranged so that the static coefficient of friction on the first movement of the manufactured bearing can be determined.
 - b. The bearing surface shall be cleaned prior to testing.
 - c. The test shall be conducted at the maximum working stress for the PTFE surface with the test load applied for 12 hours prior to measuring the friction.
 - d. The first movement static and dynamic coefficients of friction shall be determined at a sliding speed of 1 inch per minute or less and shall not exceed the coefficient of friction stated on the Contract Documents.
 - e. The bearing specimen shall be subjected to a minimum of 100 movements of at least one inch of relative movement at a speed of less than 12 inches per minute. After cycling the static and dynamic coefficients of friction shall be determined again at a speed of less than one inch per minute and shall not exceed the coefficient of friction specified for the PTFE elsewhere in this special provision. The bearing shall show no visible sign of bond failure or other defects.
4. Proof Load Test: One bearing shall be tested from each production "lot" of fixed and expansion bearings. Load shall be applied to the test bearings equal to 150% of the rated design capacity of the bearing simultaneously rotated 0.02 radians or the design rotation, whichever is greater, for one hour. During the test or subsequently upon disassembly, the bearing shall show no sign of deformation or extrusion of elastomer or PTFE.
 5. PTFE Bond Test: Bearings with Sheet PTFE Primary Surfaces shall, at the option of the Engineer, have a 180 degree peel test performed on the primary PTFE sliding surface

using the ASTM D903 Test Method. Minimum peel strength shall be 20 lbs. per inch. One bearing from each production lot shall be tested.

Bearings with Fabric PTFE Primary Sliding Surfaces shall have the primary PTFE tested in shear. One bearing from each production lot shall be tested as follows:

- a. The component carrying the Fabric PTFE (or complete bearing at the option of the manufacturer) shall be subjected to the maximum vertical design load of the bearing and simultaneously but transversely, a load equal to 13% of the vertical design load for a period of one minute. Slip or creep shall not exceed 1/8" during the test.
- b. Only bearings from lots from which test specimens have passed all the above requirements will be approved for use in the structure.

Bearing assemblies shall be securely fixed together as units so that they may be shipped to the job site and stored without relative movement of the bearing parts or disassembly at any time. Bearings shall be wrapped in moisture resistant and dust resistant material to protect against shipping and job site conditions.

Care shall be taken to ensure that bearings at the job site are stored in a dry sheltered area free from dirt or dust until installation.

When bearings are to be inspected on site, they shall be inspected within one week of arrival and may not be disassembled except under the supervision of the manufacturer or his representative or with the written approval of the manufacturer. Following inspection, the wrapping shall be reapplied and the bearings kept clean until installation.

Removal of top plates of bearings for separate attachment to the structure is not permitted except under the direct supervision of the manufacturer and by approval of the MTBA.

B. Shipping and Packing:

1. Bearing assemblies shall be securely fixed together as units so that they may be shipped to the job site and stored without relative movement of the bearing parts or disassembly at any time. Bearings shall be wrapped in moisture resistant and dust resistant material to protect against shipping and job site conditions.

Care shall be taken to ensure that bearings at the job site are stored in a dry sheltered area free from dirt or dust until installation.

When bearings are to be inspected on site, they shall be inspected within one week of arrival and may not be disassembled except under the supervision of the manufacturer or his representative or with the written approval of the manufacturer. Following inspection, the wrapping shall be reapplied and the bearings kept clean until installation.

Removal of top plates of bearings for separate attachment to the structure is not permitted except under the direct supervision of the manufacturer and by approval of the MBTA.

C. Installation:

1. Bearings shall be evenly supported over their upper and lower surfaces under all erection and service conditions.

Bearings shall be lifted only by their underside or specially designed lifting lugs.

When installing bearings, extreme care shall be exercised to protect bearing surfaces from damage and contamination.

The bearing assembly shall be aligned with the superstructure as shown on the approved drawings. On guided bearings, special care must be taken to properly align the guiding mechanism with the designated expansion direction of the structure as shown on the Design Documents.

Bearing straps or retaining clamps shall be left in place as long as possible to ensure parts of bearings are not inadvertently displaced relative to each other. Care must be taken to remove straps or clamps before any normal structural movement takes place.

Offsets of upper and lower bearing parts shall be set as required by the approved drawings to compensate for loan deflection, temperature movement, and elastic shortening and creep of post-tensioned concrete superstructure as the case may be.

Bearings installed on a concrete substructure shall be installed over a preformed fabric pad, or shall bear upon non-shrink grout, as indicated on the Design Documents.

Where bearings are installed over a prefabricated pad on a concrete bearing pad, the concrete bearing pad surface shall be prepared to the correct elevation and finished to the following flatness tolerance:

For bearings seats up to 30" in length or width.....1/16".
For bearings seats over 30" but less than 45"..... 3/32".
Bearing seats over 45"..... 1/8".
There shall be no projecting irregularities exceeding 1/32". Bearing seats shall be level within 1:200 slope.

Where bearings are installed with non-shrink grout, the masonry plate must be set to the proper elevation and leveled by adjusting the anchor bolt leveling nuts as shown on the Design Documents.

The masonry plate shall be installed level to within 1:200 slope. The anchor bolt protrusions above the masonry plate surface shall be cut off. The remaining anchor bolts shall be field welded to the masonry plate and ground flat as directed on the approved drawings. The flowable non-shrink grout must be placed at even density beneath the entire masonry plate surface such that no voids are created. Grout shall reach a minimum compressive strength of 4,500 psi before bearing loads shall be applied.

The mating surface with the superstructure shall be a plane surface to within a slope of 1:200. Following alignment of the bearing components, top plate and auxiliary plate shall be field welded in position as shown on the Design Documents. Welding procedures shall be established by the DB Entity to restrict the maximum temperature of the bonded PTFE surfaces to 300 °F and maximum temperature of the elastomer (Polyether-urethane, Neoprene or Natural Rubber) to 250°F. Temperatures shall be determined by temperature indicating wax pencils or other suitable means.

Particular care should be exercised to mask and protect the PTFE and polished stainless steel surfaces to protect them from blast abrasive and paint application during construction.

The DB Entity shall repair any damage to bearing finishes following installation at no cost to the MBTA.

Bearings shall receive touch-up painting after installation as in accordance with other Contract special provision items addressing the painting of structural steel.

A continuous bead of silicone, ¼” thick, shall be applied along the interface between auxiliary plate and the bearing proper following completion of painting where the bearing proper is retained by a recessed opening in the auxiliary plate.

3.2 FABRICATION, TESTING, AND INSTALLATION OF MULTI-ROTATIONAL DISC BEARINGS AND STEEL REINFORCED ELASTOMERIC BEARINGS FOR VIADUCT STRUCTURES

A. Fabrication:

1. General:

- a. The DB Entity shall provide complete design of Multi Rotational Disc Bearings for the loads, and movements indicated on the contract drawings. Bearing dimensions as indicated on the Contract Documents for Disc Bearings shall be used for the design. Any changes to the dimensions and sizes shown shall not be made unless prior written acceptance is made by the MBTA. The DB Entity shall submit to the MBTA shop drawings and design calculations stamped and signed by a Professional Engineer registered in the Commonwealth of Massachusetts.
- b. Bearings shall be accurately machined to the dimensions and tolerances shown on the Design Documents and shall be free from flaws.
- c. All fabrication for steel plates shall comply with Section 11.4 of Division II of AASHTO Standard Specification. All welding shall conform to, and all welders shall be qualified in accordance with, the requirements of the ANSI/AASHTO/AWS D 1.5 Bridge Welding Code.
- d. Disc Bearings shall be attached to the masonry plate a method that permits transfer of all the specified loads and that can allow for future replacement of the bearing.
- e. Unless otherwise indicated, the dimensional tolerances and surface finishes of the bearings shall satisfy the requirements of Table 18.5.1.5-1 of the AASHTO Standard, for Disc Bearings, Steel Reinforced Elastomeric Bearings, Flat PTFE Sliding Bearings, Guides and Load Plates.

2. Fabrication of PTFE elements shall be made of a single piece. All flat sheet PTFE attached to a metal backing plate shall be attached by recessing into the backing plate for one half of the PTFE thickness and bonding. PTFE attached to other materials, such as elastomers, shall be attached by methods approved by the engineer. The PTFE shall be factory-bonded, using an adhesive in accordance with these specifications and the instructions of the adhesive’s manufacturer. Prior to bonding, the surface shall be etched by an approved manufacturer

using the sodium naphthalene or sodium ammonia process. When the backing plate is metal, the bonding shall be conducted under a uniform pressure greater than 100 psi. The peel strength of the bond shall be not less than 20 pounds per inch, tested in accordance with ASTM D 429 Method B. The finished surface of the PTFE shall be smooth, free from bubbles and shall conform to the tolerances shown in AASHTO Table 18.5.1.5-1. Filled PTFE sheets shall be polished after bonding. Lubricant shall be applied to the entire PTFE surface if required by the bearing manufacture.

3. Stainless Steel Mating Surfaces shall be fabricated as a single piece. Each sheet shall be attached to its backing material by seal welding around the entire perimeter so as to prevent entry of moisture between the stainless steel and the backing material. Welds shall conform to the American Welding Society requirements for stainless steel. After welding, the stainless steel sheet shall be flat, free from wrinkles and in continuous contact with its backing plate.
4. Steel Reinforced Elastomeric Bearings shall be manufactured as a single unit to dimensions as indicated on the contract drawings. Flash tolerance, finish, and appearance shall meet the requirements of the latest edition of the Rubber Handbook as published by the Rubber Manufacturers Association, Inc., RMA F3 and T.063 for molded bearings and RMA F2 for extruded bearings. Bearings shall be cast as a unit in a mold and shall be bonded and vulcanized under heat and pressure. The mold finish shall conform to standard shop practice. The internal steel laminates shall be sandblasted and cleaned of all surface coatings, rust, mill scale and dirt before bonding, and shall be free of sharp edges and burrs. External Sole Plates shall be galvanized and vulcanized bonded to the bearing assembly due the manufacturing process.

B. Fabrication Requirements for Disc Bearings:

1. The steel housing of the disc bearing shall be made by machining from a single piece of plate or by fabrication by welding. The shear restriction mechanism shall be connected to the bearing plate by mechanical fastening, welding or other means approved by the MBTA.
2. The polyether urethane rotational element shall be molded as a single piece. The finish of the mold shall be free from burrs and shall conform to good shop practice.
3. Guide bars shall be attached to the body of the bearing by a method which minimizes distortion and allows the flatness tolerances on all parts of the bearing to be met after attachment. The sliding surfaces of the guide system shall be flat and parallel. Bolts or threaded fasteners used to attach the guide bars to their supporting plates shall have an embedded thread length adequate to develop their required strength. PTFE and Stainless steel sliding surfaces shall be attached by two or more of the following methods simultaneously: bonding, recessing and mechanical attachment with countersunk fasteners. If the material is bonded, it shall first be etched by the method recommended by the manufacturer of the material or the bonding agent. Recessing shall be one half of the material thickness. Fasteners shall be countersunk to a depth which ensures that they will not touch the mating material after allowing for wear.
4. Load plates shall be made from a single steel plate or they may be built up from several steel laminates, each oriented in the plane perpendicular to the direction of the load. Built up load plates shall be joined by complete seal welding to prevent ingress of moisture. Such welds shall also provide sufficient shear strength to resist the applied loads. The load plates shall have no sharp comers or edges. Holes may be formed by drilling or punching. All burrs shall be removed by grinding.

- C. Corrosion Protection, all exposed steel surfaces for both Disc Bearings and Steel Reinforced Elastomeric Bearings, except stainless steel, shall be galvanized in accordance with ASTM A123.
- D. Testing and Acceptance for Viaduct Structure Multi Rotational Disc Bearings and Steel Reinforced Elastomeric Bearings, shall be conducted in accordance with AASHTO Standard section 18.7.2 Tests and AASHTO M251, for the following criteria by the Manufacturer and all reports shall be submitted the MBTA for approval. Any bearing test that indicates non-compliance with the requirements will subjected to rejection of the bearing Lot. The Manufacturer may elect to test each bearing in a Lot that is rejected at their own expense. Any bearing found to be acceptable may be used in the final construction at the DB Entity's discretion. Each bearing with a tapered sole plate that is selected for testing shall be delivered to the test site accompanied by an unattached plate identical to the tapered sole plate. The single beveled plate shall be so constructed that, when placed in contact with the tapered sole plate, the two shall form a single body, rectangular in shape and uniform in thickness.
1. Material Certification Tests
 2. Dimensional Check
 3. Material Friction Test (sliding surfaces only)
 4. Bearing Friction Test (sliding surfaces only)
 5. Clearance Test
 6. Short-term Compression Proof Load Test
 7. Long-term Compression Proof Load Test
 8. Long-term Deterioration Test
 9. Bearing Horizontal Force Capacity (fixed and guided bearings only)
- E. Installation for Viaduct Structure Multi Rotational Disc Bearings and Steel Reinforced Elastomeric Bearings: Bearings shall be installed by qualified personnel at the locations shown on the Design Documents. Bearings shall be set to the dimensions and offsets as indicated on Contract Documents and shall be adjusted as necessary to take into account the temperature and future movements of the bridge due to temperature changes.
1. Each bearing shall be located within 1/8" of its correct position in the horizontal plane and oriented to within an angular tolerance of 0.02 radians. All bearings shall be set horizontal to within an angular tolerance of 0.005 radians, and must have full and even contact with load plates, where they exist. The superstructure supported by the bearing shall be set on it so that, under full dead load, its slope lies within an angular tolerance of 0.005 radians of the design value. Any departure from this tolerance shall be corrected by means of a tapered plate or by other means approved by the MBTA.

END OF SECTION

SECTION 05126

STRUCTURAL STEEL FOR RETAINING WALLS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This section specifies the following items.
 - 1. Structural Steel Elements will be used in the Soldier Pile and Lagging Retaining Walls for soldier piles and support angles.
 - 2. Structural Steel Elements will be used in the Noise Barrier Assemblies for steel anchorages.
- B. Items To Be Furnished Only: Furnish the following items for installation by the designated Sections:
 - 1. Section 03300 – CAST-IN-PLACE CONCRETE: Anchor bolts, drilled shaft reinforcement, inserts, embedded wall plates, loose leveling plates and similar items.
- C. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION

1.2 DEFINITIONS

- A. Structural Steel: Elements of structural-steel frame, as classified by AISC's "Code of Standard Practice for Steel Buildings and Bridges", that support design loads.
- B. Soldier Pile: Vertical pile member used in construction of Soldier Pile and Lagging Retaining Walls.

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Show fabrication of structural-steel components.
 - 1. Include details of cuts, connections, splices, camber, holes, and other pertinent data.
 - 2. Include embedment drawings.
 - 3. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length and type of each weld.
 - 4. For structural-steel connections indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Welding Certificates: Certificate from AWS indicating certification in type of welding required for each welder and welding operator.
- D. Welding Records and Data:

1. Before welding, submit the procedure which will be used for qualifying welders and welding procedures. For procedures other than those pre-qualified in accordance with AWS D1.1, submit a copy of procedure qualification test records.
 2. Submit certified copy of qualification test records for each welder, welding operator, and tacker who will be employed in the work.
 3. If field welding is permitted, submit descriptive data for field welding equipment.
 4. Submit all NDE records (radiographs, ultrasonic, magnetic particle) and visual inspection reports upon completion or when otherwise requested by the Engineer.
- E. Qualification Data: For installer, fabricator, professional engineer, testing agency, welding inspectors, NDE inspectors and galvanizer. Submit prior to starting work.
- F. Mill Test Reports: Signed by manufacturers certifying that the following products comply with requirements:
1. Structural steel including chemical and physical properties.
 2. Bolts, nuts, and washers including mechanical properties and chemical analysis.
 3. Shear stud connectors.
 4. Shop primers.

1.4 QUALITY ASSURANCE

- A. Fabricator Qualifications: A qualified fabricator who participates in the AISC Quality Certification Program and is certified for: Steel Building Structures (STD); or Simple Steel Bridge Structures (SBD); or Major Steel Bridges (CBR) as applicable.
- B. Galvanizer Qualifications: Engage the services of a qualified galvanizer who has demonstrated a minimum of five years' experience in the successful application of galvanized coatings specified in this Section in the facility where the work is to be performed and who will apply the coatings within the same facility.
- C. Installer Qualifications: A qualified installer with previous experience in installing structural steel.
- D. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel"
- E. Comply with applicable provisions of the following specifications and documents:
1. AISC's "Code of Standard Practice for Steel Buildings and Bridges"
 2. AISC's "Specification for Allowable Stress Design of Single-Angle Members" and "Specification for Load and Resistance Factor Design of Single-Angle Members"
 3. AASHTO Standard Specifications for Highway Bridges, 17th Edition, 2002 with latest Interims
- F. Tests and Inspection
1. The Contractor will test and inspect bolted and welded connections and prepare test reports. Specialty tests shall be performed at no expense to the MBTA by an independent testing laboratory approved by the Engineer. Costs of specialty tests shall be borne by the Contractor. Test reports shall be submitted to the Engineer for approval.
 2. The Engineer reserves the right to inspect high-strength bolted connections and weld connections. Provide access to places where structural steel work is being fabricated or erected

so that required inspection and testing can be accomplished at no change in Contract Price. At times, inspection may require moving or handling of steel to permit proper inspection. Notify Materials Testing Laboratory not less than 48 hours prior to start of fabrication.

3. The Engineer may inspect structural steel at the plant before shipment; however, the Engineer reserves the right, at any time before final acceptance, to reject material not complying with specified requirements.
4. Correct deficiencies in structural steel work that inspections and laboratory test reports have indicated to be not in compliance with requirements at the Contractor's expense. Perform additional tests, at no expense to the MBTA, as may be necessary to reconfirm any non-compliance of the original work, and as may be necessary to show compliance of corrected work.
5. Specialty Tests: Nondestructive examination of welds in accordance with provisions of AWS D1.1 and ASTM Standards noted shall be made in accordance with the following schedule:
 - a. Radiographic Examination of Welds, per ASTM E94 and E142:
 1. Field, complete joint penetration groove welds:
 - a. 1 out of 5 (20 percent) with thickness equal to or less than 3/4 inch.
 - b. 100 percent with thickness greater than 3/4 inch.
 2. Shop, complete joint penetration groove welds:
 - a. 1 out of 10 (10 percent) with thickness equal to or less than 3/4 inch.
 - b. 1 out of 2 (50 percent) with thickness greater than 3/4 inch and equal to or less than 1-1/2 inches.
 - c. 100 percent for thickness greater than 1-1/2 inches.
 - b. Ultrasonic Examination, per ASTM E164: Complete joint penetration groove butt welds not accessible for radiographic examination shall be subjected to ultrasonic testing. The extent shall be the same as noted for radiographic examination. Ultrasonic examination shall be made 48 to 72 hours after welding at locations on weldments or welded joints subject to high restraint as indicated in order to check for lameller tearing. The exact location of the areas to be inspected shall be determined with the Engineer at the time of fabrication. This examination shall be made according to the following schedule unless conditions of tearing require a greater number of tests, as directed:
 1. 1 out of 10 (10 percent) for thickness equal to or less than 3/4 inch.
 2. 1 out of 5 (20 percent) for thickness greater than 3/4 inch and equal to or less than 1-1/4 inches.
 3. 1 out of 2 (50 percent) for thickness greater than 1-1/4 inches.
 - c. Magnetic Particle Examination, per ASTM E709, field and shop:
 1. 1 out of 5 (20 percent) of complete joint penetration groove welds of tee and corner joints.
 2. 1 out of 10 (10 percent) of partial joint penetration groove and fillet welds.

- d. Penetrant Examination, per ASTM E165: Shall be used for detecting discontinuities that are open to the surface use as appropriate.
 - 6. Visual Examination: All welds whether otherwise examined or not shall be visually examined and faulty joints shall be marked for correction.
 - 7. When any testing, examination or inspection reveals faulty welds, all joints of the same type shall be checked at no expense to the MBTA until the integrity of the weld is assured before resuming examination.
 - 8. After faulty welds have been corrected or repaired, they shall each be re-examined at no expense to the MBTA in the manner specified for the original joint.
 - 9. It is intended that inspections shall be performed to permit an orderly flow of completed material from the shop. Work with the Engineer to establish a schedule that will permit this.
 - 10. Test result information shall be forwarded to the Engineer immediately after test results are available stating the acceptance or rejection of fabricated pieces in order that the repairs and re-inspection may be made as soon as possible.
- G. Pre-Installation Conference: Contractor shall schedule a meeting to be attended by Contractor, Engineer, fabricator and galvanizer. Agenda shall include the following: Project schedule, source for each fabrication, coordination between fabricator and galvanizer and adjacent work, finish of surfaces, application of coatings, submittals, and approvals.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Store materials to permit easy access for inspection and identification. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers. Protect steel members and packaged materials from erosion and deterioration.
 - 1. Store fasteners in a protected place. Clean and re-lubricate bolts and nuts that become dry or rusty before use.
 - 2. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures. Repair or replace damaged materials or structures as directed.

1.6 COORDINATION

- A. Furnish anchorage items to be embedded in or attached to other construction without delaying the Work. Provide setting diagrams, sheet metal templates, instructions and directions for installation.

PART 2 - PRODUCTS

2.1 STRUCTURAL-STEEL MATERIALS

- A. Rolled Sections: ASTM A572 Grade 50, AASHTO M270 Grade 50 or higher, galvanized.
- B. Built-Up Sections, Plates, Cap Plates, Plates Serving Non-Structural Purpose, and All Other Sections Including Angles and Channels: ASTM A36, AASHTO M270 Grade 36, galvanized.
- C. Sheet Piles: ASTM A572 Grade 50, AASHTO M222 Grade 50 or higher, ungalvanized.

- D. Grating for Stairs: ASTM A569 or ASTM A36, galvanized.
- E. Welding Electrodes: Comply with AWS requirements.

2.2 BOLTS, CONNECTORS, AND ANCHORS

- A. High-Strength Bolts, Nuts, and Washers: ASTM A325, Type 1, heavy hex steel structural bolts; ASTM A563 heavy hex carbon-steel nuts; and ASTM F436 hardened carbon-steel washers.
 - 1. Finish: Hot-dip zinc coating, ASTM A153, Class C.
- B. Anchor Bolts: ASTM F1554, Grade 55, hot-dip zinc coating, ASTM A153, Class C.
- C. Headed Welded Studs: ASTM A108, Grade 60, low carbon steel, galvanized
- D. Threaded Welded Studs: ASTM A307, Grade 60, carbon steel, galvanized

2.3 MISCELLANEOUS MATERIALS

- A. Galvanizing Repair Paint: Coatings meeting requirements of ASTM A780.
- B. Nonmetallic, Shrinkage-Resistant Grout: ASTM C1107, factory-packaged, non-shrink, nonmetallic aggregate grout, noncorrosive, non-staining, mixed with water to consistency suitable for application and a 30-minute working time.

2.4 FABRICATION

- A. Structural Steel: Fabricate and assemble in shop to greatest extent possible. Fabricate according to AISC's "Code of Standard Practice for Steel Buildings and Bridges" and AISC's "Specification for Structural Steel Buildings--Allowable Stress Design and Plastic Design".
 - 1. Camber structural-steel members where indicated.
 - 2. Identify high-strength structural steel according to ASTM A6/A6M and maintain markings until structural steel has been erected.
 - 3. Mark and match-mark materials for field assembly.
 - 4. Complete structural-steel assemblies, including welding of units, before starting shop-priming operations.
- B. Thermal Cutting: Perform thermal cutting by machine to greatest extent possible. Plane thermally cut edges to be welded to comply with requirements in AWS D1.1.
- C. Bolt Holes: Cut, drill, or punch standard bolt holes perpendicular to metal surfaces.
- D. Finishing: Accurately mill ends of stair columns and other members transmitting bearing loads prior to welding.
- E. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1 and manufacturer's written instructions.
- F. Holes: Provide holes required for securing other work to structural steel and for passage of other work through steel framing members.

1. Cut, drill, or punch holes perpendicular to steel surfaces. Do not thermally cut bolt holes or enlarge holes by burning.
2. Base-Plate Holes: Cut, drill, mechanically thermal cut, or punch holes perpendicular to steel surfaces.
3. Weld threaded nuts to framing and other specialty items indicated to receive other work.

2.5 SHOP CONNECTIONS

- A. High-Strength Bolts: Shop install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A325 or A490 Bolts" for type of bolt and type of joint specified.
- B. Weld Connections: Comply with AWS D1.1 for welding procedure specifications, tolerances, appearance, and quality of welds and for methods used in correcting welding work. Complete welds in accordance with the Contract Drawings.
 1. Remove backing bars or runoff tabs, back gouge, and grind steel smooth.
 2. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances of AISC's "Code of Standard Practice for Steel Buildings and Bridges" for mill material.
 3. Insufficient welds shall be rejected and corrected until required profiles are met.
 4. Verify that weld sizes, fabrication sequence, and equipment used for architecturally exposed structural steel will limit distortions to allowable tolerances. Prevent weld show-through on exposed steel surfaces.
 - a. Grind butt welds flush.
 - b. Grind or fill exposed fillet welds to smooth profile. Dress exposed welds.
 5. No skip welds will be permitted for steel connections to be coated.

2.6 STEEL PRIMERS AND FINISHES

- A. Hot-Dip Galvanizing for Steel: For steel exposed to the elements, weather or corrosive environments and other steel indicated to be galvanized, provide coating for iron and steel fabrications applied by the hot-dip process. Provide hot-dip galvanizing, certified OTC/VOC compliant less than 2.8 lbs/gal. and conforming to EPA and Commonwealth of Massachusetts requirements. Comply with ASTM A123 for fabricated products and ASTM A153 for hardware. Provide thickness of galvanizing specified in referenced standards. The galvanizing bath shall contain high grade zinc and other earthly materials. Fill vent holes and grind smooth after galvanizing. Blast cleaning of the surface is unacceptable for surface preparation. Coatings must meet or exceed the following performance criteria
 1. Abrasion: ASTM D4060, CS17 Wheel, 1,000 gram load.
 2. Adhesion: ASTM D3359, Method B, 5 mm crosshatch.
 3. Humidity Resistance: ASTM D4585.
 4. Salt Spray (Fog): ASTM B117.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify elevations of concrete-bearing surfaces and locations of anchor rods, bearing plates, and other embedments, with steel erector present, for compliance with requirements. Elevations shall be verified by a surveyor licensed in the Commonwealth of Massachusetts.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Provide temporary shores, guys, braces, and other supports during erection to keep structural steel secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads. Remove temporary supports when permanent structural steel, connections, and bracing are in place, unless noted otherwise.

3.3 ERECTION

- A. Set structural steel accurately in locations and to elevations indicated and according to AISC's "Code of Standard Practice for Steel Buildings and Bridges".
- B. Maintain erection tolerances of structural steel within AISC's "Code of Standard Practice for Steel Buildings and Bridges".
- C. Align and adjust various members forming part of complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact with members. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
 - 1. Level and plumb individual members of structure.
 - 2. Make allowances for difference between temperature at time of erection and mean temperature when structure is completed and in service.
- D. Splice members only where indicated.
- E. Remove erection bolts on welded structural steel; fill holes with plug welds; and grind smooth at exposed surfaces.
- F. Do not use thermal cutting during erection unless approved by Engineer. Finish thermally cut sections within smoothness limits in AWS D1.1.
- G. Do not enlarge unfair holes in members by burning or using drift pins. Ream holes that must be enlarged to admit bolts.
- H. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1 and manufacturer's written instructions.

3.4 FIELD CONNECTIONS

- A. High-Strength Bolts: Install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A325 or A490 Bolts" for type of bolt and type of joint indicated on the Drawings.

- B. Weld Connections: Comply with AWS D1.1 for welding procedure specifications, tolerances, appearance, and quality of welds and for methods used in correcting welding work.
1. Comply with AISC's "Code of Standard Practice for Steel Buildings and Bridges" for bearing, adequacy of temporary connections, alignment, and removal of paint on surfaces adjacent to field welds.
 2. Remove backing bars or runoff tabs, back gouge, and grind steel smooth.
 3. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances of AISC's "Code of Standard Practice for Steel Buildings and Bridges" for mill material.
 4. Verify that weld sizes, fabrication sequence, and equipment used for structural steel will limit distortions to allowable tolerances. Prevent weld show-through on exposed steel surfaces.
 - a. Grind butt welds flush.
 - b. Re-profile all steel surfaces (using needle guns or other profiling methods) that have been welded and ground smooth to assure proper adhesion of primers and topcoats.

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified independent testing and inspecting agency to inspect field welds and high-strength bolted connections.
- B. Bolted Connections: Bolted connections will be inspected according to RCSC's "Specification for Structural Joints Using ASTM A325 or A490 Bolts". When using bolted connections prime with "slip critical class B" primer as specified in this Section. All surfaces of bolted or bearing connections may be primed. When welding, hold back primer a minimum of 2 inches each side of weld.
- C. Welded Connections: Field welds will be visually inspected according to AWS D1.1. In addition to visual inspection, specialty tests will be performed in accordance with AWS D1.1 and at the frequency stated in Article 1.5.F.5
- D. In addition to visual inspection, test and inspect field-welded shear connectors according to requirements in AWS D1.1 for stud welding and as follows:
1. Perform bend tests if visual inspections reveal either a less-than- continuous 360-degree flash or welding repairs to any shear connector.
 2. Conduct tests on additional shear connectors if weld fracture occurs on shear connectors already tested, according to requirements in AWS D1.1.
- E. Correct deficiencies in Work that test reports and inspections indicate do not comply with the Contract Documents.

3.6 REPAIRS AND PROTECTION

- A. Repair damaged galvanized coatings on galvanized items with galvanized repair paint according to ASTM A780 and manufacturer's written instructions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05210

STEEL JOISTS

PART 1 - GENERAL

1.1 SUMMARY

- A. This section includes the contractor designed hot rolled or cold-formed steel joist framing elements. Work includes:
 - 1. Steel joist.
 - 2. Anchorage, bracing and bridging.
- B. Related Sections
 - 1. Section 05310 – Steel Deck

Safety Standards for Steel Erection, Section 1926.757 Open Web Steel Joists.

1.3 PERFORMANCE REQUIREMENTS

- A. Joist Girders shall be designed in accordance with these specifications as simply-supported primary load-carrying members. All loads shall be applied through steel joists, and placed along the Joist Girder top chord. Where any applicable design feature is not specifically covered herein, the design shall be in accordance with the following specifications:
- 1. Where the steel used consists of hot-rolled shapes, bars or plates, use the American Institute of Steel Construction, *Specification for Structural Steel Buildings*.
 - 2. For members which are cold-formed from sheet or strip steel, use the American Iron and Steel Institute, *North American Specification for the Design of Cold-Formed Steel Structural Members*.

Design Basis:

Joist Girder designs shall be in accordance with the provisions in this Standard Specification using Allowable Strength Design (ASD) as specified by the specifying professional for the project.

Structural Performance:

Design, fabricate, and erect steel joist to withstand specified design loads within limits and under conditions required. Provide joist layout as indicated on the contract documents.

- a. Design Loads: As specified on Contract Documents.
- b. Deflections: Live load deflection meeting the following (unless otherwise specified):
 - 1. Joists: Vertical deflection less than or equal to Length/360.
- c. Design framing systems to provide for movement of framing members without damage or overstressing, sheathing failure, connection failure, undue strain on fasteners and anchors, or other detrimental effects when subject to a maximum ambient temperature change (range) of 120 deg F (67 deg C).

1.4 SUBMITTALS

- A. Submit manufacturer's product data and installation instructions for each type of steel joist framing and accessory required.
- B. Submit detailed joist layouts indicating placement of joists, temporary and permanent bracing and blocking required, connection details and bearing support details with required field installed fasteners for complete installation.

- C. Engage the services of a Professional Engineer registered in the State of Massachusetts to prepare complete shop drawings and structural design computations for work of this Section. Drawings and shall bear the engineer's professional seal and signature. Note: Manufacturer's shop drawings stamped by the engineer are acceptable instead of those actually prepared by the engineer.

Submit individual joist drawings, sealed and signed by a qualified registered Professional Engineer in the Commonwealth of Massachusetts, verifying that joists are designed to the loads as indicated on the contract drawings and in accordance with building code and design Requirements Include:

1. Description of design criteria.
 2. Engineering analysis depicting member stresses and joist deflection for lifting, handling, construction loads and design loads.
 3. Joist member sizes and thickness and connections at joist joints.
 4. Joist support reactions and the connection design to supporting framing or walls.
 5. Top chord, Bottom chord and Web bracing requirements, both temporary and permanent. The structural design computations shall provide a complete structural analysis of all typical and special conditions of construction, and shall certify conformance to the governing laws and building code.
- D. Prior to joist erection, submit certified letter indicating that the contractor, joist fabricator and joist erector have verified the as installed supporting substrate conditions are acceptable for joist installation and that any discrepancies will not impact the performance of the joists in their final condition.
- E. Submit final plan drawings sealed and signed by a qualified registered Professional Engineer in the Commonwealth of Massachusetts depicting final installed joist assembly.

Include:

1. All joist to joist connections.
 2. All joist to structure connections.
 3. Plan and details for the location of all permanent lateral and diagonal bracing and/or blocking required in the top chord, web, and bottom chord planes.
 4. Affidavit signed and sealed by qualified registered Professional Engineer in the Commonwealth of Massachusetts stating that installed system will meet the load requirements and lateral bracing requirements as indicated on the contract documents.
- F. Prior to start of work submit copy of Fabricators certificate stating that conformance with the Steel Joist Institute (SJI) *Code of Standard Practice for Steel Joists and Joist Girders and Code of Standard Practice for Composite Steel Joists*. At the completion of the cold-formed steel truss fabrication and erection, the Contractor/Fabricator shall submit a certificate of compliance to the Engineer stating that all work was performed in accordance with the approved shop drawings and quality control plans.

1.5 QUALITY ASSURANCE

- A. Fabricator Qualifications: Fabrication shall be performed in a quality controlled manufacturing environment by a steel joist fabricator with experience fabricating steel joists equal in material, design, and scope to the joist required for this Project. Fabricator shall be certified by the Truss Plate Institute's Quality Assurance Program.

1. Installation of joist assembly shall be performed by an installer with experience installing steel joist equal in material, design and scope to the joists required for this Project.
- B. Welding Standards: Comply with applicable provisions of AWS D1.1 “Structural Welding Code--Steel” and AWS D1.3 “Structural Welding Code--Sheet Steel.”
 1. Qualify welding processes and welding operators in accordance with AWS “Standard Qualification Procedure.”

1.6 DELIVERY, STORAGE AND HANDLING

- A. Delivery, storage and handling as a minimum shall be in accordance with the SJI Technical Digest 9, “Handling and Erection of Steel Joists and Joist Girders.”
- B. Deliver materials in manufacturer’s unopened containers or bundles, fully identified by name, brand, type and grade. Exercise care to avoid damage during unloading, storing and erection. Each joist shall be tagged with a metal tag showing as a minimum the following information:
 1. Joist member number
 2. Joist member job number
 3. Joist erection mark consistent with the shop drawing
- C. Store joists on blocking, pallets, platforms or other supports off (free from contact with) the ground and in an upright position sufficiently braced to avoid damage from excessive bending. Timbers and/or blocks shall be placed at panel points and not between panel points.
- D. Protect joists and accessories from corrosion, deformation, damage and deterioration when stored at job site. Keep joists free of dirt and other foreign matter.
- E. Care shall be exercised at all times to avoid damage through careless handling during unloading, storing and erecting. Handling shall be done with the joist in the vertical orientation. Dropping of joist shall not be permitted.
- F. In steel framing, where Joist Girders are utilized at column lines, the Joist Girder shall be field-bolted at the column. Before hoisting cables are released and before an employee is allowed on the Joist Girder the following conditions shall be met:
 1. The seat at each end of the Joist Girder is attached in accordance with Section 1004.6.

When a bolted seat connection is used for erection purposes, as a minimum, the bolts shall be snug tightened. The snug tight condition is defined as the tightness that exists when all plies of a joint are in firm contact. This shall be attained by a few impacts of an impact wrench or the full effort of an employee using an ordinary spud wrench.
 2. Where stabilizer plates are required the Joist Girder bottom chord shall engage the stabilizer plate.
- G. During the construction period, the contractor shall provide means for the adequate distribution of loads so that the carrying capacity of any Joist Girder is not exceeded.
- H. Joist Girders shall not be used as anchorage points for a fall arrest system unless written direction to

do so is obtained from a “qualified person”, in accordance with SJI Technical Digest 9, “Handling and Erection of Steel Joists and Joist Girders.”

- I. Field welding shall not damage the Joist Girder. The total length of weld at any one cross-section on cold formed members whose yield strength has been attained by cold working and whose as-formed strength is used in the design, shall not exceed 50 percent of the overall developed width of the cold-formed section.

See Federal Register, Department of Labor, Occupational Safety and Health Administration (2001), 29 CFR Part 1926 Safety Standards for Steel Erection; Final Rule, §1926.757 Open Web Steel Joists - January 18, 2001, Washington, D.C. for definition of “qualified person”.

1.7 PROJECT CONDITIONS

- A. During construction, adequately distribute all loads applied to joists so as not to exceed the carrying capacity of any one joist.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Vulcraft Company, 5362 Railroad Street, Chemung, NY 14825
- B. Canam Steel Corporation, 4010 Clay Street, Point of Rocks, MD 21777
- C. New Millennium Building Systems, 100 Diuguids Lane, Salem VA 24153
- D. Or approved equal.

2.2 COMPONENTS

- A. Provide manufacturer’s standard steel joist members, bracing, bridging, blocking, reinforcements, fasteners and accessories with each type of steel framing required, as recommended by the manufacturer for the applications indicated and as needed to provide a complete steel joist assembly. Comply with the minimum size requirements for joist top and bottom chords and web members as indicated on the Contract Documents and as noted below.

2.3 MATERIALS

- A. Materials:
 - 1. The steel used in the manufacture of Joist Girders shall conform to one of the following ASTM Specifications In the Section 1.2 References, A. Referenced Standards or shall be of suitable quality ordered or produced to other than the listed specifications, provided that such material in the state used for final assembly and manufacture is weldable and is proved by tests performed by the producer or manufacturer to have the properties specified in Section 1002.2.
 - 2. Bracing, bridging and blocking members: Fabricate components of structural quality steel sheet per ASTM A653 with a minimum yield strength of 33,000 psi, and having a galvanized coating of G60 or better.

- B. Finish: Provide components with protective zinc coating complying with ASTM A653, minimum G60 coating.
- C. Fastenings:
 - 1. Framing components shall be fastened to each other by welding only.
 - 2. Electrodes for welding shall conform to AWS D1.1 when applicable and AWS D1.3 for welding base metals less than 1/8" thick for welding low carbon steel. Manufacturer shall furnish instructions with each container of electrodes giving recommended voltage, amperage, polarity of direct current, for all uses and positions for which electrode is suitable.
 - 3. Fastening to structural steel shall be done with bolts of size and spacing as required or by welding to resist the shear and pullout forces generated by the loads listed on the plans.

2.4 FABRICATION

- A. Factory fabricate cold-formed steel joists plumb, square, true to line, and with connections securely fastened, according to manufacturer's recommendations and the requirements of this Section.
 - 1. Fabricate joist assemblies in jig templates.
 - 2. Cut joist members by sawing or shearing or plasma cutting.
 - 3. Fasten cold-formed steel joist members by bolt or weld as indicated on the approved shop drawings and design calculations.
 - a. Locate mechanical fasteners and install according to steel joist component manufacturer's instructions with bolt penetrating joined members by not less than 3 exposed bolt threads.
- B. Care shall be taken during handling, delivery and erection. Brace, block, or reinforce joist as necessary to minimize member and connection stresses. Refer to SJI Technical Digest No. 9 (2008), *Handling and Erection of Steel Joists and Joist Girders*.
- C. Fabrication Tolerances: Fabricate joists to a maximum allowable tolerance variation from plumb, level, and true to line of 1/8 inch in 10 feet (1:960) and as follows:
 - 1. Spacing: Space individual joists no more than plus or minus 1/8 inch (3mm) from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
 - 2. Squareness: Fabricate each cold-formed steel joist to a maximum out-of-square tolerance of 1/8 inch (3mm).

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine structure, substrates and installation conditions. Do not proceed with steel joist installation until unsatisfactory conditions have been corrected. Contractor and fabricator of joists shall certify that the substrate and installed conditions are acceptable for joist erection and that any discrepancies will not impact the installed joists to perform as intended in their final condition.

- B. Installation constitutes acceptance of existing conditions and responsibility for satisfactory performance.

3.2 INSTALLATION, GENERAL

A. General:

1. Erection of joists, including proper handling, safety precautions, installation bracing and other safeguards or procedures is the responsibility of the Contractor and Contractor's installer. Refer to SJI Technical Digest No. 9 (2008), *Handling and Erection of Steel Joists and Joist Girders*
 2. Exercise care and provide installation bracing required to prevent toppling of joists during erection. Provide for lateral bracing.
- B. Erect joists with plane of joist webs vertical and parallel to each other, accurately located at design spacing indicated. Space individual joists no more than plus or minus 1/8 inch (3 mm) from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
 - C. Provide proper lifting equipment, including spreader bar, suited to sizes and types of joists required, applied at lift points recommended by joist fabricator. Exercise care to avoid damage to joist members during erection and to keep horizontal bending of the joists to a minimum.
 - D. Provide framing anchors as indicated or accepted on the engineering design drawing or erection drawings. Anchor joists securely at bearing points.
 - E. Install joists plumb, square, true to line, and with connections securely fastened, to a tolerance variation from plumb, level, and true to line of 1/8 inch in 10 feet (1:960) and according to manufacturer's recommendations.
 1. DO NOT cut joist members without prior approval of joist engineer.
 2. Fasten cold-formed steel joists by bolting or welding as indicated on approved erection drawings.
 - a. Comply with AWS requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
 - b. Locate mechanical fasteners and install according to joist manufacturer's instructions with bolt penetrating joined members by not less than 3 exposed bolt threads.
 3. Install joists in one-piece lengths, unless splice connections are indicated.
 4. Provide installation bracing and leave in place until joists are permanently stabilized.

3.3 JOIST INSTALLATION

- A. Install joists per installation documents provided for in Section 1.4 (B).
- B. Space joists per sealed joist drawings.
- C. Do not alter, cut, or remove joist members or connections of joist members.
- D. Erect joists with plane of joist webs plumb and parallel to each other, align, and accurately

position at spacing indicated.

- E. Erect joists without damaging joist members or connections.
- F. Anchor joists securely at all points of support, per installation documents provided for in Section 1.4 (B).
- G. Install all continuous bridging and permanent joist bracing per installation documents provided for in Section 1.4 (B).
- H. Perform all joist-to-joist connections per installation documents provided for in Section 1.4 (B).

3.4 REPAIRS AND PROTECTION

- A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on fabricated and installed cold-formed steel framing with galvanizing repair paint according to ASTM A780 and the manufacturer's instructions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05310

STEEL DECK

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Roof deck
 - 2. Composite floor deck
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 03300 – CAST-IN-PLACE CONCRETE for normal-weight and lightweight structural concrete fill over steel deck
 - 3. Section 05120 – STRUCTURAL STEEL FOR STATIONS AND BUILDINGS for shop- and field-welded shear connectors
 - 4. Section 05500 – MISCELLANEOUS METALS for framing deck openings with miscellaneous steel shapes
 - 5. Section 09900 – PAINTING for finish painting of exposed structural steel

1.2 SUBMITTALS

- A. Product Data: For each type of deck, accessory, and product indicated.
- B. Shop Drawings: Show layout and types of deck panels, anchorage details, reinforcing channels, pans, cut deck openings, special jointing, accessories, and attachments to other construction.
- C. Product Certificates: For each type of steel deck, signed by product manufacturer.
- D. Welder, tack welder and welding procedure qualifications.
- E. Qualifications of galvanizer and testing and inspection agencies.
- F. Field quality-control and fire resistance test and inspection reports.

1.3 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated.
- B. Welding: Qualify procedures and personnel according to AWS D1.3, "Structural Welding Code - Sheet Steel".

- C. Fire-Test-Response Characteristics: Where indicated, provide steel deck units identical to those tested for fire resistance per ASTM E 119 by a testing and inspecting agency acceptable to authorities having jurisdiction.
 - 1. Fire-Resistance Ratings: Indicated by design designations of applicable testing and inspecting agency.
 - 2. Steel deck units shall be identified with appropriate markings of applicable testing and inspecting agency.
- D. AISI Specifications: Comply with calculated structural characteristics of steel deck according to AISI's "North American Specification for the Design of Cold-Formed Steel Structural Members".
- E. Galvanizer Qualifications: Engage the services of a qualified galvanizer who has demonstrated a minimum of five years experience in the successful application of galvanized coatings specified in this Section in the facility where the galvanizing work is to be performed.
- F. FM Global Standards: Comply with Factory Mutual Global Standards (including FM deck span limitation). Steel deck shall be installed per its FM Approval listing and Data Sheet 1-29.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Protect steel deck from corrosion, deformation, and other damage during delivery, storage, and handling.
- B. Stack steel deck on platforms or pallets and slope to provide drainage. Protect with a waterproof covering and ventilate to avoid condensation.

1.5 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements shall be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Supply manufactured deck units in accordance with the applicable requirements of the Steel Deck Institute as indicated.

2.2 ROOF DECK

- A. Steel Roof Deck: Fabricate panels, without top-flange stiffening grooves, to comply with Steel Deck Institute (SDI) "SDI Specifications and Commentary for Steel Roof Deck," in SDI Publication No. 30, and with the following:
 - 1. Galvanized Steel Sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 40 with a minimum yield strength of 40 ksi. Galvanizing shall conform to coating class G90.

2. Deck Profile and Profile Depth: As required by design.
3. Design Uncoated-Steel Thickness: As required by design.
4. Span Condition: required by design.
5. Side Laps: Overlapped or interlocking seam at Contractor's option.
6. Finish: All steel roof deck shall be painted over galvanizing (refer to Section 09900 – PAINTING for finish painting of exposed structural steel).

2.3 COMPOSITE FLOOR DECK

- A. Composite Steel Floor Deck: Fabricate panels, with integrally embossed or raised pattern ribs and interlocking side laps, to comply with "SDI Specifications and Commentary for Composite Steel Floor Deck," in SDI Publication No. 30, with the minimum section properties indicated, and with the following:
1. Galvanized steel sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 40 minimum, Galvanizing shall conform to coating class G90.
 2. Profile Depth: As indicated.
 3. Design Uncoated-Steel Thickness: As required by design.
 4. Span Condition: As required by design.
 5. Finish: All composite steel deck shall be painted over galvanizing (refer to Section 09900 – PAINTING for finish painting of exposed structural steel).

2.4 ACCESSORIES

- A. General: Provide manufacturer's standard accessory materials for deck that comply with requirements indicated.
- B. Mechanical Fasteners: Corrosion-resistant, low-velocity, power-actuated or pneumatically driven carbon-steel fasteners; or self-drilling, self-threading screws.
- C. Side-Lap Fasteners: Corrosion-resistant, hexagonal washer head; self-drilling, carbon-steel screws, No. 10 minimum diameter.
- D. Flexible Closure Strips: Vulcanized, closed-cell, synthetic rubber.
- E. Miscellaneous Sheet Metal Deck Accessories: Steel sheet, minimum yield strength of 40,000 psi, not less than 0.0359-inch design uncoated thickness, of same material and finish as deck; of profile indicated or required for application.
- F. Pour Stops and Girder Fillers: Steel sheet, minimum yield strength of 40,000 psi, of same material and finish as deck, and of thickness and profile indicated.
- G. Column Closures, End Closures, Z-Closures, and Cover Plates: Steel sheet, of same material, finish, and thickness as deck, unless otherwise indicated.
- H. Weld Washers: Uncoated steel sheet, shaped to fit deck rib, 0.0747 inch thick, with factory-punched hole of 3/8-inch minimum diameter.
- I. Galvanizing Repair Paint: ASTM A 780.

- J. Headed Stud Shear Connectors: Through deck stud welded shear connectors comply with ASTM A108, Grade 1015 or 1020, cold finished carbon steel with dimensions complying with AISC Specifications.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine supporting frame and field conditions for compliance with requirements for installation tolerances and other conditions affecting performance.

3.2 INSTALLATION, GENERAL

- A. Install deck panels and accessories according to applicable specifications and commentary in SDI Publication No. 30, manufacturer's written instructions, and requirements in this Section.
- B. Install temporary shoring before placing deck panels, if required to meet deflection limitations.
- C. Locate deck bundles to prevent overloading of supporting members.
- D. Place deck panels on supporting frame and adjust to final position with ends accurately aligned and bearing on supporting frame before being permanently fastened. Do not stretch or contract side-lap interlocks.
- E. Place deck panels flat and square and fasten to supporting frame without warp or deflection.
- F. Cut and neatly fit deck panels and accessories around openings and other work projecting through or adjacent to deck.
- G. Provide additional reinforcement and closure pieces at openings as required for strength, continuity of deck, and support of other work.
- H. Comply with AWS requirements and procedures for manual shielded metal arc welding, appearance and quality of welds, and methods used for correcting welding work.
- I. Mechanical fasteners may be used in lieu of welding to fasten deck. Locate mechanical fasteners and install according to deck manufacturer's written instructions.

3.3 ROOF-DECK INSTALLATION

- A. Fasten roof-deck panels to steel supporting members by arc spot (puddle) welds of the surface diameter indicated or arc seam welds with an equal perimeter that is not less than 1-1/2 inches long, and as follows:
 - 1. Weld Diameter: 3/4 inch, nominal.
 - 2. Weld Spacing: Weld edge and interior ribs of deck units with a minimum of two welds per deck unit at each support. Space welds 12 inches apart in the field of roof and 6 inches apart in roof corners and perimeter.
- B. Side-Lap and Perimeter Edge Fastening: Fasten side laps and perimeter edges of panels between supports, at intervals not exceeding the lesser of 1/2 of the span or 18 inches and as follows:

1. Fasten with a minimum of 1-1/2-inch-long welds.
- C. End Bearing: Install deck ends over supporting frame with a minimum end bearing of 1-1/2 inches, with end joints as follows:
- D. Roof Sump Pans and Sump Plates: Install over openings provided in roof deck and weld flanges to top of deck. Space welds not more than 12 inches apart with at least one weld at each corner.
1. Install reinforcing channels or zees in ribs to span between supports and weld.
- E. Miscellaneous Roof-Deck Accessories: Install ridge and valley plates, finish strips, end closures, and reinforcing channels according to deck manufacturer's written instructions. Weld to substrate to provide a complete deck installation.
1. Weld cover plates at changes in direction of roof-deck panels, unless otherwise indicated.
- F. Flexible Closure Strips: Install flexible closure strips over partitions, walls, and where indicated. Install with adhesive according to manufacturer's written instructions to ensure complete closure.

3.4 FLOOR-DECK INSTALLATION

- A. Fasten floor-deck panels to steel supporting members by arc spot (puddle) welds of the surface diameter indicated and as follows:
1. Weld Diameter: 3/4 inch, nominal.
 2. Weld Spacing: Weld edge ribs of panels at each support. Space additional welds an average of 12 inches apart, but not more than 18 inches apart.
- B. Side-Lap and Perimeter Edge Fastening: Fasten side laps and perimeter edges of panels between supports, at intervals not exceeding the lesser of half of the span or 36 inches, and as follows:
1. Fasten with a minimum of 1-1/2-inch-long welds.
- C. End Bearing: Install deck ends over supporting frame with a minimum end bearing of 1-1/2 inches, with end joints as follows:
- D. Pour Stops and Girder Fillers: Weld steel sheet pour stops and girder fillers to supporting structure according to SDI recommendations, unless otherwise indicated.
- E. Floor-Deck Closures: Weld steel sheet column closures, cell closures, and Z-closures to deck, according to SDI recommendations, to provide tight-fitting closures at open ends of ribs and sides of deck.

3.5 SHEAR CONNECTORS

- A. Weld shear connectors to supporting through decking units in accordance with manufacturer's instructions. Do not weld shear connectors through two layers of decking units. Weld only on clean, dry deck foundations.
- B. Space and align shear connectors as shown on drawings.

3.6 REINFORCEMENT AT OPENINGS

- A. Provide additional metal reinforcement and closure pieces as required for strength, continuity of decking and support of other work shown on the Drawings.
- B. Reinforce decking around openings 6 inches to 12 inches in size by means of a flat galvanized steel sheet placed over the openings on the top of decking and fusion welded to the surface of the deck. Provide not less than 18 gauge steel sheet of same quality as the deck units, at least 12 inches wider and longer than the opening, unless otherwise indicated. Space welds at each corner and not more than 12 inches o.c. along each side.

3.7 FIELD QUALITY CONTROL

- A. Testing Agency: The Contractor shall engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare inspection and test reports.
- B. Field welds will be subject to visual inspection.
- C. Testing agency will report inspection results promptly and in writing to Contractor and Engineer.
- D. Remove and replace work that does not comply with specified requirements.
- E. Additional inspecting, at Contractor's expense, will be performed to determine compliance of corrected work with specified requirements.

3.8 REPAIRS AND PROTECTION

- A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on both surfaces of deck with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.
- B. Repair Painting: Wire brush and clean rust spots, welds, and abraded areas on both surfaces of prime-painted deck immediately after installation, and apply repair paint.
- C. Provide final protection and maintain conditions to ensure that steel deck is without damage or deterioration at time of Substantial Completion.

3.9 PLUG WELD QUALIFICATION PROCEDURE

- A. The erector shall establish the welding procedure for the plug weld of the steel decking for the particular gauge used, which is to be witnessed by the Contractors's Testing Agency.
- B. The welder should start by clamping a piece of the deck on the top flange of a scrap beam or plate of at least 1/2 in. in thickness with the edge of the sheet steel protruding over the edge of the beam by 3 in.
- C. Welding cables of length and size similar to that which will be used on the actual construction should be used for this test.
- D. The welder should make what he believes is a good 3/4 in. puddle weld through 20 gauge sheet steel to the beam with the crater filled and reasonable reinforcement above the sheet metal. The following are suggested settings for this equipment:
 - 1. Electrode - E-60.

2. Three welds per electrode.
 3. 19 second duration per weld.
 4. Burn-off rate of 4.7 seconds per inch.
- E. When the weld has cooled, strike the edge of the sheet steel with a sledge hammer so as to rotate the sheet around the puddle weld until the sheet or the weld breaks.
- F. Measure the diameter of the weld nugget remaining on the structural steel. If the weld is not satisfactory, adjust the amperage and repeat by making test welds and breaking them until the proper 3/4 in. nugget is obtained. Once the proper welds are consistently obtained (a minimum of 3 welds), have the welder make another test weld by first welding on a scrap plate to consume at least 6 in. of a new electrode and then immediately, while the electrode is still hot, make another puddle weld, test this weld and compare the results with the welds made previously and considered satisfactory.
- G. Using the same electrode, power supply unit, setting, and cable lengths established above, determine an average burn-off rate of 3 electrodes. Then make another puddle weld as a final check on the procedure.
- H. Each welder on the steel deck shall be qualified using the above procedure, prior to welding any steel roof or floor deck to the structure.

3.10 SHEAR CONNECTOR WELDING REQUIREMENTS

- A. All shear studs as indicated on the Drawings shall be based on the allowable shear capacities for shear studs in lightweight or normal weight stone concrete solid slabs as listed in the AISC.
- B. Shear connectors shall be applied in accordance with the manufacturer's printed instructions. Use only personnel and equipment authorized by the manufacturer.
- C. Inspection
1. Set-up: Two test welds shall be performed at the start of each shift or when plate thickness and/or stud type changes. Test welds, after cooling, should be bent by hammer 45 degrees from the vertical position without failure. Failure of either stud or weld will require appropriate adjustments in equipment and/or amperage and two additional test welds shall be initiated. The process of adjustment and testing shall continue until two consecutive stud welds pass the 45 degree test. Non-failure of either stud indicates that the weld set-up is satisfactory and production welding may be started.
 2. Production: After welding, the ceramic ferrule should be removed from each stud and the weld fillet visually inspected. A fillet of less than 360 degrees is cause for further inspection. Such studs, but, at a minimum, not less than four studs per frame, shall be tested for weld adequacy. After allowing the initial studs and plate to cool, test by bending to an angle of 15 degrees with the vertical by striking with a hammer. If failure occurs in the weld zone of any stud, the procedure shall be corrected and four more studs shall be welded to the member and tested. If any of the second four studs fail, additional welding shall be continued on separate material until four consecutive studs are tested and found to be satisfactory. Four consecutive studs shall then be welded to the member, tested, and found to be satisfactory before any more production studs are welded to the member. If failure occurs in the stud shank, an investigation shall be made to ascertain and correct the cause upon the review and approval of the project director, before further welds are made. All rejected studs shall be removed and replaced by studs which meet these requirements.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05411

LIGHT GAUGE METAL FRAMING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies exterior stud wall framing for metal cladding and interior finish and exterior and interior soffit framing, including cross-bridging, bracing, and anchoring to the building structure.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 06400 – CARPENTRY
 - 3. Section 07210 – BUILDING INSULATION
 - 4. Section 09260 – GYPSUM BOARD ASSEMBLIES

1.2 REFERENCES

- A. Comply with applicable requirements of the following standards. Where these standards conflict with other specified requirements, the most restrictive requirement shall govern.
 - 1. American Institute of Steel Construction (AISC)
 - a. Code: Code of Standard Practice for Steel Buildings and Bridges Specification for the Design, Fabrication and Erection of Structural Steel for Buildings
 - 2. American Iron and Steel Institute (AISI):
 - a. Specifications: Specifications for the Design of Light Gage Cold-Formed Steel Structural Members
 - 3. American Society for Testing and Materials (ASTM):
 - a. A 446: Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Structural (Physical) Quality
 - b. A 525: General Requirements for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process
 - c. A 570: Hot-Rolled Carbon Steel Sheet and Strip, Structural Quality
 - d. A 780: Repair of Damaged Hot-Dip Galvanized Coatings
 - 4. Steel Structures Painting Council (SSPC):
 - a. Manual: Painting Manual - Volumes 1 and 2

1.3 SUBMITTALS

- A. Shop Drawings and Design Computations:
 - 1. Provide under the supervision of a Professional Engineer registered in the State of Massachusetts. Submit completed shop drawings and structural design computations, prepared under the supervision of a professional engineer licensed in the State of Massachusetts for work of this Section. Drawings and computations shall bear the engineer's professional seal and signature.
 - 2. The shop drawings shall show all pertinent details of construction, installation, and anchorage of the light gauge steel framing work. Show sizes, gages, types and spacings.
 - 3. The structural design computations shall provide a complete structural analysis of all typical and special conditions of construction, and shall certify conformance to the governing laws and building code.
- B. Samples: Submit representative samples of all light gauge steel framing components to Engineer for approval.
- C. Product Data: Submit manufacturer's product data for all components to be used in the construction and anchoring of the light gauge steel framing. Include specifications, installation instructions, and data substantiating that the materials comply with specified requirements.
- D. Do not order materials or begin fabrication or installation until Engineer approves submittals.

1.4 QUALITY ASSURANCE

- A. All work shall comply with the governing laws and building code and applicable provisions of the following standards:
 - 1. AISC Specification.
 - 2. AISC Code.
 - 3. AWS D1.3.
 - 4. AISI Specifications.
 - 5. SSPC Manual.
- B. Materials and workmanship shall be subject to inspection and testing in mill, shop, and/or field by the Engineer or a designated independent testing laboratory, approved by Authority and paid by the Contractor.

1.5 QUALIFICATIONS OF WELDERS

- A. Welders shall be qualified for the work by tests as prescribed in AWS D1.3 and shall submit certification of such qualifications to the Engineer before beginning work.

1.6 DESIGN

- A. The information shown on the Drawings is intended to establish the sizes of framing members, their points of attachment, the materials to which they are to be attached, and materials which are to be attached to them. Within these limitations it is the responsibility of the Contractor to design the framing to withstand the applied loading required by State of Massachusetts State Building Code

except where more strict requirements are specified herein. The maximum allowable deflection of the steel stud backup system under full lateral load shall be $L/720$. Structural properties of members shall be computed in accordance with AISI Specifications. No composite action is to be considered between the studs and any collateral wall material. Provide delegated design meeting the requirements of subsection 1.3.A.1.

1.7 INSPECTION, TESTING, AND QUALITY CONTROL

- A. Inspection and testing of welded connections will be performed by an independent testing laboratory, engaged and paid for by the Contractor. Welded connections shall be subjected to inspection and testing in shop and field by the Engineer and/or testing laboratory. Such inspection and testing shall not relieve Contractor of his responsibility to provide his own inspection, testing, and quality control as necessary to furnish workmanship in accordance with requirements of Contract Documents.
- B. Notify the Engineer and testing laboratory prior to start of any fabrication, erection, or other phase of work requiring welded connections so as to afford them a reasonable opportunity to inspect work.
- C. Facilitate inspection and testing by the testing laboratory. The Contractor shall, upon request and at his own expense, furnish the testing laboratory with:
 - 1. Complete sets of approved Shop Drawings and corrective work procedures at shop(s) and in field.
 - 2. Representative sample pieces of materials requested for testing.
- D. The testing laboratory will inspect welded connections for burned welds, adequate size and length of welds, and general appearance and integrity of welds as required by the Engineer.
- E. Do not remove any marks or tags applied by the testing laboratory identifying rejected work.
- F. Welded connections which have been rejected by the Engineer and/or testing laboratory in shop or field shall be corrected without delay and at no expense to the Authority.
- G. Acceptance of work in the shop shall not prevent final rejection of the work at the job site, even after erection, if the work is found to be defective in any way.

1.8 STORAGE AND HANDLING

- A. Protect metal framing units from weather and damage. Deliver to the fabrication site in manufacturer's unopened containers or bundles, fully identified with name, brand, type, and grade. Store off the ground in a dry ventilated space or protect with suitable waterproof coverings.

1.9 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, the engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between the engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 FRAMING COMPONENTS

- A. Studs shall be minimum 16 gauge or heavier punched C-studs of sizes required, except provide 12 gage studs at load bearing wall framing at locations indicated. Studs shall be manufactured from steel sheet meeting the requirements of ASTM A 1003, Structural Grade, Type H with a minimum yield strength of 50,000 psi. Studs shall be hot dip galvanized in accordance with the following:
1. Grade: ST50H (ST340H).
 2. Coating: G90 (Z275).
- B. Tracks shall be 18 gauge or heavier unpunched tracks manufactured of commercial quality steel sheet meeting the requirements of ASTM A 1003 with a minimum yield strength of 50,000 psi. Provide special shaped tracks with one 4 in. high leg where required. Tracks shall be hot dip galvanized in accordance with the following:
1. Grade: ST50H (ST340H).
 2. Coating: G90 (Z275).
- C. Bridging shall be manufacturer's recommended type as required to meet the design criteria set forth in Paragraph 1.6A of this Section.
- D. Attachment angles, closure angles, and other miscellaneous components shall be manufactured of commercial quality steel sheet meeting the requirements of ASTM A 446 with a minimum yield strength of 50,000 psi and shall be formed to profiles as required. All components shall be hot dip galvanized in accordance with ASTM A 525, G 60 Coating Designation.
- E. Single Deflection Track: Manufacturer's single, deep-leg, U-shaped steel track; unpunched, with un-stiffened flanges, of web depth to contain studs while allowing free vertical movement, with flanges designed to support horizontal and lateral loads, and as follows:
1. Minimum Uncoated-Steel Thickness: 0.0538 inch (1.37 mm).
 2. Flange Width: A minimum of 2 inches (50 mm), unless otherwise noted.
- F. Double Deflection Tracks: Manufacturer's double, deep-leg, U-shaped steel tracks, consisting of nested inner and outer tracks, un-punched, with un-stiffened flanges.
1. Outer Track: Of web depth to allow free vertical movement of inner track, with flanges designed to support horizontal and lateral loads, and as follows:
 - a. Minimum Uncoated-Steel Thickness: 0.0538 inch (1.37 mm).
 - b. Flange Width: A minimum of 3 inches (75 mm), unless otherwise noted.
 2. Inner Track: Of web depth indicated, and as follows:
 - a. Minimum Uncoated-Steel Thickness: 0.0538 inch (1.37 mm).
 - b. Flange Width: Minimum flange width of 4 inches (100 mm).
- G. Vertical Deflection Clips: Manufacturer's standard bypass or head clips, capable of accommodating upward and downward vertical displacement of primary structure.

2.2 FASTENERS

- A. Framing components shall be fastened to each other by welding only.
 - 1. Electrodes for welding shall conform to AWS requirements for welding low carbon steel. Manufacturer shall furnish instructions with each container of electrodes giving recommended voltage, amperage, polarity of direct current, for all uses and positions for which electrode is suitable.
- B. Fastening to structural steel shall be done with powder activated fasteners, self-drilling screws, or bolts of size and spacing as required to resist the shear and pullout forces generated by the loads listed in Paragraph 1.6A of this Section.
- C. Fastening of sheet metal sheathing to metal studs shall be by self-drilling screws, through holes pre-drilled in sheet metal.

2.3 ZINC RICH PAINT

- A. Zinc rich paint for touch up repair of galvanized coatings damaged during handling and erection and field welding shall conform to ASTM A 780 for zinc-rich primer.

PART 3 - EXECUTION

3.1 FABRICATION

- A. Light gauge steel framing shall be field assembled or shop assembled as part of an assembly including modular wall assemblies.
- B. Metal framing shall be fabricated in accordance with manufacturer's printed or written instructions, unless otherwise indicated.
- C. Framing components shall be straight and true prior to fabrication. Flattening or straightening of components shall be done by a process not injurious to materials.
- D. Framing components shall be cut squarely (or on an angle as with bracing) to fit squarely against abutting members.
- E. No splices will be allowed in studs. Stud tracks shall be continuous, with splices butt welded.
- F. Provide all angles, clips, and other miscellaneous pieces necessary to attach light gauge framing panels to building structure or to attach other materials to light gauge framing panels.
- G. Cut all openings in light gauge framing required for ducts, grilles, pipes, etc.
- H. Components shall be set square and in line and shall be held firmly in position until properly fastened.
- I. Panel components may be joined by shop welding at the discretion of the contractor.
 - 1. Welders shall be grade certified for the weight and type of materials and the type of equipment being used.
 - 2. Welding shall be done in accordance with AWS D1.3.
 - 3. All shop welded components shall be hot-dip galvanized after welding.

- J. Finished assemblies shall be free from twists, bends, or open joints with all members straight, square, and true to line.

3.2 ERECTION

- A. Light gauge steel framing shall be erected by approved methods using equipment of adequate capacity to safely perform the work.
- B. Any damage to other building materials caused by erection of light gauge steel framing shall be repaired or replaced as directed by the Engineer at no additional cost to the Authority.
- C. Work shall be erected plumb, level, and to dimensions and elevations indicated.
- D. Do not install any member or panel which is bent or racked. Such items shall be replaced.
- E. Provide nested studs and tracks at openings, as indicated on Drawings.
- F. Provide supplementary framing, blocking, and bracing as required where walls are indicated to support fixtures, equipment, and accessories.
- G. Isolate non-load-bearing steel framing from building structure to prevent transfer of vertical loads while providing lateral support.
 - 1. Install double deep-leg deflection tracks and anchor outer track to building structure.

3.3 FIELD TOUCH UP

- A. Touch up all field welds and abrasions of galvanized materials with zinc rich paint in accordance with ASTM A 780, Annex A2.
- B. Touch up work shall be complete prior to attachment of the work of any other sections to the light gauge steel framing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05420

TEMPORARY STEEL UTILITY BRIDGES

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving the following items:
1. All labor, materials, and equipment necessary for the modification and removal of the Temporary Steel Utility Bridges.
 2. This item shall conform to the relevant provisions of MassDOT Standard Specifications (with Supplemental Specifications) Section 995 and the specific requirements stipulated for component parts of the items. Where no specific requirement is directed for a component part of an item, the Standard Specification shall apply, except for payment. For payment for components refer to Part 4 of this section. The work includes all materials and labor for the completed structures.
 3. The work under this item shall consist of the modifications of the Temporary Utility Bridge Structure for the Bridge No. S-17-013 (Broadway Bridge) and Bridge No. S-17-007 (Medford Street Bridge) as well as the removal of the Temporary Utility Bridge Structure for Bridge No. S-17-008 (School Street Bridge) in accordance with the Contract Documents, specifications, and in accordance with guidelines of the manufacturer's requirements..
 4. The work shall include detailed coordination with the operating railroads as required under Section 01571 – MAINTENANCE AND PROTECTION OF RAILROAD OPERATIONS.
- B. Related Work:
1. Section 02221 – DEMOLITION.
 2. Section 02650 – EXISTING SITE UTILITIES.
 3. Section 02800 – EXTERIOR CONDUIT SYSTEMS.
- C. For all Temporary Steel Utility Bridge requirements regarding General Information, Products, and Execution not referred to in this Specification, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 960.

1.2 DEFINITIONS

- A. See MassDOT Standard Specifications (with Supplemental Specifications) Section 995.

1.3 PERFORMANCE REQUIREMENTS

- A. See MassDOT Standard Specifications (with Supplemental Specifications) Section 960.

1.4 SUBMITTALS

- A. The Contractor shall submit shop drawings and calculations for the modification and removal of temporary steel utility support bridges. The procedures and all submissions shall be prepared by a Professional Engineer registered in the Commonwealth of Massachusetts. This engineer must be familiar with these specifications, those of the American Association of State Highway and Transportation Officials (AASHTO), the Work, and be experienced in this technical field. All submitted plans and calculations shall be stamped with the seal of a Registered Professional Engineer in the Commonwealth of Massachusetts. Note: Any acceptance or approvals of the above submissions by the Engineer shall not relieve the Contractor from responsibility for all design, construction, and demolition procedures and operations.
- B. The Contractor shall submit proposed erection and demolition procedures and methods to be used including crane capacity and location, equipment, tools, devices, etc. to the Engineer for utility bridge modifications and demolition. These submittals shall indicate a sequence of work such that at no time does an unsafe condition exist, and shall detail a specific coordination of activities with the operating railroads as part of the sequence of activities. The requirements for equipment and all procedures utilized shall be in conformance with the intent of Subsection 960.61D, Steel Erection of the Standard Specifications for Highways and Bridges. Erection procedures and any necessary calculations and drawings shall be stamped by a Professional Engineer registered in the Commonwealth of Massachusetts certifying that all structural members are suitably braced and supported throughout the erection process. Work under this item may not commence until the Engineer has given written approval.
- C. Removal Plan: Forty five days before any removal activity takes place, the Contractor shall submit to the Engineer a removal plan with a sequence of operations for review and approval. The sequence of operations shall be established such that at no time during the removal process does an unsafe condition exist. Submittals shall indicate in the sequence of operations the specific coordination activities that will be carried out with the operation railroads.

1.5 QUALITY ASSURANCE

- A. For Quality Assurance, refer to the MassDOT Standard Specifications (with Supplemental Specifications) including, but not limited to, Sections 901, 953, 960, and 995.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. See MassDOT Standard Specifications (with Supplemental Specifications) Section 960.

1.7 COORDINATION

- A. See MassDOT Standard Specifications (with Supplemental Specifications) Section 960.

1.8 UTILITIES

- A. Utility lines will be temporarily supported on temporary steel utility support bridges adjacent to the existing bridge structures. These lines will be permanently relocated to the proposed bridge structures. The removal of temporary steel utility support bridges once the utilities are in their permanent position shall be included in this Item.

PART 2 – PRODUCTS

2.1 MATERIALS

- A. Concrete
 - 1. The work to be done hereunder shall include construction of temporary reinforced concrete foundations for the utility bridges. The work shall conform to the relevant provisions of MassDOT Standard Specifications (with Supplemental Specifications) Section 901.
- B. Steel Reinforcement
 - 1. Steel reinforcement shall conform to the provisions of MassDOT Standard Specifications (with Supplemental Specifications) Section 901.
- C. Structural Steel
 - 1. Structural steel shall conform to the provisions of MassDOT Standard Specifications (with Supplemental Specifications) Section 960.

PART 3 – EXECUTION

3.1 ERECTION

- A. Assembly and Erection shall be performed in accordance with the approved Contractor assembly and erection submittals and the requirements of the Standard Specifications. The Contractor shall insure the stability of the structure during erection/modification. The Contractor shall not allow debris, tools, or incidental equipment of any kind to swing over areas where vehicular, train, or pedestrian traffic exists.
- B. Elements Left In Place
 - 1. No elements of the temporary bridges will be left in place, except when specific permission is given by the Engineer, or as described in contract documents. Any excavated areas shall be backfilled and any disturbed areas shall be restored to their original conditions. For any elements left in place, the Contractor shall provide as-built survey location information in a format approved by the Engineer.
- C. Disposal of Materials
 - 1. Materials will be removed from the project work sites for reuse by the Contractor or for legal disposal.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 05500

MISCELLANEOUS METALS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
1. All Work in this Section; refer to Schedule in Article 2.1 and as indicated on the Drawings.
 2. Furnish lintels, sleeves, anchors, inserts plates and similar miscellaneous metal items to concrete trade for installation.
- B. Related Work:
1. Section 03300 – CAST-IN-PLACE CONCRETE, for installing anchor bolts, threaded sleeves, and other items cast into concrete.
 2. Section 05120 – STRUCTURAL STEEL FOR STATIONS AND BUILDINGS
 3. Section 05122 – STRUCTURAL STEEL FOR RAIL STRUCTURES
 4. Section 05123 – STRUCTURAL STEEL FOR ROADWAY BRIDGES
 5. Section 05124 – BRIDGE RAILS
 6. Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS
 7. Section 05041 – HOT-DIP GALVANIZING.
 8. Section 05510 – PROCESS METAL WORK
 9. Section 05511 – METAL STAIRS
 10. Section 05700 – DECORATIVE METAL; for custom grilles, perforated sheet metals and other decorative formed metal.
 11. Section 05710 – METAL COLUMN COVERS
 12. Section 05720 – METAL RAILINGS AND GATES
 13. Section 05721 – STAINLESS STEEL RAILINGS AND GATES
 14. Section 07610 – SHEET METAL ROOFING
 15. Section 06610 – FIBERGLASS GRATINGS
 16. Section 09900 – PAINTING
 17. Section 10401 – METAL SIGN FRAMES

1.2 PERFORMANCE REQUIREMENTS

- A. Structural Performance of Ladders: Provide ladders capable of withstanding the effects of loads and stresses within limits and under conditions specified in ANSI A14.3.
- B. Structural Performance: of Gratings: Gratings shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated.

1. Floors: Uniform load of 250 lbf/sq. ft. (11.97 kN/sq. m) or concentrated load of 3000 lbf (13.40 kN), whichever produces the greater stress.
 2. Walkways and Elevated Platforms: Uniform load of 60 lbf/sq. ft. (2.87 kN/sq. m).
- C. Limit deflection to L/240 or 1/4 inch (6.4 mm), whichever is less. Thermal Movements: Provide exterior metal fabrications that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
1. Temperature Change (Range): 120 deg F ambient; 180 deg F material surfaces.
- D. The engineering for all miscellaneous metals shall be delegated design engineered and stamped by registered engineer in the state of Massachusetts to accommodate all related snow loads, wind loads and point loads as per Massachusetts State Building codes and FM Global requirement. Design layouts for miscellaneous metals are as shown on drawings.

1.3 SUBMITTALS

- A. Samples: One sample of each type of fabricated item, showing all types of component materials, surfaces, edges, joints, welds, and mechanical connections in selected finish and color.
- B. Shop Drawings: Show fabrication and installation details for metal fabrications.
1. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items.
 2. Provide templates for anchors and bolts specified for installation under other Sections.
 3. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer licensed in the Commonwealth of Massachusetts responsible for their preparation.
 4. Where fabrications are to receive sprayed-on fire resistive material, include statement that primer is compatible with fire resistive material proposed for use.
- C. Certificates: Welder and weld procedure qualifications.
- D. Qualifications for Inspection and Testing Agency and Contractor's professional engineer indicating registration in the Commonwealth of Massachusetts.
- E. Weld inspection reports.

1.4 QUALITY ASSURANCE

- A. Welding: Qualify procedures and personnel according to the following:
1. AWS D1.1, "Structural Welding Code--Steel".
 2. AWS D1.2, "Structural Welding Code--Aluminum".
 3. AWS D1.3, "Structural Welding Code--Sheet Steel".
 4. AWS D1.6, "Structural Welding Code--Stainless Steel".

- B. Metal Surfaces, General: Provide materials with smooth, flat surfaces, unless otherwise indicated. For metal fabrications exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.
- C. HotDip Galvanizing: See Section 05041 – HOT DIP GALVANIZING.
- D. Pre-Installation Conference: Contractor shall schedule a meeting to be attended by Contractor, Engineer, fabricator, and galvanizer prior to starting Work. Agenda shall include the following: Project schedule, source for each fabrication, coordination between fabricator and galvanizer and adjacent Work, finish of surfaces, application of coatings, submittals, and approvals.
- E. Inspection: Except as otherwise specified, only visual inspection of welds, materials, workmanship, finished products, and installation is required. Inspector shall be independent third party with 10 years experience with work of similar size and scope. Welds to be inspected before covering of finishes. Shop welds shall be inspected for both methods and materials before galvanizing and painting. If welds are visible to public, architect shall also approve at that time.

1.5 PROJECT CONDITIONS

- A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication and indicate measurements on Shop Drawings. Provide allowance for trimming and fitting at site.

1.6 COORDINATION

- A. Coordinate installation of anchorages for metal fabrications. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Coordinate installation of steel weld plates and angles for casting into concrete that are specified in this Section but required for work of another Section. Deliver such items to Project site in time for installation.

1.7 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 SCHEDULE

- A. Miscellaneous Metals include, but are not limited to, the following:

	Item	Material	Finish
1	Lintels	Steel	Galv/shop primer/shop paint
2	Interior ladders	Steel	Galv/shop prime/shop paint
3	Exterior ladders	Steel / Aluminum	Galv/shop prime/shop paint OR Anodized
4	Elevator pit ladders	Steel	Galv/shop prime/shop paint
5	Elevator door sill support angles	Steel	Galv/shop prime/shop paint
6	Elevator hoistway beams	Steel	Galv/shop prime/shop paint
7	Metal floor plate	Steel, non-slip surface	Galv/shop prime/shop paint
8	Shelf angles	Steel	Galv/shop prime/shop paint
9	Loose bearing and leveling plates	Steel	Galv/shop prime/shop paint
10	Weld plates and angles	Steel	Galv/shop prime/shop paint
11	Gratings and frames	Steel	Galv/shop prime/shop paint
12	Supports for canopies	Steel	Galv/shop prime/shop paint
13	Supports for coiling doors	Steel	Galv/shop prime/shop paint
14	Supports for countertops	Steel	Galv/shop prime/shop paint
15	Pipe Guards	Steel	Primer/Paint
16	Nosings	Steel	None
17	Wheel guards and column guards	Cast iron & Alum	None
18	Base Plates and anchor bolts	Steel	Galv/shop prime/shop paint
19		Steel	Galv/shop prime/shop paint
20	Gutters and rain leaders	Steel	Galv/shop prime/shop paint
21	Downspouts	Steel	Galv/shop prime/shop paint
22	Scuppers	Stainless Steel	No. 4
23	Sleeves	Stainless Steel	No. 4
24	Cornices and trim pieces	Stainless Steel	No. 4
25	Corner guards	Stainless Steel	No. 4
26	Ductbank enclosure system	Steel	Galv/shop prime/shop paint
27	Metal bar grilles	Steel	Galv/shop prime/shop paint
28	Metal bar gratings	Steel	Galv/shop prime/shop paint
29	Metal bar gratings W-09		
30	All other misc. metal items shown on the drawings as needed to complete the work	Steel	Galv/shop prime/shop paint

(All Galvanized metal shall be shop primed and shop Painted. Refer to 05041-Hot Dip Galvanizing)

2.2 FERROUS METALS

- A. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
- B. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A 666, Type 316L
- C. Stainless-Steel Bars and Shapes: ASTM A 276, Type 316L
- D. Steel Bars for Bar Gratings: ASTM A 36/A 36M or steel strip, ASTM A 1011/A 1011M or ASTM A 1018/A 1018M.
- E. Wire Rod for Bar Grating Crossbars: ASTM A 510 (ASTM A 510M).
- F. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from plate complying with ASTM A 36/A 36M or ASTM A 283/A 283M, Grade C or D.

- G. Steel Tubing: ASTM A 500, cold-formed steel tubing.
- H. Steel Pipe: ASTM A 53/A 53M, standard weight (Schedule 40), unless another weight is indicated or required by structural loads.
- I. Slotted Channel Framing: Cold-formed metal channels with continuous slot complying with Metal Framing Manufacturers Association MFMA-3.
- J. Cast Iron: ASTM A 48/A 48M, Class 30, unless another class is indicated or required by structural loads.

2.3 NONFERROUS METALS

- A. Aluminum Plate and Sheet: ASTM B 209, Alloy 6061-T6.
- B. Aluminum Extrusions: ASTM B 221, Alloy 6063-T6.
- C. Aluminum-Alloy Rolled Tread Plate: ASTM B 632/B 632M, Alloy 6061-T6.
- D. Aluminum Castings: ASTM B 26/B 26M, Alloy 443.0-F.

2.4 FASTENERS

- A. General: Unless otherwise indicated, provide Type 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, within exterior walls. Provide stainless-steel fasteners for fastening aluminum. Select fasteners for type, grade, and class required.
- B. Anchor Bolts: ASTM F 1554, Grade 36. Provide hot-dip, zinc-coated anchor bolts where item being fastened is indicated to be galvanized.
- C. Cast-in-Place Anchors in Concrete: Anchors shall be capable of sustaining, without failure, a load equal to four times the load imposed. Tests shall be as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency. Threaded or wedge type; galvanized ferrous castings, either ASTM A 47/A 47M malleable iron or ASTM A 27/A 27M cast steel. Provide bolts, washers, and shims as needed, hot-dip galvanized per ASTM A 153/A 153M.
- D. Expansion Anchors: Anchor bolt and sleeve assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488. Tests shall be conducted by a qualified independent testing agency.
 - 1. Material for Anchors in Interior Locations: Carbon-steel components zinc-plated to comply with ASTM B 633, Class Fe/Zn 5.
 - 2. Material for Anchors in Exterior Locations: Stainless-steel bolts complying with ASTM F 593 and nuts complying with ASTM F 594.

2.5 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- B. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds in steel, complying

with The Society for Protective Coatings SSPC-Paint 20 or ASTM A780.

- C. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
- D. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

2.6 FABRICATION, GENERAL

- A. Shop Assembly: Preassemble items in the shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- B. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- C. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- D. Form exposed work true to line and level with accurate angles and surfaces and straight edges.
- E. Weld corners and seams continuously to comply with the following:
 - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - 2. Obtain fusion without undercut or overlap.
 - 3. Remove welding flux immediately.
 - 4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
 - 5. Welds in water conveying vessels shall be performed by a welder qualified for producing waterproof welds and a minimum of five (5) years of experience in work requiring waterproof welds.
- F. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts, unless otherwise indicated. Locate joints where least conspicuous.
- G. Fabricate seams and other connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.
- H. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.
- I. Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
- J. Fabricate entire assembly before hot-dip galvanizing unless restricted by size of galvanizing tank to

sub-components.

2.7 MISCELLANEOUS FRAMING AND SUPPORTS

- A. General: Provide steel framing and supports not specified in other Sections as needed to complete the Work.
- B. Fabricate units from steel shapes, plates, and bars of welded construction, unless otherwise indicated. Fabricate to sizes, shapes, and profiles indicated and as necessary to receive adjacent construction retained by framing and supports. Cut, drill, and tap units to receive hardware, hangers, and similar items.
 - 1. Fabricate units from slotted channel framing where indicated.
 - 2. Furnish inserts if units are installed after concrete is placed.

2.8 LOOSE STEEL LINTELS

- A. Fabricate loose steel lintels from steel angles and shapes of size indicated for openings and recesses in masonry walls and partitions at locations indicated. Weld adjoining members together to form a single unit where indicated.
- B. Size loose lintels to provide bearing length at each side of openings equal to 1/12 of clear span but not less than 8 inches, unless otherwise indicated.

2.9 SHELF ANGLES

- A. Fabricate shelf angles from steel angles of sizes indicated and for attachment to structure. Provide horizontally slotted holes to receive 3/4-inch bolts, spaced not more than 6 inches from ends and 24 inches o.c., unless otherwise indicated.
 - 1. Provide mitered and welded units at corners.
 - 2. Provide open joints in shelf angles at expansion and control joints. Make open joint approximately 2 inches larger than expansion or control joint.
- B. For cavity walls, provide vertical channel brackets to support angles from backup masonry and concrete.
- C. Furnish wedge-type concrete inserts, complete with fasteners, to attach shelf angles to cast-in-place concrete.

2.10 LOOSE BEARING AND LEVELING PLATES

- A. Provide loose bearing and leveling plates for steel items bearing on masonry or concrete construction. Drill plates to receive anchor bolts and for grouting.

2.11 STEEL WELD PLATES AND ANGLES

- A. Provide steel weld plates and angles not specified in other Sections, for items supported from concrete construction as needed to complete the Work. Provide each unit with not less than two integrally welded steel strap anchors for embedding in concrete.

2.12 MISCELLANEOUS STEEL TRIM

- A. Unless otherwise indicated, fabricate units from steel shapes, plates, and bars of profiles shown with continuously welded joints and smooth exposed edges. Miter corners and use concealed field splices where possible.
- B. Provide cutouts, fittings, and anchorages as needed to coordinate assembly and installation with other work. Provide with integrally welded steel strap anchors for embedding in concrete or masonry construction.

2.13 PIPE GUARDS

- A. Fabricate pipe guards from 3/8-inch-thick by 12-inch wide steel plate, bent to fit flat against the wall or column at both ends and to fit around pipe with 2-inch clearance between pipe and pipe guard. Drill each end for two 3/4-inch anchor bolts.

2.14 METAL FLOOR PLATE

- A. Fabricate from rolled-steel patterned non-skid floor plate or rolled-aluminum-alloy non-skid tread of minimum 1/4 inch steel unless thicker units are required for anticipated loadings. Pattern to be selected by architect.
- B. Include steel angle stiffeners, and fixed and removable sections as indicated.
- C. Provide flush steel bar drop handles for lifting removable sections, one at each end of each section.

2.15 METAL BAR GRATINGS

- A. Welded Steel Grating:
 - 1. Bearing Bar Spacing: 11/16 inch (17 mm) o.c.
 - 2. Bearing Bar Depth: As required to comply with structural performance requirements.
 - 3. Bearing Bar Thickness: As required to comply with structural performance requirements.
 - 4. Crossbar Spacing: 2 inches (51 mm) o.c.
 - 5. Grating Mark: As indicated.
 - 6. Traffic Surface: Serrated.
 - 7. Steel Finish: Hot-dip galvanized with a coating weight of not less than 1.8 oz./sq. ft. (550 g/sq. m) of coated surface.
- B. Removable Grating Sections: Fabricate with banding bars attached by welding to entire perimeter of each section. Include anchors and fasteners of type indicated or, if not indicated, as recommended by manufacturer for attaching to supports.
- C. Fabricate cutouts in grating sections for penetrations indicated. Arrange cutouts to permit grating removal without disturbing items penetrating gratings.
 - 1. Edge-band openings in grating that interrupt four or more bearing bars with bars of same size and material as bearing bars.
- D. Do not notch bearing bars at supports to maintain elevation.

2.16 CABINETS FOR PANELS AND CONTROLS

- A. Cabinets for fire graphic annunciator panel, remote textual annunciator, telephone and additional controls for each station: Basis-of-design is Hoffman Pentair Equipment Protection or equal with the following characteristics:
 - 1. Material: 12 gauge Type 304 stainless steel with seams continuously welded and ground smooth.
 - 2. Hardware: Heavy-duty 3-point latching mechanism operated by Type 316L stainless steel padlocking handle on all doors. Ends of latch rods with rollers to facilitate door closing.
 - 3. Industry Standards: UL 508A Listed 508; Type 3R, 4, 4X, 12 as applicable.

2.17 WATER CONVEYING FABRICATIONS

- A. Scuppers, gutters, and other water conveying elements are intended to be complete, fully welded, water-tight vessels for conveying water from the collection point to the outlet connection. As such, these elements shall be fully welded at all seams, including any transition "tail pipe" outlet which connects to the plumbing system.
- B. After fabrication, each assembly shall be tested to determine that water is retained for 24 hours without detection of any leaks by temporarily sealing the outlet and filling the vessel with water. If any leaks are discovered during the test period, the vessel's seam or other defect shall be repair and the testing repeated until such time the unit passes the flood test.
- C. Comply with the National Association of Architectural metal Manufacturer's (NAAMM) "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- D. Finish metal fabrications after assembly.

2.18 STEEL AND IRON FINISHES

- A. Preparation for Shop Priming: For steel elements concealed from public view and protected from the elements, prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface preparation specifications and environmental exposure conditions of installed metal fabrications:
 - 1. Exteriors (SSPC Zone 1B) and Items Indicated to Receive Zinc-Rich Urethane Primer: SSPC- SP 6/NACE No. 3, "Commercial Blast Cleaning " or SSPC-SP-16, "Brush-Off Blast Cleaning of Non-Ferrous Metals."
 - 2. Interiors (SSPC Zone 1A): SSPC-SP 7, "Brush Off Blast Cleaning".
 - 3. Apply shop primer to uncoated surfaces of metal fabrications, except those with galvanized finishes and those to be field welded, embedded in concrete or masonry, unless otherwise indicated. Extend priming of partially embedded members to a depth of 2 inches.
 - 4. Comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel", for shop painting.
 - 5. Comply with SSPC-PA 2, "Measurement of Dry Coating Thickness with magnetic Gages".

- B. Hot-Dip Galvanizing: For steel exposed to the elements but not in public view, weather or corrosive environments and other steel indicated to be galvanized, provide coating for iron and steel fabrications applied by the hot-dip process. Refer to Section 05041 "Hot-Dip Galvanizing."
- C. Hot-Dip Galvanizing and Factory-Applied Urethane Primer and Finish for Steel: Provide factory-applied architectural coating over primed hot-dip galvanized steel matching approved samples. For all steel elements exposed to public view, see Section 05041 "Hot Dip Galvanizing."

2.19 STAINLESS-STEEL FINISHES

- A. Remove tool and die marks and stretch lines or blend into finish.
- B. Grind and polish surfaces to produce uniform, directionally textured #4 polished finish, free of cross scratches. Run grain with long dimension of each piece. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean. Remove all heat tint at welds and heat affected zones.
- C. Grind and polish surfaces to produce uniform, omni-directionally angel hair finish, free of cross scratches. Run grain with long dimension of each piece. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean. Remove all heat tint at welds and heat affected zones.

2.20 ALUMINUM FINISHES

- A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- B. As-Fabricated Finish: AA-M10 (Mechanical Finish: as fabricated, unspecified).
- C. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.
- D. High-Performance Organic Finish: Three coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - 1. Color and Gloss: As selected by Architect from manufacturer's full range.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

- A. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- B. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

- C. Field Welding: Comply with the following requirements:
 - 1. Field welding shall be performed only on elements not exposed to public view.
 - 2. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - 3. Obtain fusion without undercut or overlap.
 - 4. Remove welding flux immediately.
 - 5. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
 - 6. At final build-out, no visible welds are permitted unless otherwise approved by architect prior to welding.
- D. Fastening to In-Place Construction: Provide anchorage devices and fasteners where metal fabrications are required to be fastened to in-place construction. Provide threaded fasteners for use with concrete and masonry inserts, toggle bolts, through bolts, lag bolts, wood screws, and other connectors.
- E. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- F. Corrosion Protection: Coat concealed surfaces of metals that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint. Separate dissimilar materials with galvanic barriers to prevent galvanic corrosion.

3.2 INSTALLING MISCELLANEOUS FRAMING AND SUPPORTS

- A. General: Install framing and supports to comply with requirements of items being supported, including manufacturer's written instructions and requirements indicated on Shop Drawings.
- B. Support steel girders on solid grouted masonry, concrete, or steel pipe columns. Secure girders with anchor bolts embedded in grouted masonry or concrete or with bolts through top plates of pipe columns. Where grout space under bearing plates is indicated for girders supported on concrete or masonry, install as specified in this Section.
- C. Install pipe columns on concrete footings with grouted baseplates. Position and grout column baseplates as specified in this Section. Grout baseplates of columns supporting steel girders after girders are installed and leveled

3.3 INSTALLING BEARING AND LEVELING PLATES

- A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of plates.
- B. Set bearing and leveling plates on wedges, shims, or leveling nuts. After bearing members have been positioned and plumbed, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.
 - 1. Use nonshrink grout, either metallic or nonmetallic, in concealed locations where not exposed to moisture; use nonshrink, nonmetallic grout in exposed locations, unless otherwise indicated.

2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.4 INSTALLING PIPE BOLLARDS

- A. Anchor bollards in place with concrete footings. Center and align bollards in holes 3 inches above bottom of excavation. Place concrete and vibrate or tamp for consolidation. Support and brace bollards in position until concrete has cured.
- B. Fill bollards solidly with concrete, mounding top surface to shed water.

3.5 INSTALLING PIPE GUARDS

- A. Provide pipe guards at exposed vertical pipes in parking garage where not protected by curbs or other barriers. Install by bolting to wall or column with expansion anchors. Provide four 3/4-inch bolts at each pipe guard. Mount pipe guards with top edge 26 inches above driving surface.

3.6 INSTALLING STAIR NOSINGS

- A. Center extruded aluminum nosing housing in concrete stair, as shown on the architectural drawings, but no more than 4" from the edge of stair. The nosing housing shall be cast into the concrete stair, whether it is precast or cast-in-place. Install a disposable wood insert for the construction phase.
- B. At the end of construction, install the extruded aluminum nosing insert with epoxy abrasive filler, colored yellow, with stainless steel flush bolts. Install in accordance with manufacturer's instructions.

3.7 ADJUSTING AND CLEANING

- A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas. Paint uncoated and abraded areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
 1. Apply by brush or spray to provide a minimum 2.0-mil dry film thickness.
- B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05510

PROCESS METAL WORK

PART 1 - GENERAL

1.1 DESCRIPTION

- A. The Work of this section includes all labor, materials, tools and equipment required to furnish, fabricate, deliver and erect miscellaneous metal items as shown on the Contract Drawings, specified herein, and evidently required to complete the Work at the stormwater pumping stations.
- B. Construction of the Red Bridge and Washington Street pump stations (RPS and WSP, respectively) was initiated under IGMP-03, a previous GLX construction contract. That work was advanced to near completion of the basic structure. The pumps, variable frequency motor controllers, communication programmable logic controllers, pump station controls and metal work were not (or may not have been) completed, however certain items of that equipment were procured by the Owner and will be provided to the Design-Builder. The Design-Builder shall complete the construction of these two pump stations in full compliance with the specifications. The Design-Builder shall complete all work within this Section and all related work, to provide complete operable pump station facilities.
- C. The specifications relative to the WPS and RPS pump stations, including all operating parameters, control logic and other parameters, shall not be modified in any way.
- D. The Design-Builder may elect to adapt these specifications, if appropriate, to any pump station it may propose at Gilman Square.
- E. Certain work under this Section was, or may have been, completed by the previous GLX contractor. The Design-Builder shall be responsible for making its own assessments and evaluations as to the exact scope and limits of the completed and the uncompleted work. The Design-Builder shall complete any and all work associated with this Section and all Related Sections, including any and all uncompleted and/or partially completed work. The Design-Builder shall coordinate all related work, to provide complete and operable stormwater pumping facilities.
- F. The use of the word "Contractor" has been retained in this Section; however, it shall be interpreted to mean the Design-Builder for any and all work remaining to be completed. Likewise, the word "Engineer" has been retained; however, it shall be interpreted to mean the Owner for any and all work remaining to be completed.
- G. Items to be embedded in concrete or masonry shall be furnished under this section but installed under DIVISION 3- CONCRETE WORK or DIVISION 4 - MASONRY, as applicable.

1.2 SUBMITTALS

- A. Shop drawings shall be submitted for all items to be furnished in accordance Section 01300 - SUBMITTALS.
- B. Submittals required under this section include, but are not limited to, the following:
 - 1. Fabricator's quality control procedures.

2. Copies of welding certificates for welding procedures and personnel.
3. Drawings shall show finish, sizes of metal, method of assembly, hardware, and anchorage or connection with other Work.
4. Sample of proposed rail(s) indicating weld, splicing, and finish.
5. Sample of proposed stair nosing(s).

PART 2 - PRODUCTS

2.1 GENERAL PROVISIONS

- A. Standard products meeting the requirements of the Specifications may be accepted as the equivalent of those specified, if approved by the Engineer.
- B. Gauges for iron sheets and steel are U.S. Standard; for non-ferrous products is Brown & Sharpe; and for wire is United States Steel Wire.
- C. Steel W-shapes shall conform to ASTM A992 (50 ksi yield strength). Other steel shapes, and plates and bars shall conform to ASTM A36.
- D. Steel pipe columns shall conform to ASTM A53, Grade B.
- E. Structural tubing columns shall conform to ASTM A500, Grade B.
- F. Cast iron shall conform to ASTM A48.
- G. Aluminum items shall be fabricated from bars, plates, pipes, rolled and extruded shapes conforming to the following alloy designation unless otherwise indicated or specified.
 1. Standard structural shapes shall be rolled 6061-T6 conforming to ASTM B308.
 2. Rolled rod and bar shall be 6061-T6 conforming to ASTM B211.
 3. Sheets, Plates, Checkered Plates, etc., shall be 6061-T6 conforming to ASTM B209.
 4. Bolts shall be 2024-T4; Nuts shall be 6061-T6; and Washers shall be Alclad 2024-T4.
- H. Stainless Steel Items shall be Type 316 unless otherwise specified herein and/or as shown on the drawings.

2.2 SPECIFIC PRODUCTS

- A. Aluminum Railing
 1. Aluminum railing shall be formed of 1-1/2-inch round aluminum pipe in all welded construction. Posts shall be Schedule 80, alloy 6061-T6, and rails shall be Schedule 40, alloy 6063-T6. All welds shall be continuous at all intersections and ground smooth on all exposed areas. Radius corners shall be used and mitered corners are not acceptable. Where intersections occur, pieces shall be shaped and cut to fit, no distortion of the circular shape will be allowed. Railing shall be furnished in the largest practical sections with the locations and details of field connections indicated on the shop drawings. After fabrication, all railing shall be

cleaned, light circumferentially brushed, caustic etched and clear anodized in accordance with Aluminum Association M31C22A31 (0.4 mil minimum thickness).

2. Post spacing shall be a maximum of four (4) feet on centers measured along the rail. Posts shall be single, unspliced pipe length. Lower rails shall be single, unspliced length between posts. Top rails shall be continuous wherever possible and a single unspliced length shall be attached to a minimum of three (3) posts. Provide 4-inch high toe plate mechanically connected to posts, where shown on the Contract Drawings.
3. Unless otherwise noted, top rail on platforms and other level runs shall be forty-two (42) inches from upper surface of rail to floor, tank wall or other horizontal surface and intermediate rail shall be located approximately half way between top rail and floor. On stairs, railing shall be similar except that vertical height shall be thirty-six (36) inches from upper surface of top rail to surface of tread in line with face of riser at forward edge of tread.
4. Design and anchorage of all railing shall be such that the completed structure shall be capable of withstanding the loads prescribed by the Building Code of the Project state. Wall mounted railing shall be supported with cast brackets and fastened with stainless steel expansion or toggle bolts.
5. Removable railings shall be furnished at the locations shown on the Contract Drawings. Removable railings shall be mounted such that when the railing is removed, it is separated from the mounting bracket.

B. Guard Chain

1. Guard chain shall be provided at the locations shown on the Contract Drawings. Chain shall be stainless steel chain as made by Lawrence Metal Products, Inc., American Chain & Cable Co., Turner & Seymour Manufacturing Company or approved equal.
2. Chain shall be of 3/16-inch diameter stainless steel wire with welded links and thirteen (13) links per foot. Each chain shall be permanently fastened to one end, and provided with a swivel snap hook to attach to the other end. Lengths of guard chain shall be sufficient to span the openings with a minimal amount of slack.

C. Bar Rack

1. Shall be fabricated from 6061-T6 aluminum alloy stock in accordance with the details shown on the Contract Drawings. The Bar Rack shall be fabricated with 1/2" x 2" bars spaced 2" on center for a 1-1/2" clear opening. All materials shall be furnished under this section. However, those parts to be fastened to concrete shall be installed under Section 03300 - CAST-IN-PLACE CONCRETE. The rack shall be fabricated and installed under this section from field measurements after cast-in sections are in place.

D. Aluminum Gratings and Frames

1. One (1) type of aluminum grating and frames is required for the depths indicated on the Contract Drawings. Grating shall be I-bar swage locked with 1/4-inch bearing bars at 1-3/16-inches on center and cross bars at 4-inches on center. Grating shall conform to National Association of Architectural Metal Manufacturers (NAAMM) standards and be fabricated to NAAMM tolerances. Grating and frames shall be as manufactured by IKG Industries, Klemp Corporation, Ohio Gratings, Inc., or approved equal.

2. Supporting members shall be aluminum of the size and shape indicated. Grating shall be made of alloy 6063-T6 bearing bars and alloy 6063-T5 cross bars with mill finish. Straps, bolts, ties, and all necessary accessories shall be aluminum. Grating shall be fastened in accordance with the manufacturer's standard clips using micarta between the aluminum and dissimilar materials.
 3. Gratings, supports, and all other necessary accessories shall be installed under this section except that all anchor bolts and frames to be strapped into concrete shall be installed under Section 03300 - CAST-IN-PLACE CONCRETE. Portions of aluminum to be bedded in concrete shall be given a coating of heavy bodied bituminous paint. Grating sections shall be limited to a size that can be removed by one (1) man. At the ends of all sections and at openings, grating shall be banded with a 1/4-inch thick band of width equal to the full depth of grating, welded on. When span of grating changes direction, such as at channel intersections, provide suitable supporting members, as required.
- E. Expansion Bolts. Where concrete anchors or expansion bolts are noted on the Contract Drawings or as evidently required to secure members, Hilti Kwik-Bolt, Parabolt or RedHead Wedge Anchors shall be furnished and used. Stainless steel bolts shall be used when anchoring aluminum and in all submerged locations.
- F. Aluminum Ladder(s). Aluminum ladders shall be formed of alloy 6061-T6 with 2-1/2 inch by 3/8-inch flat bar side rails and alloy 6063-T5 aluminum 1-inch square corrugated, or other approved, skid proof rungs. Rails shall be bracketed to wall areas at no greater than 4 foot centers so that the center of the rungs are 7-inches from the face of wall areas. Provide aluminum ladders where shown on the Contract Drawing. Ladder and Safety Cages shall conform to all requirements of ANSI A14.3 and OSHA regulations.
- G. Hatch Covers.
1. Hatch covers shall be of the styles, types, and sizes shown on the Contract Drawings. All hatch covers shall be of the same manufacturer. Manufacturer shall guarantee proper operation and against defects in material or workmanship for a period of five (5) years. All hatch covers shall be of aluminum as manufactured by the Bilco Company, Halliday Products, Inc., or approved equal. Hatches show with in roadway shall be H20 rated.
 2. Type J and JD hatch covers shall be single leaf and double leaf, respectively, watertight, self-draining type. Door leaf shall be of 1/4-inch thick aluminum diamond pattern plates reinforced with aluminum stiffeners as required and capable of withstanding a live load of 300 pounds per square foot. Channel frame shall be 1/4-inch thick aluminum with anchor flange around the perimeter. Each door leaf shall be equipped with a minimum of two (2) hinges, with stainless steel pins, compression spring operators enclosed in telescopic tubes to afford easy operation, and an automatic hold-open arm with release handle. Snap locks with removable handle and safety chains shall be provided. A 1-1/2-inch drainage coupling shall be located in the front right corner of the channel frame. Hardware shall be stainless steel with factory mill finish and bituminous coating applied to exterior of frame.
 3. Type J and JD hatches that are not shown connected to a drainage system shall be provided with extensions to the drainage coupling to allow drainage to the area below.
 4. Hatch covers shall be installed in accordance with the recommendations of the manufacturer and as approved by the Engineer.
 5. All hatch covers shall be equipped with a factory installed fall protection grating system designed to meet OSHA 29 CFR 1910.23 and be equipped with a type 316 stainless steel hold-

open device to lock the grating panel(s) in the open position at a 90° position. The aluminum grating panel(s) shall be safety-yellow powder coat paint finish.

- H. Miscellaneous Structural Steel Items. All miscellaneous structural steel items, galvanized angles, relieving angles, plates, channels, headed concrete anchors, and all required fastenings shown on the Contract Drawings shall be fabricated as detailed and furnished under this section. They shall be installed under the applicable section of the Specifications. Miscellaneous items shall be galvanized as indicated and as specified herein.
- I. Steel frames for miscellaneous openings shall be fabricated from structural shapes and plates of the sizes indicated. Frames shall be accurately squared, mitered, butted, or coped as necessary and shall be fully welded, welded flush and ground smooth. Stops, where required, shall be plug-welded and ground smooth. Joints exposed to weather shall be seal welded.
- J. Anchor bolts shall be of the sizes indicated, threaded, headed and made of ASTM F1554 Grade 36 steel, galvanized except where stainless steel is noted. Plates shall be furnished as indicated. Stainless steel bolts shall be used in attaching aluminum, and in all submerged locations, and shall include stainless steel nuts and washers. In general, anchor bolts to be supplied under this section will only be for the other items supplied under this section that requires them.
- K. Steel Gratings and Frames shall be of the types and sizes as shown on the Contract Drawings. Gratings shall be welded steel grating with 4 inch deep by 1/4-inch bearing bars 13/16-inch on center and cross bars 4-inches on center. Gratings and frames shall be galvanized after fabrication.
- L. Manhole Rungs. Manhole rungs shall be Part No. F-14-2-D as manufactured by Washington Aluminum, or similar as made by Neenah Foundry, Flockhart Foundry or approved equal. Steps shall be of alloy 6061-T6 and portions to be embedded in concrete shall have a coat of zinc chromate paint.
- M. Aluminum Stairs. Aluminum stairs shall be fabricated and installed according to the details shown on the Contract Drawings and/or as approved by the Engineer. Aluminum shall be alloy 6061-T6. Stainless steel bolts, nuts, and washers shall be provided as required. Grating stairway treads shall be aluminum cross bar type with extruded aluminum corrugated nosing as made by the grating manufacturer. Treads shall have 3-inch by 3/16-inch carrier plates welded to the ends of the tread, punched for bolting to stringers. Bar size shall be as recommended by the manufacturer for the length of the tread as approved by the Engineer.
- N. Weirs and Baffles. Weirs and baffles shall be aluminum construction (including plates, angles, straps, bracing, channels) and shall be fabricated and installed in accordance with the details shown on the Contract Drawings and/or approved by the Engineer. Stainless steel bolts, nuts, washers shall be provided as required. Aluminum weirs and baffles shall be aluminum alloy 6061-T6. Welding shall be in accordance with the requirements as specified herein. The weir in the Red Bridge Storm water Pump Station shall have a minimum of one (1) foot of adjustment and shall be anchor bolted a maximum of two and half (2-1/2') feet apart for a minimum of 8; 1/2 inch stainless steel bolts.
- O. Lifting Eye Bolts
 1. Bolts shall be in accordance with the details shown on the Contract Drawings.
 2. Bolts shall be stainless steel.
- P. Ships Ladder and Landing

1. Stringers shall be fabricated from Alloy 6061-T6 mill finish.
 2. Grating for landing shall be I-bar swage locked with 3/16-inch bearing bars at 1-3/16-inches on center and cross bars at 4-inches on center. Grating shall conform to NAAMM standards and be fabricated to NAAMM tolerances. Grating shall be as manufactured by IKG Industries, Klemp Corporation, or Reliance Steel Products Co. or approved equal.
 3. Grating treads shall be aluminum with 6-inch tread and corrugated nosing.
 4. Railing shall be in conformance with the requirements specified herein.
 5. Entire assembly shall be capable of supporting a live load of 100 pounds per square foot.
- Q. Metal Lintels shall be of galvanized steel and of the size and shape shown on the Contract Drawings and shall have a minimum bearing on the masonry of 8-inches. Lintels shall be installed under Section 04800 - MASONRY.

PART 3 - EXECUTION

3.1 WORKMANSHIP

- A. Materials and workmanship shall be subject to the approval of the Engineer. Built-up Work shall be assembled in sections in the shop so far as practicable, accurately finished and the separate sections match marked for field erection.
- B. Where necessary, pertinent measurements shall be made before fabrication of the items so that work herein included shall properly fit the construction.

3.2 INSTALLATION

- A. Work shall be installed at the proper time and as rapidly as the condition of the supporting work will allow. Sections shall be installed in the most substantial manner, reinforced with steel shapes where necessary, using bolts, screws, or other necessary fastenings. All bolts projecting beyond the nuts, in exposed work shall be cut off close to the nuts and peened.
- B. All cutting, fitting, drilling and tapping required to install the Work and to make proper connections with adjoining supporting work, and all anchors, sockets, pipe sleeves, and fastening devices required for the proper and secure installation of the Work shall be included.

3.3 WELDING OF STEEL

- A. Welding shall be in accordance with the Structural Welding Code D1.1, current edition, as formulated by the American Welding Society. Welds shall be continuous along entire line of contact, except where plug or tack welding is noted. Exposed welds shall be ground smooth.

3.4 WELDING OF ALUMINUM

- A. Aluminum shall be fusion welded by the inert gas-shielded arc method. Where appearance is not a factor and anodizing is not required, alloy 4043 rods may be used. For appearance match, rods shall be of an alloy similar to the alloy being welded.

3.5 SHOP COATINGS

- A. Interior Service. All ferrous metal items which will be in interior service shall be cleaned in accordance with SSPC specification SP-6 for commercial blast cleaning and shall be prime painted compatible with the finish paints as specified in Section 09900 - PAINTING, for interior service. Stainless steel shall not be painted.
- B. Immersion Service. All ferrous metal items which will be in submerged service shall be cleaned in accordance with SSPC specification SP-10 for near white blast cleaning and shall be prime painted compatible with the finish paints as specified in Section 09900 - PAINTING, for immersion service.
- C. Dissimilar Material
 - 1. Where aluminum surfaces come in contact with metals other than stainless steel or other metals not compatible with aluminum, aluminum surfaces shall be kept from direct contact with such parts by painting the dissimilar metal with a coating of zinc chromate paint or use a good grade caulking or non-absorptive tape between dissimilar metals.
 - 2. Similarly, when aluminum comes in contact with concrete, masonry or by-products of these materials, the aluminum shall be given a coat of bituminous paint. Steel to be welded or encased in concrete shall not be painted.
- D. Galvanizing. All items specified as galvanized shall be coated by the hot-dip process in accordance with ASTM A123, ASTM A153, ASTM A386, and ASTM A525 as applicable in molten zinc, producing a continuous coating of uniform thickness of weight required by the referenced specifications.
 - 1. Coating shall be of best commercial quality, free from injurious defects, flux and uncoated spots, and of such quality as will endure without penetration of the coating not less than four (4) immersions in copper sulfate, conforming to ASTM A239.
 - 2. A stamp showing the name of the galvanizer, the weight of the coating and ASTM specification compliance shall identify galvanized items.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05511

METAL STAIRS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
1. Preassembled steel stairs with concrete filled treads.
 2. Industrial-type stairs with steel grating treads.
 3. Steel tube railings attached to metal stairs.
 4. Steel tube handrails attached to walls adjacent to metal stairs.
- B. Related Work:
1. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 2. Section 03300 - CAST-IN-PLACE CONCRETE for concrete fill for stair treads and platforms.
 3. Section 04800 - MASONRY for concrete masonry unit assemblies for anchoring landings and railings.
 4. Section 05041 – HOT-DIP GALVANIZING for galvanizing steel and iron products.
 5. Section 05500 – MISCELLANEOUS METALS for metal treads and nosings not installed in metal stairs.
 6. Section 09900 - PAINTING for field applied coatings.

1.2 PERFORMANCE REQUIREMENTS

- A. Structural Performance of Stairs: Provide metal stairs capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:
1. Uniform Load and Concentrated Loads: As required by IBC 780 CMR Mass State Building Code.
 2. Stair Framing: Capable of withstanding stresses resulting from railing loads in addition to loads specified above.
 3. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch, whichever is less.
- B. Structural Performance of Railings: Provide railings capable of withstanding the effects of gravity loads and Code required loads and stresses within limits.

1.3 SUBMITTALS

- A. Product Data: For metal stairs and the following:
1. Site-filled metal-pan stair treads.
 2. Paint products.

- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - 1. Provide templates for anchors and bolts specified for installation under other Sections.
 - 2. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer licensed in the Commonwealth of Massachusetts responsible for their preparation.
 - 3. Indicate required field welding.
- C. Welding certificates. Qualifications for welding procedures and welders.
- D. Weld inspection reports.
- E. Qualification Data: For professional engineer licensed in the Commonwealth of Massachusetts.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: Fabricator of products.
- B. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual", for class of stair designated, unless more stringent requirements are indicated.
 - 1. Preassembled Stairs: Commercial class.
- C. Welding: Qualify procedures and personnel according to the following:
 - 1. AWS D1.1, "Structural Welding Code--Steel".
 - 2. AWS D1.3, "Structural Welding Code--Sheet Steel".
- D. As a minimum, welds shall be visually inspected.

1.5 COORDINATION

- A. Coordinate installation of anchorages for metal stairs. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Coordinate locations of hanger rods and struts with other work so that they will not encroach on required stair width and will be within the fire-resistance-rated stair enclosure.

PART 2 - PRODUCTS

2.1 METALS, GENERAL

- A. Metal Surfaces, General: Provide materials with smooth, flat surfaces, unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

2.2 FERROUS METALS

- A. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
- B. Steel Tubing: ASTM A 500 (cold formed) or ASTM A 513, Type 5 (mandrel drawn)
- C. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from plate complying with ASTM A 36/A 36M or ASTM A 283/A 283M, Grade C or D.
- D. Uncoated, Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M commercial steel, Type B, or structural steel, Grade 30, unless another grade is required by design loads.

2.3 FASTENERS

- A. General: Provide hot-dipped galvanized fasteners for exterior use, and where built into exterior walls with coating complying with galvanizing requirements as specified in Section 05041 "Hot-Dipped Galvanizing." Select fasteners for type, grade, and class required.

2.4 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- B. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
- C. Concrete Materials and Properties: Comply with requirements in Section 03300 - CAST-IN-PLACE CONCRETE for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 4000 psi, unless otherwise indicated.

2.5 FABRICATION, GENERAL

- A. Provide complete stair assemblies, including metal framing, hangers, struts, railings, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.
 - 1. Join components by welding, unless otherwise indicated.
 - 2. Use connections that maintain structural value of joined pieces.
- B. Preassembled Stairs: Assemble stairs in shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
 - 1. All field assembly shall be by fasteners; all welding is to be done in the shop.
- C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- E. Form exposed work true to line and level with accurate angles and surfaces and straight edges.
- F. Weld connections to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately.
 4. Weld exposed corners and seams continuously, unless otherwise indicated.
 5. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated. Locate joints where least conspicuous. Where exposed fasteners are visible in final configuration, screws will be tamperproof type.
- H. Fabricate joints that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.
- I. To the greatest extent possible, Hot-Dip Galvanize after welding components and minimize post- galvanizing welding.

2.6 STEEL-FRAMED STAIRS

- A. Stair Framing:
1. Fabricate stringers of steel plates or channels. Provide closures for exposed ends of stringers.
 2. Construct platforms of steel plate or channel headers and miscellaneous framing members as needed to comply with performance requirements.
 3. Weld stringers to headers; weld framing members to stringers and headers.
 4. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.
- B. Metal-Pan Stairs: Form risers, subtread pans, and subplatforms to configurations shown from steel sheet of thickness needed to comply with performance requirements but not less than 0.0677 inch.
1. Steel Sheet: Uncoated hot-rolled steel sheet, unless otherwise indicated.
 2. Directly weld metal pans to stringers; locate welds on top of subtreads where they will be concealed by concrete fill. Do not weld risers to stringers.
 3. Shape metal pans to include nosing integral with riser.
 4. Provide subplatforms of configuration indicated or, if not indicated, the same as subtreads. Weld subplatforms to platform framing.
- C. Metal Bar-Grating Stairs: Form grate treads to comply with required loads as provided in Section 05500 "Miscellaneous Metals."

2.7 STEEL TUBE RAILINGS

- A. General: Fabricate railings to comply with requirements indicated for design, dimensions,

details, finish, and member sizes, including wall thickness of tube, post spacings, and anchorage, but not less than that needed to withstand indicated loads.

- B. Welded Connections: Fabricate railings with welded connections. Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.
 - 1. All welded connections will be done in shop, before hot-dip galvanizing.
- C. Form changes in direction of railings as detailed on the Drawings.
- D. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.
- E. Close exposed ends of railing members with welded semi-special ends, ground smooth.
- F. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated. Close ends of returns unless clearance between end of rail and wall is 1/4 inch or less.
- G. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnecting components and for attaching to other work. Furnish inserts and other anchorage devices for connecting to concrete or masonry work.
 - 1. Connect posts to stair framing with bolted fasteners, unless otherwise indicated.
 - 2. For galvanized railings, provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous-metal components.
 - 3. For galvanized railings, provide galvanized painted ferrous-metal fittings, brackets, fasteners, and sleeves, except galvanize anchors embedded in exterior masonry and concrete construction.
- H. Fillers: Provide fillers made from steel plate, or other suitably crush-resistant material, where needed to transfer wall bracket loads through wall finishes to structural supports. Size fillers to suit wall finish thicknesses and to produce adequate bearing area to prevent bracket rotation and overstressing of substrate.

2.8 STAIR RAILINGS

- A. Comply with applicable requirements in Section 05720 "Metal Railings and Gates."

2.9 FINISHES

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. All metal stairs shall be hot-dip galvanized.
- C. Galvanizing: Hot-dip galvanize items as indicated to comply with applicable standard listed in Section 05041 "Hot-Dip Galvanizing."
- D. Galvanizing and Painting: Hot-dipped galvanized and painted items as indicated shall comply with applicable standards listed in Section 05041 "Hot-Dip Galvanizing."

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.
- C. Install metal stairs by bolting stair framing to steel structure or to weld plates cast into concrete, unless otherwise indicated.
- D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- E. Fit exposed connections accurately together to form hairline joints. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- F. Place and finish concrete fill for treads and platforms to comply with Section 033000 - CAST-IN- PLACE CONCRETE.
 - 1. Install abrasive nosings with inlaid yellow epoxy strips mechanically fastened to concrete tread.Center nosings on tread width.

3.2 INSTALLING STEEL TUBE RAILINGS

- A. Adjust railing systems before anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated or, if not indicated, as required by design loads. Plumb posts in each direction. Secure posts and rail ends to building construction as follows:
 - 1. Anchor posts to steel stringers by bolted connections.
 - 2. Anchor handrail ends to concrete and masonry with steel inserts, embedded or otherwise fastened in wall, and inserted inside handrail end, and secured with bolt flush with handrail.
- B. Attach handrails to wall with wall brackets or to floor below. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads. Secure wall brackets to building construction as follows:
 - 1. Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt.
 - 2. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
 - 3. For hollow masonry anchorage, use toggle bolts.

3.3 ADJUSTING AND CLEANING

- A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
 - 1. Apply by brush or spray to provide a minimum 2.0-mil dry film thickness.
- B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780. For painted galvanized, prime and paint according to Section 09900 "Painting."

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05720

METAL RAILINGS AND GATES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies steel railings and steel fences and gates.
- B. Related Work:
 - 1. Section 05041 – HOT DIP GALVANIZING for requirements for hot-dip painting for steel.
 - 2. Section 05511 – METAL STAIRS for railings associated with metal stairs.
 - 3. Section 05721 - STAINLESS STEEL RAILINGS AND GATES for railings fabricated from stainless steel.

1.2 DEFINITIONS

- A. Railings: Guards, handrails, and similar devices used for protection of occupants at open-sided floor areas, pedestrian guidance and support, visual separation, or wall protection.

1.3 PERFORMANCE REQUIREMENTS

- A. Delegated Design: Design railings, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated. Signed and sealed structural calculations and drawings shall be prepared under the supervision of a qualified professional engineer licensed in the Commonwealth of Massachusetts.
- B. General: In engineering railings to withstand structural loads indicated, determine allowable design working stresses of railing materials based on the following:
 - 1. Steel: 72 percent of minimum yield strength.
- C. Structural Performance: Railings shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:
 - 1. Handrails and Top Rails of Guards:
 - a. Uniform load of 50 lbf/ ft. (0.73 kN/m) applied in any direction.
 - b. Concentrated load of 200 lbf (0.89 kN) applied in any direction.
 - c. Uniform and concentrated loads need not be assumed to act concurrently.
 - 2. Infill of Guards:
 - a. Concentrated load of 50 lbf (0.22 kN) applied horizontally on an area of 1 sq. ft. (0.093 sq. m).
 - b. Infill load and other loads need not be assumed to act concurrently.

- D. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on exterior metal fabrications by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects.
 - 1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.
- E. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.4 SUBMITTALS

- A. Product Data: For the following:
 - 1. Manufacturer's product lines of mechanically connected railings.
 - 2. Railing brackets.
 - 3. Grout, anchoring cement, and paint products.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
- C. Samples for Verification: For each type of exposed assembly required. If shop welding is required, provide sample of joint and geometry with weld processed to be invisible with adjacent steel; including finishes and geometry.
 - 1. Sections of each distinctly different linear railing member, including handrails, top rails, bottom rails, mid-rails, posts, and balusters.
 - 2. Fittings and brackets.
- D. Qualification Data: For qualified professional engineer and testing agency.
- E. Welding certificates.
- F. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers certifying that shop primers are compatible with topcoats.
- G. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, according to ASTM E 894 and ASTM E 935.
- H. Engineering Submittal: For installed products indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of railing from single source from single manufacturer.
- B. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- C. Welding Qualifications: Qualify procedures and personnel according to the following:
 - 1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."

2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."

- D. Inspection: Inspector shall be independent third party with 10 years experience with work of similar size and scope. Welds to be inspected before covering of finishes. Shop welds shall be inspected for both methods and materials before galvanizing and painting. If welds are visible to public, architect shall also approve at that time.

1.6 PROJECT CONDITIONS

- A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.

1.7 COORDINATION AND SCHEDULING

- A. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including bolt holes in stringers or mounting brackets and bottom of rails, sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Schedule installation so wall attachments are made only to completed walls and floors. Do not support railings temporarily by any means that do not satisfy structural performance requirements.

PART 2 - PRODUCTS

2.1 METALS, GENERAL

- A. Metal Surfaces, General: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.
- B. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails unless otherwise indicated.

2.2 STEEL AND IRON

- A. Tubing: ASTM A 500 (cold formed).
- B. Pipe: ASTM A 53/A 53M, Type F or Type S, Grade A, Standard Weight (Schedule 40), unless another grade and weight are required by structural loads.
- C. Plates, Shapes, and Bars: ASTM A 36/A 36M.
- D. Cast Iron: Either gray iron, ASTM A 48/A 48M, or malleable iron, ASTM A 47/A 47M, unless otherwise indicated.

2.3 FASTENERS

- A. General: Provide the following:
1. Hot-Dip Galvanized Painted Railings: Hot-dip zinc-coated painted steel fasteners complying with ASTM A 153/A 153M or ASTM F 2329 for zinc coating. Refer to spec 05041 – Hot-Dip Galvanizing.

2. Railings: Type 316 stainless-steel fasteners and brackets.
- B. Fasteners for Anchoring Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated and capable of withstanding design loads. Handrail brackets shall be type 316 stainless steel.
- C. Fasteners for Interconnecting Railing Components:
 1. Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless otherwise indicated.
- D. Post-Installed Anchors: Torque-controlled expansion anchors or chemical anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.
 1. Material for Interior Locations: Carbon-steel components zinc-plated to comply with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5, unless otherwise indicated.
 2. Material for Exterior Locations: Alloy Group 2 (A4) stainless-steel bolts, ASTM F 593, and nuts, ASTM F 594.

2.4 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- B. Galvanizing Repair Paint: Refer to specification 05401 – Hot- Dip Galvanizing.
- C. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
- D. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.
- E. Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound.
 1. Water-Resistant Product: At exterior locations provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

2.5 FABRICATION

- A. General: Fabricate railings and guards to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads. Fabricate units in the maximum size suitable for hot-dip galvanizing. Do not weld any galvanized elements.
- B. Assemble railings and guard units in the shop to verify dimensions and fit. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. All connections of galvanized elements shall be mechanical.

- C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- D. Form work true to line and level with accurate angles and surfaces.
- E. Fabricate connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.
- F. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.
- G. Connections: Fabricate railings with welded connections unless otherwise indicated.
- H. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.
 - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - 2. Obtain fusion without undercut or overlap.
 - 3. Remove flux immediately.
 - 4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
- I. Form changes in direction as follows:
 - 1. By bending.
- J. Bend members in jigs to produce uniform curvature for each configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.
- K. Close exposed ends of railing members with stainless steel end fittings, welded and ground smooth and finished to match rest of the railings.
- L. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work unless otherwise indicated.
- M. Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.
- N. For railing posts set in concrete, provide steel sleeves not less than 6 inches (150 mm) long with inside dimensions not less than 1/2 inch (13 mm) greater than outside dimensions of post, with metal plate forming bottom closure.
- O. Form gates of same size and shape as guards, with infill to match guards, or as indicated on the drawings. Fabricate gates and adjacent frames to accommodate specified hardware, including hinges, closers, locks, latches, panic hardware, and all associated conduit.

2.6 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for

recommendations for applying and designating finishes.

- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2.7 STEEL AND IRON FINISHES

- A. Galvanized Guards, Posts, Newels:

1. Hot-dip galvanize and paint all steel and iron guards, including hardware, after fabrication.
2. Comply with Section 05041 "Hot-Dip Galvanizing."
3. Fill vent and drain holes that will be exposed in the finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.

- B. For galvanized railings, provide hot-dip galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

- A. Fit exposed connections together to form tight, hairline joints.
- B. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
 1. Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
 2. Set posts plumb within a tolerance of 1/16 inch in 3 feet (2 mm in 1 m).
 3. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet (5 mm in 3 m).
- C. Adjust railings before anchoring to ensure matching alignment at abutting joints.
- D. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

3.2 RAILING CONNECTIONS

- A. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article 2.6.
- B. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches (50 mm) beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches (150 mm) of post.

3.3 ANCHORING POSTS

- A. Use metal sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with nonshrink, nonmetallic grout or anchoring cement, mixed and placed to comply with anchoring material manufacturer's written instructions.
- B. Cover anchorage joint with flange of same metal as post, mechanically fastened to post after placing anchoring material.
- C. Anchor posts to metal surfaces with flanges, angle type, or floor type as required by conditions and detailed on drawings, bolted to posts and to metal supporting members.

3.4 ADJUSTING AND CLEANING

- A. Clean aluminum by washing thoroughly with clean water and soap and rinsing with clean water.
- B. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
 - 1. Apply by brush or spray to provide a minimum 2.0-mil (0.05-mm) dry film thickness.
- C. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

3.5 PROTECTION

- A. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 05810

EXPANSION JOINT COVER ASSEMBLIES

PART 1 GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies expansion joint assemblies in stations and platforms.
- B. Related Work:
 - 1. Section 03300, CAST-IN-PLACE CONCRETE.
 - 2. Section 07911, EXPANSION JOINT ASSEMBLIES.
 - 3. Section 07920, JOINT SEALANTS; Sealants and backer-rods.

1.2 SUBMITTALS

- A. Product data in form of manufacturer's product specifications, installation instructions, and general recommendations for each type of expansion joint cover assembly indicated.
- B. Material test reports from qualified independent testing laboratory indicating and interpreting test results relative to compliance of fire-rated expansion joint assemblies with requirements indicated.
- C. Shop drawings showing full extent of expansion joint cover assemblies; include large-scale details indicating profiles of each type of expansion joint cover assembly, splice joints between sections, joinery with other types, special end conditions, anchorages, fasteners, and relationship to adjoining work and finishes. Include description of materials and finishes.
- D. Samples for each type of metal finish indicated on metal of same thickness and alloy to be used in work. Where normal color and texture variations are to be expected, include 2 or more units in each set of samples showing limits of such variations.
- E. Mill Certificates: Signed by manufacturers of stainless-steel certifying that products furnished comply with requirements.

1.3 QUALITY ASSURANCE

- A. Manufacturer's Instructions: In addition to requirements of these specifications, comply with manufacturer's instructions recommendations for all phases of work, including preparation of substrate, applying materials, and protection of installed units.
- B. Single-Source Responsibility: Obtain expansion joint cover assemblies from one source from a single manufacturer.
- C. Fire Performance Characteristics: Where indicated, provide expansion joint cover assemblies identical to those of assemblies whose fire resistance has been determined per ANSI/UL 263, NFPA 251, U.B.C. 43-1, or ASTM E 119 and E 814 including hose stream test at full-rated period by a nationally recognized testing and inspecting organization or by another means, as acceptable to authorities having jurisdiction.

1. Fire Rating: Not less than the rating of adjacent construction.

PART 2 PRODUCTS

2.1 EXPANSION JOINT COVER ASSEMBLIES

- A. Manufacturer: Subject to compliance with requirements, provide the following products:
 1. At interior floors, provide an expansion joint cover with a concrete-filled floating pan by Construction Specialties, Inc.; Pan Seismic Floor Covers or an approved equal.
 2. At exterior floors, provide an interlocking dual slide plate assembly expansion joints by MM Systems or an approved equal.
 3. At exterior plazas, provide Slip NOT stainless steel Grade 2 cover plate, fastened along fixed side, with ¼" Teflon pad below the opposite side.
 4. Wall and Ceiling: Provide expansion joints by Construction Specialties, Inc. or MM Systems or an approved equal; profiles as indicated on the Drawings.
 5. Preformed Expansion Joint Sealants: Provide EMSeal or equal; typical joint width 2 inches.

2.2 MATERIALS

- A. Metals:
 1. Aluminum: ASTM B 221, alloy 6063-T5 for extrusions; ASTM B 209, alloy 6061-T6, sheet and plate. Protect aluminum surfaces in contact with cementitious materials with zinc chromate primer or chromate conversion coating.
 2. Stainless Steel: ASTM A 666, Type 316, unless otherwise indicated, for plates, sheet, and strips.
- B. Nonmetal Products:
 1. Extruded Preformed Seals: Single or multilayered rubber extrusions as classified under ASTM D 2000, designed with or without continuous, longitudinal, internal baffles and formed to fit compatible frames, in color indicated, or, if not indicated, as selected by Engineer from manufacturer's standard colors.
 2. Elastomeric Sealant: Manufacturer's standard elastomeric sealant complying with ASTM C 920, Use T, factory-formed and -bonded to metal frames or anchor members; in color indicated, or, if not indicated, as selected by Engineer from manufacturer's standard colors.
 - a. Joints Up to 2 in. Wide: Withstand plus or minus 35 percent movement of the joint width without failure.
 - b. Joints 2 in. to 4 in. Wide: Withstand plus or minus 50 percent movement of the joint width without failure.
 3. Seismic Seals: Typically two single layered rubber extrusions, one interior and one exterior, as classified under ASTM D 2000, retained in a set of compatible frames, in color indicated, or, if not indicated, as selected by Engineer from manufacturer's standard colors.

4. Fire Barriers: Designed for indicated or required dynamic structural movement without material degradation or fatigue. Tested in maximum joint width condition with a field splice as a component of an expansion joint cover in accordance with ANSI/UL 263, NFPA 251, U.B.C. 43-1, or ASTM E 119 and E 814 including hose stream test at full-rated period by a nationally recognized testing and inspecting organization or by another means, as acceptable to authorities having jurisdiction.
 5. Concrete polished to match adjacent polished concrete floors in color of matrix species of aggregate, exposure of aggregate, coefficient of friction and gloss.
 6. Polyurethane joint filler, color to be selected by Architect.
- C. Preformed Foam Sealants: Provide manufacturer's standard preformed, precompressed, impregnated, open-cell foam sealant manufactured from high-density urethane foam impregnated with a nondrying, water-repellent agent; factory produced in precompressed sizes and in roll or stick form to fit joint widths indicated and to develop a watertight and airtight seal when compressed to the degree specified by manufacturer; and complying with the following:
1. Properties: Permanently elastic, mildew resistant, nonmigratory, nonstaining, and compatible with joint substrates and other joint sealants.
 2. Impregnating Agent: Manufacturer's standard.
 3. Density: Manufacturer's standard.
 4. Backing: Pressure-sensitive adhesive, factory applied to one side with protective wrapping.
- D. Accessories: Manufacturer's standard anchors, fasteners, set screws, spacers, flexible vapor seals and filler materials, drain tubes, adhesive, and other accessories compatible with material in contact, as indicated or required for complete installations.

2.3 FABRICATION

- A. General: Provide expansion joint cover assemblies of design, basic profile, materials, and operation indicated. Select units comparable to those indicated or required to accommodate joint size, variations in adjacent surfaces, and structural movement. Furnish units in longest practicable lengths to minimize number of end joints. Provide hairline mitered corners where joint changes directions or abuts other materials. Include closure materials and transition pieces, tee-joints, corners, curbs, cross-connections, and other accessories as required to provide continuous joint cover assemblies.
- B. Metal Joint Cover Assemblies: Provide continuous extruded metal frames of profile indicated with seating surface and raised floor rim to accommodate flooring and concealed bolt and steel anchors for embedment in concrete. Provide assemblies formed to receive cover plates of design indicated and to receive filler materials (if any) between raised rim of frame and edge of plate. Furnish depth and configuration to suit type of construction and to produce a continuous flush wearing surface with adjoining finish floor surface.
1. Floor-to-Floor Joints with Exposed Cover: Provide one frame on each side of joint, designed to support floor plate and filler.
 2. Flat Cover Plates: Provide cover plates of profile and wearing surface indicated. Extend flat plates to lap each side of joint. If required, furnish abrasive-resistant flexible filler for space between edge of cover plate and raised rim of frame.

- a. Fixed Cover Plates: Attach one side of the cover plate to a frame or finished wearing surface with other side resting on other frame or finished wearing surface in such a manner to allow free movement.
 - b. Floating Cover Plates: Secure the cover plate in or on top of frames in such a manner as to have free movement on both sides.
 3. Floor Cover Plate Wearing Surfaces: Provide cover plates with slip-resistant wearing surface.
 4. Provide manufacturer's continuous standard flexible vinyl moisture seals under covers at locations indicated.
 5. Floor-to-Wall Joints: Provide one frame on floor side of joint only. Provide wall side frame where required by manufacturer's design.
 6. Angle Cover Plates: Attach angle cover plates for floor-to-wall joints to wall with countersunk, flat-head exposed fasteners secured to drilled-in-place anchor shields, unless otherwise indicated, at spacing recommended by joint cover manufacturer.
 7. Wall, Ceiling, Roof, and Soffit Joint Cover Assemblies:
 - a. Fixed Metal Cover Plates: Provide on one side of the joint a concealed, continuously anchored frame fastened to wall, ceiling, or soffit only on one side of joint. Extend cover to lap each side of joint and to permit free movement on one side. Attach cover to frame with cover in close contact with adjacent finish surfaces.
 - b. Floating Metal Cover Plates: Secure the cover plate in or on top of frames in such a manner as to have free movement on both sides.
 - c. Flexible Filler: Secure the approved flexible filler between frames in such a manner that it will compress and expand.
 8. Spliced expansion joints: fabricate joints so that opposite interlocking plates shall overlap a minimum of 12 inches to preclude ant two opposite plates from butting.
- C. Joint Cover Assembly with Preformed Seal: Provide joint cover assemblies consisting of continuously anchored aluminum extrusions and continuous extruded preformed seals of profile indicated or required to suit types of installation conditions shown. Furnish extrusions designed for embedment in concrete and mechanical retention of lugs of field-installed extruded preformed seals. Vulcanize or heat-seal splices (if any) to ensure hermetic joint condition.
1. Include extruded aluminum cover plate with fluted surface; fasten plate to one side of joint and extend plate to lap each side of joint, with free movement and with cover in close contact with adjacent contact surfaces.
- D. Joint Cover Assembly with Elastomeric Sealant: Provide continuous cover joint assemblies consisting of elastomeric sealant factory-bonded to extruded aluminum frames of profile indicated or required to suit types of installation conditions shown. Provide frames for floor joints with means for embedment or anchorage to concrete without use of exposed fasteners and that will result in exposed surfaces of sealant and aluminum frames finishing flush with adjacent finished floor surface without exposing anchors.

2.4 METAL FINISHES

- A. General: Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations, except as otherwise indicated. Apply finishes in factory after products are fabricated. Protect finishes on exposed surfaces with protective covering before shipment.
- B. Aluminum Finishes: Clear Anodized, AA-C22A41; medium matte etched finish with 0.7-mil minimum thick anodic coating.
- C. Stainless-Steel Finish Type 1:
 - 1. Remove tool and die marks and stretch lines or blend into finish.
 - 2. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
 - 3. Bright, Directional Polish: No. 4 finish.
 - 4. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
- D. Stainless Steel Finish Type 2: SlipNOT, grit-free, stainless steel Grip Plate / Grip Grate Grade #2 – Medium, as manufactured by the W.S. Molnar Company (1-800-SlipNOT) manufactured to details indicated on the drawings. Stainless steel Grip Plate/ Grip Grate shall incorporate an anti-slip stainless steel surface covering 100% of substrate consisting of a random hatch matrix with a surface hardness between 55 – 63 on the Rockwell “C” scale and a surface to substrate bond strength of at least 4,000 psi. The non-slip surface shall have a minimum coefficient of friction of 0.8 and be listed as slip resistant by Underwriters Laboratories or approved equal.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Coordinate and furnish anchorages, setting drawings, templates, and instructions for installation of expansion joint cover assemblies to be embedded in concrete or have recesses formed into edges of concrete slab for later placement and grouting-in of frames.

3.2 INSTALLATION

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing expansion joint cover assemblies to in-place construction, including threaded fasteners with drilled-in expansion shields for masonry and concrete where anchoring members are not embedded in concrete. Provide fasteners of metal, type, and size to suit type of construction indicated and provide for secure attachment of expansion joint cover assemblies.
- B. Cast-in-place concrete floors: Provide blocking in floor slabs to accommodate proper relationship between slabs and covers. Cutting, Fitting and Placement: Perform all cutting, drilling, and fitting required for installation of expansion joint covers. Install joint cover assemblies in true alignment and proper relationship to expansion joints and adjoining finished surfaces measured from established lines and levels. Allow adequate free movement for thermal expansion and contraction of metal to avoid buckling. Set floor covers at elevations to be flush with adjacent finished floor materials. Locate wall, ceiling, roof, and soffit covers in continuous contact with adjacent surfaces. Securely attach in place

with all required accessories. Locate anchors at interval recommended by manufacturer, but not less than 3 inches from each end and not more than 24 inches on centers.

- C. Joinery and Continuity: Maintain continuity of expansion joint cover assemblies with end joints held to a minimum and metal members aligned mechanically using splice joints. Cut and fit ends to produce joints that will accommodate thermal expansion and contraction of metal to avoid buckling of frames. Adhere flexible filler materials (if any) to frames with adhesive or pressure-sensitive tape as recommended by manufacturer. If exterior floor joint length exceeds longest manufactured length, stagger joints of side plate assembly.
- D. Installation of Extruded Preformed Seals: Install seals to comply with manufacturer's instructions and with minimum number of end joints. For straight sections provide preformed seals in continuous lengths. Vulcanize or heat-seal all field splice joints in preformed seal material to provide watertight joints using manufacturer's recommended procedures. Apply manufacturer's approved adhesive, epoxy, or lubricant-adhesive to both frame interfaces prior to installing preformed seal. Seal transitions in accordance with manufacturer's instructions.
- E. Installation of Preformed Foam Sealants: Install each length of sealant immediately after removing protective wrapping, taking care not to pull or stretch material, to produce seal continuity at ends, turns, and intersections of joints. For applications at low ambient temperatures where expansion of sealant requires acceleration to produce seal, apply heat to sealant to comply with sealant manufacturer's written instructions.
- F. Installation of Elastomeric Sealant Joint Assemblies: Seal all end joints within continuous runs and joints at transitions in accordance with manufacturer's directions to provide a watertight installation.
- G. Installation of Seismic Seals: Install interior seals in continuous lengths; vulcanize or heat-seal all field splice joints in interior seal material to provide watertight joints using manufacturer's recommended procedures. Install exterior flexible seal in standard lengths. Seal transitions and butt joints in accordance with manufacturer's instructions.
- H. Installation of Fire Barriers: Install fire barriers in accordance with federal, state, and local building codes using manufacturer's recommended procedures. Install transition and end joints to provide continuous fire resistance and in accordance with manufacturer's instructions.

3.3 CLEANING AND PROTECTION

- A. Do not remove strippable protective material until finish work in adjacent areas is complete. When protective material is removed, clean exposed metal surfaces to comply with manufacturer's instructions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 06100

CARPENTRY

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Wood furring, blocking, cants, and nailers.
 - 2. Plywood sheathing and backing panels.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS

1.2 DEFINITIONS

- A. Dimension Lumber: Lumber of 2 inches nominal or greater but less than 5 inches nominal in least dimension.
- B. Lumber grading agencies, and the abbreviations used to reference them include the following:
 - 1. ALSC: American Lumber Standard Committee
 - 2. AWWPA: American Wood-Preservers Association
 - 3. DHI: Door and Hardware Institute
 - 4. NELMA: Northeastern Lumber Manufacturers Association
 - 5. NHLA: National Hardware Lumber Association
 - 6. NLGA: National Lumber Grades Authority

1.3 SUBMITTALS

- A. Submit for each type of process and factory-fabricated product. Indicate component materials and dimensions, and include construction and application details.
 - 1. Include data for wood preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used and net amount of preservative retained.
 - 2. Include data for fire retardant treatment from chemical treatment manufacturer and certification
by treating plant that treated materials comply with requirements. Include physical properties of treated materials based on testing by a qualified independent testing agency.
 - 3. For fire retardant treatments specified to be High-Temperature (HT) type, include physical properties of treated lumber both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D 5664.
 - 4. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to project site.

5. Include copies of warranties from chemical treatment manufacturers for each type of treatment.
- B. For the following products, provide compliance documentation with applicable building and state codes:
1. Preservative treated wood.
 2. Fire- retardant-treated wood.
 3. Power driven fasteners.
 4. Powder-actuated fasteners.
 5. Expansion anchors.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Stack lumber flat with spacers between each bundle to provide air circulation. Provide for air circulation around stacks and under coverings.
- B. Deliver interior wood materials that are to be exposed to view only after building is enclosed and weatherproof, wet work other than painting is dry, and HVAC system is operating and maintaining temperature and humidity at occupancy levels.

1.5 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 WOOD PRODUCTS

- A. Lumber: Provide lumber graded by DOC PS 20 standards and applicable rules of grading agencies. If no grading agency is indicated, provide lumber that complies with the applicable rules of any rules- writing agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.
1. Factory mark each piece of lumber with grade stamp of grading agency.
 2. For exposed lumber indicated to receive a stained or natural finish, mark grade stamp on end or back of each piece.
 3. Where nominal sizes are indicated, provide actual sizes required by DOC PS 20 for moisture content specified. Where actual sizes are indicated, produce minimum dressed sizes for dry lumber.
 4. Provide dressed lumber sanded four sides (S4S) unless otherwise indicated.

2.2 WOOD PANEL PRODUCTS

- A. Plywood: Complying with the requirements of DOC PS 1.

- B. Thickness: As needed to comply with requirements specified, but not less than thickness indicated.
- C. Factory mark panels to indicate compliance with applicable standard.

2.3 WOOD PRESERVATIVE-TREATED MATERIALS

- A. Preservative Treatment by Pressure Process complying in requirements of AWPA C2.
 - 1. Preservative Chemicals: Acceptable to the Authority and containing no arsenic or chromium.
- B. Kiln-dry lumber after treatment to maximum moisture content of 19 percent.
- C. Mark lumber with treatment quality mark of an inspection agency approved by the ALSC Board of Review.
- D. Application: Treat miscellaneous carpentry, including the following:
 - 1. Wood blocking, furring, and similar concealed members in contact with masonry, concrete or metal deck.
 - 2. Wood furring attached directly to the interior of below-grade exterior masonry or concrete walls.

2.4 FIRE- RETARDANT-TREATED MATERIALS.

- A. General: Comply with performance requirements in AWPA C20 (Lumber) and AWPA C27 (Plywood).
 - 1. Use treatment that does not promote corrosion of metal fasteners.
 - 2. Use exterior type for exterior locations and where indicated.
 - 3. Use Interior Type A, unless otherwise indicated.
- B. Identify fire-retardant-treated wood with appropriate classification marking of Underwriters Laboratory.
 - 1. All lumber and plywood to have a flame spread rating of 25 or less when tested in accordance with ASTM E-84, Standard Test Method for Surface Burning Characteristics of Building Materials
- C. Application: Treat concealed miscellaneous carpentry, including but not limited to the following:
 - 1. Concealed blocking at partition framing and window openings.
 - 2. Plywood backing panels.
 - 3. All blocking at roofing.

2.5 MISCELLANEOUS LUMBER

- A. General: Provide miscellaneous lumber indicated and lumber for support or attachment of other construction, including the following:
 - 1. Blocking
 - 2. Nailers

3. Cants
 4. Furring
- B. For items of dimension lumber size, provide Construction or No.2 grade lumber with 15 percent maximum moisture content and any of the following species:
 1. Hem-fir (north); NLGA
 2. Spruce-Pine-fir;NLGA
 - C. For concealed boards, provide lumber with 15 percent maximum moisture content and any of the following species and grades:
 1. Hem-fir or hem fir (North), Construction or 2 Common grade;NLGA.
 2. Spruce-pine-fir (south) or spruce-pine fir, Construction or 2 common grade; NELMA or NLGA
 - D. For blocking not used for attachment of other construction, utility, stud, or No.3 grade lumber of any species may be used provided that it is cut and selected to eliminate defects that will interfere with the attachment and purpose.
 - E. For blocking and nailers used for attachment of other construction, select and cut lumber to eliminate knots and other defects that will interfere with attachment of other work.
 - F. For furring strips for installing plywood or hardboard paneling, select boards with no knots capable of producing bent-over nails and damage to paneling.
 - G. Application: Provide kiln dried lumber in the following locations:
 1. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.

2.6 PLYWOOD SHEATHING

- A. Plywood Sheathing: APA B-B Marine Grade. Fire rated as required by code.
- B. Species: Douglas-fir or Western Larch.
- C. Thickness: 5/8 inch thickness.

2.7 PLYWOOD BACKING PANELS

- A. Electrical Equipment Backing Panels: DOC PS1, Exposure 1, C-D Plugged, fire-retardant treated, in thickness indicated, or if not indicated, not less than 3/4 inch nominal thickness.

2.8 FASTENERS

- A. General: Provide fasteners of size and type indicated that comply with requirements specified in this Article for material and manufacture.
 1. Where carpentry is exposed to weather, in ground contact, pressure-preservative treated, or in area of high relative humidity, provide fasteners of Type 316 stainless steel.
- B. Nails, Brads, and Staples: Complying with the requirements of ASTM F 1667.

1. All nails and brads shall be coated with hot-dip galvanize.
- C. Power-Driven Fasteners: Complying with NES NER-272.
- D. Wood Screws: Complying with the requirements of ASME B18 .6.1.
1. All wood screws shall be hot-dip galvanized.
- E. Screws for Fastening to Cold-Formed Metal Framing: Complying with the requirements ASTM C954, except with wafer heads and reamer wings, length as recommended by screw manufacturer for material be fastened.
1. All screws for fastening to cold-formed metal framing shall be type 316 stainless steel or hot- dip galvanized.
- F. Lag Bolts: Complying with ASEM B18. 2.1.
1. All lag bolts shall be hot-dip galvanized.
- G. Bolts: Steel bolts complying with ASTM A 307, Grade A; with ASTM A 563 hex nuts and, where indicated flat washers.
1. All steel bolts shall be hot-dip galvanized.
- H. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to 6 times the load imposed when installed in unit masonry assemblies and equal to 4 times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing and inspecting agency.
1. Material: Stainless steel with bolts and nuts complying with ASTM F593 and ASTM F 594 Alloy group 1 or 2.

PART 3 - EXECUTION

3.1 GENERAL

- A. Set carpentry to required levels and lines with members plumb, true to line, cut, and fitted. Fit carpentry to other construction; scribe and cope as needed for accurate fit. Locate furring, nailers, blocking and similar supports to comply with requirements for attaching other construction.
- B. Provide blocking and framing as indicated and as required to support facing materials, fixtures, specialty items and trim.
- C. Provide fire blocking in furred spaces, stud spaces, and other concealed cavities as indicated and as follows:
 1. Fire block furred spaces of walls, at each floor level, at ceiling, and not more than 96 inches on- center (o.c.) with solid wood blocking or noncombustible materials accurately fitted to close furred spaces.
 2. Fire block concealed spaces behind combustible cornices and exterior trim at not more than 20 feet o.c.

- D. Sort and select lumber so that natural characteristics will not interfere with installation or fastening other materials to lumber. Do not use materials with defects that interfere with function of member or pieces that are too small to use with minimum number of joints or optimum joint arrangement.
- E. Comply with AWWA M4 for applying field treatment to cut surfaces of preservative-treated lumber.
 - 1. 1. Use inorganic boron for items that are continuously protected from liquid water.
- F. Securely attach carpentry work to substrate by anchoring and fastening as indicated, complying with the following:
 - 1. 1. Use inorganic boron for items that are continuously protected from liquid water.
 - 2. Table 2304.9.1, "Fastening Schedule", in the International Building Code.
- G. Use common wire nails, unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood; do not countersink nail heads, unless otherwise indicated.

3.2 WOOD BLOCKING AND NAILER INSTALLATION

- A. Install where indicated and where required for screeding or attaching other work. Form to shapes indicated and cut as required for true line and level of attached work. Coordinate locations with other work involved.
- B. Attach items to substrates to support applied loading. Recess bolts and nuts flush with surfaces, unless otherwise indicated.

3.3 WOOD FURRING INSTALLATION

- A. Install level and plumb with closure strips at edges and openings. Shim with wood as required for tolerance of finish work.
- B. Furring to Receive Plywood: Install 1-by-3 inch nominal-size furring vertically 24 inches o.c.

3.4 FIRE- RETARDANT-TREATED (FRT) MATERIALS INSTALLATION

- A. Cutting to length, drilling holes, joining cuts and light sanding are permissible. It is not necessary to field treat cut ends to maintain flame spread rating.
 - 1. Ripping, milling and surfacing of FRT lumber is not permitted.
 - 2. FRT Plywood can be cut in either direction without loss of fire protection

3.5 PROTECTION

- A. Protect wood that has been treated with inorganic boron (SBX) from weather. If, despite protection inorganic boron-treated wood becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.
- B. Protect rough carpentry from weather. If despite protection, rough carpentry becomes wet, apply EPA- registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 06400

ARCHITECTURAL WOODWORK

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Plastic laminate faced cabinets.
 - 2. Architectural cabinets and millwork.
 - 3. Wood benches (IPE).

- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 03331 – ARCHITECTURAL CONCRETE FINISH
 - 3. Section 05411 – LIGHT GAUGE METAL FRAMING
 - 4. Section 06100 – CARPENTRY: for wood furring, blocking, shims, and hanging strips required for installing cabinets and concealed within other construction before cabinet installation.
 - 5. Section 06502 – COUNTERTOPS: for solid surface countertops.

1.2 REFERENCES

- A. Comply with applicable requirements of following standards. Where these standards conflict with other specified requirements, the most restrictive requirements shall govern.
 - 1. American National Standards Institute (ANSI):
 - A161.2 Performance Standards for Fabricated High Pressure Decorative Laminate Countertops
 - A208.1 Particleboard, Mat-Formed Wood
 - 2. American Society for Testing and Materials (ASTM):
 - E 84 Surface Burning Characteristics of Building Materials
 - 3. The Architectural Woodwork Institute (AWI):
 - Quality Standards Architectural Woodwork Quality Standards, Guide Specifications and Quality Certification Program

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer’s printed product data, specifications, standard details, installation instructions, use limitations and recommendations for each material used. Provide certifications that materials and systems comply with specified requirements.

- B. Shop Drawings: Provide large scale shop Drawings for fabrication, installation and erection of parts

of work. Provide plans, elevations, and details of anchorages, connections and accessory items. Provide installation templates for work installed by others. Show interfaces and relationships to work of other trades.

- C. Field Measurements: Take necessary field measurements before preparation of shop Drawings and fabrication. Do not delay progress of job. If field measurements are not possible prior to fabrication, allow for field cutting and fitting.
- D. Verification Samples: Submit representative samples of each material that is to be exposed in completed work. Show full color ranges and finish variations expected. Provide samples having minimum size of 144 sq. in.
- E. Wood certification: Provide internationally recognized certification that the Ipe being used has been grown and harvested from a sustainably managed forest.

1.4 QUALITY ASSURANCE

- A. Source: For each material type required for work of this Section, provide primary materials which are product of one manufacturer. Provide secondary or accessory materials which are acceptable to manufacturers of primary materials.
- B. Installer: A firm with a minimum of five years experience in type of work required by this Section and which is acceptable to manufacturers of primary materials.
- C. Quality Standard: Provide work complying with applicable requirements of AWI Quality Standards.
Where not otherwise indicated, fabricator may choose among options permitted by AWI for grade of work specified.
 - 1. Panel Products: Provide minimum 45 pounds per cubic foot medium density fiberboard. Do not use hardboard.
 - 2. Fire Performance: All concealed work in this Section shall be UL labeled fire-retardant treated.
Exposed woodwork shall have a flame spread of less than 200 when tested in compliance with ASTM E 84.

1.5 PROJECT CONDITIONS

- A. Substrates: Proceed with work only when substrate construction and penetration work is complete.
- B. Wet Work: Proceed with work of this Section after wet work has been complete and fully dry or cured. Wet work is defined as plaster, gypsum drywall, paint, concrete, etc.
- C. Conditioning: Advise Contractor of temperature and humidity requirements for woodwork installation. Do not install work of this Section until required temperature and relative humidity in areas of installation has been stabilized and will be maintained.

1.6 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual

agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 PLASTIC-LAMINATE-FACED ARCHITECTURAL CABINETS

- A. Quality Standard: Unless otherwise indicated provide AWI 'Premium Grade' materials and workmanship and comply with the "Architectural Woodwork Standards" for grades of architectural plastic-laminate cabinets indicated for construction, finishes, installation, and other requirements.
- B. Grade: Premium.
- C. Type of Construction: Frameless.
- D. Cabinet, Door, and Drawer Front Interface Style: Flush overlay.
- E. High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated or if not indicated, as required by woodwork quality standard.
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Formica Corporation.
 - b. Lamin-Art, Inc.
 - c. Wilsonart International; Div. of Premark International, Inc.
 - d. Or approved equal.
- F. Laminate Cladding for Exposed Surfaces:
 - 1. Horizontal Surfaces: Grade HGS.
 - 2. Postformed Surfaces: Grade HGP.
 - 3. Vertical Surfaces: Grade HGS.
 - 4. Edges: Grade HGS.
 - 5. Pattern Direction: Vertically for drawer fronts, doors, and fixed panels.
- G. Concealed Backs of Panels with Exposed Plastic-Laminate Surfaces: High-pressure decorative laminate, NEMA LD 3, Grade BKL.
- H. Drawer Construction: Fabricate with exposed fronts fastened to subfront with mounting screws from interior of body.
- I. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces complying with the following requirements:
 - 1. As selected by Architect from laminate manufacturer's full range.

2.2 WOOD CASEWORK FOR TRANSPARENT FINISH

- A. Grade: Premium.
- B. AWI Type of Casework Construction: Flush overlay.
- C. Wood Species and Cut for Exposed Surfaces: Clear rift cut ash veneer with solid wood edges; stained black.
 - 1. Grain Direction: Vertically for drawer fronts, doors, and fixed panels.
 - 2. Matching of Veneer Leaves: Slip match.
 - 3. Vertical Matching of Veneer Leaves: End match.
 - 4. Veneer Matching within Panel Face: Slip, center, book matchh.
- D. Semiexposed Surfaces: Provide surface materials indicated below:
 - 1. Surfaces Other Than Drawer Bodies: Compatible species to that indicated for exposed surfaces, stained to match.
 - 2. Drawer Sides and Backs: Solid-hardwood lumber, stained to match species indicated for exposed surfaces.
 - 3. Drawer Bottoms: Hardwood plywood.

2.3 WOOD MATERIALS

- A. Wood Products: Provide materials that comply with requirements of referenced quality standard for each type of woodwork and quality grade specified unless otherwise indicated.
- B. Benches: Clear IPE, dark brown or reddish brown walnut color as acceptable to Architect, with fine to medium texture, air dried or kiln dried to 12 percent moisture content, with no applied finish. Use stainless steel fasteners.
- C. Composite Wood and Agrifiber Products: Provide materials that comply with requirements of referenced quality standard for each type of woodwork and quality grade specified unless otherwise indicated.
 - 1. Particleboard: ANSI A208.1, Grade M-2, made with 100% recycled and recovered wood fibre containing no urea formaldehyde.
 - a. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - 1) Uniboard; NU Green Zero.
- D. Appleply: Premium quality veneer core panel constructed of uniform laminations of solid grade 1/16" Birch. Tolerances comply with American National Standards Institute (ANSI/HPVA) grade rules, HP-1-2004. Treat with Fire Stop II to achieve Class A Flame Spread and Smoke Development.
- E. Rough Sawn Wood Products: Provide Western Red Cedar rough sawn surface 4 sides, Grade D and Better Clear. Edges to form butt joints or 1/4" open joint with 7° beveled edge to be machined adjacent boards as shown on drawings. Finish long edges as required and shown in drawings.

F. Architectural millwork shall be clear birch.

2.4 SOLID SURFACING

A. Refer to Section 06502, "Countertops."

2.5 CABINET HARDWARE AND ACCESSORIES

A. General: Provide cabinet hardware and accessory materials associated with architectural cabinets. Stainless steel unless indicated otherwise.

B. Frameless Concealed Hinges (European Type): BHMA A156.9, B01602, 170 degrees of opening, self-closing as manufactured by Hafele or approved equal.

C. Wire Pulls: Back mounted, solid metal, 4 inches (100 mm) long, 5/16 inch (8 mm) in diameter.

D. Blind Pulls: ½" quarter round routed into drawer and door edges as shown on drawings.

E. Catches: Magnetic catches, BHMA A156.9, B03141

F. Adjustable Shelf Standards and Supports: BHMA A156.9, B04071; with shelf rests, B04081.

G. Shelf Rests: BHMA A156.9, B04013; metal.

H. Drawer Slides: BHMA A156.9.

1. Grade 1 and Grade 2: Side mounted full-extension type; zinc-plated steel with polymer rollers.
2. Grade 1HD-100 and Grade 1HD-200: Side mounted; full-overtravel-extension type; zinc-plated-steel ball-bearing slides.
3. For drawers not more than 3 inches (75 mm) high and not more than 24 inches (600 mm) wide, provide Grade 1.
4. For drawers more than 3 inches (75 mm) high but not more than 6 inches (150 mm) high and not more than 24 inches (600 mm) wide, provide Grade 1HD-100.
5. For drawers more than 6 inches (150 mm) high or more than 24 inches (600 mm) wide, provide Grade 1HD-200.

I. Door Locks: BHMA A156.11, E07121.

J. Drawer Locks: BHMA A156.11, E07041.

K. Brackets: Countertop Hybrid-brackets – Model HYB(1.5) 18- 18"x18".

L. Door and Drawer Silencers: BHMA A156.16, L03011.

M. Exposed Hardware Finishes: For exposed hardware, provide finish that complies with BHMA A156.18 for BHMA finish number indicated. Provide one of the following:

1. Satin Chromium Plated: BHMA 626 for brass or bronze base; BHMA 652 for steel base.
2. Satin Stainless Steel: BHMA 630.

- N. For concealed hardware, provide manufacturer's standard finish that complies with product class requirements in BHMA A156.9.

2.6 MISCELLANEOUS MATERIALS

- A. Furring, Blocking, Shims, and Hanging Strips: Fire-retardant-treated, FSC Certified softwood lumber, kiln dried to less than 15 percent moisture content. Rough sawn Cedar shims, as required at concrete form work.
- B. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide nonferrous-metal or hot-dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as required for corrosion resistance. Provide toothed-steel or lead expansion sleeves for drilled-in-place anchors.
- C. Adhesives, General: Do not use adhesives that contain urea formaldehyde.
- D. VOC Limits for Installation Adhesives and Glues: Use installation adhesives that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
 - 1. Wood Glues: 30 g/L.
 - 2. Contact Adhesive: 250 g/L.
 - 3. Refer to section 01800 – SUSTAINABLE REQUIREMENTS for compliance.

2.7 SHOP FINISHING

- A. General: Comply with AWI/AWMAC/WI's "Architectural Woodwork Standards" for factory finishing.
 - 1. Finish architectural woodwork at fabrication shop as specified in this Section. Defer only final touchup, cleaning, and polishing until after installation.
- B. Preparation for Finishing: Comply with referenced quality standard for sanding, filling countersunk fasteners, sealing concealed surfaces, and similar preparations for finishing architectural woodwork, as applicable to each unit of work.
 - 1. Backpriming: Apply one coat of sealer or primer, compatible with finish coats, to concealed surfaces of woodwork. Apply two coats to back of paneling and to end-grain surfaces. Concealed surfaces of plastic-laminate-clad woodwork do not require backpriming when surfaced with plastic laminate, backing paper, or thermoset decorative panels.
- C. Transparent Finish: Comply with requirements indicated below for grade, finish system, staining, and sheen with sheen measured on 60-degree gloss meter per ASTM D 523:
 - 1. Grade: Same as item to be finished.
 - 2. AWS Finish System 5: Water white conversion varnish.
 - 3. Staining: Match approved sample for color.
 - 4. Wash Coat for Stained Finish: Apply wash-coat sealer to woodwork made from closed-grain wood before staining and finishing.
 - 5. Open Finish for Open-Grain Woods: Do not apply filler to open-grain woods.

6. Sheen: Satin, 30-50 gloss units.
7. Effect: Partially filled pore.

2.8 FABRICATION

- A. Sand wood to remove raised grain on exposed surfaces before fabrication.
- B. Fabricate woodwork to dimensions, profiles, and details indicated. Ease edges to radius indicated for the following:
 1. Corners of Cabinets: 1/16 inch (1.5 mm) unless otherwise indicated.
- C. Complete fabrication, including assembly, finishing, and hardware application, to maximum extent possible before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.
 1. Trial fit assemblies at fabrication shop that cannot be shipped completely assembled. Install dowels, screws, bolted connectors, and other fastening devices that can be removed after trial fitting. Verify that various parts fit as intended and check measurements of assemblies against field measurements before disassembling for shipment.
- D. Shop-cut openings to maximum extent possible to receive hardware, appliances, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.

PART 3 - EXECUTION

3.1 WORKMANSHIP - GENERAL

- A. Work of this Section shall conform to design and detail indicated. Where practicable, work shall be finished and assembled at architectural millwork shop.
- B. Work shall be finished smooth and free from machine or tool marks that will telescope through finish.

3.2 INSTALLATION

- A. The Installer shall examine substrates, supports, and conditions under which this work is to be performed and notify Contractor, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning of installation work means Installer's acceptance of substrates and conditions.
- B. Proceed with installation only when required ambient conditions have been properly maintained, as determined by all attending pre-installation conference.
 1. Provide work to sizes, shapes, and profiles indicated on approved shop drawings.
 2. Install work to comply with quality standards and tolerances specified for shop work.
- C. Install architectural woodwork plumb, level, true and straight. Shim as required using concealed shims. Install work, including tops, to a tolerance of $\pm 1/8$ in. in 8 ft.

- D. Scribe and cut architectural woodwork to fit adjoining work. Refinish cut surfaces.
- E. Anchor casework securely in place.
- F. Cabinets: Install without distortion so doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete installation of hardware and accessory items as indicated.

3.3 REPAIRING AND PROTECTION

- A. Repair minor damage to eliminate all evidence of repair. Remove and replace work which cannot be satisfactorily repaired.
- B. Provide temporary protection to ensure work being without damage or deterioration at time of final acceptance. Remove protections and re-clean as necessary immediately before final acceptance

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 06502
COUNTERTOPS
PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies countertops fabricated from solid surfacing.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 06400 – ARCHITECTURAL WOODWORK
 - 3. Division 15 - MECHANICAL for sinks and plumbing fittings.

1.2 SUBMITTALS

- A. Product Data: For countertop materials.
- B. Shop Drawings: For countertops. Show materials, finishes, edge and backsplash profiles, methods of joining, and cutouts for plumbing fixtures.
- C. Samples for Verification: For the following products:
 - 1. Countertop material, 6 inches (150 mm) square with two edges finishes as directed by 2.2.A.

1.3 PROJECT CONDITIONS

- A. Field Measurements: Verify dimensions of countertops by field measurements after base cabinets are installed but before countertop fabrication is complete.

1.4 COORDINATION

- A. Coordinate locations of utilities that will penetrate countertops or backsplashes.

PART 2 - PRODUCTS

2.1 COUNTERTOP MATERIALS

- A. Plywood: Exterior softwood plywood complying with DOC PS 1, Grade C-C Plugged, touch sanded.
- B. Adhesives: Adhesives shall not contain urea formaldehyde.
- C. Quartz Agglomerate: Solid sheets consisting of quartz aggregates bound together with a matrix of filled plastic resin and complying with the "Physical Characteristics of Materials" Article of ANSI SS1.
 - 1. Available Products: Subject to compliance with requirements, provide product by Ceasarstone or one of the following comparable:

- a. Cambria.
 - b. Ceasarstone.
 - c. Silestone.
 - d. Zodiaq.
 - e. Or approved equal
2. Colors and Patterns: As selected by Architect from manufacturer's full range.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install countertops level to a tolerance of +/- 1/16 inch in 8 feet (3 mm in 2.4 m).
- B. Fasten countertops by screwing through corner blocks of base units into underside of countertop. Pre-drill holes for screws as recommended by manufacturer. Align adjacent surfaces and, using adhesive in color to match countertop, form seams to comply with manufacturer's written instructions. Carefully dress joints smooth, remove surface scratches, and clean entire surface.
 1. Install backsplashes and end splashes to comply with manufacturer's written instructions for adhesives, sealers, fabrication, and finishing.
 2. Seal edges of cutouts in plywood subtops by saturating with varnish.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 06610

FIBERGLASS GRATING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This section specifies fiberglass gratings in traction power substations.

1.2 SUBMITTALS

- A. Product Data: Indicate product description, fabrication information, and compliance with specified performance requirements.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
- C. Samples for Verification: Submit minimum 6 by 6 inch sample for each type, texture, pattern and color of grating.

1.3 QUALITY ASSURANCE

- A. Source: For each material type required for work of this Section, provide primary materials that are product of one manufacturer. Provide secondary or accessory materials that are acceptable to manufacturers of primary materials.

1.4 PRODUCT DELIVERY AND STORAGE

- A. All gratings and components shall be shop fabricated. Piece match marked to assembly or erection drawings.
- B. Delivery of Materials: All manufactured materials shall be delivered in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Adhesives, resins and their catalysts and hardeners shall be crated or boxed separately and noted as such to facilitate their movement to a dry indoor storage facility.
- C. Storage of Products: All materials shall be carefully handled to prevent them from abrasion, cracking, chipping, twisting, other deformations and other types of damage. Store items in an enclosed area and free from contact with soil and water. Store adhesives, resins and their catalysts and hardeners in dry indoor storage facilities until they are required.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Fiberglass Gratings: Strongwell, McNichols, AMD or equal.
 - 1. Configuration: T-bars, 2 inches deep by 1.5 inches on center.
 - 2. Fasteners: Stainless steel power-actuated stud and disk.
 - 3. Loading: 40 psf live load.
 - 4. Color: Gray color.

- B. All finished surfaces of FRP items and fabrications shall be smooth, resin-rich, free of voids and without dry spots, cracks, crazes or unreinforced areas. All glass fibers shall be well covered with resin to protect against their exposure due to wear or weathering.
- C. All FRP products shall be tested flame spread rating of 25 or less when tested in accordance with the ASTM E-84 Tunnel Test.

2.2 MOLDED GRATING

- A. Manufacture: Grating shall be of a one piece molded construction with tops and bottoms of bearing bars and cross bars in the same plane. Grating shall be reinforced with continuous rovings of equal number of layers in each direction. The top layer of reinforcement shall be no more than 6.35 mm below the top surface of the grating so as to provide maximum stiffness and prevent resin chipping of unreinforced surfaces. Percentage of glass (by weight) shall not exceed 40% so as to achieve maximum corrosion resistance, and as required to maintain the structural requirements.
- B. After molding, no dry glass fibers shall be visible on any surface of bearing bars or cross bars. All bars shall be smooth and uniform with no evidence of fiber orientation irregularities, interlaminar voids, porosity, resin rich or resin starved areas.
- C. Non-slip surfacing: Grating shall be manufactured with a concave profile on the top of each bar providing maximum slip resistance.

2.3 GRATING FABRICATION

- A. Measurements: Grating supplied shall meet the minimum dimensional requirements as shown or specified. The Contractor shall provide and/or verify measurements in field for work fabricated to fit field conditions as required by grating manufacturer to complete the work. Determine correct size and locations of required holes or cutouts from field dimensions before grating fabrication.
- B. Layout: Each grating section shall be readily removable, except where indicated on drawings. Manufacturer to provide openings and holes where located on the contract drawings. Grating supports shall be provided at openings in the grating by contractor where necessary to meet load/deflection requirements specified herein. Grating openings which fit around protrusions (pipes, cables, machinery, etc.) shall be discontinuous at approximately the centerline of opening so each section of grating is readily removable. Gratings shall be fabricated free from warps, twists, or other defects which affect appearance and serviceability.
- C. Sealing: All shop fabricated grating cuts shall be coated with a resin comparable to grating resin to provide maximum corrosion resistance. All field fabricated grating cuts shall be coated similarly by the contractor in accordance with the manufacturer's instructions.
- D. Hardware: Hold-down clips shall be provided and spaced at a maximum of four feet apart with a minimum of four per piece of grating, or as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions where installation of gratings will occur, with

Installer present, for compliance with manufacturer's requirements. Verify that substrates and conditions are satisfactory for installation and comply with requirements specified.

3.2 INSTALLATION

- A. Contractor shall install gratings in accordance with manufacturer's assembly drawings. Lock grating panels securely in place with hold-down fasteners as specified herein.
- B. Field cut and drill fiberglass reinforced plastic products with carbide or diamond tipped bits and blades. Seal cut or drilled surfaces in accordance with manufacturer's instructions. Follow manufacturer's instructions when cutting or drilling fiberglass products or using resin products; provide adequate ventilation.
- C. Install items specified as indicated and in accordance with manufacturer's instructions

3.3 CLEANING AND PROTECTION

- A. Protect surfaces from damage until date of substantial completion. Repair work or replace damaged work, which cannot be repaired to Architect's satisfaction.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07115

BITUMINOUS DAMPPROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies cold-applied, emulsified-asphalt dampproofing applied to the exterior of below-grade surfaces on concrete and masonry foundation and retaining walls.
- B. Related Work:
 - 1. Section 07131 - SHEET WATERPROOFING.
 - 2. Section 07141 - COLD FLUID-APPLIED WATERPROOFING.
 - 3. Section 07170 - BENTONITE WATERPROOFING.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated. Include recommendations for method of application, primer, number of coats, coverage or thickness, and protection course. Indicate material interactions with substrate, accessories or adjacent materials that could impair the performance of either item.
- B. Sample: 12 by 12 inch sample of dampproofing on typical project substrate.
- C. Installer Certificates: Signed by manufacturers certifying that installers comply with requirements.
- D. Qualification Data: For Installer and for Testing and Inspection Agency.
- E. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.

1.3 QUALITY ASSURANCE

- A. Source Limitations: Obtain primary dampproofing materials and primers through one source from a single manufacturer. Provide secondary materials recommended by manufacturer of primary materials.
- B. Installer's Qualification: Installer with 5 year experience who is approved, authorized, or licensed by manufacture in installing dampproofing systems similar to scope and complexity of work for this Project.

1.4 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit asphalt dampproofing to be performed according to manufacturers' written instructions.

- B. Ventilation: Provide adequate ventilation during application of dampproofing in enclosed spaces. Maintain ventilation until dampproofing has thoroughly cured.

PART 2 - PRODUCTS

2.1 BITUMINOUS DAMPPROOFING

- A. Cold-Applied, Emulsified-Asphalt Dampproofing, Brush and Spray Coats: ASTM D 1227, Type III, Class 1.

2.2 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 1. Euclid Chemical Company.
 2. Henry Company.
 3. Karnak Corporation.
 4. Meadows, W. R., Inc.
 5. Sonneborn, Div. of ChemRex, Inc.
 6. Or approved equal.

2.3 MISCELLANEOUS MATERIALS

- A. Emulsified-Asphalt Primer: ASTM D 1227, Type III, Class 1, except diluted with water as recommended by manufacturer.
- B. Asphalt-Coated Glass Fabric: ASTM D 1668, Type I.
- C. Protection Course, Polystyrene Type: Fan-folded, rigid, extruded-polystyrene board insulation; nominal thickness not less than 3/16 inch.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, with Applicator present, for compliance with manufacturer's requirements for surface smoothness and other conditions affecting performance of work. Begin dampproofing application only after substrate construction and penetrating work have been completed and unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Protection of Other Work: Mask or otherwise protect adjoining exposed surfaces from being stained, spotted, or coated with dampproofing. Prevent dampproofing materials from entering and clogging weep holes and drains.
- B. Clean substrates of projections and substances detrimental to work; fill voids, seal joints, and

apply bond breakers if any, as recommended by prime material manufacturer. Concrete shall be allowed to cure for a minimum of 5 days after form removal prior to dampproofing application, or as required by manufacturer.

- C. Patch holes with mortar and allow to properly cure prior to dampproofing application and in accordance with manufacturer's instructions.

3.3 APPLICATION

- A. Comply with manufacturer's written recommendations unless more stringent requirements are indicated or required by Project conditions to ensure satisfactory performance of dampproofing.
 - 1. Apply additional coats if recommended by manufacturer or required to achieve coverages indicated.
 - 2. Allow each coat of dampproofing to cure 24 hours before applying subsequent coats.
 - 3. Apply from finished-grade line to top of footing, extend over top of footing, and down a minimum of 6 inches over outside face of footing.
 - 4. Extend 12 inches onto intersecting walls and footings, but do not extend onto surfaces exposed to view when Project is completed.
 - 5. Install flashings and corner protection stripping at internal and external corners, changes in plane, construction joints, cracks, and where shown as "reinforced", by embedding an 8-inch-wide strip of asphalt-coated glass fabric in a heavy coat of dampproofing. Dampproofing coat required for embedding fabric is in addition to other coats required.
- B. On Concrete Foundations: Apply two brush or spray coats at not less than 1.5 gal./100 sq. ft. for first coat and 1 gal./100 sq. ft. for second coat.
- C. On Unparged Masonry Foundation Walls: Apply primer and two brush or spray coats at not less than 1.5 gal./100 sq. ft. for first coat and 1 gal./100 sq. ft. for second coat.
- D. On Backs of Concrete and Masonry Retaining Walls: Apply one brush or spray coat at not less than 1.25 gal./100 sq. ft.

3.4 INSTALLATION OF PROTECTION COURSE

- A. Install protection course over completed-and-cured dampproofing. Comply with dampproofing material manufacturer's written recommendations for attaching protection course. Support protection course with spot application of trowel-grade mastic where not otherwise indicated.

3.5 CLEANING

- A. Remove dampproofing materials from surfaces not intended to receive dampproofing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07116

BITUMINOUS DAMPPROOFING FOR ROADWAY BRIDGES

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving cut-back asphalt, protective seal coat emulsion, or emulsified- asphalt dampproofing applied to the exterior of below-grade surfaces on Roadway Bridge and Pedestrian Bridge concrete foundations and walls.
- B. For all Roadway Bridge and Pedestrian Bridge Bituminous Dampproofing requirements regarding General Information, Products, and Execution, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 970.
 - 1. Replace all references to Measurement and Payment with Sub-section 4.1 below.
 - 2. For submittal requirements, including, but not limited to, shop drawings, working drawings, Requests For Information, Non Conformance and testing reports, refer to Section 01300 – SUBMITTALS of the Contract Specifications.

PART 2 – PRODUCTS

Not used.

PART 3 – EXECUTION

Not used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 07117

MEMBRANE WATERPROOFING AND PROTECTIVE COURSE

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving the following items:
 - 1. The furnishing and installation of Membrane Waterproofing and Protective Course for Roadway Bridges, Underpasses and Cast-In-Place Concrete Retaining Walls.
- B. For all Roadway Bridge, Underpasses and Cast-In-Place Concrete Retaining Wall Membrane Waterproofing and Protective Course requirements regarding General Information, Products, and Execution, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 967.
 - 1. Replace all references to Measurement and Payment with Sub-section 4.1 below.
 - 2. For Roadway Bridge and Underpass Membrane Waterproofing and Protective Course submittal requirements, including, but not limited to, shop drawings, working drawings, Requests For Information, and Non Conformance and testing reports, refer to Section 01300 – SUBMITTALS of the Contract Specifications.
 - 3. For additional information regarding Membrane Waterproofing Product and Execution at the Lowell Street Bridge, see sections 2 and 3 below.

PART 2 – PRODUCTS

2.1 PRODUCT INFORMATION FOR MEMBRANE WATERPROOFING AND PROTECTIVE COURSE FOR THE LOWELL STREET BRIDGE

- A. Not used.

PART 3 – EXECUTION

3.1 GENERAL

- A. This Section specifies execution details for Membrane Waterproofing and Protective Course regarding the Lowell Street Bridge.
 - 1. Once the existing Lowell Street Bridge North Abutment stem wall has been removed and the original (1909) abutment is exposed, a Bentonite Waterproofing System shall be applied to the front face of the original abutment. For General Information, and Product Requirements refer to MassDOT Standard Specifications (with Supplemental Specifications) Sections 967 and M9.09.0.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07131

SHEET WATERPROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Rubberized-asphalt sheet waterproofing below grade.
 - 2. HDPE sheet waterproofing below grade, for blind-side applications.
- B. Related Work:
 - 1. Section 07115 – BITUMINOUS DAMPPROOFING
 - 2. Section 07141 - COLD FLUID-APPLIED WATERPROOFING.
 - 3. Section 07170 - BENTONITE WATERPROOFING.
 - 4. Section 07270 – AIR AND VAPOR BARRIER SYSTEMS.
 - 5. Section 07423 – RAIN SCREEN SYSTEMS

1.2 PERFORMANCE REQUIREMENTS

- A. Provide waterproofing that prevents the passage of water.

1.3 SUBMITTALS

- A. Product Data: Include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties of waterproofing. Indicate material interactions with substrate that could impair the performance of either item accessories or adjacent.
- B. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.
- C. Samples: For the following products:
 - 1. 12-by-12-inch square of waterproofing and flashing sheet.
 - 2. 12-by-12-inch square of insulation.
 - 3. 4-by-4-inch square of drainage panel.
- D. Installer Certificates: Signed by manufacturers certifying that installers comply with requirements.
- E. Qualification Data: For Installer and for Testing and Inspection Agency.
- F. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.

- G. Test Reports: From Testing and Inspection Agency.
- H. Sample Warranty: Copy of special waterproofing manufacturer's and Installer's warranty stating obligations, remedies, limitations, and exclusions before starting waterproofing.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified installer who is acceptable to waterproofing manufacturer to install manufacturer's products with 5 year experience with similar scope and complexity of work.
- B. Qualifications of Testing and Inspection Agency: Experienced testing and inspection agency acceptable to the Authority.
- C. Source Limitations: Obtain waterproofing materials, protection course, and molded-sheet drainage panels through one source from a single manufacturer.
- D. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1. Review requirements for waterproofing, including surface preparation specified under other Sections, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver liquid materials to Project site in original packages with seals unbroken, labeled with manufacturer's name, product brand name and type, date of manufacture, and directions for storing and mixing with other components.
- B. Store liquid materials in their original undamaged packages in a clean, dry, protected location and within temperature range required by waterproofing manufacturer.
- C. Remove and replace liquid materials that cannot be applied within their stated shelf life.
- D. Store rolls according to manufacturer's written instructions.
- E. Protect stored materials from direct sunlight.

1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate.
 - 1. Do not apply waterproofing in snow, rain, fog, or mist.
- B. Maintain adequate ventilation during preparation and application of waterproofing materials.

1.7 PRE-CONSTRUCTION MEETING

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions

that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

1.8 WARRANTY

- A. Special Manufacturer's Warranty: Written warranty, signed by waterproofing manufacturer agreeing to replace waterproofing material that does not comply with requirements or that does not remain watertight during specified warranty period.
 - 1. Warranty does not include failure of waterproofing due to failure of substrate prepared and treated according to requirements or formation of new joints and cracks in substrate exceeding 1/16 inch in width.
 - 2. Warranty Period: Five years after date of Substantial Completion.
 - 3. Warranty includes removing and reinstalling protection board, drainage panels, and overburden materials.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Rubberized-Asphalt Sheet Waterproofing:
 - a. American Hydrotech, Inc.; VM 75.
 - b. W. R. Grace & Co.; Bituthene.
 - c. Meadows, W. R., Inc.; Mel-Rol.
 - d. Or approved equal.
 - 2. HDPE Sheet Waterproofing:
 - a. Basis of Design: W. R. Grace & Co.; Preprufe 160R for vertical surfaces and Preprufe 300R for horizontal surfaces, or approved equal.
 - b. Provide all accessories associated with Preprufe systems including but not limited to, stainless steel termination bars, flashing, and accessories.

2.2 RUBBERIZED-ASPHALT SHEET WATERPROOFING

- A. Rubberized-Asphalt Sheet: 60-mil-thick, self-adhering sheet consisting of 56 mils of rubberized asphalt laminated to a 4-mil-thick, polyethylene film with release liner on adhesive side.
 - 1. Physical Properties: As follows, measured per standard test methods referenced:
 - a. Tensile Strength: 250 psi minimum; ASTM D 412, Die C, modified.
 - b. Ultimate Elongation: 300 percent minimum; ASTM D 412, Die C, modified.
 - c. Low-Temperature Flexibility: Pass at minus 20 deg F ASTM D 1970.

- d. Crack Cycling: Unaffected after 100 cycles of 1/8-inch (movement; ASTM C 836.
- e. Puncture Resistance: 40 lbf minimum; ASTM E 154.
- f. Hydrostatic-Head Resistance: 150 feet (minimum; ASTM D 5385.
- g. Water Absorption: 0.15 percent weight-gain maximum after 48-hour immersion at 70 deg F; ASTM D 570.
- h. Vapor Permeance: 0.05 perms; ASTM E 96, Water Method.

2.3 HDPE SHEET WATERPROOFING

- A. HDPE Sheet for Vertical Applications: 42-mil-thick, uniform, flexible sheets consisting of 16-mil-thick, HDPE sheet coated with a pressure-sensitive rubber adhesive, a protective adhesive coating, and a release liner.
- B. HDPE Sheet for Horizontal Applications: 56-mil-thick, uniform, flexible sheets consisting of 30-mil-thick, HDPE sheet coated with a pressure-sensitive rubber adhesive, a protective adhesive coating, a detackifying surface treatment, an uncoated self-adhering side lap strip, and a release liner.
- C. Physical Properties: As follows, measured per standard test methods referenced:
 - 1. Tensile Strength, Film: 4000 psi minimum; ASTM D 412.
 - 2. Low-Temperature Flexibility: Pass at minus 10 deg F; ASTM D 1970.
 - 3. Peel Adhesion to Concrete: 5 lbf/in.; ASTM D 903, modified.
 - 4. Lap Adhesion: 2.5 lbf/in.; ASTM D 1876, modified.
 - 5. Hydrostatic-Head Resistance: 231 feet; ASTM D 5385, modified.
 - 6. Vapor Permeance: 0.01 perms; ASTM E 96, Water Method.

2.4 AUXILIARY MATERIALS

- A. General: Furnish auxiliary materials recommended by waterproofing manufacturer for intended use and compatible with sheet waterproofing.
 - 1. Furnish liquid-type auxiliary materials that comply with VOC limits of authorities having jurisdiction.
- B. Primer: Liquid primer recommended for substrate by manufacturer of sheet waterproofing material.
- C. Surface Conditioner: Liquid, waterborne surface conditioner recommended for substrate by manufacturer of sheet waterproofing material.
- D. Sheet Strips: Self-adhering, rubberized-asphalt composite sheet strips of same material and thickness as sheet waterproofing.
- E. Liquid Membrane: Elastomeric, two-component liquid, cold fluid applied, trowel grade or low viscosity.
- F. Substrate Patching Membrane: Low-viscosity, two-component, asphalt-modified coating.
- G. Mastic, Adhesives, and Tape: Liquid mastic and adhesives, and adhesive tapes recommended by waterproofing manufacturer.

1. Detail Tape: Two-sided, pressure-sensitive, self-adhering reinforced tape, 4-1/2 inches wide, with a tack-free protective adhesive coating on one side and release film on self-adhering side.
- H. Metal Termination Bars: Alloy 316 stainless steel bars, approximately 1 by 1/8 inch thick, predrilled at 9-inch centers.
- I. Protection Course: Fan-folded, extruded-polystyrene board insulation, unfaced, nominal thickness 3/8 inch.

2.5 MOLDED-SHEET DRAINAGE PANELS

- A. Nonwoven-Geotextile-Faced, Molded-Sheet Drainage Panel: Manufactured composite subsurface drainage panels consisting of a nonwoven, needle-punched geotextile facing with an apparent opening size not exceeding No. 70 (0.21-mm) sieve laminated to 1 side and a polymeric film bonded to the other side of a 3-dimensional, nonbiodegradable, molded-plastic-sheet drainage core, with a vertical flow rate of 9 to 15 gpm per ft. (112 to 188 L/min. per m).
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Carlisle Sure-Drain V.
 - b. W. R. Grace Hydroduct 2 or HZ
 - c. Miradri Miradrain 6200 or 6200XL
 - d. Or approved equal

2.6 INSULATION

- A. Board Insulation: Extruded-polystyrene board insulation complying with ASTM C 578, square edged of type, density, and compressive strength indicated below:
1. For vertical applications, Type IV, 1.6-lb/cu. ft. minimum density and 25-psi minimum compressive strength.
 2. For horizontal applications, pedestrian traffic, Type VII, 2.2-lb/cu. ft. minimum density and 60-psi minimum compressive strength.
 3. For horizontal applications, vehicular traffic, Type V, 3-lb/cu. ft. minimum density and 100-psi minimum compressive strength.
 4. Thickness: 2 inches unless indicated otherwise on the Drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance.
1. For rubberized-asphalt membrane, verify that concrete has cured and aged for minimum time period recommended by waterproofing manufacturer. Verify that concrete is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.

2. For HDPE sheet, verify that compacted subgrade is dry, smooth, and sound, ready to receive sheet.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 SURFACE PREPARATION

- A. Clean, prepare, and treat substrates according to manufacturer's written instructions. Provide clean, dust-free, and dry substrates for waterproofing application.
- B. Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.
- C. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
- D. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
- E. Prepare, fill, prime, and treat joints, bugholes and cracks in substrates. Remove dust and dirt from joints and cracks according to ASTM D 4258.
- F. Bridge and cover isolation joints, expansion joints and discontinuous deck-to-wall and deck-to-deck joints with overlapping sheet strips.
 1. Invert and loosely lay first sheet strip over center of joint. Firmly adhere second sheet strip to first and overlap to substrate.
- G. Corners: Prepare, prime, and treat inside and outside corners according to ASTM D 6135.
 1. Install membrane strips centered over vertical inside corners. Install 3/4-inch fillets of liquid membrane on horizontal inside corners and as follows:
 - a. At footing-to-wall intersections, extend liquid membrane each direction from corner or install membrane strip centered over corner.
 - b. At plaza deck-to-wall intersections, extend liquid membrane or sheet strips onto deck waterproofing and to finished height of sheet flashing.
- H. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations through waterproofing and at drains and protrusions according to ASTM D 6135.

3.3 RUBBERIZED-ASPHALT SHEET APPLICATION

- A. Install self-adhering sheets according to waterproofing manufacturer's written instructions and recommendations in ASTM D 6135.
- B. Apply primer to substrates at required rate and allow to dry. Limit priming to areas that will be covered by sheet waterproofing in same day. Reprime areas exposed for more than 24 hours.
- C. Apply and firmly adhere sheets over area to receive waterproofing. Accurately align sheets and maintain uniform 2-1/2-inch-minimum lap widths and end laps. Overlap and seal seams and stagger end laps to ensure watertight installation.

1. When ambient and substrate temperatures range between 25 and 40 deg F, install self-adhering, rubberized-asphalt sheets produced for low-temperature application. Do not use low-temperature sheets if ambient or substrate temperature is higher than 60 deg F.
- D. Horizontal Application: Apply sheets from low point to high point of decks to ensure that side laps shed water.
 - E. Apply continuous sheets over sheet strips bridging substrate cracks, construction, and contraction joints.
 - F. Seal exposed edges of sheets at terminations not concealed by metal counterflashings or ending in reglets with mastic or sealant.
 - G. Install sheet waterproofing and auxiliary materials to tie into adjacent waterproofing as applicable.
 - H. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Slit and flatten fishmouths and blisters. Patch with sheets extending 6 inches beyond repaired areas in all directions.
 - I. Correct deficiencies in or remove sheet waterproofing that does not comply with requirements, repair substrates, reapply waterproofing, and repair sheet flashings.

3.4 HDPE SHEET APPLICATION

- A. Install HDPE sheets according to waterproofing manufacturer's written instructions.
- B. Vertical Applications: Install sheet membrane with HDPE face against substrate. Accurately align sheets and maintain uniform 3-inch-minimum lap widths and end laps. Overlap and seal seams and stagger and tape end laps to ensure watertight installation. Mechanically fasten to substrate.
 1. Securely fasten top termination of membrane with continuous metal termination bar anchored into substrate and cover with detailing tape.
- C. Horizontal Applications: Install sheet membrane with HDPE face against substrate. Accurately align sheets and maintain uniform 3-inch-minimum lap widths and end laps. Overlap and seal seams. Overlap, stagger, and seal end laps with detail tape to ensure watertight installation.
- D. Corners: Seal lapped terminations and cut edges of sheet waterproofing at inside and outside corners with detail tape.
- E. Seal penetrations through sheet waterproofing to provide watertight seal with detail tape patches or wraps and a liquid-membrane troweling.
- F. Install sheet waterproofing and auxiliary materials to produce a continuous watertight tie into adjacent waterproofing.
- G. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Tape perimeter of damaged or nonconforming area extending 6 inches beyond repaired areas in all directions. Apply a patch of sheet membrane and firmly secure with detail tape.
- H. Correct deficiencies in or remove waterproofing that does not comply with requirements, repair substrates, reapply waterproofing, and repair sheet flashings.

3.5 PROTECTION COURSE INSTALLATION

- A. For sheet membrane, install protection course within 24 hours of waterproofing application, with butted joints over waterproofing membrane before starting subsequent construction operations.
 - 1. Drainage panels may be used in place of a separate protection course to vertical applications when approved by waterproofing manufacturer.

3.6 INSULATION INSTALLATION

- A. Install insulation drainage panels over waterproofed surfaces. Cut and fit to within 3/4 inch of projections and penetrations.
- B. On vertical surfaces, set insulation units in adhesive or tape applied according to manufacturer's written instructions.
- C. On horizontal surfaces, loosely lay insulation units according to manufacturer's written instructions. Stagger end joints and tightly abut insulation units.

3.7 FIELD QUALITY CONTROL

- A. Flood Testing: Flood test each deck area for leaks, according to recommendations in ASTM D 5957, after completing waterproofing but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
 - 1. Flood to an average depth of 2-1/2 inches with a minimum depth of 1 inch and not exceeding a depth of 4 inches. Maintain 2 inches of clearance from top of sheet flashings.
 - 2. Flood each area for 24 hours.
 - 3. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight. Repair procedures shall be in strict accordance with manufacturer's recommendations.
- B. Engage an independent testing agency to observe flood testing and examine underside of decks and terminations for evidence of leaks during flood testing.

3.8 PROTECTION AND CLEANING

- A. Do not permit foot or vehicular traffic on unprotected membrane.
- B. Protect waterproofing from damage and wear during remainder of construction period.
- C. Protect installed insulation from damage due to ultraviolet light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.
- D. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07141

COLD FLUID-APPLIED WATERPROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies cold fluid-applied waterproofing for use at green roofs and other applications indicated.
- B. Related Work:
 - 1. Section 05810 – EXPANSION JOINT COVER ASSEMBLIES: Expansion-joint systems.
 - 2. Section 07131 – SHEET WATERPROOFING
 - 3. Section 07550 – MODIFIED BITUMEN BUILT-UP ROOFING

1.2 PERFORMANCE REQUIREMENTS

- A. Provide waterproofing membrane that prevents the passage of water.

1.3 SUBMITTALS

- A. Product Data: Include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties. Indicate material interactions with substrate, accessories, or adjacent materials that could impair the performance of either item.
- B. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins to adjoining waterproofing, and other termination conditions.
- C. Sample: 12 by 12 inch sample of waterproofing on typical project substrate.
- D. Installer Certificates: Signed by manufacturers certifying that installers comply with requirements.
- E. Qualification Data: For Installer and for third party Testing and Inspection Agency.
- F. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.
- G. Test Reports: From third party Testing and Inspection Agency.
- H. Sample Warranty: Copy of special waterproofing manufacturer's and Installer's warranty stating obligations, remedies, limitations, and exclusions before starting waterproofing.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified installer with 5 years' experience on similar scope and complexity of work who is authorized, approved, or licensed to install waterproofing manufacturer's products; and who is eligible to receive waterproofing warranty specified.

- B. Testing and Inspection Agency Qualifications: Qualified independent testing agency approved by manufacturer and experienced in observation and inspection of waterproofing systems.
- C. Hold Point - Mockups: Apply 100 square feet of waterproofing to demonstrate substrate surface preparation, crack and joint treatment, corner treatment, thickness, texture, and execution quality.
 - 1. If Engineer determines mockups do not comply with requirements, reapply waterproofing until mockups are approved.
 - 2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- D. Preinstallation Conference: Conduct conference at Project site to review requirements for waterproofing, including surface preparation specified under other Sections, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver liquid materials to Project site in original containers with seals unbroken, labeled with manufacturer's name, product brand name and type, date of manufacture, and directions for storing and mixing with other components.
- B. Store liquid materials in their original undamaged containers in a clean, dry, protected location and within the temperature range required by waterproofing manufacturer.
- C. Remove and replace liquid materials that cannot be applied within their stated shelf life.
- D. Protect stored materials from direct sunlight.

1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate, or when temperature is below 0 deg F. Do not apply waterproofing in snow, rain, fog, or mist.
- B. Maintain adequate ventilation during application and curing of waterproofing materials.

1.7 WARRANTY

- A. Special Manufacturer's Warranty: Written warranty, signed by waterproofing manufacturer agreeing to repair or replace waterproofing and sheet flashings that do not comply with requirements or that do not remain watertight within specified warranty period.
 - 1. Warranty does not include failure of waterproofing due to failure of substrate prepared and treated according to requirements or formation of new joints and cracks in substrate that exceed 1/8 inch in width.
 - 2. Warranty includes removing and reinstalling protection board, drainage panels, insulation, pedestals, and pavers on plaza decks.

3. Warranty Period: Five years after date of Substantial Completion.

PART 2 - PRODUCTS

2.1 UNMODIFIED POLYURETHANE OR LATEX RUBBER WATERPROOFING MATERIALS

- A. General: Provide waterproofing materials recommended by manufacturer to be compatible with one another and able to develop bond to substrate under conditions of service and application, as demonstrated by waterproofing manufacturer based on testing and field experience.
 1. Two-Component Unmodified Polyurethane or Latex-Rubber Waterproofing: Two component, reinforced polyurethane liquid resin waterproofing membrane with 360 degree needle punched non-woven polyester reinforcing fleece. Products that may be incorporated into the work include, but are not limited, to those manufactured by Kember System America, Inc., Kemperol 2K-PUR.
- B. Primer: Manufacturer's standard, factory-formulated polyurethane or epoxy primer.
- C. Sheet Flashing: 70-mil minimum, composite of the same resin as the field membrane with 165 g/m² fleece reinforcement.
 1. Adhesive: Manufacturer's recommended contact adhesive.
- D. Reinforcing Strip: Manufacturer's recommended fiberglass mesh or polyester fabric.
- E. Sealants and Accessories: Waterproofing manufacturer's recommended sealants and accessories.
 1. Backer Rod: Closed-cell polyethylene foam.
- F. Protection Course at Unmodified Polyurethane or Latex-Rubber Waterproofing: Semirigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners and as follows:
 1. Thickness: 1/8 inch nominal.
 2. Adhesive: Rubber-based solvent type recommended by waterproofing manufacturer for type of protection course.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance.
 1. Verify that concrete has cured and aged for minimum time period recommended by waterproofing manufacturer.
 2. Verify that substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
 3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 SURFACE PREPARATION

- A. Clean and prepare substrate according to manufacturer's written recommendations and as specified in sections 3.5, 3.6, or 3.7 as appropriate. Provide clean, dust-free, and dry substrate for waterproofing application.
- B. Mask off adjoining surfaces not receiving waterproofing to prevent spillage or overspray affecting other construction.
- C. Close off deck drains and other deck penetrations to prevent spillage and migration of waterproofing fluids.
- D. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
 - 1. Abrasive blast clean concrete surfaces uniformly to expose top surface of fine aggregate according to ASTM D 4259 with a self-contained, recirculating, blast-cleaning apparatus. Remove material to provide a sound surface free of laitance, glaze, efflorescence, curing compounds, concrete hardeners, or form-release agents. Remove remaining loose material and clean surfaces according to ASTM D 4258.
- E. Remove fins, ridges, and other projections and fill honeycomb, aggregate pockets, and other voids with materials as recommended by manufacturer for non-reactive with waterproofing.

3.3 PREPARATION AT TERMINATIONS AND PENETRATIONS

- A. Prepare vertical and horizontal surfaces at terminations and penetrations through waterproofing and at expansion joints, drains, and sleeves according to ASTM C 898 and manufacturer's written instructions.
- B. Prime substrate, unless otherwise instructed by waterproofing manufacturer.
- C. Apply a double thickness of waterproofing and embed a joint reinforcing strip in preparation coat when recommended by waterproofing manufacturer.
 - 1. Provide sealant cants around penetrations and at inside corners of deck-to-wall butt joints when recommended by waterproofing manufacturer.

3.4 JOINT AND CRACK TREATMENT

- A. Prepare, treat, rout, and fill joints and cracks in substrate according to ASTM C 898 and waterproofing manufacturer's written instructions. Remove dust and dirt from joints and cracks complying with ASTM D 4258 before coating surfaces.
 - 1. Comply with ASTM C 1193 for joint-sealant installation.
 - 2. Apply bond breaker between sealant and preparation strip.
 - 3. Prime substrate and apply a single thickness of preparation strip extending a minimum of 3 inches along each side of joint. Apply a double thickness of waterproofing and embed a joint reinforcing strip in preparation coat.
- B. Install sheet flashing and bond to deck and wall substrates where indicated or required according to waterproofing manufacturer's written instructions. Extend sheet flashings onto perpendicular surfaces and other work penetrating substrate according to ASTM C 898.

3.5 UNMODIFIED POLYURETHANE OR LATEX RUBBER WATERPROOFING APPLICATION

- A. Apply waterproofing according to ASTM C 898 and manufacturer's written instructions.
- B. Start installing waterproofing in presence of manufacturer's technical representative.
- C. Apply primer over prepared substrate.
- D. Mix materials and apply waterproofing by spray, roller, notched squeegee, trowel, or other application method suitable to slope of substrate.
 - 1. Apply one or two coats of waterproofing to obtain a seamless membrane free of entrapped gases, with an average dry film thickness of 60 mils and a minimum dry film thickness of 50 mils at any point.
 - 2. Apply waterproofing to prepared wall terminations and vertical surfaces.
 - 3. Verify wet film thickness of waterproofing every 100 sq. ft.
- E. Install protection course with butted joints over nominally cured membrane before starting subsequent construction operations.

3.6 FIELD QUALITY CONTROL

- A. Adhesion Tests: Conduct in accordance with ASTM D4541 to confirm adequate surface preparation. Conduct a minimum of 3 tests and one additional for every 1000 square feet installed.
- B. Membrane Thickness: Check every 100 square feet using a gauge pin standard comb-type thickness gauge.
- C. Coverage Rate: Monitored by checking quantity of materials used against the area covered.
- D. Any additional testing required by system manufacture to ensure product will meet performance criteria listed in Section 2.
- E. Flood Testing: Flood test each deck area for leaks, according to recommendations in ASTM D 5957, after completing waterproofing but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
 - 1. Flood to an average depth of 2-1/2 inches with a minimum depth of 1 inch and not exceeding a depth of 4 inches. Maintain 2 inches of clearance from top of sheet flashings.
 - 2. Flood each area for 24 hours.
 - 3. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight. Repair procedures shall be in strict accordance with manufacturer's recommendations.
- F. Engage an independent testing agency to observe flood testing and examine underside of decks and terminations for evidence of leaks during flood testing.

3.7 CURING, PROTECTING, AND CLEANING

- A. Cure waterproofing according to manufacturer's written recommendations, taking care to prevent contamination and damage during application stages and curing. Do not permit foot or vehicular traffic on unprotected membrane.
- B. Install 2 or more layers of asphaltic hardboard as required to achieve a minimum of 3/4" thickness. Stagger the panel joints.
- C. Protect waterproofing from damage and wear during remainder of construction period.
- D. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07142

HOT FLUID-APPLIED WATERPROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies hot fluid-applied waterproofing for bridge decks, underground building areas and other applications indicated on the Drawings.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 01420 – MOCK-UPS
 - 2. Section 07131 – SHEET WATERPROOFING.
 - 3. Section 07141 - COLD FLUID-APPLIED WATERPROOFING
 - 4. Section 07170 - BENTONITE WATERPROOFING

1.2 PERFORMANCE REQUIREMENTS

- A. Provide waterproofing that prevents the passage of water and complies with physical requirements in Canadian General Standards Board publication CAN/CGSB-37.50, "Hot Applied, Rubberized Asphalt for Roofing and Waterproofing".

1.3 SUBMITTALS

- A. Product Data: Include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties.
- B. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins to adjoining waterproofing, and other termination conditions.
- C. Installer Certificates: Signed by manufacturers certifying that installers comply with requirements.
- D. Qualification Data: For Installer and for Testing and Inspection Agency.
- E. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.
- F. Test Reports: From Testing and Inspection Agency.
- G. Sample Warranty: Copy of special waterproofing manufacturer's and Installer's warranty stating obligations, remedies, limitations, and exclusions before starting waterproofing.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified installer who is authorized, approved, or licensed to install waterproofing manufacturer's product; and who is eligible to receive waterproofing warranty specified.

- B. Mockups: Apply 100 square feet of waterproofing to demonstrate surface preparation, crack and joint treatment, corner treatment, thickness, texture, and execution quality.
 - 1. If Engineer determines mockups do not comply with requirements, reapply waterproofing until mockups are approved.
 - 2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- C. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1. Review requirements for waterproofing, including surface preparation specified under other Sections, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver liquid materials to Project site in original containers with seals unbroken, labeled with manufacturer's name, product brand name and type, date of manufacture, and directions for storing and mixing with other components.
- B. Store liquid materials in their original undamaged containers in a clean, dry, protected location and within the temperature range required by waterproofing manufacturer.
- C. Remove and replace liquid materials that cannot be applied within their stated shelf life.
- D. Protect stored materials from direct sunlight.

1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate, or when temperature is below 0 deg F. Do not apply waterproofing in snow, rain, fog, or mist.
- B. Maintain adequate ventilation during application and curing of waterproofing materials.

1.7 WARRANTY

- A. Special Manufacturer's Warranty: Written warranty, signed by waterproofing manufacturer agreeing to repair or replace waterproofing and sheet flashings that do not comply with requirements or that do not remain watertight within specified warranty period.
 - 1. Warranty does not include failure of waterproofing due to failure of substrate prepared and treated according to requirements or formation of new joints and cracks in substrate that exceed 1/8 inch in width.
 - 2. Warranty includes removing and reinstalling protection board, drainage panels, insulation, pedestals, and pavers on plaza decks.
 - 3. Warranty Period: Five years after date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
1. American Hydrotech, Inc.; Monolithic Membrane 6125
 2. Carlisle Corporation, Carlisle Coatings & Waterproofing Div.; CCW-500
 3. T. C. Miradri; Miraseal 9100
 4. Monsey Bakor; Elasto-Seal 790-11
 5. Tremco; Tremproof 150

2.2 MEMBRANE

- A. Single-component; 100 percent solids; hot fluid-applied, rubberized asphalt with the following properties measured per applicable test methods in CAN/CGSB-37.50:
1. Flash Point: Not less than 260 deg C or not less than 25 deg C above manufacturer's maximum recommended application temperature.
 2. Cone Penetration: 110 maximum at 25 deg C, and 200 maximum at 50 deg C.
 3. Flow: 3 mm maximum at 60 deg C.
 4. Toughness: Not less than 5.5 J.
 5. Ratio of Toughness to Peak Load: Not less than 0.040.
 6. Adhesion Rating: Pass.
 7. Water-Vapor Permeance: 1.7 ng/Pa x s x sq. m.
 8. Water Absorption: 0.35-g maximum mass gain, or 0.18-g maximum mass loss.
 9. Pinholing: Not more than one pinhole.
 10. Low-Temperature Flexibility: No cracking.
 11. Crack Bridging Capability: No cracking, splitting, or loss of adhesion.
 12. Heat Stability: Comply with requirements for penetration, flow, low-temperature flexibility, and viscosity when heated for five hours at manufacturer's recommended application temperature.
 13. Viscosity Test: 2 to 15 seconds.

2.3 AUXILIARY MATERIALS

- A. Primer: ASTM D 41, asphaltic primer.
- B. Elastomeric Flashing Sheet: 50-mil-minimum, nonstaining, uncured sheet neoprene with manufacturer's recommended contact adhesives and predrilled metal termination bars and anchors, with the following physical properties as measured per standard test methods referenced:
1. Tensile Strength: 1,400 psi minimum; ASTM D 412, Die C.

2. Elongation: 300 percent minimum; ASTM D 412.
 3. Tear Resistance: 125 psi minimum; ASTM D 624, Die C.
 4. Brittleness: Does not break at minus 30 deg F; ASTM D 2137.
- C. Sealants and Accessories: Waterproofing manufacturer's recommended sealants and accessories.
- D. Reinforcing Fabric: Manufacturer's recommended spun-bonded polyester fabric.
- E. Separator Sheet: ASTM D 4397, polyethylene sheet, minimum 4 mils thick.
- F. Protection Course: Semirigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners and as follows:
1. Thickness: 1/8 inch, nominal, for vertical applications, 1/4 inch, nominal, elsewhere.
 2. Adhesive: Rubber-based solvent type recommended by waterproofing manufacturer for type of protection course.

2.4 MOLDED-SHEET DRAINAGE PANELS

- A. Nonwoven-Geotextile-Faced, Molded-Sheet Drainage Panel: Manufactured composite subsurface drainage panels consisting of a nonwoven, needle-punched geotextile facing with an apparent opening size not exceeding No. 70 sieve laminated to 1 side and a polymeric film bonded to the other side of a 3-dimensional, nonbiodegradable, molded-plastic-sheet drainage core, with a vertical flow rate of 9 to 15 gpm per ft.
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Carlisle Sure-Drain V
 - b. W. R. Grace Hydroduct 2 or HZ
 - c. Miradri Miradrain 6200 or 6200XL

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer and all parties concerned present, for compliance with requirements and other conditions affecting performance.
1. Verify that concrete has cured and aged for minimum time period recommended by waterproofing manufacturer.
 2. Verify that substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
 3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Clean and prepare substrate according to manufacturer's written instructions. Provide clean, dust-free, and dry substrate for waterproofing application.
- B. Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.
- C. Close off deck drains and other deck penetrations to prevent spillage and migration of waterproofing fluids.
- D. Remove grease, oil, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
 - 1. Abrasive blast clean concrete surfaces uniformly to expose top surface of fine aggregate according to ASTM D 4259 with a self-contained, recirculating, blast-cleaning apparatus. Remove material to provide a sound surface free of laitance, glaze, efflorescence, curing compounds, concrete hardeners, or form-release agents. Remove remaining loose material and clean surfaces according to ASTM D 4258.
- E. Remove fins, ridges, and other projections and fill honeycombs, aggregate pockets, and other voids.

3.3 JOINTS, CRACKS, AND TERMINATIONS

- A. Prepare and treat substrates to receive waterproofing membrane, including joints and cracks, deck drains, corners, and penetrations according to CAN/CGSB-37.51, "Application of Rubberized Asphalt, Hot-Applied, for Roofing and Waterproofing", and waterproofing system manufacturer's written instructions.
 - 1. Rout and fill joints and cracks in substrate. Before filling, remove dust and dirt according to ASTM D 4258.
 - 2. Embed reinforcing fabric into a layer of hot, rubberized asphalt. Extend reinforcing fabric a minimum of 6 inches on each side of joints and cracks and beyond deck drains, corners, and penetrations.
- B. At expansion joints and discontinuous deck-to-wall or deck-to-deck joints, bridge joints with elastomeric flashing sheet extended a minimum of 6 inches on each side of joints and adhere to substrates in a layer of hot, rubberized asphalt.

3.4 FLASHING INSTALLATION

- A. Install flashing sheets at terminations of waterproofing membrane according to CAN/CGSB-37.51, "Application of Rubberized Asphalt, Hot-Applied, for Roofing and Waterproofing", and waterproofing system manufacturer's written instructions.
- B. Prime substrate with asphalt primer.
- C. Install elastomeric flashing sheet and adhere to deck and wall substrates in a layer of hot, rubberized asphalt.
- D. Extend flashing sheet up walls or parapets a minimum of 8 inches above plaza deck pavers and a minimum of 6 inches onto deck to be waterproofed unless greater coverage is indicated on

the Drawings.

- E. Install termination bars and mechanically fasten to top of flashing sheet at terminations and perimeter of roofing.

3.5 MEMBRANE APPLICATION

- A. Apply rubberized asphalt according to CAN/CGSB-37.51, "Application of Rubberized Asphalt, Hot-Applied, for Roofing and Waterproofing", and manufacturer's written instructions.
- B. Heat rubberized asphalt in an oil- or air-jacketed melter with mechanical agitator specifically designed for heating rubberized-asphalt waterproofing.
- C. Start application with manufacturer's technical representative present.
- D. Apply primer, at manufacturer's recommended rate, over prepared substrate and allow to dry.
- E. Reinforced Membrane: Apply waterproofing to substrates and adjoining surfaces indicated. Spread hot fluid-applied, rubberized asphalt to a thickness of 90 mils; embed reinforcing fabric, overlapping sheets 2 inches; and spread another 125-mil-thick layer to provide a uniform, reinforced, seamless membrane 215 mils thick.
- F. Apply waterproofing over prepared joints and up wall terminations and vertical surfaces to heights indicated or required by manufacturer.
- G. Cover waterproofing with separator sheet with overlapped joints while rubberized asphalt is still hot and before membrane is subject to traffic. Install protection course with overlapped joints over separator sheet.

3.6 MOLDED-SHEET DRAINAGE PANEL INSTALLATION

- A. Place and secure molded-sheet drainage panels to substrate according to manufacturer's written instructions. Use adhesives that do not penetrate waterproofing. Lap edges and ends of geotextile to maintain continuity. Protect installed molded-sheet drainage panels during subsequent construction. For vertical applications, install board insulation used as a protection course before installing drainage panels.

3.7 FIELD QUALITY CONTROL

- A. Flood Testing: Flood test each deck area for leaks, according to recommendations in ASTM D 5957, after completing waterproofing but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
 - 1. Flood to an average depth of 2-1/2 inches with a minimum depth of 1 inch and not exceeding a depth of 4 inches. Maintain 2 inches of clearance from top of sheet flashings.
 - 2. Flood each area for 24 hours.
 - 3. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight.
- B. Engage an independent testing agency to observe flood testing and examine underside of decks and terminations for evidence of leaks during flood testing.

3.8 CURING, PROTECTING, AND CLEANING

- A. Cure waterproofing according to manufacturer's written recommendations, taking care to prevent contamination and damage during application stages and curing. Do not permit foot or vehicular traffic on unprotected membrane.
- B. Protect waterproofing from damage and wear during remainder of construction period.
- C. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.
- D. Obtain approval of the Engineer for both the source of potable water for flood testing and the method of disposal. In no case shall water be disposed of in an uncontrolled fashion.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07160

CRYSTALLINE WATERPROOFING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes crystalline waterproofing for application with concrete.
- B. Related Sections:
 - 1. Section 03300 - CAST IN PLACE CONCRETE.
 - 2. Section 07920 - JOINT SEALANTS.

1.2 PERFORMANCE REQUIREMENTS

- A. Provide waterproofing that prevents passage of water under hydrostatic pressure and complies with physical requirements specified as demonstrated by testing performed by independent testing agency of manufacturer's current waterproofing formulation.

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated. Include material descriptions and installation instructions for crystalline waterproofing. Indicate material interactions with substrate, accessories, or adjacent materials that could impair the performance of either item.
- B. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience.
- C. Product Certificates: For waterproofing, patching, and plugging materials, from manufacturer.
- D. Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified independent testing agency, for crystalline waterproofing.
- E. Field quality-control reports.

1.4 QUALITY ASSURANCE

- A. Qualification of Installer: A qualified installer who is authorized, approved, or licensed to install waterproofing manufacturer's products; and who is eligible to receive waterproofing warranty specified.
- B. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1. Review requirements for waterproofing, including surface preparation specified under other Sections, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs

1.5 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with application only when existing and forecasted weather conditions permit crystalline waterproofing to be performed according to manufacturer's written instructions.
- B. Proceed with waterproofing work only after pipe sleeves, vents, curbs, inserts, drains, and other projections through the substrate to be waterproofed have been completed. Proceed only after substrate defects, including honeycombs, voids, and cracks, have been repaired to provide a sound substrate free of forming materials, including reveal inserts.
- C. Ambient Conditions: Proceed with waterproofing work only if temperature is maintained at 40 deg F(4.4 deg C) or above during work and cure period, and space is well ventilated and kept free of water.

1.6 WARRANTY

- A. Submit written warranty signed by manufacturer and Installer agreeing to repair or replace waterproofing, sheet flashings, and other components of waterproofing system that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 WATERPROOFING MATERIALS

- A. Crystalline Waterproofing: Prepackaged, blend of portland cement, specially treated sand, and active chemicals that, when mixed with water and applied, penetrates into concrete and concrete unit masonry and reacts chemically with the byproducts of cement hydration in the presence of water to develop crystalline growth within substrate capillaries to produce an impervious, dense, waterproof substrate; that has VOC content complying with limits of authorities having jurisdiction; with properties meeting or exceeding the criteria specified below.
 - 1. Available Products: Subject to compliance with requirements, provide one of the following:
 - a. Xypex Chemical Corporation; Xypex
 - b. AQUAFIN, Inc.; AQUAFIN-1C.
 - c. Vandex USA LLC; Vandex Super/Super White.
 - d. Or approved equal.
 - 2. Water Permeability: Maximum zero for water at 30 feet when tested according to CE CRD- C 48.
 - 3. Compressive Strength: Minimum 4000 psi at 28 days when tested according to ASTM C 109/C 109M.
- B. Crystalline Waterproofing Additive: Crystalline type that chemically controls and permanently fixes a non-soluble crystalline structure throughout the capillary voids of the concrete which causes the concrete to become sealed against the penetration of liquids and protects the concrete from deterioration due to harsh environmental conditions.

1. Available Products: Subject to compliance with requirements, provide one of the following:
 - a. Kryton International Inc.
 1. Krystol Internal Membrane (KIM)
 2. Krystol Waterstop Grout
 - b. Xypex Chemical Corporation
 1. Xypex Admix C-500 or Xypex Admix C-1000.

2.2 ACCESSORY MATERIALS

- A. Patching Compound: Factory-premixed cementitious repair mortar, crack filler, or sealant recommended by waterproofing manufacturer for filling and patching tie holes, honeycombs, reveals, and other imperfections; compatible with substrate and other materials indicated; and VOC content complying with limits of authorities having jurisdiction.
- B. Plugging Compound: Factory-premixed cementitious compound with hydrophobic properties and recommended by waterproofing manufacturer; resistant to water and moisture but vapor permeable for all standard applications (vertical, overhead, and horizontal surfaces not exposed to vehicular traffic); compatible with substrate and other materials indicated; and VOC content complying with limits of authorities having jurisdiction.
- C. Portland Cement: ASTM C 150, Type I.
- D. Sand: ASTM C 144.
- E. Water: Potable.

2.3 MIXES

- A. Crystalline Waterproofing: Add prepackaged dry ingredients to water according to manufacturer's written instructions. Mix together with mechanical mixer or by hand to required consistency.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Applicator present, for suitable conditions where waterproofing is to be applied.
- B. Proceed with application only after unsatisfactory conditions have been corrected.
- C. Notify Architect in writing of active leaks or defects that would affect system performance.

3.2 PREPARATION

- A. Protect other work from damage caused by cleaning, preparation, and application of waterproofing.
- B. Provide temporary enclosure to ensure adequate ambient temperatures and ventilation conditions for application.

- C. Do not allow waterproofing, patching, and plugging materials to enter reveals or annular spaces intended for resilient sealants or gaskets, such as joint spaces between pipes and pipe sleeves.
- D. Stop active water leaks with plugging compound according to waterproofing manufacturer's written instructions.
- E. Repair damaged or unsatisfactory substrate with patching compound according to manufacturer's written instructions.
 - 1. At holes and cracks in substrate, remove loosened chips and cut reveal with sides perpendicular to surface, not tapered, and approximately 1 inch deep. Fill reveal with patching compound flush with surface.
- F. Surface Preparation: Comply with waterproofing manufacturer's written instructions to remove efflorescence, chalk, dust, dirt, mortar spatter, grease, oils, paint, curing compounds, and form-release agents to ensure that waterproofing bonds to surfaces.
 - 1. Clean concrete surfaces according to ASTM D 4258.
 - 2. Concrete Joints: Clean reveals according to waterproofing manufacturer's written instructions.

3.3 APPLICATION

- A. General: Comply with waterproofing manufacturer's written instructions for application and curing.
 - 1. Saturate surface with water for several hours prior to application and maintain damp condition until applying waterproofing. Remove standing water.
 - 2. Apply waterproofing to surfaces indicated on Drawings.
 - 3. Number of Coats: Number required for specified water permeability.
 - 4. Application Method: Brush or spray. Apply to ensure that each coat fills voids and is in full contact with substrate or previous coat.
 - 5. Dampen surface between coats.
- B. Final Coat Finish: Smooth.
- C. Waterproofing admixture shall be added to concrete mix at time of batching.
- D. Curing: Moist-cure waterproofing for three days immediately after final coat has set, followed by air drying, unless otherwise recommended in writing by manufacturer.

3.4 FIELD QUALITY CONTROL

- A. After installation and prior to covering waterproofing system, arrange for system manufacturer's technical personnel to inspect waterproofing installation and submit report to Construction Manager.
 - 1. Notify Construction Manager and Owner 48 hours in advance of date and time of inspection.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07162

SPRAY-ON WATERPROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: The Design-Builder shall furnish and install all materials, tools, and equipment required to install spray elastomer waterproofing system to suitable concrete, masonry, miscellaneous metal, and other surfaces. Default thickness is 80 mils (2 mm) at any location on the deck to ensure adequate coverage of substrate irregularities. Work shall also include the installation of an integral pre-molded/preformed deck joint system with the spray applied waterproofing. Joint system shall maintain the integrity of the waterproof system and allow for movement as required by design. In addition, an Asphaltic Protection Board shall be provided on top of waterproofing membrane prior to placement of ballast.
- B. References: The publications listed below (latest revision applicable) form a part of this specification to the extent referenced herein. The publications are referred to within the text by the designation only.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM) Test Methods:

- ASTM C 836-00 Standard Specification for High Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane for Use with Separate Wearing Course
- ASTM D 2240 Standard Test Method for Rubber Property—Durometer Hardness ASTM D 638 Standard Test Method for Tensile Properties of Plastics
- ASTM D 4060 Standard Test Method for Abrasion Resistance of Organic Coatings by the Taber Abraser
- ASTM E 96 Standard Test Methods for Water Vapor Transmission of Materials
- ASTM D 4541 Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers
- ASTM D 4787 Standard Practice for Continuity Verification of Liquid or Sheet Linings Applied to Concrete Substrates
- ASTM D 6132 Standard Test Method for Nondestructive Measurement of Dry Film Thickness of Applied Organic Coatings Using an Ultrasonic Gage
- ASTM D 1005 Standard Test Method for Measurement of Dry-Film Thickness of Organic Coatings Using Micrometers

1.2 PERFORMANCE REQUIREMENTS

- A. Provide waterproofing membrane that prevents the passage of water.
- B. Provide pre-molded/preformed deck joint system that is compatible with the waterproofing membrane. Joint system shall be manufactured by the same firm that produces the membrane and provide for a minimum movement of 75% of the joint width.

- C. Provide Asphaltic Protection Board that is compatible with the waterproofing membrane.

1.3 SUBMITTALS

- A. The Design-Builder shall submit the following Product Data comprising:
 - 1. Product data sheets and manufacturer's installation specification, including shelf life, storage requirements, mixing and application details and allowable application temperatures and moisture content.
 - 2. Temperature and moisture content
 - 3. MSDS sheets for all products used in the work and any protective clothing, gloves, respirators or other personal protective equipment required for safe installation
 - 4. Substrate preparation details
 - 5. Two (2) samples of the proposed membrane, each eight (8) inches (200mm) square. One sample shall include color, texture and thickness of the proposed membrane system. A separate sample shall demonstrate those characteristics plus the non-skid characteristics of exposed waterproofing for use in areas not covered.
 - 6. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins to adjoining waterproofing, and other termination conditions.
 - 7. Installer Certificates: Signed by Manufacturer(s) certifying that installers comply with the requirements of the Manufacture and have been trained by the Manufacture for the installation of the proposed membrane material.
 - 8. Qualification Data: For Installer and for Testing and Inspection Agency.
 - 9. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.
 - 10. Test Reports: From Testing and Inspection Agency.
 - 11. Sample Warranty: Copy of special waterproofing manufacturer's and Installer's warranty stating obligations, remedies, limitations, and exclusions before starting waterproofing.

1.4 QUALITY ASSURANCE

- A. All items to be provided under this Section shall be furnished only by manufacturers having a minimum of five (5) years' experience in the manufacture of similar products and systems and shall demonstrate that those products have been installed in environments similar to the proposed installation on elevated structure on the Massachusetts Bay Transportation Authority. Provide a record of at least five (5) previous, separate, similar successful installations in the last five (5) years.
- B. The manufacturer shall be a primary blender with proprietary formulations, an authorized installer program and capacity to provide field technical services as required.

- C. Design-Builder shall offer a 3 year unlimited warranty on all spray-on waterproofing products against defects in materials, workmanship and installation.
- D. If a certification course is available from the manufacturer, the Design-Builder shall have a minimum of two (2) supervisory personnel with currently approved certification from the manufacturer.
- E. The Design-Builder shall schedule a pre-installation conference to review the installation schedule, shut- down details, restricted access procedures, proposed equipment and staffing requirements, mixing and delivery methods, proposed dry film thickness, worker protection, and any safety issues related to the installation. The MBTA and their designates shall be invited to participate in this meeting.
- F. The Design-Builder shall develop a Mockup of the proposed waterproofing system. Mockup shall be applied over an area of 100 square feet to demonstrate surface preparation, crack and joint treatment, corner treatment, thickness, texture, expansion joint installation and execution quality.
 - 1. If MBTA determines mockups do not comply with requirements, reapply waterproofing until mockups are approved.
 - 2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- G. The Design-Builder shall schedule a field visit to inspect the surface preparation, equipment set-up and application procedures at each installation location prior to waterproofing installation. The MBTA and their designates shall be invited to participate in this meeting.

1.5 PRODUCT DELIVERY AND STORAGE

- A. Manufactured materials shall be delivered in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer and location of manufacture. All chemical components shall be crated or boxed separately and noted as such to facilitate their movement to a dry indoor storage facility.
- B. All materials or components shall be carefully handled to prevent them and their packaging from damage and shall be stored in dry indoor storage facilities within the temperature range prescribed by the manufacturer until they are required at the project site.
- C. Any products or components exposed to weather or temperatures outside the manufacturer’s allowable range, damaged by shipment or jobsite handling or with damaged or incomplete packaging or labeling shall be replaced at Design-Builder’s expense and removed from the project and project storage sites.

PART 2 - PRODUCTS

2.1 MANUFACTURER

- A. All components of the spray-on waterproofing and deck joint system shall be manufactured by a single company to assure all constituents are compatible and intended for use as a complete waterproofing system.

2.2 GENERAL

A. Acceptable products include the following:

1. Eliminator Waterproofing Membrane Stirling Lloyd Product, Inc.
152 Rockwell Road
Newington, CT 06111
2. Bridge Deck Membrane Bridge Preservation LLC
Box 32336
Kansas City, MO 64171
3. Or MBTA approved equal

B. The membrane shall be 100% solids rapid curing elastomer, installed by spray and shall meet the following physical properties based on the test conducted at a membrane thickness of 80 mils (2mm):

<u>Property of Cured Product</u>	<u>Test Method</u>	<u>Required Value</u>
Dynamic Crack Bridging	ASTM C 836	Pass @ 10 cycles 1/8" (3.2mm) -15°F (-26°C)
Solids Content	---	100%
Hardness	ASTM D 2240	50D
Elongation	ASTM D 638	> 130%
Tensile Strength	ASTM D 638	> 1400 psi
Tabor Abrasion (grams loss, 1000 gm sample, 1000 rev., H-22)	ASTM D 4060	< 0.75 grams
Moisture Vapor Transmission	ASTM E 96	< 0.20 perm
Gel Time	---	< 10 minutes
CureTime	---	< 30 minutes
Open to Light Traffic	---	1 hour

C. Primer shall be as specified by the waterproofing membrane manufacturer.

D. Spray equipment shall be suitable for use with the product specified and approved by the waterproofing membrane manufacturer in writing.

E. The waterproofing shall not be orange, red, yellow or any bright color. Pastel shades of the banned colors may be submitted for consideration by the MBTA, but the MBTA is under no obligation to accept colors that may dilute the effect of using warning colors in worker safety.

F. Asphaltic Protective Board, Provide a protection board that meets the requirements of AREMA Chapter 8, Section 29.10, Paragraph 29.10.3, Asphaltic Panels.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Prior to the installation of primer or spray-on membrane, the Design-Builder shall inspect the substrate preparation with the MBTA's representative. The substrate preparation shall be approved prior to primer or spray-on membrane installation.

3.2 PREPARATION

- A. Provide clean, sound concrete substrate.
- B. Repair any spalls or other defects with rapid curing concrete patch material.
- C. Prepare, treat, rout, and fill cracks in substrate according to ASTM C 898 and waterproofing manufacturer's written instructions. Remove dust and dirt from cracks complying with ASTM D 4258 before coating surfaces.
 - 1. Comply with ASTM C 1193 for joint-sealant installation.
 - 2. Apply bond breaker between sealant and preparation strip.
 - 3. Prime substrate and apply a single thickness of preparation strip extending a minimum of 3 inches along each side of crack. Apply a double thickness of waterproofing and embed a joint reinforcing strip in preparation coat if manufacture recommends it.
- D. Shot blast concrete to remove laitance and other contamination and provide suitable blast profile equal to not less than 60 grit sandpaper and not more than ¼".
- E. Test prepared surface using Elcometer adhesion testing (ASTM D 4541). Minimum allowable pull strength is 150 psi.
- F. Mask surfaces that are not to be waterproofed prior to spray applications.

3.3 INSTALLATION

- A. Spray or roll primer at a rate of 160-200 square feet per gallon, or as per manufacturer's instructions and approval by MBTA, over surfaces to receive waterproof coating system. Allow primer to go tack-free before spraying waterproofing membrane.
- B. Concrete and masonry surfaces may be damp. Broom away all ponded water prior to installation.
- C. Reapply primer if in place more than twelve 12 hrs. hours prior to application of waterproofing.
- D. Spray waterproofing base coat over primed deck surface at a minimum rate of twenty 20 square feet per gallon to achieve a minimum thickness of 80 mils.
- E. Retouch waterproofing membrane coating by filling low spots or areas with inadequate thickness.
- F. Spray additional waterproofing base coats to achieve specified system thickness. Retouch as required.
- G. Repair any damaged areas prior to placement of asphaltic protection board, by removing damaged membrane and re-applying waterproofing to the specified thickness using above methods.

3.4 FIELD QUALITY CONTROL

- A. Since the waterproofing membrane typically gels too rapidly to allow wet film testing, use ultrasonic test equipment or destructive testing to determine stroke per gallon method to assure proper film thickness.
1. Perform one (1) dry film thickness test per two hundred fifty (250) track feet of track bed area treated. These tests may be either ultrasonic or destructive testing and shall be witnessed by the MBTA's representative.
 2. Adhesion Tests, Conduct in accordance with ASTM D4541 to confirm adequate surface preparation. Conduct a minimum of 3 tests and one additional for every 100 track feet installed.
 3. If destructive testing is utilized, the sample removed shall be square and between one (1") inch and two (2") inches per side. The minimum thickness shall be measured per ASTM D 1005.
 4. Flood Testing: Flood test each deck area for leaks, according to recommendations in ASTM D5957, after completing waterproofing but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
 - a. Flood to an average depth of 2-1/2 inches with a minimum depth of 1 inch and not exceeding a depth of 4 inches. Maintain 2 inches of clearance from top of sheet flashings.
 - b. Flood each area for 24 hours.
 - c. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight. Repair procedures shall be in strict accordance with manufacturer's recommendations.
 - d. Engage an independent testing agency to observe flood testing and examine underside of decks and terminations for evidence of leaks during flood testing.
 5. Repair areas damaged by destructive testing by re-spraying with membrane material or filling with special two-component gun-grade material provided by the manufacturer.
 6. If ultrasonic testing is used, it shall comply with the requirements of ASTM D 6132.
 7. As an additional check, spray equipment may be calibrated and tested to a "spray pass per gallon" of product sprayed, but this shall not replace ultrasonic or destructive testing methods.
 8. Maintain spray and other installation equipment in proper operating condition throughout installation. Provide adequate reserve equipment as required.
 9. The absence of pinholes shall be verified in accordance with ASTM D 4787.
- B. CLEANING
1. Spills and overspray shall be cleaned as they occur.

2. Consult manufacturer's literature and MSDA sheets for proper cleaning products and methods.
3. Clean the site to MBTA's satisfaction prior to Substantial Completion.

C. PROTECTION

1. Install asphaltic protection boards in accordance with the manufacture recommendations.
2. Protect all installed work until ballast has been placed and MBTA has approved of Substantial Completion.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07170

BENTONITE WATERPROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies bentonite panel waterproofing for use under slab on grade construction of the elevator and/or escalator pits or as requested by the Engineer.
- B. Related Work:
 - 1. Section 07115 – BITUMINOUS DAMPPROOFING
 - 2. Section 07920 – JOINT SEALANTS Joint sealers.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated. Include product specifications and manufacturer's written installation instructions.
- B. Shop Drawings: Show installation details for interface with other work.
- C. Samples: For each of the following products, in sizes indicated:
 - 1. Waterproofing: 6 inches square.
 - 2. Flexible Flashing Membrane: 6 inches square.
 - 3. Protection Board: 6 inches square.
 - 4. Drainage Mat: 6 inches square.
- D. Material Certificates: For each type of bentonite waterproofing, signed by manufacturers.
- E. Preconstruction Test Reports: For water samples taken at Project site along with recommendations resulting from these tests.
- F. Installer Certificates: Signed by manufacturers certifying that installers comply with requirements.
- G. Qualification Data: For Installer and for Testing and Inspection Agency.
- H. Product Test Reports: From a qualified independent testing agency indicating and interpreting test results of waterproofing for compliance with requirements, based on comprehensive testing of current waterproofing formulations.
- I. Sample Warranty: Copy of special waterproofing manufacturer's and Installer's warranty stating obligations, remedies, limitations, and exclusions before starting waterproofing.

1.3 QUALITY ASSURANCE

- A. Source Limitations: Obtain bentonite waterproofing system through one source from a single manufacturer. Obtain accessory products used with bentonite waterproofing from sources acceptable to bentonite waterproofing manufacturer.

- B. Preconstruction Testing: Engage a qualified independent testing agency to test water for compliance with requirements.
 - 1. Obtain water samples from Project site at approximate locations where waterproofing will be installed and test for acids, alkalis, brine, or other contaminants that may inhibit performance of waterproofing materials.
 - 2. Comply with manufacturer's written instructions for testing.
- C. Mockups: Build mockups to set quality standards for fabrication and installation.
 - 1. Approval of mockups is also for other material and construction qualities specifically approved by Engineer in writing.
 - 2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless such deviations are specifically approved by Engineer in writing.
- D. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to Project site in manufacturer's original unopened and undamaged containers.
- B. Store materials in a dry, well-ventilated space.
- C. Remove and replace bentonite materials that have been prematurely exposed to moisture.

1.5 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit bentonite waterproofing to be installed according to manufacturer's written instructions and warranty requirements.
 - 1. Do not apply waterproofing materials to surfaces where ice or frost is visible. Do not apply bentonite waterproofing materials in areas with standing water.
 - 2. Placing of bentonite clay products in panel or composite form on damp surfaces is allowed if approved in writing by manufacturer.

1.6 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of bentonite waterproofing system that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Water penetrating the building or structure resulting from substrate cracking of up to 1/8 inch.
 - b. Deteriorated or displaced waterproofing materials.
 - 2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GEOTEXTILE/BENTONITE SHEETS

- A. Geotextile/Bentonite Waterproofing: Minimum of 1.1 lb/sq. ft. of bentonite clay granules between 2 layers of geotextile polypropylene fabric, one woven and one nonwoven, needlepunched and heat fused together.
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. CETCO; Voltex.
 - b. Carlisle Coatings & Waterproofing Inc.; CCW Clay Mat.
 - c. MiraDRI Moisture Protection Products, TC MiraDRI; MiraCLAY.
 - d. Tremco; Paraseal
 - e. Or approved equal.
- B. Contaminant-Resistant Geotextile/Bentonite Waterproofing: Minimum of 1.2 lb/sq. ft. of bentonite clay granules specially formulated for use in saltwater or contaminated ground-water, between 2 layers of geotextile polypropylene fabric, one woven and one nonwoven, needlepunched and heat fused together.
 - 1. Available Products:
 - a. CETCO VOLTEX DS-CR
 - b. Carlisle coatings: for contaminant resistant
 - c. TREMCO; for contaminant resistant

2.2 INSTALLATION ACCESSORIES

- A. Molded-Sheet Drainage Panels: Prefabricated, composite drainage panels, manufactured with a permeable geotextile facing laminated to a molded-plastic, three-dimensional sheet drainage core.
- B. Termination Bar: Mastic tape shall be used for all terminations whether shown on the Contract Drawings or not.
- C. Fasteners: Case-hardened nails or hardened-steel, powder-actuated fasteners. Depending on manufacturer's written requirements, provide 1/2- or 1-inch-diameter washers under fastener heads.
- D. Sealants: As recommended in writing by waterproofing manufacturer. Comply with requirements specified in Section 07920 – Joint Sealants.
- E. Tapes: As recommended in writing by waterproofing manufacturer for joints between sheets or panels.
- F. Adhesive: Water-based adhesive used to secure membrane to both vertical and horizontal surfaces.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrate preparations affecting performance of bentonite waterproofing.

1. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of bentonite waterproofing.
 2. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Verify that substrate is complete and that all work that will penetrate waterproofing is complete and rigidly installed. Verify locations of waterproofing termination.

3.2 PREPARATION

- A. Coordinate work in the vicinity of waterproofing to ensure proper conditions for installing the waterproofing system and to prevent damage to waterproofing after installation.
- B. Formed Concrete Surfaces: Remove fins and projections. Fill voids, rock pockets, form-tie holes, and other defects greater than 1/8 with bentonite mastic or cementitious patching material according to manufacturer's written instructions.
- C. Horizontal Concrete Surfaces: Remove debris, standing water, oily substances, mud, and similar substances that could impair the bonding ability of concrete or the effectiveness of waterproofing. Fill voids, cracks greater than 1/8 inch, honeycomb areas, and other defects with bentonite mastic or cementitious patching material according to manufacturer's written instructions.
- D. Excavation Support and Protection or Stable Excavation: If water is seeping, use plastic sheets or other suitable means to prevent wetting the bentonite waterproofing. Fill minor gaps and spaces 1/8 inch wide or wider with wood, metal, concrete, or other appropriate filling material. Cover or fill large voids and crevices with cement mortar according to manufacturer's written instructions.

3.3 INSTALLATION, GENERAL

- A. Install waterproofing and accessories according to manufacturer's written instructions, standard details, and recommended practices.
1. Apply linear joint-sealing tubes, bentonite mastic, or both at changes of plane, construction joints in substrate, projections, and penetrations.
 2. Apply granular bentonite around penetrations in horizontal surfaces according to manufacturer's written instructions.
- B. Static Construction Joints: Protect construction joints with bentonite preformed waterstop flexible strips. Either place concrete directly over flexible strips or press strips into preformed cavities. Comply with manufacturer's written instructions where joint waterproofing is not otherwise indicated.
- C. Apply granular bentonite continuously at base of wall waterproofing (on footing, against wall) according to manufacturer's written instructions.
- D. Protect waterproofing from damage and wetting before and during subsequent construction operations. Repair punctures, tears, and cuts according to manufacturer's written instructions.
- E. Apply sealants to comply with requirements specified in Division 7 Section "Joint Sealants" and with manufacturer's written instructions.

3.4 GEOTEXTILE/BENTONITE PANEL INSTALLATION

- A. General: Install a continuous layer of waterproofing sheets with woven geotextile side directly against concrete to be waterproofed. Lap ends and edges a minimum of 4 inches on horizontal and vertical substrates. Stagger end joints between sheets a minimum of 24 inches. Fasten seams by stapling to adjacent sheet or nailing to substrate.
- B. Below Structural Slabs-on-Grade: Place waterproofing sheets on compacted substrate with woven geotextile side up with ends and edges lapped and stapled.
 - 1. Install a layer of waterproofing sheets under footings, grade beams, and pile caps; or continue waterproofing through key joints between footings and foundation walls, and extend a minimum of 8 inches up or beyond perimeter slab forms.
- C. Concrete Walls: Starting at bottom of wall, apply waterproofing sheets horizontally with primary backing side against wall. Secure with powder-actuated fasteners or case-hardened, steel-cap masonry nails; spaced according to manufacturer's written instructions. Extend to bottom of footing, grade beam, or wall and secure as recommended in writing by manufacturer.
 - 1. Termination at Grade: Fasten top edge of waterproofing sheets to wall and protect top edge with sheet metal counterflashing. Cover waterproofing with a lapped course of plastic protection sheets if backfilling does not proceed immediately. Before backfilling, install a layer of protection board.
- D. Excavation Support and Protection (Permanent Shoring): Encase tieback rods, nuts, and plates, using bentonite mastic and waterproofing sheets, according to waterproofing manufacturer's written instructions for each configuration.
 - 1. Install a layer of waterproofing sheets, with ends and edges lapped and nailed to shoring. Cover waterproofing with plastic protection sheets if needed for protection from precipitation; remove plastic sheets before placing concrete.
 - 2. Inspect and repair waterproofing after reinforcing steel has been placed. Coordinate and control concrete placement to avoid damage to waterproofing.
- E. Horizontal Roofs, Plazas, and between Slabs: Starting at lowest point, install a layer of waterproofing sheets, with ends and edges lapped a minimum of 4 inches, fastening every 18 to 24 inches to hold material in place.
 - 1. Terminations at Vertical Surfaces: Provide fillet or cant at intersection of horizontal and vertical substrates. Extend waterproofing to top of curb or to a minimum of 6 inches above plane of waterproofing; secure top edge with sheet metal flashing.
 - 2. Cover waterproofing with a plastic slip-sheet.

3.5 FIELD QUALITY CONTROL

- A. Inspection: Arrange for manufacturer's representative to inspect completed installation and provide written report that installation complies with manufacturer's written instructions. Remove and replace applications of bentonite waterproofing where inspection indicates that it does not comply with specified requirements.
- B. Perform additional testing and inspecting, at Contractor's expense, to determine compliance of replaced or additional work with specified requirements.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07190

WATER REPELLENTS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies water-repellent coatings for the following surfaces not required to have anti-graffiti coating specified in Section 09861:
 - 1. Concrete vertical surfaces.
 - 2. Concrete horizontal surfaces.
 - 3. Concrete unit masonry (unpainted and unglazed).
 - 4. Stonework.

- B. Related Work:
 - 1. Section 03300 – CAST-IN_PLACE CONCRETE.
 - 2. Section 04800 - MASONRY
 - 3. Section 07920 – JOINT SEALANTS
 - 4. Section 09861 – ANTI GRAFFITI COATINGS.

1.2 PERFORMANCE REQUIREMENTS

- A. Performance Testing: Provide water repellents that comply with test-performance requirements indicated, as evidenced by reports of tests performed by manufacturer by a qualified independent testing agency on manufacturer's standard products applied to substrates simulating those on Project using same application methods to be used for Project.

- B. Absorption: Minimum 90 percent reduction of absorption after 24 hours in comparison of treated and untreated specimens.
 - 1. Stone: ASTM C 97.
 - 2. Concrete Unit Masonry: ASTM C 140.
 - 3. Hardened Concrete: ASTM C 642.

- C. Permeability: Minimum 80 percent water-vapor transmission in comparison of treated and untreated specimens, per ASTM D 1653.

- D. Water Penetration and Leakage through Masonry: Minimum 90 percent reduction in leakage rate in comparison of treated and untreated specimens, per ASTM E 514.

- E. Durability: Maximum 5 percent loss of water repellency after 2500 hours of weathering in comparison to specimens before weathering, per ASTM G 154.

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated.

1. Include recommendations for method of application, primer, coverage or thickness and protection course. Indicate material interactions with substrate, accessories, or adjacent materials that could impair the performance of either item.
 2. Include manufacturer's printed statement of VOC content.
 3. Include manufacturer's standard colors.
- B. Samples: For each type and color of water repellent and substrate indicated, 12 by 12 inches in size, with specified water-repellent treatment applied to half of each Sample.
- C. Manufacturer Certificates: Signed by manufacturers certifying that water repellents comply with requirements.
- D. Qualifications: Installer. A qualified installer who is authorized, approved or licensed to install water repellent manufactured products and is eligible to provide the warranty specified.
- E. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer.
- B. Test Application: Apply a finish sample for each type of water repellent and substrate required. Duplicate finish of approved sample.
1. Locate each test application as directed by Engineer.
 2. Size: 10 square feet.
 3. Final approval by Engineer of color and water-repellent application will be from test applications.

1.5 PROJECT CONDITIONS

- A. Limitations: Proceed with application only when the following existing and forecasted weather and substrate conditions permit water repellents to be applied according to manufacturers' written instructions and warranty requirements:
1. Ambient temperature is above 40 deg F.
 2. Concrete surfaces and mortar have cured for more than 28 days.
 3. Concrete or masonry walls are not treated prior to 30 days after building close-in.
 4. Rain or snow is not predicted within 24 hours.
 5. Application proceeds more than 24 hours after surfaces have been wet.
 6. Substrate is not frozen, or surface temperature is above 40 deg F.
 7. Windy conditions do not exist that may cause water repellent to be blown onto vegetation or surfaces not intended to be treated.

1.6 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace materials that fail to maintain water repellency specified in Part 1 "Performance

Requirements" Article within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PENETRATING WATER REPELLENTS

- A. Silane/Siloxane-Blend, Penetrating Water Repellent: Clear, silane and siloxane blends with 3.3 lb/gal. or less of VOCs.
 1. Available Products:
 - a. Anti-Hydro International, Inc.; Aridox 40 VOC.
 - b. Hydrozo, a division of ChemRex; Enviroseal 7 or Hydrozo 100.
 - c. Pecora Corporation; 910W.
 - d. ProSoCo, Inc.; SL 100 Water Repeller.
 - e. Or approved equal.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Clean substrate of substances that might interfere with penetration or performance of water repellents.

Test for moisture content, according to water-repellent manufacturer's written instructions, to ensure that surface is dry enough.

 1. Cast-in-Place Concrete Section 03300: Remove oil, curing compounds, laitance, and other substances that could prevent adhesion or penetration of water repellents.
- B. Test for pH level, according to water-repellent manufacturer's written instructions, to ensure chemical bond to silicate minerals.
- C. Protect adjoining work, including sealant bond surfaces, from spillage or blow-over of water repellent.

Cover adjoining and nearby surfaces of aluminum and glass if there is the possibility of water repellent being deposited on surfaces. Cover live plants and grass.
- D. Coordination with Sealants: Do not apply water repellent until sealants for joints adjacent to surfaces receiving water-repellent treatment have been installed and cured.
 1. Water-repellent work may precede sealant application only if sealant adhesion and compatibility have been tested and verified using substrate, water repellent, and sealant materials identical to those used in the work.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATION

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect the

substrate before application of water repellent and to instruct Applicator on the product and application method to be used.

- B. Apply a heavy-saturation spray coating of water repellent on surfaces indicated for treatment using low-pressure spray equipment to achieve application rate recommended by manufacturer. Prepare a test area to determine proper application rate as recommended by manufacturer. Comply with manufacturer's written instructions for using airless spraying procedure, unless otherwise indicated. Thoroughly mix prior to application.

3.3 CLEANING

- A. Immediately clean water repellent from adjoining surfaces and surfaces soiled or damaged by water- repellent application as work progresses. Repair damage caused by water-repellent application. Comply with manufacturer's written cleaning instructions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07210

BUILDING INSULATION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies perimeter insulation under slabs-on-grade and perimeter foundation wall insulation and batt insulation of the following types:
 - 1. Extruded polystyrene insulation at perimeter walls and slabs.
 - 2. Glass fiber, mineral wool, and foil-faced polyisocyanurate insulation at designated exterior walls.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 04800 - MASONRY: Insulation installed in cavity walls and masonry cells.
 - 3. Section 07550 – MODIFIED BITUMINOUS BUILT UP ROOFING
 - 4. Section 09260 - GYPSUM BOARD ASSEMBLIES: Acoustic insulation in gypsum board assemblies.
 - 5. Division 15 - PLUMBING: Plumbing insulation.
 - 6. Division 15 - HVAC: Mechanical insulation.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated. Include installation instructions and accessories for installation.
- B. Exterior Wall Certification: Submit manufacturer's certification that exterior wall insulation as designed in the assemblies indicated on the Contract Drawings has been tested to meet the requirements of NFPA 285 and passed.

1.3 QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of building insulation through one source from a single manufacturer.
- B. Fire Test Performance for Insulation: Passes NFPA 285, Standard Fire Test Method for Evaluation of Fire Propagation Characteristics of Exterior Non-Load Bearing Wall Assemblies Containing Combustible Components. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
- C. Protect insulation materials from physical damage and from deterioration by moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.

D. Protect plastic insulation as follows:

1. Do not expose to sunlight, except to extent necessary for period of installation and concealment.
2. Protect against ignition at all times. Do not deliver plastic insulating materials to Project site before installation time.
3. Complete installation and enclosure of plastic materials as rapidly as possible in each area of construction.
4. Or approved equal.

1.4 PRE-CONSTRUCTION MEETINGS

A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 FOAM-PLASTIC BOARD INSULATION

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
1. DiversiFoam Products.
 2. Dow Chemical Company.
 3. Owens Corning.
- B. Extruded-Polystyrene Board Insulation: ASTM C 578, Type IV, with maximum flame-spread of 75 and smoke-developed 450.
- C. High-Compressive Strength Extruded Polystyrene Board Below Slabs at radiant heating flooring in the Vehicle Maintenance Facility topping slab : ASTM C 578, Type V, 100-psi minimum compressive strength; maximum flame-spread and smoke-developed indexes of 25 and 450, respectively, per ASTM E 84.
- D. Factory Mutual approved when installed as described in the current edition of the FM Approval Guide

2.2 GLASS-FIBER BLANKET INSULATION

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Johns Manville.
 2. Knauf Insulation.
 3. Owens Corning.

- B. Unfaced, Glass-Fiber Blanket Insulation: ASTM C 665, Type I; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively, per ASTM E 84; passing ASTM E 136 for combustion characteristics.

2.3 MINERAL-WOOL BOARD

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Roxul Inc.
 - 2. Fibrex Insulations Inc.
 - 3. Isolatek International.
 - 4. Owens Corning; Thermafiber.
- B. Unfaced, Mineral-Wool Board Insulation: ASTM C 612, Type IVB; with maximum flame-spread and smoke-developed indexes of 15 and zero, respectively, per ASTM E 84; passing ASTM E 136 for combustion characteristics.
 - 1. Nominal density of 4 lb/cu. ft. Types IA and IB, thermal resistivity of 4 deg F x h x sq. ft./Btu x in. at 75 deg F minimum.
 - 2. Fiber Color: Natural, except darkened where visible through joints in cladding.
- C. Attachment to Substrate: Manufacturer's recommended mechanical attachment clip spindle.

2.4 FOIL-FACED POLYISOCYANURATE BOARD

- A. Foil-Faced, Polyisocyanurate Board Insulation: ASTM C 1289, Type I, Class 1 or 2, with maximum flame-spread and smoke-developed indexes of 25 and 450, respectively, per ASTM E 84; 25-psi minimum compressive strength.
- B. Factory Mutual approved when installed as described in the current edition of the FM Approval Guide

2.5 AUXILIARY INSULATING MATERIALS

- A. Adhesive for Bonding Insulation: Product with demonstrated capability to bond insulation securely to substrates indicated without damaging insulation and substrates.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements of Sections in which substrates and related work are specified and for other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Clean substrates of substances harmful to materials, including removing projections capable of puncturing materials or of interfering with insulation attachment.

3.3 INSTALLATION GENERAL

- A. Comply with insulation manufacturer's written instructions applicable to products and application indicated.
- B. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed at any time to ice, rain, and snow.
- C. Extend insulation in thickness indicated to envelop entire area to be insulated. Cut and fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.

3.4 INSTALLATION OF PERIMETER AND UNDER-SLAB INSULATION

- A. On vertical surfaces, set insulation units in adhesive applied according to manufacturer's written instructions. Use adhesive recommended by insulation manufacturer. If not otherwise indicated, extend insulation a minimum of 48 inches below exterior grade line.
- B. On horizontal surfaces, loosely lay insulation units according to manufacturer's written instructions. Stagger end joints and tightly abut insulation units.

3.5 INSTALLATION OF CAVITY-WALL INSULATION

- A. Fit courses of insulation between wall ties (if applicable) and other obstructions, with edges butted tightly in both directions. Press units firmly against inside substrates indicated. Fill gaps with compatible insulating material.
- B. Mechanically attach cavity insulation per manufacturer's instructions. Fit insulation with edges butted tightly in both directions. Do not compress insulation. Maintain cavity width of dimension indicated between insulation and cladding material.

3.6 INSTALLATION OF GLASS-FIBER INSULATION

- A. Glass-Fiber Blanket Insulation:
 - 1. Use insulation widths and lengths that fill the cavities formed by framing members. If more than one length is required to fill the cavities, provide lengths that will produce a snug fit between ends.
 - 2. Place insulation in cavities formed by framing members to produce a friction fit between edges of insulation and adjoining framing members.
 - 3. Maintain 3-inch clearance of insulation around recessed lighting fixtures not rated for or protected from contact with insulation.

3.7 PROTECTION

- A. Protect installed insulation from damage due to harmful weather exposures, physical abuse, and other causes. Provide temporary coverings or enclosures where insulation is subject to abuse and cannot be enclosed and protected by permanent construction immediately after installation.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07215

CLOSED CELL SPRAYED FOAM INSULATION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies spray polyurethane foam insulation with intumescent thermal barrier.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 - 2. Section 04800 - MASONRY for insulation installed in cavity walls and masonry cells.
 - 3. Section 07131 – SHEET WATERPROOFING.
 - 4. Section 07141 – COLD FLUID-APPLIED WATERPROOFING for insulated drainage panels installed with waterproofing.
 - 5. Section 07550 – MODIFIED BITUMENT BUILT-UP ROOFING for insulation specified as part of roofing construction.

1.2 SUBMITTALS

- A. Product Data: For the type of product indicated. Include product specifications and manufacturers written instructions for installation.
- B. Exterior Wall Certification: Submit manufacturer's certification that exterior wall insulation as designed in the assemblies indicated on the Contract Drawings has been tested to meet the requirements of NFPA 285 and passed.
- C. Manufacturer's Certificates: Certify that product meet or exceed specified requirements.

1.3 QUALITY ASSURANCE

- A. Installer's Qualifications: Installer with at least five years of experience in successfully installing insulation on projects of similar type and complexity.
- B. Fire Test Performance for Insulation: Passes NFPA 285, Standard Fire Test Method for Evaluation of Fire Propagation Characteristics of Exterior Non-Load Bearing Wall Assemblies Containing Combustible Components.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Protect insulation materials from physical damage and from deterioration due to moisture, direct sunlight, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.

1.5 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under

this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 SPRAY POLYURETHANE FOAM INSULATION

- A. Closed-Cell Polyurethane Foam Insulation: ASTM C 1029, Type II, with maximum flame-spread and smoke-developed indexes of 25 and 450, respectively, per ASTM E 84.
 - 1. Basis-of-Design: Heatlok Soy 200+ by Demilec with 11 mils BlazeLok water-based intumescent coating or equal by BASF, Dow Chemical or equal.
 - 2. Core Density: ASTM D 1622, minimum 2.0 lb/cu. ft.
 - 3. Thermal Resistance: ASTM C 518, minimum of 6.2 deg F x h x sq. ft./Btu x in. at 75 deg F (43 K x m/W at 24 deg C).
 - 4. Compressive Strength: ASTM D 1621, minimum 20 psi.
 - 5. Closed Cell Content: ASTM D, minimum 90 percent.
 - 6. Water Absorption: ASTM D 2842, maximum 2.5 percent.
 - 7. Water Vapor Permeability: ASTM E 96, maximum 2.5 perm/inch.
- B. Primer: Follow manufacturer's recommendation for surfaces conditions.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Clean substrates of substances which are harmful to insulation.
- B. Cover adjacent areas to protect from overspray.
- C. Apply required primers for special conditions as recommended by manufacturer.

3.2 INSTALLATION

- A. Apply sprayed foam insulation in accordance with ASTM C1029 and with insulation manufacturer's written instructions applicable to products and applications indicated.
- B. Do not apply insulation until installation of pipes, ducts, conduits, wiring, and electrical outlets in walls is completed and windows, electrical boxes, and other items not indicated to receive insulation are masked. After insulation is applied, make flush with face of studs by using method recommended by insulation manufacturer.
- C. Apply insulation to uniform monolithic density without voids.
- D. Avoid formation of sub-layer air pockets.

- E. Miscellaneous Voids: Install insulation in miscellaneous voids and cavity spaces where required to prevent gaps in insulation.

3.3 FIELD QUALITY CONTROL

- A. Conduct field inspection and testing in accordance with manufacturers and Contractors instructions for verification of insulation and density.

3.4 CLEANING

- A. Remove overspray from non-prescribed surfaces without causing damage to surfaces.
- B. Remove protective covers from adjacent surfaces.

3.5 PROTECTION

- A. Protect installed products until completion of project per manufacturer's instructions.
- B. Repair or replace damaged products as required.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07220

ROOF DECK INSULATION

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies roof deck insulation.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 07550 - MODIFIED BITUMEN BUILT-UP ROOFING
 - 3. Section 07600 - FLASHING AND SHEET METAL

1.3 SUBMITTALS

- A. Product Data: Provide manufacturer's specification data sheets for each product.
- B. Provide approval letters from insulation manufacturer for use of their insulation within this particular roofing system type.
- C. Provide a sample of each insulation type.
- D. Certification
 - 1. Submit roof manufacturer's certification that insulation adhesive furnished is acceptable to roof manufacturer.
 - 2. Submit roof manufacturer's certification that insulation furnished is acceptable to roofing manufacturer as a component of roofing system and is eligible for roof manufacturer's system warranty.
- E. FM Global Forms: Submit copy of FM Global Form 2688 prior to installation of roofing system. This form is available by the BMTA

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to site with seals and labels intact, in manufacturer's original containers, dry and undamaged.
- B. Store all insulation materials in a manner to protect them from the wind, sun and moisture damage prior to and during installation. Any insulation that has been exposed to any moisture shall be removed from the project site.
- C. Keep materials enclosed in a water tight, ventilated enclosure (i.e. tarpaulins).
- D. Store materials off the ground. Any warped, broken or wet insulation boards shall be removed

from the site.

1.5 QUALITY ASSURANCE

- A. FM Approvals Listing: Provide roofing, base flashings, and component materials that comply with requirements in FM Approvals 4450 and FM Approvals 4470 as part of a membrane roofing system, and that are listed in FM Approvals' "RoofNav" for Class 1 or noncombustible construction, as applicable. Identify materials with FM Approvals markings. Obtain FM acceptance of system proposed for use prior to ordering materials.
 - 1. Roofing System:
 - a. Fire/Windstorm Classification: In accordance with FM recommendations.
 - b. Roofing shall meet FM Global requirements for rating in the field of the roof, perimeter and corners.
 - c. Provide additional securement as required in FMG Data Sheet 1-29.
 - d. Hail Resistance: MH and in accordance with FM recommendations.
 - e. Provide "RoofNav" assembly number corresponding to an FM approved roof assembly. Refer to www.roofnav.com for information and Form 2688.
- B. Fire Classification, ASTM E-108
- C. Submit certification that the roof system furnished meets local or nationally recognized building codes for fire Class A and/or wind resistance.
- D. Contractor shall have minimum 5 years experience installing items on work of similar scope and complexity.

1.6 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 PRODUCTS

2.1 APPROVED EQUIVALENT

- A. Contractor must submit any product not specified a minimum five days before the bid date to Engineer in order for product to be considered for approval. The Engineer will notify Contractor in writing of decision to accept or reject request.

2.2 INSULATION MATERIALS

- A. Provide thicknesses of insulation as indicated. provide combination of types and thicknesses to provide a complete system.
 - 1. Rigid Polyisocyanurate Roof Insulation

- a. Qualities: Rigid, closed cell polyisocyanurate foam core bonded to heavy-duty glass fiber mat facers.
 - 1. Thickness: 3 in.
 - 2. R-Value: Minimum 18.5
 - 3. Board Size: 4' x 8'
 - b. Source
 - 1. E'NRG'Y-2 By NRG Barriers, Inc.
 - 2. Ultra Gard Gold II by Schuller Roofing Systems
 - 3. GAFTEMP Isotherm R by GAF
 - 4. Approved Equivalent
 - c. Insulation board shall meet the following requirements
 - 1. UL, WH or FM listed under Roofing Systems
 - 2. Federal Specification HH-I-1972, Class 1
 - d. Physical Properties
 - 1. Dimensional Stability ASTM D-2126 2% max.
 - 2. Compressive Strength ASTM D-1621 25 psi min.
 - 3. Vapor Permeability ASTM E-96 1 perm max.
 - 4. Foam Core DensityASTM D-1622 2.0 pcf min.
 - 5. Water Absorption ASTM C-209 <1%
 - 6. R-Factor HR per inch
 - 7. Thickness ASTM C-518 5.6 (Design Value)
2. Tapered Polyisocyanurate Roof Insulation (drain sumps only)
- a. Qualities: Factory Tapered, closed cell polyisocyanurate foam core bonded to heavy-duty glass fiber mat facers.
 - 1. Taper Thickness: Minimum 1 in. at low points.
 - 2. Tapered Slope: 1/4 in. per foot.
 - 3. Average R-Value: Minimum 10.0.
 - b. Source
 - 1. E'NRG'Y-2 by NRG Barriers, Inc.
 - 2. Ultra Gard Gold II by Schuller Roofing Systems
 - 3. GAFTEMP Isotherm R by GAF
 - 4. Approved Equivalent
 - c. Insulation board shall meet the following requirements
 - 1. FM listed under Roofing Systems
 - 2. Federal Specification HH-I-1972, Class 1
3. High Density Fiberboard Roof Insulation

- a. Qualities: Rigid, composed of interlocking fibers factory blended treated with asphalt on the topside.
 - 1. Board Size: 4' x 4'
 - 2. Thickness: Minimum ½ in.
- b. Source
 - 1. Celotex
 - 2. Temple Inland
 - 3. GAF Building Materials Corporation
 - 4. Approved Equivalent
- c. Insulation board shall meet the following requirements
 - 1. FM listed under Roofing Systems.
 - 2. Federal Specification LLL-I-535-B.
- d. Physical Properties

1. Dry Density	ASTM C-208	17.5 pcf.
2. Compressive Strength	ASTM C-165	45 psi min.
3. Linear Expansion	ASTM C-208,209	0.5% max.
4. Foam Core Density	ASTM C-1622	2.0 pcf min.
5. Water Absorption	ASTM C-208	10% max.
6. R-Factor HR per inch	ASTM C-518	2.5 (Design Value)
7. Thickness		

2.3 RELATED MATERIALS

- A. Fiber Cant and Tapered Edge Strips: Performed rigid insulation units of sizes/shapes indicated, matching insulation board or of perlite or organic fiberboard, as per the approved manufacturer.
 - 1. Acceptable Manufacturers
 - a. The Garland Company, Inc.
 - b. Celotex
 - c. Johns-Manville Roofing Systems
 - d. International Permalite, Inc.
 - e. Or approved equal.
- B. Protection Board: Pre-molded semi-rigid asphalt composition board ½ in.
- C. Roof Board Joint Tape: 6” wide glass fiber mat with adhesive compatible with insulation board facers.
- D. Fasteners and Adhesives: Comply with FM Global requirements according to the wind rating for each building. The wind rating will be covered under 07550 - MODIFIED BITUMEN BUILT-UP ROOFING, typically 18-24-32 and 12 inches on center, but subject to change from FM Global.
- E. Single component insulation adhesive.

1. Performance Requirements:
 - a. Tensile Strength (ASTM D-412-92).... 250 psi
 - b. Density (ASTM D-1875-90) 8.5 lbs/gal
 - c. Viscosity (ASTM D-2556-93a)..... 2,000-60,000 cP
 - d. Peel Strength (ASTM D-903)17 lb/in
 - e. Flexibility (ASTM D-816-12) Pass @ -70°F

PART 3 EXECUTION

3.1 INSPECTION OF SURFACES

- A. Roofing contractor shall be responsible for preparing an adequate substrate to receive insulation.
 1. Verify that work, which penetrates roof deck, has been completed.
 2. Verify that wood nailers are properly and securely installed.
 3. Examine surfaces for defects, rough spots, ridges, depressions, foreign material, moisture, and unevenness.
 4. Do not proceed until defects are corrected.
 5. Do not apply insulation until substrate is sufficiently dry.
 6. Broom clean substrate immediately prior to application.
 7. Use additional insulation to fill depressions and low spots that would otherwise cause ponding water.
 8. Verify that temporary roof has been completed.

3.2 INSTALLATION

- A. Mechanical Attachment: Install insulation and protection board with mechanical fasteners all the way through to the metal decking.
 1. All boards shall be cut and fitted where the roof deck intersects a vertical surface. The boards shall be cut to fit a minimum of ¼” away from the vertical surface.
 2. Fasten insulation according to requirements of FM's "Approval Guide" for specified Windstorm Resistance Classification and the insulation and roofing system manufacturers' written instructions.
- A. Fasten insulation according to requirements of FM's "Approval Guide" for specified Windstorm Resistance Classification and the insulation and roofing system manufacturers' written instructions.
- B. Spacing pattern of fasteners shall be as per manufacturer’s recommendations to meet the FM requirements. Placement of any fastener from edge of insulation board shall be a minimum of three inches, and a maximum of six (6) inches.

3.3 CLEANING

- A. Remove debris and cartons from roof deck. Leave insulation clean and dry, ready to receive roofing membrane.

PART 4 MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07270

AIR AND VAPOR BARRIER SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies fluid-applied, vapor-retarding membrane air barriers.
- B. Related Work:
 - 1. Section 04800 – MASONRY: masonry substrate for air and vapor barrier system and insulation in cavity wall installed over air and vapor barrier system.
 - 2. Section 07550 - MODIFIED BITUMEN BUILT-UP ROOFING: connection to roof air and vapor barriers.

1.2 DEFINITIONS

- A. Air Barrier Assembly: The collection of air barrier materials and auxiliary materials applied to an opaque wall or soffit, including joints and junctions to abutting construction, to control air movement through the wall.

1.3 PERFORMANCE REQUIREMENTS

- A. General: Air barrier shall be capable of performing as a continuous vapor-retarding air barrier and as a liquid-water drainage plane flashed to discharge to the exterior incidental condensation or water penetration. Air barrier assemblies shall be capable of accommodating substrate movement and of sealing substrate expansion and control joints, construction material changes, penetrations, and transitions at perimeter conditions without deterioration and air leakage exceeding specified limits.
- B. Air Barrier Assembly Air Leakage: Not to exceed 0.03 cfm/sq. ft. of surface area at 1.57 lbf/sq. ft., ASTM E 283.

1.4 PRECONSTRUCTION TESTING

- A. Mockup Testing: Air barrier assemblies shall comply with performance requirements indicated, as evidenced by reports based on mockup testing by a qualified testing agency.
 - 1. Contractor shall engage a qualified testing agency.
 - 2. Quantitative Air Leakage Testing: Testing of the mockup for air leakage will be conducted not to exceed the test pressure differential, positive and negative, indicated in "Performance Requirements" Article for air barrier assembly air leakage when tested according to ASTM E 283.
 - 3. Notify Engineer a minimum of seven days in advance of the dates and times when mockup testing will take place.

1.5 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under

this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

1.6 SUBMITTALS

- A. Product Data: Include manufacturer's written instructions for evaluating, preparing, and treating substrate; technical data; and tested physical and performance properties of air barrier.
- B. Shop Drawings: Show locations and extent of air barrier. Include details for substrate joints and cracks, counterflashing strip, penetrations, inside and outside corners, terminations, and tie-ins with adjoining construction.
 - 1. Include details of interfaces with other materials that form part of air barrier.
 - 2. Include details of mockups.
- C. Product Certificates: For air barriers, certifying compatibility of air barrier and accessory materials with Project materials that connect to or that come in contact with air barrier; signed by product manufacturer.
- D. Qualification Data: For Applicator.
- E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for air barriers.
- F. Exterior Wall Certification: Submit manufacturer's certification that air vapor barrier as designed in the assemblies indicated on the Contract Drawings has been tested to meet the requirements of NFPA 285 and passed.

1.7 QUALITY ASSURANCE

- A. Applicator Qualifications: A firm experienced in applying air barrier materials similar in material, design, and extent to those indicated for this Project, whose work has resulted in applications with a record of successful in-service performance.
- B. Mockups: Before beginning installation of air barrier, build mockups of exterior wall assembly 150 sq. ft., incorporating backup wall construction, external cladding, window, door frame and sill, insulation, and flashing to demonstrate surface preparation, crack and joint treatment, and sealing of gaps, terminations, and penetrations of air barrier membrane.
 - 1. Coordinate construction of mockup to permit inspection by Contractor's testing agency of air barrier before external insulation and cladding is installed.
 - 2. Include junction with roofing membrane, building corner condition, and foundation wall intersection.
 - 3. If the Engineer determines mockups do not comply with requirements, reconstruct mockups and apply air barrier until mockups are approved.
 - 4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

- C. Preinstallation Conference: Conduct conference at Project site.
 - 1. Include installers of other construction connecting to air barrier, such as roofing, waterproofing, architectural precast concrete, masonry, joint sealants, windows, glazed curtain walls, and door frames.
 - 2. Review air barrier requirements including surface preparation, substrate condition and pretreatment, minimum substrate curing period, forecasted weather conditions, special details and sheet flashings, mockups, installation procedures, sequence of installation, testing and inspecting procedures, and protection and repairs.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Store liquid materials in their original undamaged packages in a clean, dry, protected location and within temperature range required by air barrier manufacturer.
- B. Remove and replace liquid materials that cannot be applied within their stated shelf life.
- C. Store rolls according to manufacturer's written instructions.
- D. Protect stored materials from sunlight.

1.9 PROJECT CONDITIONS

- A. Environmental Limitations: Apply air barrier within the range of ambient and substrate temperatures recommended by air barrier manufacturer. Protect substrates from environmental conditions that affect performance of air barrier. Do not apply air barrier to a damp or wet substrate or during snow, rain, fog, or mist.

PART 2 - PRODUCTS

2.1 VAPOR-RETARDING MEMBRANE AIR BARRIER

- A. Fluid-Applied, Vapor-Retarding Membrane Air Barrier: Synthetic polymer membrane.
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Synthetic Polymer Membrane:
 - 1. Grace, W. R., & Co. - Conn.; Perm-A-Barrier Liquid.
 - 2. Henry Company; Air-Bloc 32.
 - 3. Rubber Polymer Corporation, Inc.; Rub-R-Wall Airtight.
 - 4. Or approved equal
 - 2. Physical and Performance Properties:
 - a. Membrane Air Permeance: Not to exceed 0.004 cfm/sq. ft. of surface area at 1.57-lbf/sq. ft. pressure difference; ASTM E 2178.
 - b. Ultimate Elongation: 500 percent minimum; ASTM D 412, Die C.
 - c. Vapor Permeance: 0.1 perm (5.8 ng/Pa x s x sq. m); ASTM E 96/E 96M.

2.2 AUXILIARY MATERIALS

- A. General: Auxiliary materials recommended by air barrier manufacturer for intended use and compatible with air barrier. Liquid-type auxiliary materials shall comply with VOC limits of authorities having jurisdiction.
- B. Primer: Liquid waterborne or solvent-borne primer recommended for substrate by manufacturer of air barrier material.
- C. Counterflashing Strip: Modified bituminous 40-mil-thick, self-adhering sheet consisting of 32 mils of rubberized asphalt laminated to an 8-mil-thick, cross laminated polyethylene film with release liner backing.
- D. Butyl Strip at Termination with EPDM or TPO Roofing Membrane: Vapor-retarding, 30- to 40-mil- thick, self adhering; polyethylene-film-reinforced top surface laminated to layer of butyl adhesive, with release liner backing.
- E. Modified Bituminous Strip To Cover Cracks and Joints and Terminate Air Barrier to Compatible Roofing Membrane: Vapor-retarding, 40-mil-thick, smooth-surfaced, self-adhering; consisting of 36 mils of rubberized asphalt laminated to a 4-mil- polyethylene film with release liner backing.
- F. Termination Mastic: Cold fluid-applied elastomeric liquid; trowel grade.
- G. Substrate Patching Membrane: Manufacturer's standard trowel-grade substrate filler.
- H. Adhesive and Tape: Air barrier manufacturer's standard adhesive and pressure-sensitive adhesive tape.
- I. Stainless-Steel Sheet: ASTM A 240/A 240M, Type 304, 0.0187 inch thick, and Series 300 stainless- steel fasteners.
- J. Sprayed Polyurethane Foam Sealant to Fill Gaps at Penetrations and Openings: 1- or 2-component, foamed-in-place, polyurethane foam sealant, 1.5 to 2.0 lb/cu. ft. density; flame spread index of 25 or less according to ASTM E 162; with primer and noncorrosive substrate cleaner recommended by foam sealant manufacturer.
- K. Modified Bituminous Transition Strip to Seal Air Barrier Terminations with Glazing Systems: Vapor- retarding, 40-mil-thick, smooth-surfaced, self-adhering; consisting of 36 mils of rubberized asphalt laminated to a 4-mil-thick polyethylene film with release liner backing.
- L. Elastomeric Flashing Sheet to Seal Air Barrier Terminations with Glazing Systems: ASTM D 2000, 2BC415 to 3BC620, minimum 50- to 65-mil-thick, cured sheet neoprene with manufacturer's recommended contact adhesives and lap sealant with stainless-steel termination bars and fasteners.
- M. Preformed Silicone-Sealant Extrusion to Seal Air Barrier Terminations with Glazing Systems: Manufacturer's standard system consisting of cured low-modulus silicone extrusion, sized to fit opening widths, with a single-component, neutral-curing, Class 100/50 (low-modulus) silicone sealant for bonding extrusions to substrates.

- 1. Available Products: Subject to compliance with requirements, products that may

be incorporated into the Work include, but are not limited to, the following:

- a. Dow Corning Corporation, 123 Silicone Seal.
 - b. GE Silicone, UltraSpan US1100.
 - c. Pecora Corporation, Sil-Span.
 - d. Tremco, Incorporated, Spectrem EZ Seal.
 - e. Or approved equal.
- N. Joint Sealant: ASTM C 920, single-component, neutral-curing silicone; Class 100/50 (low-modulus), Grade NS, Use NT related to exposure, and, as applicable to joint substrates indicated, Use O. Comply with Section 07920 - JOINT SEALANTS.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance.
1. Verify that substrates are sound and free of oil, grease, dirt, excess mortar, or other contaminants.
 2. Verify that concrete has cured and aged for minimum time period recommended by air barrier manufacturer.
 3. Verify that concrete is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
 4. Verify that masonry joints are flush and completely filled with mortar.
 5. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 SURFACE PREPARATION

- A. Clean, prepare, and treat substrate according to manufacturer's written instructions. Provide clean, dust-free, and dry substrate for air barrier application.
- B. Mask off adjoining surfaces not covered by air barrier to prevent spillage and overspray affecting other construction.
- C. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
- D. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids in concrete with substrate-patching membrane.
- E. Remove excess mortar from masonry ties, shelf angles, and other obstructions.
- F. Prepare, fill, prime, and treat joints and cracks in substrates. Remove dust and dirt from joints and cracks according to ASTM D 4258. Install modified bituminous strips and center over treated construction and contraction joints and cracks exceeding a width of 1/16 inch.
- G. Bridge and cover isolation joints expansion joints and discontinuous deck-to-wall and deck-to-deck joints with overlapping modified bituminous strips.

- H. At changes in substrate plane, apply sealant or termination mastic beads at sharp corners and edges to form a smooth transition from one plane to another.
- I. Cover gaps in substrate plane and form a smooth transition from one substrate plane to another with stainless-steel sheet mechanically fastened to structural framing to provide continuous support for air barrier.

3.3 JOINT TREATMENT

- A. Concrete and Masonry: Prepare, treat, rout, and fill joints and cracks in substrate according to ASTM C 1193 and air-barrier manufacturer's written instructions. Remove dust and dirt from joints and cracks complying with ASTM D 4258 before coating surfaces.
 - 1. Prime substrate and apply a single thickness of air-barrier manufacturer's recommended preparation coat extending a minimum of 3 inches (75 mm) along each side of joints and cracks. Apply a double thickness of fluid air-barrier material and embed a joint reinforcing strip in preparation coat.
- B. Gypsum Sheathing: Fill joints greater than 1/4 inch (6 mm) with sealant according to ASTM C 1193 and air-barrier manufacturer's written instructions. Apply first layer of fluid air-barrier material at joints. Tape joints with joint reinforcing strip after first layer is dry. Apply a second layer of fluid air-barrier material over joint reinforcing strip.
- C. Exterior wall assemblies: treat joints between panels of metal studs with sheet metal cladding according to instructions of 07920.

3.4 INSTALLATION

- A. Apply fluid air-barrier material to form a seal with strips and transition strips and to achieve a continuous air barrier according to air-barrier manufacturer's written instructions. Apply fluid air-barrier material within manufacturer's recommended application temperature ranges.
- B. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations with termination mastic and according to ASTM D 6135.
- C. Apply primer to substrates at required rate and allow to dry. Limit priming to areas that will be covered by air barrier sheet in same day. Reprime areas exposed for more than 24 hours. Prime glass-fiber-surfaced gypsum sheathing with number of prime coats needed to achieve required bond, with adequate drying time between coats.
- D. Apply and firmly adhere modified bituminous sheets horizontally over area to receive air barrier sheets. Accurately align sheets and maintain a uniform 2-1/2-inch-minimum lap widths and end laps. Overlap and seal seams and stagger end laps to ensure airtight installation.
 - 1. Apply sheets in a shingled manner to shed water without interception by any exposed sheet edges.
 - 2. Roll sheets firmly to enhance adhesion to substrate.
- E. Apply continuous modified bituminous sheets over modified bituminous strips bridging substrate cracks, construction, and contraction joints.
- F. Seal strips and transition strips around masonry reinforcing or ties and penetrations with

termination mastic.

- G. Seal top of non-metallic through-wall flashings to air barrier sheet with an additional 6-inch-wide strip.
- H. Seal exposed edges of metallic sheets at seams, cuts, penetrations, and terminations not concealed by metal counterflashings or ending in reglets with termination mastic.
- I. Install air barrier sheets and auxiliary materials to form a seal with adjacent construction and to maintain a continuous air barrier.
 - 1. Coordinate the installation of air barrier with installation of roofing membrane and base flashing to ensure continuity of air barrier with roofing membrane.
 - 2. Install compatible strip on roofing membrane or base flashing so that a minimum of 3 inches of coverage is achieved over both substrates.
- J. Connect and seal exterior wall air barrier membrane continuously to roofing membrane air barrier, concrete below-grade structures, floor-to floor construction, exterior glazing and window systems, glazed curtain-wall systems, storefront systems, exterior louvers, exterior door framing, and other construction used in exterior wall openings using accessory materials.
- K. Wall Openings: Prime concealed perimeter frame surfaces of windows, curtain walls, storefronts, and doors. Apply membrane specified below so that a minimum of 3 inches of coverage is achieved over both substrates. Maintain 3 inches of full contact over firm bearing to perimeter frames with not less than 1 inch of full contact.
 - 1. Modified Bituminous Transition Strip: Roll firmly to enhance adhesion.
 - 2. Elastomeric Flashing Sheet: Apply adhesive to wall, frame, and flashing sheet. Install flashing sheet and termination bars, fastened at 6 inches o.c. Apply lap sealant over exposed edges and on cavity side of flashing sheet.
 - 3. Preformed Silicone-Sealant Extrusion: Set in full bed of silicone sealant applied to walls, frame, and membrane.
- L. Fill gaps in perimeter frame surfaces of windows, curtain walls, storefronts, doors, and miscellaneous penetrations of air barrier membrane with foam sealant.
- M. At end of each working day, seal top edge of membrane to substrate with termination mastic.
- N. Apply joint sealants forming part of air barrier assembly within manufacturer's recommended application temperature ranges. Consult manufacturer when sealant cannot be applied within these temperature ranges.
- O. Repair punctures, voids, and deficient lapped seams in air barrier. Slit and flatten fishmouths and blisters. Patch with air barrier sheet extending 6 inches beyond repaired areas in all directions.
- P. Do not cover air barrier until it has been tested and inspected by Contractor's testing agency.
- Q. Correct deficiencies in or remove air barrier that does not comply with requirements; repair substrates and reapply air barrier components.

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Contractor shall engage a qualified testing agency to perform tests and inspections and prepare test reports.
- B. Inspections: Air barrier materials and installation are subject to inspection for compliance with requirements. Inspections may include the following:
 - 1. Continuity of air barrier system has been achieved throughout the building envelope with no gaps or holes.
 - 2. Continuous structural support of air barrier system has been provided.
 - 3. Masonry and concrete surfaces are smooth, clean and free of cavities, protrusions, and mortar droppings.
 - 4. Site conditions for application temperature and dryness of substrates have been maintained.
 - 5. Maximum exposure time of materials to UV deterioration has not been exceeded.
 - 6. Surfaces have been primed.
 - 7. Laps in sheet materials have complied with the minimum requirements and have been shingled in the correct direction (or mastic applied on exposed edges), with no fishmouths.
 - 8. Termination mastic has been applied on cut edges.
 - 9. Strips and transition strips has been firmly adhered to substrate.
 - 10. Compatible materials have been used.
 - 11. Transitions at changes in direction and structural support at gaps have been provided.
 - 12. Connections between assemblies (membrane and sealants) have complied with requirements for cleanliness, preparation and priming of surfaces, structural support, integrity, and continuity of seal.
 - 13. All penetrations have been sealed.
- C. Tests: Testing to be performed will be determined by Contractor's testing agency from among the following tests:
 - 1. Qualitative Testing: Air barrier assemblies will be tested for evidence of air leakage according to ASTM E 1186.
 - 2. Quantitative Air Leakage Testing: Testing not to exceed the test pressure differential, positive and negative, indicated in "Performance Requirements" Article for air barrier assembly air leakage according to ASTM E 283.
- D. Remove and replace deficient air barrier components and retest as specified above.

3.6 CLEANING AND PROTECTION

- A. Protect air barrier system from damage during application and remainder of construction period, according to manufacturer's written instructions.
 - 1. Protect air barrier from exposure to UV light and harmful weather exposure as required by manufacturer. Remove and replace air barrier exposed to these conditions for more than 30 days.
 - 2. Protect air barrier from contact with creosote, uncured coal-tar products, TPO, EPDM, flexible PVC membranes, and sealants not approved by air barrier manufacturer.

- B. Clean spills, stains, and soiling from adjacent construction that would be exposed in the completed work using cleaning agents and procedures recommended by manufacturer of affected construction.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07420

METAL WALL PANEL SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
1. Factory-formed and assembled insulated metal wall panels.
 2. Honeycomb-core metal wall panels.
 3. Metal plate wall panels.
 4. Standing seam metal wall panels.
 5. Bullet-resistant fiberglass panels behind metal wall panel systems at locations indicated.
- B. Related Work:
1. Section 01800, SUSTAINABILITY REQUIREMENTS
 2. Section 05411, LIGHT GAUGE METAL FRAMING.
 3. Section 07210, BUILDING PERIMETER INSULATION.
 4. Section 07270, AIR AND VAPOR BARRIER
 5. Section 07422, TRANSLUCENT WALL PANELS.
 6. Section 07423, RAIN SCREEN SYSTEMS.
 7. Section 07600, FLASHING AND SHEET METAL
 8. Section 07920, JOINT SEALANTS
 9. Section 08801, GLASS AND GLAZING
 10. Section 08910, GLAZED METAL FRAMED CURTAIN WALLS
 11. Section 09900, PAINTING
- C. Drawing Coordination: Refer to the Drawings for the following keynotes for this Section:
1. W-12 STAINLESS STEEL PANEL, 316, ANGEL HAIR FINISH
 2. W-13 STAINLESS STEEL PANEL, 316, #4 FINISH (PANEL & TRIM)
 3. W-14 STAINLESS STEEL PANEL, PERFORATED, 316, #4 FINISH
 4. W-15 STAINLESS STEEL PANEL, HONEYCOMB PANEL, 316, #4 FINISH
 5. W-16 STAINLESS STEEL PANEL SYSTEM, PICKLED/PASSIVATED FINISH
 6. W-18 ALUMINUM FORMED PANEL SYSTEM - PAINTED/PERFORATED
 7. W-24 PORCELAIN ENAMEL PANEL – GALVANIZED STEEL
 8. W-25 316 STAINLESS STEEL PANEL - PERFORATED & FINISHED WITH ANGEL HAIR FINISH
 9. W-32 ALUMINUM PERFORATED PAINTED PANEL

- 10. W-34 ALUMINUM FORMED PANEL, NON PERFORATED
- 11. W-35 ALUMINUM PAINTED INSULATED METAL PANEL
- 12. W-36 ZINC STANDING SEAM

D. For all painted metal panels, contractors price shall include (6) six custom colors in addition to the standard panel colors for each type of panel.

1.2 DEFINITION

A. Metal Wall Panel Assembly: Metal wall panels, attachment system components, miscellaneous metal framing, and accessories necessary for a complete weathertight wall system.

1.3 PERFORMANCE REQUIREMENTS

A. General Performance: Metal wall panel assemblies shall comply with performance requirements without failure due to defective manufacture, fabrication, installation, or other defects in construction.

B. Delegated Design: Design metal wall panel assembly, including comprehensive engineering analysis prepared under the supervision of and signed and sealed by a qualified professional engineer licensed in the Commonwealth of MA, using performance requirements and design criteria indicated.

C. Structural Performance: Provide metal wall panel assemblies capable of withstanding the effects of the following loads and stresses within limits and under conditions indicated, based on testing according to ASTM E 330:

- 1. Wind Loads: Determine loads based on the following minimum design wind pressures, whichever is more stringent:
 - a. Uniform pressure of 20 lbf/sq. ft., acting inward or outward.
 - b. In accordance with FM Global data sheet 1-28 and safety factors as applicable.

2. Deflection Limits: Metal-faced composite wall panel assemblies shall withstand wind loads with horizontal deflections no greater than 1/180 of the span.

D. Air Infiltration: Air leakage through assembly of not more than 0.06 cfm/sq. ft. (0.3 L/s per sq. m) of wall area when tested according to ASTM E 283 at a static-air-pressure difference of 6.24 lbf/sq. ft. (300 Pa).

E. Water Penetration: No water penetration when tested according to ASTM E 331 at the test-pressure difference of 6.24 lbf/sq. ft. (300 Pa)

F. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

- 1. Temperature Change (Range): Minus 20 to plus 180 deg F (Minus 29 to plus 82 deg C) ambient; 180 deg F (100 deg C) material surfaces.

G. Galvanic reactions: dissimilar metals shall be separated by neoprene, bituminous paint or similar substance. This shall not be visible to public in final configuration.

- H. All exterior metal panels shall be designed and comply with the requirements of FM Global 1-28 requirements.

1.4 SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of panel and accessory.
- B. Shop Drawings: Show fabrication and installation layouts of metal wall panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment system, trim, flashings, closures, and accessories; and special details. Distinguish among factory-, shop-, and field-assembled work.
 - 1. Accessories: Include details of the following items, at a scale of not less than 1-1/2 inches per 12 inches (1:10):
 - a. Flashing and trim.
 - b. Anchorage systems.
- C. Samples For Verification: For each type of exposed finish required, prepare samples of size indicated below:
 - 1. Metal Wall Panels: 12 inches (300 mm) long by actual panel width. Include fasteners, closures, and other metal-faced composite wall panel accessories.
 - 2. Trim and Closures: 12 inches (300 mm) long. Include fasteners and other exposed accessories.
 - 3. Accessories: 12-inch-(300-mm-) long samples for each type of accessory.
- D. Delegated-Design Submittal: For wall panel assembly indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation; as stated in 1.4.B.
- E. Coordination Drawings: Exterior elevations, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - 1. Wall panels and attachments.
 - 2. Subgirts and/or furring and hat channels.
 - 3. Wall-mounted items including doors, windows, louvers, and lighting fixtures.
 - 4. Penetrations of wall by pipes and utilities.
 - 5. Adjacent construction.
- F. Qualification Data: For Installer, and professional engineer. Installed shall be trained or certified by manufacturer, installer and engineer shall have min. 5 years experience performing work of similar scope and complexity.
- G. Compatibility and Adhesion Test Reports: From sealant manufacturer, indicating the following:
 - 1. Materials forming joint substrates and joint-sealant backings have been tested for compatibility and adhesion with joint sealants.

2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.
- H. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each product.
 - I. Maintenance Data: For metal wall panels to include in maintenance manuals.
 - J. Warranties: Samples of special warranties.

1.5 QUALITY ASSURANCE:

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer.
- B. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated.
- C. Source Limitations: Obtain each type of metal wall panel from single source from single manufacturer.
- D. Preconstruction Compatibility and Adhesion Testing: Submit samples of materials that will contact joint sealants to joint-sealant manufacturers for testing indicated in subparagraphs below:
 1. Use manufacturer's standard test methods to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
 - a. Perform tests under environmental conditions replicating those that will exist during installation.
 2. Submit no fewer than nine pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
 3. Schedule enough time for testing and analyzing results to prevent delaying the Work.
 4. For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures, including use of specially formulated primers.
- E. Fire-Resistance Ratings: Where indicated, provide metal-faced composite wall panels identical to those of assemblies tested for fire resistance per ASTM E 119 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 1. Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.
- F. Mockups: Build full scale, free standing mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
 1. Provide metal panel work required to complete exterior wall mock-up; including supports, attachments, and accessories.
 2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Engineer specifically approves such deviations in writing.

1.6 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of metal wall panels to be performed according to manufacturer's written instructions and warranty requirements.
- B. Field Measurements: Verify locations of structural members and wall opening dimensions by field measurements before metal wall panel fabrication and indicate measurements on Shop Drawings.

1.7 COORDINATION

- A. Coordinate metal wall panel assemblies with rain drainage work, flashing, trim, and construction of studs, soffits, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

1.8 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal wall panel assemblies that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures, including rupturing, cracking, or puncturing.
 - b. Deterioration of metals and other materials beyond normal weathering.
 - 2. Warranty Period: Two years from date of Substantial Completion.
- B. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal wall panels that show evidence of deterioration of factory-applied finishes within specified warranty period.
 - 1. Exposed Panel Finish: Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
 - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
 - 2. Finish Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 METAL-FACED INSULATED WALL PANELS

- A. Metal panels for fabrication of wall panels shall be a factory insulated, shop assembled laminated aluminum panels for exterior walls complete with associated trim. Acceptable products include:
 - 1. Designwall 2000; Kingspan Benchmark, Columbus, OH
 - 2. Centria, Boston, MA
 - 3. Protean, Burnsville, MN
 - 4. Or approved equal

- B. General: Provide factory-formed and -assembled metal wall panels fabricated from two metal facing sheets and insulation core foamed in place during fabrication, and with joints between panels designed to form weathertight seals. Include accessories required for weathertight installation
 - 1. Fire-Retardant Core: Noncombustible, with the following surface-burning characteristics as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
 - a. Flame-Spread Index: 25 or less.
 - b. Smoke-Developed Index: 450 or less.
- C. Aluminum-Faced Insulated Wall Panels: Formed with 0.040-inch- thick, coil-coated aluminum sheet facings.
 - 1. Panel Thickness: 3 inch (R21) and 4 inch (R30), at areas indicated on the Drawings.
 - 2. Surface Texture: Smooth:
 - 3. Width: As indicated on the Drawings.
 - 4. Core Insulation: One of the following.
 - a. Shall be formed isocyanurate, nominal density 2.0 pcf with minimum shear strength of 24 psi.
 - b. Shall be expanded polystyrene (EPS), Report #NER-479, nominal density 1.0 pcf with minimum shear strength of 20 psi.
- D. Attachment System Components: Formed from extruded aluminum.
 - 1. Include manufacturer's standard panel stiffeners, panel clips and anchor channels.

2.2 MISCELLANEOUS METAL FRAMING

- A. Miscellaneous Metal Framing, General: ASTM C 645, cold-formed metallic-coated steel sheet, ASTM A 653/A 653M, G60 (Z180) hot-dip galvanized.
- B. Subgirts: Manufacturer's standard C-or Z-shaped sections 0.064-inch (1.63-mm) nominal thickness.
- C. Zee Clips: 0.079-inch (2.01-mm) nominal thickness.
- D. Base or Sill Angles or Channels: 0.079-inch (2.01-mm) nominal thickness.
- E. Hat-Shaped, Rigid Furring Channels:
 - 1. Nominal Thickness: As required to meet performance requirements.
- F. Cold-Rolled Furring Channels: Minimum 1/2-inch-(13-mm-) wide flange. Nominal Thickness: As required to meet performance requirements.
 - 1. Furring Brackets: Adjustable, corrugated-edge type of steel sheet with nominal thickness of 0.040 inch (1.02 mm).
 - 2. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.062-inch-(1.57mm-) diameter wire, or double strand of 0.048-inch-(1.22-mm-) diameter wire.

- G. Fasteners for Miscellaneous Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten miscellaneous metal framing members to substrates.

2.3 MISCELLANEOUS MATERIALS

- A. Aluminum Extrusions: ASTM B 221 (ASTM B 221M), alloy and temper recommended by manufacturer for type of use and finish indicated.
- B. Fasteners: Self-tapping screws, bolts, nuts, self-locking rivets and bolts, end-welded studs, and other suitable fasteners designed to withstand design loads. Provide exposed fasteners with heads matching color of metal wall panels by means of plastic caps or factory-applied coating. Provide EPDM, PVC, or neoprene sealing washers.

2.4 ACCESSORIES

- A. Wall Panel Accessories: Provide components required for a complete metal wall panel assembly including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of metal wall panels unless otherwise indicated.
- B. Flashing and Trim: Provide flashing and trim as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, end walls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent metal wall panels.

2.5 FABRICATION

- A. General: Fabricate and finish metal wall panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.
- B. Fabricate metal wall panels in a manner that eliminates condensation on interior side of panel and with joints between panels designed to form weathertight seals.
- C. Metal Wall Panels: Factory form panels in a continuous process. Trim and square edges of sheets with no displacement of face sheets or protrusion of core material.
 - 1. Form panel lines, breaks, and angles to be sharp and true, with surfaces free from warp and buckle.
 - 2. Fabricate panels with sharply cut edges, with no displacement of face sheets or protrusion of core material.
 - 3. Fabricate panels with panel stiffeners, as required to comply with deflection limits, attached to back of panels with structural silicone sealant or bond tape.
 - 4. Dimensional Tolerances:
 - a. Length: Plus 1/8 inch.
 - b. Width: Plus 1/8 inch.
 - c. Thickness: Plus or minus 0.008 inch (0.2 mm).
 - d. Panel Bow: 0.8 percent maximum of panel length or width.

- e. Squareness: 0.2 inch (5 mm) maximum.
- D. Sheet Metal Accessories: Fabricate flashing and trim to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.
- 1. Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
 - 2. Seams for Aluminum: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.
 - 3. Sealed Joints: Form nonexpansion but movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.
 - 4. Conceal fasteners and expansion provisions. Exposed fasteners are not allowed on faces of accessories exposed to view.
 - 5. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended by metal wall panel manufacturer.
 - a. Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal wall panel manufacturer for application, but not less than thickness of metal being secured.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, metal wall panel supports, and other conditions affecting performance of the Work.
- 1. Examine wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by metal wall panel manufacturer.
 - 2. Examine wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by metal-faced composite wall panel manufacturer.
 - 3. Verify that sheet waterproofing has been installed over sheathing or backing substrate to prevent air infiltration or water penetration.
- B. Examine roughing-in for components and systems penetrating metal-faced composite wall panels to verify actual locations of penetrations relative to seam locations of panels before panel installation.
- C. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Miscellaneous Framing: Install subgirts, base angles, sills, furring, and other miscellaneous wall panel support members and anchorage according to ASTM C 754 and metal-faced composite wall panel manufacturer's written instructions.

3.3 METAL PANEL INSTALLATION

- A. General: Install metal panels according to manufacturer's written instructions in orientation, sizes, and locations indicated. Install panels perpendicular to supports unless otherwise indicated. Anchor metal panels and other components of the Work securely in place, with provisions for thermal and structural movement.
 - 1. Shim or otherwise plumb substrates receiving metal panels.
 - 2. Flash and seal metal panels at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until air- or water-resistive barriers and flashings that will be concealed by metal panels are installed.
 - 3. Install screw fasteners in predrilled holes.
 - 4. Locate and space fastenings in uniform vertical and horizontal alignment.
 - 5. Install flashing and trim as metal panel work proceeds.
 - 6. Locate panel splices over, but not attached to, structural supports. Stagger panel splices and end laps to avoid a four-panel lap splice condition.
 - 7. Align bottoms of metal panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
 - 8. Provide weathertight escutcheons for pipe- and conduit-penetrating panels.
- B. Fasteners: Use stainless-steel fasteners approved by panel manufacturer for the applicable requirements.
- C. Metal Protection: Where dissimilar metals contact each other or corrosive substrates, protect against galvanic action as recommended in writing by metal panel manufacturer.
- D. Joint Sealers: Install gaskets, joint fillers, and sealants where indicated and where required for weathertight performance of metal wall panel assemblies. Provide types of gaskets, fillers, and sealants indicated by metal panel manufacturer; or, if not indicated, provide types recommended by metal wall panel manufacturer.
 - 1. Seal metal wall panel end laps with double beads of tape or sealant, full width of panel. Seal side joints where recommended by metal wall panel manufacturer.
 - 2. Prepare joints and apply sealants to comply with requirements in Section 079200 "Joint Sealants."

3.4 INSULATED METAL WALL PANEL INSTALLATION

- A. General: Apply continuous ribbon of sealant to panel joint on concealed side of insulated metal wall panels as vapor seal; apply sealant to panel joint on exposed side of panels for weather seal.
 - 1. Fasten foamed-insulation-core metal wall panels to supports with fasteners at each lapped joint at location and spacing and with fasteners recommended by manufacturer.

2. Apply panels and associated items true to line for neat and weathertight enclosure. Avoid "panel creep" or application not true to line.
 3. Provide metal-backed washers under heads of exposed fasteners on weather side of insulated metal wall panels.
 4. Locate and space exposed fasteners in uniform vertical and horizontal alignment. Use proper tools to obtain controlled uniform compression for positive seal without rupture of washer.
 5. Provide sealant tape at lapped joints of insulated metal wall panels and between panels and protruding equipment, vents, and accessories.
 6. Apply a continuous ribbon of sealant tape to panel side laps and elsewhere as needed to make panels weathertight.
 7. Apply snap-on battens to exposed-fastener, insulated-core metal wall panel seams to conceal fasteners.
- B. Foamed-Insulation-Core Metal Wall Panels: Fasten metal wall panels to supports with concealed clips at each joint at location and spacing and with fasteners recommended by manufacturer. Fully engage tongue and groove of adjacent panels.
1. Install clips to supports with self-tapping fasteners.

3.5 ACCESSORY INSTALLATION

- A. General: Install accessories with positive anchorage to building and weathertight mounting and provide for thermal expansion. Coordinate installation with flashings and other components.
1. Install components required for a complete metal wall panel assembly including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items.
- B. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.
1. Install exposed flashing and trim that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof and weather-resistant performance.
 2. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet (3 m) with no joints allowed within 24 inches (610 mm) of corner or intersection. Where lapped expansion provisions cannot be used or would not be sufficiently weather resistant and waterproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch (25 mm) deep, filled with mastic sealant (concealed within joints).
- C. Bullet-Resistant Fiberglass: Install in accordance with manufacturer's instructions and in proper relationship with adjacent construction. Provide continuous coverage.

3.6 ERECTION TOLERANCES

- A. Installation Tolerances: Contractor to shim and align metal wall panel units within installed tolerance of 1/4 inch in 20 feet (6 mm in 6 m), nonaccumulative, on level, plumb, and location lines as indicated and within 1/8-inch (3-mm) offset of adjoining faces and of alignment of matching profiles.

3.7 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified independent testing agency to perform field tests and inspections.
- B. Water-Spray Test: After installation, test area of assembly as directed by Architect for water penetration according to AAMA 501.2.
- C. Metal wall panels will be considered defective if they do not pass test and inspections.
- D. Additional tests and inspections, at Contractor's expense, are performed to determine compliance of replaced or additional work with specified requirements.
- E. Prepare test and inspection reports.

3.8 CLEANING

- A. Remove temporary protective coverings and strippable films, if any, as metal wall panels are installed unless otherwise indicated in manufacturer's written installation instructions. On completion of metal wall panel installation, clean finished surfaces as recommended by panel manufacturer. Maintain in a clean condition during construction.
- B. After metal wall panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.
- C. Replace metal wall panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07423

RAIN SCREEN SYSTEMS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies metal rain screen wall panels and ultra high performance concrete (UHPC) rain screen panels.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 05411 – LIGHT GAUGE METAL FRAMING
 - 3. Section 07210 – BUILDING INSULATION
 - 4. Section 07131 – SHEET WATERPROOFING
 - 5. Section 07270 – AIR AND VAPOR BARRIER SYSTEMS
 - 6. Section 07600 – FLASHING AND SHEET METAL
 - 7. Section 07920 – JOINT SEALANTS
 - 8. Section 08801 – GLASS AND GLAZING

1.2 DEFINITION

- A. Metal Plate Wall Panel Assembly: Metal plate wall panels, attachment system components, miscellaneous metal framing, and accessories necessary for a complete weathertight wall system based on AAMA CW-RS-1.

1.3 PERFORMANCE REQUIREMENTS

- A. General Performance: Metal wall panel assemblies shall comply with performance requirements without failure due to defective manufacture, fabrication, installation, or other defects in construction.
- B. Delegated Design: Design metal wall panel assembly, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- C. Design, Fabricate, and erect a dry joint, pressure equalized rainscreen metal wall panel system without the use of sealants, gaskets, or butyl tape in accordance with AAMA 508.
- D. Pressure Equalization Cycling: ASTM E 1233, 5 to 25 psf for 100 three-second cycles at 0.08 seconds or less.
- E. Structural Performance: Provide metal wall panel assemblies capable of withstanding the effects of the following loads and stresses within limits and under conditions indicated, based on testing according to ASTM E 330:
 - 1. Wind Loads: Determine loads based on the following minimum design wind pressures whichever is more stringent:
 - a. Uniform pressure of 30 lbf/sq. ft. (1436 Pa), acting inward or outward.

- b. In accordance with FM Global data sheet 1-28 and safety factors as applicable.
- 2. Deflection Limits: Metal wall panel assemblies shall withstand wind loads with horizontal deflections no greater than $L/360$ of the span.
- F. Air Infiltration: Air leakage through assembly of not more than 0.13 cfm/sq. ft. of wall area when tested according to ASTM E 283 at a static-air-pressure difference of 1.57 lbf/sq. ft..
- G. Water Penetration: No water penetration when tested according to ASTM E 331 at the test-pressure difference of 6.24 lbf/sq. ft. (300 Pa)
- H. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
 - 1. Temperature Change (Range): Minus 20 to plus 180 deg F (Minus 29 to plus 82 deg C) ambient; 180 deg F (100 deg C) material surfaces.
- I. All exterior metal panels shall be designed and comply with the requirements of FM Global 1-28 requirements.

1.4 SUBMITTALS

- A. Product Data: For each type of product:
 - 1. Include construction details, material descriptions,, dimensions of individual components and profiles, and finishes for each type of panel and accessory.
 - 2. Exterior Wall Certification: Submit manufacturer's certification that exterior wall composite metal panels as designed in the assemblies indicated on the Contract Drawings has been tested to meet the requirements of NFPA 285 and passed.
- B. Drawings: Show fabrication and installation layouts of metal wall panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment system, trim, flashings, closures, and accessories; and special details.
 - 1. Accessories: Include details of the following items, at a scale of not less than 1-1/2 inches per 12 inches (1:10):
- C. For Verification: For each type of exposed finish required, prepare samples of size indicated below:
 - 1. Metal Wall Panels: 12 inches (300 mm) long by actual panel width. Include fasteners, closures, and other metal-faced composite wall panel accessories.
- D. Qualification Data: For Installer, and professional engineer.
- E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each product.
- F. Maintenance Data: For metal wall panels to include in maintenance manuals.
- G. Warranties: Samples of special warranties.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer, with 5 years of experience of work of similar scope and complexity.
- B. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
 - 1. Provide metal panel work required to complete exterior wall mock-up; including supports, attachments, and accessories.
 - 2. Water-Spray Test: Conduct water-spray test of mockup of metal panel assembly, testing for water penetration according to AAMA 501.2.
 - 3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Engineer specifically approves such deviations in writing.

1.6 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of metal wall panels to be performed according to manufacturer's written instructions and warranty requirements.
- B. Field Measurements: Verify locations of structural members and wall opening dimensions by field measurements before metal wall panel fabrication and indicate measurements on Shop Drawings.

1.7 COORDINATION

- A. Coordinate metal wall panel assemblies with rain drainage work, flashing, trim, and construction of studs, soffits, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

1.8 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal wall panel assemblies that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures, including rupturing, cracking, or puncturing.
 - b. Deterioration of metals and other materials beyond normal weathering.
 - 2. Warranty Period: Two years from date of Substantial Completion.
- B. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal wall panels that show evidence of deterioration of factory-applied finishes within specified warranty period.
 - 1. Finish Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 METAL RAIN SCREEN WALL PANELS

- A. Metal Rain Screen Wall Panels: Provide factory-formed, metal plate wall panels fabricated from single sheets of metal formed into profile for installation method indicated. Include attachment assembly components, and accessories required for weathertight system.
1. Dri-Design (basis of design)
 2. North Clad
 3. Metalwerks
- B. Zinc Alloy Plate Panels: Alloy and temper as recommended by manufacturer for application, Architecturally Rolled Zinc, Type 1, ASTM B 69.
1. Panel Thickness: 0.059 inch (1.5 mm).
 2. Tensile Strength: ASTM B 69, 14 to 38 ksi.
 3. Hardness: ASTM E 18, 54 to 74 tested with Rockwell tester for 15T scale.
 4. Panel Depth: 1-1/4 inch.
 5. Panel Size: As indicated on drawings.
 6. Panel Joints: As indicated on drawings.
 7. Finish and Color:
 - a. Lechmere Station: Quartz-zinc
 - b. Union Square Station: Quartz-zinc
- C. Zinc Composite Panels: Alloy and temper as recommended by manufacturer for application, Architecturally Rolled Zinc, Type 1, ASTM B 69.
1. Basis-of-Design: Alcoa, Reynobond ZCM or equal, dry joint system.
 2. Panel Thickness: 0.7 mm, fire-retardant core
 3. Panel Size: As indicated on drawings.
 4. Panel Joints: As indicated on drawings.
 5. Fire Test Performance for Metal Panels as part of an exterior wall assembly: Assembly passes NFPA 285, Standard Fire Test Method for Evaluation of Fire Propagation Characteristics of Exterior Non-LoadBearing Wall Assemblies Containing Combustible Componen
- D. Attachment System Components: Rainscreen-principle system, supplied or approved by rainscreen manufacturer.

2.2 MISCELLANEOUS MATERIALS

- A. Miscellaneous Metal Subframing and Furring: ASTM C 645, cold-formed, metallic-coated steel sheet, ASTM A 653/A 653M, G90 (Z275 hot-dip galvanized) coating designation or ASTM A 792/A 792M, Class AZ50 (Class AZM150) aluminum-zinc-alloy coating designation unless

otherwise indicated. Provide manufacturer's standard sections as required for support and alignment of metal panel system.

- B. Panel Accessories: Provide components required for a complete, weathertight panel system including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of metal panels unless otherwise indicated.
- C. Flashing and Trim: Provide flashing and trim formed from same material as metal panels as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Match finish flashing and trim with same finish system as adjacent metal panels.
- D. Panel Fasteners: Self-tapping screws designed to withstand design loads. Provide exposed fasteners with heads matching color of metal panels by means of plastic caps or factory-applied coating. Provide EPDM or PVC sealing washers for exposed fasteners.
 - 1. For Zinc Alloy Metal Panels: Stainless steel fasteners, as approved by rainscreen manufacturer.
- E. Weather Barriers: Refer to Section 07131, "Sheet Waterproofing."

2.3 FABRICATION

- A. General: Fabricate and finish metal wall panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.
- B. Fabricate metal wall panels in a manner that eliminates condensation on interior side of panel and with joints between panels designed to form weathertight seals.
- C. Sheet Metal Accessories: Fabricate flashing and trim to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.
 - 1. Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
 - 2. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
 - 3. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal. These attachment devices shall be supplied or recommended by metal-faced composite wall panel manufacturer.
 - a. Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal-faced composite wall panel manufacturer for application, but not less than thickness of metal being secured.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, metal wall panel supports, and other conditions affecting performance of the Work.
 - 1. Examine wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by metal wall panel manufacturer.
 - 2. Examine wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by metal wall panel manufacturer.
 - 3. Verify that air- or water-resistive barriers have been installed over sheathing or backing substrate to prevent air infiltration or water penetration.
- B. Examine roughing-in for components and systems penetrating metal wall panels to verify actual locations of penetrations relative to seam locations of panels before panel installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Miscellaneous Framing: Install subgirts, base angles, sills, furring, and other miscellaneous wall panel support members and anchorage according to ASTM C 754 and metal-faced composite wall panel manufacturer's written instructions.

3.3 METAL PANEL INSTALLATION

- A. General: Install metal panels according to manufacturer's written instructions in orientation, sizes, and locations indicated. Install panels perpendicular to supports unless otherwise indicated. Anchor metal panels and other components of the Work securely in place, with provisions for thermal and structural movement.
 - 1. Shim or otherwise plumb substrates receiving metal panels.
 - 2. Flash and seal metal panels at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until air- or water-resistive barriers and flashings that will be concealed by metal panels are installed.
 - 3. Install screw fasteners in predrilled holes.
 - 4. Locate and space fastenings in uniform vertical and horizontal alignment.
 - 5. Install flashing and trim as metal panel work proceeds.
 - 6. Locate panel splices over, but not attached to, structural supports. Stagger panel splices and end laps to avoid a four-panel lap splice condition.
 - 7. Align bottoms of metal panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
 - 8. Provide weathertight escutcheons for pipe- and conduit-penetrating panels.

- B. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action as recommended by metal-faced composite wall panel manufacturer.
- C. Attachment Assembly, General: Install attachment assembly required to support metal plate wall panels and to provide a complete weathertight wall system, including subgirts, perimeter extrusions, tracks, drainage channels, panel clips, and anchor channels.
 - 1. Include attachment to supports, panel-to-panel joinery, panel-to-dissimilar-material joinery.
- D. Rainscreen-Principle Installation: Install using manufacturer's standard assembly with vertical channel that provides support and secondary drainage assembly, draining at base of wall. Notch vertical channel to receive support pins. Install vertical channels supported by channel brackets or adjuster angles and at locations, spacings, and with fasteners recommended by manufacturer. Attach metal plate wall panels by inserting horizontal support pins into notches in vertical channels and into flanges of panels. Leave horizontal and vertical joints with open reveal.
 - 1. Install metal plate wall panels to allow individual panels to be installed and removed without disturbing adjacent panels.
 - 2. Do not apply sealants to joints unless otherwise indicated.
- E. Accessory Installation: Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.
- F. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that are permanently watertight.
 - 1. Install exposed flashing and trim that is without buckling and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof performance.
 - 2. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet (3 m) with no joints allowed within 24 inches (605 mm) of corner or intersection. Where lapped expansion provisions cannot be used or would not be sufficiently waterproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch (25 mm) deep, filled with mastic sealant (concealed within joints).

3.4 ERECTION TOLERANCES

- A. A. Installation Tolerances: Contractor to shim and align metal wall panel units within installed tolerance of 1/4 inch in 20 feet (6 mm in 6 m), nonaccumulative, on level, plumb, and location lines as indicated and within 1/8-inch (3-mm) offset of adjoining faces and of alignment of matching profiles.

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified independent testing agency to perform field tests and inspections.
- B. Water-Spray Test: After installation, test area of assembly as directed by Architect for water penetration according to AAMA 501.2.
- C. Metal wall panels will be considered defective if they do not pass test and inspections.

- D. At the Contractor's expense, additional tests and inspections, via the testing agency above, will be performed to determine compliance of replaced or additional work with specified requirements.
- E. Prepare test and inspection reports.

3.6 CLEANING

- A. Remove temporary protective coverings and strippable films, if any, as metal wall panels are installed unless otherwise indicated in manufacturer's written installation instructions. On completion of metal wall panel installation, clean finished surfaces as recommended by panel manufacturer. Maintain in a clean condition during construction.
- B. After metal wall panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.
- C. Replace metal wall panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07550

MODIFIED BITUMEN BUILT-UP ROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies modified bitumen built-up roofing systems in cold process, with fascia and flashing, miscellaneous caulking and damproofing necessary to satisfactorily complete the entire work.
- B. Related Work: None
- C. These specifications have been reviewed by Factory Mutual Global for compliance with standards and procedures according to Roof NAV assembly number 231414-224944-0 and 133087-2249-0 for built up roof on steel deck.
- D. Refer to FM Global property Loss Prevention Data Sheet 1-28 for ratings of roof covering system. Based on initial review by FM Global, the following ratings have been identified for the following structures:
 - 1. Lechmere Station:
 - a. System as approved per location; the roof of the north access structure and south egress stair structure area shall require a roof with an I-75/I-120/I-165 wind rating in the field, perimeter and corners respectively.
 - 2. East Somerville:
 - a. System as approved per location; the roof of the Bike Storage Building will require a roof with an I-60/I-90/I-135 wind rating in the field, perimeter and corners.
 - 3. Traction Power substations:
 - a. System as approved per location.
 - 4. College Avenue
 - 5.
 - a. System as approved per location; station structure area shall require a roof with an I-75/I-120/I-165 wind rating in the field, perimeter and corners respectively.
 - 6. Vehicle Maintenance Facility:
 - a. System as approved per location.

9. ASTM D6163, Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Glass Fiber Reinforcements.
10. ASTM E108, Test Methods for Fire Test of Roof Coverings.

C. National Roofing Contractors Association (NRCA):

1. Roofing and Waterproofing Manual.

1.3 SYSTEM DESCRIPTION

- A. FM Approvals Listing: Provide roofing, base flashings, and component materials that comply with requirements in FM Approvals 4450 and FM Approvals 4470 as part of a membrane roofing system, and that are listed in FM Approvals' "RoofNav" for Class 1 or noncombustible construction, as applicable. Identify materials with FM Approvals markings. Obtain FM acceptance of system proposed for use prior to ordering materials.

1. Roofing System:

- a. Fire/Windstorm Classification: In accordance with FM recommendations.
- b. Roofing shall meet FM Global requirements for rating in the field of the roof, perimeter and corners.
- c. Provide additional securement as required in FMG Data Sheet 1-29.
- d. Hail Resistance: MH and in accordance with FM recommendations.
- e. Provide "RoofNav" assembly number corresponding to an FM approved roof assembly. Refer to www.roofnav.com for information and Form 2688.

- B. It is the intent of this specification to install a long-term, quality roof system that meets or exceeds all current NRCA guidelines as stated in the most recent edition of the NRCA Roofing and Waterproofing Manual.

1.4 SUBMITTALS

- A. Provide submittals in accordance with Volume 2 Technical Provisions Subsection 2.8.
- B. Product Data: Provide manufacturer's technical product data for each type of roofing product specified. Include data substantiating that materials comply with specified requirements.

- C. Samples: Submit two (2) samples of each product specified.
- D. Manufacturer's Certificate: Certify that roof system furnished is approved by Factory Mutual in accordance with ASTM E108, Class A for external fire and meets local or nationally recognized building codes.
- E. Manufacturer's Certificate: Certify that the roof system is adhered properly to meet or exceed the requirements of FM Global.
- F. Manufacturer's Certificate: Certify that materials are manufactured in the United States and conform to requirements specified herein, are chemically and physically compatible with each other, and are suitable for inclusion within the total roof system specified herein.
- G. Manufacturer's Certificate: Submit a certified copy of the roofing manufacturer's ISO 9001 compliance certificate.
- H. Test Reports: Submit test reports, prepared by an independent testing agency, for all modified bituminous sheet roofing, indicating compliance with ASTM D5147.
- I. Submit a copy of an unexecuted manufacturer's 30-year single source warranty for review. This warranty shall include modified bituminous roofing. Warranty shall cover wind speeds up to 90 mph.
- J. Manufacturer providing warranty will include a list of ten (10) completed projects of similar scope and complexity with contact information for reference within a 50 mile distance. Projects will include daily job site inspections and be a minimum of five (5) years old.
- K. Submit a sample of roof coating for review.

1.5 QUALIFICATIONS

- A. Manufacturer of the modified bitumen roof membrane shall have a minimum [10] years experience in the manufacturing of modified bitumen roof membranes and have ISO 9001 certification.
- B. Installer: Company specializing in modified bituminous roofing installation with a minimum 5 years' experience and certified by roofing system manufacturer as qualified to install manufacturer's roofing materials.
- C. Installer's Field Supervision: Maintain a full-time Supervisor/Foreman on job site during all phases of roofing work and at any time roofing work is in progress. Maintain proper supervision of workmen. Maintain a copy of the specifications in the possession of the Supervisor/Foremen and on the roof at all times.
- D. Insurance Certification: Assist DB Entity in preparation and submittal of roof installation acceptance certification as may be necessary in connection with fire and extended coverage insurance on roofing and associated work.

1.6 PRE-INSTALLATION CONFERENCE

- A. Pre-Roofing Conference: Convene a pre-roofing conference approximately two (2) weeks before scheduled commencement of modified bituminous roofing system installation and associated work.
- B. Require attendance of installer of each component of associated work, installers of deck or substrate construction to receive roofing work, installers of rooftop units and other work in and around roofing

which must precede or follow roofing work (including mechanical work if any), DB Entity, roofing system manufacturer's representative, and other representatives directly concerned with performance of the Work, including (where applicable) DB Entity's insurers, testing agencies and governing authorities.

C. Objectives of conference to include:

1. Review foreseeable methods and procedures related to roofing work.
2. Tour representative areas of roofing substrates (decks), inspect and discuss condition of substrate, roof drains, curbs, penetrations and other preparatory work performed by others.
3. Review structural loading limitations of deck and inspect deck for loss of flatness and for required attachment.
4. Review roofing system requirements (Refer to Contract Documents).
5. Review required submittals both completed and yet to be completed.
6. Review and finalize construction schedule related to roofing work and verify availability of materials, installer's personnel, equipment and facilities needed to make progress and avoid delays.
7. Review required inspection, testing, certifying and material usage accounting procedures.
8. Review weather and forecasted weather conditions and procedures for inclement conditions.
9. Record discussion of conference including decisions and agreements (or disagreements) reached and furnish copy of record to each party attending. If substantial disagreements exist at conclusion of conference, determine how disagreements will be resolved and set date for reconvening conference.
10. Review notification procedures for weather or non-working days.

1.7 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to site with seals and labels intact, in manufacturer's original containers, dry and undamaged.
- B. Store and handle roofing sheets in a dry, well-ventilated, weather-tight place to ensure no possibility of significant moisture exposure. Store rolls of felt and other sheet materials on pallets or other raised surface. Stand all roll materials on end. Cover roll goods with a canvas tarpaulin or other breathable material (not polyethylene).
- C. Do not leave unused materials on the roof overnight or when roofing work is not in progress unless protected from weather and other moisture sources.
- D. It is the responsibility of the DB Entity to secure all material and equipment on the job site. If any material or equipment is stored on the roof, the DB Entity must make sure that the integrity of the deck is not compromised at any time. Damage to the deck caused by the DB Entity will be the sole responsibility of the DB Entity and will be repaired or replaced at his expense.

1.8 MANUFACTURER'S INSPECTIONS

- A. When the project is in progress, the roofing system manufacturer will provide the following:
 1. Keep the MBTA contacts informed as to the progress and quality of the work as observed.
 2. Provide daily job site inspections including documented weekly progress reports including pho-

tos.

3. Report to the designated personal in writing any failure or refusal of the DB Entity to correct unacceptable practices called to the DB Entity's attention. Confirm after completion that manufacturer has observed no applications procedures in conflict with the specifications other than those that may have been previously reported
4. The presence of the manufacturer's representative shall in no way be construed as the manufacturer or the representative as having any responsibility or oversight of the DB Entity's employees for safety issues. The sole purpose of the manufacturer's representative is to ensure the specified materials are applied in a manner consistent with this specification.

1.9 PROJECT CONDITIONS

- A. Weather Condition Limitations: Do not apply roofing membrane during inclement weather or when a 40% chance of precipitation is expected.
- B. Do not apply roofing insulation or membrane to damp deck surface.
- C. Do not expose materials vulnerable to water or sun damage in quantities greater than can be weather-proofed during same day.

1.10 SEQUENCING AND SCHEDULING

- A. Sequence installation of modified bituminous sheet roofing with related units of work specified in other sections to ensure that roof assemblies including roof accessories, flashing, trim and joint sealers are protected against damage from effects of weather, corrosion and adjacent construction activity.
- B. Fully complete all modified bituminous membrane roofing field assembly work each day. Phased construction will not be accepted.

1.11 WARRANTY

- A. Upon completion of installation, and acceptance by the Owner, the manufacturer will supply to the Owner a 30-year water tight roofing system warranty.
- B. Installer will submit a minimum of a two (2) year warranty to the membrane manufacturer with a copy directly to Owner.
- C. Membrane manufacturer will provide an annual inspection for the life of the warranty.

1.12 PRODUCT OPTIONS AND SUBSTITUTIONS

- A. Any material submitted as an equal to the specified material must include a list of three (3) projects where the proposed material has been used in a similar roofing system as that which is specified and is located within a fifty mile radius from the location of the project. In addition, the three projects must be at least three (3) years old and be available for inspection by the MBTA.
- B. Any deficiencies in performance, warranty terms or improper submittal procedure will constitute grounds for immediate rejection of substitution.
- C. Single ply EPDM and or PVC roof membrane system will not be considered as equals to the specified system and will be immediately rejected.

- D. No modified bitumen membrane will be considered unless it can meet or exceed the performance characteristics described in Article 2.4 of this Section

PART 2 - PRODUCTS

2.1 PERFORMANCE STANDARD

- A. When a performance standard is specified it shall be indicative of a standard required.
- B. Any item or materials submitted as a substitution to the performance specified must comply in all respects as to the quality and performance specified. The MBTA shall be the sole judge as to whether or not an item submitted as a substitute is truly equal. Should the DB Entity choose to submit a substitute product, he shall assume all monetary or other risk involved, should the MBTA find the substitution unacceptable.

2.2 DESCRIPTION

- A. Modified bituminous roofing work including but not limited to:
 - 1. Base Ply and Base Flashing Ply: Will be one ply of approved ASTM D 6163 Type I, 80 mil SBS (Stryrene-Butadiene-Styrene) rubber modified base sheet.
 - 2. Cold Bitumen Membrane Inner Ply Adhesive: The standard bitumen will consist of a V.O.C. free, non-asbestos containing cold applied adhesive.

Performance Requirements:

- a. Flash Point 400°F (232°C) (ASTM D 93)
 - b. Density @ 77°F (25°C) , 11.2 lbs./gal. (1.11 g/m3) (ASTM D 1475)
 - c. Non-Volatile 100% (ASTM D 4586)
 - d. Slope Limitations 3:12
 - e. Viscosity @ 73.4 ± 2°F 25,000 - 30,000 cP (23 ± 2°C) Brookfield HADT T-bar; Spindle A; 10 RPM
 - f. VOC, 0 g/l
- 3. Modified Membrane/Top Flashing Ply: 160 mil SBS (Stryrene-Butadiene-Styrene) and SIS (Stryrene-Isoprene-Styrene) rubber modified membrane incorporating recycled content and reinforced with a strong fiberglass and polyester composite scrim.
 - 4. Surfacing: Two coats of specified coating, manufacturer approved.
 - 5. Insulation Adhesive Performance Requirements: Two component, foam adhesive as recommended by insulation manufacturer and approved by FM indicated ratings.
 - a. Tensile Strength (ASTM D412), 250 psi
 - b. Density (ASTM D1875), 8.5 lbs./gal.
 - c. Viscosity (ASTM D2556), 16,000 to 24,000 cP.
 - d. 2`Peel Strength (ASTM D903), 17 lb/in.

- e. 3`Flexibility (ASTM D816), Pass @ -70°F

2.3 BITUMINOUS MATERIALS

- A. Asphalt Primer: V.O.C. compliant, ASTM D41.
- B. Asphalt Roofing Mastic: V.O.C. compliant, ASTM D2822, Type II.
- C. Cold Applied Membrane Adhesive: Performance Requirements:
 - 1. Flash Point , 400°F (232°C) (ASTM D 93)
 - 2. Density @ 77°F (25°C), 11.2 lbs./gal. (1.11 g/m3) (ASTM D 1475)
 - 3. Non-Volatile 100% (ASTM D 4586)
 - 4. Slope Limitations 3:12
 - 5. Viscosity @ 73.4 ± 2°F 25,000 - 30,000 cP (23 ± 2°C) Brookfield HADT T-bar; Spindle A; 10 RPM
 - 6. VOC 0 g/l
- D. Brush Grade Flashing Adhesive Performance Requirements:
 - 1. Non-Volatile Content, ASTM D-4479, 70 min.
 - 2. Density, ASTM D-1475, 8.6 lb./gal.
 - 3. V.O.C., ASTM D-3960, 295 g/l max.
 - 4. Flash Point, ASTM D-93, 100°F

2.4 SHEET MATERIALS

- A. Type I Base Sheet:
 - 1. Tensile Strength, MD 100 lbf./in. , XD 100 lbf./
 - 2. Tear Strength, MD 110 lbf., XD 110 lbf
 - 3. Elongation, MD 2.5%, XD 2.5%
 - 4. Low Temp Flex passes -20°F (-28.8°C)
 - 5. Recycled Content pre-consumer 27%
 - 6. Finished membrane meets and/or exceeds ASTM D 6163, TYPE I
 - 7. Test Method ASTM D 5147 is tested at *2 in./min. @ 73.4 ± 3.6°F (50 mm/min. @ 23 ± 2°C)
- B. Modified Membrane Independent Test Properties/Top Modified Flashing Ply:
 - 1. ASTM D-6162, Type III minimum performance characteristics.
 - 2. Tensile Strength (ASTM D-5147) 2 in/min. @ 73.4 °F, MD 700 lbf/in, CMD 750 lbf/in
 - 3. Tear Strength (ASTM D-5147) 2 in/min. @ 73.4 °F, MD 1300 lbf, CMD 1400 lbf
 - 4. Elongation at Maximum Tensile (ASTM D-5147) 2 in/min. @ 73.4 °F, MD 6%, CMD 6%

5. Low Temperature Flexibility (ASTM D-5147) Passes -30°F (-34°C)
6. Thickness, 160mm

2.5 SURFACINGS

A. White coating

1. ASTM D 4798 - No deterioration over 1,000 hours per ASTM G 26 test requirements
2. Non-Volatile (ASTM D 1644), 66% min
3. Density @ 77°F (25°C) (ASTM D 1475), 12 lb./gal (1.43g/cm³)
4. Elongation (ASTM D 2370), 100% minimum
5. Tensile Strength (ASTM D 2370), 200 psi minimum
6. VOC, <50 g/l
7. Reflectance, 0.84
8. Emittance, 0.91
9. SRI, 106

B. Grey Coating

1. ASTM D 4798 - No deterioration over 1,000 hours per ASTM G 26 test requirements
2. Non-Volatile (ASTM D 1644), 66% min
3. Density @ 77°F (25°C) (ASTM D 1475), 12 lb./gal (1.43g/cm³)
4. Elongation (ASTM D 2370), 100% minimum
5. Tensile Strength (ASTM D 2370), 200 psi minimum
6. VOC, <50 g/l

2.6 RELATED MATERIALS

A. Roof Insulation: as required to meet Energy Code requirements.

B. Two component, foam adhesive as recommended by insulation manufacturer and approved by FM indicated ratings.

1. Tensile Strength (ASTM D412), 250 psi
2. Density (ASTM D1875), 8.5 lbs./gal.
3. Viscosity (ASTM D2556), 16,000 to 24,000 cP.
4. 2`Peel Strength (ASTM D903), 17 lb/in.
5. 3`Flexibility (ASTM D816), Pass @ -70°F

C. Nails and Fasteners: Non-ferrous metal or galvanized steel, except that hard copper nails shall be used with copper; aluminum or stainless steel nails shall be used with aluminum; and stainless steel nails shall be used with stainless steel. Fasteners shall be self-clinching type of penetrating type as recommended by the manufacturer of the deck material. Nails and fasteners shall be flush-driven through flat metal discs of not less than one (1) inch diameter. Omit metal discs when one-piece composite nails or

fasteners with heads not less than one (1) inch diameter are used.

- D. Metal Discs: Flat discs or caps of zinc-coated sheet metal not lighter than twenty eight (28) gauge and not less than one (1) inch in diameter. Form discs to prevent dishing. Bell or cup shaped caps are not acceptable.
- E. Zinc Transitions, gravel stops, and flashings: sheet metal as required for a complete and warrantable roofing system installation.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that deck surfaces and project conditions are ready to receive work of this section.
- B. Verify that deck is supported and secured to structural members.
- C. Verify that deck is clean and smooth, free of depressions, projections or ripples, and is properly sloped to drains.
- D. Verify that adjacent roof members do not vary more than ¼” in height.
- E. Verify that deck surfaces are dry and free of snow or ice.
- F. Confirm that moisture content does not exceed twelve (12) percent by moisture meter tests.
- G. Verify that openings, curbs, pipes, conduit, sleeves, ducts, and other items, which penetrate the roof, are set solidly, and that wood cant strips and wood nailing strips are set in place.
- H. Coordinate work with sheet metal roofing edge conditions as required.

3.2 GENERAL INSTALLATION REQUIREMENTS

- A. Cooperate with manufacturer, inspection and test agencies engaged or required to perform services in connection with installing the roof system
- B. Insurance/Code Compliance: Where required by code, install and test the roofing system to comply with governing regulation and specified insurance requirements.
- C. Protect other work from spillage of roofing materials and prevent materials from entering or clogging drains and conductors. Replace or restore other work damaged by installation of the modified bituminous roofing system.
- D. Coordinate installing roofing system components so that insulation and roofing plies are not exposed to precipitation or left exposed overnight. Provide cut-offs at end of each day’s work to cover exposed ply sheets and insulation with two (2) plies of #15 organic roofing felt with joints and edges sealed with roofing cement. Remove cut-offs immediately before resuming work.
- E. Cold applied membrane adhesive coverage rates for interply application (2.5) two and a half gallons per 100 square feet (plus or minus 25% on total job average basis.)

- F. Substrate Joint Penetrations: Prevent bitumen from penetrating substrate joints or damaging roofing system components.
- G. Apply roofing materials as specified by manufacturer's instructions.
 - 1. Keep roofing materials dry before and during application.
 - 2. Do not permit phased construction.
 - 3. Complete application of roofing plies, modified sheet and flashing in a continuous operation.
 - 4. Begin and apply only as much roofing in one day as can be completed that same day.
- H. Cut-Offs (Waterstops): At end of each day's roofing installation, protect exposed edge of incomplete work, including ply sheets and insulation. Provide temporary covering of two (2) plies of #15 organic roofing felt set in flashing adhesive.

3.3 BASE PLY INSTALLATION

- A. Base Plies: Install (2) two base sheets in 2.5 gallons per ply per square of bitumen shingled uniformly to achieve two plies throughout over the prepared substrate. Shingle in proper direction to shed water on each large area of roofing. Prior to installation, cut sheets into 18' lengths and allow to relax.
- B. Lap ply sheet ends eight (8) inches. Stagger end laps twelve (12) inches minimum.
- C. Lightly broom in base plies to assure complete adhesion.
- D. Extend plies two (2) inches beyond top edges of cants at wall and roof projections and equipment bases.
- E. Install base flashing ply to all perimeter and projection details.
- F. Allow the two plies of base sheet to cure at least thirty minutes before installing the modified membrane. However, the modified membrane must be installed the same day as the base plies.

3.4 MODIFIED MEMBRANE APPLICATION

- A. The modified membrane shall then be solidly bonded to the base layers with specified cold adhesive at the rate of 2.5 gallons per 100 square feet. Two hours prior to installation, cut sheets into 18' lengths and allow to relax.
- B. The modified membrane roll must push a puddle of asphalt in front of it with asphalt slightly visible at all side laps. Exercise care during application to eliminate air entrapment under the membrane.
- C. Subsequent rolls of modified shall be installed across the roof as above with a minimum of 4" side laps and 8" end laps. The end laps shall be staggered. The modified membrane shall be laid in the same direction as the underlayers but the laps shall not coincide with the laps of the base layers.
- D. For best results, allow the cold adhesive to set for five to ten minutes before installing the top layer of modified membrane.
- E. Extend membrane 2" beyond top edge of all cants in full moppings of the cold adhesive as shown on the drawings.

3.5 FLASHING MEMBRANE INSTALLATION

- A. Seal all curb, wall and parapet flashings with an application of mastic and mesh on a daily basis. Do not permit conditions to exist that will allow moisture to enter behind, around or under the roof or flashing membrane.
- B. Prepare all walls, penetrations, expansion joints [and where shown on the drawings] to be flashed with asphalt primer at the rate of one hundred (100) square feet per gallon. Allow primer to dry tack free.
- C. Install pressure treated wood nailers on the existing parapet wall to prepare for installation of new coping caps.
- D. Use the modified membrane as the flashing membrane. Adhere to the underlying base flashing ply with specified asphalt unless otherwise noted in these specifications. Nail off at a minimum of eight (8) inches o.c. from the finished roof at all vertical surfaces.
- E. Solidly adhere the entire sheet of flashing membrane to the substrate.
- F. Seal all vertical laps of flashing membrane with a three-course application of trowel-grade mastic and fiberglass mesh.
- G. Coordinate counter flashing, cap flashings, expansion joints, and similar work with modified bitumen roofing work.
- H. Coordinate roof accessories, miscellaneous sheet metal accessory items, including piping vents and other devices with the roofing system work.
- I. Metal Edge
 - 1. Inspect the nailer to assure proper attachment and configuration.
 - 2. Run one ply over the edge. Assure coverage of all wood nailers. Fasten plies with ring shank nails at eight (8) inches o.c.
 - 3. Install continuous cleat and fasten at six (6) inches o.c.
 - 4. Install new metal edge hooked to continuous cleat and set in bed of roof cement. Fasten flange to wood nailer every three (3) inches o.c. staggered.
 - 5. Prime metal edge at a rate of 100 square feet per gallon and allow to dry.
 - 6. Strip in flange with base flashing ply covering entire flange in bitumen with six (6) inches on to the field of roof. Assure ply laps do not coincide with metal laps.
 - 7. Install a second ply of modified flashing ply in bitumen over the base flashing ply, nine (9) inches on to the field of the roof.
- J. Coping Cap
 - 1. Minimum flashing height is eight (8) inches (203mm) above finished roof height. Maximum flashing height is 24 inches. Prime vertical wall at a rate of 100 square feet per gallon and allow to dry.
 - 2. Set cant in bitumen. Run all field plies over cant a minimum of two (2) inches (50mm).
 - 3. Attach tapered board to top of wall.

4. Install base flashing ply covering entire wall and wrapped over top of wall and down face with six (6) inches (152mm) on to field of roof and set in cold asphalt. Nail membrane at eight (8) inches (203mm) o.c.
5. Install a second ply of modified flashing ply in bitumen over the base flashing ply, nine (9) inches (228mm) on to the field of the roof. Apply a three-course application of mastic and mesh at all seams and allow to cure and aluminize.
6. Install continuous cleat and fasten at six (6) inches (152mm) o.c. to outside wall.
7. Install new metal coping cap hooked to continuous cleat.
8. Fasten inside cap 24 inches (609mm) o.c. with approved fasteners and neoprene washers.

K. Reglet Mounted Counterflashing

1. Minimum flashing height is eight (8) inches (203mm) above finished roof height. Maximum flashing height is 24 inches. Prime vertical wall at a rate of 100 square feet per gallon and allow to dry.
2. Set cant in bitumen. Run all field plies over cant a minimum of two (2) inches (50mm).
3. Install base flashing ply covering wall set in bitumen with six (6) inches (152mm) on to field of the roof.
4. Install a second ply of modified flashing ply in bitumen over the base flashing ply, nine (9) inches (228mm) on to the field of the roof. Apply a three-course application of mastic and mesh at all vertical seams and allow to cure and aluminize.
5. Apply butyl tape to wall behind flashing. Secure termination bar through flashing, butyl tape and into wall. Alternatively use caulk to replace the butyl tape.
6. Cut reglet in masonry one joint above flashing.
7. Secure reglet counterflashing with expansion fasteners and caulk reglet opening.

L. Through Wall Counterflashing

1. Minimum flashing height is 8". Prime vertical wall at a rate of 100 square feet per gallon and allow to dry.
2. Set cant in Flashing Mastic. Run all plies over cant a minimum of 2".
3. Install base flashing ply set in Flashing Mastic covering wall with 6" on to field of roof.
4. The second ply shall be a modified flashing ply installed in Flashing Mastic over the base flashing ply and 9" on to field of roof. All vertical seams will receive a three-course application of Flashing Mastic and mesh allowed to cure and aluminize.
5. Apply butyl tape to wall behind flashing. Secure termination bar through flashing, butyl tape and into wall 8" O.C.

M. Manufactured Wall Panel W/Modified Roof/Flashing (Slip Flashing)

1. Minimum flashing height is eight (8) inches (203mm) above finished roof height. Prime vertical wall at a rate of 100 square feet per gallon and allow to dry.
2. Set cant in bitumen. Run all plies over cant a minimum of two (2) inches (50mm).
3. Install base flashing ply covering wall with six (6) inches (152mm) on to field of the roof.

4. Install a second ply of modified flashing ply in bitumen over the base flashing ply, nine (9) inches (228mm) on to the field of the roof. Apply a three-course application of mastic and mesh at all vertical seams and allow to cure and aluminize.
5. Install manufacturer's standard hat channel into the top of the modified membrane to act as a termination bar.
6. Install hat channels at 24" (609mm) o.c. vertically spaced up the wall.
7. Install the uppermost hat channel at the bottom edge of the coping cap. Insert rigid insulation between the hat channels. Place manufacturer's standard seam tape on top of all hat channels.
8. Fasten the first manufactured wall panel vertically plumb and fasten every six (6) inches (152mm)o.c.
9. Install adjoining panels by engaging the opposing interlocking seam and fastening as described above.
10. Complete inside and outside corners by installing pre-fabricated corners or job site braking a full width panel to accommodate the corner, so that the sides engage the lock of the panels to the corner areas.
11. Trim excess seam tape and seam raw edges with manufacturer's recommended sealant.
12. Fasten slip flashing to existing coping cap with a waterproof rivet every 24" (609mm) o.c. to act as a counterflashing over the manufactured wall panel.

N. Expansion Joint

1. Minimum curb height is eight (8) inches (203mm) above finished roof height. Chamfer top of curb. Prime vertical curb at a rate of 100 square feet per gallon and allow to dry.
2. Mechanically attach wood cant to expansion joint nailers. Run all field plies over cant a minimum of two (2) inches (50mm).
3. Install compressible insulation in neoprene cradle.
4. Install base flashing ply covering curb set in bitumen with six (6) inches (152mm) on to field of the roof.
5. Install a second ply of modified flashing ply in bitumen over the base flashing ply, nine (9) inches (228mm) on to the field of the roof. Attach top of membrane to top of curb and nail at eight (8) inches (203mm) o.c. Apply a three-course application of mastic and mesh at all vertical seams and allow to cure and aluminize.
6. Install pre-manufactured expansion joint cover. Fasten sides at 12 inches (609mm) o.c. with fasteners and neoprene washers. Furnish all joint cover laps with butyl tape between metal covers.

O. Equipment Support

1. Minimum curb height is eight (8) inches. Prime vertical at a rate of 100 square feet per gallon and allow to dry.
2. Set cant in bitumen. Run all field plies over cant a minimum of two (2) inches.
3. Install base flashing ply covering curb set in bitumen with six (6) inches on to field of the roof.
4. Install a second ply of modified flashing ply in bitumen over the base flashing ply, nine (9) inches on to the field of the roof. Attach top of membrane to top of curb and nail at eight (8) inches o.c. Apply a three-course application of mastic and mesh at all vertical seams and allow time to cure. Once cured aluminize.

5. Install pre-manufactured cover. Fasten sides at 24 inches o.c. with fasteners and neoprene washers. Furnish all joint cover laps with butyl tape between metal covers.
6. Set equipment on neoprene pad and fasten as required by equipment manufacturer.

P. Curb Detail/Air Handling Station

1. Minimum curb height is eight (8) inches (203mm) above finished roof height. Prime vertical at a rate of 100 square feet per gallon and allow to dry.
2. Set cant in bitumen. Run all field plies over cant a minimum of two (2) inches (50mm).
3. Install base flashing ply covering curb set in bitumen with six (6) inches (152mm) on to field of the roof.
4. Install a second ply of modified flashing ply in bitumen over the base flashing ply, nine (9) inches (228mm) on to the field of the roof. Apply a three-course application of mastic and mesh at all vertical seams and allow to cure and aluminize.
5. Install pre-manufactured counterflashing with fasteners and neoprene washers or per manufacturer's recommendations.
6. Set equipment on neoprene pad and fasten as required by equipment manufacturer.

Q. Hatch

1. Minimum curb height is eight (8) inches (203mm) above finished roof height. Prime vertical at a rate of 100 square feet per gallon and allow to dry.
2. Set cant in bitumen. Run all field plies over cant a minimum of two (2) inches (50mm).
3. Install base flashing ply covering curb set in bitumen with six (6) inches (152mm) on to field of the roof.
4. Install a second ply of modified flashing ply in bitumen over the base flashing ply, nine (9) inches (228mm) on to the field of the roof. Attach top of membrane to top of wood nailer and apply a three-course application of mastic and mesh. Allow to cure and aluminize.

R. Roof Drain

1. Plug drain to prevent debris from entering plumbing.
2. Taper insulation to drain minimum of 8' from center of drain.
3. Run roof system plies over drain. Cut out plies inside drain bowl.
4. Set lead/copper flashing (30" square minimum) in 1/4" bed of mastic.
5. Run lead/copper into drain a minimum of 2". Prime lead/copper at a rate of 100 square feet per gallon and allow to dry.
6. Install base flashing ply (40" square minimum) in Flashing Mastic.
7. Install modified membrane (48" square minimum) in Flashing Mastic.
8. Install clamping ring and assure all plies are under the clamping ring.
9. Remove drain plug and install strainer.

S. Plumbing Stack

1. Minimum stack height is 12".

2. Run roof system over the roof. Seal the base of the stack with elastomeric sealant.
3. Prime flange of new sleeve. Install properly sized sleeves set in 1/4" bed of roof cement.
4. Install base flashing ply in Flashing Mastic.
5. Install modified membrane in Flashing Mastic.
6. Caulk the intersection of the membrane with elastomeric sealant.
7. Turn sleeve a minimum of 1" down inside of stack.

T. Pitch Pocket

1. Run all plies up to the penetration.
2. Place the pitch pocket over the penetration and prime all flanges.
3. Strip in flange of pitch pocket with one (1) ply of base flashing ply. Extend six (6) inches onto field of roof.
4. Install second layer of modified membrane extending nine (9) inches onto field of the roof.
5. Fill pitch pocket half full with non-shrink grout. Let this cure and top off with pourable sealant.
6. Caulk joint between roof system and pitch pocket with roof cement.

3.6 APPLICATION OF SURFACING

A. Roof Coating:

1. The existing roof surface must be sound and free of defects such as blisters, splits, fish mouths, etc., all defects must be repaired with a suitable patching material.
2. Coating should be spray, brush or roller applied at a rate of 1.5 gal./100 sq. ft. over mineral surfaced modified. Apply a two-coat application in a crosshatch manner.
3. White energy star rated coating will be installed first. Grey base coat will be installed second as a top coat.

3.7 FIELD QUALITY CONTROL

- A. The DB Entity shall engage and pay for an independent testing laboratory to perform field inspection and testing as required.
- B. Correct defects or irregularities discovered during field inspection.
- C. Require attendance of roofing and insulation materials manufacturers' representatives at site during installation of the roofing system.

3.8 CLEANING

- A. Remove bitumen adhesive drippings from all walls, windows, floors, ladders and finished surfaces.
- B. In areas where finished surfaces are soiled by asphalt or any other sources of soiling caused by work of this section, consult manufacturer of surfaces for cleaning instructions and conform to their instructions.
- C. Repair or replace defaced or disfigured finishes caused by work of this Section.

3.9 FINAL INSPECTION

- A. At completion of roofing installation and associated work, meet with the DB Entity, installer, installer of associated work, Owner, roofing system manufacturer representative's, and other representatives directly concerned with performance of roofing system.
- B. Walk roof surface areas of the building, inspect perimeter building edges as well as flashing of roof penetrations, walls, curbs and other equipment. List all items requiring correction or completion and furnish copy of list to each party in attendance.
- C. The roofing system manufacturer reserves the right to request a thermographic scan of the roof during final inspection to determine if any damp or wet materials have been installed. The thermographic scan shall be provided by the [Roofing] subcontractor.
- D. If core cuts verify the presence of damp or wet materials, the [Roofing] subcontractor shall be required to replace the damaged areas at his own expense.
- E. Repair or replace deteriorated or defective work found at time above inspection as required to produce an installation which is free of damage and deterioration at time of Contract Substantial Completion and according to warranty requirements.
- F. Notify the MBTA upon completion of corrections.
- G. Following the final inspection, provide written notice of acceptance of the installation from the roofing system manufacturer.

END OF SECTION

SECTION 07600

FLASHING AND SHEET METAL

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Edge strip and flashing.
 - 2. Fascia and trim.
 - 3. Counterflashings over bituminous base flashing.
 - 4. Counterflashings for roof accessories.
 - 5. Base flashing coverings.
 - 6. Fascia and edge metal.
 - 7. Lead flashing for bituminous membranes.
 - 8. Other components.
 - 9. Counterflashings at roof mounted equipment and vent stacks.
 - 10. Fully welded scupper and drainage assemblies.

- B. Related Work:
 - 1. Section 06100 – ROUGH CARPENTRY
 - 2. Section 07420 – METAL WALL PANEL SYSTEMS
 - 3. Section 07423 – RAIN SCREEN SYSTEMS
 - 4. Section 07550 – MODIFIED BITUMEN BUILT-UP ROOFING
 - 5. Section 07720 – ROOF ACCESSORIES

1.3 SUBMITTALS

- A. Submit under provisions of Section 01300 - Submittals.
- B. Product Data: Provide manufacturer's specification data sheets for each product in accordance with Section 01300.
- C. Provide approval letters from metal manufacturer for use of their metal within this particular roofing system type.
- D. Submit two samples, 12 x 12 inch in size illustrating typical external corner, internal corner, valley, junction to vertical dissimilar surface, material and finish.
- E. Shop Drawings
 - 1. For manufactured and shop fabricated gravel stops, fascia, scuppers, and all other sheet metal fabrications.
 - 2. Shop drawings: Indicate material profile, jointing pattern, jointing details, fastening methods, flashing, terminations, and installation details.
 - 3. Indicate type, gauge and finish of metal. Indicate adjacent materials and substrates.
- F. Certification
 - 1. Submit roof manufacturer's certification where metal fasteners furnished are acceptable to roof manufacturer.
 - 2. Submit roof manufacturer's certification that metal furnished is acceptable to roofing manufacturer as a component of roofing system and is eligible for roof manufacturer's system warranty.
 - 3. Submit certification that metal and fastening system furnished is Tested and Approved by Factory Mutual for 1-90 Wind Up-Lift Requirements.
- G. Manufacturer's Product Data
 - 1. Metal material characteristics and installation recommendations.
 - 2. Submit color chart to Architect prior to material ordering and/or fabrication so that equivalent colors to those specified can be approved.

1.4 QUALITY CONTROL

- A. FM Approvals Listing: Provide roofing, base flashings, and component materials that comply with requirements in FM Approvals 4450 and FM Approvals 4470 as part of a membrane roofing system, and that are listed in FM Approvals' "RoofNav" for Class 1 or noncombustible construction, as applicable. Identify materials with FM Approvals markings. Obtain FM acceptance of system proposed for use prior to ordering materials.
 - 1. Flashing and Sheet Metal:

- a. Fire/Windstorm Classification: In accordance with FM recommendations.
- b. Roofing shall meet FM Global requirements for rating in the field of the roof, perimeter and corners.
- c. Provide additional securement as required in FMG Data Sheet 1-49. Wind ratings shall be calculated based on individual site conditions.
- d. Hail Resistance: MH and in accordance with FM recommendations.
- e. Provide "RoofNav" assembly number corresponding to an FM approved roof assembly. Refer to www.roofnav.com for information and Form 2688.

B. Reference Standards

1. Comply with details and recommendations of SMACNA Manual for workmanship, methods of joining, anchorage, provisions for expansion, etc.
2. Factory Mutual Loss Prevention Data Sheet 1-49 windstorm resistance 1-90.

C. Contractor's Warranty

1. Contractor shall provide the Authority with a notarized written warranty assuring that all sheet metal work including caulking and fasteners to be watertight and secure for a period of two years from the date of final acceptance of the building. Warranty shall include all materials and workmanship required to repair any leaks that develop, and make good any damage to other work or equipment caused by such leaks or the repairs thereof.

1.5 QUALIFICATIONS

- A. Fabricator and Installer: Company specializing in sheet metal flashing work with 5 years experience.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials in manufacturer's original, unopened containers or packages with labels intact and legible.
- B. Stack pre-formed and pre-finished material to prevent twisting, bending, or abrasion, and to provide ventilation. Slope metal sheets to ensure drainage.
- C. Prevent contact with materials which may cause discoloration or staining.

1.7 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 APPROVED EQUIVALENT

- A. Contractor must submit any product not specified a minimum ten days before the bid date to Architect in order for product to be considered for approval. The Architect will notify Contractor, in writing, of decision to accept or reject request. Submission shall include supporting information including material sample, installation instructions, product data, and specifications.

2.2 MATERIALS

- A. Miscellaneous Metals and Flashings:

- 1. All installed metal shall be of similar material to its associated base material. Refer to scope of work for but not limited to the list of base materials. Materials that cause interactions that impair performance, or cause degradation, including galvanic corrosion shall be prohibited. Lead coated copper flashing, except when prohibited due to corrosive or material reaction of adjacent or lower materials.

2.3 RELATED MATERIALS

- A. Metal Primer: Zinc chromate type.
- B. Plastic Cement: ASTM D 4586.
- C. Sealant: Specified in Section 07900 or on drawings.
- D. Lead: Meets Federal Specification QQ-L-201, Grade B, four pounds per square foot.
- E. Zinc: Matching color and thickness of adjacent zinc panels.
 - 1. Underlayment at Zinc shall be Enkamat or other approved separator. Rosin paper or roofing felt not allowed in zinc assemblies.
- F. Solder: ANSI/ASTM B32; 95/05 type.
- G. Flux: FS O-F-506.
- H. Underlayment: ASTM D2178, No15 asphalt saturated roofing felt.
- I. Slip Sheet: Rosin sized building paper.
- J. Fasteners:
 - 1. Corrosion resistant screw fastener as recommended by metal manufacturer. Finish exposed fasteners same as flashing metal.
 - 2. Fastening shall conform to Factory Mutual 1-90 requirements or as stated on section details, whichever is more stringent.

K. Termination Bars:

1. Shall be aluminum unless otherwise recommended by membrane manufacturers.
Material shall be .125" x 1" (minimum) aluminum conforming to ASTM B-221, mill finish.
2. Bar shall have caulk cup as required.

PART 3 - EXECUTION

3.1 PROTECTION

- A. Protect contact areas of dissimilar metals with heavy asphalt or other approved coating, specifically made to stop electrolytic action.
- B. All dissimilar materials shall be separated with non-reactive substrate to prevent galvanic interaction and corrosion.

3.2 GENERAL

- A. Install work watertight, without waves, warps, buckles, fastening stress, or distortion, allowing for expansion and contraction.
- B. Fastening of metal to walls and wood blocking shall comply with SMACNA Architectural Sheet Metal Manual, Factory Mutual I-90 wind uplift specifications and/or manufacturer's recommendations whichever is of the highest standard.
- C. All accessories or other items essential to the completeness of sheet metal installation, whether specifically indicated or not, shall be provided and of the same material as item to which applied.
- D. Metal fascia and copings shall be secured to wood nailers at the bottom edge with a continuous cleat. Cleats shall be at least one gauge heavier than the metal it secures.

3.3 INSPECTION

- A. Verify roof openings, curbs, pipes, sleeves, ducts, or vents through roof are solidly set, cant strips and reglets are in place, and nailing strips locations in conjunction with FM Global requirements.
- B. Verify membrane termination and base flashings are in place, sealed, and secure.
- C. Beginning of installation means acceptance of existing conditions.
- D. Field measure site conditions prior to fabricating work.

3.4 SHOP FABRICATED SHEET METAL

- A. Installing Contractor shall be responsible for determining if the sheet metal systems are in general conformance with roof manufacturer's recommendations.
- B. Metal work shall be shop fabricated to configurations and forms in accordance with recognized sheet metal practices.
- C. Hem exposed edges.

- D. Angle bottom edges of exposed vertical surfaces to form drip.
- E. All corners for sheet metal shall be lapped with adjoining pieces fastened and set in sealant.
- F. Joints for gravel stop fascia system, cap flashing, and surface-mount counterflashing shall be formed with a 1/4" opening between sections. The opening shall be covered by a cover plate or backed by an internal drainage plate formed to the profile of fascia piece. The cover plate shall be embedded in mastic, fastened through the opening between the sections and loose locked to the drip edges.
- G. Install sheet metal to comply with Architectural Sheet Metal manual, Sheet Metal and Air Conditioning Contractor's National Associations, Inc.
- H. Fully welded water tight scupper assemblies, with flanges, tail pipes, end caps and transitions, as shown and required. The scupper assemblies shall be tested for water tightness after fabrication is complete, and prior to incorporation into the finished construction.

3.5 FLASHING MEMBRANE INSTALLATION

A. METAL EDGE DETAIL

- 1. See details for scuppers. For manufactured edge metal, scuppers shall be factory fabricated.
- 2. Accessories: Joint covers, corners, supports, strip flashing at joining, fastenings and other accessories shall be included.
- 3. Install continuous cleat fasten 6" O.C. Fasten flange to wood nailer every 6" staggered.
- 4. Install new metal edge hooked to continuous cleat.
- 5. Metal shall match adjacent wall panels indicated on drawings, unless otherwise noted.
- 6. Prime metal edge at a rate of 100 square feet per gallon and allow to dry.

B. COPING CAP/ SURFACE MOUNTED COUNTERFLASHING

- 1. Copings shall be provided with factory fabricated welded watertight coping accessories such as miters, transitions, end caps, etc. and finished to match coping system.
- 2. Accessories: Joint covers, corners, supports, strip flashing at joinings, fastening, and other accessories shall be included.
- 3. Install continuous cleat fasten 6" O.C.
- 4. Install new coping cap hooked to continuous cleat.

C. HATCH

- 1. Counterflashing shall be provided with watertight accessories such as miters, transitions, end caps, etc. and finished to match.
- 2. Accessories: Joint covers, corners, fasteners, strip flashing at joinings, fastening, and other accessories shall be included.
- 3. Install pre-manufactured expansion joint cover. Fasten sides 8" O.C. with fasteners

and neoprene washers.

4. Set equipment on neoprene pad and fasten as required by equipment manufacturer.

D. ROOF DRAIN

1. Prime lead/copper at a rate of 100 square feet per gallon and allow to dry.
2. Set lead/copper flashing (30" square minimum) in a 1/4" bed of mastic.
3. Install clamping ring and strainer assure all plies are under the clamping ring.

E. PLUMBING STACK

1. Prime flange and sleeve at a rate of 100 square feet per gallon and allow to dry.
2. Install properly sized sleeves in a 1/4" bed of elastomeric sealant.
3. Turn sleeve a minimum of 1" down inside of stack.
4. Caulk intersection of the membrane and flange with elastomeric sealant.
5. Provide seamless Stainless steel vent pip as Washington Station, as indicated on drawings.

F. SCUPPER ASSEMBLIES

1. Scupper assemblies shall be configured as shown in drawings with the minimum joints possible, fully welded with waterproof, water tight joints.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07610

SHEET METAL ROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
1. Batten seam roofing.
 2. Flat seam roofing.
 3. High-temperature underlayment.
 4. Drainage mat.
 5. Snow guards.
 6. Gutters and downspouts adjacent to sheet metal roofing.
- B. Related Work:
1. Section 01800, SUSTAINABILITY REQUIREMENTS
 2. Section 06100, CARPENTRY; Roof sheathing.
 3. Section 07600, FLASHING AND SHEET METAL.

1.2 REFERENCES

- A. Comply with applicable requirements of the following standards. Where these standards conflict with other specified requirements, the most restrictive requirements shall govern.
1. American National Standards Institute(ANSI):
58.1 Design Loads for Buildings and Other Structures
 2. American Society for Testing and Materials (ASTM):
D 226 Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing
 3. Sheet Metal and Air Conditioning Contractors National Association
(SMACNA): Manual Architectural Sheet Metal Manual
 4. United Laboratories (UL):
580 Tests for Uplift Resistance of Roof Assemblies
 5. Rheinzink Application in Architecture, 2nd Updated Edition, January 2002

1.3 SUBMITTALS

- A. Product data including metal manufacturer's and fabricator's specifications, installation instructions, and general recommendations for roofing applications. Include certification or other data substantiating that materials comply with requirements.

- B. Shop Drawings: Show fabrication and installation layouts of sheet metal roofing, including plans, elevations, and keyed references to termination points. Distinguish between shop- and field- assembled work. Include the following:
1. Details for forming sheet metal roofing, including seams and dimensions.
 2. Details for joining and securing sheet metal roofing, including layout of fasteners, clips, and other attachments. Include pattern of seams.
 3. Details of termination points and assemblies, including fixed points.
 4. Details of expansion joints, including showing direction of expansion and contraction.
 5. Details of roof penetrations.
 6. Details of edge conditions, including eaves, ridges, valleys, rakes, crickets, and counterflashings.
 7. Details of special conditions.
 8. Details of connections to adjoining work.
 9. Details of the following accessory items, at a scale of not less than 1-1/2 inches per 12 inches:
 - a. Flashing and trim.
 - b. Roof curbs.
 - c. Snow guards.
- C. Verification Samples: Submit representative samples to architect for approval of each material that is to be exposed in the completed work. Show full color ranges and finish variations expected. Provide samples having minimum size of 144 sq. in.
- D. Delegated Design: Under the supervision of an engineer, licensed in the state of MA, provide sign and sealed calculations and certification of the performance of this work. Indicate how design requirements for resistance to wind loading and other performance criteria have been satisfied.
- E. Test Reports: Provide certified reports for all specified tests.
- F. Installer and Manufacturer: Installer shall be trained or certified by the manufacturer to perform work. Manufacturer shall certify installer as acceptable for terms of warranty.

1.4 PERFORMANCE REQUIREMENTS

- A. General: Provide complete sheet metal roofing system, including, but not limited to, custom-fabricated metal roof pans, cleats, clips, anchors and fasteners, sheet metal flashing and drainage components related to sheet metal roofing, fascia panels, trim, underlayment, and accessories as indicated and as required for a weathertight installation.
- B. Wind-Uplift Resistance: Provide custom-fabricated sheet metal roofing capable of resisting the following design negative uplift pressure. Provide clips, fasteners, and clip spacings of type indicated and with capability to sustain, without failure, a load equal to 3 times the design negative uplift pressure.

1. Design Negative Uplift Pressures:

<u>AREA</u>	<u>Positive</u>	<u>Negative</u>
Main Roof	35 psf	35 psf
Roof Edges	35 psf	45 psf
Roof Corners	35 psf	68 psf

C. Thermal Movements: Provide sheet metal roofing that allows for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, hole elongation, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Provide clips that resist rotation and avoid shear stress as a result of sheet metal roofing thermal movements. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

D. Water Infiltration: Provide sheet metal roofing that does not allow water infiltration to building interior, with metal flashing and connections of sheet metal roofing lapped to allow moisture to run over and off the material.

E. Metal Protection: Where dissimilar metals will contact each other, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by manufacturers of dissimilar metals or by fabricator. Metal protection shall not be visible to public in final configuration.

1.5 QUALITY ASSURANCE

A. Custom-Fabricated Sheet Metal Roofing Fabricator Qualifications: Shop that employs skilled workers who custom-fabricate sheet metal roofing similar to that required for this Project and whose products have a record of successful in-service performance. Shop must have 5 years minimum experience doing work of similar scope and complexity.

B. FM Approvals Listing: Provide roofing, base flashings, and component materials that comply with requirements in FM Approvals 4450 and FM Approvals 4470 as part of a roofing system, and that are listed in FM Approvals' "RoofNav" for Class 1 or noncombustible construction, as applicable. Identify materials with FM Approvals markings. Obtain FM acceptance of system proposed for use prior to ordering materials.

1. Roofing System:

2. Fire/Windstorm Classification: In accordance with FM recommendations.

3. Roofing shall meet FM Global requirements for rating in the field of the roof, perimeter and corners.

4. Provide additional securement as required in FMG Data Sheet 1-52.

5. Hail Resistance: MH and in accordance with FM recommendations.

6. Provide "RoofNav" assembly number corresponding to an FM approved roof assembly. Refer to www.roofnav.com for information and Form 2688.

- C. Sheet Metal Roofing Standard: Comply with SMACNA's "Architectural Sheet Metal Manual." Conform to dimensions and profiles shown unless more stringent requirements are indicated.
- D. Pre-installation Roofing Conference: Before starting roof construction, conduct conference at Project site. Review methods and procedures related to roof construction and sheet metal roofing including, but not limited to, the following:
 - 1. Meet with Authority, Architect, Authority's insurer if applicable, sheet metal roofing Installer, and installers whose work interfaces with or affects sheet metal roofing including installers of roof substrates, accessories and roof-mounted equipment.
 - 2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
 - 3. Review methods and procedures related to sheet metal roofing installation.
 - 4. Examine substrate conditions for compliance with requirements, including flatness and attachment to structural members.
 - 5. Review structural loading limitations of substrate during and after roofing.
 - 6. Review flashings, special roof details, roof drainage, roof penetrations, equipment curbs, and condition of other construction that will affect sheet metal roofing.
 - 7. Review governing regulations and requirements for insurance, certificates, and testing and inspecting if applicable.
 - 8. Review temporary protection requirements for sheet metal roofing during and after installation.
 - 9. Review roof observation and repair procedures after sheet metal roofing installation.
- E. Mockups: Build full scale mockups for each roofing type to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
 - 1. Provide Sheet Metal Roofing work required to complete mock-up; including supports, attachments, and accessories. Provide each roof condition such as internal and external corners, fascia wrapping, parapet or ridge condition.
 - 2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Engineer specifically approves such deviations in writing.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver sheet metal roofing, components, and other sheet metal roofing materials so as not to be damaged or deformed. Package sheet metal roofing materials for protection during transportation and handling.
- B. Unload, store, and erect sheet metal roofing materials in a manner to prevent bending, warping, twisting, and surface damage.
- C. Stack materials on platforms or pallets, covered with suitable weathertight and ventilated covering.
- D. Store sheet metal roofing materials to ensure dryness. Do not store sheet metal roofing materials in contact with other materials that might cause staining, denting, or other surface damage.

- E. Store metal away from uncured concrete and masonry.
- F. Protect strippable protective covering on sheet metal roofing from exposure to sunlight and high humidity, except to extent necessary for period of sheet metal roofing installation.

1.7 WARRANTY

- A. Submit 2-part, 5-year, written, signed and sealed warranty:
 - 1. By the roofing manufacturer for roof material defects
 - 2. By the manufacturers of other components of the wall assembly for their material defects.
 - 3. By the installer agreeing to repair or replace systems or components as a result of workmanship defects.
 - a. Structural failures.
 - b. Loose parts.
 - c. Wrinkling or buckling.
 - d. Failure to remain weathertight, including uncontrolled water leakage.
 - e. Deterioration of metals, metal finishes, and other materials beyond normal weathering, including nonuniformity of color or finish.
 - f. Galvanic action between sheet metal roofing and dissimilar materials.
 - 4. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 ROOFING MATERIALS

- A. Zinc Alloy Sheet/Coils: Zinc Alloy meeting ASTM B69-13 for ARCHITECTURAL rolled zinc whose base is electrolytic high grade fine zinc (DIN EN1179) with a 99.995 % Zn degree of purity and alloying additives of 1% copper and 1% titanium in accordance with DIN EN 988.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Rheinzink America Inc.; RHEINZINK.
 - b. Umicore Building Products USA, Inc.; VM ZINC series.
 - c. Jarden Zinc Products; Zinc meeting ASTM B69-13.
 - 2. Pre-Weathered: Pickling process (no phosphating)
 - 3. Minimum Panel Thickness: 0.7 mm
 - 4. Minimum Flashing Thickness: 0.7 mm
 - 5. Finish: Standard manufacturer's palette .
- B. Aluminum Sheet: ASTM B 209 (ASTM B 209M), alloy as standard with manufacturer for finish required, with temper as required to suit forming operations and performance required; with smooth, flat surface.
 - 1. Thickness: 0.040 inch (1.02 mm) unless otherwise indicated.

- a. Batten Caps: 0.050 inch (1.27 mm) thick.
 - b. Exterior Finish: Clear anodized.
- C. Flashing shall be the same material type, finish, color, and thickness as the roof panels, but the temper may be reduced to facilitate fabrication.
- D. Gutters and Downspouts shall be manufactured from 316L Stainless Steel, minimum thickness - 12 gauge.
 - 1. Gutter shape shall be as shown on drawings.
 - 2. Allowances for gutter expansion shall be determined per SMACNA Plate 6, and butt type expansion joints per SMACNA Plate 8 shall spaced a maximum 30 ft. -0 in. on centers.
 - 3. The minimum width for the gutter bottom is 12 in.
 - 4. The minimum downspout size is 3 in diameter.
 - 5. The gutter shall be fabricated as a fully welded trough with end plates and 6" tail pipes.
 - 6. Gutter sets in a supporting steel channel, provide separation pad between materials.
 - 7. Downspout strainers: Provide custom fabricated 3" diameter stainless steel strainers with 70% open perforations, including at the top cap. Strainers shall be 6" tall, with 3" exposed above the gutter bottom.
- E. Snow Guards: Prefabricated, noncorrosive units designed to be installed without penetrating sheet metal roofing, and complete with predrilled holes, clamps, or hooks for anchoring.
 - 1. Seam-Mounted, Bar-Type Snow Guards: Stainless-steel rods or bars held in place by stainless- steel clamps attached to vertical ribs of standing-seam sheet metal roofing.
 - a. Stainless-Steel Finish: Mill.
 - b. Provide one of the following or approved equal:
 - 1. Alpine Snow Guards, Div. of Vermont Slate & Copper Services, Inc.; Model No. 05-98.
 - 2. LMCurbs; S-5! SnoFence.
 - 3. Riddell & Company, Inc.; Snobar.
 - 4. Snow Management Systems, a division of Contek, Inc.; Vermont Snowguard.
- F. Pipe Flashing: Premolded, EPDM pipe collar with flexible aluminum ring bonded to base.

2.2 PRODUCT PERFORMANCE

- A. The standing seam roof system shall be designed to safely resist the positive and negative loads as required for the location and type of project designed. The panel system shall have a U.L. Class 90 rating.
- B. Structural-uniform uplift load capacity of the panel system shall be determined in accordance with the principles of ASTM E1592, "Standard Test Method for Structural Performance of Sheet Metal Roof and Siding Systems by Uniform Static Air Pressure Difference" as follows:

- C. The Factor of Safety on the test results shall be 1.65 for the panel and clip/halter ultimate loads with no increase for wind.
 - 1. The Factor of Safety for fasteners shall be 3.0 for single fastener in each connection, 2.25 for 2 or more fasteners in each connection and 4.0 in masonry.
 - 2. Design uplift capacity for condition of gage, span or loading other than those tested may be determined by interpolation of test results.
 - 3. Deflection shall be I/180 for positive loading.
- D. Water penetration of the panel assembly at 20psf pressure for 15 minutes at 5 gal./hr./sf shall have "no uncontrollable leakage" when tested in accordance with ASTM E331 and ASTM E1646.
- E. Panels are to be fabricated full length with absolutely no end lap conditions allowed. The manufacturing equipment must be owned and operated by the manufacturer who must also be the installer and take complete responsibility for the entire workscope.
- F. Fasten the roofing panels to the structure through the use of concealed halters/clips which are designed to allow for all panel movement through a temperature differential of 180°F without impeding the performance of the panel.

2.3 UNDERLAYMENT MATERIALS

- A. Self-Adhering, High-Temperature Sheet: 30 to 40 mils thick minimum, consisting of slip-resisting polyethylene-film top surface laminated to layer of butyl or SBS-modified asphalt adhesive, with release-paper backing; cold applied. Provide primer when recommended by underlayment manufacturer.
 - 1. Thermal Stability: Stable after testing at 240 deg F; ASTM D 1970.
 - 2. Low Temperature Flexibility: Passes after testing at minus 20 deg F; ASTM D 1970.
 - 3. Available Products:
 - a. Carlisle Coatings & Waterproofing, Div. of Carlisle Companies Inc.; Dri-Start "HR" High Performance Roofing Underlayment.
 - b. Grace, W. R. & Co.; Vycor Ultra.
 - c. Henry Company; Perma-Seal PE.
 - d. Metal-Fab Manufacturing, LLC; MetShield.
 - e. TC MiraDRI; WIP 300HT.
- B. Roof Underlayment: Enkamat 7010 AirZ, or equal compatible with adjacent materials

2.4 MISCELLANEOUS MATERIALS

- A. General: Provide materials and types of fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required for a complete roofing system and as recommended by fabricator for sheet metal roofing.
- B. Solder for Zinc: ASTM B 32, 60 percent lead and 40 percent tin with low antimony, as recommended by manufacturer.

- C. Elastomeric Joint Sealant: ASTM C 920, of base polymer, type, grade, class, and use classifications required to produce joints in sheet metal roofing that will remain weathertight and as recommended by roll-formed sheet metal roofing manufacturer for installation indicated.
- D. Bituminous Coating: Cold-applied asphalt emulsion according to ASTM D 1187.

2.5 ACCESSORIES

- A. Sheet Metal Roofing Accessories: Provide components required for a complete sheet metal roofing assembly including trim, copings, fasciae, corner units, ridge closures, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of sheet metal roofing, unless otherwise indicated.
 - 1. Cleats: Intermittent and continuous attachment devices for mechanically seaming into joints and formed from the following materials and thicknesses unless otherwise indicated:
 - a. Aluminum Roofing: 0.0250-inch thick stainless steel.
 - b. Zinc Roofing: Manufacturer's preformed stainless-steel cleats.
 - 2. Expansion-Type Cleats: Cleats of a design that allows longitudinal movement of roof panels without stressing panel seams; of same material as other cleats.
 - 3. Backing Plates: Plates at roofing splices, fabricated from material recommended by SMACNA.
 - 4. Closure Strips: Closed-cell, expanded, cellular, rubber or crosslinked, polyolefin foam or closed-cell laminated polyethylene; minimum 1-inch- (25-mm-) thick, flexible-closure strips; cut or premolded to match sheet metal roofing profile. Provide closure strips where necessary to ensure weathertight construction.
 - 5. Clips: Minimum 0.024-in. thick, stainless-steel panel clips designed to withstand negative-load requirements.

2.6 FABRICATION

- A. General: Custom fabricate sheet metal roofing to comply with details shown and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions (panel width and seam height), geometry, metal thickness, and other characteristics of installation. Fabricate sheet metal roofing and accessories in shop to greatest extent possible.
 - 1. Flat-Seam Roofing: Form flat-seam panels from metal sheets 15 by 24 inches with 1/2-inch (13-mm) notched and folded edges.
 - 2. Batten-Seam Roofing: Form batten-seam panels with edges turned up 1.5 inches and with 1/2-inch (13-mm) flange turned toward center of pan.
 - 3. Zinc Double-Lock Standing Seam: Double-Lock Standing Seam 1.5 inch high seams. (maximum width 15.75" o.c.).
- B. Fabricate sheet metal roofing to allow for expansion in running work sufficient to prevent leakage, damage, and deterioration of the Work. Form exposed sheet metal work to fit substrates without excessive oil canning, buckling, and tool marks, true to line and levels indicated, and with exposed edges folded back to form hems.
 - 1. Form expansion joints of intermeshing hooked flanges, not less than 1 inch (25 mm) deep,

filled with butyl sealant concealed within joints.

2. Use lapped expansion joints only where indicated on Drawings.
- C. Sealant Joints: Where movable, nonexpansion-type joints are indicated or required to produce weathertight seams, form metal to provide for proper installation of elastomeric sealant, in compliance with SMACNA standards.
- D. Sheet Metal Accessories: Custom fabricate flashings and trim to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated. Obtain field measurements for accurate fit before shop fabrication.
1. Form exposed sheet metal accessories without excessive oil canning, buckling, and tool marks; true to line, levels, and slopes; and with exposed edges folded back to form hems.
 2. Seams: Fabricate nonmoving seams with flat-lock seams. Tin edges to be seamed, form seams, and solder.
 3. Sealed Joints: Form nonexpansion, but movable, joints in metal to accommodate elastomeric sealant.
 4. Conceal fasteners and expansion provisions where possible. Do not use exposed fasteners on faces of accessories exposed to view.
 5. Fabricate cleats and attachment devices of sizes recommended by SMACNA's "Architectural Sheet Metal Manual" for application, but not less than thickness of metal being secured.
- E. Do not use graphite pencils to mark metal surfaces.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, substrate, and other conditions affecting performance of the Work.
1. Examine solid roof sheathing to verify that sheathing joints are supported by framing or blocking, that tops of fasteners are flush with surface, and that installation is within flatness tolerances required for finished roofing installation.
 2. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and completely anchored, and that provision has been made for drainage, flashings, and penetrations through sheet metal roofing.
- B. Examine roughing-in for components and systems penetrating sheet metal roofing to verify actual locations of penetrations relative to seam locations of sheet metal roofing before installation.

3.2 PREPARATION

- A. Coordinate metal roofing with rain drainage work, flashing, trim and construction of decks, parapets, walls, and other adjoining work to provide a permanently leakproof, secure, and noncorrosive installation.

3.3 INSTALLATION, GENERAL

- A. Manufacturer's Recommendations: Except as otherwise shown or specified, comply with recommendations and instructions of manufacturer of sheet metal being fabricated and installed.
- B. Separate dissimilar metals by painting each metal surface in area of contact with a bituminous coating, by applying rubberized asphalt underlayment to each metal surface, or by other permanent separation as recommended by manufacturers of dissimilar metals.
- C. Install flashings to cover underlayment according to requirements in Section 076200 "Sheet Metal Flashing and Trim."
- D. Form and fabricate sheets, seams, strips, cleats, valleys, ridges, edge treatments, integral flashings, and other components of metal roofing to profiles, patterns, and drainage arrangements shown and as required for permanently leakproof construction. Provide for thermal expansion and contraction of the work. Seal joints as shown and as required for leakproof construction. Shop-fabricate materials to greatest extent possible.
- E. Fabricate and install work with lines and corners of exposed units true and accurate. Form exposed faces flat and free of buckles, excessive waves, and avoidable tool marks considering temper and reflectivity of metal. Provide uniform, neat seams with minimum exposure of solder, welds, and sealant. Except as otherwise shown, fold back sheet metal to form a hem on concealed side of exposed edges.
- F. Conceal fasteners and expansion provisions where possible in exposed work, and locate so as to minimize possibility of leakage. Cover and seal fasteners and anchors as required for a tight installation.
- G. Soldered Joints: Clean surfaces to be soldered, removing oils and foreign matter. Pre-tin edges of sheets with solder to a width of 1-1/2 inches (38 mm); however, reduce pre-tinning where pre-tinned surface would show in completed Work.
 - 1. Do not solder aluminum sheet.

3.4 INSTALLATION

- A. The manufacturer must certify the installer in order to provide a complete single source weather-tight package.
- B. All attachments shall allow for thermal expansion and contraction of the roofing materials.
- C. Flat-Seam Roofing: Attach flat-seam metal panels to substrate with cleats, starting at eave and working upward toward ridge. After panels are in place, mallet seams tight and solder.
 - 1. Attach roofing panels with cleats spaced not more than 24 inches (600 mm) o.c. Lock and solder panels to base flashing.
 - 2. Attach edge flashing to face of roof edge with continuous cleat fastened to roof substrate at 12-inch (300-mm) o.c. spacing. Lock panels to edge flashing and solder.
- D. Batten-Seam Roofing: Attach batten-seam metal panels to substrate with cleats, starting at eave and working upward toward ridge. Hold cleats in place with battens and fold edges of cleats over to hold panels. After panels are in place and before batten cap is installed, apply continuous bead of sealant to top of upturned flanges of each panel. Install batten cap covering batten and panel

edges, and fold batten cap and panel together so batten cap and panel edges are completely engaged in seams.

- E. Standing-Seam Zinc Roofing: Attach standing-seam metal panels to substrate with cleats, starting at canopy edge and working upward toward gutter. After panels are in place, mallet seams tight and solder.
 - 1. Attach roofing panels with cleats spaced as required to meet FM Global standards. Lock and solder panels to base flashing.
 - 2. Attach edge flashing to face of canopy edge, as shown on drawings. Use continuous cleat fastened to roof substrate at as required to meet FM Global Standards. Lock panels to edge flashing and solder.

3.5 CLEANING AND PROTECTION

- A. Remove protective film (if any) from exposed surfaces of metal roofing promptly upon installation. Strip with care to avoid damage to finishes.
- B. Clean and neutralize flux materials. Clean off excess solder.
- C. Provide final protection in a manner acceptable to installer that ensures that metal roofing is without damage or deterioration at time of Substantial Completion.
- D. Replace sheet metal roofing components that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07720

ROOF ACCESSORIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies roof hatches and roof tie-offs.
- B. Related Work:
 - 1. Section 05500 - MISCELLANEOUS METALS: Metal vertical ladders
 - 2. Section 06100 - ROUGH CARPENTRY: Wood cants and wood nailers
 - 3. Section 07620 - SHEET METAL FLASHING AND TRIM: Shop- and field-fabricated metal flashing and counterflashing, roof expansion-joint covers, and miscellaneous sheet metal trim and accessories.
 - 4. Division 15 - HEATING, VENTILATING, AND AIR CONDITIONING: Roof-mounted ventilators.
 - 5. Division 16 - ELECTRICAL: Power supply and final connections for automatically operated heat and smoke vents.

1.2 SUBMITTALS

- A. Product Data: For each type of roof accessory indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
- B. Shop Drawings: Show fabrication and installation details for roof accessories. Show layouts of roof accessories including plans and elevations. Indicate dimensions, weights, loadings, required clearances, method of field assembly, and components. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Roof Tie-Offs: Include provide plans, elevations, and details of anchorages, connections and accessory items. Provide installation templates for work installed by others. Show the general arrangement of all components, clearances and principal dimensions, assemblies of window washing equipment. Include weights of components and maximum loads and spacings. Include the seal of a qualified professional engineer who is legally qualified to practice in the Commonwealth of Massachusetts. As part of shop drawings, include a safety inspection log book for yearly inspections. Submit two copies of as-built shop drawings showing anchor locations and details. This drawing shall be posted near exits onto the roof.

1.3 QUALITY ASSURANCE

- A. Sheet Metal Standard: Comply with SMACNA's "Architectural Sheet Metal Manual" details for fabrication of units, including flanges and cap flashing to coordinate with type of roofing indicated.
- B. FM Approvals Listing: Provide roof accessories and component materials that comply with requirements in FM Approvals 4450 and FM Approvals 4470 as part of a membrane roofing system, and that are listed in FM Approvals' "RoofNav" for Class 1 or noncombustible construction,

as applicable. Identify materials with FM Approvals markings. Obtain FM acceptance of system proposed for use prior to ordering materials.

1. Roofing System:

- a. Fire/Windstorm Classification: In accordance with FM recommendations.
- b. Roofing shall meet FM Global requirements for rating in the field of the roof, perimeter and corners.
- c. Provide additional securement as required in FMG Data Sheet 1-29.
- d. Hail Resistance: MH and in accordance with FM recommendations.
- e. Provide "RoofNav" assembly number corresponding to an FM approved roof assembly. Refer to www.roofnav.com for information and Form 2688.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Pack, handle, and ship roof accessories properly labeled in heavy-duty packaging to prevent damage.

1.5 PROJECT CONDITIONS

- A. Field Measurements: Verify required openings for each type of roof accessory by field measurements before fabrication and indicate measurements on Shop Drawings.

1.6 COORDINATION

- A. Coordinate layout and installation of roof accessories with roofing membrane and base flashing and interfacing and adjoining construction to provide a leakproof, weathertight, secure, and noncorrosive installation.

PART 2 -PRODUCTS

2.1 ROOF HATCHES

- A. Roof Hatches: Fabricate roof hatches with insulated double-wall lids and insulated double-wall curb frame with integral deck mounting flange and lid frame counterflashing. Fabricate with welded or mechanically fastened and sealed corner joints. Provide continuous weathertight perimeter gasketing and equip with corrosion-resistant or hot-dip galvanized hardware.

1. Available Manufacturers:

- a. Babcock-Davis; a Cierra Products Inc. Company.
- b. Bilco Company (The).
- c. Nystrom, Inc.
- d. O'Keeffe's Inc.
- e. Wasco Products, Inc.

2. Loads: Fabricate roof hatches to withstand 40-lbf/sq. ft. external and 20-lbf/sq. ft. internal loads.

3. Type and Size: Lid type and size as indicated on the Drawings.

4. Curb and Lid Material: Galvanized steel sheet, 0.079 inch thick.
5. Insulation: Manufacturer's standard board insulation.
6. Interior Lid Liner: Manufacturer's standard metal liner of same material and finish as outer metal lid.
7. Exterior Curb Liner: Manufacturer's standard metal liner of same material and finish as metal curb.
8. Fabricate units to minimum height of 12 inches unless otherwise indicated.
9. Hardware: Galvanized steel spring latch with turn handles, butt- or pintle-type hinge system, and padlock hasps inside and outside.
10. Ladder Safety Post: Manufacturer's standard ladder safety post. Post to lock in place on full extension. Provide release mechanism to return post to closed position.

2.2 ROOF TIE-OFFS

- A. Roof Tie-Offs (Safety Tie-Back Anchors): Model SM-4 by Summit Anchor Company, or equal by ProBel, Boston Anchor or equal.
 1. Configuration: Forged pad eye quenched and tempered, welded to high-strength steel tube and welded to base plate and set flush with substrate.
 2. Material: Hot-dip galvanized steel with stainless steel bolts.

2.3 MISCELLANEOUS MATERIALS

- A. Wood Nailers: Softwood lumber, pressure treated with waterborne preservatives for aboveground use, complying with AWPA C2; not less than 1-1/2 inches thick.
- B. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.
- C. Fasteners: Same metal as metals being fastened, or nonmagnetic stainless steel or other noncorrosive metal as recommended by roof accessory manufacturer. Match finish of exposed fasteners with finish of material being fastened. Provide nonremovable fastener heads to exterior exposed fasteners.
- D. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, or PVC; or flat design of foam rubber, sponge neoprene, or cork.
- E. Elastomeric Sealant: ASTM C 920, polyurethane sealant; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of work.

1. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored and is ready to receive roof accessories.
2. Verify dimensions of roof openings for roof accessories.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General: Install roof accessories according to manufacturer's written instructions. Anchor roof accessories securely in place and capable of resisting forces specified. Use fasteners, separators, sealants, and other miscellaneous items as required for completing roof accessory installation. Install roof accessories to resist exposure to weather without failing, rattling, leaking, and fastener disengagement.
- B. Install roof accessories to fit substrates and to result in watertight performance.
- C. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.
 1. Coat concealed side of uncoated aluminum roof accessories with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.
 2. Underlayment: Where installing exposed-to-view components of roof accessories directly on cementitious or wood substrates, install a course of felt underlayment and cover with a slip sheet, or install a course of polyethylene underlayment.
 3. Bed flanges in thick coat of asphalt roofing cement where required by roof accessory manufacturers for waterproof performance.
- D. Install roof accessories level, plumb, true to line and elevation, and without warping, jogs in alignment, excessive oil canning, buckling, or tool marks.
- E. Roof Hatch Installation:
 1. Check roof hatch for proper operation. Adjust operating mechanism as required. Clean and lubricate joints and hardware.
 2. Attach safety railing system to roof hatch curb.
 3. Attach ladder safety post according to manufacturer's written instructions.
- F. Roof Tie-Off Installation: Erect and install tieback and lifeline anchor systems complete in accordance with the approved shop drawings and all applicable codes, and in accordance with manufacturer's recommendations.
- G. Seal joints with elastomeric sealant as required by manufacturer of roof accessories.

3.3 TOUCH UP

- A. Touch up factory-primed surfaces with compatible primer ready for field painting in accordance with Division 9 painting Sections.
- B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair

galvanizing to comply with ASTM A 780.

3.4 CLEANING

- A. Clean exposed surfaces according to manufacturer's written instructions.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07811

SPRAYED FIRE-RESISTIVE MATERIALS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies exposed and concealed sprayed fire-resistive materials.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 03300 - CAST-IN-PLACE CONCRETE: Concrete protecting structural steel.
 - 3. Section 04800 - MASONRY: Masonry protecting structural steel.
 - 4. Section 05120 - STRUCTURAL STEEL FOR STATIONS AND BUILDINGS: Surface conditions required for structural steel receiving sprayed fire-resistive materials.
 - 5. Section 07840 - FIRESTOPPING: Firestopping and firesafing insulation.
 - 6. Section 09260 - GYPSUM BOARD ASSEMBLIES: Fire-resistance-rated assemblies.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Structural framing plans indicating the following:
 - 1. Locations and types of surface preparations required before applying sprayed fire-resistive material.
 - 2. Extent of sprayed fire-resistive material for each construction and fire-resistance rating, including the following:
 - a. Applicable fire-resistance design designations of a qualified testing and inspecting agency acceptable to authorities having jurisdiction.
 - b. Minimum thicknesses needed to achieve required fire-resistance ratings of structural components and assemblies.
 - 3. Treatment of sprayed fire-resistive material after application.
- C. Samples for Verification: For each type of colored, exposed sprayed fire-resistive material, two Samples, each 4 inches square, of each color, texture, and material formulation to be applied. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.
- D. Qualification Data: For Installer, manufacturer, and testing agency.
- E. Compatibility and Adhesion Test Reports: From sprayed fire-resistive material manufacturer indicating the following:

1. Materials have been tested for bond with substrates.
 2. Materials have been verified by sprayed fire-resistive material manufacturer to be compatible with substrate primers and coatings.
 3. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.
- F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for proposed sprayed fire-resistive materials.

1.3 QUALITY ASSURANCE

- A. Installer Qualifications: A firm or individual certified, licensed, or otherwise qualified by sprayed fire-resistive material manufacturer as experienced and with sufficient trained staff to install manufacturer's products according to specified requirements. A manufacturer's willingness to sell its sprayed fire-resistive materials to Contractor or to an installer engaged by Contractor does not in itself confer qualification on the buyer.
1. Installer's responsibilities include providing professional engineering services needed to assume engineering responsibility for designation of restrained and unrestrained conditions.
- B. Testing Agency Qualifications: An independent third party testing agency, acceptable to authorities having jurisdiction, with the experience and capability to conduct the testing indicated, as documented according to ASTM E 548.
- C. Source Limitations: Obtain sprayed fire-resistive materials through one source from a single manufacturer.
- D. Sprayed Fire-Resistive Materials Testing: By a qualified third party testing and inspecting agency engaged by Contractor or manufacturer to test for compliance with specified requirements for performance and test methods.
1. Sprayed fire-resistive materials are randomly selected for testing from bags bearing the applicable classification marking of UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
 2. Testing is performed on specimens of sprayed fire-resistive materials that comply with laboratory testing requirements specified in Part 2 and are otherwise identical to installed fire-resistive materials, including application of accelerant, sealers, topcoats, tamping, troweling, rolling, and water overspray, if any of these are used in final application.
 3. Testing is performed on specimens whose application the independent testing and inspecting agency witnessed during preparation and conditioning. Include in test reports a full description of preparation and conditioning of laboratory test specimens.
- E. Compatibility and Adhesion Testing: Engage a qualified testing and inspecting agency to test for compliance with requirements for specified performance and test methods.
1. Test for bond per ASTM E 736 and requirements in UL's "Fire Resistance Directory" for coating materials. Provide bond strength indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
 2. Verify that manufacturer, through its own laboratory testing or field experience, has not

found primers or coatings to be incompatible with sprayed fire-resistive material.

- F. Fire-Test-Response Characteristics: Provide sprayed fire-resistive materials with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify bags containing sprayed fire-resistive materials with appropriate markings of applicable testing and inspecting agency.
 - 1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory" or from the listings of another testing and inspecting agency acceptable to authorities having jurisdiction, for sprayed fire-resistive material serving as direct-applied protection tested per ASTM E 119.
 - 2. Surface-Burning Characteristics: ASTM E 84.
- G. Provide products containing no detectable asbestos as determined according to the method specified in 40 CFR 763, Subpart E, Appendix E, Section 1, "Polarized Light Microscopy".
- H. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1. Review methods and procedures related to sprayed fire-resistive materials including, but not limited to, the following:
 - 1. Review and finalize construction schedule and verify sequencing and coordination requirements.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to Project site in original, unopened packages with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, shelf life if applicable, and fire- resistance ratings applicable to Project.
- B. Use materials with limited shelf life within period indicated. Remove from Project site and discard materials whose shelf life has expired.
- C. Store materials inside, under cover, aboveground, and kept dry until ready for use. Remove from Project site and discard wet or deteriorated materials.

1.5 PROJECT CONDITIONS

- A. Environmental Limitations: Do not apply sprayed fire-resistive material when ambient or substrate temperature is 40 deg F or lower unless temporary protection and heat is provided to maintain temperature at or above this level for 24 hours before, during, and for 24 hours after product application.
- B. Ventilation: Ventilate building spaces during and after application of sprayed fire-resistive material.
- C. Use natural means or, if they are inadequate, forced-air circulation until fire-resistive material dries thoroughly.

1.6 COORDINATION

- A. Sequence and coordinate application of sprayed fire-resistive materials with other related work specified in other Sections to comply with the following requirements:
1. Provide temporary enclosure as required to confine spraying operations and protect the environment.
 2. Provide temporary enclosures for applications to prevent deterioration of fire-resistive material due to exposure to weather and to unfavorable ambient conditions for humidity, temperature, and ventilation.
 3. Avoid unnecessary exposure of fire-resistive material to abrasion and other damage likely to occur during construction operations subsequent to its application.
 4. Do not apply fire-resistive material to metal roof deck substrates until concrete topping, if any, has been completed. For metal roof decks without concrete topping, do not apply fire-resistive material to metal roof deck substrates until roofing has been completed; prohibit roof traffic during application and drying of fire-resistive material.
 5. Do not apply fire-resistive material to metal floor deck substrates until concrete topping has been completed.
 6. Except for thin-film intumescent fireproofing, do not begin applying fire-resistive material until clips, hangers, supports, sleeves, and other items penetrating fire protection are in place.
 7. Defer installing ducts, piping, and other items that would interfere with applying fire-resistive material until application of fire protection is completed.
 8. Do not install enclosing or concealing construction until after fire-resistive material has been applied, inspected, and tested and corrections have been made to defective applications.

1.7 WARRANTY

- A. Special Warranty: Manufacturer's standard form, signed by Contractor and by Installer, in which manufacturer agrees to repair or replace sprayed fire-resistive materials that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, the following:
1. Cracking, flaking, spalling, or eroding in excess of specified requirements; peeling; or delaminating of sprayed fire-resistive materials from substrates.
 2. Not covered under the warranty are failures due to damage by occupants and maintenance personnel, exposure to environmental conditions other than those investigated and approved during fire-response testing, and other causes not reasonably foreseeable under conditions of normal use.
- B. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 CONCEALED SPRAYED FIRE-RESISTIVE MATERIALS

- A. General: For concealed applications of sprayed fire-resistive materials, provide manufacturer's standard products complying with requirements indicated for material composition and physical properties representative of installed products.

- B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Cementitious Sprayed Fire-Resistive Material:
 - a. Carboline Co., Fireproofing Products Div.; Pyrolite 15 High Yield.
 - b. Grace, W. R. & Co.--Conn., Construction Products Div.; Monokote Type MK-6/HY.
 - c. Isolatek International Corp., Cafco Products; Cafco 300.
 - d. Southwest Vermiculite Co., Inc.; 5EF.
- C. Material Composition: Cementitious sprayed fire-resistive material consisting of factory-mixed, dry formulation of gypsum or Portland cement binders and lightweight mineral or synthetic aggregates mixed with water at Project site to form a slurry or mortar for conveyance and application.
- D. Physical Properties: Minimum values, unless otherwise indicated, or higher values required to attain designated fire-resistance ratings, measured per standard test methods referenced with each property as follows:
1. Dry Density: 15 lb/cu. ft. for average and individual densities regardless of density indicated in referenced fire-resistance design, or greater if required to attain fire-resistance ratings indicated, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method".
 2. Thickness: Provide minimum average thickness required for fire-resistance design indicated according to the following criteria, but not less than 0.375 inch, per ASTM E 605:
 - a. Where the referenced fire-resistance design lists a thickness of 1 inch or greater, the minimum allowable individual thickness of sprayed fire-resistive material is the design thickness minus 0.25 inch.
 - b. Where the referenced fire-resistance design lists a thickness of less than 1 inch but more than 0.375 inch, the minimum allowable individual thickness of sprayed fire-resistive material is the greater of 0.375 inch or 75 percent of the design thickness.
 - c. No reduction in average thickness is permitted for those fire-resistance designs whose fire-resistance ratings were established at densities of less than 15 lb/cu. ft.
 3. Bond Strength: 150 lbf/sq. ft. minimum per ASTM E 736 under the following conditions:
 - a. Field test sprayed fire-resistive material that is applied to flanges of wide-flange, structural steel members on surfaces matching those that will exist for remainder of steel receiving fire-resistive material.
 - b. If surfaces of structural steel receiving sprayed fire-resistive material are primed or otherwise painted for coating materials, perform series of bond tests specified in UL's "Fire Resistance Directory". Provide bond strength indicated in referenced UL fire-resistance criteria, but not less than 150 lbf/sq. ft. minimum per ASTM E 736.
 - c. Minimum thickness of sprayed fire-resistive material tested in laboratory shall be 0.75 inch.

4. Compressive Strength: 5.21 lbf/sq. in. as determined in the laboratory per ASTM E 761. Minimum thickness of sprayed fire-resistive material tested shall be 0.75 inch and minimum dry density shall be as specified, but not less than 15 lb/cu. ft.
5. Corrosion Resistance: No evidence of corrosion per ASTM E 937.
6. Deflection: No cracking, spalling, or delamination per ASTM E 759.
7. Effect of Impact on Bonding: No cracking, spalling, or delamination per ASTM E 760.
8. Air Erosion: Maximum weight loss of 0.025 g/sq. ft. in 24 hours per ASTM E 859. For laboratory tests, minimum thickness of sprayed fire-resistive material is 0.75 inch maximum dry density is 15 lb/cu. ft. test specimens are not prepurged by mechanically induced air velocities, and tests are terminated after 24 hours.
9. Fungal Resistance: No observed growth on specimens per ASTM G 21.

2.2 EXPOSED CEMENTITIOUS SPRAYED FIRE-RESISTIVE MATERIALS

- A. General: For exposed applications of sprayed fire-resistive materials, provide manufacturer's standard products complying with manufacturer's published performance for material composition and for minimum physical properties of each product listed, measured by standard test methods referenced with each property.
- B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 1. Exposed Cementitious Sprayed Fire-Resistive Material:
 - a. Carbolite Co., Fireproofing Products Div.; Pyrocrete 239.
 - b. Grace, W. R. & Co.--Conn., Construction Products Div.; Monokote Type Z106.
 - c. Isolatek International Corp., Cafco Products; Cafco 400.
 - d. York, Inc.; -MD.
 - e. Southwest Vermiculite Co., Inc.; FW7.

2.3 AUXILIARY FIRE-RESISTIVE MATERIALS

- A. General: Provide auxiliary fire-resistive materials that are compatible with sprayed fire-resistive materials and substrates and are approved by UL or another testing and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance designs indicated.
- B. Substrate Primers: For use on each substrate and with each sprayed fire-resistive product, provide primer that complies with one or more of the following requirements:
 1. Primer's bond strength complies with requirements specified in UL's "Fire Resistance Directory", for coating materials based on a series of bond tests per ASTM E 736.
 2. Primer is identical to those used in assemblies tested for fire-test-response characteristics of sprayed fire-resistive material per ASTM E 119 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Adhesive for Bonding Fire-Resistive Material: Product approved by manufacturer of sprayed fire-resistive material.

- D. Metal Lath: Expanded metal lath fabricated from material of weight, configuration, and finish required to comply with fire-resistance designs indicated and fire-resistive material manufacturer's written recommendations. Include clips, lathing accessories, corner beads, and other anchorage devices required to attach lath to substrates and to receive sprayed fire-resistive material.
- E. Reinforcing Fabric: Glass-fiber fabric of type, weight, and form required to comply with fire-resistance designs indicated, approved by manufacturer of intumescent mastic coating fire-resistive material.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrates and other conditions affecting performance of work. A substrate is in satisfactory condition if it complies with the following:
 - 1. Substrates comply with requirements in the Section where the substrate and related materials and construction are specified.
 - 2. Substrates are free of oil, grease, rolling compounds, incompatible primers, loose mill scale, dirt, or other foreign substances capable of impairing bond of fire-resistive materials with substrates under conditions of normal use or fire exposure.
 - 3. Objects penetrating fire-resistive material, including clips, hangers, support sleeves, and similar items, are securely attached to substrates.
 - 4. Substrates are not obstructed by ducts, piping, equipment, and other suspended construction that will interfere with applying fire-resistive material.
- B. Conduct tests according to fire-resistive material manufacturer's written recommendations to verify that substrates are free of oil, rolling compounds, and other substances capable of interfering with bond.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Cover other work subject to damage from fallout or overspray of fire-resistive materials during application.
- B. Clean substrates of substances that could impair bond of fire-resistive material, including dirt, oil, grease, release agents, rolling compounds, loose mill scale, and incompatible primers, paints, and encapsulants.
- C. For exposed applications, repair substrates to remove any surface imperfections that could affect uniformity of texture and thickness in finished surface of sprayed fire-resistive material. Remove minor projections and fill voids that would telegraph through fire-resistive products after application.

3.3 INSTALLATION, GENERAL

- A. Comply with fire-resistive material manufacturer's written instructions for mixing materials, application procedures, and types of equipment used to mix, convey, and spray on fire-resistive material, as applicable to particular conditions of installation and as required to achieve fire-resistance ratings indicated.
- B. Apply sprayed fire-resistive material that is identical to products tested as specified in Part 1 "Quality Assurance" Article and substantiated by test reports, with respect to rate of application, accelerator use, sealers, topcoats, tamping, troweling, water overspray, or other materials and procedures affecting test results.
- C. Install metal lath, as required, to comply with fire-resistance ratings and fire-resistive material manufacturer's written recommendations for conditions of exposure and intended use. Securely attach lath to substrate in position required for support and reinforcement of fire-resistive material. Use anchorage devices of type recommended in writing by sprayed fire-resistive material manufacturer. Attach lathing accessories where indicated or required for secure attachment to substrate.
- D. Coat substrates with adhesive before applying fire-resistive material where required to achieve fire-resistance rating or as recommended in writing by sprayed fire-resistive material manufacturer for material and application indicated.
- E. Extend fire-resistive material in full thickness over entire area of each substrate to be protected.
- F. Unless otherwise recommended in writing by sprayed fire-resistive material manufacturer, install body of fire-resistive covering in a single course.
- G. Spray apply fire-resistive materials to maximum extent possible. Following the spraying operation in each area, complete the coverage by trowel application or other placement method recommended in writing by sprayed fire-resistive material manufacturer.
- H. Where sealers are used, apply products that are tinted to differentiate them from sprayed fire-resistive material over which they are applied.

3.4 INSTALLATION, CONCEALED SPRAYED FIRE-RESISTIVE MATERIALS

- A. Apply concealed sprayed fire-resistive material in thicknesses and densities not less than those required to achieve fire-resistance ratings designated for each condition, but apply in greater thicknesses and densities if specified in Part 2 "Concealed Sprayed Fire-Resistive Materials" Article.

3.5 INSTALLATION, EXPOSED SPRAYED FIRE-RESISTIVE MATERIALS

- A. Apply exposed sprayed fire-resistive material in thicknesses and densities not less than those required to achieve fire-resistance ratings designated for each condition, but apply in greater thicknesses and densities if indicated.
- B. Provide a uniform finish complying with description indicated for each type of material and matching Engineer's sample or, if none, finish approved for field-erected mockup.

- C. Apply exposed cementitious sprayed fire-resistive material to produce the following finish:
 - 1. Spray-textured finish with no further treatment.
- D. Cure exposed cementitious sprayed fire-resistive material according to product manufacturer's written recommendations to prevent premature drying.

3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified independent testing and inspecting agency to perform field tests and inspections and to prepare test reports.
 - 1. Testing and inspecting agency will interpret tests and state in each report whether tested work complies with or deviates from requirements.
- B. Remove and replace applications of sprayed fire-resistive material where test results indicate that it does not comply with specified requirements for cohesion and adhesion, for density, or for both.
- C. Apply additional sprayed fire-resistive material per manufacturer's written instructions where test results indicate that thickness does not comply with specified requirements.
- D. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.7 CLEANING, PROTECTING, AND REPAIR

- A. Cleaning: Immediately after completing spraying operations in each containable area of Project, remove material overspray and fallout from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.
- B. Protect sprayed fire-resistive material, according to advice of product manufacturer and Installer, from damage resulting from construction operations or other causes so fire protection will be without damage or deterioration at time of Substantial Completion.
- C. Coordinate application of sprayed fire-resistive material with other construction to minimize need to cut or remove fire protection. As installation of other construction proceeds, inspect sprayed fire-resistive material and patch any damaged or removed areas.
- D. Repair or replace work that has not been successfully protected.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07812

INTUMESCENT FIREPROOFING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies spray applied intumescent fireproofing.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 09900 – PAINTING; Finish top coats on top of intumescent fireproofing

1.2 REFERENCES

- A. Comply with applicable requirements of the following standards. Where these standards conflict with other specified requirements, the most restrictive requirement shall govern.
 - 1. American Society for Testing and Materials (ASTM):
 - E 84 Test for Surface Burning Characteristics of Building Materials
 - E 119 Fire Tests of Building Construction and Materials
 - 2. Steel Structures Painting Council (SSPC):
 - SP 1 Solvent Cleaning
 - SP 2 Hand Tool Cleaning
 - SP 3 Power Tool Cleaning
 - 3. Underwriters Laboratories, Inc. (UL):
 - UL Directory Fire Resistance Directory

1.3 SUBMITTALS

- A. Samples: Submit duplicate sample panels of sprayed-on intumescent fireproofing on sheet steel, at least 12 in. by 12 in., with proposed thickness, color, and surface finish.
- B. Product Data: Submit manufacturer's printed product data, specifications, standard details, installation instructions, use limitations and recommendations for each material used. Provide certifications that materials and systems comply with specified requirements.
- C. Test Reports: Provide certified reports for all specified tests indicating the following:
 - 1. Bond Strength of Fireproofing: ASTM D 4541, tested to provide minimum bond strength twenty times weight of fireproofing materials.
 - 2. Fire test reports of fireproofing application to substrate materials similar to project conditions.

3. U.L. Design Listings from U.L., Inc.

- D. Certification: Submit applicator's current certification, by product manufacturer, as a factory trained and manufacturer approved installer of this product.

1.4 QUALITY ASSURANCE

- A. Source: For each material type required for the work of this section, provide primary materials which are the product of one manufacturer. Provide secondary or accessory materials which are acceptable to the manufacturers of the primary materials.
- B. Installer: A firm with a minimum of three years experience in type of work required by this section and which is acceptable to the manufacturers of the primary materials.
- C. Mock-Ups: Prior to commencing the primary work of this section, provide 20 square foot mock-up at locations acceptable to Engineer. Obtain Engineer's acceptance of visual qualities. Protect and maintain accepted mock-ups throughout the remainder of the work of this section to serve as criteria for acceptance of the work. Approved mock-ups may be incorporated into the finished work.

1.5 ENVIRONMENTAL REQUIREMENTS

- A. When air and substrate temperature is less than 45 deg. F., follow manufacturer's field instructions for cold weather installation. Do not apply when surface temperature is less than 5 deg. F. above the dew point.
- B. Provide ventilation in areas to receive fireproofing during and 72 hours minimum after application, to dry materials and dissipate solvent odors.
- C. Maintain non-toxic, unpolluted working area. Provide temporary enclosures to prevent spray from contaminating air.

1.6 TESTS

- A. Fire Resistance Ratings: Where fire resistant ratings are indicated or required by Authorities having jurisdiction, provide materials and construction which are identical to assemblies whose fire resistance ratings have been tested in compliance with ASTM E 119 by independent agencies acceptable to the Engineer and authorities having jurisdiction.
- B. Burning Characteristics: Provide materials whose surface burning characteristics, when tested in compliance with ASTM E 84 are Class A.

1.7 DELIVERY, STORAGE AND HANDLING

- A. Manufactured materials shall be mill-mixed and shall be delivered in original, unopened packages bearing the name of the product, manufacturer's name, and the Underwriters' Laboratories, Inc. label.
- B. Materials shall be kept dry until ready for use, and shall be kept off the ground, under cover and away from sweating walls and other damp surfaces with minimum temperature of 55°F.

1.8 WARRANTY

- A. Provide certificate stating that sprayed fireproofing has been completed in full accordance with requirements to provide necessary fire resistance ratings.
- B. Provide warranty stating applied fireproofing will remain free from cracks, checking, dusting, flaking, separation, and blistering for one year from date of Substantial Completion, and that failure to provide such performance will constitute reinstallation or repair to satisfaction of Authority at no additional cost.

PART 2 - PRODUCTS

2.1 INTUMESCENT FIREPROOFING

- A. Provide CAFCO Sprayfilm WB5, thin film intumescent fireproof coating system for interior fire protection of structural steel, manufactured by Isolatek International, Stanhope, NJ 07874; or equal as manufactured by Carbolite or Albi.
 - 1. Provide materials that have been fire tested and classified by Underwriter's Laboratories in accordance with ASTM E 84 and E 119.
 - 2. Assume full responsibility for the proper performance of all materials used, for appropriateness of method of application with respect to materials used, for appropriateness of method of application with respect to materials used and substrates encountered, and for the compatibility of any materials applied with shop coats and other coats previously applied, including primers. Follow manufacturer's instructions for compatibility check.
 - 3. Durometer Hardness: 69, Shore D as per ASTM D 2240.
 - 4. Bond Strength: 340 psi minimum as per ASTM D 4541.
 - 5. Abrasion Resistance: 0.2600 g/1000 cycles loss as per ASTM D 4060.
 - 6. Impact Resistance: minimum 40 inch- lbs. intrusions, as per ASTM D 2794.
- B. Primer: Surface preparation of structural steel and primer is specified as work of Section 05100, STRUCTURAL STEEL. Coordinate with structural steel fabricator to ensure that compatible primers are used.
- C. Top Coat: Colored top coats are specified as work of Section 09900, PAINTING. Coordinate with the painting trades to ensure that compatible top coats are applied in the field.

2.2 PERFORMANCE CRITERIA

- A. Materials, procedures for application, dry densities, and thickness necessary to provide the required protection shall be approved by UL for the uses and fire ratings indicated on the Drawings. Submit certification by an independent Testing Laboratory that materials, dry densities, thickness, and application procedures satisfy the requirements of the governing laws and building code, and UL requirements, with respect to the minimum protection requirements below when tested in accordance with ASTM E 119.
- B. Fireproofing Performance: Structural steel members throughout the Project to receive intumescent fireproofing shall be protected under this Section with adequate fireproofing thickness

to provide the fire resistance ratings indicated on the Drawings.

- C. Fire ratings interpolated or extrapolated from actual test data will not be acceptable. Provide evidence prior to application that proposed materials, and installation methods and materials have been approved by all authorities that have jurisdiction.

PART 3 - EXECUTION

3.1 PRIOR WORK OF OTHER SECTIONS

- A. Ducts, piping, conduit, and other suspended equipment which would interfere with the uniform application of the intumescent fireproofing material shall be positioned after application of fireproofing.
- B. Patching and repairing of intumescent fireproofing resulting from cutting or damage by other trades shall be performed under this Section.
- C. Finish Painting: Paint top coats will be applied in the field by the Painting Trade under Section 09900 PAINTING.

3.2 SURFACE PREPARATION

- A. Examine surfaces to which intumescent fireproofing is to be applied, and notify Engineer in writing of conditions detrimental to the proper and expeditious application of fireproofing which cannot be corrected by normal cleaning of surfaces. Starting of work within an area shall be construed as acceptance of the conditions of that area.
 - 1. Where shop painted steel is to be fireproofed with intumescent fireproofing, paint surface shall be checked for compatibility with intumescent coating prior to fireproofing application.
 - 2. Where compatibility is a problem, steel shall be sandblasted and reprimed with fireproofing manufacturer's recommended primer material.
- B. Application of fireproofing shall constitute acceptance of the suitability of the surface to receive this work by the fireproofing applicator.

3.3 SAMPLE AREA

- A. Install 20 sq. ft. minimum sample area of fireproofing comprising a typical column installation for joint approval by representative of fireproofing manufacturer and Engineer and local authority (if required). Fireproofing in other areas shall not proceed until sample installation is approved. Approved sample installation shall remain in place and open to observation as a standard for fireproofing work.

3.4 MIXING AND APPLICATION

- A. Mixing and installation shall conform to manufacturer's published instructions.
- B. Materials and equipment shall be as approved by materials manufacturer. Application shall be by manufacturer's licensed applicators. Provide supervisory services of qualified manufacturer's representative for initial application.

- C. Work shall comply with applicable UL standards in addition to requirements imposed by applicable laws and codes, for indicated ratings.
- D. Apply intumescent fireproofing exactly as described in certificates submitted to prove compliance with specified protection requirements. Control application to maintain uniform quality and thickness.
 - 1. Apply in number of coats required in accordance with UL Directory. Final wet film thickness application shall meet or exceed that required for specified rating.
 - 2. Prior to drying of surface film, all surfaces shall be rolled to remove unsightly drippings or surface irregularities.

3.5 CLEAN-UP

- A. Upon completion of each day's work, sweep area clean, place waste material in suitable bags or containers, and remove from site.
- B. Upon completion of fireproofing work, clean walls, floors, and surrounding surfaces of overspray, drippings, etc.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07840

FIRESTOPPING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Through-penetration firestop systems for penetrations through fire-resistance-rated constructions, including both empty openings and openings containing penetrating items.
 - 2. Fire-resistive joint systems for floor, wall, and head-of-wall joints.

- B. Related Work:
 - 1. Section 07842 - FIRE-RESISTIVE JOINT SYSTEMS: Fire-resistive joint sealers.
 - 2. Section 07920 - JOINT SEALANTS: Standard joint sealers.
 - 3. Section 15400 – PLUMBING FIXTURES: Piping penetrations.
 - 4. Section 15500 - FIRE PROTECTION: Fire-suppression piping penetrations.
 - 5. Section 15600 – HEATING, VENTILATING, AND AIR CONDITIONING: Duct and piping penetrations.
 - 6. Division 16 – ELECTRICAL: Cable and conduit penetrations.

1.2 PERFORMANCE REQUIREMENTS

- A. General: For penetrations through fire-resistance-rated constructions, including both empty openings and openings containing penetrating items, provide through-penetration firestop systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of construction penetrated.

- B. F-Rated Systems: Provide through-penetration firestop systems with F-ratings indicated, but not less than that equaling or exceeding fire-resistance rating of constructions penetrated, as determined per ASTM E 814.

- C. For through-penetration firestop systems exposed to view, traffic, moisture, and physical damage, provide products that, after curing, do not deteriorate when exposed to these conditions both during and after construction.
 - 1. For piping penetrations for plumbing and wet-pipe sprinkler systems, provide moisture-resistant through-penetration firestop systems.
 - 2. For floor penetrations with annular spaces exceeding 4 inches in width and exposed to possible loading and traffic, provide firestop systems capable of supporting floor loads involved, either by installing floor plates or by other means.
 - 3. For penetrations involving insulated piping, provide through-penetration firestop systems not requiring removal of insulation.

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For each through-penetration firestop system, show each type of construction condition penetrated, relationships to adjoining construction, and type of penetrating item. Include firestop design designation of qualified testing and inspecting agency that evidences compliance with requirements for each condition indicated. Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each through-penetration firestop system configuration for construction and penetrating items.
- C. Through-Penetration Firestop System Schedule: Indicate locations of each through-penetration firestop system, along with the following information:
 - 1. Types of penetrating items.
 - 2. Types of constructions penetrated, including fire-resistance ratings and, where applicable, thicknesses of construction penetrated.
 - 3. Through-penetration firestop systems for each location identified by firestop design designation of qualified testing and inspecting agency.
- D. Qualification Data: For Installer and Inspection and Testing Agency.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: Either a firm that has been approved by FM Global according to FMG 4991, "Approval of Firestop Contractors" or a firm experienced in installing through-penetration firestop systems similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction of a minimum of five projects with a record of successful performance. Qualifications include having the necessary experience, staff, and training to install manufacturer's products per specified requirements.
- B. Source Limitations: Obtain through-penetration firestop systems, for each kind of penetration and construction condition indicated, through one source from a single manufacturer.
- C. Fire-Test-Response Characteristics: Provide through-penetration firestop systems that comply with the following requirements and those specified in Part 1 "Performance Requirements" Article:
 - 1. Firestop tests are performed by a qualified testing and inspecting agency.
 - 2. Through-penetration firestop systems are identical to those tested per testing standard referenced in Part 1 "Performance Requirements" Article. Provide rated systems complying with the following requirements:
 - a. Through-penetration firestop system products bear classification marking of qualified testing and inspecting agency.
 - b. Through-penetration firestop systems correspond to those indicated by reference to through-penetration firestop system designations listed in the UL "Fire Resistance Directory".

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver through-penetration firestop system products to Project site in original, unopened containers or packages with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, lot number, shelf life if applicable, qualified testing and inspecting agency's classification marking applicable to Project, curing time, and mixing instructions for multicomponent materials.
- B. Store and handle materials for through-penetration firestop systems to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install through-penetration firestop systems when ambient or substrate temperatures are outside limits permitted by through-penetration firestop system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.
- B. Ventilate through-penetration firestop systems per manufacturer's written instructions by natural means or, where this is inadequate, forced-air circulation.

1.7 COORDINATION

- A. Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to specified requirements.
- B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems.
- C. Do not cover up through-penetration firestop system installations that will become concealed behind other construction until each installation has been inspected by the building inspector, if required by authorities having jurisdiction.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Products: Subject to compliance with requirements, through-penetration firestop systems that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Hilti, Inc.
 - 2. BioFireshield; RectorSeal Corporation.
 - 3. 3M; Fire Protection Products Division.
 - 4. Or approved equal.

2.2 FIRESTOPPING MATERIALS

- A. Compatibility: Provide through-penetration firestop systems that are compatible with one another; with the substrates forming openings; and with the items, if any, penetrating through-penetration firestop systems, under conditions of service and application, as demonstrated by through-penetration firestop system manufacturer based on testing and field experience.

- B. **Materials:** Provide through-penetration firestop systems containing primary materials and fill materials which are part of the tested assemblies indicated in the Through-Penetration Firestop System Schedule at the end of Part 3. Fill materials are those referred to in directories of referenced testing and inspecting agencies as "fill", "void" or "cavity" materials.
- C. **Accessories:** Provide components for each through-penetration firestop system that are needed to install fill materials and to comply with requirements in this Section. Use only components specified by through-penetration firestop system manufacturer and approved by qualified testing and inspecting agency for firestop systems indicated

2.3 MIXING

- A. For those products requiring mixing before application, comply with through-penetration firestop system manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of work. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. **Surface Cleaning:** Clean out openings immediately before installing through-penetration firestop systems to comply with firestop system manufacturer's written instructions and with the following requirements:
 - 1. Remove from surfaces of opening substrates and from penetrating items foreign materials that could interfere with adhesion of through-penetration firestop systems.
 - 2. Clean opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with through-penetration firestop systems. Remove loose particles remaining from cleaning operation.
 - 3. Remove laitance and form-release agents from concrete.
- B. **Priming:** Prime substrates where recommended in writing by through-penetration firestop system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.
- C. **Masking Tape:** Use masking tape to prevent through-penetration firestop systems from contacting adjoining surfaces that will remain exposed on completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from firestop system materials. Remove tape as soon as possible without disturbing firestop system's seal with substrates.

3.3 THROUGH-PENETRATION FIRESTOP SYSTEM INSTALLATION

- A. General: Install through-penetration firestop systems to comply with requirements in this Section and with firestop system manufacturer's written installation instructions and published drawings for products and applications indicated.
- B. Install forming/damming/backing materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.
- C. Install fill materials for firestop systems by proven techniques to produce the following results:
 - 1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items as required to achieve fire-resistance ratings indicated.
 - 2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
 - 3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 FIELD QUALITY CONTROL

- A. Inspecting Agency: Engage a qualified, independent inspecting agency to inspect through-penetration firestops. Independent inspecting agency shall comply with ASTM E 2174 requirements including those related to qualifications, conducting inspections, and preparing test reports.
- B. Where deficiencies are found, repair or replace through-penetration firestop systems so they comply with requirements.
- C. Proceed with enclosing through-penetration firestop systems with other construction only after inspection reports are issued and firestop installations comply with requirements.

3.5 CLEANING AND PROTECTING

- A. Clean off excess fill materials adjacent to openings as Work progresses by methods and with cleaning materials that are approved in writing by through-penetration firestop system manufacturers and that do not damage materials in which openings occur.
- B. Provide final protection and maintain conditions during and after installation that ensure that through- penetration firestop systems are without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated through-penetration firestop systems immediately and install new materials to produce systems complying with specified requirements.

* No UL-Classified system is available as of August 2003. Engineer Judgement Drawing Required

NOTES:

1. Jobsite conditions of each through-penetration firestop system must meet all details of the UL-Classified System selected.
2. If jobsite conditions do not match any UL-classified systems in the schedules above, contact firestop manufacturer for alternative systems or Engineer Judgement Drawings.
3. Coordinate work with other trades to assure that penetration opening sizes are appropriate for penetrant locations, and vice versa.
4. For 3-hour rated gypsum walls, contact the firestop manufacturer for a UL-classified system or engineer judgement drawing.
5. The Contractor shall verify that the schedule is current at the time of construction, and that each referenced system is suitable for the intended application.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07842

FIRE-RESISTIVE JOINT SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies fire-resistive joint systems at the following locations.
1. Floor-to-floor joints.
 2. Floor-to-wall joints.
 3. Head-of-wall joints.
 4. Wall-to-wall joints.
 5. Perimeter fire-resistive joint systems consisting of floor-to-wall joints between perimeter edge of fire-resistance-rated floor assemblies and exterior curtain walls.
- B. Related Work:
1. Section 07840 - FIRESTOPPING: Firestopping for firestopping.
 2. Section 07920 - JOINT SEALANTS: Standard joint sealers.
 3. Section 15400 – PLUMBING FIXTURES: Piping penetrations.
 4. Section 15500 - FIRE PROTECTION: Fire-suppression piping penetrations.
 5. Section 15600 – HEATING, VENTILATING, AND AIR CONDITIONING: Duct and piping penetrations.
 6. Division 16 – ELECTRICAL: Cable and conduit penetrations.

1.2 PERFORMANCE REQUIREMENTS

- A. General: Provide fire-resistive joint systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of assembly in which fire-resistive joint systems are installed.
- B. For fire-resistive systems exposed to view, provide products with flame-spread and smoke-developed indexes of less than 25 and 450, respectively, as determined per ASTM E 84.

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For each fire-resistive joint system, show each kind of construction condition in which joints are installed; also show relationships to adjoining construction. Include fire-resistive joint system design designation of testing and inspecting agency acceptable to authorities having jurisdiction that demonstrates compliance with requirements for each condition indicated. Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each fire-resistive joint system configuration for construction

and penetrating items.

- C. Product Certificates: For each type of fire-resistive joint system, signed by product manufacturer.
- D. Qualification Data: For Installer and Inspection and Testing Agency.
- E. Field quality-control test reports.
- F. Research/Evaluation Reports: For each type of fire-resistive joint system.

1.4 QUALITY ASSURANCE

- A. Installation Responsibility: Assign installation of through-penetration firestop systems and fire-resistive joint systems in Project to a single qualified installer.
- B. Source Limitations: Obtain fire-resistive joint systems, for each kind of joint and construction condition indicated, through one source from a single manufacturer.
- C. Fire-Test-Response Characteristics: Provide fire-resistive joint systems that comply with the following requirements and those specified in this Section:
 - 1. A qualified testing and inspecting agency shall perform fire-resistance tests.
 - 2. Fire-resistive joint systems are identical to those tested per methods indicated in Article 1.2 "Performance Requirements" and comply with the following:
 - a. Fire-resistive joint system products bear classification marking of qualified testing and inspecting agency.
 - b. Fire-resistive joint systems correspond to those indicated by referencing system designations of the qualified testing and inspecting agency.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver fire-resistive joint system products to Project site in original, unopened containers or packages with qualified testing and inspecting agency's classification marking applicable to Project and with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, lot number, shelf life, curing time, and mixing instructions for multi-component materials.
- B. Store and handle materials for fire-resistive joint systems to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install fire-resistive joint systems when ambient or substrate temperatures are outside limits permitted by fire-resistive joint system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.
- B. Ventilate fire-resistive joint systems per manufacturer's written instructions by natural means or, if this is inadequate, forced-air circulation.

1.7 COORDINATION

- A. Coordinate construction of joints to ensure that fire-resistive joint systems are installed according to specified requirements.
- B. Coordinate sizing of joints to accommodate fire-resistive joint systems.
- C. Do not cover up fire-resistive joint system installations that will become concealed behind other construction until Contractor's inspecting agency and building inspector of authorities having jurisdiction have examined each installation. Warrantee: 2 years from substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Products: Subject to compliance with requirements, fire-resistive joint systems that may be incorporated into the Work include, but are not limited to, those systems indicated in the Fire- Resistive Joint System Schedule at the end of Part 3.
 - 1. Hilti, Inc.
 - 2. BioFireshield; RectorSeal Corporation.
 - 3. 3M; Fire Protection Products Division.
 - 4. Or approved equal.

2.2 FIRE-RESISTIVE JOINT SYSTEMS

- A. Compatibility: Provide fire-resistive joint systems that are compatible with joint substrates, under conditions of service and application, as demonstrated by fire-resistive joint system manufacturer based on testing and field experience.
- B. Accessories: Provide components of fire-resistive joint systems, including primers and forming materials that are needed to install fill materials and to comply with Part 1 "Performance Requirements" Article. Use only components specified by fire-resistive joint system manufacturer and approved by the qualified testing and inspecting agency for systems indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for joint configurations, substrates, and other conditions affecting performance of work.
 - 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Surface Cleaning: Clean joints immediately before installing fire-resistive joint systems to comply with fire-resistive joint system manufacturer's written instructions and the following

requirements:

1. Remove from surfaces of joint substrates foreign materials that could interfere with adhesion of fill materials.
 2. Clean joint substrates to produce clean, sound surfaces capable of developing optimum bond with fill materials. Remove loose particles remaining from cleaning operation.
 3. Remove laitance and form-release agents from concrete.
- B. Priming: Prime substrates where recommended in writing by fire-resistive joint system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.
- C. Masking Tape: Use masking tape to prevent fill materials of fire-resistive joint system from contacting adjoining surfaces that will remain exposed on completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from fire-resistive joint system materials. Remove tape as soon as possible without disturbing fire-resistive joint system's seal with substrates or damaging adjoining surfaces.

3.3 INSTALLATION

- A. General: Install fire-resistive joint systems to comply with Part 1 "Performance Requirements" Article and fire-resistive joint system manufacturer's written installation instructions for products and applications indicated.
- B. Install forming/packing/backing materials and other accessories of types required to support fill materials during their application and in position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.
- C. Install fill materials for fire-resistive joint systems by proven techniques to produce the following results:
1. Fill voids and cavities formed by openings and forming/packing/backing materials as required to achieve fire-resistance ratings indicated.
 2. Apply fill materials so they contact and adhere to substrates formed by joints.
 3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 FIELD QUALITY CONTROL

- A. Inspecting Agency: Engage a qualified independent inspecting agency to inspect fire-resistive joint systems and prepare inspection reports.
- B. Testing Services: Inspecting of completed installations of fire-resistive joint systems shall take place in successive stages as installation of fire-resistive joint systems proceeds. Do not proceed with installation of joint systems for the next area until inspecting agency determines completed work shows compliance with requirements.
1. Inspecting agency shall state in each report whether inspected fire-resistive joint systems comply with or deviate from requirements.

- C. Remove and replace fire-resistive joint systems where inspections indicate that they do not comply with specified requirements.
- D. Additional inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
- E. Proceed with enclosing fire-resistive joint systems with other construction only after inspection reports are issued and fire-resistive joint systems comply with requirements.

3.5 CLEANING AND PROTECTING

- A. Clean off excess fill materials adjacent to joints as Work progresses by methods and with cleaning materials that are approved in writing by fire-resistive joint system manufacturers and that do not damage materials in which openings occur.
- B. Provide final protection and maintain conditions during and after installation that ensure fire-resistive joint systems are without damage or deterioration at time of Substantial Completion. If damage or deterioration occurs despite such protection, cut out and remove damaged or deteriorated fire-resistive joint systems immediately and install new materials to produce fire-resistive joint systems complying with specified requirements.

3.6 TESTED (DYNAMIC) JOINT FIRESTOP SYSTEM SCHEDULE

** CONTACT MANUFACTURER FOR CURRENT UL-CLASSIFIED SYSTEM OR ENGINEER JUDGEMENT DRAWING

NOTES:

1. EDGE OF SLAB, CURTAIN WALL SYSTEMS ARE ALSO TESTED BY OMEGA POINT LABS. CONTACT MANUFACTURER FOR ADDITIONAL LISTINGS.
2. CLASSIFIED SYSTEMS FOR 2" - 6" WIDE JOINTS MAY BE USED FOR JOINTS 2" WIDE AND

LESS.

3. CONFIRM THAT MOVEMENT CAPABILITIES OF THE SELECTED UL SYSTEM MEETS OR EXCEEDS THE SPECIFIED MOVEMENT RANGE OF THE PARTICULAR JOINT.
4. SYSTEM PERFORMANCE MAY BE AFFECTED BY FACTORS SUCH AS METAL STUD WIDTH, JOINT WIDTH OR THE PRESENCE OF FIREPROOFING MATERIALS WITHIN THE JOINT. CONSULT INDIVIDUAL DETAILS FOR SPECIFICATIONS & LIMITATIONS.
5. HEAD-OF-WALL SYSTEMS SPECIFIED ONLY FOR 2- OR 3-HR SYSTEMS MAY NOT BE SUITABLE FOR MASONRY WALLS OR GYPSUM WALL ASSEMBLIES WITH LOWER HOURLY RATINGS.
6. CONTACT THE FIRESTOP MANUFACTURER FOR CLARIFICATION

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 07911

EXPANSION JOINT ASSEMBLIES

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving the following items:
1. The furnishing and installation of expansion joints for Roadway Bridges.
 2. The furnishing and installation of expansion joints for the Washington Street Railroad Bridge.
 3. The furnishing and installation of expansion joints for Emergency Egress Viaduct Structures. For expansion joint systems for the Green Line Viaduct, see specification Section 07162 – Spray-On Waterproofing.
- B. Related Work:
1. Section 05810 – EXPANSION JOINT COVER ASSEMBLIES.
 2. Section 07162 – SPRAY-ON WATERPROOFING.
- C. For all Roadway Bridge Strip Seal Bridge Joint System requirements regarding General Information, Products, and Execution, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 972.
1. For Roadway Bridge expansion joint submittal requirements, including, but not limited to shop drawings, working drawings, Requests For Information, and Non Conformance and testing reports, refer to Section 01300 – SUBMITTALS of the Contract Specifications.
 2. Per Division 1 of the Contract Specifications, the Contractor is responsible for all sampling and testing as outlined in their approved Quality Management Plan and Testing Plan. The Contractor is also responsible for all costs related to the sampling, testing, and related work.
 3. For all expansion joint requirements regarding Measurement and Payment, see Part 4 below.
- D. For the Washington Street Railroad Bridge and Emergency Egress Viaduct, the Contractor shall install a Strip Seal Bridge Joint System in conformance with the contract drawings and details. The details as indicated on the contract drawings are intended as a general guide for a typical glandular type strip seal joint system. Shop drawings which include details of the gland shape, steel extrusion shape, welding procedure specifications, anchor arrangement, temperature correction requirements, and temporary support details shall be submitted for approval of the Engineer. For requirements regarding General Information, Products, and Execution, refer to MassDOT Standard Specifications (with Supplemental Specifications) Section 972.
1. For all Washington Street Railroad Bridge and Emergency Egress Viaduct expansion joint requirements regarding Measurement and Payment, see Part 4 below.

PART 2 – PRODUCTS

2.1 EXPANSION JOINTS FOR WASHINGTON STREET RAILROAD BRIDGE

- A. Not used.

2.2 EXPANSION JOINTS FOR VIADUCT STRUCTURES

- A. Not used.

2.3 ACCEPTANCE SAMPLING AND DOCUMENTATION REQUIREMENTS FOR MASSDOT ROADWAY BRIDGES

- A. The following samples must be submitted to the Program Manager per MassDOT Research and Materials assurance requirements:
 - 1. For Neoprene Strip Seals
 - a. Sampling Frequency: A minimum of one per joint.

PART 3 – EXECUTION

3.1 TESTING, INSTALLATION, AND INSPECTION OF EXPANSION JOINTS FOR WASHINGTON STREET RAILROAD BRIDGE

- A. Not used.

3.2 TESTING, INSTALLATION, AND INSPECTION OF EXPANSION JOINTS FOR VIADUCT STRUCTURES

- A. Not used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 07920

JOINT SEALANTS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies joint sealants and fillers for interior and exterior applications.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 - 2. Section 04800 - MASONRY: Masonry control and expansion joint fillers and gaskets.
 - 3. Section 08801 - GLASS AND GLAZING: Glazing sealants.
 - 4. Section 09260 - GYPSUM BOARD ASSEMBLIES: Sealing perimeter joints of gypsum board partitions to reduce sound transmission.
 - 5. Section 09360 – MODULAR TACTILE SURFACES.
 - 6. Section 09510 - ACOUSTICAL CEILINGS: Sealing edge moldings at perimeters of acoustical ceilings.

1.2 PERFORMANCE REQUIREMENTS

- A. Provide elastomeric joint sealants that establish and maintain watertight and airtight continuous joint seals without staining or deteriorating joint substrates.
- B. Provide joint sealants for interior applications that establish and maintain airtight and water-resistant continuous joint seals without staining or deteriorating joint substrates.

1.3 SUBMITTALS

- A. Product Data: For each joint-sealant product indicated.
- B. Samples for Verification: For each type and color of joint sealant required, provide Samples with joint sealants in 1/2-inch wide joints formed between two 6-inch long strips of material matching the appearance of exposed surfaces adjacent to joint sealants.
- C. Qualification Data: For Installer.
- D. Preconstruction Field Test Reports: Indicate which sealants and joint preparation methods resulted in optimum adhesion to joint substrates based on preconstruction testing specified in Part 1 "Quality Assurance" Article.
- E. Compatibility and Adhesion Test Reports: From sealant manufacturer, indicating the following:
 - 1. Materials forming joint substrates and joint-sealant backings have been tested for compatibility and adhesion with joint sealants.
 - 2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.

- F. Field Test Report Log: For each elastomeric sealant application.
- G. Product Test Reports: Based on comprehensive testing of product formulations performed by a qualified testing agency, indicating that sealants comply with requirements.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized Installer who is approved or licensed for installation of elastomeric sealants required for this Project.
- B. Source Limitations: Obtain each type of joint sealant through one source from a single manufacturer.
- C. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for testing indicated below, samples of materials that will contact or affect joint sealants.
 - 1. Use manufacturer's standard test method to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
 - 2. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
 - 3. For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures including use of specially formulated primers.
 - 4. Testing will not be required if joint-sealant manufacturers submit joint preparation data that are based on previous testing of current sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted.
- D. Preconstruction Field-Adhesion Testing: Before installing elastomeric sealants, field test their adhesion to Project joint substrates as follows:
 - 1. Locate test joints where indicated on Project or, if not indicated, as directed by Engineer.
 - 2. Conduct field tests for each application indicated below:
 - a. Each type of elastomeric sealant and joint substrate indicated.
 - b. Each type of nonelastomeric sealant and joint substrate indicated.
 - 3. Notify Engineer seven days in advance of dates and times when test joints will be erected.
 - a. Test Method: Test joint sealants according to Method A, Field-Applied Sealant Joint Hand Pull Tab, in Appendix X1 in ASTM C 1193.
 - 1. For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.
 - 4. Report whether sealant in joint connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each type of product and joint substrate. For sealants that fail adhesively, retest until satisfactory adhesion is obtained.
 - 5. Evaluation of Preconstruction Field-Adhesion-Test Results: Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use sealants that fail to adhere to joint substrates during testing.

- E. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1.

1.5 PROJECT CONDITIONS

- A. Do not proceed with installation of joint sealants under the following conditions:
 - 1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer or are below 40 deg F.
 - 2. When joint substrates are wet.
 - 3. Where joint widths are less than or greater than those allowed by joint-sealant manufacturer for applications indicated.
 - 4. Contaminants capable of interfering with adhesion have not yet been removed from joint substrates.
 - 5. When substrates have not cured sufficiently.

1.6 WARRANTY

- A. Special Installer's Warranty: Installer's standard form in which Installer agrees to repair or replace elastomeric joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.
 - 1. Warranty Period: Two years from date of Substantial Completion.
- B. Special Manufacturer's Warranty: Manufacturer's standard form in which elastomeric sealant manufacturer agrees to furnish elastomeric joint sealants to repair or replace those that do not comply with performance and other requirements specified in this Section within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.
- C. Special warranties specified in this Article exclude deterioration or failure of elastomeric joint sealants from the following:
 - 1. Movement of the structure resulting in stresses on the sealant exceeding sealant manufacturer's written specifications for sealant elongation and compression caused by structural settlement or errors attributable to design or construction.
 - 2. Disintegration of joint substrates from natural causes exceeding design specifications.
 - 3. Mechanical damage caused by individuals, tools, or other outside agents.
 - 4. Changes in sealant appearance caused by accumulation of dirt or other atmospheric contaminants.

1.7 PRE-CONSTRUCTION MEETING

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

- A. Compatibility: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by sealant manufacturer, based on testing and field experience.
- B. VOC Content of Interior Sealants: Provide interior sealants and sealant primers that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
 - 1. Sealants: 250 g/L.
 - 2. Sealant Primers for Nonporous Substrates: 250 g/L.
 - 3. Sealant Primers for Porous Substrates: 775 g/L.
- C. Colors of Exposed Joint Sealants: As indicated by manufacturer's designations.
- D. All joints between panels shall be sealed with sealant matching adjacent panels or substrates. Any areas that are unclear shall be brought to the attention of the Engineer/Architect to determine the appropriate action.

2.2 JOINT SEALANTS

- A. Elastomeric Sealants: Comply with ASTM C 920 and other requirements indicated for each liquid-applied chemically curing sealant specified, including those referencing ASTM C 920 classifications for type, grade, class, and uses related to exposure and joint substrates.
- B. Stain-Test-Response Characteristics: Elastomeric sealants shall be nonstaining to porous substrates. Provide products that have undergone testing according to ASTM C 1248 and have not stained porous joint substrates indicated for Project.
- C. Suitability for Contact with Food: Where elastomeric sealants are indicated for joints that will come in repeated contact with food, provide products that comply with 21 CFR 177.2600.
- D. Single-Component Neutral-Curing Silicone Sealant:
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Dow Corning Corporation; 790.
 - b. GE Silicones; SilPruf LM SCS2700.
 - c. Tremco; Spectrem 1.
 - d. Pecora Corporation; 864.
 - 2. Extent of Use: Joints in exterior vertical surfaces and soffit surfaces.
- E. Multicomponent Pourable Urethane Sealant:
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:

- a. Bostik Findley; Chem-Calk 550.
 - b. Meadows, W. R., Inc.; POURTHANE.
 - c. Pecora Corporation; Urexpan NR-200.
 - d. Tremco; THC-901.
2. Extent of Use: Joints in exterior horizontal surfaces; heel proof.
- F. Single-Component Mildew-Resistant Acid-Curing Silicone Sealant:
- 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Dow Corning Corporation; 786 Mildew Resistant.
 - b. GE Silicones; Sanitary SCS1700.
 - c. Tremco; Tremsil 200.
 - 2. Extent of Use: Sanitary joints at toilet rooms.
- G. Latex Sealant: Comply with ASTM C 834, Type P, Grade NF.
- 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Bostik Findley; Chem-Calk 600.
 - b. Pecora Corporation; AC-20+.
 - c. Sonneborn, Division of ChemRex Inc.; Sonolac.
 - d. Tremco; Tremflex 834.
 - 2. Extent of Use: Joints in interior vertical and horizontal surfaces. Coordinate with spec section 03331 – Architectural Concrete Finish for joint fillers on horizontal surfaces at polished concrete floor areas.

2.3 JOINT-SEALANT BACKING

- A. General: Provide sealant backings of material and type that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.
- B. Cylindrical Sealant Backings: ASTM C 1330, Type C (closed-cell material with a surface skin). O (open-cell material). B (bicellular material with a surface skin) or any of the preceding types, as approved in writing by joint-sealant manufacturer for joint application indicated, and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance:
- C. Elastomeric Tubing Sealant Backings: Neoprene, butyl, EPDM, or silicone tubing complying with ASTM D 1056, nonabsorbent to water and gas, and capable of remaining resilient at temperatures down to minus 26 deg F. Provide products with low compression set and of size and shape to provide a secondary seal, to control sealant depth, and to otherwise contribute to optimum sealant performance.

- D. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surfaces at back of joint where such adhesion would result in sealant failure. Provide self-adhesive tape where applicable.

2.4 MISCELLANEOUS MATERIALS

- A. Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.
- B. Compressible Filler: Premolded filler strips complying with ASTM D 1056, Grade 2A1; compressible up to 35 percent; of width and thickness indicated; formulated from neoprene.
- C. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces in any way, and formulated to promote optimum adhesion of sealants to joint substrates.
- D. Masking Tape: Nonstaining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:
 - 1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.
 - 2. Clean porous joint substrate surfaces by brushing, grinding, blast cleaning, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include concrete, masonry and unglazed surfaces of ceramic tile.
 - 3. Remove laitance and form-release agents from concrete.
 - 4. Clean nonporous surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint substrates include the following metal, glass, porcelain enamel and glazed surfaces of ceramic tile.

- B. Joint Priming: Prime joint substrates, where recommended in writing by joint-sealant manufacturer, based on preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.
- C. Masking Tape: Use masking tape where required to prevent contact of sealant with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

3.3 INSTALLATION OF JOINT SEALANTS

- A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.
- B. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.
- C. Install sealant backings of type indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.
 - 1. Do not leave gaps between ends of sealant backings.
 - 2. Do not stretch, twist, puncture, or tear sealant backings.
 - 3. Remove excess material.
 - 4. Remove absorbent sealant backings that have become wet before sealant application and replace them with dry materials.
- D. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.
- E. Install sealants using proven techniques that comply with the following and at the same time backings are installed:
 - 1. Place sealants so they directly contact and fully wet joint substrates.
 - 2. Completely fill recesses in each joint configuration.
 - 3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.
 - 4. Install in uniform continuous ribbons without gaps or air pockets.
- F. Tooling of Nonsag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.
 - 1. Remove excess sealant from surfaces adjacent to joints.
 - 2. Use tooling agents that are approved in writing by sealant manufacturer and that do not discolor sealants or adjacent surfaces.

3. Provide concave joint configuration per Figure 5A in ASTM C 1193, unless otherwise indicated.

3.4 REPAIR AND CLEANING

- A. Remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.
- B. Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

3.5 PROTECTION

- A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 08111

STEEL DOORS AND FRAMES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies hollow-metal doors and frames.
- B. Items To Be Installed Only: Install lock cylinders and cores as furnished by Section 08711 – DOOR HARDWARE.
- C. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 04800 – MASONRY; building anchors into and grouting steel frames in masonry construction.
 - 3. Section 08711 – DOOR HARDWARE; door hardware for steel doors.
 - 4. Section 08801 – GLASS AND GLAZING; glazed lites.
 - 5. Section 09900 – PAINTING; field painting steel doors and frames.

1.2 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, core descriptions, label compliance, fire-resistance rating, and finishes for each type of steel door and frame specified.
- B. Shop Drawings: In addition to requirements below, provide a schedule of standard steel doors and frames using same reference numbers for details and openings as those on Drawings:
 - 1. Elevations of each door design.
 - 2. Details of doors, including vertical and horizontal edge details.
 - 3. Frame details for each frame type, including dimensioned profiles.
 - 4. Details and locations of reinforcement and preparations for hardware.
 - 5. Details of each different wall opening condition.
 - 6. Details of anchorages, accessories, joints, and connections.
 - 7. Details of glazing frames and stops showing glazing.
 - 8. Details of conduit and preparations for electrified door hardware and controls.
- C. Qualification Data: For Installer.
- D. Product Test Reports: Based on evaluation of comprehensive fire tests performed by a qualified testing agency, for each type of standard steel door and frame.

1.3 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer.
- B. Source Limitations: Obtain standard steel doors and frames through one source from a single

manufacturer.

- C. Fire-Rated Door, Sidelight and Transom Frame Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated.
- D. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Deliver doors and frames palletized, wrapped, or crated to provide protection during transit and Project-site storage. Do not use nonvented plastic. Provide additional protection to prevent damage to finish of factory-finished doors and frames.
- B. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions.
- C. Store doors and frames under cover at Project site. Place units in a vertical position with heads up, spaced by blocking, on minimum 4-inch-high wood blocking. Avoid using nonvented plastic or canvas shelters that could create a humidity chamber. If wrappers on doors become wet, remove cartons immediately. Provide minimum 1/4-inch space between each stacked door to permit air circulation.

1.5 PROJECT CONDITIONS

- A. Field Measurements: Verify openings by field measurements before fabrication and indicate measurements on Shop Drawings.
 - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish opening dimensions and proceed with fabricating standard steel frames without field measurements. Coordinate wall construction to ensure that actual opening dimensions correspond to established dimensions.

1.6 COORDINATION

- A. Coordinate installation of anchorages for standard steel frames. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

1.7 PRE-CONSTRUCTION MEETINGS

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 1. Ceco Door Products; an ASSA ABLOY Group Company.
 2. CURRIES Company; an ASSA ABLOY Group Company.
 3. Mesker Door Inc.
 4. Pioneer Industries, Inc.
 5. Republic Builders Products Company.
 6. Steelcraft Doors.

2.2 MATERIALS

- A. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B; suitable for exposed applications.
- B. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.
- C. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with minimum A40 zinc-iron-alloy (galvannealed) coating designation.
- D. Supports and Anchors: After fabricating, galvanize units to be built into exterior walls according to ASTM A 153/A 153M, Class B.
- E. Inserts, Bolts, and Fasteners: Provide items to be built into exterior walls, hot-dip galvanized according to ASTM A 153/A 153M.
- F. Powder-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching standard steel door frames of type indicated.
- G. Grout: Comply with ASTM C 476, 3,000 psi with a slump of 4 inches for standard steel door frames built into concrete or masonry, as measured according to ASTM C 143/C 143M.
- H. Glazing: Comply with requirements in Section 08801 – GLASS AND GLAZING.
- I. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

2.3 STANDARD STEEL DOORS

- A. General: Provide doors of design indicated, not less than thickness indicated; fabricated with smooth surfaces, without visible joints or seams on exposed faces, unless otherwise indicated. Comply with ANSI A250.8.
 1. Design: Flush panel.
 2. Core Construction: Manufacturer's standard kraft-paper honeycomb, polystyrene, polyurethane, mineral-board, or vertical steel-stiffener core that produces doors complying with ANSI A250.8.

- a. Fire Door Core: As required to provide fire-protection and temperature-rise ratings indicated.
 - b. Thermal-Rated (Insulated) Exterior Doors: Where indicated, provide doors fabricated with thermal-resistance value (R-value) of not less than 4.0 deg F x h x sq. ft./Btu when tested according to ASTM C 1363.
 - 3. Top and Bottom Edges: Closed with flush 0.042-inch-thick end closures or channels of same material as face sheets.
 - 4. Tolerances: Comply with Steel Door Institute, SDI 117, "Manufacturing Tolerances for Standard Steel Doors and Frames."
- B. Exterior Doors: Face sheets fabricated from metallic-coated steel sheet. Provide doors complying with requirements indicated below by referencing ANSI A250.8 for level and model and ANSI A250.4 for physical-endurance level:
- 1. Level 3 and Physical Performance Level A (Extra Heavy Duty), Model 2 (Seamless), 1-3/4 inches thick.
- C. Interior Doors: Face sheets fabricated from cold-rolled steel sheet, unless otherwise indicated to comply with exterior door requirements. Provide doors complying with requirements indicated below by referencing ANSI A250.8 for level and model and ANSI A250.4 for physical-endurance level:
- 1. Level 2 and Physical Performance Level B (Heavy Duty), Model 2 (Seamless), 1-3/4 inches thick.
- D. Hardware Reinforcement: Fabricate reinforcement plates from same material as door face sheets to comply with the following minimum sizes:
- 1. Hinges: Minimum 0.123 inch thick by 1-1/2 inches wide by 6 inches longer than hinge, secured by not less than 6 spot welds.
 - 2. Pivots: Minimum 0.167 inch thick by 1-1/2 inches wide by 6 inches longer than hinge, secured by not less than 6 spot welds.
 - 3. Lock Face, Closers, and Concealed Holders: Minimum 0.067 inch thick.
 - 4. All Other Surface-Mounted Hardware: Minimum 0.067 inch thick.
- E. Fabricate concealed stiffeners and hardware reinforcement from either cold- or hot-rolled steel sheet.

2.4 STANDARD STEEL FRAMES

- A. General: Comply with ANSI A250.8 and with details indicated for type and profile.
- B. Exterior Frames: Fabricated from metallic-coated steel sheet.
 - 1. Fabricate frames with mitered or coped and welded face corners and seamless face joints.
 - 2. Frames for Level 3 Steel Doors: 0.067-inch-thick steel sheet.
- C. Interior Frames: Fabricated from cold-rolled steel sheet, unless otherwise indicated to comply with exterior frame requirements.
 - 1. Fabricate frames with mitered or coped and welded face corners and seamless face joints.
 - 2. Frames for Level 2 Steel Doors: 0.053-inch-thick steel sheet.
- D. Hardware Reinforcement: Fabricate reinforcement plates from same material as frames to comply

with the following minimum sizes:

1. Hinges: Minimum 0.123 inch thick by 1-1/2 inches wide by 6 inches longer than hinge, secured by not less than 6 spot welds.
 2. Pivots: Minimum 0.167 inch thick by 1-1/2 inches wide by 6 inches longer than hinge, secured by not less than 6 spot welds.
 3. Lock Face, Flush Bolts, Closers, and Concealed Holders: Minimum 0.067 inch thick.
 4. All Other Surface-Mounted Hardware: Minimum 0.067 inch thick.
- E. Supports and Anchors: Fabricated from electrolytic zinc-coated or metallic-coated steel sheet.
- F. Jamb Anchors:
1. Masonry Type: Adjustable strap-and-stirrup or T-shaped anchors to suit frame size, not less than 0.042 inch thick, with corrugated or perforated straps not less than 2 inches wide by 10 inches long; or wire anchors not less than 0.177 inch thick.
 2. Stud-Wall Type: Designed to engage stud, welded to back of frames; not less than 0.042 inch thick.
 3. Postinstalled Expansion Type for In-Place Concrete or Masonry: Minimum 3/8-inch-diameter bolts with expansion shields or inserts. Provide pipe spacer from frame to wall, with throat reinforcement plate, welded to frame at each anchor location.
- G. Floor Anchors: Formed from same material as frames, not less than 0.042 inch thick, and as follows:
1. Monolithic Concrete Slabs: Clip-type anchors, with two holes to receive fasteners.
 2. Separate Topping Concrete Slabs: Adjustable-type anchors with extension clips, allowing not less than 2-inch height adjustment. Terminate bottom of frames at finish floor surface.
- H. Fabricate concealed stiffeners and hardware reinforcement from either cold- or hot-rolled steel sheet.

2.5 STOPS AND MOLDINGS

- A. Moldings for Glazed Lites in Doors: Minimum 0.032 inch thick, fabricated from same material as door face sheet in which they are installed.
- B. Fixed Frame Moldings: Formed integral with standard steel frames, minimum 5/8 inch high, unless otherwise indicated.
- C. Loose Stops for Glazed Lites in Frames: Minimum 0.032 inch thick, fabricated from same material as frames in which they are installed.

2.6 FABRICATION

- A. General: Fabricate standard steel doors and frames to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for thickness of metal. Where practical, fit and assemble units in manufacturer's plant. To ensure proper assembly at Project site, clearly identify work that cannot be permanently factory assembled before shipment.
- B. Standard Steel Doors:
1. Exterior Doors: Provide weep-hole openings in bottom of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.
 2. Glazed Lites: Factory cut openings in doors.

- C. Standard Steel Frames: Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated of same thickness metal as frames.
1. Welded Frames: Weld flush face joints continuously; grind, fill, dress, and make smooth, flush, and invisible.
 2. Sidelight and Transom Bar Frames: Provide closed tubular members with no visible face seams or joints; fabricated from same material as door frame. Fasten members at crossings and to jambs by butt welding.
 3. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners, unless otherwise indicated.
 4. Plaster Guards: Weld guards to frame at back of hardware mortises in frames installed in concrete or masonry.
 5. Where installed in masonry, leave vertical mullions in frames open at top for grouting.
 6. Floor Anchors: Weld anchors to bottom of jambs and mullions with at least four spot welds per anchor.
 7. Jamb Anchors: Provide number and spacing of anchors as follows:
 - a. Masonry Type: Locate anchors not more than 18 inches from top and bottom of frame. Space anchors not more than 32 inches o.c. and as follows:
 - 1) Two anchors per jamb up to 60 inches in height.
 - 2) Three anchors per jamb from 60 to 90 inches in height.
 - 3) Four anchors per jamb from 90 to 120 inches in height.
 - 4) Four anchors per jamb plus 1 additional anchor per jamb for each 24 inches or fraction thereof more than 120 inches in height.
 - b. Stud-Wall Type: Locate anchors not more than 18 inches from top and bottom of frame. Space anchors not more than 32 inches o.c. and as follows:
 - 1) Three anchors per jamb up to 60 inches in height.
 - 2) Four anchors per jamb from 60 to 90 inches in height.
 - 3) Five anchors per jamb from 90 to 96 inches in height.
 - 4) Five anchors per jamb plus 1 additional anchor per jamb for each 24 inches or fraction thereof more than 96 inches in height.
 - 5) Two anchors per head for frames more than 42 inches wide and mounted in metal- stud partitions.
 - c. Compression Type: Not less than two anchors in each jamb.
 - d. Postinstalled Expansion Type: Locate anchors not more than 6 inches from top and bottom of frame. Space anchors not more than 26 inches o.c.
 8. Door Silencers: Except on weather-stripped doors, drill stops to receive door silencers as follows. Provide plastic plugs to keep holes clear during construction.
 - a. Single-Door Frames: Drill stop in strike jamb to receive three door silencers.
 - b. Double-Door Frames: Drill stop in head jamb to receive two door silencers.
- D. Hardware Preparation: Factory prepare standard steel doors and frames to receive templated mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping, according to the Door Hardware Schedule and templates furnished as specified in Section 08711 - DOOR HARDWARE.

1. Reinforce doors and frames to receive nontemplated mortised and surface-mounted door hardware.
 2. Comply with applicable requirements in ANSI A250.6 and ANSI/DHI A115 Series specifications for door and frame preparation for hardware. Locate hardware as indicated on Shop Drawings or, if not indicated, according to ANSI A250.8.
- E. Stops and Moldings: Provide stops and moldings around glazed lites where indicated. Form corners of stops and moldings with butted or mitered hairline joints.
1. Single Glazed Lites: Provide fixed stops and moldings welded on secure side of door or frame.
 2. Multiple Glazed Lites: Provide fixed and removable stops and moldings such that each glazed lite is capable of being removed independently.
 3. Provide fixed frame moldings on outside of exterior and on secure side of interior doors and frames.
 4. Provide loose stops and moldings on inside of doors and frames.
 5. Coordinate rabbet width between fixed and removable stops with type of glazing and type of installation indicated.

2.7 STEEL FINISHES

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Finish standard steel door and frames after assembly.
- B. Metallic-Coated Steel Surface Preparation: Clean surfaces with nonpetroleum solvent so surfaces are free of oil and other contaminants. After cleaning, apply a conversion coating suited to the organic coating to be applied over it. Clean welds, mechanical connections, and abraded areas, and apply galvanizing repair paint specified below to comply with ASTM A 780.
1. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds in steel, complying with SSPC-Paint 20.
- C. Steel Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning"; remove dirt, oil, grease, or other contaminants that could impair paint bond. Remove mill scale and rust, if present, from uncoated steel; comply with SSPC-SP 3, "Power Tool Cleaning," or SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
- D. Factory Priming for Field-Painted Finish: Apply shop primer specified below immediately after surface preparation and pretreatment. Apply a smooth coat of even consistency to provide a uniform dry film thickness of not less than 0.7 mils.
1. Shop Primer: Manufacturer's standard, fast-curing, lead- and chromate-free primer complying with ANSI A250.10 acceptance criteria; recommended by primer manufacturer for substrate; compatible with substrate and field-applied finish paint system indicated; and providing a sound foundation for field-applied topcoats despite prolonged exposure.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements

for installation tolerances and other conditions affecting performance of standard steel doors and frames.

1. Examine roughing-in for embedded and built-in anchors to verify actual locations of standard steel frame connections before frame installation.
2. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Remove welded-in shipping spreaders installed at factory.
- B. Prior to installation and with installation spreaders in place, adjust and securely brace standard steel door frames for squareness, alignment, twist, and plumb to the following tolerances:
 1. Squareness: Plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
 2. Alignment: Plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.
 3. Twist: Plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
 4. Plumbness: Plus or minus 1/16 inch, measured at jambs on a perpendicular line from head to floor.
- C. Drill and tap doors and frames to receive nontemplated mortised and surface-mounted door hardware.

3.3 INSTALLATION

- A. General: Provide doors and frames of sizes, thicknesses, and designs indicated. Install standard steel doors and frames plumb, rigid, properly aligned, and securely fastened in place; comply with Drawings and manufacturer's written instructions.
- B. Standard Steel Frames: Install standard steel frames for doors, sidelights, transoms, borrowed lights and other openings, of size and profile indicated. Comply with SDI 105.
 1. Set frames accurately in position; plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces, leaving surfaces smooth and undamaged.
 - a. At fire-protection-rated openings, install frames according to NFPA 80.
 - b. Where frames are fabricated in sections due to shipping or handling limitations, field splice at approved locations by welding face joint continuously; grind, fill, dress, and make splice smooth, flush, and invisible on exposed faces.
 - c. Install frames with removable glazing stops located on secure side of opening.
 - d. Install door silencers in frames before grouting.
 - e. Remove temporary braces necessary for installation only after frames have been properly set and secured.
 - f. Check plumb, squareness, and twist of frames as walls are constructed. Shim as necessary to comply with installation tolerances.
 - g. Apply bituminous coating to backs of frames that are filled with mortar, and grout.
 2. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor and secure with postinstalled expansion anchors.

- a. Floor anchors may be set with powder-actuated fasteners instead of postinstalled expansion anchors if so indicated and approved on Shop Drawings.
3. Metal-Stud Partitions: Solidly pack mineral-fiber insulation behind frames.
 4. Masonry Walls: Coordinate installation of frames to allow for solidly filling space between frames and masonry with mortar as specified in Section 04800 - MASONRY,
 5. Concrete Walls: Solidly fill space between frames and concrete with grout. Install grout in lifts and take precautions, including bracing frames, to ensure that frames are not deformed or damaged by grout forces.
 6. In-Place Concrete or Masonry Construction: Secure frames in place with postinstalled expansion anchors. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.
 7. In-Place Gypsum Board Partitions: Secure frames in place with postinstalled expansion anchors through floor anchors at each jamb. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.
 8. Ceiling Struts: Extend struts vertically from top of frame at each jamb to supporting construction above, unless frame is anchored to masonry or to other structural support at each jamb. Bend top of struts to provide flush contact for securing to supporting construction above.
Provide adjustable wedged or bolted anchorage to frame jamb members.
 9. Installation Tolerances: Adjust standard steel door frames for squareness, alignment, twist, and plumb to the following tolerances:
 - a. Squareness: Plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
 - b. Alignment: Plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.
 - c. Twist: Plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
 - d. Plumbness: Plus or minus 1/16 inch, measured at jambs at floor.
- C. Standard Steel Doors: Fit hollow-metal doors accurately in frames, within clearances specified below.
Shim as necessary.
1. Non-Fire-Rated Standard Steel Doors:
 - a. Jambs and Head: 1/8 inch plus or minus 1/16 inch.
 - b. Between Edges of Pairs of Doors: 1/8 inch plus or minus 1/16 inch.
 - c. Between Bottom of Door and Top of Threshold: Maximum 3/8 inch.
 - d. Between Bottom of Door and Top of Finish Floor (No Threshold): Maximum 3/4 inch.
 2. Fire-Rated Doors: Install doors with clearances according to NFPA 80.
 3. Smoke-Control Doors: Install doors according to NFPA 105.
- D. Glazing: Comply with installation requirements in Section 08801 – GLASS AND GLAZING and with standard steel door and frame manufacturer's written instructions. Secure stops with countersunk flat- or oval-head machine screws spaced uniformly not more than 9 inches o.c., and not more than 2 inches o.c. from each corner.

3.4 ADJUSTING AND CLEANING

- A. Final Adjustments: Check and readjust operating hardware items immediately before final

inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including standard steel doors or frames that are warped, bowed, or otherwise unacceptable to the Engineer.

- B. Clean grout and other bonding material off standard steel doors and frames immediately after installation.
- C. Prime-Coat Touchup: Immediately after erection, sand smooth rusted or damaged areas of prime coat and apply touchup of compatible air-drying primer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 08139

ACCESS DOORS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Factory fabricated heavy duty access doors (hatches).
 - 2. Access doors to pipe spaces, if required.
 - 3. Access doors to equipment not otherwise accessible.
- B. Items To Be Installed Only: Install lock cylinders and cores as furnished by Section 08711 – DOOR HARDWARE.
- C. Related Work:
 - 1. Section 03450 – ARCHITECTURAL PRECAST CONCRETE.
 - 2. Section 03331 – ARCHITECTURAL CONCRETE FINISH.
 - 3. Section 08711 – DOOR HARDWARE.
 - 4. Section 16720 – ELECTRONIC ACCESS CONTROL SYSTEMS.

1.2 SUBMITTALS

- A. Product Data: Provide manufacturer's product data for all materials and assembly in this specification. Provide evidence that each manufacturer providing access doors has been manufacturing that type of access door or hatch for a minimum of five years.
- B. Shop Drawings showing plans, sections and details. Shop Drawings shall show dimensions locating assembly in the building and relation to supporting structural elements
- C. Engineering and structural analysis, as well as any necessary calculations shall be prepared under the supervision of, and signed and sealed by, a qualified professional engineer licensed in the Commonwealth of Massachusetts. Engineer shall have minimum 5 years experience performing work of similar scope and complexity. These calculations shall include gravity, wind and seismic loading. The internal structure, dimensions and specifications for all items shall be indicated in the Contractor's shop drawings.
- D. Installer: Installer shall be trained or certified by the manufacturer to perform work. Manufacturer shall certify installer as acceptable for terms of warranty.

1.3 QUALITY ASSURANCE

- A. For actual installation of the work of this Section, use only personnel who are thoroughly familiar with the manufacturer's recommended methods of installation and who are completely trained in the skills required.

- B. The manufacturers of the access doors or hatches shall have a minimum of five years experience in the manufacture of access doors of the type they are providing. Each type of access door shall be provided by a single manufacturer.
- C. Fire-Resistance:
 - 1. Provide bituminous coating and all available methods to increase fire resistance of assembly of floor access door.
 - 2. Whenever a fire-resistance classification is shown, or for construction where access doors are installed, provide access required door assembly with panel door, frame, hinge, and latch from manufacturers listed in UL Classified Building Materials index for the rating shown.
 - 3. Provide UL label on each access panel for which a fire rating is required. Do not paint over label. All labels shall be clear and visible for inspection
- D. Coordinate with structural design.

1.4 CITED STANDARDS

- A. Underwriters Laboratories (UL)
 - 1. Classified Building Material Index

1.5 WARRANTY

- A. Materials and workmanship shall be free of defects for period of 25 years from date of installation. Should a part fail to function in normal use within this period, manufacturer shall furnish a new part at and replace it in the assembly at no charge.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. General Performance: Comply with performance requirements specified, as determined by testing of stainless steel-framed entrances representing those indicated for this Project without failure due to defective manufacture, fabrication, installation, or other defects in construction.
- B. Structural Loads:
 - 1. Wind Loads: As indicated on Drawings.

2.2 MANUFACTURERS - HATCHES

- A. Design of hatches is based on BILCO Company products. Provide fire-rated and non-rated heavy-duty access hatch doors as manufactured by BILCO Company, or approved equal.
 - 1. Performance Characteristics
 - a. Non-rated door shall be designed to support either a minimum live load of 300-psf or match the design load of the surrounding floor, whichever is more, and support a concentrated load of 1,000-pounds.

- b. Rated door shall be designed to support a minimum live load of 150-psf, or shall match the design load of the surrounding floor, whichever is more, and support a concentrated load of 1,000-pounds.
 - c. Operation of the cover shall be smooth and easy with controlled operation throughout the entire arc of opening and closing.
 - d. Double door (non-rated) shall be designed w/ reinforced cover to accommodate H-20 psf live load. Basis of design: Bilco model JD-AL H20 Channel Frame Door or approved equal.
2. Entire door, including all hardware components, shall be highly corrosion resistant.
3. Covers:
- a. Fire Rated: 1/4" aluminum 2hr rated floor hatch. Basis of Design: Bilco FR-Fire Rated Floor Door or approved equal.
 - b. Unrated: 1/4" Aluminum metal plate with slip-resistant coating equal to SlipNOT by W.S. Molnar Company or equal, , thickness to meet load requirements
4. Frame: Channel frame shall be extruded aluminum with bend down anchor tabs around the perimeter. A continuous EPDM gasket shall be mechanically attached to the aluminum frame to create a barrier around the entire perimeter of the cover and significantly reduce the amount of dirt and debris that may enter the channel frame.
5. Provide drainage connection to sanitary system from floor hatches in public areas, platforms, and mezzanines.
6. Hinges: Shall be specifically designed for horizontal installation and shall be through bolted to the cover with tamperproof Type 316 stainless steel lock bolts and shall be through bolted to the frame with Type 316 stainless steel bolts and locknuts.
7. Lifting mechanisms: Manufacturer shall provide the required number and size of compression spring operators enclosed in telescopic tubes to provide, smooth, easy, and controlled cover operation throughout the entire arc of opening and to act as a check in retarding downward motion of the cover when closing. The upper tube shall be the outer tube to prevent accumulation of moisture, grit, and debris inside the lower tube assembly. The lower tube shall interlock with a flanged support shoe fastened to a formed 1/4-inch gusset support plate.
8. A removable exterior turn/lift handle with a spring loaded ball detent shall be provided to open the covers and the latch release shall be protected by a flush, gasketed, removable screw plug.
9. Hardware:
- a. Hinges: Heavy forged aluminum hinges, each having a minimum 1/4-inch diameter Type 316 stainless steel pin, shall be provided and shall pivot so the cover does not protrude into the channel frame.
 - b. Covers shall be equipped with a hold open arm that automatically locks the covers in the open position.
 - c. Covers shall be fitted with the required number and size of compression spring operators. Springs shall have an electro-coated acrylic finish. Spring tubes

shall be constructed of a reinforced nylon 6/6-based engineered composite material.

- d. A Type 316 stainless steel snap lock with fixed handle shall be mounted on the underside of the cover.
 - e. Hardware: Anti-corrosion throughout. For installation in highly corrosive environments or when prolonged exposure to hot water or steam is anticipated, specify Type 316 stainless steel hardware. Platforms, mezzanines and pump rooms are highly corrosive environments in this context.
10. Finishes: Factory finish shall be mill finish aluminum with bituminous coating applied to the exterior of the frame.
11. Personnel Hatches: Where required by the Hatch Schedule, hatches shall have integral security roll up shutter with protection on exposed three sides of open hatch. Shutter shall not impede hatch clearances and access.

2.3 MANUFACTURERS - FLOOR ACCESS DOORS

- A. Floor Access Door: Type JD-H20 by BILCO or equal by Milcor or Nystrom.
- B. Performance characteristics:
 - 1. Covers: Shall be a bar grate type with 73% open and reinforced to support AASHTO H-20 wheel load with a maximum deflection of 1/150th of the span. Manufacturer to provide structural calculations stamped by a registered professional engineer upon request. (Note: For installation in an off-street location where not subject to high density, fast moving traffic.)
 - 2. Operation of the covers shall be smooth and easy with controlled operation throughout the entire arc of opening and closing.
 - 3. Operation of the covers shall not be affected by temperature.
- C. Covers: Shall be 1/4" steel diamond pattern.
- D. Frame: Channel frame shall be 1/4" steel with full anchor flange around the perimeter.
- E. Hinges: Shall be specifically designed for horizontal installation and shall be through bolted to the covers with tamperproof Type 316 stainless steel lock bolts and shall be through bolted to the frame with Type 316 stainless steel bolts and locknuts.
- F. Drain Coupling: Provide a 1-1/2" drain coupling located in the right front corner of the channel frame (note: can be placed at a different location if specified).
- G. Lifting mechanisms: Manufacturer shall provide the required number and size of compression spring operators enclosed in telescopic tubes to provide, smooth, easy, and controlled cover operation throughout the entire arc of opening and to act as a check in retarding downward motion of the covers when closing. The upper tube shall be the outer tube to prevent accumulation of moisture, grit, and debris inside the lower tube assembly. The lower tube shall interlock with a flanged support shoe fastened to a formed 1/4" gusset support plate.
- H. A removable exterior turn/lift handle with a spring loaded ball detent shall be provided to open the covers and the latch release shall be protected by a flush, gasketed, removable screw plug.

I. Hardware

1. Hinges: Heavy forged brass hinges, each having a minimum 3/8" (9.5mm) diameter Type 316 stainless steel pin, shall be provided and shall pivot so the cover does not protrude into the channel frame.
2. Covers shall be equipped with a hold open arm that automatically locks the cover in the open position.
3. Covers shall be fitted with the required number and size of compression spring operators.
4. A Type 316 stainless steel snap lock with fixed handle shall be mounted on the underside of the cover.
5. Hardware: Compression spring tubes shall be an anti-corrosive composite, all fasteners shall be Type 316 stainless steel material, and all other hardware shall be zinc plated and chromate sealed. [For installation in highly corrosive environments or when prolonged exposure to hot water or steam is anticipated, specify Type 316 stainless steel hardware].

J. Finishes: Factory finish shall be red oxide primed steel.

2.4 MANUFACTURERS - ACCESS DOORS

- A. Provide access door assembly manufactured by BAR-CO; DUR-RED; Bilco; Milcor Inc.; Nystrom Inc.; Karp Associates, Inc.; or approved equal. Assembly shall be an integral unit complete with all parts and ready for installation.
- B. Provide fire-rated units as required by fire rating of penetrated assembly. Design is based on BAR-CC Model FB-1.
- C. Frames for Concrete, Masonry, and Tile Wall Only (Flush Panel Units): Fabricate frame from 10-gauge steel. Provide frame with exposed flange not less than 1-inch wide around perimeter of frame for exposed masonry and tile finish.
- D. Frameless Units for Drywall Surfaces (Recessed Panel Units): Provide access doors without exposed frames for drywall adhered to recessed panel.
- E. Panels: Fabricate from 14-gauge steel with concealed spring hinges set to open to 175-degrees. Provide removable pin type hinges of the quantity required to support the access panel sizes used in the Work.
- F. Provide fire-rated insulation on door of fire-rated assemblies.
- G. Locking Devices
 1. For non-rated access doors, provide flush, screwdriver operated cam locks of number required to hold door in flush, smooth plane when closed.
 2. For fire-rated doors, provide flush, key operated cylinder locks.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Ensure substrates are in suitable condition to receive the Work.

- B. Verify that other trades with related work are completed before installing hatch door.

3.2 INSTALLATION

- A. Check as-built conditions and verify the manufacturer's access hatch door details for accuracy to fit the application prior to fabrication. Comply with the vault access door manufacturer's installation instructions.
- B. Furnish manufacturer's recommended attachment system for installing door and anchoring it to the supporting structure.

3.3 FIELD QUALITY CONTROL

- A. Examine the areas and conditions where access doors are to be installed and correct any conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions are corrected to permit proper installation of the Work. For floor hatches, ensure that the drainage pipes are properly located.

3.4 COORDINATION

- A. Coordinate all work with the mechanical trades to insure proper locations and in a timely manner to permit orderly progress of the total work.
- B. Set frames accurately in position and securely attach to supports with face panels plumb or level in relation to adjacent finish surfaces.
- C. Adjust hardware and panels after installation for proper operation.
- D. Remove and replace panels or frames that are warped, bowed, or otherwise damaged.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 08334

OVERHEAD COILING GRILLES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies manually operated and electric-motor operated overhead coiling grilles.
- B. Items To Be Installed Only: Install lock cylinders and cores as furnished by Section 08711 – DOOR HARDWARE.
- C. Related Work:
 - 1. Section 05500 - MISCELLANEOUS METALS; miscellaneous steel supports.
 - 2. Section 07920 - JOINT SEALANTS; weatherproof joints at hoods.
 - 3. Section 08711 - DOOR HARDWARE; lock cylinders and keying.
 - 4. Section 09900 - PAINTING; field-applied paint finish.
 - 5. Division 16 - ELECTRICAL; electrical service and connections for powered operators, and accessories.

1.2 PERFORMANCE REQUIREMENTS

- A. Operation-Cycle Requirements: Provide overhead coiling grille components and operators capable of operating for not less than 20,000 cycles and for 10 cycles per day.

1.3 SUBMITTALS

- A. Product Data: For each type and size of overhead coiling grille and accessory.
 - 1. Summary of forces and loads on walls and jambs.
- B. Shop Drawings: For special components and installations not dimensioned or detailed in manufacturer's product data.
- C. Qualification Data: For Installer.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for both installation and maintenance of units required for this Project.
- B. Source Limitations: Obtain overhead coiling grilles through one source from a single manufacturer.
 - 1. Obtain operators and controls from overhead coiling grille manufacturer.

- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Overhead Door Corp.
 - 2. Raynor.
 - 3. Wayne-Dalton Corp.

2.2 GRILLE CURTAIN MATERIALS AND CONSTRUCTION

- A. General: Fabricate overhead coiling grille curtain consisting of a network of 1/4-inch-minimum diameter horizontal rods, or rods covered with tube spacers, spaced as indicated. Interconnect rods by vertical links approximately 5/8 inch wide, spaced as indicated and rotating on rods.
 - 1. Space rods at approximately 1-1/2 inches o.c.
 - 2. Space links approximately 6 inches apart in a straight in-line pattern.
 - 3. Aluminum Grille Curtain: ASTM B 221 alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.
- B. Endlocks: Continuous end links, chains, or other devices at ends of rods; locking and retaining grille curtain in guides against excessive pressures, maintaining grille curtain alignment, and preventing lateral movement.
- C. Bottom Bar: Manufacturer's standard continuous channel, tubular shape, or two angles, finished to match grille.
 - 1. Astragal: Provide a replaceable, adjustable, continuous, compressible gasket of flexible vinyl, rubber, or neoprene; for placement between angles or fitted to shape, as a cushion bumper for grille.
 - 2. Provide motor-operated grilles with combination bottom astragal and sensor edge.
- D. Grille Curtain Jamb Guides: Manufacturer's standard extruded-aluminum shape having curtain groove with return lips or bars to retain curtain. Provide continuous integral wear strips to prevent metal-to-metal contact and to minimize operational noise; with removable stops on guides to prevent overtravel of curtain.

2.3 HOODS AND ACCESSORIES

- A. Hood: Form to entirely enclose coiled curtain and operating mechanism at opening head. Contour to fit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Provide closed ends for surface-mounted hoods, and provide fascia for any portion of between-jamb mounting projecting beyond wall face. Provide intermediate support brackets as required to prevent sagging.

1. Fabricate hoods for aluminum grilles of minimum 0.032-inch-thick aluminum, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, complying with ASTM B 209.
 2. Provide removable metal soffit of same material and finish as curtain if hood is mounted above ceiling, unless otherwise indicated.
- B. Push/Pull Handles: For push-up-operated or emergency-operated grilles, provide manufacturer's standard lifting handles on each side of grille.
- C. Fabricate locking device assembly with lock, spring-loaded dead bolt, operating handle, cam plate, and adjustable locking bar to engage through slots in tracks. Lock cylinder is specified in Section 08711 - DOOR HARDWARE.
- D. If grille curtain is power operated, provide safety interlock switch to disengage power supply when grille is locked.

2.4 COUNTERBALANCING MECHANISM

- A. General: Counterbalance grille curtain by means of adjustable-tension, steel helical torsion spring mounted around a steel shaft and contained in a spring barrel connected to grille curtain with barrel rings. Use grease-sealed bearings or self-lubricating graphite bearings for rotating members.
- B. Counterbalance Barrel: Fabricate spring barrel of hot-formed, structural-quality, welded or seamless carbon-steel pipe, of sufficient diameter and wall thickness to support rolled-up grille curtain without distortion of curtain and to limit barrel deflection to not more than 0.03 in./ft. of span under full load.
- C. Provide spring balance of one or more oil-tempered, heat-treated steel helical torsion springs. Size springs to counterbalance weight of grille curtain, with uniform adjustment accessible from outside barrel. Provide cast-steel barrel plugs to secure ends of springs to barrel and shaft.
- D. Fabricate torsion rod for counterbalance shaft of cold-rolled steel, sized to hold fixed spring ends and carry torsional load.
- E. Brackets: Provide mounting brackets of manufacturer's standard design, either cast iron or cold-rolled steel plate.

2.5 MANUAL GRILLE OPERATORS

- A. Push-up Operation: Design counterbalance mechanism so required lift or pull for grille operation does not exceed 25 lbf.

2.6 ELECTRIC GRILLE OPERATORS

- A. General: Provide electric grille operator assembly of size and capacity recommended and provided by grille manufacturer for grilles specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, solenoid-operated brake, clutch, remote-control stations, control devices, integral gearing for locking grille, and accessories required for proper operation.
- B. Comply with NFPA 70.

- C. Disconnect Device: Provide hand-operated disconnect or mechanism for automatically engaging chain and sprocket operator and releasing brake for emergency manual operation while disconnecting motor, without affecting timing of limit switch. Mount disconnect and operator so they are accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.
- D. Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
- E. Provide control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6, with NFPA 70 Class 2 control circuit, maximum 24-V, ac or dc.
- F. Grille-Operator Type: Provide wall-, hood-, or bracket-mounted, jackshaft, gear-head-type grille operator unit consisting of electric motor, enclosed worm-gear running-in-oil primary drive, and chain and sprocket secondary drive; with quick disconnect-release for manual operation.
- G. Electric Motors: Provide high-starting torque, reversible, continuous-duty, Class A insulated, electric motors complying with NEMA MG 1; with overload protection; sized to start, accelerate, and operate grille in either direction from any position, at not less than 2/3 fps and not more than 1 fps, without exceeding nameplate ratings or service factor.
 - 1. Type: Polyphase, medium-induction type.
 - 2. Service Factor: According to NEMA MG 1, unless otherwise indicated.
 - 3. Coordinate wiring requirements and electric characteristics of motors with building electrical system.
- H. Remote-Control Station: Provide momentary-contact, three-button control station with push-button controls labeled "Open," "Close," and "Stop."
 - 1. Provide interior units, full-guarded, surface-mounted, heavy-duty type, with general-purpose NEMA ICS 6, Type 1 enclosure.
- I. Obstruction Detection Device: Provide each motorized grille with indicated external automatic safety sensor capable of protecting full width of grille opening. Activation of sensor immediately stops and reverses downward grille travel.
- J. Limit Switches: Provide adjustable switches, interlocked with motor controls and set to automatically stop grille at fully opened and fully closed positions.
- K. Provide electric operators with ADA-compliant audible alarm and visual indicator lights.

2.7 FINISHES, GENERAL

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.8 ALUMINUM FINISHES

- A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- B. Class II, Clear Anodic Finish: AA-M12C22A31 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.010 mm or thicker) complying with AAMA 611.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Install grilles and operating equipment, complete with necessary hardware, according to Shop Drawings, manufacturer's written instructions, and as specified.

3.2 ADJUSTING

- A. Lubricate bearings and sliding parts; adjust grilles to operate easily, free of warp, twist, or distortion and with tight fit around entire perimeter.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Section 01015-SCHEDULE OF PRICES.

END OF SECTION

SECTION 08520

ALUMINUM WINDOWS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies fixed and casement aluminum windows (AW Class) with factory-installed glass and glazing.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 07600 – FLASHING AND SHEET METAL
 - 3. Section 07920 – JOINT SEALANTS
 - 4. Section 08801 – GLASS AND GLAZING

1.2 INTENT

- A. A major intent of the work of this section is to provide architectural aluminum windows meeting specified performance criteria.
- B. Drawings and details are intended to show basic design, profiles, sightlines, dimensions, sizes, alignment, pattern, and similar visual information. The Contractor shall design, engineer, and detail the entire aluminum window system and shall meet specified performance requirements while strictly maintaining the visual design concept indicated.

1.3 QUALITY ASSURANCE

- A. Source: For each type of window required for the work of this section, provide products of one manufacturer. Provide secondary materials which are acceptable to the manufacturers of the primary materials.
- B. Reference Standards: Comply with applicable requirements of the following standards. Where these standards are in conflict with specification requirements, the most restrictive requirement shall govern.
 - 1. AAMA GS-001, Voluntary Guide Specification for Aluminum Architectural Windows.
 - 2. ANSI/AAMA 101, Voluntary Specifications for Aluminum Prime Windows & Sliding Glass Doors.
 - 3. AAMA Curtain Wall Manual #10, Care and Handling of Architectural Aluminum from Shop to Site.
 - 4. AAMA 605.2, Voluntary Specifications for High Performance Organic Coatings on Architectural Extrusions and Panels.
 - 5. SMACNA, Architectural Sheet Metal Manual; details for fabrication and installation of flashings and counter flashings.
- C. Subdivision of Work: To limit responsibility, assign the complete aluminum window system, including installation of glass and perimeter sealants to one installer.

1.4 TESTS PROCEDURES AND PERFORMANCE REQUIREMENTS

- A. General: Provide aluminum windows capable of complying with performance requirements indicated, based on testing manufacturer's windows that are representative of those specified and that are of test size indicated below:
1. Minimum size required by AAMA/NWWDA/CSA 101/I.S.2/A440.
- B. AAMA/NWWDA Performance Requirements: Provide aluminum windows of the performance class and grade indicated that comply with AAMA/NWWDA/CSA 101/I.S.2/A440.
1. Performance Class: Architectural Grade AW.
 2. Performance Grade: Minimum for performance class indicated.
 3. Exception to AAMA/NWWDA/CSA 101/I.S.2/A440: In addition to requirements for performance class and performance grade, design glass framing system to limit lateral deflections of glass edges to less than 1/175 of glass-edge length or 3/4 inch whichever is less, at design pressure based on the following:
- C. Structural Performance: Provide aluminum windows capable of withstanding the following, including wind loads based on passing AAMA/NWWDA/CSA 101/I.S.2/A440, Uniform Load Structural Test, at basic wind speed indicated and as required by Code:
1. Deflection: Design glass framing system to limit lateral deflections of glass edges to less than 1/175 of glass-edge length or 3/4 inch, whichever is less, at design pressure based on structural computations.
 2. Wind and Seismic Loads: As indicated on the Structural Drawings, but not less than that required by Code.
 3. Movements of supporting structure including, but not limited to, story drift and deflection from uniformly distributed and concentrated live loads will require special considerations including but not limited to head receptors.
- D. Air Infiltration: Maximum rate not more than indicated when tested according to AAMA/NWWDA/CSA 101/I.S.2/A440, Air Infiltration Test.
1. Maximum Rate: As required by Code.
- E. Water Resistance: No water leakage as defined in AAMA/NWWDA/CSA referenced test methods at a water test pressure equaling that indicated, when tested according to AAMA/NWWDA/CSA 101/I.S.2/A440, Water Resistance Test.
1. Test Pressure: 15 percent of positive design pressure, but not less than 2.86 lbf/sq. ft. or more than 12 lbf/sq. ft.
- F. Condensation-Resistance Factor: Provide aluminum windows tested for thermal performance according to AAMA 1503, showing a CRF of 52 where windows are indicated to be "thermally improved."
- G. Thermal Transmittance: Provide aluminum windows with a whole-window U-value maximum indicated at 15-mph exterior wind velocity and winter condition temperatures when tested according to AAMA 1503.
1. U-Value: As required by Code. Submit proof of compliance with submittals as specified.
- H. Solar Heat-Gain Coefficient: Provide aluminum windows with a whole-window SHGC maximum as required by Code, determined according to NFRC 200 procedures. Submit proof of compliance with submittals as specified.

- I. Thermal Movements: Provide aluminum windows, including anchorage, that accommodate thermal movements of units resulting from the following maximum change (range) in ambient and surface temperatures without buckling, distortion, opening of joints, failure of joint sealants, damaging loads and stresses on glazing and connections, and other detrimental effects. Base engineering calculation on actual surface temperatures of materials due to solar heat gain and nighttime-sky heat loss.
 - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F material surfaces.
- J. Field Leakage Tests: The Contractor shall engage and pay for an independent testing agency to make in-place field tests for water leakage. Cooperate and complete window mock-up and surrounding wall construction as early as possible so that problems, if any, can be identified before majority of windows are installed. Test will generally include a prolonged water spray test. Any uncontrolled leakage will be considered a failure. Contractor shall pay for all remedial work and all retesting required because of failures.
- K. All exterior windows shall be designed and comply with the requirements of FM Global 1-28 requirements.

1.5 SUBMITTALS

- A. Product Data: Submit manufacturer's product data, installation instructions, use limitations and recommendations for each product used. Provide certifications stating that windows comply with requirements.
- B. Shop Drawings: Provide large scale shop drawings for fabrication, installation and erection of all parts of the work. Provide elevations and details of anchorages, connections, operators and accessory items. Provide glazing details. Provide installation templates for work installed by others.
- C. Verification Samples: Submit representative samples of each material that is to be exposed in the finished work, showing the full range of color and finish variations expected. Provide samples having minimum area of 144 square inches.
- D. Test Reports: Submit certified reports for tests required.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Reference Standard: Comply with applicable requirements of AAMA Aluminum Curtain Wall Manual Volume 10, Care and Handling of Architectural Aluminum from Shop to Site.
- B. Storage: Remove wrappings that are wet or could become wet. Store in a well drained, protected area free from dust and corrosive fumes. Stack on edge to prevent trapping water and shim to promote water drainage and air circulation. Cover materials with durable coverings supported by frames to provide good air circulation and to prevent contaminants from contacting materials. Sequence deliveries to avoid delays, but minimize on-site storage.

1.7 SEQUENCING AND SCHEDULING

- A. Conference: Convene a pre-installation conference to establish procedures to maintain optimum working conditions and to coordinate this work with related and adjacent work.
- B. Complete mock-up for field testing and Engineer's review of visual qualities as early as possible. Coordinate with surrounding work.

1.8 WARRANTY

- A. Total Window System Warranty: Provide a written warranty assuming full responsibility for the satisfactory performance of the total window system including, but not limited to, windows, hardware, glass, glazing, anchorage, setting, perimeter sealing, flashing, and other work as it relates to the performance required by the Contract Documents. Repair or replace all work not meeting specified performance requirements including removal and replacement of covering or connected adjacent work.
1. Warranty Period: 5 years from date of Final Acceptance.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Provide products of one of the following manufacturers if they meet or exceed the requirements of these specifications:
1. Profile Systems, Inc.
 2. Wausau Metals Corporation
 3. Architectural Window Manufacturing Corporation.
 4. Custom Window Company.
 5. EFCO, a Pella Company.
 6. Graham Architectural Products Corp.
 7. Kawneer North America.
 8. Mannix; a Division of Interstate Window Corp.
 9. Peerless Products, Inc.

2.2 MATERIALS AND PRODUCTS

- A. Windows: Provide high performance architectural windows meeting specified performance requirements, finish requirements, and complying with referenced standards.
1. Types and Operation: Provide fixed, non-operable windows and operable windows as indicated.
 2. Profiles and Appearance: Provide windows matching profiles and appearance shown. Drawings and Specifications are based upon Wausau 4250 Low Profile Series. Provide units with site lines of operable units the same as fixed units. Site lines of intermediate horizontal and vertical members shall match site line of the perimeter frame.
 3. Glazing: Provide windows which are easily reglazable without disassembly from the inside (unless otherwise noted). Comply with Section 08801 – Glass and GLAZING.
 4. Provide units with removable stile as indicated on Drawings so that entire unit can be removed for equipment access.
- B. Aluminum Extrusions: Provide alloy and temper recommended by manufacturer for strength, corrosion resistance, and application indicated, but not less than 22,000,000 psi ultimate strength and not less than 0.125 in. thickness at any locations.
1. Sheet and Plate: ASTM B 209

2. Extruded Bars, Rods, Shapes, and Tubes: ASTM B 221
- C. Fasteners: Comply with referenced standards. Provide non-magnetic stainless steel fasteners. Conceal fasteners wherever possible; provide Phillips flat head screws for exposed fasteners.
- D. Aluminum Spandrel Panels: Provide 3/16" aluminum plate with concealed fasteners as indicated on Drawings.
- E. Aluminum Composite Trims and Panels: Provide aluminum composite trims and panels at areas indicated. Provide units complete with concealed fasteners and intermediate framing as required to complete the work.
- F. Screens: Provide manufacturer's standard 18 x 16 stainless steel wire, 0.009 in. diameter mesh.
- G. Hardware: Provide manufacturer's standard hardware fabricated from stainless steel, bronze, or other corrosion-resistant metal, of strength to perform intended function for size of window indicated and as follows:
 1. Casement Windows: Provide heavy-duty combination lever handle and cam-type lock, with balance-support arms with 5-nuckle hinges attached to jambs (two per sash).

2.3 GLAZING

- A. Insulating-Glass Units for Vertical Glazing: 1 inch thick insulating glass consisting of two lites of 1/4 inch glass, low e coating on the No. 2 surface and argon gas filled.

2.4 FABRICATION

- A. Fabricate windows to be truly straight and square within tolerances permitted by referenced standards. Provide work to sizes, shapes, and profiles indicated on Contract Documents and approved shop drawings. Where 3 in. window frame sight lines are indicated, 2-5/8 in. to 3- 5/8 in. would be acceptable; however, site lines of intermediate horizontal and vertical members are to match site line of the perimeter frame.
- B. Make work with uniform, tight joints free from sharp edges. Do not bridge thermal barriers with fasteners, welds, hardware, or metal items, unless the tested assembly had the same thermal bridges.
- C. Provide windows with effective means of draining water and condensation which may build- up in members. Fabricate windows with sealed insulating glass to prevent water from contacting glass edge seal.
- D. Provide subframes, sills, mullions, cover plates, and other components and accessories as needed for a complete weatherproof and waterproof assembly meeting specified performance requirements.
- E. All vent and frame corners shall be mitered and, at manufacturer's discretion, either corner blocked, using 6061 T6 structural aluminum alloy extruded corner blocks and stainless steel machine screws, or welded and ground smooth. The above attachment shall be made at both sides of the thermal break.

2.5 FINISHES

- A. Fluorocarbon Coating: Properly prepare substrates by inhibited chemical cleaning, conversion coating, and priming in compliance with coating manufacturer's instructions and recommendations. Provide minimum 1.0 dry film thickness of thermo-cured fluorocarbon coating containing minimum 70% of one of the following resins:

1. Hylar 5000; Ausimont USA, Inc., Morristown, NJ 07962-1838
 2. Kynar 500; Atochem North America, Inc., Philadelphia, PA 19102.
- B. Colors: Provide custom mixed colors, to match Engineer's sample.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The Installer shall examine substrates, supports, and conditions under which this work is to be performed and notify Contractor, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means Installer accepts substrates, rough openings, and conditions.

3.2 INSTALLATION

- A. Manufacturer's Instructions: Strictly comply with manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this section.
- B. Installation: Install windows truly plumb, level, in alignment and plane without warp or rack. Install windows in one true plane for each wall plane on the building. Anchor securely in- place to maintain positions permanently when subjected to normal thermal and building movement and specified wind loads.
- C. Dissimilar Materials: Provide for effective means of isolating dissimilar materials. Comply with ANSI/AAMA 101, Appendix. Obtain Engineer's approval of method used.
- D. Sealants: Set sills and subframes in thick bed of sealant. Install sealants at all joints and intersections and at window perimeters. Comply with applicable requirements of Section 07920 - SEALANTS AND CAULKINGS.
- E. Flashings: Coordinate window installation with flashings to ensure weathertight construction and assembly. Thoroughly seal all penetrations through flashings with thick bed of sealant. Comply with applicable requirements of Section 07600 - FLASHINGS AND SHEET METAL.
- F. Glass and Glazing: Comply with applicable requirements of Section 08800 - GLAZING. Create a leak free installation.
- G. Insulation and Vapor Barriers: Provide insulation and vapor barriers between window perimeter and adjacent construction to ensure complete continuity. Comply with applicable requirements of Section 07210 - BUILDING INSULATION.

3.3 CLEANING, TOUCH-UP AND PROTECTION

- A. Touch-up damaged coatings and finishes and repair minor damage to eliminate all evidence of repair. Remove and replace work which cannot be satisfactorily repaired.
- B. Clean exposed surfaces using materials and methods recommended by window manufacturer. Remove labels. Remove and replace work that cannot be successfully cleaned.
- C. Provide temporary protection to ensure work being without damage or deterioration at time of final acceptance. Remove protections and reclean as necessary immediately before final acceptance.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 08801

GLASS AND GLAZING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. Work Included: This Section specifies glass and glazing for the following applications:

1. Exterior metal-framed openings.
2. Steel doors, frames and sidelights specified in Section 08111.
3. Interior borrowed lites.
4. Unframed mirrors.
5. Aluminum entrance doors.
6. Pre-fractured laminated glass (Art Program).
7. Tempered laminated wind screens.
8. Tempered laminated glass with custom ceramic ink artwork (Art Program).
9. Structural tempered, heat soaked, laminated glazing.
10. Comply with requirements in the Glass Matrix in this Section for glazing locations.

B. Related Work:

1. Section 01800 – SUSTAINABILITY REQUIREMENTS
2. Section 08130 – METAL FRAMED GLASS DOORS.
3. Section 08510 – STEEL WINDOWS.
4. Section 08511 – STAINLESS STEEL WINDOWS.
5. Section 08520 – ALUMINUM WINDOWS.
6. Section 08910 – GLAZED METAL FRAMED CURTAIN WALLS.
7. Section 08970 – STRUCTURAL GLASS WALLS.

C. Drawing Coordination: Refer to the Drawings for the following keynotes for this Section:

1. GL-01 GLAZING, 9/16" LAMINATED WITH TRANSLUCENT CERAMIC FRIT AND CLEAR INTERLAYER, TEMPERED
2. GL-02 GLAZING, 9/16" LAMINATED WITH CLEAR INTERLAYER, TEMPERED
3. GL-03 GLAZING, 9/16" LAMINATED WITH TRANSLUCENT CERAMIC FRIT AND CLEAR INTERLAYER, TEMPERED, BACK PAINTED
4. GL-04 NOT USED
5. GL-05 NOT USED
6. GL-06 GLAZING, 1" INSULATED, TEMPERED

7. GL-06A GLAZING 1" INSULATED WITH TRANSLUCENT CERAMIC FRIT, TEMPERED
8. GL-07 NOT USED
9. GL-08 GLAZING, 1" INSULATED WITH GRADUATION FROM TRANSLUCENT TO CLEAR
10. GL-09 NOT USED
11. GL-10 NOT USED
12. GL-11 GLAZING, LAMINATED WITH SECURITY INTERLAYER, TEMPERED
13. GL-12 GLAZING, 9/16" LAMINATED WITH PATTERNED CERAMIC FRIT, SECURITY INTERLAYER
14. GL-13 GLAZING BULLET-PROOF

1.2 DEFINITIONS

- A. Manufacturers of Glass Products: Firms that produce primary glass, fabricated glass, or both, as defined in referenced glazing publications.
- B. Glass Thicknesses: Indicated by thickness designations in millimeters according to ASTM C 1036.
- C. Interspace: Space between lites of an insulating-glass unit that contains dehydrated air or a specified gas.
- D. Deterioration of Coated Glass: Defects developed from normal use that are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning coated glass contrary to manufacturer's written instructions. Defects include peeling, cracking, and other indications of deterioration in metallic coating.
- E. Deterioration of Insulating Glass: Failure of hermetic seal under normal use that is attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is the obstruction of vision by dust, moisture, or film on interior surfaces of glass.
- F. Deterioration of Laminated Glass: Defects developed from normal use that are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning laminated glass contrary to manufacturer's written instructions. Defects include edge separation, delamination materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated-glass standard.

1.3 PERFORMANCE REQUIREMENTS

- A. General: Provide glazing systems capable of withstanding normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, and installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.
- B. Glass Design: Glass thickness designations indicated are minimums and are for detailing only. Confirm glass thicknesses by analyzing Project loads and in-service conditions. Provide glass lites in

the thickness designations indicated for various size openings, but not less than thicknesses and in strengths (annealed or heat treated) required to meet or exceed the following criteria:

1. Glass Thicknesses: Select minimum glass thicknesses to comply with ASTM E 1300, according to the following requirements:
 - a. Specified Design Wind Loads: As required by Code.
 - b. Probability of Breakage for Vertical Glazing: 8 lites per 1000 for lites set vertically or not more than 15 degrees off vertical and under wind action.
 1. Load Duration: 60 seconds minimum.
 - c. Maximum Lateral Deflection: For the following types of glass supported on all 4 edges, provide thickness required that limits center deflection at design wind pressure to 1/50 times the short side length or 1 inch, whichever is less.
 1. For monolithic-glass lites heat treated to resist wind loads.
 2. For insulating glass.
 3. For laminated-glass lites.
 - d. Minimum Glass Thickness for Exterior Lites: Not less than 6 mm.
- C. Thermal Movements: Provide glazing that allows for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures acting on glass framing members and glazing components. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- D. Thermal and Optical Performance Properties: Provide glass with performance properties specified based on manufacturer's published test data, as determined according to procedures indicated below:
 1. For laminated-glass lites, properties are based on products of construction indicated.
 2. For insulating-glass units, properties are based on units with lites 6.0 mm thick and a nominal 1/2-inch-wide interspace.
 3. Center-of-Glass Values: Based on using LBL-44789 WINDOW 5.0 computer program for the following methodologies:
 - a. U-Factors: NFRC 100 expressed as Btu/ sq. ft. x h x deg F.
 - b. Solar Heat Gain Coefficient: NFRC 200.
 - c. Solar Optical Properties: NFRC 300.
- E. All exterior glazing shall be designed and comply with the requirements of FM Global 1-28 requirements.

1.4 SUBMITTALS

- A. Product Data: For each glass product and glazing material indicated. Submit manufacturer's printed product data, specifications, standard details, installation instructions, use limitations and recommendations for each material used. Provide certifications that materials and systems comply with specified requirements.
- B. Samples: For the following products, in the form of 12-inch- square Samples for glass.

1. Coated vision glass.
 2. Ceramic-coated spandrel glass.
 3. Each pattern and color of ceramic-coated vision glass.
 4. Each type of glass clad polycarbonate, in insulated and non-insulated panels
 5. Insulating glass for each designation indicated.
 6. For each color (except black) of exposed glazing sealant indicated.
- C. Glazing Schedule: Use same designations indicated on Drawings for glazed openings in preparing a schedule listing glass types and thicknesses for each size opening and location.
- D. Product Certificates: Signed by manufacturers of glass and glazing products certifying that products furnished comply with requirements. For solar-control low-e-coated glass, provide documentation demonstrating that manufacturer of coated glass is certified by coating manufacturer.
- E. Qualification Data: For installers, in accordance with Par. 1.5A.
- F. Preconstruction Adhesion and Compatibility Test Report: From glazing sealant manufacturer indicating glazing sealants were tested for adhesion to glass and glazing channel substrates and for compatibility with glass and other glazing materials.
- G. Delegated Design: For point supported glass used in conjunction with structural steel: Employ a Professional Engineer licensed in the Commonwealth of Massachusetts to supervise and coordinate the design for the entire glass assembly as well as preparing signed and sealed drawings and calculations including gravity, lateral and seismic loading. This Professional Engineer shall have 10 years experience in projects with composite structural assemblies of this type scope and complexity.
- H. Product Test Reports: For each of the following types of glazing products:
1. Monolithic glass.
 2. Laminated tempered glass Panels.
 3. Laminated, tempered insulating glass.
 4. Glass clad polycarbonate.
 5. Insulating glass.
 6. Point Supported Glass
 7. Glazing sealants.
 8. Glazing gaskets.
- I. Calculations: Provide wind load charts, calculations and certification of performance of this Work. Indicate how design requirements for loading and other performance criteria have been satisfied. All calculations shall bear the stamp of a Professional Engineer licensed and registered in the Commonwealth of Massachusetts.
- J. Affidavit of Experience: Installer to submit work experience as specified herein.
- K. Warranties: Special warranties specified in this Section.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer with a minimum of three years experience who has completed glazing similar in material, design, and extent to that indicated for this Project; whose work has resulted in glass installations with a record of successful in-service performance..
- B. Source Limitations for Glass: Obtain the following through one source from a single manufacturer for each glass type: clear float glass, laminated glass and insulating glass.
- C. Source Limitations for Glass Sputter-Coated with Solar-Control Low-E Coatings: Where solar-control low-e coatings of a primary glass manufacturer that has established a certified fabricator program is specified, obtain sputter-coated solar-control low-e-coated glass in fabricated units from a manufacturer that is certified by coated-glass manufacturer.
- D. Source Limitations for Glazing Accessories: Obtain glazing accessories through one source from a single manufacturer for each product and installation method indicated.
- E. Elastomeric Glazing Sealant Product Testing: Obtain sealant test results for product test reports in Part 1 "Submittals" Article from a qualified testing agency based on testing current sealant formulations within a 36-month period.
 - 1. Sealant Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1021 to conduct the testing indicated, as documented according to ASTM E 548.
 - 2. Test elastomeric glazing sealants for compliance with requirements specified by reference to ASTM C 920, and where applicable, to other standard test methods.
- F. Hold Point - Preconstruction Adhesion and Compatibility Testing: Submit to elastomeric glazing sealant manufacturers, for testing indicated below, samples of each glazing material type, tape sealant, gasket, glazing accessory, and glass-framing member that will contact or affect elastomeric glazing sealants:
 - 1. Use ASTM C 1087 to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of glazing sealants to glass, tape sealants, gaskets, and glazing channel substrates.
 - 2. Submit not fewer than eight pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
 - 3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
 - 4. For materials failing tests, obtain sealant manufacturer's written instructions for corrective measures, including the use of specially formulated primers.
 - 5. Testing will not be required if elastomeric glazing sealant manufacturers submit data based on previous testing of current sealant products for adhesion to, and compatibility with, glazing materials matching those submitted.
- G. Safety Glazing Products: Comply with testing requirements in 16 CFR 120 and, for wired glass, ANSI Z97.1.
 - 1. Subject to compliance with requirements, obtain safety glazing products permanently marked with certification label of the Safety Glazing Certification Council or another certification agency acceptable to authorities having jurisdiction.
 - 2. Where glazing units, including Kind FT glass and laminated glass, are specified in Part 2 articles for glazing lites more than 9 sq. ft. in exposed surface area of one side, provide glazing

products that comply with Category II materials, for lites 9 sq. ft. or less in exposed surface area of one side, provide glazing products that comply with Category I or II materials, except for hazardous locations where Category II materials are required by 16 CFR 1201 and regulations of authorities having jurisdiction.

- H. Glazing Publications: Comply with published recommendations of glass product manufacturers and organizations below, unless more stringent requirements are indicated. Refer to these publications for glazing terms not otherwise defined in this Section or in referenced standards.
 - 1. GANA Publications: GANA Laminated Division's "Laminated Glass Design Guide" and GANA's "Glazing Manual."
 - 2. IGMA Publication for Insulating Glass: SIGMA TM-3000, "Glazing Guidelines for Sealed Insulating Glass Units."
- I. Insulating-Glass Certification Program: Permanently marked either on spacers or on at least one component lite of units with appropriate certification label of the following testing and inspecting agency: Insulating Glass Certification Council.
- J. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Protect glazing materials according to manufacturer's written instructions and as needed to prevent damage to glass and glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.
- B. For insulating-glass units that will be exposed to substantial altitude changes, comply with insulating-glass manufacturer's written recommendations for venting and sealing to avoid hermetic seal ruptures.

1.7 PROJECT CONDITIONS

- A. Environmental Limitations: Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes. Do not install liquid glazing sealants when ambient and substrate temperature conditions are outside limits permitted by glazing sealant manufacturer or below 40 deg F.

1.8 PRE-CONSTRUCTION MEETING

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

1.9 WARRANTY

- A. Manufacturer's Special Warranty for Coated-Glass Products: Manufacturer's standard form, made out to the Authority and signed by coated-glass manufacturer agreeing to replace coated-glass units that deteriorate as defined in "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.
1. Warranty Period: Ten years from date of Substantial Completion.
- B. Manufacturer's Special Warranty on Laminated Glass: Manufacturer's standard form, made out to the Authority and signed by laminated-glass manufacturer agreeing to replace laminated-glass units that deteriorate as defined in Part 1 "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.
1. Warranty Period: Five years from date of Substantial Completion.
- C. Manufacturer's Special Warranty on Mirrors: Manufacturer's standard form in which mirror manufacturer agrees to replace mirrors that deteriorate within specified warranty period. Deterioration of mirrors is defined as defects developed from normal use that are not attributed to mirror breakage or to maintaining and cleaning mirrors contrary to manufacturer's written instructions. Defects include discoloration, black spots, and clouding of the silver film.
1. Warranty Period: Five years from date of Substantial Completion.
- D. Manufacturer's Special Warranty on Insulating Glass: Manufacturer's standard form, made out to the Authority and signed by insulating-glass manufacturer agreeing to replace insulating-glass units that deteriorate as defined in "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.
1. Warranty Period: Ten years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 INSULATING-GLASS UNITS

- A. Insulating-Glass Units for Vertical Glazing: 1 inch thick insulating glass consisting of two lites of 1/4 inch glass, low e coating on the No. 2 surface and argon gas filled. Provide one of the following or equal:
1. VE1-2M by Viracon.
 - a. Visible Light Transmittance: 70 percent.
 - b. Reflectance Visible Light: 11 percent.
 - c. U Value (Winter): 0.25.
 - d. Shading Coefficient: 0.43.
 - e. Solar Heat Gain Coefficient: 0.37.
 2. Solarban 60 by PPG Industries.
 - a. Visible Light Transmittance: 70 percent.
 - b. Reflectance Visible Light: 11 percent.
 - c. U Value (Winter): 0.29.

- d. Shading Coefficient: 0.44.
 - e. Solar Heat Gain Coefficient: 0.38.
3. SN-68 by Guardian Industries.
- a. Visible Light Transmittance: 68 percent.
 - b. Reflectance Visible Light: 10 percent.
 - c. U Value (Winter): 0.29.
 - d. Shading Coefficient: 0.43.
 - e. Solar Heat Gain Coefficient: 0.37.
- B. Insulating-Glass Units, General: Factory-assembled units consisting of sealed lites of glass separated by a dehydrated interpane air space, and complying with ASTM E2190 and with requirements specified in this Section.
- 1. Provide Kind HS (heat-strengthened) float glass in place of annealed glass where needed to resist thermal stresses induced by differential shading of individual glass lites and to comply with glass design requirements specified in Part 1 "Performance Requirements" paragraph.
 - 2. Provide Kind FT (fully tempered) glass lites where safety glass is indicated.
 - 3. Overall Unit Thickness and Thickness of Each Lite: Dimensions indicated for insulating-glass units are nominal and the overall thicknesses of units are measured perpendicularly from outer surfaces of glass lites at unit's edge.
 - 4. Sealing System: Dual seal, with primary and secondary sealants as follows:
 - a. Manufacturer's Standard Sealants. Butyl primary and silicone secondary sealants. Secondary sealant shall cover entire spacer bar at IGU perimeter.
 - 5. Spacer Specifications: Manufacturer's standard spacer material. Spacer corners shall be bent, soldered, or welded. Keyed spacer corners will not be accepted. Spacer may have a mid-span spacer key located at the midpoint of the insulating glass unit head. Where a mid-span spacer key is used, the key must be fully embedded (all sides) in butyl sealant.

2.2 GLASS PRODUCTS

- A. Float Glass: ASTM C 1036, Type I, Quality-Q3, Class I (clear) unless otherwise indicated.

2.3 LAMINATED GLASS

- A. Laminated Glass: ASTM C 1172, and complying with testing requirements in 16 CFR 1201 for Category II materials, and with other requirements specified. Use materials that have a proven record of no tendency to bubble, discolor, or lose physical and mechanical properties after fabrication and installation.
 - 1. Construction: Laminate glass with one of the following to comply with interlayer manufacturer's written recommendations.
 - a. DuPont™ SentryGlas® Ionoplast Interlayer
 - b. Polyvinyl butyral interlayer.
 - 2. Interlayer Thickness: Minimum 0.060 clear interlayer..
 - 3. Interlayer Color: Clear, translucent, opaque, patterned, and custom graphics may be required.. Refer to Drawings.

B. Laminated Glass Units:

1. Low-E Laminated Glass: 9/16 inch laminated vision glass with two plies of 1/4 inch clear tempered glass, low e coating on the No. 3 surface with 0.060 inch clear interlayer.
 - a. VLE1-70 by Viracon.
 1. Visible Light Transmittance: 68 percent.
 2. Reflectance Visible Light: 13 percent.
 3. U Value (Winter): 0.96.
 4. Shading Coefficient: 0.50.
 5. Solar Heat Gain Coefficient: 0.43.
2. Etched Laminated Glass: 1 inch laminated etched glass with two plies of 1/4 inch etched safety dichroic glass, with 0.030 inch interlayer.
 - a. Product: ALICE ceramic ink on No. 2 surface as specified elsewhere in this Section.
3. Laminate Low Iron Glass: 9/16 inch laminated vision glass with one ply of 1/4 inch OptiWhite tempered glass, one ply 1/4 inch OptiWhite tempered glass, with 0.060 inch clear interlayer.
 - a. Optiwhite by Viracon.
 1. Visible Light Transmittance: 90 percent
 2. Reflectance Visible Light: 8 percent
 3. U Value (Winter): 0.95.
 4. Shading Coefficient: 0.95
 5. Solar Heat Gain Coefficient: 0.83

2.4 LAMIANTED TEMPERED GLASS

- A. Laminated Fully Tempered glass panels - ASTM C 1048 Standard Specification for Heat-Strengthened and Fully Tempered Flat.
- B. Structural Glass, Point Supported: Lamianted panels shall be fully tempered glass. Provide a test result which warrants that heat soaked tempered glass will not break spontaneously as a result of Nickel Sulfide (NiS) inclusions at a rate exceeding 0.5% (5/1000) for a period of five years from the date of manufacture for each panel.
- C. Thickness: Provide thickness as determined by engineering requirements, as determined sizes and loads.

2.5 INTERIOR GLAZING

- A. Tempered Float Glass: ASTM C 1048; Type I (transparent flat glass); Quality-Q3; Kind FT; 1/4 inch thick unless indicated otherwise.
- B. Mirrors: ASTM C 1503. Mirror Glazing Quality, for blemish requirements; and comply with ASTM C 1048 for Kind FT, Condition A, tempered float glass before silver coating is applied.
 1. Nominal Thickness: 6.0 mm.

2.6 TRANSLUCENT GLASS UNITS

- A. Translucent Glass Unit: Air filled pre-assembled units consisting of 3 inch thick translucent glass consisting of two lites of 1/4 clear inch annealed glass, light diffusing veil on the No. 2 and 3 surfaces, with honeycomb transparent insulation aligned perpendicular to glazing and filled with Lumira aerogel.
1. Available Product: Provide Advanced Glazings Limited, Solera+ Lumira Aerogel R18 or approved equal.

2.7 GLASS CLAD POLYCARBONATE

- A. Polycarbonate Sheet: ASTM C 1349, Appendix X1, Type II, coated, mar-resistant, UV-stabilized polycarbonate with coating on exposed surfaces and Type I, standard, UV-stabilized polycarbonate where no surfaces are exposed.
- B. Glass-Clad Polycarbonate: ASTM C 1349, and other requirements specified.
1. Basis of Design: Viracon; GuardVue, physical attack resistant glass clad polycarbonate.
 - a. 13/16 inch thick, GuardVue 400.
 - b. 3/4 inch thick, GuardVue 350.
 2. Provide glass-clad polycarbonate that complies with testing requirements in 16 CFR 1201 for Category II materials, and with other requirements specified.
 3. Performance Requirements:
 - a. Safety Glazing: ANSI Z97.1.
 - b. Forced Entry Resistance: H.P. White TP-0500.02 - Level II.
 - c. Ballistics Resistance: H.P. White Level B Ballistics - 9 mm (low spall).
 - d. Physical Attack Resistance: WMFL Level III - 30 minutes.

2.8 GLAZING SEALANTS

- A. General: Provide products of type indicated, complying with the following requirements:
1. Compatibility: Verify glazing sealants that are compatible with one another and with other materials they will contact, including glass products, seals of insulating-glass units, and glazing channel substrates, under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience.
 2. Suitability: Comply with sealant and glass manufacturers' written instructions for selecting glazing sealants suitable for applications indicated and for conditions existing at time of installation.
 3. Colors of Exposed Glazing Sealants: As selected by Engineer from manufacturer's full range.
- B. Elastomeric Glazing Sealants: Comply with ASTM C 920 and other requirements indicated for each liquid-applied chemically curing sealant specified, including those referencing ASTM C 920 classifications for type, grade, class, and uses related to exposure and joint substrates.
1. Single-Component Neutral- and Basic-Curing Silicone Glazing Sealants:

- a. Dow Corning Corporation; 790.
- b. GE Silicones; SilPruf LM SCS2700.
- c. Tremco; Spectrem 1 (Basic).

2.9 GLAZING TAPES

- A. Back-Bedding Mastic Glazing Tapes: Preformed, butyl-based elastomeric tape with a solids content of 100 percent; nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and glass manufacturers for application indicated; packaged on rolls with a release paper backing; and complying with ASTM C 1281 and AAMA 800 for project conditions.
- B. Expanded Cellular Glazing Tapes: Closed-cell, PVC foam tapes; factory coated with adhesive on both surfaces; packaged on rolls with release liner protecting adhesive; and complying with AAMA 800 for the following types:
 1. Type 1, for glazing applications in which tape acts as the primary sealant.
 2. Type 2, for glazing applications in which tape is used in combination with a full bead of liquid sealant.

2.10 MISCELLANEOUS GLAZING MATERIALS

- A. General: Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials for application indicated, and with a proven record of compatibility with surfaces contacted in installation.
- B. Cleaners, Primers, and Sealers: Types recommended by sealant or gasket manufacturer.
- C. Setting Blocks: Elastomeric material with a Shore, Type A durometer hardness of 85, plus or minus 5.
- D. Spacers: Elastomeric blocks or continuous extrusions with a Shore, Type A durometer hardness required by glass manufacturer to maintain glass lites in place for installation indicated.
- E. Edge Blocks: Elastomeric material of hardness needed to limit glass lateral movement (side walking).
- F. Perimeter Insulation for Fire-Resistive Glazing: Identical to product used in test assembly to obtain fire-resistance rating.
- G. Mirror Mastic: An adhesive setting compound, asbestos-free, produced specifically for setting mirrors and certified by both mirror manufacturer and mastic manufacturer as compatible with glass coating and substrates on which mirrors will be installed.
 1. Adhesive shall have a VOC content of not more than 70 g/L when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- H. Mirror Hardware: Aluminum extrusions with a return deep enough to produce a glazing channel to accommodate mirrors of thickness indicated and in lengths required to cover bottom and top edges of each mirror in a single piece.

2.11 FABRICATION OF GLAZING UNITS

- A. Fabricate glazing units in sizes required to glaze openings indicated for Project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.
- B. Clean-cut or flat-grind vertical edges of butt-glazed monolithic lites in a manner that produces square edges with slight kerfs at junctions with outdoor and indoor faces.
- C. Grind smooth and polish exposed glass edges and corners.

2.12 GRAPHICS ON GLASS

- A. Graphics Printer for Images on Glass: ALICE printer by GeneralGlass or equal:
 - 1. Print resolution: Up to 360 dpi..
 - 2. Ink type: Ceramic enamel frit.
 - 3. Equipment: Flat bed digital printing unit.
 - 4. Drying: Infrared drying.
 - 5. Image format: All standard graphic formats including PDF, PS, EPS, TIFF, BMP and JPEG.
 - 6. Drop Fixation: Droplets dried immediately to prevent drop gain.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine framing glazing, with Installer present, for compliance with the following:
 - 1. Manufacturing and installation tolerances, including those for size, squareness, and offsets at corners.
 - 2. Presence and functioning of weep system.
 - 3. Minimum required face or edge clearances.
 - 4. Effective sealing between joints of glass-framing members.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not firmly bonded to substrates.

3.3 GLAZING, GENERAL

- A. Comply with combined written instructions of manufacturers of glass, sealants, gaskets, and other glazing materials, unless more stringent requirements are indicated, including those in referenced glazing publications.
- B. Glazing channel dimensions, as indicated on Drawings, provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances. Adjust as required by Project conditions during installation.
- C. Protect glass edges from damage during handling and installation. Remove damaged glass from Project site and legally dispose of off Project site. Damaged glass is glass with edge damage or other imperfections that, when installed, could weaken glass and impair performance and appearance.
- D. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction sealant-substrate testing.
- E. Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.
- F. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
- G. Provide spacers for glass lites where length plus width is larger than 50 inches as follows:
 - 1. Locate spacers directly opposite each other on both inside and outside faces of glass. Install correct size and spacing to preserve required face clearances, unless gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and to comply with system performance requirements.
 - 2. Provide 1/8-inch minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.
- H. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass manufacturer and according to requirements in referenced glazing publications.
- I. Set glass lites in each series with uniform pattern, draw, bow, and similar characteristics.

3.4 TAPE GLAZING

- A. Position tapes on fixed stops so that, when compressed by glass, their exposed edges are flush with or protrude slightly above sightline of stops.
- B. Install tapes continuously, but not necessarily in one continuous length. Do not stretch tapes to make them fit opening.
- C. Cover vertical framing joints by applying tapes to heads and sills first and then to jambs. Cover horizontal framing joints by applying tapes to jambs and then to heads and sills.
- D. Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape manufacturer.

- E. Do not remove release paper from tape until just before each glazing unit is installed.
- F. Center glass lites in openings on setting blocks and press firmly against tape by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings.

3.5 SEALANT GLAZING (WET)

- A. Install continuous spacers, or spacers combined with cylindrical sealant backing, between glass lites and glazing stops to maintain glass face clearances and to prevent sealant from extruding into glass channel and blocking weep systems until sealants cure. Secure spacers or spacers and backings in place and in position to control depth of installed sealant relative to edge clearance for optimum sealant performance.
- B. Force sealants into glazing channels to eliminate voids and to ensure complete wetting or bond of sealant to glass and channel surfaces.
- C. Tool exposed surfaces of sealants to provide a substantial wash away from glass.

3.6 CLEANING AND PROTECTION

- A. Protect exterior glass from damage immediately after installation by attaching crossed streamers to framing held away from glass. Do not apply markers to glass surface. Remove nonpermanent labels, and clean surfaces.
- B. Protect glass from contact with contaminating substances resulting from construction operations, including weld splatter. If, despite such protection, contaminating substances do come into contact with glass, remove substances immediately as recommended by glass manufacturer.
- C. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less than once a month, for buildup of dirt, scum, alkaline deposits, or stains; remove as recommended in writing by glass manufacturer.
- D. Remove and replace glass that is broken, chipped, cracked, or abraded or that is damaged from natural causes, accidents, and vandalism, during construction period.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09220

PORTLAND CEMENT PLASTER

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items:
 - 1. Exterior Portland cement plasterwork (stucco) with integral color on metal lath.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 05411 – LIGHT GAUGE METAL FRAMING; steel studs that support lath and portland cement plaster.
 - 2. Section 06100 - CARPENTRY; wood furring included in portland cement plaster assemblies.
 - 3. Section 07920 - JOINT SEALANTS; sealants installed with exterior portland cement plaster.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Show locations and installation of control and expansion joints including plans, elevations, sections, details of components, and attachments to other work.
- C. Samples for Verification: For each type of finish coat indicated; 12 by 12 inches and prepared on rigid backing.

1.3 QUALITY ASSURANCE

- A. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes.

1.5 PROJECT CONDITIONS

- A. Comply with ASTM C 926 requirements.

- B. Exterior Plasterwork:
 - 1. Apply and cure plaster to prevent plaster drying out during curing period. Use procedures required by climatic conditions, including moist curing, providing coverings, and providing barriers to deflect sunlight and wind.
 - 2. Apply plaster when ambient temperature is greater than 40 deg F.
 - 3. Protect plaster coats from freezing for not less than 48 hours after set of plaster coat has occurred.
- C. Factory-Prepared Finishes: Comply with manufacturer's written recommendations for environmental conditions for applying finishes.

PART 2 - PRODUCTS

2.1 METAL LATH

- A. Expanded-Metal Lath: ASTM C 847 with ASTM A 653/A 653M, G60, hot-dip galvanized zinc coating.

2.2 ACCESSORIES

- A. General: Comply with ASTM C 1063 and coordinate depth of trim and accessories with thicknesses and number of plaster coats required.
- B. Zinc and Zinc-Coated (Galvanized) Accessories: ASTM A 653/A 653M, G60 zinc coating.

2.3 MISCELLANEOUS MATERIALS

- A. Water for Mixing: Potable and free of substances capable of affecting plaster set or of damaging plaster, lath, or accessories.
- B. Bonding Compound: ASTM C 932.
- C. Steel Drill Screws: For metal-to-metal fastening, ASTM C 1002 or ASTM C 954, as required by thickness of metal being fastened; with pan head that is suitable for application; in lengths required to achieve penetration through joined materials of not fewer than three exposed threads.
- D. Fasteners for Attaching Metal Lath to Substrates: Complying with ASTM C 1063.
- E. Isolation Strip at Exterior Walls: ASTM D 226, Type I (No. 15 asphalt felt), unperforated.

2.4 PLASTER MATERIALS

- A. Portland Cement: ASTM C 150, Type I, white color for finish coats.
- B. Plastic Cement: ASTM C 1328.

- C. Colorants for Job-Mixed Finish-Coats: Colorfast mineral pigments that produce finish plaster color to match Engineer's sample.
- D. Lime: ASTM C 206, Type S; or ASTM C 207, Type S.
- E. Sand Aggregate: ASTM C 897.
- F. Ready-Mixed Finish-Coat Plaster: Mill-mixed portland cement, aggregates, coloring agents, and proprietary ingredients.
 - 1. Available Products:
 - a. California Stucco Products Corp.; Conventional Portland Cement Stucco.
 - b. Florida Stucco Corp.
 - c. United States Gypsum Co.; Oriental Exterior Finish Stucco.
 - 2. Color: As selected by Engineer from manufacturer's full range.

2.5 PLASTER MIXES

- A. General: Comply with ASTM C 926 for applications indicated.
 - 1. Fiber Content: Add fiber to base-coat mixes after ingredients have mixed at least two minutes. Comply with fiber manufacturer's written instructions for fiber quantities in mixes, but do not exceed 1 lb of fiber/cu. ft. of cementitious materials. Reduce aggregate quantities accordingly to maintain workability.
- B. Base-Coat Mixes for Use over Metal Lath: Scratch and brown coats for three-coat plasterwork as follows:
 - 1. Portland Cement Mixes:
 - a. Scratch Coat: For cementitious material, mix 1 part portland cement and 0 to 3/4 parts lime. Use 2-1/2 to 4 parts aggregate per part of cementitious material (sum of separate volumes of each component material).
 - b. Brown Coat: For cementitious material, mix 1 part portland cement and 0 to 3/4 parts lime. Use 3 to 5 parts aggregate per part of cementitious material (sum of separate volumes of each component material).
- C. Factory-Prepared Finish-Coat Mixes: For ready-mixed finish-coat plasters, comply with manufacturer's written instructions.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Protect adjacent work from soiling, spattering, moisture deterioration, and other harmful effects caused by plastering.

3.3 INSTALLING METAL LATH

- A. Expanded-Metal Lath: Install according to ASTM C 1063.

3.4 INSTALLING ACCESSORIES

- A. Install according to ASTM C 1063 and at locations indicated on Drawings.
- B. Reinforcement for External Corners:
 1. Install lath-type external-corner reinforcement at exterior locations.
 2. Install cornerbead at interior and exterior locations.
- C. Control Joints: Install control joints in specific locations approved by Engineer for visual effect as follows:
 1. As required to delineate plasterwork into areas (panels) of the following maximum sizes:
 - a. Vertical Surfaces: 144 sq. ft.
 - b. Horizontal and other Non-vertical Surfaces: 100 sq. ft.
 2. At distances between control joints of not greater than 18 feet o.c.
 3. As required to delineate plasterwork into areas (panels) with length-to-width ratios of not greater than 2-1/2:1.
 4. Where control joints occur in surface of construction directly behind plaster.
 5. Where plasterwork areas change dimensions, to delineate rectangular-shaped areas (panels) and to relieve the stress that occurs at the corner formed by the dimension change.

3.5 PLASTER APPLICATION

- A. General: Comply with ASTM C 926.
 1. Do not deviate more than plus or minus 1/4 inch in 10 feet from a true plane in finished plaster surfaces, as measured by a 10-foot straightedge placed on surface.
 2. Grout hollow-metal frames, bases, and similar work occurring in plastered areas, with base-coat plaster material, before lathing where necessary. Except where full grouting is indicated or required for fire-resistance rating, grout at least 6 inches at each jamb anchor.
 3. Finish plaster flush with metal frames and other built-in metal items or accessories that act as a plaster ground, unless otherwise indicated. Where casing bead does not terminate plaster at metal

frame, cut base coat free from metal frame before plaster sets and groove finish coat at junctures with metal.

4. Provide plaster surfaces that are ready to receive field-applied finishes indicated.

B. Plaster Finish Coats: Apply to provide finish to match Engineer's sample.

3.6 CUTTING AND PATCHING

A. Cut, patch, replace, and repair plaster as necessary to accommodate other work and to restore cracks, dents, and imperfections. Repair or replace work to eliminate blisters, buckles, crazing and check cracking, dry outs, efflorescence, sweat outs, and similar defects and where bond to substrate has failed.

3.7 CLEANING AND PROTECTION

A. Remove temporary protection and enclosure of other work. Promptly remove plaster from doorframes, windows, and other surfaces not indicated to be plastered. Repair floors, walls, and other surfaces stained, marred, or otherwise damaged during plastering.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment."

END OF SECTION

SECTION 09260

GYPSUM BOARD ASSEMBLIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items:
 - 1. Interior gypsum wallboard.
 - 2. Tile backing panels.
 - 3. Exterior sheathing board.
 - 4. Non-load-bearing steel framing.
 - 5. Installation of access doors in gypsum board assemblies, furnished under mechanical and electrical sections.

- B. Related Work:
 - 1. Section 05411, LIGHT GAGE METAL FRAMING.
 - 2. Section 07210, BUILDING INSULATION
 - 3. Section 09281, CEMENT BOARD
 - 4. Section 09270, GYPSUM VENEER PLASTERING
 - 5. Section 09900, PAINTING

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated.

- B. Samples: For the following products:
 - 1. Trim Accessories: Full-size Sample in 12-inch-long length for each trim accessory indicated.

1.3 QUALITY ASSURANCE

- A. Fire-Resistance-Rated Assemblies: For fire-resistance-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing agency.

- B. Sound Transmission Coefficient Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.

1.4 STORAGE AND HANDLING

- A. Store materials inside under cover and keep them dry and protected against damage from weather, condensation, direct sunlight, construction traffic, and other causes. Stack panels flat to prevent sagging.

1.5 PROJECT CONDITIONS

- A. Environmental Limitations: Comply with ASTM C 840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.
- B. Do not install interior products until installation areas are enclosed and conditioned.
- C. Do not install panels that are wet, those that are moisture damaged, and those that are mold damaged.
 - 1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
 - 2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 2 - PRODUCTS

2.1 NON-LOAD-BEARING STEEL FRAMING, GENERAL

- A. Framing Members, General: Comply with ASTM C 754 for conditions indicated.
 - 1. Steel Sheet Components: Comply with ASTM C 645 requirements for metal, unless otherwise indicated.
 - 2. Protective Coating: manufacturer's standard corrosion-resistant zinc coating, unless otherwise indicated.

2.2 SUSPENSION SYSTEM COMPONENTS

- A. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.0625-inch-diameter wire, or double strand of 0.0475-inch-diameter wire.
- B. Hanger Attachments to Concrete:
 - 1. Anchors: Fabricated from corrosion-resistant materials with holes or loops for attaching wire hangers and capable of sustaining, without failure, a load equal to 5 times that imposed by construction as determined by testing according to ASTM E 488 by an independent testing agency.
 - a. Type: Postinstalled, expansion anchor.
- C. Wire Hangers: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.162-inch diameter.
- D. Carrying Channels: Cold-rolled, commercial-steel sheet with a base-metal thickness of 0.0538 inch and minimum 1/2-inch- wide flanges with depth as required for span and loading and indicated on Drawings.
- E. Furring Channels (Furring Members): 0.0538-inch bare-steel thickness, with minimum 1/2-inch- wide flanges, 3/4 inch deep.
- F. Grid Suspension System for Ceilings: ASTM C 645, direct-hung system composed of main beams and cross-furring members that interlock.

1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Armstrong World Industries, Inc.; Drywall Grid Systems.
 - b. Chicago Metallic Corporation; Drywall Furring System.
 - c. USG Corporation; Drywall Suspension System.

2.3 STEEL FRAMING FOR FRAMED ASSEMBLIES

- A. Steel Studs and Runners: ASTM C 645.
 1. Minimum Base-Metal Thickness: 0.0312 inch.
- B. Slip-Type Head Joints: Where indicated, provide one of the following:
 1. Single Long-Leg Runner System: ASTM C 645 top runner with 2-inch- deep flanges in thickness not less than indicated for studs, installed with studs friction fit into top runner and with continuous bridging located within 12 inches of the top of studs to provide lateral bracing.
 2. Double-Runner System: ASTM C 645 top runners, inside runner with 2-inch-deep flanges in thickness not less than indicated for studs and fastened to studs, and outer runner sized to friction fit inside runner.
 3. Deflection Track: Steel sheet top runner manufactured to prevent cracking of finishes applied to interior partition framing resulting from deflection of structure above; in thickness not less than indicated for studs and in width to accommodate depth of studs.
 - a. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - 1) Steel Network Inc. (The); VertiClip Series.
 - 2) Superior Metal Trim; Superior Flex Track System (SFT).
- C. Flat Strap and Backing Plate: Steel sheet for blocking and bracing in length and width indicated.
 1. Minimum Base-Metal Thickness: 0.0312 inch.
- D. Cold-Rolled Channel Bridging: 0.0538-inch bare-steel thickness, with minimum 1/2-inch- wide flanges.
 1. Depth: 1-1/2 inches.
 2. Clip Angle: Not less than 1-1/2 by 1-1/2 inches, 0.068-inch-thick, galvanized steel.
- E. Hat-Shaped, Rigid Furring Channels: ASTM C 645.
 1. Minimum Base Metal Thickness: 0.0312 inch.
 2. Depth: 7/8 inches.
- F. Resilient Furring Channels: 1/2-inch-deep, steel sheet members designed to reduce sound transmission.
 1. Configuration: Asymmetrical or hat shaped.

- G. Z-Shaped Furring: With slotted or non-slotted web, face flange of 1-1/4 inches wall attachment flange of 7/8 inch, minimum bare-metal thickness of 0.0179 inch, and depth required to fit insulation thickness indicated.

2.4 GLASS-MAT GYPSUM SHEATHING BOARD

- A. Glass-Mat Gypsum Sheathing Board: ASTM C 1177.
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. CertainTeed Corp.; GlasRoc.
 - b. Georgia-Pacific Gypsum LLC; Dens-Glass Gold.
 - c. National Gypsum Company; Gold Bond, e²XP.
 - d. USG Corporation; Securock.
 - 2. Type and Thickness: 5/8 inch, Type X.
- B. Screws for Fastening Gypsum Sheathing to Cold-Formed Metal Framing: Steel drill screws, in length recommended by sheathing manufacturer for thickness of sheathing board to be attached, with organic-polymer or other corrosion-protective coating having a salt-spray resistance of more than 800 hours according to ASTM B 117.
 - 1. For steel framing from 0.033 to 0.112 inch thick, attach sheathing to comply with ASTM C 954.

2.5 AUXILIARY MATERIALS

- A. General: Provide auxiliary materials that comply with referenced installation standards.
 - 1. Fasteners for Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.
- B. Isolation Strip at Exterior Walls: Provide one of the following:
 - 1. Asphalt-Saturated Organic Felt: ASTM D 226, Type I (No. 15 asphalt felt), non-perforated.
 - 2. Foam Gasket: Adhesive-backed, closed-cell vinyl foam strips that allow fastener penetration without foam displacement, 1/8 inch thick, in width to suit steel stud size.

2.6 INTERIOR GYPSUM BOARD

- A. General: Complying with ASTM C 36/C 36M or ASTM C 1396/C 1396M, as applicable to type of gypsum board indicated and whichever is more stringent.
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. USG Corporation.
 - b. G-P Gypsum.
 - c. National Gypsum Company.

- B. Fire-Resistant Type X:
 - 1. Thickness: 5/8 inch.
 - 2. Long Edges: Tapered.
- C. Ceiling Type: Manufactured to have more sag resistance than regular-type gypsum board.
 - 1. Thickness: 1/2 inch.
 - 2. Long Edges: Tapered.
- D. Abuse-Resistant Type: Manufactured to produce greater resistance to surface indentation and through-penetration (impact resistance) than standard, regular-type and Type X gypsum board.
 - 1. Core: 5/8 inch, Type X.
 - 2. Long Edges: Tapered.

2.7 TILE BACKING PANELS

- 1. Refer to Section 09281 Cement Board

2.8 TRIM ACCESSORIES

- A. Interior Trim: ASTM C 1047.
 - 1. Material: Galvanized or aluminum-coated steel sheet or rolled zinc.
 - 2. Shapes:
 - a. Cornerbead.
 - b. Bullnose bead.
 - c. LC-Bead: J-shaped; exposed long flange receives joint compound.
 - d. Expansion (Control) Joint.
 - e. Curved-Edge Cornerbead: With notched or flexible flanges.
- B. Exterior Trim: ASTM C 1047.
 - 1. Material: Hot-dip galvanized steel sheet, plastic, or rolled zinc.
 - 2. Shapes:
 - a. Cornerbead.
 - b. LC-Bead: J-shaped; exposed long flange receives joint compound.
 - c. Expansion (Control) Joint: One-piece, rolled zinc with V-shaped slot and removable strip covering slot opening.
- C. Aluminum Trim: Extruded accessories of profiles and dimensions indicated.
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Fry Reglet Corp.
 - b. Gordon, Inc.
 - c. Pittcon Industries.

2. Aluminum: Alloy and temper with not less than the strength and durability properties of ASTM B 221, Alloy 6063-T5.
3. Finish: Corrosion-resistant primer compatible with joint compound and finish materials specified.

2.9 JOINT TREATMENT MATERIALS

- A. General: Comply with ASTM C 475/C 475M.
- B. Joint Tape:
 1. Interior Gypsum Wallboard: Fiberglass mesh..
 2. Exterior Gypsum Soffit Board: Fiberglass mesh..
 3. Glass-Mat Gypsum Sheathing Board: 10-by-10 glass mesh.
 4. Tile Backing Panels: As recommended by panel manufacturer.
- C. Joint Compound for Interior Gypsum Wallboard: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.
 1. Prefilling: At open joints, rounded or beveled panel edges, and damaged surface areas, use setting-type taping compound.
 2. Embedding and First Coat: For embedding tape and first coat on joints, fasteners, and trim flanges, use setting-type taping compound.
 3. Fill Coat: For second coat, use setting-type, sandable topping compound.
 4. Finish Coat: For third coat, use setting-type, sandable topping compound.
 5. Skim Coat: For final coat of Level 5 finish, use setting-type, sandable topping compound.

2.10 AUXILIARY MATERIALS

- A. General: Provide auxiliary materials that comply with referenced installation standards and manufacturer's written recommendations.
- B. Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.
 1. Use adhesives that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- C. Steel Drill Screws: ASTM C 1002, unless otherwise indicated.
 1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch thick.
 2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.
- D. Sound Attenuation Blankets: ASTM C 665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool, or rock wool.
 1. Fire-Resistance-Rated Assemblies: Comply with mineral-fiber requirements of assembly.

- E. Acoustical Sealant: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Acoustical Sealant for Exposed and Concealed Joints:
 - a. Pecora Corp.; AC-20 FTR Acoustical and Insulation Sealant.
 - b. United States Gypsum Co.; SHEETROCK Acoustical Sealant.
 - 2. Acoustical Sealant for Concealed Joints:
 - a. Ohio Sealants, Inc.; Pro-Series SC-170 Rubber Base Sound Sealant.
 - b. Pecora Corp.; BA-98.
 - c. Tremco, Inc.; Tremco Acoustical Sealant.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames and framing, for compliance with requirements and other conditions affecting performance.
- B. Examine panels before installation. Reject panels that are wet, moisture damaged, and mold damaged.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Suspended Assemblies: Coordinate installation of suspension systems with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive hangers at spacing required to support the Work and that hangers will develop their full strength.
 - 1. Furnish concrete inserts and other devices indicated to other trades for installation in advance of time needed for coordination and construction.
- B. Coordination with Sprayed Fire-Resistive Materials:
 - 1. Before sprayed fire-resistive materials are applied, attach offset anchor plates or ceiling tracks to surfaces indicated to receive sprayed fire-resistive materials. Where offset anchor plates are required, provide continuous plates fastened to building structure not more than 24 inches o.c.
 - 2. After sprayed fire-resistive materials are applied, remove them only to extent necessary for installation of non-load-bearing steel framing. Do not reduce thickness of fire-resistive materials below that required for fire-resistance ratings indicated. Protect adjacent fire-resistive materials from damage.

3.3 INSTALLATION, GENERAL

- A. Installation Standard: ASTM C 754. Also comply with requirements in ASTM C 840 that apply to framing installation.
- B. Install supplementary framing, and blocking to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction.
- C. Install bracing at terminations in assemblies.
- D. Do not bridge building control and expansion joints with non-load-bearing steel framing members. Frame both sides of joints independently.

3.4 INSTALLING SUSPENSION SYSTEMS

- A. Install suspension system components in sizes and spacings indicated on Drawings, but not less than those required by referenced installation standards for assembly types and other assembly components indicated.
- B. Isolate suspension systems from building structure where they abut or are penetrated by building structure to prevent transfer of loading imposed by structural movement.
- C. Suspend hangers from building structure as follows:
 - 1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system.
 - a. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
 - 2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with locations of hangers required to support standard suspension system members, install supplemental suspension members and hangers in the form of trapezes or equivalent devices.
 - a. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced installation standards.
 - 3. Wire Hangers: Secure by looping and wire tying, either directly to structures or to inserts, eye screws, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause hangers to deteriorate or otherwise fail.
 - 4. Flat Hangers: Secure to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices and fasteners that are secure and appropriate for structure and hanger, and in a manner that will not cause hangers to deteriorate or otherwise fail.
 - 5. Do not attach hangers to steel roof deck.
 - 6. Do not attach hangers to permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.
 - 7. Do not attach hangers to rolled-in hanger tabs of composite steel floor deck.
 - 8. Do not connect or suspend steel framing from ducts, pipes, or conduit.
- D. Fire-Resistance-Rated Assemblies: Wire tie furring channels to supports.

- E. Seismic Bracing: Sway-brace suspension systems with hangers used for support.
- F. Grid Suspension Systems: Attach perimeter wall track or angle where grid suspension systems meet vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.
- G. Installation Tolerances: Install suspension systems that are level to within [1/8 inch in 12 feet measured lengthwise on each member that will receive finishes and transversely between parallel members that will receive finishes.

3.5 INSTALLING FRAMED ASSEMBLIES

- A. Where studs are installed directly against exterior masonry walls or dissimilar metals at exterior walls, install isolation strip between studs and exterior wall.
- B. Install studs so flanges within framing system point in same direction.
- C. Install tracks (runners) at floors and overhead supports. Extend framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at suspended ceilings. Continue framing around ducts penetrating partitions above ceiling.
 - 1. Slip-Type Head Joints: Where framing extends to overhead structural supports, install to produce joints at tops of framing systems that prevent axial loading of finished assemblies.
 - 2. Door Openings: Screw vertical studs at jambs to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.
 - a. Install two studs at each jamb, unless otherwise indicated.
 - b. Install cripple studs at head adjacent to each jamb stud, with a minimum 1/2-inch clearance from jamb stud to allow for installation of control joint in finished assembly.
 - c. Extend jamb studs through suspended ceilings and attach to underside of overhead structure.
 - 3. Other Framed Openings: Frame openings other than door openings the same as required for door openings, unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.
 - 4. Fire-Resistance-Rated Partitions: Install framing to comply with fire-resistance-rated assembly indicated and support closures and to make partitions continuous from floor to underside of solid structure.
 - a. Firestop Track: Where indicated, install to maintain continuity of fire-resistance-rated assembly indicated.
 - 5. Sound-Rated Partitions: Install framing to comply with sound-rated assembly indicated.
- D. Direct Furring: Attach to concrete or masonry with stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 24 inches o.c.
- E. Z-Furring Members:
 - 1. Erect insulation (specified in Section 07210 "Building Insulation") vertically and hold in place with Z-furring members spaced 24 inches o.c.

2. Except at exterior corners, securely attach narrow flanges of furring members to wall with concrete stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 24 inches o.c.
3. At exterior corners, attach wide flange of furring members to wall with short flange extending beyond corner; on adjacent wall surface, screw-attach short flange of furring channel to web of attached channel. At interior corners, space second member no more than 12 inches from corner and cut insulation to fit.

3.6 APPLYING AND FINISHING PANELS, GENERAL

- A. Comply with ASTM C 840.
- B. Install ceiling panels across framing to minimize the number of abutting end joints and to avoid abutting end joints in central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member.
- C. Install panels with face side out. Butt panels together for a light contact at edges and ends with not more than 1/16 inch of open space between panels. Do not force into place.
- D. Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.
- E. Form control and expansion joints with space between edges of adjoining gypsum panels.
- F. Cover both faces of support framing with gypsum panels in concealed spaces, above ceilings and similar locations, except in chases braced internally.
 1. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. in area.
 2. Fit gypsum panels around ducts, pipes, and conduits.
 3. Where partitions intersect structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by structural members; allow 1/4- to 3/8-inch-wide joints to install sealant.
- G. Isolate perimeter of gypsum board applied to non-load-bearing partitions at structural abutments, except floors. Provide 1/4- to 1/2-inch- wide spaces at these locations, and trim edges with edge trim where edges of panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.
- H. Attachment to Steel Framing: Attach panels so leading edge or end of each panel is attached to unsupported open edges of stud flanges first.

3.7 APPLYING INTERIOR GYPSUM BOARD

- A. Single-Layer Application:
 1. On ceilings, apply gypsum panels before wall/partition board application to greatest extent possible and at right angles to framing, unless otherwise indicated.
 2. On partitions/walls, apply gypsum panels to minimize end joints.

3. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.
 4. Fastening Methods: Apply gypsum panels to supports with steel drill screws.
- B. Multilayer Application:
1. On ceilings, apply gypsum board indicated for base layers before applying base layers on walls/partitions; apply face layers in same sequence. Apply base layers at right angles to framing members and offset face-layer joints 1 framing member, 16 inches minimum, from parallel base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly.
 2. On partitions/walls, apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.
 3. On Z-furring members, apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.
 4. Fastening Methods: Fasten base layers and face layers separately to supports with screws.
- C. Laminating to Substrate: Where gypsum panels are indicated as directly adhered to a substrate (other than studs, joists, furring members, or base layer of gypsum board), comply with gypsum board manufacturer's written recommendations and temporarily brace or fasten gypsum panels until fastening adhesive has set.

3.8 APPLYING TILE BACKING PANELS

- A. Cementitious Backer Units: ANSI A108.1, at locations indicated to receive tile.
- B. Areas Not Subject to Wetting: Install regular-type gypsum wallboard panels to produce a flat surface except at showers, tubs, and other locations indicated to receive water-resistant panels.
- C. Where tile backing panels abut other types of panels in same plane, shim surfaces to produce a uniform plane across panel surfaces.

3.9 APPLYING GYPSUM SHEATHING

- A. General: Install gypsum sheathing to comply with GA-253 and manufacturer's written instructions.
- B. Cut boards at penetrations, edges, and other obstructions of the work; fit tightly against abutting construction, except provide a 3/8-inch setback where non-load-bearing construction abuts structural elements.
- C. Coordinate sheathing installation with flashing and joint sealant installation so these materials are installed in the sequence and manner that prevent exterior moisture from passing through completed exterior wall assembly.
- D. Apply fasteners so screw heads bear tightly against face of sheathing boards but do not cut into facing.

- E. Do not bridge building expansion joints with sheathing; cut and space edges to match spacing of structural support elements.
- F. Vertical Installation: Install 48-inch- wide gypsum sheathing boards vertically with vertical edges centered over flanges of steel studs. Abut ends and edges of each board with those of adjacent boards. Screw-attach boards at perimeter and within field of board to each steel stud:
 - 1. Perimeter: 6 inches on center.
 - 2. Field: 8 inches on center.

3.10 INSTALLING TRIM ACCESSORIES

- A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.
- B. Control Joints: Install control joints according to ASTM C 840 and in specific locations approved by Architect for visual effect.
- C. Interior Trim: Install in the following locations:
 - 1. Cornerbead: Use at outside corners, unless otherwise indicated.
 - 2. LC-Bead: Use at exposed panel edges.
 - 3. Curved-Edge Cornerbead: Use at curved openings.
- D. Exterior Trim: Install in the following locations:
 - 1. Cornerbead: Use at outside corners.
 - 2. LC-Bead: Use at exposed panel edges.
- E. Aluminum Trim: Install in locations indicated on Drawings.

3.11 FINISHING GYPSUM BOARD

- A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.
- B. Prefill open joints, rounded or beveled edges, and damaged surface areas.
- C. Apply joint tape over gypsum board joints, except those with trim having flanges not intended for tape.
- D. Gypsum Board Finish Levels: Finish panels to levels indicated below:
 - 1. Level 1: Ceiling plenum areas, concealed areas, and where indicated.
 - 2. Level 2: Panels that are substrate for tile.
 - 3. Level 4: At panel surfaces that will be exposed to view, unless otherwise indicated.
 - 4. Level 5: Where indicated on Drawings.
- E. Cementitious Backer Units: Finish according to manufacturer's written instructions.

3.12 PROTECTION

- A. Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.
- B. Remove and replace panels that are wet, moisture damaged, or exhibit mold growth. Repair of damaged panels in place is not acceptable.
 - 1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
 - 2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09265

GYPSUM BOARD SHAFT WALL ASSEMBLIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies gypsum board shaft wall assemblies.
- B. Related Work:
 - 1. Section 09260 - GYPSUM BOARD ASSEMBLIES for non-shaft-wall gypsum board assemblies, and for applying and finishing panels in gypsum board assemblies.

1.2 DEFINITIONS

- A. Gypsum Board Construction Terminology: Refer to ASTM C 11 for definitions of terms for gypsum board construction not defined in this Section or in other referenced standards.

1.3 PERFORMANCE REQUIREMENTS

- A. Structural Performance:
 - 1. Provide gypsum board shaft wall assemblies capable of withstanding the full air-pressure loads indicated for maximum heights of partitions without failing and while maintaining an airtight and smoke-tight seal. Evidence of failure includes deflections exceeding limits indicated, bending stresses causing studs to break or to distort, and end-reaction shear causing track (runners) to bend or to shear and studs to become crippled.
 - 2. Provide gypsum board shaft wall assemblies for horizontal duct enclosures capable of spanning distances indicated within deflection limits indicated.
- B. Marking and Identification for Fire- and Smoke-Partitions: Fire walls, fire barriers, fire partitions, smoke barriers, smoke partitions and other walls required to have protected openings or penetrations shall be effectively and permanently identified with signs or stenciling. Such identification shall:
 - 1. Be located in accessible concealed floor, floor-ceiling or attic spaces; and
 - 2. Be repeated at intervals not exceeding 30 feet measured horizontally along the wall or partition; and
 - 3. Include lettering not less than 0.5 inch in height, incorporating the suggested wording: "FIRE AND/OR SMOKE BARRIER-PROTECT ALL OPENINGS," or other wording.

1.4 SUBMITTALS

- A. Product Data: For each gypsum board shaft wall assembly indicated.
- B. Fire-Test-Response Reports: From a qualified independent testing and inspecting agency substantiating each gypsum board shaft wall assembly's required fire-resistance rating.
 - 1. Include data substantiating that elevator entrances and other items that penetrate each gypsum board shaft wall assembly do not negate fire-resistance rating.

1.5 QUALITY ASSURANCE

- A. Fire-Resistance-Rated Assemblies: Provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
 - 1. Fire-Resistance-Rated Assemblies: Indicated by design designations from FM's "Approval Guide, Building Products," UL's "Fire Resistance Directory," or ITS's "Directory of Listed Products."
- B. STC-Rated Assemblies: For gypsum board shaft wall assemblies indicated to have STC ratings, provide assembly materials and construction complying with requirements of assemblies whose STC ratings were determined according to ASTM E 90 and classified according to ASTM E 413 by a qualified independent testing agency.
- C. Preinstallation Conference: Conduct conference at Project site to comply with requirements of Division 01. Review methods and procedures for installing work related to gypsum board shaft wall assemblies including, but not limited to, the following:
 - 1. Fasteners proposed for anchoring steel framing to building structure.
 - 2. Sprayed fire-resistive materials applied to structural framing.
 - 3. Elevator equipment, including hoistway doors, elevator call buttons, and elevator floor indicators.
 - 4. Wiring devices in shaft wall assemblies.
 - 5. Doors and other items penetrating shaft wall assemblies.
 - 6. Items supported by shaft wall-assembly framing.
 - 7. Mechanical work enclosed within shaft wall assemblies.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials in original packages, containers, and bundles bearing brand name and identification of manufacturer or supplier.
- B. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes. Stack gypsum panels flat on leveled supports off the ground to prevent sagging.

1.7 PROJECT CONDITIONS

- A. Comply with requirements for environmental conditions, room temperatures, and ventilation specified in Section 092110 - GYPSUM BOARD ASSEMBLIES.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. American Gypsum Co.
 - 2. G-P Gypsum Corp.

3. National Gypsum Company.
4. United States Gypsum Co.

2.2 ASSEMBLY MATERIALS

- A. General: Provide materials and components complying with requirements of fire-resistance-rated assemblies indicated.
 1. Provide panels in maximum lengths available to eliminate or minimize end-to-end butt joints.
 2. Provide auxiliary materials complying with gypsum board shaft wall assembly manufacturer's written recommendations.
- B. Steel Framing: ASTM C 645.
 1. Protective Coating: ASTM A 653/A 653M, G40, hot-dip galvanized coating.
- C. Gypsum Liner Panels: Manufacturer's proprietary liner panels in 1-inch thickness and with moisture-resistant paper faces.
- D. Gypsum Wallboard: ASTM C 1396, core type as required by fire-resistance-rated assembly indicated.
- E. Accessories: Cornerbead, edge trim, and control joints of material and shapes specified in Section 09260 - GYPSUM BOARD ASSEMBLIES comply with gypsum board shaft wall assembly manufacturer's written recommendations for application indicated.
- F. Gypsum Wallboard Joint-Treatment Materials: ASTM C 475 and as specified in Section 09260 - GYPSUM BOARD ASSEMBLIES.
- G. Steel Drill Screws: ASTM C 1002, unless otherwise indicated.
- H. Track (Runner) Fasteners: Power-driven fasteners of size and material required to withstand loading conditions imposed on shaft wall assemblies without exceeding allowable design stress of track, fasteners, or structural substrates in which anchors are embedded.
 1. Powder-Actuated Fasteners: Provide powder-actuated fasteners with capability to sustain, without failure, a load equal to 10 times that imposed by shaft wall assemblies, as determined by testing conducted by a qualified independent testing agency according to ASTM E 1190.
 2. Postinstalled Expansion Anchors: Where indicated, provide expansion anchors with capability to sustain, without failure, a load equal to 5 times that imposed by shaft wall assemblies, as determined by testing conducted by a qualified independent testing agency according to ASTM E 488.
- I. Laminating Adhesive: Adhesive or joint compound recommended by manufacturer for directly adhering gypsum face-layer panels and gypsum-base face-layer panels to backing-layer panels in multilayer construction.
- J. Acoustical Sealant: As recommended by gypsum board shaft wall assembly manufacturer for application indicated.

- K. Sound Attenuation Blankets: ASTM C 665 for Type I, unfaced mineral-fiber-blanket insulation produced by combining thermosetting resins with mineral fibers manufactured from slag or rock wool.

2.3 GYPSUM BOARD SHAFT WALL

- A. Basis-of-Design Product: As indicated on Drawings by design designation of a qualified testing and inspecting agency.
- B. Sustained Air-Pressure Loads: 5 lbf/sq. ft.
- C. Deflection Limit: L/240.
- D. Studs: Manufacturer's standard profile for repetitive members and corner and end members and for fire-resistance-rated assembly indicated.
 - 1. Depth: As indicated.
 - 2. Minimum Base Metal Thickness: Manufacturer's standard thicknesses that comply with structural performance requirements for stud depth indicated.
- E. Track (Runner): Manufacturer's standard J-profile track with long-leg length as standard with manufacturer, but at least 2 inches in depth matching studs.
 - 1. Minimum Base Metal Thickness: Manufacturer's standard thicknesses that comply with structural performance requirements for stud depth indicated.
- F. Jamb Struts: Manufacturer's standard J-profile strut with long-leg length of 3 inches, in depth matching studs, and not less than 0.0341 inch thick.
- G. Room-Side and Shaft-Side Finish: As indicated.
- H. STC Rating: As indicated.
- I. Cavity Insulation: Sound attenuation blankets.

2.4 IDENTIFICATION LABELS FOR FIRE- AND SMOKE-PARTITIONS

- A. Identification Labels: Vinyl adhesive signs, to comply with applicable local Code.
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Fire Wall Signs, Inc.
 - b. My Safety Sign.
 - c. Safety Supply Warehouse.
 - 2. Text: "FIRE AND SMOKE BARRIER-PROTECT ALL OPENINGS"

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates to which gypsum board shaft wall assemblies attach or abut, with Installer present, including hollow-metal frames, elevator hoistway doorframes, cast-in anchors, and structural framing.

Examine for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Sprayed Fire-Resistive Materials: Coordinate with gypsum shaft wall assemblies so both elements of Work remain complete and undamaged. Patch or replace sprayed fire-resistive materials removed or damaged during installation of shaft wall assemblies to comply with requirements specified in Section 078100 - APPLIED FIREPROOFING.

1. Before sprayed fire-resistive materials are applied, attach offset anchor plates or ceiling runners (tracks) to surfaces indicated to receive sprayed fire-resistive materials. Where offset anchor plates are required, provide continuous plates fastened to building structure not more than 24 inches o.c.

2. After sprayed fire-resistive materials are applied, remove them only to extent necessary for installation of gypsum board assemblies and without reducing the fire-resistive material thickness below that which is required to obtain fire-resistance rating indicated. Protect remaining fire-resistive materials from damage.

3.3 INSTALLATION

- A. General: Install gypsum board shaft wall assemblies to comply with requirements of fire-resistance-rated assemblies indicated, manufacturer's written installation instructions, and the following:

1. ASTM C 754 for installing steel framing and gypsum shaft wallboard.

- B. Do not bridge building expansion joints with shaft wall assemblies; frame both sides of joints with furring and other support.

- C. Install supplementary framing in gypsum board shaft wall assemblies around openings and as required for blocking, bracing, and support of gravity and pullout loads of fixtures, equipment, services, heavy trim, furnishings, and similar items that cannot be supported directly by shaft wall assembly framing.

1. At elevator hoistway doorframes, provide jamb struts on each side of doorframe.

2. Where handrails directly attach to gypsum board shaft wall assemblies, provide galvanized steel reinforcing strip with 0.0312-inch minimum thickness of base (uncoated) metal, accurately positioned and secured behind at least 1 face-layer panel.

- D. Integrate stair hanger rods with gypsum board shaft wall assemblies by locating cavity of assemblies where required to enclose rods.

- E. At penetrations in shaft wall, maintain fire-resistance rating of shaft wall assembly by installing supplementary steel framing around perimeter of penetration and fire protection behind boxes containing wiring devices, elevator call buttons, elevator floor indicators, and similar items.
- F. Isolate gypsum finish panels from building structure to prevent cracking of finish panels while maintaining continuity of fire-rated construction.
- G. Install control joints to maintain fire-resistance rating of assemblies.
- H. Seal gypsum board shaft walls with acoustical sealant at perimeter of each assembly where it abuts other work and at joints and penetrations within each assembly. Install acoustical sealant to withstand dislocation by air-pressure differential between shaft and external spaces; maintain an airtight and smoke-tight seal; and comply with manufacturer's written instructions or ASTM C 919, whichever is more stringent.
- I. In elevator shafts where gypsum board shaft wall assemblies cannot be positioned within 2 inches of the shaft face of structural beams, floor edges, and similar projections into shaft, install 1/2- or 5/8- inch- thick, gypsum board cants covering tops of projections.
 - 1. Slope cant panels at least 75 degrees from horizontal. Set base edge of panels in adhesive and secure top edges to shaft walls at 24 inches o.c. with screws fastened to shaft wall framing.
 - 2. Where steel framing is required to support gypsum board cants, install framing at 24 inches o.c. and extend studs from the projection to the shaft wall framing.

3.4 FINISHING GYPSUM BOARD SHAFT WALL ASSEMBLIES

- A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.
- B. Prefill open joints, rounded or beveled edges, and damaged surface areas.
- C. Apply joint tape over gypsum board joints, except those with trim having flanges not intended for tape.
- D. Gypsum Board Finish Levels: Finish panels to levels indicated below:
 - 1. Level 1: Ceiling plenum areas and concealed areas not exposed to view.
 - 2. Level 2: Panels that are substrate for tile.
 - 3. Level 4: Panel surfaces that will be exposed to view (typical panels).
 - 4. Level 5: Where indicated on Drawings.

3.5 INSTALLING IDENTIFICATION FOR FIRE- AND SMOKE-PARTITIONS

- A. Marking and Identification for Fire- and Smoke-Partitions: Permanently install as required by Code.

3.6 PROTECTION

- A. Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.

- B. Remove and replace panels that are wet, moisture damaged, or exhibit mold growth. Repair of damaged panels in place is not acceptable.
 - 1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
 - 2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09281

CEMENT BOARD

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies decorative cement board.
- B. Related Work:
 - 1. Section 06100 – CARPENTRY.
 - 2. Section 09260 – GYPSUM BOARD ASSEMBLIES for tile backer units related requirements.

1.2 SUBMITTALS

- A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

1.3 QUALITY ASSURANCE

- A. Testing Agency Qualifications: For testing agency providing classification marking for fire-retardant-treated material, an inspection agency acceptable to authorities having jurisdiction that periodically performs inspections to verify that the material bearing the classification marking is representative of the material tested.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Stack panels flat with spacers beneath and between each bundle to provide air circulation. Protect cement board from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Fire-Test-Response Characteristics: For assemblies with fire-resistance ratings, provide materials and construction identical to those of assemblies tested for fire resistance per ASTM E 119 by a testing and inspecting agency acceptable to authorities having jurisdiction.
 - 1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory."

2.2 CEMENT BOARD

A. Decorative Cement Board:

1. Basis-of-Design: Geoboard Décor, Ameriform LLC, or approved equal.
2. Thickness: 5/8" (16 mm), minimum

2.3 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.

1. Provide fasteners with hot-dip zinc coating complying with ASTM A 153/A 153M.

B. Nails, Brads, and Staples: ASTM F 1667.

C. Power-Driven Fasteners: NES NER-272.

D. Screws for Fastening Board to Cold-Formed Metal Framing: Steel drill screws, in length recommended by sheathing manufacturer for thickness of sheathing to be attached, with organic-polymer or other corrosion-protective coating having a salt-spray resistance of more than 800 hours according to ASTM B 117.

1. For steel framing less than 0.0329 inch (0.835 mm) thick, use screws that comply with ASTM C 1002.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Do not use materials with defects that impair quality of cement board or pieces that are too small to use with minimum number of joints or optimum joint arrangement. Arrange joints so that pieces do not span between fewer than three support members.

B. Cut panels at penetrations, edges, and other obstructions of work; fit tightly against abutting construction unless otherwise indicated.

C. Securely attach to substrate by fastening as indicated, complying with the following:

1. NES NER-272 for power-driven fasteners.
2. Table 2304.9.1, "Fastening Schedule," in ICC's "International Building Code."

D. Coordinate wall board installation with joint-sealant installation so these materials are installed in sequence and manner that prevent moisture from passing through completed assembly. Do not bridge building expansion joints; cut and space edges of panels to match spacing of structural support elements.

3.2 CEMENT BOARD INSTALLATION

- A. Install panels and treat joints according to ANSI A108.11 and manufacturer's written instructions for type of application indicated.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09300

TILE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Wall tile, floor tile and base.
 - 2. Waterproof membrane for thin-set tile installations.
 - 3. Surface preparation for tile and accessories.
 - 4. Installation of access doors in gypsum board assemblies, furnished under mechanical and electrical sections.

- B. Related Work:
 - 1. Section 01420 – MOCK-UPS
 - 2. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 - 3. Section 07920 - JOINT SEALANTS; sealing of expansion, contraction, control, and isolation joints in tile surfaces.
 - 4. Section 09260 – GYPSUM BOARD ASSEMBLIES; cementitious backer units.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated.

- B. Shop Drawings: Show locations of each type of tile and tile pattern. Show widths, details, and locations of expansion, contraction, control, and isolation joints in tile substrates and finished tile surfaces.

- C. Samples for Verification:
 - 1. Assembled samples with grouted joints for each type and composition of tile and for each color and finish required, at least 12 inches square and mounted on rigid panel. Use grout of type and in color or colors approved for completed work. Include sealant specified in Section 07920 - JOINT SEALANTS, in color approved for completed work.
 - 2. Full-size units of each type of trim and accessory for each color and finish required.

- D. Qualification Data: For Installer.

- E. Material Test Reports: For each tile-setting and -grouting product.

- F. Installation Bonding Report: Including dates sounding test performed and remedial action taken.

- G. Mock-ups: Provide up to one full-size 48"x48" area in-place mock-up for each tile type. Locations as determined by the Engineer/ Architect. Build mock-ups to comply with the specified requirements, using materials indicated for final unit of work. Approved mock-ups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.3 QUALITY ASSURANCE

- A. Source Limitations for Tile: Obtain all tile of same type and color or finish from one source or producer.
 - 1. Obtain tile from same production run and of consistent quality in appearance and physical properties for each contiguous area.
- B. Source Limitations for Setting and Grouting Materials: Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from a single manufacturer and each aggregate from one source or producer.
- C. Source Limitations for Other Products: Obtain each of the following products specified in this Section through one source from a single manufacturer for each product:
 - 1. Waterproofing.
 - 2. Joint sealants.
 - 3. Cementitious backer units.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use. Comply with requirement in ANSI A137.1 for labeling sealed tile packages.
- B. Store tile and cementitious materials on elevated platforms, under cover, and in a dry location.
- C. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.
- D. Store liquid additives in unopened containers and protected from freezing.

1.5 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install tile until construction in spaces is complete and ambient temperature and humidity conditions are maintained at the levels indicated in referenced standards and manufacturer's written instructions.

PART 2 - PRODUCTS

2.1 TILE GENERAL

- A. Wall Tile and Installation: Thin-set mortar on cementitious backer units; TCA W244.
 - 1. Tile Type: Rittenhouse Square, Price Group 3 Color, by Daltile or equal by American Olean or Summitville, nominal 3 by 6 by 5/16 inch nominal field tile size, with matching bullnose and cove base, color as selected by Architect.
 - 2. Thin-Set Mortar: Latex- portland cement mortar.
 - 3. Grout: Polymer-modified sanded.

- B. Floor Tile and Installation: Floor installation on concrete; thin-set mortar; TCA F113 on-ground and ANSI A108.5.
 - 1. Tile Type: Colorbody Porcelain Mosaic, Price Group 4 Color, by Daltile or equal by American Olean or Summitville, nominal 2 by 1 by 1/4 inch oblong (brickwork), color as selected by Architect.
 - 2. Thin-Set Mortar: Latex-portland cement mortar.
 - 3. Grout: Polymer-modified unsanded grout.
 - 4. Joint Width: 1/16 inch.

2.2 PRODUCTS, GENERAL

- A. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1, "Specifications for Ceramic Tile," for types, compositions, and other characteristics indicated.
 - 1. Provide tile complying with Standard grade requirements, unless otherwise indicated.
- B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI standards referenced in this Section.
- C. Factory Blending: For tile exhibiting color variations within ranges selected during Sample submittals, blend tile in factory and package so tile units taken from one package show same range in colors as those taken from other packages and match approved Samples.
- D. Mounting: For factory-mounted tile, provide back- or edge-mounted tile assemblies as standard with manufacturer, unless otherwise indicated.
- E. Tile Trim Units: Matching characteristics of adjoining flat tile and coordinated with sizes and coursing of adjoining flat tile where applicable. Provide shapes selected from manufacturer's standard shapes.
- F. Waterproofing: Manufacturer's standard product that complies with ANSI A118.10.
- G. Trowelable Underlayments and Patching Compounds: Latex-modified, Portland cement-based formulation provided or approved by manufacturer of tile-setting materials for installations indicated.
- H. Tile Cleaner: A neutral cleaner capable of removing soil and residue without harming tile and grout surfaces, specifically approved for materials and installations indicated by tile and grout manufacturers.

2.3 ELASTOMERIC SEALANTS

- A. General: Provide manufacturer's standard chemically curing, elastomeric sealants of base polymer and characteristics indicated that comply with applicable requirements in Section 07920 - JOINT SEALANTS.
- B. Colors: Provide colors of exposed sealants to match colors of grout in tile adjoining sealed joints, unless otherwise indicated.
- C. One-Part, Mildew-Resistant Silicone Sealant: ASTM C 920; Type S; Grade NS; Class 25; Uses NT, G, A, and, as applicable to nonporous joint substrates indicated, O; formulated with fungicide,

intended for sealing interior ceramic tile joints and other nonporous substrates that are subject to in-service exposures of high humidity and extreme temperatures.

1. Available Products or equal:

- a. Dow Corning Corporation; Dow Corning 786.
- b. GE Silicones; Sanitary 1700.
- c. Pecora Corporation; Pecora 898 Sanitary Silicone Sealant.
- d. Tremco, Inc.; Tremsil 600 White.

D. Multipart, Pourable Urethane Sealant for Use T: ASTM C 920; Type M; Grade P; Class 25; Uses T, M, A, and, as applicable to joint substrates indicated, O.

1. Available Products or equal:

- a. Bostik; Chem-Calk 550.
- b. Mameco International, Inc.; Vulkem 245.
- c. Pecora Corporation; NR-200 Urexpan.
- d. Tremco, Inc.; THC-900.

2.4 MIXING MORTARS AND GROUT

- A. Mix mortars and grouts to comply with referenced standards, compressive strength requirements and mortar and grout manufacturers' written instructions.
- B. Add materials, water, and additives in accurate proportions.
- C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
 1. Verify that substrates for setting tile are firm; dry; clean; free of oil, waxy films, and curing compounds; and within flatness tolerances required by referenced ANSI A108 Series of tile installation standards for installations indicated.
 2. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed before installing tile.
 3. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust joint locations in consultation with Engineer.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Remove coatings, including curing compounds and other substances that contain soap, wax, oil, or silicone, that are incompatible with tile-setting materials.
- B. Provide concrete substrates for tile floors that comply with flatness tolerances specified in referenced ANSI A108 Series of tile installation standards.
 - 1. Fill cracks, holes, and depressions with trowelable leveling and patching compound according to tile-setting material manufacturer's written instructions. Use product specifically recommended by tile-setting material manufacturer.
 - 2. Remove protrusions, bumps, and ridges by sanding or grinding.
- C. Blending: For tile exhibiting color variations within ranges selected during Sample submittals, verify that tile has been factory blended and packaged so tile units taken from one package show same range of colors as those taken from other packages and match approved Samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

3.3 INSTALLATION, GENERAL

- A. ANSI Tile Installation Standards: Comply with parts of ANSI A108 Series "Specifications for Installation of Ceramic Tile" that apply to types of setting and grouting materials, to methods indicated in ceramic tile installation schedules, and resistance to deleterious substances.
- B. TCA Installation Guidelines: TCA's "Handbook for Ceramic Tile Installation." Comply with TCA installation methods indicated in ceramic tile installation schedules.
- C. Extend tile work into recesses and under or behind equipment and fixtures to form complete covering without interruptions, unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.
- D. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.
- E. Jointing Pattern: Lay tile in grid pattern, unless otherwise indicated. Align joints when adjoining tiles on floor, base, walls, and trim are same size. Lay out tile work and center tile fields in both directions in each space or on each wall area. Adjust to minimize tile cutting. Provide uniform joint widths, unless otherwise indicated.
 - 1. For tile mounted in sheets, make joints between tile sheets same width as joints within tile sheets so joints between sheets are not apparent in finished work.
- F. Lay out tile wainscots to next full tile beyond dimensions indicated.
- G. Expansion Joints: Locate expansion joints and other sealant-filled joints, including control, contraction, and isolation joints, where indicated during installation of setting materials, mortar beds, and tile. Do not saw-cut joints after installing tiles.
 - 1. Locate joints in tile surfaces directly above joints in concrete substrates.

2. Prepare joints and apply sealants to comply with requirements in Section 07920 - JOINT SEALANTS.
- H. Grout tile to comply with requirements of the following tile installation standards:
1. For ceramic tile grouts (sand-Portland cement; dry-set, commercial Portland cement; and latex-Portland cement grouts), comply with ANSI A108.10.
- I. At showers and where indicated, install cementitious backer units and treat joints to comply with ANSI A108.11 and manufacturer's written instructions for type of application indicated.

3.4 WATERPROOFING MEMBRANE INSTALLATION

- A. Install waterproofing to comply with ANSI A108.13 and waterproofing manufacturer's written instructions to produce waterproof membrane of uniform thickness bonded securely to substrate.
- B. Do not install tile over waterproofing until waterproofing has cured and been tested to determine that it is watertight.

3.5 WALL TILE INSTALLATION

- A. Install types of tile designated for wall installations to comply with requirements in the Wall Tile Installation Schedule, including those referencing TCA installation methods and ANSI setting-bed standards.

3.6 CLEANING AND PROTECTING

- A. Cleaning: On completion of placement and grouting, clean all ceramic tile surfaces so they are free of foreign matter.
 1. Remove grout residue from tile as soon as possible.
 2. Clean grout smears and haze from tile according to tile and grout manufacturer's written instructions, but no sooner than 10 days after installation. Use only cleaners recommended by tile and grout manufacturers and only after determining that cleaners are safe to use by testing on samples of tile and other surfaces to be cleaned. Protect metal surfaces and plumbing fixtures from effects of cleaning. Flush surfaces with clean water before and after cleaning.
 3. Remove temporary protective coating by method recommended by coating manufacturer that is acceptable to tile and grout manufacturer. Trap and remove coating to prevent it from clogging drains.
- B. When recommended by tile manufacturer, apply coat of neutral protective cleaner to completed tile walls and floors. Protect installed tile work with kraft paper or other heavy covering during construction period to prevent staining, damage, and wear.
- C. Prohibit foot and wheel traffic from tiled floors for at least seven days after grouting is completed. After seven days, cover areas subject to construction traffic with heavy cardboard.
- D. Before final inspection, remove protective coverings and rinse neutral cleaner from tile surfaces.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09510

ACOUSTICAL CEILINGS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies acoustical ceiling systems including suspension systems.
- B. Related Work:
 - 1. Division 15 - MECHANICAL; sprinklers, grilles, and diffusers located in ceilings.
 - 2. Division 16 - ELECTRICAL; light fixtures and alarm system components located in ceilings.

1.2 QUALITY ASSURANCE

- A. Source: For each type of material required for the work of this section, provide primary materials which are the products of one manufacturer. Provide secondary materials which are acceptable to the manufacturers of the primary materials.

1.3 TESTS

- A. Fire-Resistance: Where fire-resistance ratings are indicated or required by authorities having jurisdiction, provide materials and construction which are identical to assemblies whose fire-resistance rating has been tested in compliance with ASTM E119 by independent agencies acceptable to the Engineer and authorities having jurisdiction.
- B. Burning Characteristics: Provide materials whose surface burning characteristics, when tested in compliance with ASTM E84 are Class A or Class 1.

1.4 SUBMITTALS

- A. Product Data: Submit manufacturer's product data, installation instructions, use limitations and recommendations for each material used. Provide certifications stating that materials comply with requirements.
- B. Initial Selection Samples: Submit samples showing complete range of colors, textures, and finishes available for each material used.
- C. Verification Samples: Submit representative samples of each material that is to be exposed in the finished work, showing the full range of color and finish variations expected. Provide samples having minimum area of 144 square inches.
- D. Test Reports: Submit certified reports for tests required.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials and products in unopened factory labeled packages. Store and handle in strict compliance with manufacturer's instructions and recommendations. Protect from damage, moisture and direct sunlight. Sequence deliveries to avoid delays, but minimize on-site storage.

1.6 PROJECT CONDITIONS, SEQUENCING AND SCHEDULING

- A. Environment: Perform work only when conditions are within the limits established by manufacturers of the materials and products used.
- B. Conference: Convene a pre-installation conference to establish procedures to maintain optimum working conditions and to coordinate this work with related and adjacent work.
 - 1. Proceed with installation of ceiling tiles and panels only when construction above ceilings and penetrating work is complete. Delay installation of ceiling tiles or panels until near time of Substantial Completion.
 - 2. Perform work of this section to coordinate with the layout of light fixtures, HVAC equipment and fixtures, fire suppression system components and all other related work. In general, every penetration shall occur at the center of a ceiling tile or panel.

PART 2 - PRODUCTS

2.1 MATERIALS AND PRODUCTS

- A. Interior Ceiling Panels: Provide ceiling panels as follows:
 - 1. Interior Ceiling Panels Type I: Provide units with NRC, color and texture equal to Armstrong Beveled Tegular Cirrus, 24 in. x 24 in. x 3/4 in. lay-in, #589 (non-rated) and Armstrong Beveled Tegular Cirrus, 24" x 24" x 3/4 in. #577 (at rated conditions); for narrow 9/16 in. grid, or equal by USG or Celotex Corp.
- B. Suspension Systems: Provide suspension systems complying with requirements of ASTM C635.
 - 1. Suspension System Type I -Provide manufacturers narrow exposed "Tee", commercial quality cold-rolled, electro-galvanized steel grid system, equal to Armstrong 9/16 in. Suprafine, complying with ASTM C 635 for "Intermediate-Duty System" or equal by USG or Celotex Corp. Provide grid modules to match ceiling panel sizes. Provide manufacturer's standard white baked enamel finish on steel exposed surfaces. Grid and ceiling panels shall be manufactured by the same company.
- C. Attachment Devices: Provide and size for 5 times design load indicated in ASTM C635, Table 1, direct hung.
- D. Hanger Wire: ASTM A641, galvanized steel wire, soft temper, prestretched, class 1 coating, minimum 12 gage. Size wire so that stress at three times hanger design load given in ASTM C635, Table 1, Direct Hung, will be less than the yield stress of the wire.
- E. Moldings and Trim: Provide manufacturer's standard profiles to suit edge conditions, panel profile and penetrations. Provide custom fabricated work as necessary to provide exact fit.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The Installer shall examine substrates, supports, and conditions under which this work is to be performed and notify Contractor, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means Installer accepts substrates and conditions.

3.2 PREPARATION AND INSTALLATION

- A. General Requirement: Strictly comply with manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this section.
- B. Coordination: Coordinate installation with other work to ensure proper location of related work such as light fixtures, mechanical fixtures, fire protection systems and the like.
- C. Layout: Refer to drawings for layout and patterns of ceiling tiles.
- D. Suspension Installation: Erect suspension system to comply with ASTM C636 and supported only from building structure. Level main suspension members to within tolerance of 1/8" in 12'. Splay hangers where necessary and countersplay to balance resulting horizontal forces. Cross brace suspension to prevent lateral sway and displacement during full seismic load prescribed by code.
- E. Edge Moldings and Trim: Provide edge moldings at entire perimeter of ceiling, at columns, and wherever necessary to conceal edges of acoustical units. Miter corners of edge moldings accurately and connect securely, but do not use exposed fasteners nor pop rivets.
 - 1. Sealing: Provide a continuous bead of exposed acoustical sealant, specified in Section 07920 - JOINT SEALANTS, between edge moldings and walls.
- F. Ceiling Panel Installation: Use clean white gloves when handling ceiling materials. Install ceiling panels in coordination with suspension system. Scribe and cut panels to fit accurately.
 - 1. Orientation: Lay panels with grain running in one direction throughout the project.

3.3 ADJUSTING, TOUCH-UP AND CLEANING

- A. Adjust panels so that ceilings are in one plane and look uniform with no individual panels too high or too low.
- B. Touch-up damaged suspension system coatings and finishes and repair minor damage to eliminate all evidence of repair. Remove and replace work which cannot be satisfactorily repaired.
- C. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully cleaned.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09650
RESILIENT FLOORS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following item.
 - 1. Rubber floor tile.
 - 2. Vinyl composition tile.
 - 3. Resilient wall base and accessories.
 - 4. Resilient stair accessories.
 - 5. Substrate preparation for resilient flooring and accessories.

- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 03300 - CAST-IN-PLACE CONCRETE: Concrete substrate.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Samples for Verification: Full-size units of each color and pattern of resilient floor tile required.
 - 1. Resilient Wall Base and Accessories: Manufacturer's standard-size Samples, but not less than 12 inches long, of each resilient product color and pattern required.
- C. Maintenance Data: For resilient products to include in maintenance manuals.

1.3 QUALITY ASSURANCE

- A. Fire-Test-Response Characteristics: Provide products identical to those tested for fire-exposure behavior per test method indicated. Tests to be performed by a testing and inspecting agency acceptable to authorities having jurisdiction.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Store resilient products and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 50 deg F or more than 90 deg F. Store tiles on flat surfaces.

1.5 PROJECT CONDITIONS

- A. Maintain temperatures within range recommended by manufacturer, but not less than 70 deg F or more than 95 deg F in spaces to receive floor tile during the following time periods:
 - 1. 48 hours before installation.
 - 2. During installation.
 - 3. 48 hours after installation.
- B. After postinstallation period, maintain temperatures within range recommended by manufacturer, but not less than 55 deg F or more than 95 deg F.
- C. Close spaces to traffic during floor covering installation.
- D. Close spaces to traffic for 48 hours after floor covering installation.
- E. Install resilient products after other finishing operations, including painting, have been completed.

PART 2 - PRODUCTS

2.1 RUBBER FLOOR TILE

- A. Rubber Floor Tile: ASTM F 1344.
 - 1. Endura
 - 2. Johnsonite
 - 3. Mondo Rubber International, Inc.
 - 4. Nora Rubber Flooring, Freudenberg Building Systems, Inc.
- B. Style and Colors: As selected by Engineer.
- C. Thickness: 0.125 inch.
- D. Size: 24 by 24 inches nominal.

2.2 VINYL COMPOSITION TILE

- A. Vinyl Composition Tile (VCT): ASTM F 1066.
 - 1. Armstrong World Industries, Inc.
 - 2. Azrock Commercial Flooring, DOMCO
 - 3. Congoleum Corporation
 - 4. Tarkett Inc.
- B. Style and Colors: As selected by Engineer.
- C. Thickness: 0.125 inch.
- D. Size: 12 by 12 inches.

2.3 RESILIENT WALL BASE

- A. Wall Base: ASTM F 1861.
 - 1. Armstrong World Industries, Inc.
 - 2. Burke Mercer Flooring Products
 - 3. Johnsonite
 - 4. Nora Rubber Flooring, Freudenberg Building Systems, Inc.
 - 5. Roppe Corporation
- B. Style and Colors: As selected by Engineer.
- C. Type (Material Requirement): TS (rubber, vulcanized thermoset) or TP (rubber, thermoplastic).
- D. Shape: Straight (toeless) at carpet and coved at resilient flooring.
- E. Minimum Thickness: 0.125 inch.
- F. Height: 4 inches.
- G. Lengths: Cut lengths 48 inches long or coils in manufacturer's standard length].
- H. Outside Corners: Premolded.
- I. Inside Corners: Premolded.
- J. Surface: Smooth.

2.4 RESILIENT STAIR ACCESSORIES

- A. Treads and Risers: ASTM F 2169.
 - 1. Burke Flooring Products.
 - 2. Johnsonite, a division of Tarkett.
 - 3. Mondo Rubber International, Inc.
 - 4. Nora Systems, Inc.
 - 5. Roppe Corporation.
- B. Style and Colors: As indicated on the Finish Legend.
- C. Material: Rubber, Composition A.
- D. Size: Lengths and depths to fit each stair tread in one piece.
- E. Stringers: Of same thickness as risers, height and length after cutting to fit risers and treads and to cover stair stringers; produced by same manufacturer as treads and recommended by manufacturer for installation with treads.

2.5 RESILIENT MOLDING ACCESSORY

- A. Types Include the Following As Applicable: Cap for cove carpet, cap for cove resilient sheet floor covering, carpet edge for glue-down applications, nosing for carpet, nosing for resilient floor covering, reducer strip for resilient floor covering, joiner for tile and carpet
 - 1. Burke Mercer Flooring Products
 - 2. Johnsonite
 - 3. Marley Flexco (USA), Inc
 - 4. Roppe Corporation
- B. Material: Rubber.
- C. Profile and Dimensions: As indicated.

2.6 INSTALLATION MATERIALS

- A. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic cement based formulation provided or approved by resilient product manufacturer for applications indicated.
- B. Adhesives: Water-resistant type recommended by manufacturer to suit resilient products and substrate conditions indicated.
 - 1. Use adhesives that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
 - a. VCT and Asphalt Tile Adhesives: 50 g/L.
 - b. Cove Base Adhesives: 50 g/L.
 - c. Rubber Floor Adhesives: 60 g/L.
- C. Stair-Tread-Nose Filler: Two-part epoxy compound recommended by resilient tread manufacturer to fill nosing substrates that do not conform to tread contours.
- D. Metal Edge Strips: Extruded aluminum with mill finish of width shown, of height required to protect exposed edges of tiles, and in maximum available lengths to minimize running joints.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, with Installer present, for compliance with requirements for installation tolerances, concrete curing progress, moisture content, and other conditions affecting performance.
 - 1. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of resilient products.
 - 2. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Prepare substrates according to manufacturer's written recommendations to ensure adhesion of resilient products.
- B. Concrete Substrates: Prepare according to ASTM F 710.
 - 1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
 - 2. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.
 - 3. Moisture Testing:
 - a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. in 24 hours.
 - b. Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing and PH is acceptable to manufacturer.
- C. Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
- D. Access Flooring Panels: Remove protective film of oil or other coating using method recommended by access flooring manufacturer.
- E. Use trowelable leveling and patching compound to fill cracks, holes, and depressions in substrates.
- F. Move resilient products and installation materials into spaces where they will be installed at least 48 hours in advance of installation.
 - 1. Do not install resilient products until they are same temperature as space where they are to be installed.
- G. Sweep and vacuum clean substrates to be covered by resilient products immediately before installation. After cleaning, examine substrates for moisture, alkaline salts, carbonation, and dust. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 TILE INSTALLATION

- A. Lay out tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half tile at perimeter.
 - 1. Lay tiles in pattern indicated.
- B. Match tiles for color and pattern by selecting tiles from cartons in the same sequence as manufactured and packaged, if so numbered. Discard broken, cracked, chipped, or deformed tiles.
- C. Scribe, cut, and fit tiles to butt neatly and tightly to vertical surfaces and permanent fixtures including built-in furniture, cabinets, pipes, outlets, edgings, door frames, thresholds, and nosings.

- D. Extend tiles into toe spaces, door reveals, closets, and similar openings.
- E. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on floor tiles as marked on substrates. Use chalk or other nonpermanent, nonstaining marking device.
- F. Install tiles on covers for telephone and electrical ducts and similar items in finished floor areas. Maintain overall continuity of color and pattern with pieces of tile installed on covers. Tightly adhere tile edges to substrates that abut covers and to cover perimeters.
- G. Adhere tiles to flooring substrates using a full spread of adhesive applied to substrate to produce a completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.

3.4 RESILIENT WALL BASE INSTALLATION

- A. Apply wall base to walls, columns, pilasters, casework and cabinets in toe spaces, and other permanent fixtures in rooms and areas where base is required.
- B. Install wall base in lengths as long as practicable without gaps at seams and with tops of adjacent pieces aligned.
- C. Tightly adhere wall base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.
- D. Do not stretch wall base during installation.
- E. On masonry surfaces or other similar irregular substrates, fill voids along top edge of wall base with manufacturer's recommended adhesive filler material.
- F. Premolded Corners: Install premolded corners before installing straight pieces.

3.5 RESILIENT ACCESSORY INSTALLATION

- A. Resilient Stair Accessories:
 - 1. Use stair-tread-nose filler to fill nosing substrates that do not conform to tread contours.
 - 2. Tightly adhere to substrates throughout length of each piece.
 - 3. For treads installed as separate, equal-length units, install to produce a flush joint between units.
- B. Resilient Molding Accessories: Butt to adjacent materials and tightly adhere to substrates throughout length of each piece. Install reducer strips at edges of floor coverings that would otherwise be exposed.

3.6 CLEANING AND PROTECTION

- A. Perform the following operations immediately after completing resilient product installation:
 - 1. Remove adhesive and other blemishes from exposed surfaces.
 - 2. Sweep and vacuum surfaces thoroughly.

3. Damp-mop surfaces to remove marks and soil.
 - a. Do not wash surfaces until after time period recommended by manufacturer.
- B. Protect resilient products from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period. Use protection methods recommended in writing by manufacturer.
 1. Apply protective floor polish to horizontal surfaces that are free from soil, visible adhesive, and surface blemishes if recommended in writing by manufacturer.
 - a. Coordinate selection of floor polish with the Authority's maintenance personnel.
 2. Cover products installed on horizontal surfaces with undyed, untreated building paper until Substantial Completion.
 3. Do not move heavy and sharp objects directly over surfaces. Place hardboard or plywood panels over flooring and under objects while they are being moved. Slide or roll objects over panels without moving panels.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09670

FLUID APPLIED FLOORING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies decorative resinous flooring systems.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include manufacturer's technical data, application instructions, and maintenance recommendations for each resinous flooring component required.
- B. Samples for Verification: For each resinous flooring system required, 6 inches (150 mm) square, applied to a rigid backing by Installer for this Project.

1.3 INFORMATIONAL SUBMITTALS

- A. Installer Certificates: Signed by manufacturer certifying that installers comply with specified requirements.
- B. Material Certificates: For each resinous flooring component, from manufacturer.
- C. Material Test Reports: For each resinous flooring system.

1.4 CLOSEOUT SUBMITTALS

- A. Maintenance Data: Provide manufacturer's maintenance recommendations for resinous flooring to include in maintenance manuals.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of flooring systems required for this Project.
 - 1. Engage an installer who is certified in writing by resinous flooring manufacturer as qualified to apply resinous flooring systems indicated.
- B. Source Limitations: Obtain primary resinous flooring materials, including primers, resins, hardening agents, grouting coats, and topcoats, from single source from single manufacturer. Provide secondary

materials, including patching and fill material, joint sealant, and repair materials, of type and from source recommended by manufacturer of primary materials.

- C. Mockups: Apply mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Apply full-thickness mockups on 48-inch- (1200-mm-) square floor area selected by Architect.
 - a. Include 48-inch (1200-mm) length of integral cove base with inside corner.
 - 2. Simulate finished lighting conditions for Architect's review of mockups.
 - 3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name and directions for storage and mixing with other components.

1.7 PROJECT CONDITIONS

- A. Environmental Limitations: Comply with resinous flooring manufacturer's written instructions for substrate temperature, ambient temperature, moisture, ventilation, and other conditions affecting resinous flooring application.
- B. Lighting: Provide permanent lighting or, if permanent lighting is not in place, simulate permanent lighting conditions during resinous flooring application.
- C. Close spaces to traffic during resinous flooring application and for not less than 24 hours after application unless manufacturer recommends a longer period.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide Sherwin Williams Company General Polymers; FastTop 12S-U1 or an approved equal.

2.2 MATERIALS

- A. VOC Content of Liquid-Applied Flooring Components: Not more than 100 g/L when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

2.3 DECORATIVE RESINOUS FLOORING

- A. Resinous Flooring: Low odor, self-leveling, abrasion-, impact- and chemical-resistant, decorative-aggregate-filled, epoxy-resin-based, monolithic floor surfacing designed to produce a seamless floor and integral cove base.
- B. System Characteristics:
 - 1. Color and Pattern: As selected by Architect from manufacturer's full range.
 - 2. Wearing Surface: Textured for slip resistance
 - 3. Overall System Thickness: 1/4 inch (6.4 mm)
- C. Body Coats:
 - 1. Resin: Urethane
 - 2. Application Method: Self-leveling slurry with broadcast aggregates.
 - a. Thickness of Coats: 3/16 inch (4.8 mm)
 - b. Number of Coats: One.
 - 3. Aggregates: Colored quartz (ceramic-coated silica).
- D. Topcoat: Sealing or finish coats.
 - 1. Resin: Urethane.
 - 2. Type: Clear.
 - 3. Finish: Gloss.
 - 4. Number of Coats: One.
- E. System Physical Properties: Provide resinous flooring system with the following minimum physical property requirements when tested according to test methods indicated:
 - 1. Compressive Strength: 5,000 psi per ASTM C 579.
 - 2. Tensile Strength: 550-600 psi per ASTM C 307.
 - 3. Flexural Strength: 3,700 per ASTM C 580.
 - 4. Coefficient of Friction: >0.80 per ASTM D 2047.
 - 5. Abrasion Resistance: 20-30 maximum weight loss per ASTM D 4060.
 - 6. Flammability: Self-extinguishing per ASTM D 635.
 - 7. Hardness: 75, Shore D per ASTM D 2240.

2.4 ACCESSORIES

- A. Primer: Type recommended by manufacturer for substrate and body coats indicated.

PART 3 - EXECUTION

3.1 PREPARATION

- A. General: Prepare and clean substrates according to resinous flooring manufacturer's written instructions for substrate indicated. Provide clean, dry substrate for resinous flooring application.

- B. Resinous Materials: Mix components and prepare materials according to resinous flooring manufacturer's written instructions.

3.2 APPLICATION

- A. General: Apply components of resinous flooring system according to manufacturer's written instructions to produce a uniform, monolithic wearing surface of thickness indicated.
 - 1. Coordinate application of components to provide optimum adhesion of resinous flooring system to substrate, and optimum intercoat adhesion.
 - 2. Cure resinous flooring components according to manufacturer's written instructions. Prevent contamination during application and curing processes.
- B. Apply primer over prepared substrate at manufacturer's recommended spreading rate.
- C. Integral Cove Base: Apply cove base mix to wall surfaces before applying flooring. Apply according to manufacturer's written instructions and details including those for taping, mixing, priming, troweling, sanding, and topcoating of cove base. Round internal and external corners.
 - 1. Integral Cove Base: 4 inches (100 mm) high.
- D. Apply self-leveling slurry body coats in thickness indicated for flooring system.
 - 1. Broadcast aggregates at rate recommended by manufacturer and, after resin is cured, remove excess aggregates to provide surface texture indicated.
- E. Apply troweled or screeded body coats in thickness indicated for flooring system. Hand or power trowel and grout to fill voids. When cured, remove trowel marks and roughness using method recommended by manufacturer.
- F. Apply topcoats in number indicated for flooring system and at spreading rates recommended in writing by manufacturer.

3.3 FIELD QUALITY CONTROL

- A. Core Sampling: At the direction of Authority and at locations designated by Authority, take one core sample per 1,000 sq. ft. (92.9 sq. m) of resinous flooring, or portion of, to verify thickness. For each sample that fails to comply with requirements, take two additional samples. Repair damage caused by coring and correct deficiencies.
- B. Material Sampling: Authority may at any time and any number of times during resinous flooring application require material samples for testing for compliance with requirements.
 - 1. The Contractor will engage an independent testing agency to take samples of materials being used. Material samples will be taken, identified, sealed, and certified in presence of Engineer.
 - 2. Testing agency will test samples for compliance with requirements, using applicable referenced testing procedures or, if not referenced, using testing procedures listed in manufacturer's product data.
 - 3. If test results show applied materials do not comply with specified requirements, pay for testing, remove noncomplying materials, prepare surfaces coated with unacceptable materials, and reapply flooring materials to comply with requirements.

3.4 PROTECTION

- A. Protect resinous flooring from damage and wear during the remainder of construction period. Use protective methods and materials, including temporary covering, recommended in writing by resinous flooring manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are be included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09680

CARPETING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies carpet for direct-glue down installation, carpet accessories and substrate preparation for carpet and accessories.
- B. Related Work:
 - 1. Section 09650 - RESILIENT FLOORS for resilient wall base and accessories installed with carpet.
 - 2. Section 09681 - TILE CARPETING for carpet tiles and accessories.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated. Include manufacturer's written data on physical characteristics, durability, and fade resistance. Include installation recommendations for each type of substrate required.
- B. Shop Drawings: Show the following:
 - 1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet.
 - 2. Carpet type, color, and dye lot.
 - 3. Seam locations, types, and methods.
 - 4. Type of subfloor.
 - 5. Type of installation.
 - 6. Pattern type, repeat size, location, direction, and starting point.
 - 7. Pile direction.
 - 8. Type, color, and location of insets and borders.
 - 9. Type, color, and location of edge, transition, and other accessory strips.
 - 10. Transition details to other flooring materials.
- C. Samples: For each of the following products and for each color and texture required. Label each Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.
 - 1. Carpet: 12-inch- square Sample.
 - 2. Exposed Edge Stripping and Accessory: 12-inch-long Samples.
 - 3. Carpet Seam: 6-inch Sample.
- D. Product Schedule: Use same room and product designations indicated on Drawings and in schedules.
- E. Maintenance Data: For carpet to include in maintenance manuals specified in Division 01. Include the following:
 - 1. Methods for maintaining carpet, including cleaning and stain-removal products and procedures and manufacturer's recommended maintenance schedule.
 - 2. Precautions for cleaning materials and methods that could be detrimental to carpet.

1.3 QUALITY ASSURANCE

- A. Carpeting Standard: Comply with the Carpet and Rug Institute's "CRI Carpet Installation Standard," 2011 edition, formerly CRI 104 "Standard For Installation Specification Of Commercial Carpet."
- B. Installer Qualifications: An experienced installer who is certified by the Floor Covering Installation Board or who can demonstrate compliance with its certification program requirements.
- C. Fire-Test-Response Characteristics: Provide products with the critical radiant flux classification indicated in Part 2, as determined by testing identical products per ASTM E 648 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
- D. Mockups: Before installing carpet, build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. General: Comply with CRI Carpet Installation Standard, Section 5, "Storage and Handling."

1.5 PROJECT CONDITIONS

- A. General: Comply with CRI Carpet Installation Standard, Section 7, "Site Conditions."
- B. Environmental Limitations: Do not install carpet until wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- C. Do not install carpet over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive and concrete slabs have pH range recommended by carpet manufacturer.
- D. Where demountable partitions or other items are indicated for installation on top of carpet, install carpet before installing these items.

1.6 WARRANTY

- A. General Warranty: Special warranty specified in this Article shall not deprive the Authority of other rights the Authority may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.
- B. Special Carpet Warranty: Written warranty, signed by carpet manufacturer agreeing to replace carpet that does not comply with requirements or that fails within specified warranty period. Warranty does not include deterioration or failure of carpet due to unusual traffic, failure of substrate, vandalism, or abuse. Failures include, but are not limited to, more than 10 percent loss of face fiber, edge raveling, snags, runs, and delamination.
 - 1. Warranty Period: Ten years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 CARPET

- A. Products: Subject to compliance with requirements, provide one of the following:
 - 1. Provide sheet carpet as indicated on the Finish Schedule and as approved by the Architect.
 - 2. Environmental Requirements: Provide carpet that complies with testing and product requirements of CRI Carpet and Rug Institute's "Green Label Plus" program.

2.2 INSTALLATION ACCESSORIES

- A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided by or recommended by the carpet manufacturer.
- B. Adhesives: Water-resistant, mildew-resistant, nonstaining type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet and that is recommended by carpet manufacturer.
- C. Seaming Cement: Hot-melt adhesive tape or similar product recommended by carpet manufacturer for taping seams and butting cut edges at backing to form secure seams and to prevent pile loss at seams.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting carpet performance. Verify that substrates and conditions are satisfactory for carpet installation and comply with requirements specified.
- B. Concrete Subfloors: Comply with CRI Carpet Installation Standard, Section 9, "Testing Concrete Substrates." Verify that concrete slabs comply with ASTM F 710 and the following:
 - 1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by the carpet manufacturer.
 - 2. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. General: Comply with CRI Carpet Installation Standard, Section 7.3, "Site Conditions; Floor Preparation," and carpet manufacturer's written installation instructions for preparing substrates indicated to receive carpet installation.
- B. Concrete Substrates: Prepare according to ASTM F 710.
 - 1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
 - 2. Alkalinity and Adhesion Testing: Perform tests recommended by flooring manufacturer.

Proceed with installation only after substrate alkalinity falls within a range on pH scale not less than 5 or more than 9 pH, or as otherwise required in writing by manufacturer of flooring.

3. Moisture Vapor Emission Testing:

- a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. in 24 hours, or as otherwise required in writing by manufacturer of flooring.

4. Relative Humidity Testing:

- a. Perform relative humidity test, ASTM F 2170. Proceed with installation only after substrates have a maximum relative humidity level of 75 percent, or as otherwise required in writing by manufacturer of flooring.

5. Perform tests indicated above and as recommended by flooring manufacturer. Proceed with installation only after substrates pass testing.

C. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, and depressions in substrates.

D. Broom and vacuum clean substrates to be covered immediately before installing carpet. After cleaning, examine substrates for moisture, alkaline salts, carbonation, or dust. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 INSTALLATION

A. Direct-Glue-Down Installation: Comply with CRI Carpet Installation Standard, Section 13, "Direct Glue-Down Installation."

B. Comply with carpet manufacturer's written recommendations for seam locations and direction of carpet; maintain uniformity of carpet direction and lay of pile. At doorways, center seams under the door in closed position.

C. Do not bridge building expansion joints with carpet.

D. Cut and fit carpet to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet manufacturer.

E. Extend carpet into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.

F. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.

G. Install pattern parallel to walls and borders.

3.4 CLEANING AND PROTECTION

- A. Perform the following operations immediately after installing carpet:
 - 1. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet manufacturer.
 - 2. Remove yarns that protrude from carpet surface.
 - 3. Vacuum carpet using commercial machine with face-beater element and HEPA filter.
- B. Protect installed carpet to comply with CRI Carpet Installation Standard, Section 20, "Protecting Indoor Installations."
- C. Protect carpet against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09681

TILE CARPETING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies carpet tile including preparation of concrete floor slabs and fills, except leveling and repair of faulty surfaces and those not constructed to stated tolerance.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated. Include manufacturer's written data on physical characteristics, durability, and fade resistance. Include installation methods.
- B. Shop Drawings: Show the following:
 - 1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet tiles.
 - 2. Carpet tile type, color, and dye lot.
 - 3. Type of subfloor.
 - 4. Type of installation.
 - 5. Pattern of installation.
 - 6. Pattern type, location, and direction.
 - 7. Pile direction.
 - 8. Type, color, and location of insets and borders.
 - 9. Type, color, and location of edge, transition, and other accessory strips.
 - 10. Transition details to other flooring materials.
- C. Samples: For each of the following products and for each color and texture required. Label each Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.
 - 1. Carpet Tile: Full-size Sample.
 - 2. Exposed Edge Stripping and Accessory: 12-inch- (300-mm-) long Samples.
- D. Product Schedule: Use same room and product designations indicated on Drawings and in schedules.
- E. Maintenance Data: For carpet tile to include in maintenance manuals specified in Division 1. Include the following:
 - 1. Methods for maintaining carpet tile, including cleaning and stain-removal products and procedures and manufacturer's recommended maintenance schedule.
 - 2. Precautions for cleaning materials and methods that could be detrimental to carpet tile.

1.3 QUALITY ASSURANCE

- A. **Installer Qualifications:** An experienced installer who is certified by the Floor Covering Installation Board or who can demonstrate compliance with its certification program requirements.
- B. **Fire-Test-Response Characteristics:** Provide products with the critical radiant flux classification indicated in Part 2, as determined by testing identical products per ASTM E 648 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
- C. **Product Options:** Products and manufacturers named in Part 2 establish requirements for product quality in terms of appearance, construction, and performance. Other manufacturers' products comparable in quality to named products and complying with requirements may be considered.
- D. **Mockups:** Before installing carpet tile, install mockups for each type of carpet tile installation required to demonstrate aesthetic effects and qualities of materials and execution. Install mockups to comply with the following requirements, using materials indicated for the completed Work:
 - 1. Install mockups in the location and of the size indicated or, if not indicated, as directed by Architect.
 - 2. Notify Architect seven days in advance of dates and times when mockups will be installed.
 - 3. Demonstrate the proposed range of aesthetic effects and workmanship.
 - 4. Obtain Architect's approval of mockups before starting work.
 - 5. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
 - 6. Remove mockups when directed.
 - 7. Approved mockups may become part the completed Work if undamaged at time of Substantial Completion.
- E. **Moisture-Vapor Emissions Test and Relative Humidity Test:** Before purchasing carpet tile, provide moisture-vapor emissions test and relative humidity test as specified under Article 3.1 of this Section. Report results of the tests to carpet tile manufacturer for approval.

1.4 STORAGE, AND HANDLING

- A. **General:** Comply with CRI 104, Section 5, "Storage and Handling."

1.5 PROJECT CONDITIONS

- A. **General:** Comply with CRI 104, Section 6.1, "Site Conditions; Temperature and Humidity."
- B. **Environmental Limitations:** Do not install carpet tile until wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- C. Do not install carpet tile over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive and concrete slabs have pH range recommended by carpet tile manufacturer.
- D. Where demountable partitions or other items are indicated for installation on top of carpet tile, install carpet tile before installing these items.

1.6 WARRANTY

- A. General Warranty: Special warranty specified in this Article shall not deprive Authority of other rights Authority may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.
- B. Special Carpet Tile Warranty: Written warranty, signed by carpet tile manufacturer agreeing to replace carpet tile that does not comply with requirements or that fails within specified warranty period. Warranty does not include deterioration or failure of carpet tile due to unusual traffic, failure of substrate, vandalism, or abuse. Failures include, but are not limited to, more than 10 percent loss of face fiber, edge raveling, snags, runs, and delamination.
 - 1. Warranty Period: 10 years from date of Substantial Completion.

1.7 EXTRA MATERIALS

- A. Furnish extra materials described below, before installation begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Carpet Tile: Full-size units equal to 5 percent of amount installed for each type indicated, but not less than 10 sq. yd. (8.3 sq. m).

PART 2 - PRODUCTS

2.1 CARPET TILE

- A. Carpet Tile Materials: Basis-Of-Design, provide as follows, or approved equal:
 - 1. Milliken "Plan A", #P/6675, Pie; color shall be #216 Grape.
- B. Carpet Tile Requirements: Provide carpet tile meeting the following requirements:
 - 1. Construction: Tufted, Textured Loop Pile
 - 2. Face Fiber: 100% Milliken-Certified WearOn® Type 6,6 Nylon
 - 3. Stain Repel / Stain Resist / Soil Release: StainSmart®
 - 4. Antimicrobial : AlphaSan® Built-In Protection
 - 5. Dye Method: DCP (Digital Color Placement)
 - 6. Finished Face Weight: 21 oz./sq.yd. (712.1 g./sq.m.)
 - 7. Gauge: 1/8 (31.5/10 cm.)
 - 8. Rows: 14.0/in. (55.1/10 cm.)
 - 9. Tufts: 112.0/sq.in. (1,735.7/100 sq. cm.)
 - 10. Finished Pile Height: 0.09 in. (2.3 mm.) avg.
 - 11. Density Factor: 543,994
 - 12. Average Density: 8,400
 - 13. Standard Backing: PVC-Free Comfort Plus® ES cushion
 - 14. Tile Size: 50cm x 50cm (19.7 x 19.7 in.)

2.2 INSTALLATION MATERIALS

- A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided by or recommended by carpet tile manufacturer, with a VOC content of 65 g/L or less when calculated according to 40 CFR 59, Subpart D.
- B. Adhesives for Carpets: Water-resistant, mildew-resistant, nonstaining type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet and is recommended or provided by carpet manufacturer.
 - 1. Limits: Provide adhesives that comply with the following limits for VOC content when tested according to ASTM D 5116:
 - a. Total VOCs: 10.00 mg/sq. m x h.
 - b. Formaldehyde: 0.05 mg/sq. m x h.
 - c. 2-Ethyl-1-Hexanol: 3.00 mg/sq. m x h.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting carpet tile performance. Verify that substrates and conditions are satisfactory for carpet tile installation and comply with requirements specified.
- B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F 710 and the following:
 - 1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by carpet tile manufacturer.
 - 2. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.
- C. Provide sound concrete surfaces free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with tile carpeting.
 - 1. Repair damaged and deteriorated concrete according to tile carpeting manufacturer's written instructions.
 - 2. Verify that concrete substrates are dry and moisture-vapor emissions are within acceptable levels according to manufacturer's written instructions.
 - a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with application of tile carpeting only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. (1.36 kg of water/92.9 sq. m) of slab area in 24 hours.
 - b. Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. General: Comply with CRI 104, Section 6.2, "Site Conditions; Floor Preparation," and carpet tile manufacturer's written installation instructions for preparing substrates indicated to receive carpet tile installation.
- B. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, and depressions in substrates.
- C. Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet tile manufacturer.
- D. Broom and vacuum clean substrates to be covered immediately before installing carpet tile. After cleaning, examine substrates for moisture, alkaline salts, carbonation, or dust. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 INSTALLATION

- A. General: Comply with CRI 104, Section 13, "Carpet Modules (Tiles)."
- B. Glue-down installations are appropriate for wheel traffic; partial glue-down, for carpet tiles of moderate dimensional stability and moderate weight and mass; and free-lay, for dimensionally stable carpet tiles with heavy backings.
- C. Installation Method: As recommended in writing by carpet tile manufacturer.
- D. Cut and fit carpet tile to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet tile manufacturer.
- E. Extend carpet tile into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
- F. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.
- G. Install pattern parallel to walls and borders.

3.4 CLEANING AND PROTECTION

- A. Perform the following operations immediately after installing carpet tile:
 - 1. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet tile manufacturer.
 - 2. Remove yarns that protrude from carpet tile surface.
 - 3. Vacuum carpet tile using commercial machine with face-beater element.
- B. Protect installed carpet tile to comply with CRI 104, Section 15, "Protection of Indoor Installations."

- C. Protect carpet tile against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet tile manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09840

ACOUSTICAL PANEL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies direct-applied acoustical panel systems at interior underside of decking.
- B. Related Work:
 - 1. Division 15 - MECHANICAL; sprinklers, grilles, and diffusers located in ceilings.
 - 2. Division 16 - ELECTRICAL; light fixtures and alarm system components located in ceilings.

1.2 QUALITY ASSURANCE

- A. Source: For each type of material required for the work of this section, provide primary materials which are the products of one manufacturer. Provide secondary materials which are acceptable to the manufacturers of the primary materials.

1.3 TESTS

- A. Fire-Resistance: Where fire-resistance ratings are indicated or required by authorities having jurisdiction, provide materials and construction which are identical to assemblies whose fire-resistance rating has been tested in compliance with ASTM E119 by independent agencies acceptable to the Engineer and authorities having jurisdiction.
- B. Burning Characteristics: Provide materials whose surface burning characteristics, when tested in compliance with ASTM E84 are Class A or Class 1.

1.4 SUBMITTALS

- A. Product Data: Submit manufacturer's product data, installation instructions, use limitations and recommendations for each material used. Provide certifications stating that materials comply with requirements.
- B. Shop Drawings: For acoustical panels. Include mounting devices and details; details at panel head, base, joints, and corners; and details at ceiling, floor base, and wall intersections. Include elevations showing panel sizes. Indicate panel edge and core materials.
- C. Coordination Drawings: Show intersections with adjacent and penetrating work.
- D. Verification Samples: Submit representative samples of each material that is to be exposed in the finished work, showing the full range of color and finish variations expected. Provide samples having minimum area of 144 square inches.

- E. Test Reports: Submit certified reports for tests required.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials and products in unopened factory labeled packages. Store and handle in strict compliance with manufacturer's instructions and recommendations. Protect from damage, moisture and direct sunlight. Sequence deliveries to avoid delays, but minimize on-site storage.

1.6 PROJECT CONDITIONS, SEQUENCING AND SCHEDULING

- A. Environment: Perform work only when conditions are within the limits established by manufacturers of the materials and products used.
- B. Conference: Convene a pre-installation conference to establish procedures to maintain optimum working conditions and to coordinate this work with related and adjacent work.
 - 1. Proceed with installation of ceiling tiles and panels only when construction above ceilings and penetrating work is complete. Delay installation of ceiling tiles or panels until near time of Substantial Completion.
 - 2. Perform work of this section to coordinate with the layout of light fixtures, HVAC equipment and fixtures, fire suppression system components and all other related work. In general, every penetration shall occur at the center of a ceiling tile or panel.

1.7 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of acoustical panels that fail in performance, materials, or workmanship within specified warranty period.
 - 1. Failure in performance includes, but is not limited to, acoustical performance.
 - 2. Failures in materials include, but are not limited to, warping of core.
 - 3. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MATERIALS AND PRODUCTS

- A. Acoustic Panel: Recycled wood and cementitious panels with factory painted finish.
 - 1. Basis of Design: Tectum Inc.; Finale Panel, or approved equal.
 - 2. Nominal Core Thickness: 2 inches.
 - 3. Overall System NRC: Not less than 0.80, for Type A mounting per ASTM E 795.
 - 4. Panel Size: 4' x 8' typical.
 - 5. Corner Detail: As indicated on Drawings.
 - 6. Factory Finish: Manufacturer's standard painted finish; custom color to be selected by Architect.

- B. Fasteners: Provide exposed steel drywall screws, to extend at least 1 inch into substrate, painted to match panel.

2.2 FABRICATION

- A. Sound-Absorption Performance: Provide acoustical panels with minimum NRCs indicated, as determined by testing per ASTM C 423 for mounting type specified.
- B. Dimensional Tolerances of Finished Units: Plus or minus 1/16 inch for the following:
 - 1. Thickness.
 - 2. Edge straightness.
 - 3. Overall length and width.
 - 4. Squareness from corner to corner.
 - 5. Chords, radii, and diameters.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The Installer shall examine substrates, supports, and conditions under which this work is to be performed and notify Contractor, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means Installer accepts substrates and conditions.

3.2 INSTALLATION

- A. Install acoustical panels in locations indicated with surfaces and edges plumb, top edges level and in alignment with other panels, faces flush, and scribed to fit adjoining work accurately at borders and at penetrations.
- B. Comply with acoustical panel manufacturer's written instructions for installation of panels using type of mounting accessories indicated or, if not indicated, as recommended by manufacturer. Anchor panels securely to supporting substrate.
 - 1. Acoustical Panels: Mechanically fasten directly to ceiling substrates, as indicated on Drawings.
- C. Installation Tolerances: As follows:
 - 1. Variation from Level and Plumb: Plus or minus 1/16 inch.
 - 2. Variation of Panel Joints from Hairline: Not more than 1/16 inch wide.

3.3 PROTECTION

- A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, to ensure that acoustical panels are without damage or deterioration at time of Substantial Completion.

- B. Replace acoustical panels that cannot be cleaned and repaired, in a manner approved by Architect, before time of Substantial Completion.
- C. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully cleaned.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 09861

ANTI-GRAFFITI COATINGS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies anti-graffiti (AG) coatings on exposed structural substrates on fixed property and in rights-of way under the purview of MBTA.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 03300 – CAST IN-PLACE CONCRETE
 - 3. Section 03450 – ARCHITECTURAL PRECAST CONCRETE
- C. The basic technical concept involves installing protective coatings to prevent permanent marking of surfaces via convenient removal of graffiti markings on a repeated basis. Coatings with non-wetting or other physico-chemically properties that discourage graffiti marking may warrant preferred selection.
- D. Affected substrates include:
 - 1. Bare and painted concrete, concrete block.
 - 2. Cast-in-place concrete and precast concrete.
 - 3. Architectural precast concrete.
- E. At the discretion of the MBTA Engineer, the anti-graffiti coating shall be a clear material that does not significantly alter the appearance of the substrate.

1.2 NOT USED

1.3 DESIGN GUIDANCE

- A. Surface texture:
 - 1. Surface cleanability depends on roughness and porosity. Architectural surface textures range from super-smooth glaze finishes on tiles and glass to coarsely fractured concrete block. Porosity of the surfaces also ranges from zero for glass and metal to significant for concrete and masonry.
 - 2. Rough surfaces should get an AG coating that permanently seals surface porosity. Conversely, smooth surfaces may need to be roughened/profiled in a controlled manner in order for the AG coating to bond adequately to the surface.
- B. Recoating:
 - 1. The number of times a coated surface can be cleaned before it is recoated depends on the coating durability and the cleaning procedure. Cleaning procedures should follow the coating manufacturer's instructions unless these are superseded by specific MBTA Engineer's instructions for that specific AG coated surface.
 - 2. Coatings for specific surfaces should be selected with an approximate expected number

of cleaning cycles to recoat in mind, depending on such factors as work location and accessibility, surface preparation requirements for recoating, and other coating application considerations, including compatibility and adhesion between the old and new AG coatings.

- C. New construction:
 - 1. Anti-graffiti measures should be an architectural design consideration in selecting materials and surface textures. At a minimum, graffiti-susceptible surfaces should be amenable to sealing with a clear or pigmented AG coating, or incorporate other anti-graffiti measures approved by the MBTA Engineer.

1.4 CERTIFICATION AND REGULATIONS

- A. Contractor certification:
- B. Contractors installing anti-graffiti coatings shall be certified in writing by the manufacturer as a trained installer of the specified coating materials.
- C. Handling, storing, disposal, and installation of coating materials and solvents: Contractor is responsible for fully meeting health, occupational safety and environmental requirements of all applicable local, state, or federal codes, regulations, and ordinances. Contractor shall ascertain what local, state and federal codes, regulations, and ordinances are in effect.
- D. To ensure full product compatibility, primary materials for each coating system installed in accordance with this Section shall be sourced from a single manufacturer. Secondary materials and solvents from other sources shall be approved by the coating system manufacturer.
- E. Coating materials shall meet Federal and State requirements for Volatile Organic Compound (VOC) content.

1.5 SUBMITTALS

- A. Product Data Sheets:
 - 1. Coating manufacturer's product data sheets, including installation instructions and service limitations for each material used shall be submitted to the MBTA Project Engineer.
- B. Certified test reports shall be provided for all specified coating performance test claims.
- C. Performance test reports:
 - 1. Submit evidence the AG coating has successfully performed or been field-tested for AG purposes for a minimum of six months. Longer performance and testing shall work in the coating's favor. Descriptions of test conditions and performance criteria shall be sufficiently detailed for results to be comparatively evaluated by the MBTA Engineer and for testing to be repeated by others.

1.6 PRODUCT STORAGE, HANDLING AND DISPOSAL

- A. Deliver materials and products in sealed, factory-labeled containers.
- B. Store the materials in a safe place that cannot be accessed by unauthorized people.
- C. Store, handle and prepare all coating materials under cover and protect from weather damage, strictly complying with the product manufacturer's directions and temperature limits.

- D. Collected, package and dispose of spoiled, unused and waste materials and product debris in total compliance with MBTA rules for chemical and solvent disposal.

1.7 INSTALLATION WORK RESTRICTIONS

- A. Weather:
 - 1. Perform anti-graffiti coating installation work, including surface preparation and curing, only when ambient weather conditions definitely will remain within temperature and humidity limits specified by the coating manufacturer.
- B. Temperature:
 - 1. Unless otherwise approved by the product manufacturer, apply the coating materials only when substrate surface and ambient temperatures are between 50°F - 85°F and will not be out of this range during the entire work period.
 - 2. Unless otherwise approved by the product manufacturer, store base materials and mixed products between 60°F and 80°F during application.
 - 3. Do not apply materials that are hotter than permitted by the product manufacturer.
- C. Schedule coating installation work to avoid interference between construction work, surface preparation and to minimize exposure of pedestrian and auto traffic.
- D. Spills and overspray:
 - 1. Deliberately avoid overspray on nearby surfaces and public property.
 - 2. Divert and protect pedestrian and auto traffic that could be affected by inhalation and overspray exposure during coating preparation and installation. Remove misapplied material, spills and overspray immediately.
- E. Personnel safety:
 - 1. Contractor employees installing the coating shall fully comply with all applicable personnel safety and health rules and procedures (see 1.02 B) and with the coating manufacturer's health and safety directions and recommendations.
 - 2. Do not use flammable products near fire or extreme heat.
 - 3. Always work in adequately ventilated conditions. Applicators shall wear NIOSH/MSHA approved respirators, eye protection, and protective clothing. Read material safety data sheets for additional toxicity and product hazard information.
 - 4. The public and all people not employed by the Contractor and MBTA shall be adequately protected from inhalation and overspray exposure to the coating materials.

1.8 PRE-CONSTRUCTION MEETING

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 COATINGS

- A. Anti-graffiti (AG) coatings for concrete, masonry, stone, suitable for repeated cleaning:
 - 1. Tnemec; Chemprobe V626 Dur A Plus GS
 - 2. QC Construction Products Anti-Graffiti
 - 3. Prosoco Blok-Guard and Graffiti Control

2.2 CLEANING SOLUTIONS

- A. Cleaning solutions shall be as approved or recommended by the AG coating manufacturer to maximize cleaning effect without harming the AG coating.
- B. Cleaning solutions and procedures shall not damage the substrate beneath the AG coating except where this is approved by the MBTA Engineer (e.g., because the substrate will be newly coated.)
- C. Cleaning solutions shall meet MBTA requirements for personnel exposure, safe handling and disposal.

PART 3 - EXECUTION

3.1 WORK AREA SUBSTRATE INSPECTION

- A. Examine substrates and identify conditions that could impede successful and smooth execution of the work. Factors to consider:
 - 1. Type of surface, including texture and porosity – influences surface preparation and coating system selection.
 - 2. Time windows and worker access for required sequence of surface preparation, coating installation (number of coats); curing.
 - 3. Potential effects of changes in ambient conditions in the work area and dryness of the substrate.
 - 4. Health and safety protection requirements for Contractor and public.
- B. Do not start work until job conditions are satisfactory to complete all required tasks in the available time.

3.2 COATING SELECTION

- A. Protected substrates shall be adequately sealed and non-porous before the anti-graffiti coating is applied.
- B. To select the right anti-graffiti product, the MBTA Engineer shall adequately weigh the following criteria:
 - 1. Selection for simpler application with fewer chemical exposure concerns from solvents.
 - 2. Selection for higher hardness to resist repeat cleaning performance.
 - 3. Selection for longer gloss retention in UV exposure.

4. Highest anti-graffiti performance.
- C. Clear coating shall be used to preserve architectural/aesthetic surface appearance, as directed by the MBTA Engineer.

3.3 APPLICATION

- A. General Application procedures:
1. Strictly follow the coating manufacturer's surface preparation, application and curing instructions, unless more restrictive requirements are specified in this Section. The coating manufacturer's limits for thinning, additives, pot-life, wet film thickness per coat and recoat time shall be known and carefully followed.
- B. Masking and overspray protection:
1. Protect contingent surfaces that should not be coated, oversprayed or contacted by cleaning or coating chemicals. Normally this is done with strippable masking materials, plastic sheeting and waterproof tape, or masking materials barriers approved by the MBTA Engineer.
- C. Surface Preparation: The substrate shall be flat and smooth enough to be thoroughly prepared and for the coating material to be evenly applied everywhere. NOTE: Coarsely profiled substrates like fractured concrete block require extra measures to benefits from anti-graffiti coatings.
1. Cavities and protuberances that can cause shadowing shall be filled or removed. Substrate roughness shall allow the method of application (brush, roller or spray) to provide uniform film thickness everywhere.
 2. Materials used to clean, patch, caulk and fill the substrate shall be approved by the coating manufacturer. Compatibility of existing materials shall be patch-tested before the coating is applied or painted with a primer or tie-coat from the coating manufacturer.
 3. The surface shall be thoroughly cleaned, dust-free, with no dirt, loose material, oil, water and other residues or contaminants.
 4. Masonry, tile and concrete surfaces shall be power-washed with high pressure water and appropriate chemical additives to remove surface contamination.
 5. Visible moisture is not permitted. Dampness shall not exceed the coating manufacturer's limits.
- D. Sample Preparation:
1. At the MBTA Engineer's discretion, the Contractor shall provide portable, finished samples of the final product on the target substrate(s) that are prepared in the specified manner. The resulting samples shall be used for comparative acceptance of actual work at the MBTA Engineer's discretion.

3.4 FIELD QUALITY CONTROL

- A. The Contractor shall establish and maintain throughout the work of this Section effective quality control measures described in a written scheme to ensure that all coating related work is performed as required by the Contract Documents.

- B. Quality-related test and inspection procedures, acceptance criteria and test reporting requirements for all phases of coating installation shall be defined by the MBTA Engineer before the work commences.

3.5 GRAFFITI REMOVAL

- A. Main objectives in removing graffiti from surfaces protected with AG coatings installed as described in this Section shall be to use experience and engineering judgment of all parties – MBTA, Contractor and AG coating manufacturer to:
 - 1. Minimize the physical and chemical harshness of the cleaning procedure so as to minimize environmental and health effects and preserve as much of the AG coating as practical during the cleaning operation.
 - 2. Clean with water, including hydro-blasting up to 5,000psi, wherever possible. Increase the solvent power of water by adding low concentrations of detergent or non-toxic emulsifier, such as tri-sodium phosphate (TSP), sodium carbonate (soda ash) or approved proprietary cleaning surfactants.
 - 3. Use only commercial organic solvent cleaners specified by the AG coating manufacturer for their specific coatings. These must contain non-toxic, biodegradable chemicals that do not require special containment and disposal.
- B. Use an escalating scale of more aggressive cleaning procedures on a systematic basis, using test cleaning to select the cleaning procedure.
- C. Carefully follow recoat time limits if new AG coating material is applied to surfaces freshly cleaned with solvent cleaners.
- D. Keep a complete log of cleaning events and procedures used to remove graffiti on every project doing work in accordance with this Section.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 10160

TOILET COMPARTMENTS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies stainless steel toilet compartments configured as toilet enclosures and urinal screens.
- B. Related Work:
 - 1. Section 05500 - MISCELLANEOUS METALS for supports that attach floor-and-ceiling-anchored compartments to overhead structural system.
 - 2. Section 06100 - CARPENTRY for blocking overhead support of floor-and-ceiling-anchored compartments.
 - 3. Section 10801 - TOILET ACCESSORIES for toilet tissue dispensers, grab bars, and similar accessories.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
- B. Shop Drawings: For toilet compartments. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Show locations of cutouts for compartment-mounted toilet accessories.
 - 2. Show locations of reinforcements for compartment-mounted grab bars.
 - 3. Show locations of centerlines of toilet fixtures.
 - 4. Show ceiling grid and overhead support or bracing locations.
- C. Samples for Verification: For the following products, in manufacturer's standard sizes unless otherwise indicated:
 - 1. Each type of material, color, and finish required for units, prepared on 6-inch- square Samples of same thickness and material indicated for Work.
 - 2. Each type of hardware and accessory.

1.3 INFORMATIONAL SUBMITTALS

- A. Product Certificates: For each type of toilet compartment, from manufacturer.

1.4 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For toilet compartments to include in maintenance manuals.

1.5 QUALITY ASSURANCE

- A. Comply with requirements in GSA's CID-A-A-60003, "Partitions, Toilets, Complete."
- B. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84, or another standard acceptable to authorities having jurisdiction, by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Flame-Spread Index 75 or less.
 - 2. Smoke-Developed Index: 450 or less.
- C. Regulatory Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA) and Architectural Barriers Act (ABA) Accessibility Guidelines for Buildings and Facilities" and ICC/ANSI A117.1 for toilet compartments designated as accessible.

1.6 PROJECT CONDITIONS

- A. Field Measurements: Verify actual locations of toilet fixtures, walls, columns, ceilings, and other construction contiguous with toilet compartments by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Stainless-Steel Sheet: ASTM A 666, Type 304, stretcher-leveled standard of flatness.
- B. Stainless-Steel Castings: ASTM A 743/A 743M.

2.2 STAINLESS STEEL UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- B. Basis-of-Design Product: Subject to compliance with requirements, provide stainless steel partitions by Bradley Company, or comparable product by one of the following:
 - 1. Accurate Partitions Corporation.
 - 2. Comtec Industries/Capitol Partitions.
 - 3. General Partitions Mfg. Corp.
 - 4. Global Steel Products Corp.
 - 5. Hadrian Manufacturing Inc.
 - 6. Metpar Corp.
 - 7. Santana Products, Inc.
 - 8. Weis-Robart Partitions, Inc.
- C. Toilet-Enclosure Style: Floor and ceiling anchored.
- D. Urinal-Screen Style: Wall hung.
- E. Door, Panel, and Pilaster Construction: Stainless steel panels 1, not less than 1 inch (25 mm) thick, seamless.

1. Integral Hinges: Configure doors and pilasters to receive integral hinges.
- F. Pilaster Shoes: Manufacturer's standard design; stainless steel.
- G. Brackets (Fittings):
1. Full-Height (Continuous) Type: Manufacturer's standard design; stainless steel.

2.3 ACCESSORIES

- A. Hardware and Accessories: Manufacturer's standard design, heavy-duty operating hardware and accessories.
1. Material: Stainless steel.
 2. Hinges: Manufacturer's standard continuous, spring-loaded type.
 3. Latch and Keeper: Manufacturer's standard recessed latch unit designed for emergency access and with combination rubber-faced door strike and keeper. Provide units that comply with regulatory requirements for accessibility at compartments designated as accessible.
 4. Coat Hook: Manufacturer's standard combination hook and rubber-tipped bumper, sized to prevent in-swinging door from hitting compartment-mounted accessories.
 5. Door Bumper: Manufacturer's standard rubber-tipped bumper at out-swinging doors.
 6. Door Pull: Manufacturer's standard unit at out-swinging doors that complies with regulatory requirements for accessibility. Provide units on both sides of doors at compartments designated as accessible.
- B. Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel or chrome-plated steel or brass, finished to match the items they are securing, with theft-resistant-type heads. Provide sex-type bolts for through-bolt applications. For concealed anchors, use stainless steel, hot-dip galvanized steel, or other rust-resistant, protective-coated steel.

2.4 FABRICATION

- A. Floor-and-Ceiling-Anchored Units: Provide manufacturer's standard stainless steel anchoring assemblies with leveling adjustment at tops and bottoms of pilasters. Provide shoes and sleeves (caps) at pilasters to conceal anchorage.
- B. Door Size and Swings: Unless otherwise indicated, provide 24-inch- (610-mm-) wide, in-swinging doors for standard toilet compartments and 36-inch- (914-mm-) wide, out-swinging doors with a minimum 32-inch- (813-mm-) wide, clear opening for compartments designated as accessible.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, level, and plumb. Secure units in position with manufacturer's recommended anchoring devices.
 - 1. Maximum Clearances:
 - a. Pilasters and Panels: 1/2 inch (13 mm).
 - b. Panels and Walls: 1 inch (25 mm).
- B. Floor-and-Ceiling-Anchored Units: Secure pilasters to supporting construction and level, plumb, and tighten. Hang doors and adjust so doors are level and aligned with panels when doors are in closed position.
- C. Urinal Screens: Attach with anchoring devices to suit supporting structure. Set units level and plumb, rigid, and secured to resist lateral impact.

3.2 ADJUSTING

- A. Hardware Adjustment: Adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set hinges on in-swinging doors to hold doors open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors to return doors to fully closed position.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 10200

ARCHITECTURAL LOUVERS AND GRILLES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies fixed extruded-aluminum, stainless steel and galvanized steel formed-metal louvers and frames. Work includes louvers set within curtain wall frames without the louver having its own frame.
- B. Related Work:
 - 1. Section 05500 – MISCELLANEOUS METALS.
 - 2. Section 07920 – JOINT SEALANTS; sealants installed in perimeter joints between louver frames and adjoining construction.
 - 3. Division 15 – MECHANICAL; louvers that are a part of mechanical equipment.
 - 4. Section 08111 – STEEL DOORS AND FRAMES
 - 5. Section 08120 – STAINLESS STEEL DOORS AND FRAMES

1.2 DEFINITIONS

- A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.
- B. Drainable-Blade Louver: Louver with blades having gutters that collect water and drain it to channels in jambs and mullions, which carry it to bottom of unit and away from opening.

1.3 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Provide louvers capable of withstanding the effects of gravity loads and wind loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act on vertical projection of louvers. Loads as required by Code.
- B. Seismic Performance: Provide louvers capable of withstanding the effects of earthquake motions as required by code.
- C. Thermal Movements: Provide louvers that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
 - 1. Temperature Change (Range): 120 deg F ambient; 180 deg F material surfaces.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For louvers and accessories. Include plans, elevations, sections, details, and attachments to other Work. Show blade profiles, angles, and spacing.
 - 1. For installed louvers indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Verification: For each type of metal finish required.
- D. Qualification Data: For professional engineer performing services required by paragraph 1.3.
- E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency or by manufacturer and witnessed by a qualified testing agency, for each type of louver.

1.5 QUALITY ASSURANCE

- A. Source Limitations: Obtain louvers and vents through one source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.
- B. Welding: Qualify procedures and personnel according to the following:
 - 1. AWS D1.2, "Structural Welding Code--Aluminum."
 - 2. AWS D1.3, "Structural Welding Code--Sheet Steel."
- C. SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

1.6 PROJECT CONDITIONS

- A. Field Measurements: Verify louver openings by field measurements before fabrication and indicate measurements on Shop Drawings.
 - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish opening dimensions and proceed with fabricating louvers without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to established dimensions.

1.7 PRE-CONSTRUCTION MEETING

- A. Arrange a pre-construction conference meeting to be attended by interested parties including contractor, architect, engineer, insurance agent and others whose installed work is specified under this section. Discuss conditions, interrelated responsibilities, schedule, applications, installation procedures, inspection procedures, specification requirements and other related matters. Conditions that exceed or contradict building code requirements should be discussed and mutual agreed upon between engineer, architect, insurance carriers and building code officials prior to construction or installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Louvers:
 - a. Airline Products Co.
 - b. Airolite Company (The).
 - c. Construction Specialties, Inc.
 - d. Greenheck.
 - e. Industrial Louvers, Inc.
 - f. Ruskin Company; Tomkins PLC

2.2 FIXED, EXTRUDED-ALUMINUM LOUVERS

- A. High-Performance Drainable Fixed Mullion Louvers at Lechmere Station
1. Basis-of-Design Product: Subject to compliance with requirements, provide Model A2097 by Construction Specialties or equal by Ruskin or Airolite.
- B. Horizontal, High Performance Louver at Union and Washington Stations:
1. Basis-of-Design Product: Subject to compliance with requirements, provide Model A6177 by Construction Specialties or equal by Ruskin or Airolite.
 2. Louver Depth: 6 inches.
 3. Blade Profile: Drainable blades positioned at 37.5 degree angle and spaced approximately 5 29/32" center to center.
 4. Frame and Blade Nominal Thickness: Not less than 0.081 inch for blades and .125 inches perforated panel and for frames.
 5. Louver Performance Ratings:
 - a. Free Area: 57% free area.
 - b. Point of Beginning Water Penetration: Not less than 700 fpm (4.1 m/s).
 - c. Air Performance: Not more than 0.13-inch wg static pressure drop at 822-fpm free-area exhaust velocity.
- C. High-Performance Drainable Fixed Frameless Mullion Louvers
1. Basis-of-Design Product: Subject to compliance with requirements, provide Model K609HP by Airolite or equal by Construction Specialties or Ruskin.
 - a. Provide louver with "frameless" mullion frame. Louver blades shall be notched to extend past the face of the vertical frame members.

2.3 FIXED, FORMED-METAL LOUVERS

- A. Horizontal, Drainable-Blade Louver
1. Basis-of-Design Product: Subject to compliance with requirements, provide Ruskin Company; Tomkins PLC; Model L6375D or approved equal.

2. Louver Depth: 6 inches (150 mm).
 3. Frame and Blade Material and Nominal Thickness: Galvanized-steel sheet, not less than 0.052 inch (1.32 mm).
 4. Mullion Type: Exposed.
 5. Louver Performance Ratings:
 - a. Free Area: Not less than 54 percent for 48-inch- (1220-mm-) wide by 48-inch- (1220-mm-) high louver.
 - b. Point of Beginning Water Penetration: Not less than 850 fpm (4.3 m/s).
 - c. Air Performance: Not more than 0.10-inch wg (25-Pa) static pressure drop at 896-fpm free-area velocity.
- B. Flush-mounted Transom Louvers
1. Basis of Design Product: Air Louvers model 700TL
 2. Louver depth 1 13/16"
 3. Frame and Blade Material and Nominal Thickness: 20 Gauge stainless steel

2.4 STAINLESS STEEL GRILLES

- A. Fixed, Stainless Steel Grilles: Model AG10 A-frame by Architectural Grille or equal, welded stainless steel with 7/8 inch frame depth and 3/4 inch grille depth with satin finish.

2.5 MATERIALS

- A. Aluminum Extrusions: ASTM B 221, alloy 6063-T5 or T-52.
- B. Aluminum Sheet: ASTM B 209, alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.
- C. Galvanized-Steel Sheet: ASTM A 653/A 653M, G60 (Z180) zinc coating, mill phosphatized.
- D. Fasteners: Of same basic metal and alloy as fastened metal or 300 Series stainless steel, unless otherwise indicated. Do not use metals that are incompatible with joined materials.
- E. Postinstalled Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed, for masonry, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
- F. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.6 FABRICATION, GENERAL

- A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- B. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.
- C. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

- D. Include supports, anchorages, and accessories required for complete assembly.
- E. Provide vertical mullions of type and at spacings indicated, but not more than recommended by manufacturer, or 72 inches o.c., whichever is less.
 - 1. Fully Recessed Mullions: Provide mullions fully recessed behind louver blades. Where length of louver exceeds fabrication and handling limitations, fabricate with close-fitting blade splices designed to permit expansion and contraction.
 - 2. Exposed Mullions: Where indicated, provide units with exposed mullions of same width and depth as louver frame. Where length of louver exceeds fabrication and handling limitations, provide interlocking split mullions designed to permit expansion and contraction.
- F. Join frame members to each other and to fixed louver blades with fillet welds concealed from view, unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

2.7 LOUVER SCREENS

- A. General: Provide screen at each exterior louver.
 - 1. Screen Location for Fixed Louvers: Interior face.
 - 2. Screening Type: Bird screening.
- B. Secure screens to louver frames with stainless-steel machine screws, spaced a maximum of 6 inches from each corner and at 12 inches o.c.
- C. Louver Screen Frames: Fabricate with mitered corners to louver sizes indicated.
- D. Louver Screening for Aluminum Louvers: Bird screening, aluminum, 1/2-inch-square mesh, 0.063-inch wire.
- E. Louver Screening for Galvanized-Steel Louvers: Bird screening, galvanized steel, 1/2-inch-square mesh, 0.041-inch wire.

2.8 BLANK-OFF PANELS

- A. Insulated, Blank-off Panels: Laminated metal-faced panels consisting of insulating core surfaced on back and front with metal sheets.
 - 1. Thickness: 1 inch.
 - 2. Metal Facing Sheets:
 - a. Aluminum Louvers: Aluminum sheet, not less than 0.032-inch nominal thickness.
 - b. Galvanized Steel Louvers: Galvanized-steel sheet for galvanized-steel louvers, not less than 0.040-inch nominal thickness.
 - 3. Insulating Core: Rigid insulation board.
 - 4. Seal perimeter joints between panel faces and louver frames with 1/8-by-1-inch PVC compression gaskets.

5. Panel Finish: Same finish applied to louvers.

2.9 ALUMINUM FINISHES

- A. High-Performance Organic-Coating Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 1. Fluoropolymer Three-Coat Coating System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.
 - a. Color and Gloss: As selected by Engineer from manufacturer's full range.

2.10 GALVANIZED-STEEL SHEET FINISHES

- A. Finish louvers after assembly.
- B. Surface Preparation: Clean surfaces with nonpetroleum solvent so surfaces are free of oil and other contaminants. After cleaning, apply a conversion coating compatible with the organic coating to be applied over it. Clean welds, mechanical connections, and abraded areas and repair according to ASTM A 780.
- C. Baked-Enamel or Powder-Coat Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat, with a minimum dry film thickness of 2 mils (0.05 mm).
 1. Color and Gloss: As selected by Architect from manufacturer's full range.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.3 INSTALLATION

- A. Locate and place louvers and vents level, plumb, and at indicated alignment with adjacent work.
- B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

- C. Form closely fitted joints with exposed connections accurately located and secured.
- D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.
- E. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.
- F. Protect galvanized and nonferrous-metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.
- G. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required. Comply with Division 7 Section "Joint Sealants" for sealants applied during louver installation.

3.4 ADJUSTING AND CLEANING

- A. Clean exposed surfaces of louvers and vents that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate until final cleaning.
- B. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.
- C. Restore louvers and vents damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Engineer, remove damaged units and replace with new units.
 - 1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 10213
FIXED LOUVERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Fixed, extruded-aluminum louvers.

1.3 DEFINITIONS

- A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.
- B. Horizontal Louver: Louver with horizontal blades (i.e., the axes of the blades are horizontal).
- C. Drainable-Blade Louver: Louver with blades having gutters that collect water and drain it to channels in jambs and mullions, which carry it to bottom of unit and away from opening.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. For louvers specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.
- B. Shop Drawings: For louvers and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.
 - 1. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.
 - 2. Show mullion profiles and locations.
- C. Delegated-Design Submittal: For louvers indicated to comply with structural and seismic performance requirements, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

- A. Product Test Reports: Based on evaluation of comprehensive tests performed according to AMCA 500-L by a qualified testing agency or by manufacturer and witnessed by a qualified

testing agency, for each type of louver and showing compliance with performance requirements specified.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."

1.7 FIELD CONDITIONS

A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations: Obtain louvers from single source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design louvers, including comprehensive engineering analysis by a qualified professional engineer, using structural and seismic performance requirements and design criteria indicated.

B. Structural Performance: Louvers shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver-blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.

1. Wind Loads: Determine loads based on a uniform pressure of 20 lbf/sq. ft., acting inward or outward.

C. Seismic Performance: Louvers, including attachments to other construction, shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

D. Louver Performance Ratings: Provide louvers complying with requirements specified, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width according to AMCA 500-L.

E. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

- F. SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

2.3 **FIXED, EXTRUDED-ALUMINUM LOUVERS**

A. Horizontal, Drainable-Blade Louver:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Greenheck Fan Corporation.
 - b. Louvers & Dampers; a division of Mestek, Inc.
2. Louver Depth: 6 inches.
3. Frame and Blade Nominal Thickness: Not less than 0.125 inch.
4. Mullion Type: Exposed.
5. Louver Performance Ratings:
 - a. Free Area: Not less than 9.03 sq. ft. for 48-inch-wide by 48-inch-high louver.
 - b. Point of Beginning Water Penetration: Not less than 1000 fpm.
 - c. Air Performance: Not more than 0.10-inch wg static pressure drop at 850-fpm free-area exhaust and intake velocity.
6. AMCA Seal: Mark units with AMCA Certified Ratings Seal.

2.4 **LOUVER SCREENS**

A. General: Provide screen at each exterior louver.

1. Screen Location for Fixed Louvers: Interior face.
2. Screening Type: Bird screening.

B. Secure screen frames to louver frames with stainless-steel machine screws, spaced a maximum of 6 inches from each corner and at 12 inches o.c.

C. Louver Screen Frames: Fabricate with mitered corners to louver sizes indicated.

1. Metal: Same type and form of metal as indicated for louver to which screens are attached. Reinforce extruded-aluminum screen frames at corners with clips.
2. Finish: Same finish as louver frames to which louver screens are attached.
3. Type: Rewirable frames with a driven spline or insert.

D. Louver Screening for Aluminum Louvers:

1. Bird Screening: Stainless steel, 1/2-inch- square mesh, 0.047-inch wire.

2.5 BLANK-OFF PANELS (IF NOTED ON DRAWINGS)

- A. Insulated, Blank-Off Panels: Laminated panels consisting of an insulating core surfaced on back and front with metal sheets and attached to back of louver.
 - 1. Metal Facing Sheets: Aluminum sheet, not less than 0.032-inch nominal thickness.
 - 2. Metal Facing Sheets: Galvanized-steel sheet, not less than 0.028-inch nominal thickness.
 - 3. Metal Facing Sheets: Stainless-steel sheet, not less than 0.031-inch nominal thickness.
 - 4. Insulating Core: Rigid, glass-fiber-board insulation.
 - 5. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard extruded-aluminum-channel frames, not less than 0.080-inch nominal thickness, with corners mitered and with same finish as panels.
 - 6. Seal perimeter joints between panel faces and louver frames with gaskets or sealant.
 - 7. Panel Finish: Same finish applied to louvers.
 - 8. Attach blank-off panels with sheet metal screws.

2.6 MATERIALS

- A. Aluminum Extrusions: ASTM B 221, Alloy 6063-T5, T-52, or T6.
- B. Aluminum Sheet: ASTM B 209, Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.
- C. Fasteners: Use types and sizes to suit unit installation conditions.
 - 1. Use tamper-resistant screws for exposed fasteners unless otherwise indicated.
 - 2. For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.
 - 3. For color-finished louvers, use fasteners with heads that match color of louvers.
- D. Postinstalled Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed for masonry, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

2.7 FABRICATION

- A. Factory assemble louvers to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- B. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.
- C. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.
 - 1. Frame Type: Exterior flange unless otherwise indicated.
- D. Include supports, anchorages, and accessories required for complete assembly.

- E. Provide vertical mullions of type and at spacings indicated, but not more than is recommended by manufacturer, or 72 inches o.c., whichever is less.
 - 1. Fully Recessed Mullions: Where indicated, provide mullions fully recessed behind louver blades. Where length of louver exceeds fabrication and handling limitations, fabricate with close-fitting blade splices designed to permit expansion and contraction.
 - 2. Exterior Corners: Prefabricated corner units with mitered and welded blades and with fully recessed mullions at corners.
- F. Provide subsills made of same material as louvers for recessed louvers.
- G. Join frame members to each other and to fixed louver blades with fillet welds concealed from view unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

2.8 ALUMINUM FINISHES

- A. Finish louvers after assembly.
- B. Color Anodic Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.
 - 1. Color: Black.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.3 INSTALLATION

- A. Locate and place louvers level, plumb, and at indicated alignment with adjacent work.
- B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.
- C. Form closely fitted joints with exposed connections accurately located and secured.

- D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.
- E. Protect unpainted galvanized and nonferrous-metal surfaces that are in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.
- F. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required. Comply with Section 07920 "Joint Sealants" for sealants applied during louver installation.

3.4 ADJUSTING AND CLEANING

- A. Clean exposed louver surfaces that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.
- B. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.
- C. Restore louvers damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Architect, remove damaged units and replace with new units.
 - 1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

PART 4 - EXECUTION

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 10261

MISCELLANEOUS SPECIALTIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items:
1. Platform and lobby benches.
 2. Art Benches (MBTA approved artist).
 3. Bomb-mitigating trash containers.
 4. Tables, Desks and Seating.

1.2 SUBMITTALS

- A. Shop Drawings: Submit complete shop drawings of all work of this Section to Engineer for approval, showing all pertinent details of construction and installation.
- B. Product Data: Submit complete manufacturer's product data of all work of this Section to Engineer for approval, consisting of complete product description and specifications, catalog cuts, and other descriptive data required for complete product and product use information.
- C. Samples: Provide samples of all materials to be exposed in the completed work.

1.3 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Deliver miscellaneous specialties to Project site, fully identified, and protected by padded blankets, scheduled to arrive at time of installation sequence requirements.
- B. Store units off ground, under cover, protected from weather and construction operations.
- C. Handle units during transportation and installation in a manner that prevents racking or damage to finish or adjacent construction.

PART 2 - PRODUCTS

2.1 BOMB-MITIGATING TRASH CONTAINER

- A. Provide bomb-mitigating trash containers for installation at areas indicated on Drawings. All bomb- mitigating trash containers shall be manufactured by the same manufacturer. Bomb mitigating trash containers shall conform to the following:
1. Exterior Finish: Provide Stainless Steel.
 2. Size: 40 gallon.
 3. Standard: Provide bomb mitigating trash containers that conform to ASTM E2740 and ASTM E2639.

4. Approvals: Provide bomb mitigating trash containers that have been Safety Act approved by the Department of Homeland Security.
5. Provide units with manufacturer's optional frame with locking and disintegrating lids.

2.2 TABLES AND SEATING

A. Chairs:

1. Semi-Upholstered Swivel Chairs: Recycled aluminum, hand welded w/ brushed anodized finish.
 - a. Basis of Design: Emeco 1022 SW chair or approved equal.
 - b. Quantity: (9) nine chairs.
2. Stacking Chair: Polyimide shell, w/ chrome base standard.
 - a. Basis of Design: Hightower Four Cast Line Stacker #FC13200A or approved equal.
 - b. Quantity: (8) eight chairs.
3. Lounge Chair: Fully upholstered w/ chrome post legs standard.
 - a. Basis of Design: Berliner Lounge #S3911 or approved equal.
 - b. Quantity: (6) six chairs.
4. 3-Seat Sofa: Fully upholstered w/ chrome post legs standard.
 - a. Basis of Design: Berliner Sofa- 3 Seat #S3918 or approved equal.
 - b. Quantity: (1) one sofa.
5. Ergonomic Task Chair: Upholstered flexogel seat with flexible, breathable mesh back, w/ 5- star castered base, height adjustable seat and arms.
 - a. Basis of Design: Liberty Chair by Humanscale or approved equal.
 - b. Quantity: (5) five chairs.

B. Tables:

1. Stainless Steel table with casters
 - a. Basis of Design: Quovis Table #1181 or approved equal
 - b. Quantity: (1) one.
2. Solid Surface 42" round table with #90230-28.5" flat bottom stainless steel pedestal base, with adjustable glides
 - a. Basis of Design: Beaufurn #1205-ST stainless steel base and 42" round Solid Surface top or approved equal
 - b. Quantity: (2) two tables.
3. Cast resin round occasional table, 20" diameter, 18" high.
 - a. Basis of Design: Hightower Martini round occasional table #HT9450B or approved equal
 - b. Quantity: (3) three tables.
4. 72" x 30" Desk with Single Box, box, file pedestal. Locking drawers. Steel frame, laminate top,

- a. Basis of Design: Desk by Steelcase, Knoll, or Herman Miller
- b. Quantity: (1) one desk.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. All items furnished under this Section shall be installed in strict accordance with the approved shop drawings and the manufacturer's printed instructions and recommendations.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 10290

BIRD CONTROL SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Post-and-wire bird deterrent.
 - 2. Spike bird deterrent.
 - 3. Electrified tape bird deterrent systems at locations indicated.
 - 4. Area mesh system at locations indicated.

1.2 QUALITY ASSURANCE

- A. Source: Provide bird control systems that are the products of one manufacturer.
- B. Locations on Drawings indicate the intent of the design with the understanding that locations of equipment, adjustments in the spacing of the wires, and the dimensions that the wires are held off the protected surfaces may be adjusted or modified as necessary to provide guarantees.
- C. Installer Qualification Standard
 - 1. The installer must provide evidence of at least 3 similar projects in size and complexity which have been performed by the contractor.
 - 2. The installer must provide individual qualifications and past projects history of each installer who will work on this project.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's product data, installation instructions, certified performance data and finish specifications. Provide certifications stating that materials comply with requirements.
- B. Shop Drawings: Provide large scale shop drawings for fabrication, installation and erection of all parts of the work. Provide elevations and details of anchorages, connections and accessory items. Indicate joinery, fasteners and all other relevant information.
- C. Field Measurements: Take accurate field measurements before preparation of shop drawings and fabrication. Do not delay job progress.
- D. Samples: Submit representative samples of each material that is to be exposed in the finished work.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store and handle in strict compliance with manufacturer's instructions and recommendations. Protect from damage.
- B. Sequence deliveries to avoid delays, but minimize on-site storage.

1.5 WARRANTIES

- A. Provide a written warranty, signed by the manufacturer, installer, and Contractor, that birds will not perch or roost on the surfaces where anti-perching system is installed in locations indicated on Drawings.

1. Warranty period: 3 years from date of Final Acceptance.

PART 2 - PRODUCTS

2.1 PRODUCTS

- A. Post and Wire Anti-Roosting System

1. Basis of Design: Bird Wire and Post by Bird-X, BirdBGone, Bird Control Systems or equal.
- a. Stainless Steel Wire Cable: 1x7 nylon-coated, 0.7 mm diameter.
 - b. Posts: Stainless steel with flattened heads with hold for wire.
 - c. Accessories including weatherproof glue-on bases, railing clamps, springs and crimps as applicable.

- B. Electrified Tape Bird Deterrent System

1. Basis of Design: Provide BirdMaster Bird Control Systems, BirdMaster Voltape System, or approved equal, with the following:
- a. Clear acrylic tape with aluminum flat wire and pressure sensitive adhesive with peel off backing.
 - b. UL Approved 115VAC Line Chargers, Input Voltage: 115 VAC, 60mhz.
 - c. UL Approved Solar Line Chargers, Input Voltage: 6VDC, 4.5 amp rechargeable battery included- 2 year lifespan; Range: up to 1,000 feet (610 M).
 - d. Jumper Wire, Rating: 20KV
 - e. Aluminum Sleeves, use aluminum sleeves to make all wire and tape connections.

- C. Wire Mesh Area Bird Deterrent

1. Basis of Design: Provide Bird Control Systems, BirMaster, or approved equal.
- a. Mesh: Light gauge stainless steel mesh and anchors at locations indicated on the drawings.

- D. Spike Bird Deterrent

1. Basis of Design: Stainless Steel Spikes by Bird-X, BirdBGone, Bird Control Systems or equal
- a. Spikes: Bird-X Spikes, stainless steel with flexible base, width and height as required for application.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The Installer/Erector shall examine substrates, supports, and conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning of installation will be construed as installer accepting substrates and conditions.

3.2 INSTALLATION

- A. General Installation Requirements: Strictly comply with manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this Section.
- B. Holes to be drilled in mortar joints only where deemed necessary and be no more than 3/16" in diameter and 1" deep or as recommended by manufacturer.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 10340

LIGHTWEIGHT TRENCH COVERS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies the following items:
1. Design, fabrication and installation of prefabricated lightweight trench covers made of Fiber Reinforced Plastic (FRP) for use on viaduct conduit enclosures.
 2. Field verification of as-built layout of constructed conditions prior to fabrication of covers.
 3. Installation of sealants and caulking of covers joints as indicated in this specification and or as required by design.
 4. Temporary protection of installed covers prior to full system operation.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
1. PROTECTION OF WORK AND PROPERTY – Volume 2 Technical Provisions Exhibit 2I “Additional Project Requirements”.
 2. TEMPORARY CONTROLS – Volume 2 Technical Provisions Exhibit 2I “Additional Project Requirements”.
 3. SUSTAINABILITY REQUIREMENTS – Volume 2 Technical Provisions Exhibit 2I “Additional Project Requirements”.
 4. Section 03300 – CAST-IN-PLACE CONCRETE.
 5. Section 05041 – HOT DIP GALVANIZING.
 6. Section 05122 – STRUCTURAL STEEL FOR RAIL STRUCTURES.
 7. Section 05500 – MISCELLANEOUS METALS.
- C. Trench Covers:
1. Lightweight FRP covers shall be used as the standard type for viaduct conduit enclosure.
 2. The covers and associated hardware shall meet the structural and finish requirements as specified in this specification section.
 3. FRP covers shall be used in the spaces between ballast retainer stem walls and exterior viaduct parapet structure walls and at any other locations as required by design. The covers and associated hardware shall meet the specified structural and finish requirements and are intended to perform as a walkway surface. Conduit enclosures under the walkways will be used for all systemwide cables.
 4. Covers and associated hardware shall meet or exceed the following minimum design requirements:
 - a. Cover assemblies shall be designed to support a uniform live load of 100 pounds per square foot and a concentrated live load of 1,000 pounds over a 1 foot by 1 foot area

without damage to any trench components. Deflection at center of span under 100 pounds per square foot shall not be more than 1/16 inch.

- b. Stationary and hinged cover assemblies shall provide a walking surface. Abutting joint surfaces shall not produce a tripping hazard by misalignment of more than a 1/8 inch. Ends of each unit shall be configured and manufactured to interlock in such a manner that units will remain connected and aligned under the above specified live loads and normal environmental conditions.
- c. Walking surfaces of covers shall have a non-slip and non-skid surface.
- d. Covers shall be protected from ultraviolet deterioration. Plastic resins for cover manufacture shall be formulated to provide extremely low smoke (ELS) generation as specified in this specification section.

1.2 REFERENCES

- A. The publications listed below, latest revision applicable, form a part of this specification to the extent referenced herein. The publications are referred herein by the text designation only.
 - 1. AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM), ASTM D 635 Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position.
 - 2. ASTM E 84 Surface Burning Characteristics of Building Materials.

1.3 SUBMITTALS

- A. Final approval for incorporation into the project will be made only after the review of shop drawings, specifications, and data as follows.
 - 1. Cover Manufacture qualifications as described in subsection 1.4.A.
 - 2. Shop drawings shall be complete with all As-Built field dimensions, anchor locations, details of connecting items and the size and locations of any required openings. In addition, setting drawings shall be submitted indicating each specific cover panel and its location on the viaduct structure.
 - 3. Specifications for all components shall be provided. Details of the major fabricated components showing the arrangement of components and labeled with component sizes and materials of construction shall be submitted.
 - 4. Structural design calculations, sealed and signed by a Professional Engineer registered in the Commonwealth of Massachusetts, engaged by the Design-Builder, for all components shall be submitted.
 - 5. Manufacturer's recommended procedures for job site storage of equipment, handling, and erection shall be submitted.
 - 6. Manufacturer's internal fabrication Quality Control and Quality Assurance program indicating how the fabricator evaluates and confirms the material usage and completed production cover panels.

- B. The Design-Builder shall submit sample pieces of each item specified herein for acceptance by the MBTA as to quality, finish and color. Sample pieces shall be manufactured by the method to be used in the work. Sample sizes shall have a minimum length and width of 12 inches, and thickness of the item being represented. Samples shall represent the final production units.
- C. The Design-Builder shall submit a reference List of prior projects of similar size, providing a description of the project, location of project, year and date of project start and completion, project owner address and contact and general contractor responsible for final installation. A minimum of 10 projects shall be listed.
- D. Design Calculations:
 - 1. As part of the shop drawings for the cover components, the fabricator shall supply any and all analyses pertinent to the composite design. The calculations shall include standard strength of materials approaches and computerized finite element analyses of sections where conventional methods do not apply. Furthermore, for the calculated loads, a complete laminate analysis shall be submitted identifying the various factors of safety for the proposed laminate schedule. Factors of safety shall be evaluated using criteria such as Tsai-Hill or equivalent theories.
 - 2. The evaluation of deflection and stresses on panel sections under uniform loading shall incorporate numerical analysis calculations.
 - 3. The calculations shall fully consider the access openings or access hatches within each cover panel.
 - 4. A written narrative that clearly states all of the basic design assumptions and parameters shall accompany the computerized calculations.
 - 5. Approval by the MBTA shall not relieve the manufacturer of responsibility for providing materials and designs conforming to the intent of these specifications.
 - 6. Complete structural design calculations and drawings shall be submitted as required herein.
 - 7. Design calculations and drawings shall be approved and stamped by a registered Professional Engineer registered in the Commonwealth of Massachusetts, engaged by the Design-Builder.

1.4 QUALITY ASSURANCE

- A. Qualifications: Cover manufacturer shall have a minimum of five (5) years history of successful fabrication and installations of similar size project and covers. Past job list with customer contact information will be required.
- B. Manufacturer's Quality Control: All fabrication shall be carefully inspected at the site of fabrication by factory inspectors who shall use whatever means necessary to assure the proper fit of all field connections and compliance with all material and fabrication requirements of the specifications.
- C. Warranty: A general warranty of the fabricated covers and associated hardware for materials and workmanship shall be for a minimum of five (5) year after installation.
- D. The Design-Builder and cover fabricator shall be responsible for verifying and coordinating all field dimensions to develop fabrication shop drawings. No fabrication shall take place until shop drawings are approved by the MBTA.

1.5 PRODUCT DELIVERY AND STORAGE

- A. Delivery of Materials: Manufactured materials shall be delivered in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer and location of manufacture.
- B. Storage of Products: All materials shall be carefully handled to prevent damage from abrasion, cracking, chipping, twisting, and other deformations, and other types of damage. Cover units and other materials for installation, shall be kept in an environmentally controlled enclosure until they are ready for final placement within the viaduct structure.

PART 2 - PRODUCTS

2.1 FIBERGLASS REINFORCED PLASTIC (FRP)

- A. FRP materials for covers shall be manufactured from a mineral-filled, continuous strand roving-mat reinforced, thermoset unsaturated polyester electrical insulating laminate, conforming to NEMA L1-1, Grade GPO-3, Polyester Glass Mat Sheet Laminates.
- B. Covers shall be manufactured from fiberglass-reinforced, extremely low smoke reinforced acrylic (ELSRA) resin that meets the requirements of these Specifications. The reinforcements and the resins used in the laminate shall provide the strength required in the longitudinal and transverse directions and the service conditions of chemical resistance and electrical insulating properties, as well as temperature, weather (ultraviolet light), and water resistance. All formulated resins shall have 0.2% to 0.3% ultraviolet absorber (UV 5411) added.
- C. FRP Cover Physical Requirements:
 - 1. Covers are a walking surface. They shall conform to design details and applicable requirements of Title 29 CFR 1910, Walking Working Surfaces, and shall be provided with a non-slip and non-skid surface. Smoke density and flame spread test shall be performed on covers after the non-slip and non-skid surface has been applied.
 - 2. Cover assemblies shall be capable of supporting a uniform live load of 100 pounds per square foot or a concentrated live load of 1,000 pounds over a 1 foot by 1 foot area. Deflection at center of span at 100 pounds per square foot loading shall not be more than 1/16 inch.
 - 3. Covers shall not exceed 30 pounds per unit.
 - 4. Fabrication:
 - a. FRP covers shall be produced by the cast/lay-up process with the cover, cast in the mold as one-piece finished product.
 - b. The color of the covers shall be light gray. The color shall be uniformly dispersed throughout the entire cover.
 - c. FRP covers shall consist of straight lateral load bearing bars extending in the direction of the span and perpendicular cross bars extending across the bearing bars with the surface cast-into-place at the same time to form a continuous one-piece construction. A skid-resistant surface shall be cast into the top of the cover at the time of manufacture while the cover is in the mold.

- d. Various selected additives shall be combined with the resin system to achieve ultra violet (weather) resistance. Fire retardant and smoke toxicity requirements in this specification section specified shall be achieved by using selected additives.
- e. Covers for conduit enclosure shall be capable of being hinged to sidewalls as required by design.
- f. Covers shall be one piece cast or molded unit with provision for lifting.
- g. Bolt or screws used to fasten covers to conduit enclosure shall be type 316 stainless steel.
- h. A minimum ½ inch diameter fastener size shall be used at a maximum spacing of 12 inches along each supporting side of cover.
- i. Depth: As required to accomplish strength and deflection requirements listed above. As a minimum, all supporting edges of cover shall be 2 inches thick. Depth dimension shall be submitted for review and approval of the MBTA. Tolerance on the approved depth dimension shall be plus or minus 1/32 inches.

D. FRP components shall exhibit the following properties when tested in accordance with specified test methods:

Property/Test Procedure	Value
Flexural Strength per ASTM D790	25,000 psi, minimum
Flexural Modulus per ASTM D790	1.0x10 ⁶ psi, minimum
Tensile Strength per ASTM D638	17,000 psi, minimum
Tensile Modulus per ASTM D638	9.0x10 ⁵ psi, minimum
Impact Strength per ASTM D256	25 ft-lb/in, minimum
Dielectric Strength per ASTM D149 (0.25 in.)	170 volts/mil, minimum
Arc Resistance per ASTM D495	180 seconds, minimum
Water Absorption per ASTM D570	0.2%, maximum
Thermal Expansion per ASTM D696	6 to 10 x 10 ⁶ in/in/°F, maximum
Flame Spread Index per ASTM E84	20 maximum
Flame Resistance per UL 94	UL 94 V-0, minimum
Tracking Resistance per ASTM D2303	600 minutes, minimum

Specific Optical Smoke Density per ASTM E662 (Flaming & Non-Flaming) 10 maximum within 4 minutes after start of test and 200 maximum at end of test.

- E. Smoke toxicity of gases emitted or produced from FRP components shall not exceed the following permissible values when tested in accordance with DDC Report No. AD297457:

Gases	Maximum Permissible Level (PPM)
Hydrogen Chloride	10
Hydrogen Bromide	10
Hydrogen Cyanide	10
Hydrogen Sulfide	10
Vinyl Chloride	10
Ammonia	500
Aldehydes	30
Oxides of Nitrogen	100
Carbon Dioxide	15,000
Carbon Monoxide	1,000

- F. Cover surfaces, shall be treated or coated with 1-1/2 mils of polyvinyl fluoride containing an ultraviolet ray inhibitor. The polyvinyl fluoride shall be integrally manufactured into the surface. Bonding of polyvinyl fluoride film on the cover surface using an adhesive is acceptable subject to the MBTA's approval. The cover fabricator shall submit proposed adhesive, bonding procedures, and test procedures to demonstrate long-term performance of the adhesion. Spraying or painting of a polyvinyl fluoride paint or coating material will not be acceptable.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Prior to any fabrication, manufacture and Design-Builder shall field measure supports, and shall coordinate final production fabrication with these field dimensions, making adjustments as needed in each cover unit.
- B. Manufacture shall inform the Design-Builder of any unacceptable field conditions prior to fabrication. Design-Builder shall promptly fix unacceptable conditions. Any additional costs associated with fixing unacceptable conditions will be borne by the Design-Builder.

3.2 PREPARATION

- A. Covers:
1. Shop Assembly: The manufacturer shall pre-assemble a minimum of three (3) equal cover segments to a full scale layout to insure proper fit and assembly.

2. Fiberglass cutouts from cover segments shall be identified and shipped with covers. Cutouts will be used by the MBTA to determine proper thickness, glass content and laminate sequence.
3. Assembly of panel segments will be such as to allow all bolting to be performed from the exterior of cover.
4. Anchor bolts, assembly hardware, rail nut plates, hinges and lock sets shall be type 316 stainless steel.
5. Accurately locate bolt anchoring for cover in the structure supports by using jigs, templates, or other standardized measuring devices. Location accuracy shall be sufficient to permit covers to be raised and lowered without binding or engaging adjacent covers.
6. Covers shall be placed into the designated location and temporarily supported in place to allow for installation of supports.
7. Hinged covers shall be installed as required by design, with two hinges per panel. Where covers meet, a gap and vertical offset no greater than 1/8 inch will be permitted.
8. Stationary covers shall be installed with overlapping adjacent units and without creating a tripping hazard.

3.3 PROTECTION

- A. Cover Protection: Provide temporary coating or wrap on covers to prevent damage from adjacent construction activities. Remove temporary coating or wrap only upon direction of the MBTA prior to the full operation of the system.

3.4 REPAIRS

- A. Promptly repair damage to covers or adjacent construction due to cover installation. If covers cannot be repaired, Design-Builder shall replace the damaged units at no additional cost.

3.5 CLEANING

- A. Clean covers after installation of dust, dirt, and debris caused by installation operations. Provide temporary wrap/cover over installed covers to prevent following construction activities from marring or damaging the surfaces. Remove temporary wrap/cover only when the MBTA confirms that all adjacent construction work is complete and system is ready for operations.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

NOISE PANELS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies pre-fabricated absorptive acoustic barrier panels and attachment system including transparent acrylic noise barrier panels.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 2. Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE
 - 3. Section 05120 – STRUCTURAL STEEL FOR STATIONS AND BUILDINGS, for steel supporting members.
 - 4. Section 09900 PAINTING
- C. Alternate: if the design Builder elects to use precast concrete panels for noise mitigation, the performance and quality of the precast concrete panels shall meet or exceed what is specified under articles herein. The appearance and aesthetic of the precast concrete panels shall be subject to MBTA’s approval, and in the case of the Cambridge Viaduct to local and state Authorities Having Jurisdiction.

1.2 QUALITY ASSURANCE

- A. The following Codes, Regulations, Referenced Standards and Specifications apply to work included in this Section:
 - 1. Codes and Standards:
 - a. ASTM E-90: Standard Test method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions.
 - b. ASTM C423: Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
 - c. ASTM E413: Classification for Rating Sound Insulation
 - 2. Acoustical Performance:
 - a. The acoustical panel manufacturer will be required to submit acoustical performance data in the form of up-to-date test reports from an independent testing laboratory indicating the panel system to be provided will have the required Sound Transmission Class Rating. Tests shall be performed in accordance with ASTM E90 and ASTM E413.
 - b. The acoustical panel manufacturer will be required to submit acoustical performance data in the form of up-to-date test reports from an independent testing laboratory indicating the panel system to be provided will have the required Sound Absorption Coefficients. Tests shall be performed in accordance with ASTM C423.

1.3 SUBMITTALS

- A. Submit the following for approval in compliance with Submittals, Section 01300 and with the additional requirements as specified for each.
 - 1. Product Data:
 - a. Submit the following:
 - 1) Material list of items provided under this section.
 - 2) Manufacturer's specifications and other data needed to prove compliance with these specifications. Include specifications, standard details, certified product test results, installation instructions and general recommendations as applicable to materials and finishes for each component and for the total panel system.
 - 2. Shop Drawings: Submit shop drawings showing layout, profiles and product components, including anchorage, accessories, finish colors, patterns and textures.
 - 3. Samples: Submit selection and verification samples for finishes, colors and textures. Sample materials minimum 12" x 12" x depth of panel. Include any panel accessories as required.
 - 4. Quality Assurance Submittals: Submit the following:
 - a. Certificates: Product certificates and literature signed by the manufacturer certifying materials comply with specified performance characteristics and criteria, and physical requirements.
 - b. Manufacturer's Instructions: Manufacturer's printed installation and handling instructions.
 - c. Field Reports: Manufacturer's field reports supporting specified application.
 - 5. Closeout Submittals: Submit the following:
 - a. Operation and Maintenance Data: Include methods for maintaining installed products and precautions against cleaning materials and methods detrimental to finishes and performance.
 - b. Warranty documents as further specified.

1.4 WARRANTY

- A. Warrant fabricated panels to be free from defective workmanship for one (1) year from date of Substantial Completion.
- B. Warrant factory applied finishes to be free from fading, chalking or cracking for ten (10) years from date of Substantial Completion.
- C. Warranty for acrylic panels, minimum 20 years against change in light transmission of more than 2-15 percent when tested in accordance with ASTM D 1003.

PART 2 - PRODUCTS

2.1 PRE-CAST CONCRETE BARRIER PANELS

- A. Panel Construction: Materials used in the fabrication of precast wall components shall be resistant to damage caused by insects and rodents. Panels shall be constructed of materials according to Section

03410 – PLANT-PRECAST STRUCTURAL CONCRETE.

- B. Concrete Coatings: Shall be an acrylic coating with silane in accordance with Section 09900 PAINTING for exterior concrete and masonry. Protective coatings shall be applied to all permanently exposed faces of concrete surfaces
- C. Absorptive Surface: Noise absorptive concrete should be considered a coating subject to other provisions in the specifications; the manufacturer's cited standards, or proprietary materials.

2.2 PRE-CAST CONCRETE BARRIER PANEL PERFORMANCE

- A. Acoustical Performance: Minimum NRC (noise reduction coefficient) rating of 0.7 or greater and Sound Transmission Class (STC) of 30 or greater after barrier installation. To aid in preventing the transmission of noise through the barrier, the payout should minimize or eliminate gaps or openings. Typically gaps should be less than 3% of the surface area of the barrier and fill materials should be used to seal all gaps.
- B. Durability: Panels should be resistant to freeze-thaw cycles. Test should be conducted in accordance with ASTM C666 Method B for 300 cycles. The product should experience a maximum weight loss of no more than of 7% and no physical distress (no cracking or breaking).

2.3 PRE-CAST CONCRETE BARRIER PANEL FABRICATION

- A. Components of the precast concrete noise barrier shall be fabricated to conform to the shape, size, texture and reinforcing details as shown on approved submittals.

2.4 PRE-CAST CONCRETE BARRIER PANEL FINISH

- A. Precast noise walls color will be in accordance with Section 09900 - PAINTING. Panel colors shall be uniform throughout the panel as well as across all panels. The concrete finish will be that of the concrete absorptive material.

2.5 STEEL ACOUSTIC BARRIER PANELS

- A. Panel Construction: Individual panels shall have a width of 12 inches and 3-3/4" thick, or as indicated on Drawings. Construct panels of galvanized steel manufactured in accordance with the requirements of ASTM A924, coated to ASTM A653 specification class G-90. Panel components shall meet the following structural requirements:
 - 1. Perforated face sheets shall be 22gauge cold formed ASTM A-653 steel and has 3/16 inch diameter perforations in a 3/8 inch staggered pattern.
 - 2. Solid face back panel sheet shall be 16 gauge cold formed ASTM A-653 steel.
 - 3. Caps shall be the same material and thickness as the metal panels.
 - 4. Panel back tray shall be filled with mineral wool.
- B. Acoustic Fill: Mineral rock wool conforming to Federal Specifications HH-I-558B and ASTM Standard E-136 with a density of 6 pounds per cubic foot and the following characteristics.
 - 1. Non-hygroscopic and absorbs less than 1% water.
 - 2. Melts about 2,000 degrees Fahrenheit, has a flame spread of 15 or less, and smoke

development of 0 when tested in accordance with ASTM E84.

2.6 STEEL ACOUSTIC BARRIER PANEL PERFORMANCE

- A. Acoustical Performance: Minimum NRC (noise reduction coefficient) rating of 0.7 or greater and Sound Transmission Class (STC) of 30 or greater after barrier installation. To aid in preventing the transmission of noise through the barrier, the payout should minimize or eliminate gaps or openings. Typically gaps should be less than 3% of the surface area of the barrier and fill materials should be used to seal all gaps.

2.7 STEEL ACOUSTIC BARRIER PANEL FABRICATION

- A. The perforated and solid sheet shall be roll-formed to lengths up to an including 16'-0". The panel shall be assembled forming a non-welded, free draining module. Spot welds or mechanical fasteners shall not be acceptable. Fabric 8 panels to be rigid, need in appearance and free from defects, warp or buckle.
- B. The panel assembly shall be such so as to compress and hold the fill materials in place under severe conditions of vibration such as encountered in shipment, installation and operation. Any voids in the panel will be unacceptable.
- C. Internal panel reinforcement shall not the required as the maximum unsupported height of the fill shall not exceed the 24 inches and the length of 16 feet.
- D. The panel manufacturer, where required, shall provide openings for any large known penetrations.
Pipe and conduit penetrations shall be located and cut in field and sealed in accordance with manufacturer's instructions.
- E. No field welding.

2.8 STEEL ACOUSTIC BARRIER PANEL FINISH

- A. Powder Coating: after the module is formed it shall be factory coated utilizing a polyester powder coating system that is applied through the use of an electrostatic charge to ensure complete panel and edge coverage. The coating shall be thermally bonded to the surface of the galvanized steel. Finish coating shall have a drive film thickness of three mils.
- B. Corrosion Testing: modules shall prove testing for corrosion resistance in accordance with ASTM B117. After 2400 hours of exposure the coating system shall not failed due to blistering, loss of adhesion, or corrosion along the score lines.
- C. Weathering Testing: modules shall prove testing for accelerated whether ring in accordance with ASTM G23. After 2400 hours of testing, module samples shall not exhibit chalking less than No.8 per ASTM D 4214 or a color change greater than 5 and NBS units per ASTMD2244.

2.9 TRANSPARENT ACRYLIC NOISE BARRIER PANELS

- A. Acrylic Panels: Colorless rigid monolithic sheet complying with the following. Sheet thickness and mounting details as indicated on the Drawings.
 - 1. Performance Requirements:

- a. Tensile Strength, ASTM D 638: Greater than 9,250 psi.
 - b. Flexural Modulus, ASTM D 790: Greater than 445,000 psi.
 - c. Rockwell Hardness, ASTM D 785: M-90.
 - d. STC, ASTM E 90 / ASTM D 413: Greater than 27.
2. Optical Requirements:
- a. Light Transmission, ASTM D 1003: Greater than 90 percent.
 - b. Haze, ASTM D 1003: less than 1.5 percent.
 - c. Yellowness Index, ASTM E 313: Less than 1.
 - d. Self Ignition, ASTM D 1929: Greater than 650 degrees F.
3. Weathering Requirements: Comply with values below after 10 years. Provide manufacturer's compliance documentation if requested.
- a. Light Transmission, ASTM D1003: Greater than 88 percent.
 - b. Haze, ASTM D 1003: Less than 10 percent.
 - c. Tensile Strength, ASTM D 638: Greater than 80 percent of initial value.
 - d. Flexural Strength, ASTM D 790: Greater than 80 percent of initial value
4. Flammability Requirements:
- a. Resistance to Brush Fire, EN 1794-2: Minimum, Class 3.
 - b. Horizontal Burn Rate, ASTM D 635: Less than 2.5 in/min.
 - c. Smoke Density, ASTM D 2843, less than 50 percent.
5. Impact Resistance:
- a. Comply with EN 1794-1, Appendix C.
 - b. Meet ANSI Z97.1 for a safety glazing material.
 - c. Pass large missile impact test, ASTM E 1996-97/02.
6. Resistance to Roadside Chemicals: Calcium chloride, magnesium chloride, potassium acetate, calcium/magnesium acetate and sodium acetate.
7. Resistance to Fungi, ASTM G21: Zero rating, no signs of fungi grown after standard 28 day test period.
8. Bird Deterrence: Manufacturer's standard pattern capable of preventing in excess of 90 percent bird impacts. Pattern shall be an integral part of the panel, capable of withstanding graffiti removal efforts. Application of films in a secondary post production process is not acceptable.
9. Fabrication Tolerances: Minus 0, plus 0.25 inches.
10. Bolts and Fasteners: Type 316/316L stainless steel conforming to ASTM A 276.
11. Mounting Gaskets: As detailed on the Drawings.
12. Graffiti Remover: Provide a list of manufacturer's approved graffiti removal products.

PART 3 - EXECUTION

3.1 MANUFACTURER'S INSTRUCTIONS

- A. Compliance: Comply with manufacturer's product data, including product technical bulletins, product catalog installation instructions and product carton instructions.

3.2 PREPARATION

- A. Adjacent Surfaces Protection: Protect adjacent work areas and finish surfaces from damage during product installation.
- B. Adjacent Construction: Coordinate steel frame details and details of approved Shop Adjacent Construction: Coordinate steel frame details and details of approved Shop

3.3 INSTALLATION

- A. Panels: Install work in accordance with reviewed shop drawings and these specifications using only factory-trained personnel as required by the manufacturer and approved by the project manager.
 - 1. Block bottom panels in accordance with approved shop drawings.
 - 2. Ensure that panels are placed properly toward noise source and right side up.
 - 3. Be sure panels are properly seated before installing next.
- B. Acrylic Panels: Install work in accordance with reviewed shop drawings and these specifications using only factory-trained personnel as required by the manufacturer and approved by the project manager.
 - 1. Installation tolerances shall be not more than 0.25 inch difference between the two diagonals for squareness, and plus or minus 0.25 inches for out of flat.
 - 2. Attachment bolts shall be fully engaged with no exposed threads, and bolts shall not be cross threaded. Bolts shall be tested to confirm a torque of at least 30 ft-lbs.
 - 3. Gaskets shall be installed the full length, less up to 1/4 inch at each end of the U-channel section in which the sheet edge resides.

3.4 FIELD QUALITY CONTROL

- A. Upon completion of this portion of work, and prior to its acceptance by the Authority, security visit to the job site by a qualified representative of the manufacturer of the acoustical barrier system to confirm the installation is in conformance with the manufacturer's recommendations.

3.5 DEMONSTRATION

- A. Instruct maintenance personnel regarding operation and maintenance of acoustic barrier

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 10501

PLASTIC LOCKERS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies solid plastic lockers.

1.2 SUBMITTALS

- A. Product Data: For each type of locker.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of locker.
- B. Shop Drawings: For plastic HDPE lockers.
 - 1. Include plans, elevations, sections, details, and attachments to other work.
 - 2. Show details full size.
 - 3. Show locations and sizes of furring, blocking, and hanging strips, including concealed blocking and reinforcement specified in other Sections.
 - 4. Show locations and sizes of cutouts and holes for items installed in lockers.
 - 5. Show locker fillers, trim, base, sloping tops, and accessories.
 - 6. Show locker numbering sequence.
- C. Samples for Verification: Furnish a physical sample of the material in the selected color.
 - 1. Size: 6 by 6 inch (102 by 102mm) in the type of finish specified.
- D. Qualification Data: For qualified Installer.
- E. Sample Warranty: For special warranty.
- F. Maintenance Data: For adjusting, repairing, and replacing locker doors and latching mechanisms to include in maintenance manuals.

1.3 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Approved manufacturer listed in this section, with minimum 5 years of experience in the manufacture of plastic lockers.
- B. Installers Qualifications: An experienced Installer regularly engaged in the installation of lockers for a minimum of 3 years.
- C. Source Limitations: Obtain plastic lockers from and trim accessories from single manufacturer.

- D. Accessibility Requirements: Comply with requirements of ADA/ABA and with requirements of authorities having jurisdiction.
- E. Surface Binding Characteristics: As determined by testing identical products according to ASTM E84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Flame-Spread Index: 100 or less.
 - 2. Smoke-Developed Index: 450 or less.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Do not deliver plastic lockers to the site until the building is enclosed and HVAC systems are in operation. Deliver plastic lockers in manufacturer's original packaging. Store in an upright condition. Protect plastic lockers from exposure to direct sunlight.
- B. Ship plastic lockers fully assembled.
- C. Lift and handle plastic lockers from the base not the sides.

1.5 FIELD CONDITIONS

- A. Environmental Limitations: Do not deliver or install lockers until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature between 60 and 90 degrees F (16 and 32 degrees C) and relative humidity between 43 and 70 percent during the remainder of the construction period.
- B. Field Measurements: Where lockers are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication, and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
- C. Locate concealed framing, blocking, and reinforcements that support lockers by field measurements before being enclosed, and indicate measurements on Shop Drawings.
- D. Established Dimensions: Where lockers are indicated to fit to other construction, establish dimensions for areas where lockers are to fit. Provide allowance for trimming at site, and coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.6 COORDINATION

- A. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of work specified in other Sections to ensure that lockers can be supported and installed as indicated.

1.7 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of lockers against rust, delamination or breakage of plastic parts under normal use within specified warranty period.
 - 1. Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Accessibility Requirements: For lockers indicated to be accessible, comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines and ICC A117.1.M

2.2 PLASTIC- LOCKERS

- A. Basis-of-Design Product: Lenox Z-Lockers by Bradley Corp., or equal by Lyons, Penco or equal.
- B. Locker Configurations: Multiple height double tier units with full-height garment and half-height accessory storage compartments.
- C. Locker Dimensions:
 - 1. Height, Nominal: 72 inches.
 - 2. Width: 18 inches.
 - 3. Depth: 15 inches.
- D. Sides, Tops, Bottoms, Dividers, and Shelves: 3/8 inch thick HDPE plastic with smooth finish.
- E. Locker Tops: Individual slope top.
- F. Doors: Fabricate from a single piece 1/2 inch HDPE plastic.
 - 1. Doors and Frame: 1/2 inch thick HDPE plastic with matte texture finish, with ventilation slots.
 - 2. Handle: ADA/ABA-compliant handle fabricated from injection molded plastic.
 - 3. Locks: Standard Hasp.
 - 4. Hinges: Continuous piano hinges, 0.05 inch thick type 304 stainless steel fabricated to wrap around edges of door and frame and attached with stainless steel tamper-resistant screws.
 - a. Finish: Powder coated to match color of locker.
 - 5. Latching Bar: Full-height latch bar constructed of 1/2 inch HDPE plastic secured to locker with stainless steel tamper-resistant screws.
- G. Color: Charcoal Gray.
- H. Accessories: End Panels: Match style, material, construction, and finish of plastic doors.
 - 1. Coat Hooks: Black polycarbonate double hook.
 - 2. End Panels: 3/8 inch thick, with color and finish matching locker body.
 - 3. Filler Panels: 1/2 inch HDPE filler panel, with color and finish matching locker body, attached with 3/8 inch thick HDPE solid plastic angle bracket.
 - 4. Number Plate: Black painted aluminum with silver numbers. Provide one per locker.
 - 5. Locker Base: 1 inch solid HDPE plastic, with color and finish matching locker body, 4 inch high.

2.3 MATERIALS

- A. High Density Polyethylene (HDPE): 100 percent pre-consumer or post-consumer recycled content polyethylene thermoplastic formed under high pressure into solid plastic components.
- B. Stainless-Steel Sheet: ASTM A666, Type 304
- C. Fasteners: Tamper-Resistant Fasteners: Stainless steel torx-head screws.
 - 1. Locker Connectors: No 10-24 sex bolts.
 - 2. Anchors: Type and size required for secure anchorage.
 - 3. Drilled-in-place Masonry Anchors: Minimum 1/4 by 1-3/4 inch screws.

2.4 LOCKER FABRICATION

- A. Fabricate locker box from a single sheet of HDPE solid plastic with corners fused together. Weld frames and shelves to box assembly. Provide all welded construction of locker parts without dovetail slots or metal fasteners.
- B. Center Dividers: Full-depth, vertical partitions between bottom and shelf; finished to match lockers.
- C. Hardware Attachment: All hinges, handles, hasps, hooks, latch bars, and locks attached with tamper-resistant screws.
- D. Provide ventilated panels where indicated.
- E. Continuous Base: Set toe clearance 3 inch from locker front. Notch end caps for ease of installation.
- F. Sloping Tops: Manufacturer's optional individual slope tops fabricated in lengths indicated, without visible fasteners at splice locations; and finished to match lockers.
- G. Filler Panels: Fabricated in unequal leg angle shape; finished to match lockers.
- H. Finished End Panels: Fabricated with 3/8 inch wide edge dimension, configured to conceal fasteners and holes at exposed ends of plastic lockers.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine walls, floors, and support bases, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Verify that furring is attached to concrete and masonry walls that are to receive lockers.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install lockers in climate controlled environment, shielded from direct sunlight.

- B. General: Install on floor or other firm support. Install level, plumb, and true.
 - 1. Position locker base per approved shop drawing. Using fasteners provided by manufacturer, anchor base sections to the floor.
 - 2. Attach filler pieces to lockers with male-female sex bolts.
 - 3. Position first locker according to submittal layout. Square and plumb the locker using concealed shims. Secure the locker to the wall at the top and bottom of the locker. Position second locker next to the first, square and plumb to align the tops and bottoms; and temporary clamp lockers together. Drill four holes through the sides of the lockers and connect lockers using sex bolts provided by the manufacturer.
- C. Accessories: Fit exposed connections of trim, fillers and closures together to form tight, hairline joints, with concealed fasteners and splice plates furnished by locker manufacturer. Install as indicated on approved shop drawings.

3.3 FINAL CLEANING

- A. Clean locker interior and exterior surfaces.
- B. Remove packaging and construction debris and legally dispose of off-site.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 10520

FIRE EXTINGUISHERS AND CABINETS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
 - 1. Hand carried fire extinguishers.
 - 2. Fire extinguisher cabinets
 - 3. Surface mounted extinguisher support brackets.

1.2 QUALITY ASSURANCE

- A. Source: For each type of product required for the work of this section, provide products which are the products of one manufacturer.
- B. Provide portable extinguishers which bear the UL listing mark.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's product data, installation instructions and recommendations. For cabinets in rated wall assemblies, cabinet and installation shall meet or exceed rating of assembly.
- B. Verification Samples: Submit representative samples of each material that is to be exposed in the finished work, showing the full range of color and finish variations expected. Provide samples having minimum area of 144 square inches.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver products in unopened factory labeled packages. Store and handle in strict compliance with manufacturers' instructions and recommendations. Protect from damage.
- B. Sequence deliveries to avoid delays, but minimize on-site storage.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Provide products of one of the following manufacturers that meet or exceed the requirements of these specifications:
 - 1. Potter Roemer LLC.
 - 2. J.L. Industries, Embassy Series.
 - 3. Larsens Manufacturing Co.

2.2 FIRE EXTINGUISHERS

- A. Multipurpose Dry-Chemical Type in Steel Container: UL-rated 20-A:120-B:C, 20-lb (9.1-kg) nominal capacity, with monoammonium phosphate-based dry chemical in red enameled-steel container.
 - 1. Basis-of-Design Product: Subject to compliance with requirements, provide Potter Roemer LLC; #3020 or comparable product by one of the specified manufacturer.
- B. Brackets: Provide manufacturer's standard stainless steel wall bracket that permits easy removal, but not accidental dislodgment.

2.3 FIRE-PROTECTION CABINET

- A. Cabinet Type: Suitable for fire extinguisher.
 - 1. Basis-of-Design Product: Subject to compliance with requirements, provide Potter Roemer LLC; or comparable product by one of the specified manufacturer.
- B. Cabinet Construction: Nonrated.
 - 1. Fire-Rated Cabinets: Construct fire-rated cabinets with double walls fabricated from 0.043- inch- (1.09-mm-) thick cold-rolled steel sheet lined with minimum 5/8-inch- (16-mm-) thick fire-barrier material. Provide factory-drilled mounting holes.
- C. Cabinet Material: Cold-rolled steel sheet.
- D. Recessed Cabinet:
 - 1. Trimless with Concealed Flange: Surface of surrounding wall finishes flush with exterior finished surface of cabinet frame and door, without overlapping trim attached to cabinet. Provide recessed flange, of same material as box, attached to box to act as drywall bead.
 - 2. Basis-of-Design Product: Subject to compliance with requirements, provide Potter Roemer LLC; Model 1716 or comparable product by one of the specified manufacturer.
- E. Surface-Mounted Cabinet: Cabinet box fully exposed and mounted directly on wall with no trim.
 - 1. Basis-of-Design Product: Subject to compliance with requirements, provide Potter Roemer LLC; Model 1756 or comparable product by one of the specified manufacturer.
- F. Cabinet Trim Material: Same material and finish as door.
- G. Door Material: Stainless-steel sheet.
- H. Door Style: Fully glazed panel with frame.
- I. Door Glazing: Tempered break glass (clear).
- J. Door Hardware: Manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.
 - 1. Provide manufacturer's standard.
 - 2. Provide continuous hinge, of same material and finish as trim permitting door to open 180 degrees.

K. Accessories:

1. Mounting Bracket: Manufacturer's standard steel, designed to secure fire extinguisher to fire-protection cabinet, of sizes required for types and capacities of fire extinguishers indicated, with plated or baked-enamel finish.
2. Break-Glass Strike: Manufacturer's standard metal strike, complete with chain and mounting clip, secured to cabinet.
3. Door Lock: Cylinder lock, keyed alike to other cabinets.
4. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location.
 - a. Identify fire extinguisher in fire-protection cabinet with the words "**FIRE EXTINGUISHER.**"
 - 1) Location: Applied to cabinet door.
 - 2) Application Process: Pressure-sensitive vinyl letters.
 - 3) Lettering Color: Red.
 - 4) Orientation: Vertical.

L. Materials:

1. Cold-Rolled Steel: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B.
 - a. Finish: Baked enamel or powder coat.
 - b. Color: White.
2. Stainless Steel: ASTM A 666, Type 304.
 - a. Finish: No. 4 directional satin finish.
3. Tempered Break Glass: ASTM C 1048, Kind FT, Condition A, Type I, Quality q3, 1.5 mm thick.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The Contractor shall examine substrates, supports, and conditions under which this work is to be performed and notify Engineer, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means Contractor accepts substrates and conditions.

3.2 INSTALLATION

- A. Strictly comply with manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this section.
- B. Securely install at heights indicated or, if not indicated, at heights acceptable to authorities having jurisdiction and the Engineer. If exact locations are not indicated, locate where field directed by Engineer.
- C. Fire-Protection Cabinets: Fasten cabinets to structure, square and plumb.

- D. Coordinate with work in other sections to ensure proper sequence, position, height and clearances.

3.3 ADJUSTING, CLEANING AND PROTECTION

- A. Adjust operating parts to work easily, smoothly, and correctly.
- B. Repair minor damage to eliminate all evidence of repair. Remove and replace work which cannot be satisfactorily repaired.
- C. Clean exposed surfaces using materials and methods recommended by manufacturer of product being cleaned. Remove and replace work that cannot be successfully cleaned.
- D. Provide temporary protection to ensure work being without damage or deterioration at time of final acceptance. Remove protections and reclean as necessary immediately before final acceptance.

END OF SECTION

SECTION 10670

STORAGE SHELVING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the Design-Builder shall be provided at no additional cost to the Agency and shall be as approved by the Contracting Officer.
- D. Furnish and install the equipment items listed below by their identifier.:
 - 1. Board, peg, tool (EQ ID: 1005)
 - 2. Rack, storage, 72 bin (EQ ID: 1270)
 - 3. Rack, bulk storage, 2x6x6 (EQ ID: 1295)
 - 4. Rack, pallet, 8' (EQ ID: 1325)
 - 5. Rack, pallet, 12', with deck (EQ ID: 1330)
 - 6. Rack, pallet, 10', with deck (EQ ID: 1340)
 - 7. Rack, pallet, 16' high bay (EQ ID: 1345)
 - 8. Shelving unit, 18", 36" W, 7' High (EQ ID: 1511)
 - 9. Shelving unit, 18", 7' high (EQ ID: 1516)
- E. The work specified in this Section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The Design-Builder shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 2 - Site Work
 - 2. Division 3 - Concrete
 - 3. Division 5 - Metals
 - 4. Division 15 - Mechanical
 - 5. Division 16 - Electrical

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
- B. Operations and Maintenance Manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Follow the requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the Design-Builder.
- C. Substitution Approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by the MBTA .

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer’s containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer’s recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with Division 1 - General Requirements.

PART 2 – PRODUCTS

2.1 BOARD, PEG, TOOL (EQ ID: 1005)

- A. Manufacturer's Reference:
1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Kennedy Manufacturing Company, Van Wert, OH - (800) 413-8665
 - 1) Model: 50004
 2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Modern Metal Products, Owatonna, MN - (507) 451-0882
 - b. Trion Industries, Inc., Wilkes-Barre, PA - (570) 824-1000
- B. Capacities/Dimensions:
1. Overall dimensions (nominal):
 - a. Width: 72"
 - b. Height: 36"
 - c. Depth: ½"
- C. Features/Performance/Construction:
1. The panels shall be steel reinforced with square holed perforations. Flanged panels shall be reinforced to support heavy loads.
 2. Panels shall be capable of being attached to any surface that can support the weight of heavy tools (fasteners not included).
 3. Panels shall be manufactured of chip resistant material that will withstand abuse over time.
 4. The tool board shall be a standard four-panel set, including a 60-piece tool holder set.
 5. Hooks, clips, and accessories shall be heavy-duty steel and capable of locking onto the panel.
- D. Finish:
1. Gray, durable chip-resistant baked on finish.

2.2 RACK, STORAGE, 72 BIN (EQ ID: 1270)

- A. Manufacturer's Reference:
1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Equipto, Tatamy, PA - (610) 253-2775
 - 1) Model: 30528 w/ accessories
 2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Akro-Mils, Akron OH – (800) 253-2467
 - b. Tri-Boro Shelving and Partition Corp., Farmville, VA – (434) 315-5600

- B. Capacities/Dimensions:
 - 1. No. of shelves: 9
 - 2. No. of drawers: 72
 - 3. Shelf capacity: 350 lbs. per shelf
 - 4. Overall structure dimensions:
 - a. Height: 60"
 - 5. Bin dimensions
 - a. Width: 4 ¼"
 - b. Depth: 11"
 - c. Height: 2"
- C. Features/Performance/Construction:
 - 1. System components shall be adjustable for reconfiguration.
 - 2. System shall accommodate high-rise and multi-level applications.
- D. Finish:
 - 1. Durable enamel paint finish
 - 2. Standard color – Office gray. For other colors refer to the manufacturer color chart.

2.3 RACK, BULK STORAGE (EQ ID: 1295)

- A. Manufacturer's Reference:
 - 1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Equipto, Tatamy, PA - (610) 253-2775
 - 1) Model: 1027D62S starter unit
 - 2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Lyon Metal Products, Inc., Aurora, IL - (708) 892-8941
 - b. Modern Equipment Company, Inc., Omaha, NE - (402) 341-4939
- B. Capacities/Dimensions:
 - 1. Overall dimensions (nominal):
 - a. Length: 72"
 - b. Depth: 24"
 - c. Height: 84"
 - 2. Steel Decking capacity: 2,778 lbs./level
- C. Features/Performance/Construction:
 - 1. Construction: Continuously welded heavy gauge steel.
 - 2. Unit shall have three (3) lugs on each beam connector that locks securely to the posts.
 - 3. Adjustments: Adjusts on 1½" centers.
 - 4. The unit shall have three shelves with solid decking.
 - 5. Seismic bracing and anchorage shall be provided to meet any local, state, and national codes and provisions.
 - 6. Floor anchors shall be provided to fasten racks to floor.
- D. Finish:
 - 1. Durable enamel using the MBTA's choice from the manufacturer's standard color office gray.

2.4 RACK, PALLET, VARIOUS DIMENSIONS

A. Manufacturer’s Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer’s name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Lyon Workspace Products, Montgomery, IL, (630) 892-8941
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Justrite Manufacturing Co., Des Plaines, IL - (847) 298-9250
 - b. Equipto, Tatamy, PA - (610) 253-2775

B. Capacities/Dimensions

1. Capacity: 8,000 lbs. per pair of beams
2. Provide dimensions below.

Equipment ID #	1325	1345	1340	1330
<u>Overall Dimensions (Nominal)</u>				
Length	8'	9'	10'	12'
Height of highest level	10'	10'	10'	10'
Height of second level	5'	5'	5'	5'
Depth	42"	42"	42"	42"
Upright frames, part number	42M120	42M120	42M120	42M120
Beams, part number	S96	S108	S120	S144
Wire Decking, part number	WD4642H	WD5242H	WD5842H	WD4642H
Decking quantity, per level	2	2	2	3

3. Verify beam heights with MBTA prior to installation.

C. Features/Performance/Construction:

1. Rack shall be roll formed upright
2. Unit shall have tapered keyhole slots on 2" centers for vertical adjustment of beams.
3. Racks shall be interchangeable with other traditional teardrop designs.
4. Beams shall be welded, step-type, heavy gauge steel box channel.
5. Provide integral safety catch that automatically snaps and locks into place when beam is properly seated.
6. Provide at least one front –to-back support (Part Number FBSUP42) on units with beams 120” or longer.
7. Install racks level, plumb, and anchor all column posts to floor.
8. Provide 4” wall ties and attach all pallet racks to adjacent walls per manufacturer’s instructions.
9. Provide seismic bracing and anchorage to meet any local, state, and national codes and provisions.

D. Finish:

1. The unit shall have a baked on, corrosion resistant, powder epoxy finish.

2.5 SHELVING UNIT, 18", 36" W, 7' HIGH (EQ ID: 1511)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Equipto, Tatamy, PA - (610) 253-2775
 - 1) Model: 773-7S, with 773-7A Add-ons where applicable.
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Lyon Workspace Products, Montgomery, IL, (630) 892-8941
 - b. Stanley Vidmar, Allentown, PA - (800) 523-9462

B. Capacities/Dimensions:

1. No. of shelves: Seven (7)
2. Shelf capacity: 1,170 lbs. per shelf
3. Overall dimensions, nominal:
 - a. Width: 36"
 - b. Depth: 18"
 - c. Height: 84"
 - d. Installed height from finished floor (nominal):
 - 1) Bottom shelf: 4 ½"
 - 2) Top shelf: 84"
 - 3) Space the remaining bottom six shelves evenly, approximately 12" center to center, and the top two shelves 10 ½" center to center.
4. Weight: 170 lbs.

C. Features/Performance/Construction:

1. Shelf construction shall be double flange 18 gauge steel and double flanged box-formed edges on all four sides.
2. Uprights shall be double flanged uprights with tapered bracket slots punched on 1 ½" centers for vertical shelf adjustment.
3. Shelf fastening shall consist of slip-in shelf brackets which reinforce and securely lock the shelf into place in all four corners.
4. Units shall share common end panels with adjoining units. Back-to-back units shall be joined with common upright joints.
5. Provide one stand-alone unit where indicated. Add-on units shall be used for adjacent units.
6. Provide seismic bracing and anchoring to meet any local, state, and national codes and provisions.
7. Accessories:
 - a. Anchors: Floor, for seismic bracing, Equipto No. 190317A. Four (4) per starter unit and two (2) per add-on unit.

D. Finish:

1. Durable enamel using the MBTA's choice from the manufacturer's standard colors

2.6 SHELVING Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.

- a. Lyon Workspace Products, Montgomery, IL, (630) 892-8941
 - 1) Model: 8464H
 - 2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Equipto, Tatamy, PA - (610) 253-2775
 - b. Stanley Vidmar, Allentown, PA - (800) 523-9462
- B. Capacities/Dimensions:
- 1. No. of shelves: Six (6)
 - 2. Overall dimensions, nominal:
 - a. Width: 48”
 - b. Depth: 18”
 - c. Height: 84”
 - d. Installed height from finished floor (nominal):
 - 1) Space shelves evenly throughout the unit.
- C. Features/Performance/Construction:
- 1. Shelf construction shall be 22 gauge steel.
 - 2. All posts shall be punched on 1 1/2" centers with pairs of parallel slots 1 1/16" long with 1 slot keyhole-shaped for bolting cross braces and other accessories to uprights.
 - 3. Shelf fastening shall consist of slip-in shelf brackets which reinforce and securely lock the shelf into place in all four corners.
 - 4. Provide seismic bracing and anchoring to meet any local, state, and national codes and provisions.
- D. Finish:
- 1. Durable enamel using the MBTA’s choice from the manufacturer’s standard colors. Coordinate with MBTA to select color.

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Perform work under the direct supervision of the Foreman or Construction Superintendent who has the authority to coordinate the installation of scheduled equipment with the Architect or designated representative.
- B. Install equipment in accordance with the plans, shop drawings, and manufacturer’s instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.

2. **Fitting:** Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 3. **Anchorage:** Attach equipment as directed by the Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the Architect or designated representative for acceptance inspection.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 10801

TOILET ACCESSORIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies toilet accessories as shown on the Drawings and as scheduled herein.
- B. Related Work:
 - 1. Section 06100, CARPENTRY; blocking.

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated. Include the following:
 - 1. Construction details and dimensions.
 - 2. Anchoring and mounting requirements, including requirements for cutouts in other work and substrate preparation.
 - 3. Material and finish descriptions.
 - 4. Features that will be included for Project.
 - 5. Manufacturer's warranty.
- B. Product Schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required.
 - 1. Identify locations using room designations indicated on Drawings.
 - 2. Identify products using designations indicated on Drawings.
- C. Maintenance Data: For toilet accessories to include in maintenance manuals.

1.4 QUALITY ASSURANCE

- A. Source Limitations: For products listed together in the same articles in Part 2, provide products of same manufacturer unless otherwise approved by Engineer.
- B. Comply with ADA/ADAAG and MAAB requirements for accessibility.

1.5 COORDINATION

- A. Coordinate accessory locations with other work to prevent interference with clearances required for access by people with disabilities, and for proper installation, adjustment, operation, cleaning, and servicing of accessories.
- B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. A & J Washroom Accessories, Inc.
 - 2. American Specialties, Inc.
 - 3. Bobrick Washroom Equipment, Inc.
 - 4. Bradley Corporation.
 - 5. General Accessory Manufacturing Co. (GAMCO).

2.2 MATERIALS

- A. Stainless Steel: ASTM A 666, Type 304, 0.0312-inch minimum nominal thickness, unless otherwise indicated.
- B. Galvanized Steel Mounting Devices: ASTM A 153/A 153M, hot-dip galvanized after fabrication.
- C. Fasteners: Screws, bolts, and other devices of same material as accessory unit and tamper-and theft resistant where exposed, and of galvanized steel where concealed.

2.3 FABRICATION

- A. General: Fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with full-length, continuous hinges. Equip units for concealed anchorage and with corrosion-resistant backing plates.
- B. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to the Engineer.

2.4 TOILET ACCESSORIES SCHEDULE

- A. Basis-Of-Design: The following schedule of items are Bobrick catalog designations which are specified to establish standards of quality for performance and materials and not to limit competition. Provide the specified toilet accessories, or equal from another manufacturer listed above.
 - 1. Recessed Combination Waste Receptacle/Paper Towel Dispenser: Bobrick B-3961.
 - 2. Surface Mounted Combination Waste Receptacle/Paper Towel Dispenser: B-43949.
 - 3. Recessed Feminine Napkin Disposal: Bobrick B-353.
 - 4. Surface Mounted Feminine Napkin Disposal: Bobrick B-254
 - 5. Soap Dispenser: Bobrick B-826.18.
 - 6. Grab Bar with Concealed Mounting: Bobrick B-5806 x 42 w/ complete anchor and fastener kit.
 - 7. Grab Bar – Custom: Bobrick B-5806 (similar) Custom grab bar as shown on drawings.

8. Toilet Tissue Dispenser: Bobrick B-4288.
9. Mirror: Bobrick B-290 2436.
10. Hook: Bobrick B-7671.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Before installation of toilet accessories, check openings and recesses to receive recessed units to assure they are of proper size and location, and are plumb and square. Check substrate materials, blockings, and built-in anchor plates for structural adequacy to support the accessories.
- B. Mount recessed accessories securely into wall openings and recesses, tightly anchored into place, and with trim fitted tightly and neatly against the wall surface. Mount surface mounted accessories plumb, level, and true, and securely anchored into place.
- C. After installation, adjust all accessories for proper operation, and clean and polish all exposed surfaces. Protect accessories from damage from all sources whatever.
- D. Deliver to Authority duplicate keys for each lockable accessory door or panel, properly tagged as to location.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 11170

SOLID WASTE HANDLING EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the Design-Builder shall be provided at no additional cost to the Agency and shall be as approved by the Contracting Officer.
- D. Furnish and install the equipment items listed below by their identifier:
 - 1. Compactor, stationary, trash, 40 cubic yard (EQ ID: 2123)
 - 2. Baler, vertical, heavy-duty (EQ ID: 2129)
- E. The work specified in this Section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The Design-Builder shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 2 - Site Work
 - 2. Division 3 - Concrete
 - 3. Division 5 - Metals
 - 4. Division 15 - Mechanical
 - 5. Division 16 - Electrical

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements".

- B. Operations and Maintenance Manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Follow the requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the Design-Builder.
- C. Substitution Approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by the MBTA.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with Division 1 - General Requirements.

PART 2 – PRODUCTS

2.1 COMPACTOR, STATIONARY, TRASH, 40 CY. (EQ ID: 2123)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Marathon Equipment Company, Vernon, AL – (800)269-7237
 - 1) RJ-225 with RJ-40 OC Container
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Komar Industries, Groveport, OH – (614) 836-2366
 - b. SP Industries, Hopkins, MI – (800) 592-5959

B. General Description:

1. This compactor is built for reliable performance in commercial and medium industrial situations. It effectively reduces solid waste material to a fraction of its original size. It features 56 second cycle time and powerful 55,100 lbs. maximum compaction force.

C. Capacity/Dimensions

1. Charge box capacity:
 - a. Mfrs. Rating: 2.0 cy
 - b. WASTEC Rating: 1.55 cy
 - c. Clear top opening: 40.5”X60”
 - d. Capacity per hour: 100 cy
2. Performance Data:
 - a. Cycle time: 56 s
 - b. Total Normal Force: 46,700 lb
 - c. Total Maximum Force: 55,100 lb
 - d. Normal Ram Face Pressure: 26.8 psi
 - e. Maximum Ram Face Pressure: 31.7 psi
 - f. Ram Penetration: 14”
3. Electrical Equipment:
 - a. Electrical Motor 3/60-208/230/460: 10 hp/7.5 Kw
 - b. Electrical Control Voltage: 120 VAC
 - c. UL Labeled Panel Box: Type NEMA 3R, All Circuits Fused
 - d. Standard 2 Button Controls: Keylock Start/ Mushroom Stop Connected to 13' Sealtite

4. Hydraulic Equipment:
 - a. Hydraulic Pump Capacity: 13 gpm/49.2 L/min.
 - b. Normal Pressure: 1650 psi/11.4 mPa
 - c. Maximum Pressure: 1950 psi 13.4 mPa
 - d. Hydraulic Cylinder: 6" Bore x 2 1/2" Rod/152 mm x 64 mm
 - e. Weight 5150 lbs.: 2336 kg

D. Features/Performance/Construction:

1. Allen-Bradley Motor Starter
2. Heavier steel in key structural areas for heavy-duty construction: Floor & ram face made of 1/2" steel Ram top have 3/8" steel Sides have 1/4" steel
3. TEFC (totally enclosed fan cooled) motor
4. Quick Release Motor Mount for easy servicing and maintenance
5. TRICON Fullness Assurance System. This time shifting device eliminates all but one limit switch. It also produces better compaction ratios by making the ram dwell against the trash reducing the "memory" and springback. TRICON offers better cold weather performance and extends the life of the machine.
6. Ram Guide System
 - a. The packing ram is supported by specially formulated cast iron shoes which ride on replaceable wear strips. This exclusive design protects the charge box floor from the full force of the packing ram, extending its life and dramatically reducing compaction-robbing friction.
7. Side-Mount Power Unit
 - a. Side-Mounted Power Unit
8. Container:
 - a. Provide grease fittings on hinges, guide rollers, and ground rollers.
 - b. Provide door opening to match the RJ-225 Compactor.

2.2 BALER, VERTICAL, HEAVY-DUTY (EQ ID: 2129)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on equipment identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Marathon Equipment Company, Vernon, AL - (205) 695-7250
 - 1) Model: V-7230 HD
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. J.M. Hydraulics, Inc., Sun Valley, CA - (818) 771-0534
 - b. HJA International, Buffalo, NY - (716) 332-7061

B. Capacities/Dimensions:

1. Hydraulic cylinder:
 - a. Bore: 2.5”
 - b. Rod: 4”
 - c. Stroke: 48”

2. Hydraulic pump: 10.5 gallons per minute
3. Motor: 10 H.P.
4. System pressure: 2,000 PSI
5. RAM pressure: 62,200 lbs.
6. Platen pressure: 29 PSI
7. Cycle time: 58 seconds
8. Overall dimensions (nominal):
 - a. Width: 101”
 - b. Depth: 45”
 - c. Height: 11’-10”

9. Bale size:
 - a. Width: 72”
 - b. Depth: 30”
 - c. Height: 48”

10. Bale volume: 60 cu. ft.
11. Bale weight: 1,400 lbs.

C. Features/Performance/Construction:

1. Redundant interlock system works with gate latch for added safety redundancy.
2. Platen features replicable high density polyethylene guides to absorb side thrust and replaceable “no-lube” cast iron shoe guides. Cylinder rod locking collar with 1” plate.
3. Baler shall be constructed of heavy gauge steel plate and backed with structural steel channel.
4. Standard controls: Key lock, on/off auto cycle, emergency stop, platen raise/lower, and a baler “ready light.”
5. The panel box features a programmable “smart” relay control system which disables the baler if an attempt to override the interlocks is made.
6. Control system shall be UL listed and located in a weather proof NEMA 4 enclosure and a simple button operation. All electrical components shall be located outside of the baler.
7. Accessories:
 - a. Baler made light.
 - b. Automatic bale ejector.

D. Utility Requirements:

1. Electrical - 460 VAC, 3 phase, 10 H.P.

E. Finish:

1. Durable powder coat using the MBTA’s choice from the manufacturer’s standard colors

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Perform work under the direct supervision of the Foreman or Construction Superintendent who has the authority to coordinate the installation of scheduled equipment with the Architect or designated representative.
- B. Install equipment in accordance with the plans, shop drawings, and manufacturer's instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 - 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 - 3. Anchorage: Attach equipment as directed by the Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the Architect or designated representative for acceptance inspection.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 11306

SUBMERSIBLE SOLIDS HANDLING PUMPS AND APPURTENANCES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Provide and test submersible solids handling pumps, motors, discharge base elbow, variable frequency motor controllers, and appurtenances as indicated and specified for installation at stormwater pumping stations.
- B. Construction of the Red Bridge and Washington Street pump stations (RPS and WSP, respectively) was initiated under IGMP-03, a previous GLX construction contract. That work was advanced to near completion of the basic structure. The pumps, variable frequency motor controllers, communication programmable logic controllers, and pump station controls were not (or may not have been) completed, however certain items of that equipment were procured by the Owner and will be provided to the Design-Builder. The Design-Builder shall complete the construction of these two pump stations in full compliance with the specifications. The Design-Builders shall complete all work within this Section and all related work, to provide complete operable pump station facilities.
- C. The specifications relative to the WPS and RPS pump stations, including all operating parameters, control logic and other parameters, shall not be modified in any way.
- D. The Design-Builder may elect to adapt these specifications, if appropriate, to any pump station it may propose at Gilman Square.
- E. Certain work under this Section was, or may have been, completed by the previous GLX contractor. The Design-Builder shall be responsible for making its own assessments and evaluations as to the exact scope and limits of the completed and the uncompleted work. The Design-Builder shall complete any and all work associated with this Section and all Related Sections, including any and all uncompleted and/or partially completed work. The Design-Builder shall coordinate all related work, to provide complete and operable stormwater pumping facilities.
- F. The terms and meaning of “Manufacturer’s Services Engineer”, “Startup/Testing Engineer”, “Factory Trained Service Engineer” and “Service Engineer” (collectively, “Startup, Testing and Service Engineers”) as used in this Section shall all remain unchanged and any remaining work required of these Startup, Testing and Service Engineers shall be the responsibility of the Design-Builder. Likewise, the services of a Structural Engineer as required herein shall be the responsibility of the Design-Builder unless that work was completed by the previous Contractor.
- G. The use of the word “Contractor” has been retained in this Section; however, it shall be interpreted to mean the Design-Builder for any and all work remaining to be completed. Likewise, the word “Engineer” has been retained; however, it shall be interpreted to mean the Owner for any and all work remaining to be completed.

1.3 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01300 – SUBMITTALS:
 - 1. Data regarding pump and motor characteristics and performance:
 - a. Prior to fabrication and testing, provide manufacturer’s guaranteed performance curves based on actual shop tests of mechanically duplicate pumps, showing they meet indicated and specified requirements for head, capacity, horsepower, efficiency and NPSH₃.
 - 1) For units of same size and type, provide curves for a single unit only.
 - b. Provide catalog performance curves at maximum pump speed indicated and specified for each service showing maximum and minimum impeller diameters available, acceptable operating range (AOR) and preferred operating range (POR).
 - c. Results of shop performance tests as specified.
 - d. Submit curves for manufacturer’s guaranteed performance, and shop performance tests on 8-1/2-inch by 11-inch sheets, one curve per sheet.
 - 2. Characteristic curves for variable speed pumps for maximum pump speed and for speeds required to obtain minimum pump flow and head conditions specified and indicated. Identify curves by speed and provide all curves on one sheet. Provide NPSH₃ curve and wire to water efficiency for each speed.
 - 3. Shop drawing data for accessory items.

4. Certified setting plans, with tolerances, for anchor bolts.
5. Manufacturer's literature as needed to supplement certified data.
6. Operating and maintenance instructions and parts lists.
7. Listing of reference installations as specified with contact names and telephone numbers.
8. Certified results of hydrostatic testing.
9. Certified results of dynamic balancing.
10. List of recommended spare parts other than those specified.
11. Shop and field inspection reports.
12. Bearing Life: Certified by the pump manufacturer. Include design data.
13. Pump shop test results.
14. Motor shop test results.
15. Qualifications of field service engineer.
16. Recommendations for short and long-term storage.
17. Resonant frequency analysis.
18. Shop and field testing procedures, pump and piping set up, equipment to be used and ANSI/HI testing tolerances to be followed.
19. Special tools.
20. Number of service person-days provided and per diem field service rate.
21. Results of shop vibration test data for each pump and drive assembly.
22. Recommended location of discharge pressure gauges.
23. Manufacturer's product data, specifications, and color charts for shop painting.
24. Provide a listing of the materials recommended for each service specified and indicated.
Provide documentation showing compatibility with process fluid and service specified and indicated.
25. The latest ISO 9001 series certification.
26. Provide a scaled drawing for each pump service showing the pumps, motors, hoists and bridge cranes including equipment weights, lifting attachments, slings and clearances for equipment removal and maintenance.
27. Material Certification:
 - a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

- b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
- B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.
 - 1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
- C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 - 1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.4 SPARE PARTS:

- A. Comply with the requirements specified in Section 01600 – MATERIALS AND EQUIPMENT.
- B. Provide spare parts that are identical to and interchangeable with similar parts installed.
 - 1. For each pump:
 - a. One complete set of gaskets and O-rings.
 - 2. For each set of pumps of the same size and performance.
 - a. One set of all special tools required.

1.5 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01400 – QUALITY ASSURANCE.
- B. Pumps shall be the product of one manufacturer.
- C. Pumps shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.
- D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.
- E. Shop tests as specified.
- F. The Contractor shall obtain the pumps, motors and appurtenances from the pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1. Variable frequency motor controllers can be supplied by the Contractor or the pump manufacturer at the Contractor's option. The pumping system must be a complete and integrated package to insure proper coordination and compatibility and operation of the system.
 - a. The Contractor shall coordinate the variable frequency motor controllers with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.
 - b. Provide variable frequency motor controllers in accordance with Section 16260 – VARIABLE FREQUENCY MOTOR CONTROLLERS FOR THE STORMWATER PUMP STATIONS.
 2. Guide cables or rails and hatches can be supplied by the Contractor or the pump manufacturer at the Contractor's option. The pumping system must be a complete and integrated package to insure proper coordination and compatibility and operation of the system.
 - a. The Contractor shall coordinate the hatch size with the pump manufacturer and submit as part of the shop drawings a written statement signed by the Contractor and pump manufacturer that the Contractor has received the required information from the pump manufacturer and that all parties have reviewed the hatch size and coordinated the hatch size, bridge crane and equipment removal.
 - b. The Contractor shall coordinate the cable or rail size with the pump manufacturer and submit as part of the shop drawings a written statement signed by the contractor and pump manufacturer that the Contractor has received the required information from the pump manufacturer and that all parties have reviewed the cable or rail size and coordinated the size and equipment removal.
- G. Services of Manufacturer's Representative as stated in Section 01400 - QUALITY ASSURANCE and as specified herein.
- H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
 2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping and electrical:
 - a. 2 person-days.
 3. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.
 - a. 2 person-days.
 4. Performance Testing: Field performance test equipment specified.
 - a. 3 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts, and preparation to lead and teach classroom sessions.
 - a. 2 person-days.
 6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation or testing, or to correct deficiencies in installation, equipment, or material shall be provided at no additional cost to the Owner.
- I. Manufacturer of pumps shall have a minimum of five (5) operating installations with pumps of the size specified and in a similar service as specified operating for not less than five (5) years.
 - J. If equipment proposed is heavier or taller, different rotation, or discharge arrangement than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.
 1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.
 - K. For variable speed pump systems the pump manufacturer must perform an analysis of the combined motor and pump assembly for resonant frequency or their harmonics independent of a structure.
 1. Submit a copy of these calculations for the record.
 2. Should calculations indicate the probability of encountering such frequencies within the speed range required, provide all additional supporting devices necessary to affect the unit mass, and raise or lower resonant point to be within the speed range required.
 3. Provide and install such additional devices at no additional cost to the Owner.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01600 - MATERIALS AND EQUIPMENT.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Pump capacities and operating data are indicated in the Process Pump Schedule.

2.2 MANUFACTURERS

- A. Submersible Solids Handling Pumps
 1. KSB
 2. Flowserve

2.3 SEISMIC DESIGN REQUIREMENTS

- A. Conform to the requirements indicated on the structural drawings and as specified.
- B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.
- C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.
- D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.4 PUMP CONSTRUCTION

- A. Pumps: Solids handling radial and mixed flow single-stage, centrifugal pumps. Driven as indicated in the Process Pump Schedule.
- B. Design and proportion all parts of pump specially adapted for the service specified and indicated.
- C. Pump Mounting: Provide type as indicated and specified.
 - 1. Mount each pump on a discharge elbow discharging vertically.
- D. Pump Casing, Fronthead, Backhead and Lower Housing:
 - 1. Cast iron ASTM A48 Class 30 or 35.
 - 2. Provide lifting devices on pump/motor assembly for handling.
 - a. Type 316 stainless steel.
 - 3. Provide ribs or reinforcing if required to withstand the specified hydrostatic test pressure, to prevent deflection caused by hydraulic thrust and to support the motor.
 - 4. Face and drill flanges of discharge connections in accordance with 125-lb. ANSI B16.1 Standard.
 - 5. Provide components with machined registered concentric shoulder fits for precision alignment.
Equipment without registered fits is not acceptable.
 - 6. Pumps with splitter vanes in casing are not acceptable unless specifically indicated in the Process Pump Schedule.
 - 7. Lining
 - a. Manufacturer:
 - 1) Belzona Supermetalglide
 - 2) Devcon Brushable Ceramic BlueType: Ceramic filled epoxy
 - b. Percent Solids by Volume: 100 percent
 - c. Provide two coats 8 to 15 mils thick with total minimum DFT of 20 mils
 - d. Cured Hardness: 90D in accordance with ASTM D2240

- e. Surface preparation, mixing and application and safety requirements shall be in accordance with the lining manufacturer's printed instructions and as specified.

E. Impellers:

1. Type: Enclosed radial, solids handling single suction.
2. Provide vanes having wide suction and waterways that will pass solids and stringy without clogging.
3. Provide pumps capable of passing a solid sphere size as indicated in the Process Pump Schedule.
 - a. Pumps capable of only passing a deformable sphere are not acceptable.
4. Provide impellers not greater than 95 percent or the percentage indicated in the Process Pump Schedule, of the maximum diameter impeller available.
5. Do not design hub with ports for reduction of thrust on impeller.
6. Key-seat and hold impeller to shaft by a streamlined bolt or locknut capable of holding in event of motor reversal under full torque.
 - a. Impeller Fasteners: Type 416 stainless steel or Type 316Ti stainless steel
7. Statically and dynamically balance each impeller.
8. Enclosed Impellers:
 - a. Material:
 - 1) Provide Stainless Steel:
 - a) ASTM A743 Grade CA-6NM (13 percent Cr, 4 percent Ni-Mo)
 - b) CD4MCu duplex stainless steel
 - b. Wearing Rings:
 - 1) Provide on impeller and in pump casing at suction side.
 - 2) Impeller and Casing Wearing Rings:
 - a) Impeller: Stainless Steel ASTM A743 Grade CA-40 with a 300 to 350 BHN.
 - b) Casing Wearing Rings: Stainless Steel ASTM A743 Grade CA-40 with a 450 to 480 BHN.
 - c) Impeller and casing wearing rings of VG434 duplex stainless steel 350 BHN.

2.5 MOTORS

- A. Provide in accordance with Section 01600 – MATERIALS AND EQUIPMENT and as specified and indicated.
- B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of pumps under any condition of operation specified and indicated without operating in the motor service factor.
- C. Maximum motor speed: As indicated in the Process Pump Schedule.

- D. Enclosure: Explosion proof, Class I, Division 1, Group D; UL or FM certified.
- E. In addition to the requirements for bearings specified under Electric Motors in Section 01600, provide pump motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.
- F. Operate without overheating at the speeds specified and indicated.
- G. Service Factor: 1.15, with 1.0 inverter duty rating for pumps equipped with variable frequency motor controllers.
- H. Rating: 460V, 3 PH, 60 Hz.
- I. Insulation: Class H with Class B temperature rise, 40 degrees C ambient.
- J. Site Altitude: Less than 3,300 feet above sea level.
- K. Motors:
 1. Provide complete sealed electric submersible squirrel cage induction motors in accordance with the above and as specified herein.
 2. Provide all components housed in an air or oil filled cast-iron watertight electric submersible squirrel cage induction motor in accordance with the above and as specified herein.
 3. Provide a closed loop cooling system which circulates a non-toxic oil or glycol-water mixture through a cooling jacket surrounding the motor, and through an integrated heat exchanger to transfer the motor heat to the process fluid. Insulate stator-winding and lead with moisture resistant Class H insulation for continuous duty in 40 degrees C rise liquids.
 4. Provide motor capable of ten (10) starts per hour at maximum speed.
 5. Motor shaft: Type 416 or Type 420 stainless steel or ASTM A576 Cr 1040 with Type 420 stainless steel sleeve.
 - a. One piece internal pump/motor shaft.
 - b. Provide shaft of sufficient diameter that the ratio of the shaft overhand, distance from lowest bearing to the impeller hub, to the shaft diameter through the seal area not to exceed 2.5.
 6. Dynamically balance rotor to within NEMA vibration limits.
 7. All hardware: Type 316 stainless steel.
 8. Provide all cables of multi-conductor SOW-A, G-GC or W of sufficient length to extend from pump motor to the control panel. Cable size shall be in accordance with NEC specifications.
 9. Cable Entry:
 - a. Provide all power and control lead wires double sealed entering the motor in a method that prevents cable wicking.
 - b. Provide the sealing system consisting of a rubber grommet to seal the cable exterior followed by interior epoxy seal.

- c. Provide each cable wire with a section of insulation removed to establish a window area of bare wire and each wire surrounded by epoxy potting material.
 - d. Provide a cable strain relief mechanism as an integral part of this sealing system.
 - e. Provide the cable sealing system capable of withstanding an external pressure test of 1,200 psi as well as a cable assembly pull test as required by UL or FM.
 - f. Provide the cable entry rated by UL or FM for submerged operating depths to 85 feet.
 - g. Singular grommet or other similar sealing systems are not acceptable.
10. Seals:
- a. Provide two separate tandem-mounted mechanical seals with the upper and lower seals mounted to rotate in the same direction.
 - b. Upper Seals:
 - 1) Provide seal completely immersed in an oil or glycol bath sealing the oil chamber and motor housing.
 - 2) Materials: Silicon carbide rotating and stationary faces.
 - c. Lower Seals:
 - 1) Provide lower seal with mating faces immersed in the oil or glycol bath sealing the pump volute and oil chamber.
 - 2) Materials: Silicon carbide rotating and stationary faces.
 - 3) Provide a cover extending completely over the lower seal spring.
 - d. Springs: Type 316 stainless steel.
 - e. Elastomers: Viton.
11. Moisture and Temperature Probes:
- a. Provide two moisture detection probes to detect moisture in the seal and stator cavity measuring conductivity.
 - b. Provide moisture detection panel and one piece cable from pump to panel; see electrical drawings for panel location. Contractor to provide conduit and cable from pump to control panel.
 - c. Provide sufficient length of cable to extend from the pump assembly to a junction box above top of wet well as stated in Part 6.
 - d. Provide O-ring sealed plugged fill and drain inspection ports.
 - e. Provide winding over temperature protection.
 - f. Moisture detection to alarm, over temperature to shut down pumps, indicates condition and alarm.
 - g. Provide NEMA 4X Type 316L stainless steel panel with moisture detection system.
12. Bearings:
- a. Provide a minimum of two bearings permanently lubricated but capable of being regreased.
 - b. Minimum B-10 bearing life of 100,000 hours.
 - c. Provide RTD for thrust bearing for pumps 100 hp and larger.

13. Provide all mating surfaces machined and fitted with O-rings. All fittings shall be metal to metal contact between each machine surface.
14. Provide a Type 316 lifting attachment capable of lifting the entire pump and motor assembly.
15. Motors shall conform to UL or FM quality assurance specifications and be manufactured by an ISO-9001 company.
16. Provide a motor resistance monitor.

2.6 DISCHARGE BASE

- A. Provide an ASTM A48 Class 30 or Class 35 cast iron discharge base assembly including a 90 degree elbow and base to support the entire weight of the pump and motor and to secure the lower end of the guide rails.
- B. Provide base machined to receive sliding bracket of pump discharge.
- C. Provide seat constructed of bronze or non-metallic O-ring that is self-cleaning, non-clogging and non-sparking UL or FM certified explosionproof.
- D. Bolt to floor with Type 316 stainless steel anchors.

2.7 GUIDE ASSEMBLY

- A. Provide Schedule 40 Type 316L stainless steel guide rails or Type 316 cables for each pump discharge assembly.
 1. Guide Rail: Pump manufacturer's standard size but not less than 2-inch diameter.
- B. Provide Type 316L stainless steel intermediate supports for guide rails with a maximum spacing of 10 feet between supports.
- C. Provide Type 316L stainless steel top guide rail retainer brackets to support the guide rails or cables. Bracket to be attached to top slab of wet well.
- D. Provide Type 316 stainless steel chain of sufficient length, to reach from pump to top of wet well plus 10 feet and of strength for lifting pump and motor. Provide chain designed for attachment to lifting bail provided on motor and to the guide rail retainer bracket.

2.8 PUMP LIFTING/DOCKING DEVICE

- A. Provide a chain and latch mechanism to allow the pumps and motors to be removed in one pull without re-rigging the system. Provide a device that is lowered along the guide cables or rails and can be remotely latched to the pump lifting bail without the need to enter the wet well.
- B. Materials:
 1. Lifting Bail: ASTM A248 B
 2. Hook, Shackle, Counterweight and Chain: ASTM A322
 3. Guide Ropes: Stainless Steel
 4. Latch Operating Rope: Polyamid
- C. Mechanism Lifting Capacity to be suitable for equipment provided.

- D. Provide one (1) device for each size pump

2.9 HARDWARE

- A. Type 316 stainless steel.

2.10 GAUGES

- A. Provide gauges assemblies for discharge of each pump in accordance with Section 15101 – PROCESS VALVES AND APPURTENANCES and as indicated.
- B. Discharge Gauges: Compound type with operating range with top limit above pump shutoff head at maximum pump speed.
 - 1. Scale: Inches Hg to psi.

2.11 SHOP PAINTING

- A. Primer and Finish Paint: Shop-apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09900 - PAINTING.
- B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.
- C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

2.12 SHOP TESTING

- A. Provide motor shop testing in accordance with Section 01600 – MATERIALS AND EQUIPMENT and as specified.
 - 1. Provide the following motor tests in accordance with ANSI/HI 11.6
 - a. Test motor integrity in a submerged condition.
 - b. Dry run no load test.
 - c. Motor electrical integrity test.
 - d. Moisture and temperature sensors integrity test.
- B. Pump Tests:
 - 1. Test pump casings under a hydrostatic head of at least 75 psi or 150 percent of rated shutoff head, whichever is greater. Test casing with pump assembled.
 - 2. Provide witnessed performance tests as specified herein for all pumps.
 - 3. Witnessed performance testing.
 - a. Testing of submersible pumps dry is not acceptable.
 - b. Run pump at full speed rating point for 60 minutes prior to start of any testing or until temperature has stabilized.
 - c. Full speed tests:
 - 1) Test pumps at the conditions specified and indicated and take not less than seven operating points between shut-off and run out. Test points must be at the conditions specified and indicated.
 - 2) Take readings to determine flow, differential pressure, rpm, horsepower, and wire to water efficiency.
 - 3) Operate each pump for not less than one hour and take readings to determine that the pump will operate as specified and indicated without cavitation at the

specified minimum head condition with not more than the specified NPSH available.

- d. Variable speed tests:
 - 1) Conduct tests as specified above for full speed at reduced speeds except that tests for cavitation at run out are not required.
 - 2) Run one speed test at speed required to discharge the minimum rating point specified and indicated with one point of test at the minimum rating point.
 - 3) Run a second test at a speed approximately midway between full and minimum speed.
 - 4) Run addition tests for each reduced speed operating condition specified and indicated.
 - e. Conduct additional tests as follows:
 - 1) Run each pump at the minimum speed rating point for 4 hours and continuously record motor temperature. Pumps must be run submerged at LWL submergence as indicated.
 - f. Factory tests on pumps:
 - 1) Use tested job motors and one (1) job variable frequency motor controller shipped to the pump testing facility for use in these pump tests for all pumps 100 hp and larger.
 - 2) Use factory calibrated test drives for all pumps less than 100 hp.
 - g. Provide a minimum of 30 days written notice to the Engineer prior to shop testing.
- 4. Run all tests in accordance with the latest standards of the Hydraulic Institute and as specified.
 - 5. Testing Acceptance Grade and Tolerances:
 - a. ANSI/HI 14.6 Acceptance Grade: 1U.
 - b. Wire to Water Efficiency Tolerance: -0 percent.
 - c. If pumps do not meet the tolerances specified, trim the impeller or modify the pump and retest until the specified results are obtained.
 - 6. Tests of variable frequency motor controllers specified in Section 16260 - VARIABLE FREQUENCY MOTOR CONTROLLERS FOR THE STORMWATER PUMP STATIONS.
 - 7. In the event that specified tests indicate that pump, motor, or variable frequency drive will not meet specifications, the Engineer has the right to require additional complete witnessed tests for all pumps, motors, and variable frequency drives at no additional cost to the Owner.
 - 8. Repeat tests until specified results are obtained.
 - 9. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.
 - 10. When pump witness performance testing is specified, provide roundtrip airfare\\, all transportation and lodging for witness testing for two (2) people. If air travel is more than 6 hours provide business class airfare.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install items in accordance with shop drawings, and manufacturer's printed instructions.
- B. Install pumping units and align.
 - 1. Set base on metal shims placed directly under the part of the base carrying the greatest weight and spaced close enough to provide uniform support.
- C. After alignment is correct, grout using high grade non-shrink grout.
 - 1. Do not imbed leveling nuts in grout.

3.2 FIELD TESTING

- A. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list.
- B. After installation of pumping equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each pump in presence of the Engineer to determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.
 - 1. During tests, observe and record head, capacity, and motor inputs.
 - a. Test Duration: Determined by the Engineer but not less than three hours of continuous operation at each condition specified and indicated.
 - 2. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.
 - 3. Repeat tests until specified results are obtained.
 - 4. Contractor to provide all water labor, piping, testing equipment, equipment, flow meters and test gauges for conducting tests.
 - a. Contractor shall provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all pumping systems even in those cases where permanent flow meters are installed.
 - b. All calibrations must be within 30 days of the field testing.
 - c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted.
- C. Make all adjustments necessary to place equipment in specified working order at time of above tests.
- D. Test pump on product only. If product is not available, test with water. Water for testing furnished by Contractor.
- E. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

3.3 FIELD TOUCH-UP PAINTING

- A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.4 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – CONTRACT CLOSEOUT.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 11450

APPLIANCES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies appliances including refrigerators, microwave ovens and flat screen televisions.
- B. Related Work:
 - 1. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 - 2. Division 16 - ELECTRICAL for services and connections to appliances.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated. Include operating characteristics, dimensions of individual appliances, and finishes for each appliance.
- B. Appliance Schedule: For appliances; use same designations indicated on Drawings.
- C. Maintenance Data: For each product to include in maintenance manuals.
- D. Warranties: Special warranties specified in this Section.

1.3 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer for installation and maintenance of units required for this Project.
- B. Source Limitations: Provide products from same manufacturer for each type of appliance required.
- C. Regulatory Requirements: Comply with provisions of the following product certifications:
 - 1. NFPA: Provide electrical appliances listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
 - 2. UL and NEMA: Provide electrical components required as part of residential appliances that are listed and labeled by UL and that comply with applicable NEMA standards.
 - 3. ANSI: Provide gas-burning appliances that comply with ANSI Z21 Series standards.
- D. Regulatory Requirements, Accessibility: Where residential appliances are indicated to comply with accessibility requirements, comply with Massachusetts Architectural Access Board requirements and the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)."

- E. Energy Ratings: Provide residential appliances that carry labels indicating energy-cost analysis (estimated annual operating costs) and efficiency information as required by the FTC Appliance Labeling Rule.
 - 1. Provide appliances that qualify for the EPA/DOE ENERGY STAR product labeling program.
- F. Switches: Provide mercury-free switches in appliances.
- G. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 01.

1.4 WARRANTY

- A. Special Warranties: Manufacturer's standard form in which manufacturer of each appliance specified agrees to repair or replace residential appliances or components that fail in materials or workmanship within manufacturer's standard warranty period.

PART 2 - PRODUCTS

2.1 APPLIANCES

- A. Refrigerators: 4.1 cu.ft, 32 inch stainless steel undercounter refrigerator, Basis of Design: FF511LB17ADA Series or approved equal.
- B. Microwave Ovens: 1200-watt stainless steel countertop microwave oven with baking dish, Architect Series II by KitchenAid or equal by General Electric or Jenn-Air.
- C. Flat Screen Televisions: 60 inch screen class diagonal flat-panel plasma HDTV by Samsung, or equal by Sony or LG.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. Examine roughing-in for piping systems to verify actual locations of piping connections before equipment installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

- A. General: Comply with manufacturer's written instructions.

- B. Built-in Equipment: Securely anchor units to supporting cabinets or countertops with concealed fasteners. Verify that clearances are adequate for proper functioning and rough openings are completely concealed.
- C. Freestanding Equipment: Place units in final locations after finishes have been completed in each area. Verify that clearances are adequate to properly operate equipment, including ventilation clearances.
- D. Utilities: Refer to Division 16 - ELECTRICAL for electrical requirements.

3.3 CLEANING AND PROTECTION

- A. Test each item to verify proper operation. Make necessary adjustments.
- B. Verify that accessories required have been furnished and installed.
- C. Remove packing material from appliances and leave units in clean condition, ready for operation.

3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train the Owner's maintenance personnel to adjust, operate, and maintain appliances.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 12490

WINDOW TREATMENTS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Motor-operated roller shades with single rollers.
- B. Related Requirements:
 - 1. Section 06100 "Carpentry" for wood blocking and grounds for mounting roller shades and accessories.
 - 2. Section 08520 Aluminum Windows
 - 3. Section 07920 "Joint Sealants" for sealing the perimeters of installation accessories for light-blocking shades with a sealant.

1.2 SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include styles, material descriptions, construction details, dimensions of individual components and profiles, features, finishes, and operating instructions for roller shades.
- B. Shop Drawings: Show fabrication and installation details for roller shades, including shadeband materials, their orientation to rollers, and their seam and batten locations.
 - 1. Motor-Operated Shades: Include details of installation and diagrams for power, signal, and control wiring.
- C. Samples: For each exposed product and for each color and texture specified, 10 inches (250 mm) long.
- D. Qualification Data: For Installer.
- E. Product Certificates: For each type of shadeband material, signed by product manufacturer.
- F. Product Test Reports: For each type of shadeband material, for tests performed by a qualified testing agency.
- G. Maintenance Data: For roller shades to include in maintenance manuals.

1.3 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Roller Shades: Full-size units equal to 5 percent of quantity installed for each size, color, and shadeband material indicated, but no fewer than two units.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: Fabricator of products.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver roller shades in factory packages, marked with manufacturer, product name, and location of installation using same designations indicated on Drawings.

1.6 FIELD CONDITIONS

- A. Environmental Limitations: Do not install roller shades until construction and finish work in spaces, including painting, is complete and dry and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- B. Field Measurements: Where roller shades are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operating hardware of operable glazed units through entire operating range. Notify Architect of installation conditions that vary from Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Roller shades shall: be flame-retardant treated 100% polyester; also treated to resist dust, dirt, static, and stains; single cell construction; aluminum alloy 6063 rails width to fit finished openings; spring for un-motorized operation by cord; concealed mounting hardware of stainless steel.
- B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 1. BTX Window Automation, Inc.
 2. Draper Inc.
 3. Hunter Douglas Contract.
 4. Lutron Electronics Co., Inc.
 5. MechoShade Systems, Inc.
 6. Shade Techniques, LLC.
 7. Silent Gliss USA, Inc.
- C. Source Limitations: Obtain roller shades from single source from single manufacturer.

2.2 SHADEBAND MATERIALS

- A. Shadeband Material Flame-Resistance Rating: Comply with NFPA 701. Testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
- B. Light-Blocking Fabric: Opaque fabric, stain and fade resistant.
 - 1. Source: Roller-shade manufacturer.
 - 2. Type: PVC free fiberglass with acrylic backing.
 - 3. Openness: 0 percent
 - 4. Orientation on Shadeband: Up the bolt.
 - 5. Color: As selected by Architect from manufacturer's full range.

2.3 ROLLER-SHADE FABRICATION

- A. Product Safety Standard: Fabricate roller shades to comply with WCMA A 100.1, including requirements for flexible, chain-loop devices; lead content of components; and warning labels.
- B. Unit Sizes: Fabricate units in sizes to fill window and other openings, measured at 74 deg F (23 deg C).
- C. Shadeband Fabrication: Fabricate shadebands without battens or seams to extent possible except as follows:
 - 1. Vertical Shades: Where width-to-length ratio of shadeband is equal to or greater than 1:4, provide battens and seams at uniform spacings along shadeband length to ensure shadeband tracking and alignment through its full range of movement without distortion of the material.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, accurate locations of connections to building electrical system, and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 ROLLER-SHADE INSTALLATION

- A. Install roller shades level, plumb, and aligned with adjacent units according to manufacturer's written instructions.
 - 1. Opaque Shadebands: Located so shadeband is not closer than 2 inches (51 mm) to interior face of glass. Allow clearances for window operation hardware.
- B. Electrical Connections: Connect motor-operated roller shades to building electrical system.

3.3 ADJUSTING

- A. Adjust and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.

3.4 CLEANING AND PROTECTION

- A. Clean roller-shade surfaces after installation, according to manufacturer's written instructions.
- B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that roller shades are without damage or deterioration at time of Substantial Completion.
- C. Replace damaged roller shades that cannot be repaired, in a manner approved by Architect, before time of Substantial Completion.

3.5 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain motor-operated roller shades.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 12570

INDUSTRIAL FURNITURE

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the Design-Builder shall be provided at no additional cost to the Agency and shall be as approved by the Contracting Officer.
- D. Furnish and install the equipment items listed below by their identifier:
 - 1. Workbench, severe duty, 6' x 32" (EQ ID: 8117)
- E. The work specified in this Section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The Design-Builder shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 2 - Site Work
 - 2. Division 3 - Concrete
 - 3. Division 5 - Metals
 - 4. Division 15 - Mechanical
 - 5. Division 16 – Electrical

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
- B. Operations and Maintenance Manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Follow the requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the Design-Builder.
- C. Substitution Approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by the MBTA .

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with Division 1 - General Requirements.

PART 2 – PRODUCTS

2.1 WORKBENCH, SEVERE DUTY, 6' X 32" (EQ ID: 8117)

- A. Manufacturer's Reference: Fabricated Item
- B. Capacities/Dimensions:

1. Load capacity: 2,500 lbs.
2. Work surface thickness: 3/8"
3. Overall dimensions (nominal):
 - a. Length: 72"
 - b. Depth: 32"
 - c. Height: 34"

C. Features/Performance/Construction:

1. Legs: Workbench legs shall be fabricated of 3" x 3" x 3/16" steel tube.
2. Leg braces: Leg braces shall be 3" x 1/4" steel plate continuously welded to tubing.
3. Top braces: Top braces shall be 3" x 3" x 1/4" steel angle with continuous electrical welds to tubing.
4. Top: Top shall be 3/8" steel plate with 50% minimum electrical welds to top braces. The corners of the top shall have a 2" radius for protection of personnel. All edges shall be ground smooth.
5. Skid plate: Skid plate shall be 4" x 4" x 1/4" steel plate with continuous welds to tubing.
6. Welds: All welds shall conform to American Welding Society standards.

D. Finish:

1. Cover all exposed steel surfaces, including both sides of the top, braces and legs, with one (1) coat of zinc chromate primer and two (2) coats of epoxy, using the MBTA's choice color

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Perform work under the direct supervision of the Foreman or Construction Superintendent who has the authority to coordinate the installation of scheduled equipment with the Architect or designated representative.
- B. Install equipment in accordance with the plans, shop drawings, and manufacturer's instructions:
 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 3. Anchorage: Attach equipment as directed by the Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the Architect or designated representative for acceptance inspection.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 12690

ENTRANCE MATS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies recessed entrance mats and frames of the following types:
 - 1. Aluminum entrance mat with carpet inserts.
 - 2. Polypropylene entrance mats.
- B. Related Work:
 - 1. Section 03300- CAST-IN-PLACE CONCRETE.

1.2 SUBMITTALS

- A. Product Data: Submit manufacturer's product data, installation instructions, and maintenance recommendations for each material used. Provide certifications stating that materials comply with requirements.
- B. Shop Drawings: Provide large scale shop drawings for fabrication and installation of all parts of the work. Provide large scale plans and details of anchorages, connections and accessory items. Provide installation templates for frames installed in coordination with concrete work.
- C. Field Measurements: Where possible, take accurate field measurements before preparation of shop drawings and fabrication. Do not delay job progress; allow for field cutting and fitting where taking field measurements before fabrication is not possible.
- D. Verification Samples: Submit representative samples of each material that is to be exposed in the finished work, showing the full range of finish variations expected. Provide samples having minimum area of 144 square inches.

1.3 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials and products in unopened factory labeled packages. Store and handle in strict compliance with manufacturers' instructions and recommendations. Protect from damage.
- B. Sequence deliveries to avoid delays, but minimize on-site storage.

1.4 SEQUENCING AND SCHEDULING

- A. Conference: Convene a pre-installation conference to establish procedures to coordinate this work with related and adjacent work.
- B. Provide oversized recess in concrete subfloors and delay actual installation of recessed mat frame until near time of Substantial Completion of Project. Do not install mats until immediately before Authority's Final Acceptance of the Project.

PART 2 - PRODUCTS

2.1 ENTRANCE MATS

- A. Basis-of-Design: Advanced Track by Mats Inc., or equal by Construction Specialties, Kadee Industries or equal Provide aluminum entrance grate and frame as follows:
 - 1. Type: Cross-bolted heavy gauge 6061-T6 aluminum with aluminum alloy 6063-T5 scraping rails and 100 percent nylon fiber drying inserts. Panel thickness 1-1/2 inches for recessed mounting. Blade spacing not to exceed 3/16 inch. Manufacturer's standard 10 year warranty. Insert color as selected by Engineer from manufacturer's standard colors
- B. Basis-of-Design: Berber Vinylback by Mats Inc., or equal by Construction Specialties, Kadee Industries or equal Provide aluminum entrance grate and frame as follows:
 - 1. Type: 100% solution-dyed UV stabilized polypropylene fibers with Premium SureTac Vinyl backing. Mat thickness 3/8 inches. Face weight 37 ounces per square yard; loose lay installation. Manufacturer's standard 1 year warranty. Color as selected by Engineer from manufacturer's standard colors.

2.2 FABRICATION

- A. Fabricate frame to be truly straight, level and square. Provide frame pieces in longest available lengths to minimize joints. Space unavoidable joints evenly about centerline of mat and spline butt-joints with connecting pins. Form corners with tightly mitered joints or use prefabricated jointless corners.
- B. Shop fabricate framework to the greatest extent possible.

PART 3 - EXECUTION

3.1 INSPECTION

- A. The Installer shall examine substrates, supports, and conditions under which this work is to be performed and notify Contractor, in writing, of conditions detrimental to the proper completion of the work. Do not proceed with work until unsatisfactory conditions are corrected. Beginning work means Installer accepts substrates and conditions.

3.2 INSTALLATION

- A. Strictly comply with manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this Section.
- B. Coordinate top of grid elevation with frame and floor elevations to provide proper foot cleaning and to avoid all possibility of tripping hazard. Coordinate installation with door bottom clearances of doors that swing across grids.
 - 1. Entrance grates shall be fabricated full length in not less than two (2) equal width sections, unless otherwise indicated. For mats over 5 ft. in width, provide equal width sections not less than 214 in. or more than 36 in. in width. Length shall be measured perpendicular to path of travel. Width of section shall be measured parallel to path of travel.

- C. Install frame near time of Substantial Completion of Project. Shim and grout frame into oversize recess. Provide temporary filler of plywood or other suitable material to protect frame until installation of grid at time of final acceptance of Project.

3.3 CLEANING

- A. Clean exposed surfaces using materials and methods recommended by manufacturer of material or product being cleaned. Remove and replace work that cannot be successfully cleaned.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for work under this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 13200

STORAGE TANKS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the Design-Builder shall be provided at no additional cost to the Agency and shall be as approved by the Contracting Officer.
- D. Furnish and install the equipment items listed below by their identifier:
 - 1. Tank, Waste Oil, w/Transfer Pump, 250 gallons (EQ ID: 7937)
- E. The work specified in this Section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in 1.2, Related Work.

1.2 RELATED WORK

- A. Carefully examine all of the contract documents for requirements which affect the work of this section.
- B. The Design-Builder shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 2 - Site Work
 - 2. Division 3 - Concrete
 - 3. Division 5 - Metals
 - 4. Division 15 - Mechanical
 - 5. Division 16 - Electrical

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Division 1 - General Requirements.
- B. Operations and Maintenance Manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
- B. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the Design-Builder.
- C. Substitution Approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by the MBTA.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer’s containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer’s recommended preventive maintenance schedule.
- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with Division 1 - General Requirements.

PART 2 – PRODUCTS

2.1 TANK, WASTE OIL, W/TRANSFER PUMP, 250 GALLONS (EQ ID: 7937)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on furniture identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Containment Solutions, (877) CSI-TANK
 - 1) Model: Safewaste SW250
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, furniture produced by other manufacturers, including the following, may be considered as equal.
 - a. XXXX
 - b. YYYY

B. General Tank Description:

1. Capacity: 250 gallons.
2. The Aboveground Used Oil Collection and Storage System is to be constructed in accordance with National, State, and Locally recognized Aboveground Storage Tank Standards, such as: Underwriters Laboratory Standard 142 for the primary tank, National Fire Protection Association Sections 30 & 30A, and Uniform Fire Code.
3. The system is to provide a minimum of 110% secondary containment for the primary tank, and 360° radius containment for the primary tank and control assemblies.
4. The control assemblies shall be new, and installed on top of the primary tank at the factory.
5. The anchoring tie downs shall be an integral part of the exterior support feet and shall be welded to the bottom of the Environmental Tank Enclosure.
6. The system must be off-loaded on site with a large forklift or crane.
7. All openings in the primary tank shall be from the top, with threaded NPT fittings.
8. The system shall include a one (1) year warranty for the tanks and accessories.
9. The manufacturer shall provide proof of a minimum 5 years of manufacturing hazardous liquid storage systems.

C. Primary Storage Tank:

1. The primary storage tank shall be rectangular in design and constructed of UL specified steel thickness, with continuous welds.
2. The primary storage tank shall be constructed and listed in accordance with UL 142 standards.

3. The primary tank shall be fitted with a minimum of: a 3/4" product inlet, a 2" overfill prevention valve, a 2" suction tube for product withdrawal, a 2" primary working vent, either a 4" or 6" emergency vent, a 2" product level gauge, and a 1" sampling port.
4. The primary tank shall be pressure tested to UL 142 Standard (minimum 3 to maximum 5 psi) at the factory.
5. The primary tank shall be mounted within the secondary containment cabinet by means of at least four (4) stabilizing brackets to prevent the primary tank from shifting.
6. The primary tank shall be placed within the secondary containment cabinet with a minimum of 3" visual clearance around all sides to allow for 100% visual inspection.
7. The exterior of the primary tank shall be cleansed of foreign material, and coated with a corrosion resistant industrial paint (3 to 5 mils dry film thickness).

D. Environmental Tank Enclosure:

1. The Environmental Enclosure (secondary leak containment tank) shall be rectangular in design and constructed with a minimum 12 ga. steel. All welds shall be full penetration.
2. The Environmental Enclosure shall be separate from the primary tank, and shall not be welded or attached to the primary tank in any fashion.
3. The secondary leak containment tank shall completely enclose the primary tank and all operating equipment (360° radius), providing secondary containment to the primary tank and operating equipment. It shall be sized to contain 110% of the primary tank storage capacity.
4. The inside bottom of the secondary tank shall be fitted with a minimum of two (2) raised steel channels (a minimum of 2" in height), to support the primary tank above the secondary tank floor.
5. The secondary tank shall be supported by two (2) 4" high steel support feet channels with integral anchoring holes to maintain ground clearance for better anchoring to concrete foundation.
6. The secondary tank shall contain a removable, locking roof that provides at least 30" of clearance from the top of the primary tank to the bottom of the roof.
7. The secondary containment cabinet shall contain louvered vents on the cabinet, which is above the level of the primary tank. These vents shall provide a minimum of 20" of venting capacity.
8. The secondary containment cabinet shall contain a knock-out hole above the primary tank level to provide for the working vent installation. Internally threaded couplers for air supply hose (1/2") and product suction (3/4") shall be welded into the side of the cabinet above the top of the primary tank, so that the respective hoses are easily installed, and contractors do not have to create any hole in the side of the cabinet. The cabinet shall not be drilled or penetrated, or in any way destroy the integrity of its containment capacity.
9. The secondary containment cabinet shall include a hinged, locking security door with viewport for the product level gauge and OPTIONAL annular space leak detection gauge, and shall be mounted on a removable door frame, at or above the level of the primary tank. This will provide access to the components for service or extraction operations. The removable door frame shall allow for easy replacement of the door and frame if they are damaged during operating procedures.
10. The interior surface of the secondary containment cabinet shall be cleansed of foreign material, and coated with a corrosion resistant industrial paint (3 to 5 mils dry film thickness). The exterior

surface of the secondary containment cabinet shall be cleansed of foreign material, and coated with a corrosion resistant industrial paint (3 to 5 mils dry film thickness).

11. The primary tank shall be stabilized from lateral movement within the enclosure by placement of four (4) lateral supports, one at each corner of the primary tank, welded to the base plate of the enclosure.

E. Control Assemblies:

1. The control assemblies shall be installed on top of the primary tank, enclosed totally within the environmental containment cabinet and tested at the factory before shipment.
2. PUMP ASSEMBLY: The pump assembly consists of a 1" UL Listed air operated double diaphragm suction pump with a capacity of 10-15 gpm at 50 psi.
3. AUTOMATIC OVERFILL VALVE ASSEMBLY: The automatic overfill valve assembly consists of air operated valve that is preset at the factory to stop the air flow to the suction pump when the liquid level in the storage tank reaches 95% of its capacity. This assembly also includes an air filter/regulator, pressure gauge, and flexible air supply hose to connect the valve to the 1/2" coupler and air pump.
4. AUDIBLE ALARM: The audible alarm is incorporated within the automatic overfill valve assembly, and engages at the 95% capacity level.
5. PRODUCT INTAKE LINE: The product intake line consists of a UL Listed 3/4" by 8' hardwall suction hose with in-line strainer, one each 3/4" female quick coupler and 3/4" male quick coupler, and hose hanger bracket.
6. PRODUCT REMOVAL: The product contained inside the primary tank shall be removed through a 2" cam and groove fitting with locking cap assembly and 2" suction tube.
7. NORMAL VENTING: The working vent consists of a 2" mushroom vent cap and rubber grommet for sealing penetration through the secondary tank.
8. EMERGENCY VENT: The emergency vent consists of a 4" or 6" emergency relief device.
9. PRODUCT LEVEL GAUGE: The sight level gauge is mechanical, reading in inches. A tank conversion chart shall be provided to convert the inch readings into gallons.
10. ANNULAR SPACE LEAK DETECTOR: An OPTIONAL leak gauge can be installed.

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Perform work under the direct supervision of the Foreman or Construction Superintendent who has the authority to coordinate the installation of scheduled equipment with the Architect or designated representative.
- B. Install equipment in accordance with the plans, shop drawings, and manufacturer's instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 - 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 - 3. Anchorage: Attach equipment as directed by the Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Notify the Architect or designated representative for acceptance inspection.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 14100

DUMBWAITERS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. The provisions of Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions apply to the Work in this Section.
- B. Furnish and install as required all equipment, as specified, complete and ready for operation. Provide any necessary accessories, mechanical, electrical and structural items, whether specified or not in order to deliver properly installed and functional equipment.
- C. Equipment shall be suitable for installation in the space allocated and operate on the available building utilities. Any modification or redesign to the building structure or utilities because of an alternate equipment selection by the Design-Builder shall be provided at no additional cost to the Agency and shall be as approved by the Contracting Officer.
- D. Furnish and install the equipment items listed below by their identifier:
 - 1. Lift, Parts, Two stops, 3,000 lbs. (EQ ID: 9705)
- E. The work specified in this Section shall be performed and coordinated with the work of other trades including, but not limited to, those listed in 1.2, Related Work.

1.2 RELATED WORK

- F. Carefully examine all of the contract documents for requirements which affect the work of this section.
- G. The Design-Builder shall coordinate all disciplines indicated herein and as required to ensure that the equipment is tested, inspected and fully operational prior to use. Specification divisions which directly relate to the work of this Section include, but are not limited to, the following:
 - 1. Division 2 - Site Work
 - 2. Division 3 - Concrete
 - 3. Division 5 - Metals
 - 4. Division 15 - Mechanical
 - 5. Division 16 – Electrical

1.3 SUBMITTALS

- A. Product Data - Submit Product Data in accordance with Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
- B. Operations and Maintenance Manual - Provide a complete parts, operating and maintenance manual covering the equipment when the item is shipped.

1.4 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five (5) years experience supplying the specified equipment.

1.5 PRODUCT SUBSTITUTIONS

- A. Follow the requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from product substitutions other than those specified, including drawing changes and construction will be at the expense of the Design-Builder.
- C. Substitution Approval: Prior to delivery or installation, submittals for each item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by the Owner and Architect.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Deliver equipment in the manufacturer’s containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Permanently label all containers, including those contained in others, on the outside with item description(s) per title and the Equipment Identifier listed in this specification.
- C. Provide the equipment and materials specified complete in one shipment for each item. Split or partial shipments are not permissible.

1.7 WARRANTY

- A. Warrant work specified herein for one (1) year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include all materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect,

misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.

- D. All parts shall be readily available locally in the United States.
- E. Submit warranties in accordance with Division 1 - General Requirements.

PART 2 – PRODUCTS

2.1 LIFT, PARTS, TWO STOPS, 3,000 LBS. (EQ ID: 9705)

A. Manufacturer's Reference:

1. Prime Manufacturer: Specifications are based on furniture identified herein by the manufacturer's name and model in order to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Pflow Industries, (414) 352-9000
 - 1) Model: Series D VRC
2. Alternate manufacturers: Contingent upon compliance with these specifications, and the documentation requirements set forth in Division 1 - Submittals, furniture produced by other manufacturers, including the following, may be considered as equal.
 - a. XXXX
 - b. YYYY

B. General Description

1. The parts lift purpose is to provide the capability to roll a pallet into the lift with a pallet jack, lower the pallet to the pit floor, then roll off the pallet from the other side to allow transport of parts and equipment to and from the pit.

C. Capacities/Dimensions:

1. Capacity: The VRC shall be rated at a live load capacity of 3000 lbs..
2. Speed: The VRC shall have a lifting speed of 17 feet per minute when loaded to capacity.
3. Vertical Travel: The VRC shall have a total of 2 operating levels.
4. Lift Platform: The VRC platform shall be a minimum of 60 inches wide x 60 inches long x 84" load height with a steel deck plate and minimum 48" high welded handrails and kickplates on non-operating ends and safety chains with snaphooks on operating ends.

5. Support Columns: The VRC shall have a minimum of two (2) 6” wide, roll formed or wide flange support columns.
6. Deflection Under Load: When loaded to rated capacity, no portion of the VRC shall exhibit permanent deformations.
7. Hydraulic Power Unit:
 - a. A pressure compensated flow control valve shall be included to provide for safe lowering of the load.
 - b. A velocity sensing check valve is required to prevent uncontrolled carriage descent in case of a failure in the hydraulic pressure line.
 - c. A pressure relief valve shall be provided to protect the hydraulic system from excessive pressure due to overloading or jam situations.
8. Lifting Means:
 - a. Raising and lowering of the carriage shall be provided by dual 2” ram direct-acting hydraulic cylinders. Sheaves, wire ropes, or chains are not to be incorporated in the lifting means.
 - b. An adjustable mechanical stop and pressure switch act to limit the upward travel of the lift platform to a height flush and level with the upper floor. The pressure switch shall be designed and set to allow full build up of hydraulic pressure to secure the lift platform in place and prevent bounce during loading or unloading.
9. Safety Enclosure: Guarding on all non-operating sides of the VRC shall be by safety enclosures a minimum of 8’ high consisting of material which will reject a ball 1/2” in diameter.
10. Floor Level Gates: Gates are required on all operating sides of the VRC at each level of operation.
 - a. The gates shall be (vertical acting) (swing) (slide) type.
 - b. Each gate shall be equipped with an electro-mechanical interlock to prevent opening of the gate unless the carriage is present, and to prevent operation of the VRC unless all gates are closed.
11. Signs: “NO RIDER” signs shall be provided. Lettering shall be a minimum of 2” high for visibility.
12. Approach Ramp: If a pit is not specified, the manufacturer shall supply or option a steel fabricated approach ramp to be installed within 1” of the VRC platform at the ground level.

VRC ELECTRICAL SPECIFICATION

13. Motor:
 - a. Motor horsepower shall be sized for the rated live load and specified speed.

- b. All motors are three phase and shall be designed for continuous duty at ambient temperatures from 32° to 102° Fahrenheit.

14. Controls:

- a. Each operating floor level shall be equipped with a momentary contact push button control station with call, send, and mushroom style E-stop operators for manual control of lift operation.
- b. An internally pre-wired main control panel shall be provided with step-down transformer and field wiring terminal block.
- c. The motor/pump unit shall be pre-wired to the main control panel.
- d. Provide quick-connect type cables and connectors for field connection of push button control stations and gate interlocks to the main control panel.

15. Power Source: Owner shall terminate high voltage operating power within 10' of the location designated for installation of the VRC.

FINISHES

- 16. All carbon steel surfaces shall be coated with an industrial enamel finish over primer.
- 17. Prior to painting, all dirt, mill scale, oil, and grease shall be removed from carbon steel surfaces by a combination of brushing, wiping, and use of solvents.

PART 3 – EXECUTION

3.1 INSPECTION

- A. Coordinate the location of rough-in work and utility stub-outs to assure that they match with the equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare the delivered equipment with packing lists and specifications to assure receipt of all items and specified accessories.

3.2 INSTALLATION

- A. Perform work under the direct supervision of the Foreman or Construction Superintendent who has the authority to coordinate the installation of scheduled equipment with the Architect or designated representative.
- B. Install equipment in accordance with the plans, shop drawings, and manufacturer's instructions:

1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, and professional manner without damaging equipment or adjacent work.
 3. Anchorage: Attach equipment as directed by the Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of the work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.3 TESTING

- A. After final installation is complete, and prior to authorizing payment, specified equipment shall be checked against the specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.
- B. Operating Load Test: The owner will provide a 3000 pound test load and load the VRC at the ground level. The loaded VRC platform shall be conveyed to an upper floor level and returned to the ground level to assure proper operation. If the VRC conveyor cannot lift or lower the load, the VRC shall fail the test.
- C. Performance Test: This Test is to be performed in conjunction with Test 1 above. During the demonstration of the lifting and lowering test, the owner shall measure the time required to lift and lower the capacity load. The owner will average times for lifting and lowering the load and calculate the average lifting and lowering speed. If the VRC does not lift the load within 10% of the specified speed, or if the lowering speed exceeds the lifting speed by more than 10%, the VRC shall fail the test.
- D. Stationary Load Test: This Test is to be performed in conjunction with Test 1 above. The loaded VRC platform shall remain stationary at an upper level for a minimum of one (1) hour. After the one (1) hour period, the VRC will be inspected for deflection of the components or drift of the platform. If deformation or downward drift is evident, the VRC shall fail the test.

3.4 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean the area around equipment installation and remove packing and installation debris from the job site.
- D. Verify that equipment is properly installed and guarded per ANSI/ASME B20.1
- E. Notify the Architect or designated representative for acceptance inspection.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 15050

BASIC MATERIALS AND METHODS FOR HVAC WORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.

1.2 SUMMARY

- A. This Section includes the following:

1. Piping materials and installation instructions common to most piping systems.
2. Ductwork materials and installation instructions common to most air systems.
3. Transition fittings.
4. Dielectric fittings.
5. Mechanical sleeve seals.
6. Sleeves.
7. Escutcheons.
8. Grout.
9. Equipment installation requirements common to equipment sections.
10. Painting and finishing.
11. Concrete bases.
12. Supports and anchorages.

- B. Related Sections:

1. Volume 2 Technical Provisions Exhibit 2I “Additional Project Requirements” – SUSTAINABILITY REQUIREMENTS
2. Section 03300 - CAST IN PLACE CONCRETE
3. Section 07840 - FIRE STOPPING
4. Section 07920 - JOINT SEALANTS
5. Section 08139 – ACCESS DOORS
6. Section 09900 – PAINTING
7. Section 15058 – COMMON MOTOR REQUIREMENTS FOR EQUIPMENT
8. Section 15062 – HANGERS AND SUPPORTS FOR PIPING AND EQUIPMENT
9. Section 15074 – VIBRATION AND SEISMIC CONTROLS FOR PIPING AND EQUIPMENT
10. Section 15077 – IDENTIFICATION FOR PIPING AND EQUIPMENT
11. Section 15086 – DUCT INSULATION
12. Section 15088 – HVAC PIPING INSULATION
13. Section 15093 – SLEEVES AND SLEEVE SEALS FOR PIPING
14. Section 15112 – GENERAL-DUTY VALVES FOR PIPING
15. Section 15127 – METERS AND GAGES FOR PIPING

1.3 DEFINITIONS

- A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.
- B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.
- C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations, installations below overhangs.
- D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.
- E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.
- F. The following are industry abbreviations for National and International Standards organizations:
 - 1. ASME: American Society of Mechanical Engineers
 - 2. ASTM: American Society for Testing and Materials.
 - 3. AWS: American Welding Society
 - 4. SMACNA: Sheet Metal and Air Conditioning Contractors' National Association.
- G. The following are industry abbreviations for plastic materials:
 - 1. ABS: Acrylonitrile-butadiene-styrene plastic.
 - 2. CPVC: Chlorinated polyvinyl chloride plastic.
 - 3. PE: Polyethylene plastic.
 - 4. PVC: Polyvinyl chloride plastic.
 - 5. PP-R: Polypropylene pipe
 - 6. PEX: Crosslinked Polyethylene Plastic
- H. The following are industry abbreviations for rubber materials:
 - 1. EPDM: Ethylene-propylene-diene terpolymer rubber.
 - 2. NBR: Acrylonitrile-butadiene rubber.

1.4 SUBMITTALS

- A. Product Data: For the following:
 - 1. Transition fittings.
 - 2. Dielectric fittings.
 - 3. Mechanical sleeve seals.
 - 4. Escutcheons.

5. Painting

B. Welding certificates.

1.5 QUALITY ASSURANCE.

A. System Life Expectancy:

1. All HVAC piping and ductwork distribution systems shall be designed and installed with materials and practices to meet a minimum 50-year median useful life in their respective environments. This includes the selection of appropriate corrosion resistant materials, compatible joining methods, provisions for moisture shedding, access for inspection, cleaning and service and isolation from incompatible materials, protection from wildlife and moisture.
2. All HVAC system equipment including but not limited to fans, refrigerant-based air conditioning equipment and electric fan-forced heaters shall be selected, designed and installed to meet a minimum median 15 year operating useful life in their respective environments. Design and installation shall take into account access for regular service and replacement. This shall include the ability to disconnect, make safe and remove a piece of equipment and replace in-kind, restored to function, without disrupting other services.
3. For specific equipment not listed, the median useful life shall conform to "Table 4 Comparison of Service Life Estimates, 2015 ASHRAE Handbook, HVAC Applications".
4. Useful life shall include consideration of the expected design duty including hours of use, frequency of start-stop cycles, availability of common or specific parts and consumables including attic stock spare parts to limit down-time.
5. Where rotating equipment uses selectable bearings, the bearings shall have a minimum duty life of L10 - 200,000 Hours.

B. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

C. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

D. Electrical Characteristics for Mechanical Equipment: Equipment that requires different voltages, amperages or additional, electrical services, devices or equipment may be furnished provided such proposed equipment is approved in writing, connecting electrical services, circuit breakers, and conduit sizes are appropriately modified, and required additional services, devices and equipment are provided. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements. Variations approved under this subparagraph shall be at no additional cost to the MBTA.

E. Ductwork Materials and Configurations: Ductwork installed in interior locations at a minimum shall be fabricated per standard SMACNA figures of minimum G90 galvanized sheet steel of not less than

24 gauge. Default minimum pressure class shall be 2.0 inches. Seal and leakage class shall be Seal Class A/Leakage Class 3. Ductwork conveying moist air, including locker-shower areas, vehicle wash areas, shall be aluminum. Sheet metal exposed to the weather shall be 304 or 316 Stainless Steel. Higher pressure classes and materials of construction for corrosion resistance shall be specified, furnished and installed according to their system requirements, including process exhaust, material handling and locations of exposure. Other duct categories shall be designed for specific processes and applications, including exposed ductwork for architectural aesthetic requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver pipes and tubes with factory-applied end caps and ductwork ends sealed with self-adhering plastic wrap. Maintain end caps and sealing means through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture into piping and ductwork.
- B. Maintain all crating and shrink-wrapping in factory condition except where inspection is required. All protection shall be restored to factory condition after inspections.

1.7 COORDINATION

- A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.
- B. Coordinate installation of required supporting devices in form work and set sleeves in poured-in-place concrete and other structural components as they are constructed.
- C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 8 Section "Access Doors and Frames."
- D. Coordinate requirements for concrete pads and foundations with the providing subcontractor. In general, all concrete pads shall be of sufficient height to promote drainage from the equipment but not less than four (4) inches high and shall extend beyond the supporting footprint of the equipment by not less than six (6) inches in all directions. Concrete work is specified in DIVISION 3.

Special Coordination at the VMF: The Vehicle Maintenance Facility is intended to have a light-weight insulated panel skin system which will be replaceable over time. No connections of services, piping, conduits, clips controls, equipment and the like, shall be attached directly to this panel system. All attachments of such services to the exterior walls shall be made only to permanent structure, girts or secondary steel strut systems, independent of the exterior panel skin system.

1.8 MANUFACTURERS

- A. There is no intention of requiring proprietary products for products and systems under this section. Any reference to a particular manufacturer is to indicate the level of quality and commercial availability of the product or system in a competitive market.
- B. The final Design-Builder design specifications shall indicate at least three manufacturer's names for the proposed equipment, product or system. This requirement does not apply to common sundry

materials such as piping and sheet metal available from numerous suppliers, subject to meeting the specifications.

PART 2 - PRODUCTS

2.1 PIPE, TUBE, AND FITTINGS

Refer to individual Division 15 piping Sections for pipe, tube, and fitting materials and joining methods.

2.2 JOINING MATERIALS

A. Refer to individual Division 15 piping Sections for special joining materials for specific systems.

2.3 DIELECTRIC SEPARATION

A. Description: Separate connections of dis-similar metals with electrically insulated devices. Refer to individual Division 15 piping Sections for dielectric separation for specific systems.

2.4 SLEEVES

A. Refer to Section 15093- "SLEEVES AND SLEEVE SEALS FOR PIPING".

2.5 ESCUTCHEONS

A. Refer to Section 15098 "ESCUTCHEONS FOR HVAC PIPING."

2.6 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.

1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
2. Design Mix: (5000-psi), 28-day compressive strength.
3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 15 Sections for specific piping systems.

- B. All piping installations shall be installed with provisions to allow thermal expansion in runs over 25 feet and where piping passes across building expansion joints. Expansion shall be accommodated by means of offsets, passive loops, applied expansion joints, anchors and guides.
- C. Verify final equipment locations for roughing-in.
- D. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.2 PIPING JOINT CONSTRUCTION

- A. Join pipe and fittings according to the Division 15 Sections for specific piping systems.

3.3 PIPING CONNECTIONS

- A. Make connections according to the Division 15 Sections for specific piping systems.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

- A. Install equipment to allow maximum possible headroom unless specific mounting heights are indicated.
- B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.
- C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.
- D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

- A. Painting of mechanical systems, equipment, and components is specified in Division 9 Section 09900 "PAINTING."
- B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.6 CONCRETE BASES

- A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project. All concrete bases shall be furnished and installed as specified under DIVISION 3.
 - 1. Coordinate concrete bases of dimensions indicated, but not less than (4 inches) larger in both directions than supported unit.

2. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.
5. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.7 ERECTION OF WOOD SUPPORTS AND ANCHORAGES

- A. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor mechanical materials and equipment.
- B. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.
- C. Attach to substrates as required to support applied loads.

3.8 GROUTING

- A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.
- B. Clean surfaces that will come into contact with grout.
- C. Provide forms as required for placement of grout.
- D. Avoid air entrapment during placement of grout.
- E. Place grout, completely filling equipment bases.
- F. Place grout on concrete bases and provide smooth bearing surface for equipment.
- G. Place grout around anchors.
- H. Cure placed grout

PART 4 - MEASUREMENTS AND PAYMENTS

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 15051

BASIC MATERIALS AND METHODS FOR PLUMBING WORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.

1.2 SUMMARY

- A. This Section includes the following:

1. Piping materials and installation instructions common to most piping systems.
2. Transition fittings.
3. Dielectric fittings.
4. Mechanical sleeve seals.
5. Sleeves.
6. Escutcheons.
7. Grout.
8. Equipment installation requirements common to equipment sections.
9. Painting and finishing.

21. Section 15165 - STORM DRAINAGE PIPING SPECIALTIES

22. Section 15182 – HIGH PRESSURE PIPING
23. Section 15195 - FACILITY NATURAL-GAS PIPING

C. Product Conformance

1. All plumbing and gas-related equipment, products and appliances shall be approved by the Commonwealth of Massachusetts Board of State Examiners of Plumbers and Gas Fitters, for the appropriate category of Plumbing, Gas or Plumbing/Gas Combination and the approval number furnished with the submittals.

1.3 DEFINITIONS

- A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.
- B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.
- C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations, installations below overhangs.
- D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.
- E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.
- F. The following are industry abbreviations for National and International Standards organizations:
 1. ASME: American Society of Mechanical Engineers.
 2. ASPE: American Society of Plumbing Engineers.
 3. ASTM: American Society for Testing and Materials.
 4. AWS: American Welding Society.
 5. AWWA: American Water Works Association.
- G. The following are industry abbreviations for plastic materials:
 1. ABS: Acrylonitrile-butadiene-styrene plastic.
 2. CPVC: Chlorinated polyvinyl chloride plastic.
 3. PE: Polyethylene plastic.
 4. PVC: Polyvinyl chloride plastic.
- H. The following are industry abbreviations for rubber materials:
 1. EPDM: Ethylene-propylene-diene terpolymer rubber.
 2. NBR: Acrylonitrile-butadiene rubber.

1.4 SUBMITTALS

- A. Product Data: For the following:
 - 1. Transition fittings.
 - 2. Dielectric fittings.
 - 3. Mechanical sleeve seals.
 - 4. Escutcheons.
 - 5. Painting
- B. Welding certificates.

1.5 QUALITY ASSURANCE.

- A. System Life Expectancy:
 - 1. All plumbing piping distribution systems shall be designed and installed with materials and practices to meet a minimum 50-year median useful life in their respective environments. This includes the selection of appropriate corrosion resistant materials, permanent coatings, compatible joining methods, provisions for moisture shedding, access for inspection, cleaning and service and isolation from incompatible materials, protection from wildlife and moisture.
 - 2. Design and installation shall take into account access for regular service and replacement. This shall include the ability to disconnect, make safe and remove a piece of equipment and replace in-kind, restored to function, without disrupting other services.
 - 3. All plumbing system fixtures including but not limited to water closets, lavatories, service sinks, eyewash and emergency shower stations shall be selected, designed and installed to meet a minimum median 30 year operating useful life in their respective environments, with faucets, flush valves, exposed connections and associated trim to meet a minimum median 15 year operating useful life.
 - 4. Domestic Hot Water Heaters shall be selected for the following: Fuel Fired; Gas: 10-year minimum warranty; 10-year median useful life. Electric Resistance: 10-year minimum warranty; 12-year median useful life. Electric Heat Pump: 10-year minimum warranty; 8-year median useful life.
 - 5. Useful life shall include consideration of the expected design duty including hours of use, frequency of start-stop cycles, availability of common or specific parts and consumables including attic stock spare parts to limit down-time.
- B. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."
- C. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
 - 1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."

2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
- D. Electrical Characteristics for Mechanical Equipment: Equipment that requires different voltages, amperages or additional, electrical services, devices or equipment may be furnished provided such proposed equipment is approved in writing, connecting electrical services, circuit breakers, and conduit sizes are appropriately modified, and required additional services, devices, and equipment are provided. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements. Variations approved under this subparagraph shall be at no additional cost to the MBTA.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver all materials, fixtures, pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.
- B. Maintain all crating and shrink-wrapping in factory condition except where inspection is required. All protection shall be restored to factory condition after inspections.
- C. Store plastic pipes protected from direct sunlight. Properly support plastic pipes to prevent sagging and bending.

1.7 COORDINATION

- A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.
- B. Coordinate installation of required supporting devices in form work and set sleeves in poured-in-place concrete and other structural components as they are constructed.
- C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces. Access panel and doors shall be flush mounted, paintable and use concealed hinges and latches.
- D. Coordinate requirements for concrete pads and foundations with the providing subcontractor. In general, all concrete pads shall be of sufficient height to promote drainage from the equipment but not less than four (4) inches high and shall extend beyond the supporting footprint of the equipment by not less than six (6) inches in all directions. Concrete work is specified in DIVISION 3.
- E. Special Coordination at the VMF: The Vehicle Maintenance Facility is intended to have a light-weight insulated panel skin system which will be replaceable over time. No connections of services, piping, conduits, clips controls, equipment and the like, shall be attached directly to this panel system. All attachments of such services to the exterior walls shall be made only to permanent structure, girts or secondary steel strut systems, independent of the exterior panel skin system.

1.8 MANUFACTURERS

- A. There is no intention of requiring proprietary products for products and systems under this section. Any reference to a particular manufacturer is to indicate the level of quality and commercial availability of the product or system in a competitive market.
- B. The final Design-Builder design specifications shall indicate at least three manufacturer's names for the proposed equipment, product or system. This requirement does not apply to common sundry materials such as piping and joining materials available from numerous suppliers, subject to meeting the specifications.

PART 2 - PRODUCTS

2.1 PIPE, TUBE, AND FITTINGS

- A. Refer to individual Division 15 piping Sections for pipe, tube, and fitting materials and joining methods. For specific systems with additional joining requirements.
- B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.2 JOINING MATERIALS

- A. Refer to individual Division 15 piping Sections for specific systems for special joining materials not listed below.
- B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of the fluids within the piping system
 - 1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
 - a. Full-Face Type: For flat-face, Class 125, and Class 250 cast-iron and cast-bronze flanges.
 - b. Narrow-Face Type: For raised-face, steel flanges.
 - 2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.
- C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.
- D. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated. Full face gaskets required.
- E. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
- F. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAgl, silver alloy for refrigerant piping and copper tubing run below slabs or below grade outside the building lines, unless otherwise indicated.

- G. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.3 TRANSITION FITTINGS

- A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Cascade Waterworks Mfg. Co.
 - b. Dresser Industries, Inc.; DMD Div.
 - c. Ford Meter Box Company, Incorporated (The); Pipe Products Div.
 - d. JCM Industries.
 - e. Smith-Blair, Inc.
 - f. Viking Johnson.
 2. Underground Piping NPS 1-1/2 and Smaller: Manufactured fitting or coupling.
 3. Underground Piping NPS 2 and Larger: AWWA C219, metal sleeve-type coupling.
 4. Aboveground Pressure Piping: Pipe fitting.
- B. Plastic-to-Metal Transition Fittings: PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Eslon Thermoplastics.
- C. Plastic-to-Metal Transition Adaptors: One-piece fitting with manufacturer's SDR 11 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Thompson Plastics, Inc.
- D. Plastic-to-Metal Transition Unions: MSS SP-107, PVC four-part union. Include brass end, solvent-cement-joint end, rubber O-ring, and union nut.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. NIBCO INC.
 - b. NIBCO, Inc.; Chemtrol Div.
- E. Flexible Transition Couplings for Underground Nonpressure Drainage Piping: ASTM C 1173 with elastomeric sleeve, ends same size as piping to be joined, and corrosion-resistant metal band on each end.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Cascade Waterworks Mfg. Co.
 - b. Fernco, Inc.
 - c. Mission Rubber Company.
 - d. Plastic Oddities, Inc.

2.4 DIELECTRIC FITTINGS

- A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.
- B. Insulating Material: Suitable for system fluid, pressure, and temperature.
- C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 deg F.
 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Capitol Manufacturing Co.
 - b. Central Plastics Company.
 - c. Eclipse, Inc.
 - d. EpcO Sales, Inc.
 - e. Hart Industries, International, Inc.
 - f. Watts Industries, Inc.; Water Products Div.
 - g. Zurn Industries, Inc.; Wilkins Div.
- D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.
 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Capitol Manufacturing Co.
 - b. Central Plastics Company.
 - c. EpcO Sales, Inc.
 - d. Watts Industries, Inc.; Water Products Div.
- E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Advance Products & Systems, Inc.
 - b. Calpico, Inc.
 - c. Central Plastics Company.
 - d. Pipeline Seal and Insulator, Inc.

2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.
- F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Calpico, Inc.
 - b. Lochinvar Corp.
- G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Perfection Corp.
 - b. Precision Plumbing Products, Inc.
 - c. Sioux Chief Manufacturing Co., Inc.
 - d. Victaulic Co. of America.

2.5 MECHANICAL SLEEVE SEALS

- A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Advance Products & Systems, Inc.
 - b. Calpico, Inc.
 - c. Metraflex Co.
 - d. Pipeline Seal and Insulator, Inc.
 2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
 3. Pressure Plates: Stainless steel. Include two for each sealing element.
 4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.6 SLEEVES

- A. Refer to Section 15093- "Sleeves and Sleeve Seals for Piping".

2.7 ESCUTCHEONS

- A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.
- B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.
- C. One-Piece, Cast-Brass Type: With set screw.
 - 1. Finish: Polished chrome-plated.
- D. One-Piece, Stamped-Steel Type: With set screw or spring clips and chrome-plated finish.
- E. One-Piece, Floor-Plate Type: Cast-iron floor plate.

2.8 GROUT

- A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
 - 1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
 - 2. Design Mix: 5000-psi, 28-day compressive strength.
 - 3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

- A. Install piping according to the following requirements and Division 15 Sections specifying piping systems.
- B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
- C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.
- D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- F. Install piping to permit valve servicing, installation of insulation and tightening of flange bolts.
- G. Install piping at indicated slopes.
- H. Install piping free of sags and bends.

- I. Install fittings for changes in direction and branch connections.
- J. Install piping to allow application of insulation.
- K. Select system components with pressure rating equal to or greater than system operating pressure.
- L. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:
 - 1. New Piping:
 - a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
 - b. Chrome-Plated Piping: One-piece, cast-brass type with polished chrome-plated finish.
 - c. Insulated Piping: One-piece, stamped-steel type with spring clips.
 - d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
 - e. Bare Piping in Unfinished Service Spaces: One-piece, stamped-steel type with concealed hinge and set screw or spring clips.
 - f. Bare Piping in Equipment Rooms: Two-piece, cast-brass type.
 - g. Bare Piping at Floor Penetrations in Equipment Rooms: Two-piece, floor-plate type.
- M. Sleeves are not required for core-drilled holes.
- N. Permanent sleeves are not required for holes formed by removable PE sleeves.
- O. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
 - 1. Cut sleeves to length for mounting flush with both surfaces.
 - a. Exception: Extend sleeves installed in floors of mechanical equipment areas, fire sprinklered areas, or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required.
 - 2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
 - 3. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
 - a. Steel Pipe Sleeves.
 - 4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Division 7 Section 07920 "JOINT SEALANTS" for materials and installation.
- P. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
 - 1. Install steel pipe for sleeves smaller than 6 inches in diameter.
 - 2. Install steel pipe for sleeves 6 inches and larger in diameter.
 - 3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and

install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

- Q. Underground, Exterior-Wall Pipe Penetrations: Install steel pipe for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
 - 1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
- R. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Division 7 Section 07840 "FIRESTOPPING" for materials.
- S. Verify final equipment locations for roughing-in.
- T. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.2 PIPING JOINT CONSTRUCTION

- A. Join pipe and fittings according to the following requirements and Division 15 Sections specifying piping systems. For specific systems
- B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe to be welded.
- C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
- E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.
- F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - 1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
 - 2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
- G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.
- H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.3 PIPING CONNECTIONS

- A. Make connections according to the following, unless otherwise indicated:
1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
 2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
 3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
 4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.
 5. Locate unions and flanges so that equipment and appurtenances are easily removable without removing additional piping.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

- A. Install equipment to allow maximum possible headroom unless specific mounting heights are indicated.
- B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.
- C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.
- D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

- A. Painting of mechanical systems, equipment, and components is specified in Division 9 Section 09900 "PAINTING."
- B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.6 CONCRETE BASES

- A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project. All concrete bases shall be furnished and installed as specified under DIVISION 3.
1. Coordinate concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit.
 2. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.

3. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.
5. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.7 ERECTION OF METAL SUPPORTS AND ANCHORAGES

- A. Refer to Division 5 Section 05500 "MISCELLANEOUS METALS" for structural steel.
- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.
- C. Field Welding: Comply with AWS D1.1.

3.8 GROUTING

- A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.
- B. Clean surfaces that will come into contact with grout.
- C. Provide forms as required for placement of grout.
- D. Avoid air entrapment during placement of grout.
- E. Place grout, completely filling equipment bases.
- F. Place grout on concrete bases and provide smooth bearing surface for equipment.
- G. Place grout around anchors.
- H. Cure placed grout

PART 4 - MEASUREMENTS AND PAYMENTS

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 15052

BASIC MATERIALS AND METHODS FOR FIRE PROTECTION WORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.

1.2 SUMMARY

- A. This Section includes the following:

1. Piping materials and installation instructions common to most piping systems.
2. Joining Materials
3. Transition fittings.
4. Dielectric fittings.
5. Mechanical sleeve seals.
6. Sleeves.
7. Escutcheons.
8. Grout.
9. Equipment installation requirements common to equipment sections.
10. Painting and finishing.
11. Concrete bases.
12. Supports and anchorages.

- B. Related Section:

1. Section 03300 - CAST IN PLACE CONCRETE
2. Section 07840 - FIRESTOPPING
3. Section 07920 - JOINT SELANTS
4. Section 09900 - PAINTING
5. Section 05500 - MISCELLANEOUS METALS
6. Section 15058 - COMMON MOTOR REQUIREMENTS FOR EQUIPMENT
7. Section 15062 - HANGERS AND SUPPORTS FOR PIPING AND EQUIPMENT
8. Section 15074 - VIBRATION AND SEISMIC CONTROLS FOR PIPING AND EQUIPMENT
9. Section 15093 - SLEEVES AND SLEEVE SEALS FOR PIPING
10. Section 15112 - GENERAL-DUTY VALVES FOR PIPING
11. Section 15127 - METERS AND GAGES FOR PIPING
12. Section 15160 - STORM DRAINAGE PIPING
13. Section 15165 - STORM DRAINAGE PIPING SPECIALTIES

1.3 DEFINITIONS

- A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

- B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.
- C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.
- D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.
- E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.
- F. The following are industry abbreviations for rubber materials:
 - 1. EPDM: Ethylene-propylene-diene terpolymer rubber.
 - 2. NBR: Acrylonitrile-butadiene rubber.

1.4 SUBMITTALS

- A. Product Data: For the following:
 - 1. Piping materials and installation instructions common to most piping systems.
 - 2. Joining Materials
 - 3. Transition fittings.
 - 4. Dielectric fittings.
 - 5. Mechanical sleeve seals.
 - 6. Sleeves.
 - 7. Escutcheons.
 - 8. Grout.
 - 9. Equipment installation requirements common to equipment sections.
 - 10. Painting and finishing.
 - 11. Concrete bases.
 - 12. Supports and anchorages.
- B. Welding certificates.

1.5 QUALITY ASSURANCE.

- A. System Life Expectancy:
 - 1. All Fire Protection piping and distribution systems shall be designed and installed with materials and practices to meet a minimum 50-year median useful life in their respective environments. This includes the selection of appropriate corrosion resistant materials, compatible joining methods, provisions for moisture shedding, access for inspection, cleaning and service and isolation from incompatible materials, protection from wildlife and moisture.
 - 2. All Fire Protection system design and installation shall take into account access for regular service and replacement. This shall include the ability to disconnect, make safe and remove a piece of equipment and replace in-kind, restored to function, without disrupting other services.

3. Useful life shall include consideration of the expected design duty including hours of use, frequency of start-stop cycles, availability of common or specific parts and consumables including attic stock spare parts to limit down-time.
- B. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."
 - C. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
 1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
 2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
 - D. Electrical Characteristics for Mechanical Equipment: Equipment that requires different voltages, amperages or additional, electrical services, devices or equipment may be furnished provided such proposed equipment is approved in writing, connecting electrical services, circuit breakers and conduit sizes are appropriately modified, and required additional services, devices, and equipment are provided. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements. Variations approved under this subparagraph shall be at no additional cost to the MBTA.

1.2 DELIVERY, STORAGE, AND HANDLING

- A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

1.3 COORDINATION

- A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.
- B. Coordinate installation of required supporting devices in form work and set sleeves in poured-in-place concrete and other structural components as they are constructed.
- C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces.
- D. Special Coordination at the VMF: The Vehicle Maintenance Facility is intended to have a light-weight insulated panel skin system which will be replaceable over time. No connections of services, piping, conduits, clips controls, equipment and the like, shall be attached directly to this panel system. All attachments of such services to the exterior walls shall be made only to permanent structure, girts or secondary steel strut systems, independent of the exterior panel skin system.

PART 2 - PRODUCTS

2.1 PIPE, TUBE, AND FITTINGS

- A. Refer to individual Division 15 piping Sections for pipe, tube, and fitting materials and joining methods.
- B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.2 JOINING MATERIALS

- A. Refer to individual Division 15 piping Sections for special joining materials not listed below.
- B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of the fluids within the piping system
 - 1. ASME B16.21, nonmetallic, flat, asbestos-free, (1/8-inch) maximum thickness unless thickness or specific material is indicated.
 - a. Full-Face Type: For flat-face, Class 125, and Class 250 cast-iron and cast-bronze flanges.
 - b. Narrow-Face Type: For raised-face, steel flanges.
 - 2. AWWA C110, rubber, flat face, (1/8 inch) thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.
- C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.
- D. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
- E. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping and copper tubing run below slabs or below grade outside the building lines, unless otherwise indicated.
- F. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.3 TRANSITION FITTINGS

- A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Cascade Waterworks Mfg. Co.
 - b. Dresser Industries, Inc.; DMD Div.
 - c. Ford Meter Box Company, Incorporated (The); Pipe Products Div.
 - d. JCM Industries.
 - e. Smith-Blair, Inc.
 - f. Viking Johnson.

2. Underground Piping (NPS 1-1/2) and Smaller: Manufactured fitting or coupling.
 3. Underground Piping (NPS 2) and Larger: AWWA C219, metal sleeve-type coupling.
 4. Aboveground Pressure Piping: Pipe fitting.
- B. Flexible Transition Couplings for Underground Nonpressure Drainage Piping: ASTM C 1173 with elastomeric sleeve, ends same size as piping to be joined, and corrosion-resistant metal band on each end.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Cascade Waterworks Mfg. Co.
 - b. Fernco, Inc.
 - c. Mission Rubber Company.
 - d. Plastic Oddities, Inc.

2.2 DIELECTRIC FITTINGS

- A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.
- B. Insulating Material: Suitable for system fluid, pressure, and temperature.
- C. Dielectric Unions: Factory-fabricated, union assembly, for (250-psig) minimum working pressure at (180 deg F).following:
- a. Capitol Manufacturing Co.
 - b. Central Plastics Company.
 - c. Eclipse, Inc.
 - d. Epco Sales, Inc.
 - e. Hart Industries, International, Inc.
 - f. Watts Industries, Inc.; Water Products Div.
 - g. Zurn Industries, Inc.; Wilkins Div.
- D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Capitol Manufacturing Co.
 - b. Central Plastics Company.
 - c. Epco Sales, Inc.
 - d. Watts Industries, Inc.; Water Products Div.
- E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

- a. Advance Products & Systems, Inc.
 - b. Calpico, Inc.
 - c. Central Plastics Company.
 - d. Pipeline Seal and Insulator, Inc.
2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.
- F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and (300-psig) minimum working pressure at (225 deg F).
- 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Calpico, Inc.
 - b. Lochinvar Corp.
- G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and (300-psig) minimum working pressure at (225 deg F). Following:
- a. Perfection Corp.
 - b. Precision Plumbing Products, Inc.
 - c. Sioux Chief Manufacturing Co., Inc.
 - d. Victaulic Co. of America.

2.2 MECHANICAL SLEEVE SEALS

- A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
- 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Advance Products & Systems, Inc.
 - b. Calpico, Inc.
 - c. Metraflex Co.
 - d. Pipeline Seal and Insulator, Inc.
 - 2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
 - 3. Pressure Plates: Stainless steel. Include two for each sealing element.
 - 4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.3 SLEEVES

- A. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

2.4 ESCUTCHEONS

- A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.
- B. One-Piece, Cast-Brass Type: With set screw.
 - 1. Finish: Polished chrome-plated.
- C. One-Piece, Stamped-Steel Type: With set screw or spring clips and chrome-plated finish.
- D. One-Piece, Floor-Plate Type: Cast-iron floor plate.

2.5 GROUT

- A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
 - 1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
 - 2. Design Mix: (5000-psi), 28-day compressive strength.
 - 3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

- A. Install piping according to the following requirements and Division 15 Sections specifying piping systems.
- B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems.

Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
- C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.
- D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- F. Install piping to permit valve servicing, installation of insulation and tightening of flange bolts.
- G. Install piping at indicated slopes.

- H. Install piping free of sags and bends.
- I. Install fittings for changes in direction and branch connections.
- J. Install piping to allow application of insulation.
- K. Select system components with pressure rating equal to or greater than system operating pressure.
- L. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:
 - 1. New Piping:
 - a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
 - b. Chrome-Plated Piping: One-piece, cast-brass type with polished chrome-plated finish.
 - c. Insulated Piping: One-piece, stamped-steel type with spring clips.
 - d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
 - e. Bare Piping in Unfinished Service Spaces: One-piece, stamped-steel type with concealed hinge and set screw or spring clips.
 - f. Bare Piping in Equipment Rooms: One-piece, cast-brass type.
 - g. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.
- M. Sleeves are not required for core-drilled holes.
- N. Permanent sleeves are not required for holes formed by removable PE sleeves.
- O. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
 - 1. Cut sleeves to length for mounting flush with both surfaces.
 - a. Exception: Extend sleeves installed in floors of mechanical equipment areas, fire sprinklered areas, or other wet areas (2 inches) above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
 - 2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
 - 3. Install sleeves that are large enough to provide (1 inch) annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
 - a. Steel Pipe Sleeves: For pipes smaller than (NPS 6).
 - b. Steel Sheet Sleeves: For pipes (NPS 6) and larger, penetrating gypsum-board partitions.
 - c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing.
 - d. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to (2 inches) above finished floor level.

- 1) Seal space outside of sleeve fittings with grout.

4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint.
- P. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for (1-inch) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
1. Install steel pipe for sleeves smaller than (6 inches) in diameter.
 2. Install steel pipe for sleeves (6 inches) and larger in diameter.
 3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
- Q. Underground, Exterior-Wall Pipe Penetrations: Install steel pipe for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for (1-inch) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
- R. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials.
- S. Verify final equipment locations for roughing-in.
- T. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.2 PIPING JOINT CONSTRUCTION

- A. Join pipe and fittings according to the following requirements and Division 15 Sections specifying piping systems.
- B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe to be welded.
- C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end.
- E. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
- F. Brazed Joints: Construct joints according to AWS's "Braze Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

- G. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
- H. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
- I. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.
- J. Do not use pipe sections that have cracked or open welds.
- K. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.
- L. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application.
- M. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
- N. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.
 - 1. Plain-End Pipe and Fittings: Use butt fusion.
 - 2. Plain-End Pipe and Socket Fittings: Use socket fusion.

3.3 PIPING CONNECTIONS

- A. Make connections according to the following, unless otherwise indicated:
 - 1. Install unions, in piping (NPS 2) and smaller, adjacent to each valve and at final connection to each piece of equipment.
 - 2. Install flanges or couplings, in piping (NPS 2-1/2) and larger, adjacent to flanged or grooved valves and at final connection to each piece of equipment.
 - 3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
 - 4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.
 - 5. Locate unions and flanges so that equipment and appurtenances are easily removable without removing additional piping.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

- A. Install equipment in accordance with applicable codes and standards to allow maximum possible headroom unless specific mounting heights are indicated.
- B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

- C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.
- D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

- A. Painting of mechanical systems, equipment, and components is specified in Division 09 Section 09900 "Painting."
- B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.6 CONCRETE BASES

- A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project. All concrete bases shall be furnished and installed under DIVISION 3.
 - 1. Coordinate concrete bases of dimensions indicated, but not less than (4 inches) larger in both directions than supported unit.
 - 2. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
 - 3. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 4. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - 5. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.7 ERECTION OF METAL SUPPORTS AND ANCHORAGES

- A. Refer to Division 05 Section "Miscellaneous Metal" for structural steel.
- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.
- C. Field Welding: Comply with AWS D1.1.

3.8 ERECTION OF WOOD SUPPORTS AND ANCHORAGES

- A. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor mechanical materials and equipment.

- B. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.
- C. Attach to substrates as required to support applied loads.

3.9 GROUTING

- A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.
- B. Clean surfaces that will come into contact with grout.
- C. Provide forms as required for placement of grout.
- D. Avoid air entrapment during placement of grout.
- E. Place grout, completely filling equipment bases.
- F. Place grout on concrete bases and provide smooth bearing surface for equipment.
- G. Place grout around anchors.
- H. Cure placed grout

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 15053

COORDINATION AMONG MECHANICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.

1.2 SUMMARY

- A. This Section includes the following:

1. Coordination of Work
2. Coordination Drawings
3. Record Drawings.
4. Giving Information
5. Mechanical-Electrical Coordination

- B. Related Section:

1. Volume 2 Technical Provisions Exhibit 2I “Additional Project Requirements”
2. Section 03300 - CAST IN PLACE CONCRETE
3. Section 07840 - FIRESTOPPING
4. Section 07600 - FLASHING AND SHEET METAL
5. Section 07920 - JOINT SEALANTS
6. Section 09900 - PAINTING
7. Section 05500 - MISCELLANEOUS METALS
8. Section 15050 – BASIC MATERIALS AND METHODS FOR HVAC WORK
9. Section 15051 – BASIC MATERIALS AND METHODS FOR PLUMBING WORK
10. Section 15052 – BASIC MATERIALS AND METHODS FOR FIRE PROTECTION
11. Section 15058 - COMMON MOTOR REQUIREMENTS FOR EQUIPMENT
12. Section 15062 - HANGERS AND SUPPORTS FOR PIPING AND EQUIPMENT
13. Section 15074 - VIBRATION AND SEISMIC CONTROLS FOR PIPING AND EQUIPMENT
14. Section 15084 - PLUMBING EQUIPMENT INSULATION
15. Section 15085 - PLUMBING PIPING INSULATION
16. Section 15086 – DUCT INSULATION
17. Section 15093 - SLEEVES AND SLEEVE SEALS FOR PIPING
18. Section 15112 - GENERAL-DUTY VALVES FOR PIPING
19. Section 15127 - METERS AND GAGES FOR PIPING
20. Section 15140 - DOMESTIC WATER PIPING
21. Section 15145 - DOMESTIC WATER PIPING SPECIALTIES
22. Section 15150 – SANITARY WASTE AND VENT PIPING
23. Section 15155 - SANITARY WASTE PIPING SPECIALTIES
24. Section 15160 - STORM DRAINAGE PIPING
25. Section 15165 - STORM DRAINAGE PIPING SPECIALTIES
26. Section 15183 – REFRIGERANT PIPING
27. Section 15195 - FACILITY NATURAL-GAS PIPING
28. Section 15815 – METAL DUCTS

29. Section 15900 – HVAC INSTRUMENTATION AND CONTROLS
30. Section 15940 – SEQUENCE OF OPERATION FOR HVAC SYSTEMS
31. Section 15950 – TESTING, ADJUSTING and BALANCING
32. Specific Sections Used On This Project Not Listed Here
33. DIVISION 16 – ELECTRICAL

1.3 COORDINATION OF WORK

- A. All work shall be coordinated by the Design-Builder.
- B. Work shall be performed in full harmony in cooperation with other trades on the project and so scheduled as to allow speedy and efficient completion of the work.
- C. In all spaces, prior to installation of visible material and equipment, including access panels, review Architectural Drawings for exact locations and where not definitely indicated, request information from Architect. Where the HVAC work shall interfere with the work of other trades, assist in working out the space conditions to make satisfactory adjustments before installation. Maintain maximum headroom at all locations. All piping, duct, conduit, and associated components to be as tight to underside of structure as possible.
- D. If any HVAC work has been installed before coordination with other trades so as to cause interference with the work of such trades, all necessary adjustments and corrections shall be made by the trades involved without extra cost to MBTA.
- E. Where conflicts or potential conflicts exist and engineering guidance is desired, submit sketch of proposed resolution to Architect for review and approval.
- F. Protect all materials and work of other trades from damage which may be caused by the HVAC work, and repair all damages without extra cost to MBTA.
- G. Base all required measurements, both horizontal and vertical, on reference and datum points established by the Design-Builder and be responsible for the correct laying out of the trade work. In the event of a discrepancy between actual measurements and those indicated, notify the General Contractor in writing, and do not proceed with the work required until written instructions have been issued by the General Contractor.
- H. Special Coordination at the VMF: The Vehicle Maintenance Facility is intended to have a light-weight insulated panel skin system which will be replaceable over time. No connections of services, piping, conduits, clips controls, equipment and the like, shall be attached directly to this panel system. All attachments of such services to the exterior walls shall be made only to permanent structure, girts or secondary steel strut systems, independent of the exterior panel skin system.

1.4 COORDINATION DRAWINGS

- A. Conform to the requirements of DIVISION 01. The Design-Builder shall comply with provisions of documentation including drawing format, electronic 3-D and Building Information Modeling (BIM) processes, specified elsewhere. For the purposes of this specification, the term, “coordination drawings” and, “drawings” will be used to indicate documentation in any number of forms for the purposes of this project.

- B. In general, the larger system elements including structures shall lead the coordination effort, followed by smaller systems and elements. Services and systems that must pitch shall have right-of-way over systems that may change elevation. Architectural elements including finishes, reflected ceiling plans, fixtures and construction, shall have first order precedence. Systems serving the building shall have a first duty to conform, prior to changing the architectural or structural elements. Nothing in this paragraph shall prohibit parallel work-flow by separate parties if it is in the best interests of the project schedule.
- C. Produce composite All-Trade systems Coordination Drawings showing how HVAC, Plumbing, Fire Protection and Electrical systems are to be installed where conflicts with the work of other trades may occur. The Design-Builder, before transmittal of the Shop Drawings for approval, may require the HVAC and Sheet Metal Subcontractors to revise the composite systems and Shop Drawings and to make reasonable modifications in the layout of the HVAC work, so that the HVAC work may be properly accommodated without the interference with work of other trades. The HVAC and Sheet Metal Subcontractors shall make such revisions to composite systems coordination drawings, when requested, without extra charge.
- D. The Design-Builder shall be responsible for the cost of changes in their respective systems and adjoining work where an approved substitution of the any trade equipment requires such changes in the work or in the adjoining work of any other trade. Coordination Drawings shall show all changes.
- E. In no case shall the work of any trade and their systems be used to support the ceiling construction.
- F. No trade contractor shall install their systems in any portion which interferes with access to any element requiring access by any trade's work.
- G. Access Panel Coordination: Show locations and sizes of all access panels for all trades on Coordination Drawings. The Testing Adjusting and Balancing Sub-subcontractor (TAB) shall review the Coordination Drawings and verify that all balancing devices are shown and all required access has been addressed. The Design-Builder shall sign-off on the Coordination Drawings prior to submittal.
- H. The Design-Builder shall produce a set of Rooftop-Level Equipment Coordination Drawings; complete with air intakes, boiler stacks, emergency generator exhaust and air systems exhausts shown and identifying the appropriate clearances between discharge and intake points and illustrating that minimum clearances are identified, dimensioned and maintained, including elevations.

1.5 RECORD DRAWINGS

- A. Comply with Volume 1 DB Contract Terms and Conditions.
- B. This trade shall submit the record set for approval by the fire and building departments in a form acceptable to the departments, when required by the jurisdiction.
- C. Drawings shall show record condition of details, sections, riser diagrams, control changes and corrections to schedules. Schedules shall show actual manufacturer and make and model numbers of final equipment installation.

1.6 GIVING INFORMATION

- A. The Design-Builder shall keep themselves and others continuously informed of the progress of their respective work. This shall include scheduling of pending work, coordination of related work by other contractors, cutting, patching, operations affecting schedule and progress of others.
- B. Furnish to other trades advance information on locations and sizes of all frames, boxes, sleeves and openings needed for their work, and also furnish information and shop drawings necessary to permit trades affected by the work to install same properly and without delay.

1.7 MECHANICAL-ELECTRICAL COORDINATION

- A. Each Mechanical (HVAC, Plumbing and Fire Protection) Contractor shall furnish and install various electrical items relating to the HVAC equipment and control apparatus. The Electrical Contractor shall be required to connect power wiring to this equipment unless noted otherwise.
- B. For this project in general, HVAC equipment with motors up to 1/2 HP shall be 120 volt single-phase. Motors $\frac{3}{4}$ HP and above shall be 480 volt three-phase. It shall be understood that equipment manufacturer's increments, motor ratings and commercial availability may differ from the above core voltages. All shall be coordinated and accommodated.
- C. Single-phase variable speed motor driven equipment shall be furnished with speed controllers. These speed controllers shall be furnished to the DIV 16 Subcontractor for installation and wiring in the power train to the equipment served.
- D. Variable Frequency Drives VFD for 3-phase motors under this Division shall be furnished and installed under this Division and wired from source to VFD and from VFD to load, by the DIV 16 Subcontractor. This shall include but not be limited to pumps, fans and loose equipment that does not have packaged VFDs. Packaged VFDs shall be wired to source by the DIV 16 Subcontractor.
- E. The Mechanical and Electrical Contractors shall coordinate their respective portions of the work, as well as the electrical characteristics of the powered equipment and maintain a common shared schedule for reference prior to commencing work.
- F. All power wiring and local disconnect switches will be provided by the Electrical Contractor for the line voltage power. All low-voltage control and interlocking wiring shall be the responsibility of the HVAC contractor's ATC Subcontractor.
- G. 120V and above power wiring sources extended and connected to HVAC control panels, transformers and switches shall be the responsibility of the Electrical Contractor. All low voltage thermostats, zone valve and any switch wiring shall be the responsibility of the HVAC contractor's ATC/DDC Subcontractor.
- H. DDC System control and equipment wiring shall be installed by the ATC/DDC Sub-subcontractor. This work shall include connection to 120 Volt source as provided under Division 16, transformers, power supplies and power conditioners. All such wiring shall conform to wiring standards and practices in accordance with applicable Division 16 specifications.

PART 2 - PRODUCTS

2.1 Not Used.

PART 3 - EXECUTION

3.1 Not Used

PART 4 - MEASUREMENTS AND PAYMENTS

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment"

END OF SECTION

SECTION 15054

ELECTRICAL REQUIREMENT FOR MECHANICAL WORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.
- B. Related Sections:
 - 1. Section 15050 – BASIC MATERIALS AND METHODS FOR HVAC WORK
 - 2. Section 15051 – BASIC MATERIALS AND METHODS FOR PLUMBING WORK
 - 3. Section 15077 – IDENTIFICATION FOR PIPING AND EQUIPMENT

1.2 SUMMARY

- A. Section Includes:
 - 1. This section defines the extent of electrical equipment and wiring for mechanical equipment and systems that shall be provided under Division 15 – MECHANICAL and Division 16 – ELECTRICAL.
 - 2. Motors provided with mechanical equipment shall meet the requirements of Section 15058- COMMON MOTOR REQUIREMENTS FOR EQUIPMENT.
 - 3. Motor starting equipment provided by Division 15 for mechanical units shall meet the requirements of Section 15058- COMMON MOTOR REQUIREMENTS FOR EQUIPMENT. Drawings and general provisions of the Contract.

1.3 DEFINITIONS

- A. “Power wiring” is defined as wiring (120V and higher) from the power source, e.g., panelboard, motor control center, or switchboards, to the equipment disconnect switch or disconnect switch and starter, including wiring from the switches to the equipment.
- B. “Control wiring” is defined as wiring and conduit not defined as power wiring, whether line (120V) voltage or low voltage, to provide for the operation of the equipment, equipment-motorized dampers and ATC control devices.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Wiring Diagrams: For power, signal, and control wiring.

PART 2 - PRODUCTS

2.1 MOTOR STARTING EQUIPMENT

A. General:

1. The Division 15 Contractor, in accordance with this section, shall furnish all magnetic motor starters and combination starters, which serve the mechanical equipment.
2. Motor control centers, starters, disconnect switches, and combination starters and disconnect switches shall be installed by the Division 16 Contractor, except for packaged equipment which contains integral control panels.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Siemens
2. Square-D
3. Allen Bradley
4. Cutler Hammer

C. Motor starters shall be three pole, 60 Hertz, full-voltage magnetic across the line type with NEMA 1A gasketed enclosures. For exterior, damp, or wet locations, enclosures shall be NEMA 4 stainless steel, or NEMA 3R rain tight.

1. Minimum size starter shall be NEMA size 0.

D. Starters shall be of the combination thermal/magnetic circuit breaker type.

1. The short circuit interrupting rating of the protective device provided shall be higher than the available system short circuit capacity at the point of connection, and match the bus bracing withstand rating.

E. Starter shall be furnished complete with "hand-off-automatic" selector switches, pilot indicating lights, a minimum of four auxiliary convertible contacts and fuses unless otherwise noted. Include other equipment as required and as necessary for proper power operation including but not limited to the following:

1. Green pilot light for starter contacts "OPEN" or motor not running.
2. Red pilot light for starter contacts "CLOSED" or motor running.

F. Each magnetic starter shall have a 120 volt coil and a fuse for protection of control wiring. Each starter shall have an individual control power transformer with primary and secondary fuses. Control power transformer shall have a VA rating sufficient to provide power for devices to be operated from transformer.

G. Class K-5 shall provide dual element current limiting fuses for fused starters circuit protection.

H. Each starter shall be furnished complete with the proper quantity of ambient compensated thermal overload relays rated for the motor amperes. Overload relays, used with power factor corrected motors, shall be selected to compensate for the reduced line current due to the capacitor.

I. Motor starters for two-speed, two winding motors shall be three pole, non-reversing type with three position "hand-off-automatic" selector switch and two position "high-low" selector switch. Starters

for three or four speed motors shall be of the same type with the number of contactors and wiring as required for the application.

- J. All magnetic starters shall be electrically held, and equipped with two (2) normally opened and two (2) normally closed auxiliary contacts.

2.2 MOTOR CIRCUIT FUSES

- A. Individual motor circuit fuses, rated 480 volts or less, shall be rated approximately 125 percent of motor full load current except where high ambient temperatures prevail or where the motor drives a heavy revolving part which cannot be brought up to full speed quickly, such as large fans. Under such conditions, the fuse should be 150 to 200 percent of motor full load current.

2.3 THERMAL MANUAL MOTOR STARTING SWITCHES

- A. Thermal manual motor starting switches, for single phase motors, shall be manually operated toggle switches equipped with a melting alloy type thermal overload relay.
 - 1. Thermal unit shall be interchangeable and starter shall be inoperative if thermal overload unit is removed.
 - 2. Toggle switch shall be quick make and break type with self-indicating trip free handle.
- B. Single phase motors, which are controlled by devices not rated for control of the motor, shall be provided with magnetic starter and accessories as specified in paragraph 2.1.
- C. Enclosures to be NEMA 1 for interior use and NEMA 4 stainless steel or NEMA 3R rain tight for exterior, damp, or wet locations. Provide handle guard having locking provisions on enclosures. Provide flush mounted enclosures for units located in finished areas.
- D. Starting switches shall be combined with a three-position "hand-off-automatic" selector switch horsepower rated and a red pilot light mounted in the same enclosure.
- E. For two speed single phase motors, furnish two-speed starters combined with at three position "hand-off-automatic" selector switch and a two position "high-low" selector switch.

2.4 VARIABLE FREQUENCY CONTROLLERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. ABB Power Distribution, Inc.; ABB Control, Inc. Subsidiary.
 - 2. Eaton Corporation; Cutler-Hammer Products.
 - 3. General Electric Company; GE Industrial Systems.
 - 4. Rockwell Automation; Allen-Bradley Co.; Industrial Control Group.
 - 5. Siemens Energy and Automation; Industrial Products Division.
 - 6. Square D.
- B. Description: NEMA ICS 2, IGBT, PWM, VFC; listed and labeled as a complete unit and arranged to provide variable speed of an NEMA MG 1, Design B, 3-phase induction motor by adjusting output voltage and frequency.

1. Provide unit suitable for operation of premium-efficiency motor as defined by NEMA MG 1.
- C. Design and Rating: Match load type such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.
- D. Output Rating: 3-phase; 6 to 60 Hz, with voltage proportional to frequency throughout voltage range.
- E. Unit Operating Requirements:
1. Input ac voltage tolerance of 480 V plus or minus 10 percent.
 2. Input frequency tolerance of 50/60 Hz, plus or minus 6 percent.
 3. Minimum Efficiency: 96 percent at 60 Hz, full load.
 4. Minimum Displacement Primary-Side Power Factor: 98 percent.
 5. Overload Capability: 1.1 times the base load current for 60 seconds; 1.5 times the base load current for 3 seconds.
 6. Starting Torque: 100 percent of rated torque or as indicated.
 7. Speed Regulation: Plus or minus 1 percent.
- F. Isolated control interface to allow controller to follow control signal over an 11:1 speed range.
1. Electrical Signal: 4 to 20 mA at 24 V.
- G. Internal Adjustability Capabilities:
1. Minimum Speed: 5 to 25 percent of maximum rpm.
 2. Maximum Speed: 80 to 100 percent of maximum rpm.
 3. Acceleration: 2 to a minimum of 22 seconds.
 4. Deceleration: 2 to a minimum of 22 seconds.
 5. Current Limit: 50 to a minimum of 110 percent of maximum rating.
- H. Self-Protection and Reliability Features:
1. Input transient protection by means of surge suppressors.
 2. Under- and overvoltage trips; inverter overtemperature, overload, and overcurrent trips.
 3. Motor Overload Relay: Adjustable and capable of NEMA ICS 2, Class 20 performance.
 4. Notch filter to prevent operation of the controller-motor-load combination at a natural frequency of the combination.
 5. BACnet® card
 6. Instantaneous line-to-line and line-to-ground overcurrent trips.
 7. Loss-of-phase protection.
 8. Reverse-phase protection.
 9. Short-circuit protection.
 10. Motor overtemperature fault.
- I. Automatic Reset/Restart: Attempts three restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Bidirectional autospeed search shall be capable of starting into rotating loads spinning in either direction and returning motor to set speed in proper direction, without damage to controller, motor, or load.
1. Provide power loss ride through of 2 seconds.
- J. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.

- K. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
- L. Input Line Conditioning 3% Line Reactor
- M. Status Lights: Door-mounted LED indicators shall indicate the following conditions:
 - 1. Power on.
 - 2. Run.
 - 3. Overvoltage.
 - 4. Line fault.
 - 5. Overcurrent.
 - 6. External fault.
- N. Panel-Mounted Operator Station: Start-stop and auto-manual selector switches with manual speed control potentiometer and elapsed time meter.
- O. Indicating Devices: Meters or digital readout devices and selector switch, mounted flush in controller door and connected to indicate the following controller parameters:
 - 1. Output frequency (Hz).
 - 2. Motor speed (rpm).
 - 3. Motor status (running, stop, fault).
 - 4. Motor current (amperes).
 - 5. Motor torque (percent).
 - 6. Fault or alarming status (code).
 - 7. PID feedback signal (percent).
 - 8. DC-link voltage (VDC).
 - 9. Set-point frequency (Hz).
 - 10. Motor output voltage (V).
- P. Control Signal Interface:
 - 1. Electric Input Signal Interface: A minimum of 2 analog inputs (0 to 10 V or 0/4-20 mA) and 6 programmable digital inputs.
 - 2. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the BMS or other control systems:
 - a. 0 to 10-V dc.
 - b. 0-20 or 4-20 mA.
 - c. Potentiometer using up/down digital inputs.
 - d. Fixed frequencies using digital inputs.
 - e. BACnet® interface.
 - f. Keypad display for local hand operation.
 - 3. Output Signal Interface:
 - a. A minimum of 1 analog output signal (0/4-20 mA), which can be programmed to any of the following:
 - 1) Output frequency (Hz).
 - 2) Output current (load).
 - 3) DC-link voltage (VDC).

- 4) Motor torque (percent).
 - 5) Motor speed (rpm).
 - 6) Set-point frequency (Hz).
4. Remote Indication Interface: A minimum of 2 dry circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
- a. Motor running.
 - b. Set-point speed reached.
 - c. Fault and warning indication (overtemperature or overcurrent).
 - d. PID high- or low-speed limits reached.
- Q. Communications: Provide a BACnet® interface allowing VFC to be used with an external system within a multidrop LAN configuration. Interface shall allow all parameter settings of VFC to be programmed via BMS control. Provide capability for VFC to retain these settings within the nonvolatile memory.
- R. Integral Disconnecting Means: NEMA KS 1 non-fusible switch with lockable handle.
- S. Enclosures shall be NEMA 1.
- T. Accessories:
- 1. Devices shall be factory installed in controller enclosure, unless otherwise indicated.
 - 2. Control Relays: Auxiliary and adjustable time-delay relays.
 - 3. Standard Displays:
 - a. Output frequency (Hz).
 - b. Set-point frequency (Hz).
 - c. Motor current (amperes).
 - d. DC-link voltage (VDC).
 - e. Motor torque (percent).
 - f. Motor speed (rpm).
 - g. Motor output voltage (V).
- U. Historical Logging Information and Displays:
- 1. Real-time clock with current time and date.
 - 2. Running log of total power versus time.
 - 3. Total run time.
 - 4. Fault log, maintaining last four faults with time and date stamp for each.
- V. Factory finishes: Manufacturer's standard paint applied to factory-assembled and -tested VFCs before shipping.

PART 3 - EXECUTION

3.1 GENERAL

- A. All electric wiring, motors and motor starting equipment provided under Division 15 shall be installed in accordance with the requirements of Division 16 Specifications.

- B. Control panels provided as a part of mechanical equipment shall include circuit protection for each motor, electric heater, control circuit and other circuits requiring protection. Where remote manual controls are required, they shall operate at 120 volts maximum. A control power transformer shall be provided for these remote manual controls.
- C. All outdoor equipment shall be wired in weatherproof, seal tight cast boxes with rigid steel conduit. Provide flexible, seal tight conduit final connection to equipment.
- D. All panels, relays, terminal boxes, junction boxes, contactors, circuit breakers, safety switches, motor starters and similar items, shall be identified by name, function and/or control. See Specification Section 15077 "IDENTIFICATION FOR PIPING AND EQUIPMENT" for further identification requirements

3.2 DIVISION 15 – REQUIREMENTS

- A. The Division 15 Control Subcontractor shall provide all controls, control devices, and mountings for controls and all other electrical devices as specified and necessary for the complete installation and satisfactory operation of all electrically operated controls furnished under the mechanical contract. Control wiring throughout the project, including wiring to controls installed on equipment, piping and in ductwork, shall be provided by the Division 15 Contractor.
- B. Control wiring under Division 15 shall include all connections to control devices, interlock wiring, control relays, alarm wiring, and minor power wiring to auxiliary components for major pieces of equipment. Minor power wiring, 120 volts and below, shall include requirements for such equipment as damper motors, speed controllers, control switches, VAV boxes, solenoid valves, water treatment equipment, electrically operated filters, control panels, controllers, other ATC devices and interconnecting wiring on equipment that has not been factory installed. In general, all control wiring that is not shown on Electrical Drawings shall be provided under Division 15.
- C. Provide power sources for all control wiring from spare breakers in building electrical panels. Coordinate spare breaker usage with Division 16 Contractor. Provide additional breakers in panels or addition electrical panels if required, to obtain power sources. Provide transformers to reduce voltage as required.
- D. All internal wiring in equipment shall be completely factory installed. Where internal wiring cannot be factory installed, it shall be field installed under Division 15.
- E. Internal wiring in equipment shall be brought to terminal facilities at one location, for connection of field wiring. For individual motors, a larger wiring chamber of conduit entry shall be provided. For equipment with a control panel, barrier type terminal strips shall be provided in an enclosure arranged for conduit entry.
- F. The Division 15 Contractor shall coordinate with the Division 16 Contractor the exact location of disconnects, smoke detectors and combination disconnects and starter when not indicated.
- G. It shall be the responsibility of the Division 15 Contractor to insure that the voltage and current characteristics of the electrical equipment provided under Division 15 shall be suitable for the electrical services provided.

- H. The Division 15 Contractor shall receive smoke detectors from Division 16. The Division 15 Contractor shall mount detectors in ductwork, but Division 16 shall wire detectors as specified in Division 16 requirements below.

3.3 DIVISION 16 – REQUIREMENTS

- A. All starters and combination starters/ disconnect switches shall be furnished by the Division 15 Contractor, and installed by the Division 16 Contractor. Disconnect Switches not noted in the Division 15 Equipment Schedules shall be provided by the Division 16 Contractor. Power wiring from the power source to the above noted devices, from these devices to the equipment, and final connection to the equipment and devices, shall be by the Division 16 Contractor.
- B. Power wiring under Division 16 shall include power feeders to major pieces of equipment. From the source of building power, the feeder shall be extended to wiring terminals on the equipment as following noted:
 - 1. At individual motors, such as those used for fans and pumps, power wiring shall be extended to the wiring chamber on the motor.
 - 2. At factory assemblies of components, such as duplex pumps, power wiring shall be extended to the assembly. Where control panels include motor starters, power wiring under Division 16 will terminate at the control panel terminal strip or starter, but shall be extended to each motor under Division 15. Where control panels do not include motor starters, power wiring under Division 16, shall be extended through motor starters and terminate at the wiring chamber on each motor.
 - 3. At factory assembled manufactured equipment with control panels having starters, power wiring under Division 16 shall terminate at the control panel terminal strip or starter, and shall be extended to each motor by the equipment manufacturer, if control panel is mounted on equipment, or by the Division 15 Contractor if the control panel is remote from equipment.

PART 4 - PAYMENTS AND MEASUREMENTS

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 15058

COMMON MOTOR REQUIREMENTS FOR EQUIPMENT

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.
- B. Related Sections
 - 1. Section 15050 – BASIC MATERIALS AND METHODS FOR HVAC WORK
 - 2. Section 15051 – BASIC MATERIALS AND METHODS FOR PLUMBING
 - 3. Section 15077 – IDENTIFICATION FOR PIPING AND EQUIPMENT
 - 4. Division 15 Sections for specific motorized equipment.

1.2 SUMMARY

- A. Section includes general requirements for single-phase and polyphase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on ac power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation. Section also includes single-phase and poly-phase variable-speed brushless DC Electronically Commutating Motors (ECM) and associated controls, installed at equipment manufacturer's factory.

1.3 COORDINATION

- A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:
 - 1. Motor speed controllers.
 - 2. Torque, speed, and horsepower requirements of the load.
 - 3. Ratings and characteristics of supply circuit and required control sequence.
 - 4. Ambient and environmental conditions of installation location.

PART 2 - PRODUCTS

2.1 GENERAL MOTOR REQUIREMENTS

- A. Comply with NEMA MG 1 unless otherwise indicated.

2.2 MOTOR CHARACTERISTICS

- A. Duty: Continuous duty at ambient temperature of 40 deg C and at altitude of 3300 feet above sea level.

- B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

2.3 POLYPHASE MOTORS

- A. Description: NEMA MG 1, Design B, medium induction motor.
- B. Efficiency: Energy efficient, as defined in NEMA MG 1.
- C. Service Factor: 1.15.
- D. Multispeed Motors: Variable torque.
 - 1. For motors with 2:1 speed ratio, consequent pole, single winding.
 - 2. For motors with other than 2:1 speed ratio, separate winding for each speed.
- E. Multispeed Motors: Separate winding for each speed.
- F. Rotor: Random-wound, squirrel cage.
- G. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.
- H. Temperature Rise: Match insulation rating.
- I. Insulation: Class F.
- J. Code Letter Designation:
 - 1. Motors 15 HP and Larger: NEMA starting Code F or Code G.
 - 2. Motors Smaller than 15 HP: Manufacturer's standard starting characteristic.
- K. Enclosure Material: Cast iron for motor frame sizes 324T and larger; rolled steel for motor frame sizes smaller than 324T.

2.4 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

- A. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.
 - 1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width modulated inverters.
 - 2. Energy- and Premium-Efficient Motors: Class B temperature rise; Class F insulation.
 - 3. Inverter-Duty Motors: Class F temperature rise; Class H insulation.
 - 4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

2.5 SINGLE-PHASE AND CERTAIN POLYPHASE MOTORS

- A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application:
 - 1. Electronically Commutating (EC) Motors; Default for all variable and constant torque applications including fans and circulators. Applications and controls specific to equipment in which installed.
 - 2. Permanent-split capacitor (PSC): Use limited to constant speed motors not exceeding ¼ HP and where EC motors are not specified.
 - 3. Capacitor start, inductor run.
- B. EC Motor Controls: Integral 0-10 VDC potentiometer dial switches for manual adjustment at a minimum. Automatic controllers for applications requiring external input signals; switchable values including 0-10 VDC, 4-10 VDC, 4-20 mA and 0-135 Ohm, to suit available control inputs.
- C. Bearings: Prelubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.
- D. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 - EXECUTION

Not Applicable.

PART 4 - MEASUREMENTS AND PAYMENTS

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 15062

HANGERS AND SUPPORTS FOR PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.

1.2 SUMMARY

- A. Section Includes:

1. Metal pipe hangers and supports.
2. Trapeze pipe hangers.
3. Metal framing systems.
4. Fastener systems.
5. Pipe stands.
6. Equipment supports.
7. Miscellaneous materials

- B. Related Sections:

1. Section 05500 - MISCELLANEOUS METALS for structural-steel shapes and plates for trapeze hangers for equipment supports.
2. Section 07720 – ROOF ACCESSORIES
3. Section 15074 - VIBRATION AND SEISMIC CONTROLS" for vibration isolation devices.
4. Section 15815 - METAL DUCTS" for duct hangers and supports.
5. Section 07720 - ROOF ACCESSORIES
6. Section 15085 - PLUMBING PIPING INSULATION
7. Section 15088 - HVAC PIPING INSULATION
8. Section 15093 - SLEEVES AND SLEEVE SEALS FOR PIPING
9. Section 15140 - DOMESTIC WATER PIPING
10. Section 15150 - SANITARY WASTE AND VENT PIPING
11. Section 15160 - STORM DRAINAGE PIPING
12. Section 15183 - REFRIGERANT PIPING
13. Section 15195 - FACILITY NATURAL-GAS PIPING

1.3 DEFINITIONS

- A. MSS: Manufacturers Standardization Society of The Valve and Fittings Industry Inc.

1.4 PERFORMANCE REQUIREMENTS

- A. Delegated Design: Design trapeze pipe hangers and equipment supports, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Signed and sealed by a qualified professional engineer, registered in MA. Show fabrication and installation details and include calculations for the following; include Product Data for components:
 - 1. Metal framing systems.
 - 2. Pipe stands.
 - 3. Equipment supports.
- C. Delegated-Design Submittal: For trapeze hangers indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - 1. Detail fabrication and assembly of trapeze hangers.
 - 2. Design Calculations: Calculate requirements for designing trapeze hangers.

1.6 INFORMATIONAL SUBMITTALS

- A. Welding certificates.

1.7 QUALITY ASSURANCE

- A. Structural Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

PART 2 - PRODUCTS

2.1 METAL PIPE HANGERS AND SUPPORTS

- A. Carbon-Steel Pipe Hangers and Supports:
 - 1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
 - 2. Galvanized Metallic Coatings: Pregalvanized or hot dipped.
 - 3. Nonmetallic Coatings: Plastic coating, jacket, or liner.
 - 4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
 - 5. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.
- B. Stainless-Steel Pipe Hangers and Supports:
 - 1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
 - 2. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
 - 3. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

C. Copper Pipe Hangers:

1. Description: MSS SP-58, Types 1 through 58, copper-coated-steel, factory-fabricated components.
2. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

2.2 TRAPEZE PIPE HANGERS

- A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural carbon-steel shapes with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U-bolts.

2.3 METAL FRAMING SYSTEMS

A. MFMA Manufacturer Metal Framing Systems:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Allied Tube & Conduit.
 - b. Cooper B-Line, Inc.
 - c. Flex-Strut Inc.
 - d. GS Metals Corp.
 - e. Thomas & Betts Corporation.
 - f. Unistrut Corporation; Tyco International, Ltd.
2. Description: Shop- or field-fabricated pipe-support assembly for supporting multiple parallel pipes.
3. Standard: MFMA-4.
4. Channels: Continuous slotted steel channel with inturned lips.
5. Channel Nuts: Formed or stamped steel nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.
6. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.
7. Metallic Coating: Electroplated zinc.

2.4 FASTENER SYSTEMS

- A. Mechanical-Expansion Anchors: Insert-wedge-type, stainless- steel anchors, for use in hardened Portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

2.5 PIPE STANDS

- A. General Requirements for Pipe Stands: Shop- or field-fabricated assemblies made of manufactured corrosion-resistant components to support roof-mounted piping.
- B. Compact Pipe Stand: One-piece plastic unit with integral-rod roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.

- C. Low-Type, Single-Pipe Stand: One-piece stainless-steel base unit with plastic roller, for roof installation without membrane penetration.
- D. High-Type, Single-Pipe Stand:
 - 1. Description: Assembly of base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.
 - 2. Base: Stainless steel.
 - 3. Vertical Members: Two or more cadmium-plated-steel or stainless-steel, continuous-thread rods.
 - 4. Horizontal Member: Cadmium-plated-steel or stainless-steel rod with plastic or stainless-steel, roller-type pipe support.
- E. Curb-Mounted-Type Pipe Stands: Shop- or field-fabricated pipe supports made from structural-steel shapes, continuous-thread rods, and rollers, for mounting on permanent stationary roof curb.

2.6 EQUIPMENT SUPPORTS

- A. Description: Welded, shop- or field-fabricated equipment support made from structural carbon-steel shapes.

2.7 MISCELLANEOUS MATERIALS

- A. Structural Steel: ASTM A 36/A 36M, carbon-steel plates, shapes, and bars; black and galvanized.
- B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
 - 1. Properties: Nonstaining, noncorrosive, and nongaseous.
 - 2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT INSTALLATION

- A. Metal Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.
 - 1. Trapeze pipe hanger in first paragraph below requires calculating and detailing at each use.
 - 2. Metal framing system in first paragraph below requires calculating and detailing at each use.
- B. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled metal framing systems.
- C. Fastener System Installation:
 - 1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.

2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.
- D. Pipe Stand Installation:
1. Curb-Mounted-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. See Section 07720 "ROOF ACCESSORIES" for curbs.
- E. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.
- F. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- G. Install lateral bracing with pipe hangers and supports to prevent swaying.
- H. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.
- I. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.
- J. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

3.2 EQUIPMENT SUPPORTS

- A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.
- B. Grouting: Place grout under supports for equipment and make bearing surface smooth.
- C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.3 METAL FABRICATIONS

- A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.
- B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.
- C. Field Welding: Comply with AWS D1.1/D1.1M procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:
 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.

3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.4 ADJUSTING

- A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.
- B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.5 PAINTING

- A. Touchup: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Section 09900 "PAINTING"
- B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

3.6 HANGER AND SUPPORT SCHEDULE

- A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.
- B. Comply with MSS SP-69 for pipe-hanger selections and applications that are not specified in piping system Sections.
- C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish and where stainless steel materials are not specified. All support systems including hardware, brackets, hangers, rods and isolators shall be of compatible materials for each application.
- D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.
- E. Use carbon-steel pipe hangers and supports metal trapeze pipe hangers and metal framing systems and attachments for general interior service applications.
- F. Use stainless-steel pipe hangers and supports metal trapeze pipe hangers and metal framing systems and attachments for general exterior service applications. All exterior-applied support systems shall be manufactured specifically for exterior applications.
- G. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
 1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
 2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.
 3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
 4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
 5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 deg F piping installations.

H. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joint construction, to attach to top flange of structural shape.
3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
6. C-Clamps (MSS Type 23): For structural shapes.
7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
11. Malleable-Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
12. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
 - a. Light (MSS Type 31): 750 lb.
 - b. Medium (MSS Type 32): 1500 lb.
 - c. Heavy (MSS Type 33): 3000 lb.
13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

I. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41, roll hanger with springs.
4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.
6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.
7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.

J. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system Sections.

PART 4 - MEASUREMENTS AND PAYMENTS

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 15074

VIBRATION AND SEISMIC CONTROLS FOR PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.
- B. Related Sections
 - 1. Section 15050 – BASIC MATERIALS AND METHODS FOR HVAC WORK
 - 2. Section 15051 - BASIC MATERIALS AND METHODS FOR PLUMBING WORK
 - 3. Section 15062 – HANGERS AND SUPPORTS FOR PIPING AND EQUIPMENT
 - 4. Section 15077 – IDENTIFICATION FOR PIPING AND EQUIPMENT
 - 5. Section 15084 – PLUMBING EQUIPMENT INSULATION
 - 6. Section 15085 – PLUMBING PIPING INSULATION
 - 7. Section 15086 – DUCT INSULASTION
 - 8. Section 15088 – HVAC PIPING INSULATION

 - 14. Section 15183 – REFRIGERANT PIPING
 - 15. Section 15195 – FACILITY NATURAL-GAS PIPING
 - 16. Section 15815 – METAL DUCTS

1.2 SUMMARY

- A. Section Includes:
 - 1. Elastomeric isolation pads.
 - 2. Elastomeric isolation mounts.
 - 3. Open-spring isolators.
 - 4. Housed-spring isolators.
 - 5. Pipe-riser resilient supports.
 - 6. Resilient pipe guides.
 - 7. Elastomeric hangers.
 - 8. Spring hangers.
 - 9. Snubbers.
 - 10. Restraint channel bracings.
 - 11. Restraint cables.
 - 12. Seismic-restraint accessories.
 - 13. Mechanical anchor bolts.
 - 14. Adhesive anchor bolts.

1.3 DEFINITIONS

- A. IBC: International Building Code.
- B. ICC-ES: ICC-Evaluation Service.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include rated load, rated deflection, and overload capacity for each vibration isolation device.
 - 2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of vibration isolation device and seismic-restraint component required.
 - a. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an agency acceptable to authorities having jurisdiction.
 - b. Annotate to indicate application of each product submitted and compliance with requirements.
 - 3. Interlocking Snubbers: Include ratings for horizontal, vertical, and combined loads.
- B. Shop Drawings:
 - 1. Detail fabrication and assembly of equipment bases. Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.
 - 2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.
- C. Delegated-Design Submittal: For each vibration isolation and seismic-restraint device.
 - 1. Include design calculations and details for selecting vibration isolators, seismic restraints, and vibration isolation bases complying with performance requirements, design criteria, and analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - 2. Design Calculations: Calculate static and dynamic loading due to equipment weight, operation, and seismic and wind forces required to select vibration isolators and seismic and wind restraints and for designing vibration isolation bases.
 - a. Coordinate design calculations with wind load calculations required for equipment mounted outdoors. Comply with requirements in other Sections for equipment mounted outdoors.
 - 3. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system was examined for excessive stress and that none exists.
 - 4. Seismic- and Wind-Restraint Details:
 - a. Design Analysis: To support selection and arrangement of seismic and wind restraints. Include calculations of combined tensile and shear loads.
 - b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values

of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.

- c. Coordinate seismic-restraint and vibration isolation details with wind-restraint details required for equipment mounted outdoors. Comply with requirements in other Sections for equipment mounted outdoors.
- d. Preapproval and Evaluation Documentation: By an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Show coordination of vibration isolation device installation and seismic bracing for HVAC piping and equipment with other systems and equipment in the vicinity, including other supports and restraints, if any.
- B. Qualification Data: For professional engineer and testing agency.
- C. Welding certificates.
- D. Field quality-control reports.

1.6 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7 and that is acceptable to authorities having jurisdiction.
- B. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.
- C. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- D. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval by ICC-ES, or preapproval by another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are unavailable, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.

PART 2 - PRODUCTS

2.1 ELASTOMERIC ISOLATION PADS

- 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Ace Mountings Co., Inc.

- b. California Dynamics Corporation.
 - c. Isolation Technology, Inc.
 - d. Kinetics Noise Control, Inc.
 - e. Mason Industries, Inc.
 - f. Vibration Eliminator Co., Inc.
 - g. Vibration Isolation.
 - h. Vibration Mountings & Controls, Inc.
2. Fabrication: Single or multiple layers of sufficient durometer stiffness for uniform loading over pad area.
 3. Size: Factory or field cut to match requirements of supported equipment.
 4. Pad Material: Oil and water resistant with elastomeric properties.
 5. Surface Pattern: Waffle pattern.
 6. Infused nonwoven cotton or synthetic fibers.
 7. Load-bearing metal plates adhered to pads.
 - a. Surface Pattern: Waffle pattern.
 - b. Infused nonwoven cotton or synthetic fibers.

2.2 ELASTOMERIC ISOLATION MOUNTS

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Ace Mountings Co., Inc.
 - b. California Dynamics Corporation.
 - c. Isolation Technology, Inc.
 - d. Kinetics Noise Control, Inc.
 - e. Mason Industries, Inc.
 - f. Vibration Eliminator Co., Inc.
 - g. Vibration Isolation.
 - h. Vibration Mountings & Controls, Inc.
2. Mounting Plates:
 - a. Top Plate: Encapsulated steel load transfer top plates, factory drilled and threaded with threaded studs or bolts.
 - b. Baseplate: Encapsulated steel bottom plates with holes provided for anchoring to support structure.
3. Elastomeric Material: Molded, oil-resistant rubber, neoprene, or other elastomeric material.

2.3 OPEN-SPRING ISOLATORS

- A. Freestanding, Laterally Stable, Open-Spring Isolators: .
 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Ace Mountings Co., Inc.
 - b. California Dynamics Corporation.
 - c. Isolation Technology, Inc.
 - d. Kinetics Noise Control, Inc.
 - e. Mason Industries, Inc.
 - f. Vibration Eliminator Co., Inc.
 - g. Vibration Isolation.
 - h. Vibration Mountings & Controls, Inc.

2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Baseplates: Factory-drilled steel plate for bolting to structure with an elastomeric isolator pad attached to the underside. Baseplates shall limit floor load to 500 psig.
7. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

2.4 HOUSED-SPRING ISOLATORS

A. Freestanding, Laterally Stable, Open-Spring Isolators in Two-Part Telescoping Housing:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Ace Mountings Co., Inc.
 - b. California Dynamics Corporation.
 - c. Isolation Technology, Inc.
 - d. Kinetics Noise Control, Inc.
 - e. Mason Industries, Inc.
 - f. Vibration Eliminator Co., Inc.
 - g. Vibration Isolation.
 - h. Vibration Mountings & Controls, Inc.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Two-Part Telescoping Housing: A steel top and bottom frame separated by an elastomeric material and enclosing the spring isolators.
 - a. Drilled base housing for bolting to structure with an elastomeric isolator pad attached to the underside. Bases shall limit floor load to 500 psig.
 - b. Top housing with elastomeric pad.

2.5 PIPE-RISER RESILIENT SUPPORT

1. Vertical-Limit Stops: Steel and neoprene vertical-limit stops arranged to prevent vertical travel in both directions.
2. Maximum Load Per Support: 500 psig on isolation material providing equal isolation in all directions.

2.6 RESILIENT PIPE GUIDES

1. Factory-Set Height Guide with Shear Pin: Shear pin shall be removable and reinsertable to allow for selection of pipe movement. Guides shall be capable of motion to meet location requirements.

2.7 ELASTOMERIC HANGERS

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Ace Mountings Co., Inc.
 - b. California Dynamics Corporation.
 - c. Isolation Technology, Inc.
 - d. Kinetics Noise Control, Inc.
 - e. Mason Industries, Inc.
 - f. Vibration Eliminator Co., Inc.
 - g. Vibration Mountings & Controls, Inc.
2. Frame: Steel, fabricated with a connection for an upper threaded hanger rod and an opening on the underside to allow for a maximum of 30 degrees of angular lower hanger-rod misalignment without binding or reducing isolation efficiency.
3. Dampening Element: Molded, oil-resistant rubber, neoprene, or other elastomeric material with a projecting bushing for the underside opening preventing steel to steel contact.

2.8 SPRING HANGERS

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Ace Mountings Co., Inc.
 - b. California Dynamics Corporation.
 - c. Kinetics Noise Control, Inc.
 - d. Mason Industries, Inc.
 - e. Vibration Eliminator Co., Inc.
 - f. Vibration Isolation.
 - g. Vibration Mountings & Controls, Inc.
2. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.
3. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
4. Minimum Additional Travel: 50 percent of the required deflection at rated load.
5. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
7. Elastomeric Element: Molded, oil-resistant rubber or neoprene. Steel-washer-reinforced cup to support spring and bushing projecting through bottom of frame.
8. Adjustable Vertical Stop: Steel washer with neoprene washer "up-stop" on lower threaded rod.
9. Self-centering hanger-rod cap to ensure concentricity between hanger rod and support spring coil.

2.9 SNUBBERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Kinetics Noise Control, Inc.
 2. Mason Industries, Inc.
 3. Vibration Mountings & Controls, Inc.

- B. Description: Factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.
 - 1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.
 - 2. Resilient Isolation Washers and Bushings: Oil- and water-resistant neoprene.
 - 3. Maximum 1/4-inch air gap, and minimum 1/4-inch-thick resilient cushion.

2.10 RESTRAINT CHANNEL BRACINGS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Cooper B-Line, Inc.
 - 2. Hilti, Inc.
 - 3. Mason Industries, Inc.
 - 4. Unistrut.
- B. Description: MFMA-4, shop- or field-fabricated bracing assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.11 RESTRAINT CABLES

- A. Manufacturers: Subject to compliance with requirements, provide products by the following provide products by one of the following:
 - 1. Kinetics Noise Control, Inc.
 - 2. Loos & Co., Inc.
 - 3. Vibration Mountings & Controls, Inc.
- B. Restraint Cables: ASTM A 492 stainless-steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for restraining cable service; with a minimum of two clamping bolts for cable engagement.

2.12 SEISMIC-RESTRAINT ACCESSORIES

- A. Manufacturers: Subject to compliance with requirements, provide products by the following provide products by one of the following:
 - 1. Cooper B-Line, Inc.
 - 2. Kinetics Noise Control, Inc.
 - 3. Mason Industries, Inc.
 - 4. TOLCO.
- B. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections or reinforcing steel angle clamped to hanger rod.
- C. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

- D. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.
- E. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.
- F. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.13 MECHANICAL ANCHOR BOLTS

- A. Manufacturers: Subject to compliance with requirements, provide products by the following provide products by one of the following:
 - 1. Cooper B-Line, Inc.
 - 2. Hilti, Inc.
 - 3. Kinetics Noise Control, Inc.
 - 4. Mason Industries, Inc.
- B. Expansion-type anchor bolts are not permitted by ASCE/SEI 7 for nonisolated equipment in excess of 10 hp.
- C. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

2.14 ADHESIVE ANCHOR BOLTS

- A. Manufacturers: Subject to compliance with requirements, provide products by the following provide products by one of the following:
 - 1. Hilti, Inc.
 - 2. Kinetics Noise Control, Inc.
 - 3. Mason Industries, Inc.
- B. Adhesive Anchor Bolts: Drilled-in and capsule anchor system containing PVC or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and equipment to receive vibration isolation and seismic- and wind-control devices for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

- B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

- A. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by an agency acceptable to authorities having jurisdiction.
- B. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.
- C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength is adequate to carry present and future static and seismic loads within specified loading limits.

3.3 VIBRATION CONTROL AND SEISMIC-RESTRAINT DEVICE INSTALLATION

- A. Coordinate the location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in Section 03300 "CAST-IN-PLACE CONCRETE."
- B. Installation of vibration isolators must not cause any change of position of equipment, piping, or ductwork resulting in stresses or misalignment.
- C. Comply with requirements in Section 07720 "Roof Accessories" for installation of roof curbs, equipment supports, and roof penetrations.
- D. Equipment Restraints:
 - 1. Install seismic snubbers on HVAC equipment mounted on vibration isolators. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.
 - 2. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch.
 - 3. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction that provides required submittals for component.
- E. Piping Restraints:
 - 1. Comply with requirements in MSS SP-127.
 - 2. Space lateral supports a maximum of 40 feet o.c., and longitudinal supports a maximum of 80 feet o.c.
 - 3. Brace a change of direction longer than 12 feet.
- F. Install cables so they do not bend across edges of adjacent equipment or building structure.
- G. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction that provides required submittals for component.

- H. Install bushing assemblies for anchor bolts for floor-mounted equipment, arranged to provide resilient media between anchor bolt and mounting hole in concrete base.
- I. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.
- J. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.
- K. Drilled-in Anchors:
 - 1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
 - 2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
 - 3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
 - 4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
 - 5. Set anchors to manufacturer's recommended torque, using a torque wrench.
 - 6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.4 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

- A. Install flexible connections in piping where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where the connections terminate with connection to equipment that is anchored to a different structural element from the one supporting the connections as they approach equipment.

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform tests and inspections.
- C. Tests and Inspections:
 - 1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
 - 2. Schedule test with MBTA, through Architect, before connecting anchorage device to restrained component (unless postconnection testing has been approved), and with at least seven days' advance notice.
 - 3. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.

4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.
 5. Test to 90 percent of rated proof load of device.
 6. Measure isolator restraint clearance.
 7. Measure isolator deflection.
 8. Verify snubber minimum clearances.
 9. Test and adjust restrained-air-spring isolator controls and safeties.
- D. Remove and replace malfunctioning units and retest as specified above.
- E. Prepare test and inspection reports.

3.6 ADJUSTING

- A. Adjust isolators after piping system is at operating weight.
- B. Adjust limit stops on restrained-spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

PART 4 - EXECUTION

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 15077

IDENTIFICATION FOR PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.
- B. Related Sections
 - 1. Section 09900 - PAINTING
 - 2. Section 15050 - BASIC MATERIALS AND METHODS FOR HVAC WORK
 - 3. Section 15051 - BASIC MATERIALS AND METHODS FOR PLUMBING WORK
 - 4. Section 15084 - PLUMBING EQUIPMENT INSULATION
 - 5. Section 15085 - PLUMBING PIPING INSULATION
 - 6. Section 15086 - DUCT INSULATION
 - 7. Section 15088 - HVAC PIPING INSULATION
 - 8. Section 15112 – GENERAL DUTY VALVES FOR PIPING
 - 9. Section 15145 – DOMESTIC WATER PIPING
 - 10. Section 15150 – SANITARY WASTE AND VENT PIPING
 - 11. Section 15160 – STORM DRAINAGE PIPING
 - 12. Section 15181 – HYDRONIC PIPING
 - 13. Section 15183 – REFRIGERANT PIPING
 - 14. Section 15195 – FACILITY NATURAL GAS PIPING
 - 15. Section 15211 – GENERAL-SERVICE COMPRESSED AIR PIPING

1.2 SUMMARY

- A. Section Includes:
 - 1. Equipment labels.
 - 2. Warning signs and labels.
 - 3. Pipe labels.
 - 4. Duct labels.
 - 5. Valve tags.
 - 6. Warning tags.
 - 7. Nameplates.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.

- C. Valve numbering scheme.
- D. Valve Schedules: For each piping system to include in maintenance manuals.

1.4 STANDARDS

- A. All labels, colors, contrast, sizes and designations shall conform to ASME A13.1-2007, unless otherwise noted.

1.5 COORDINATION

- A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
- B. Coordinate installation of identifying devices with locations of access panels and doors.
- C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 EQUIPMENT LABELS

- A. Plastic Labels for Equipment:
 - 1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.
 - 2. Letter Color: Black.
 - 3. Background Color: White.
 - 4. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
 - 5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
 - 6. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
 - 7. Fasteners: Stainless-steel self-tapping screws.
 - 8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- B. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified.
- C. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch bond paper. Tabulate equipment identification number and identify Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.2 WARNING SIGNS AND LABELS

- A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8-inch-thick, and having predrilled holes for attachment hardware.
- B. Letter Color: Red.
- C. Background Color: Yellow.
- D. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
- E. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
- F. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
- G. Fasteners: Stainless-steel self-tapping screws.
- H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- I. Label Content: Include caution and warning information, plus emergency notification instructions.
- J. Buried gas and pressure water utilities within the building and to a point 10 feet outside the building shall have detectable buried label tape, minimum 4.5 mil thickness, buried plumb over the protected line.

2.3 PIPE LABELS

- A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.
- B. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive.
- C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.
- D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings, pipe size, and an arrow indicating flow direction.
 - 1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions, or as separate unit on each pipe label to indicate flow direction.
 - 2. Lettering Size: At least 1-1/2 inches high.

2.4 DUCT LABELS

- A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8-inch-thick, and having predrilled holes for attachment hardware.

- B. Letter Color: White.
- C. Background Color: Blue or Yellow.
- D. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
- E. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
- F. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
- G. Fasteners: Stainless-steel self-tapping screws.
- H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- I. Duct Label Contents: Include identification of duct service using same designations or abbreviations as used on Drawings, duct size, and an arrow indicating flow direction.
 - 1. Flow-Direction Arrows: Integral with duct system service lettering to accommodate both directions, or as separate unit on each duct label to indicate flow direction.
 - 2. Lettering Size: At least 1-1/2 inches high.

2.5 VALVE TAGS

Retain requirement in "Action Submittals" Article to submit numbering scheme for approval.

- A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.
 - 1. Tag Material: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
 - 2. Fasteners: Brass beaded chain.
- B. Valve Schedules: For each piping system, on 8-1/2-by-11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
 - 1. Valve-tag schedule shall be included in operation and maintenance data.

2.6 WARNING TAGS

- A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags, of plasticized card stock with matte finish suitable for writing.
 - 1. Size: 3 by 5-1/4 inches minimum.
 - 2. Fasteners: Brass grommet and wire.

3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE."
4. Color: Yellow background with black lettering.

2.7 NAMEPLATES

- A. Each piece of motorized or fuel-burning equipment shall bear a permanent operational data nameplate. The nameplate shall indicate the manufacturer, product name, model number, serial number, performance capacity, operating and power characteristics, labels of tested compliances and listings and other essential data. The nameplate shall be in an accessible and visible location on the equipment as installed and shall not be obscured by insulation, coverings, attached devices or services.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.2 EQUIPMENT LABEL INSTALLATION

- A. Install or permanently fasten labels on each major item of mechanical equipment.
- B. Locate equipment labels where accessible and visible.

3.3 PIPE LABEL INSTALLATION

- A. Piping Color-Coding: Painting of piping is specified in Section 09900 "Painting".
- B. Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
 1. Within 36 inches of each valve and control device.
 2. Within 36 inches of each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
 3. Within 36 inches of penetrations through walls, floors, ceilings, and inaccessible enclosures.
 4. At access doors, manholes, and similar access points that permit view of concealed piping.
 5. Within 36 inches of major equipment items and other points of origination and termination.
 6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
 7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.
- C. Pipe Label Color Schedule:
 1. Natural Gas Piping:

- a. Background Color: Yellow.
- b. Letter Color: Black.

3.4 DUCT LABEL INSTALLATION

- A. Install plastic-laminated self-adhesive duct labels with permanent adhesive on air ducts in the following color codes:
 - 1. Blue: For cold-air supply ducts.
 - 2. Yellow: For hot-air supply ducts.
 - 3. Green: For exhaust-, outside-, relief-, return-, and mixed-air ducts.
 - 4. ANSI/ASME A13.1 Colors and Designs: For hazardous material exhaust.
- B. Locate labels Within 36 inches of points where ducts enter concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.5 VALVE-TAG INSTALLATION

- A. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; shutoff valves; faucets; convenience and lawn-watering hose connections; and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.
- B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:
 - 1. Valve-Tag Size and Shape:
 - a. 1-1/2 inches, round.
 - 2. Valve-Tag Color:
 - a. Natural.
 - 3. Letter Color:
 - a. Black.

3.6 WARNING-TAG AND LABEL INSTALLATION

- A. Machine-print required message on, and attach warning tags to, equipment and other items where required.
- B. Include warning labels on heat-traced lines maximum 25-foot spacing in addition to standard location requirements.
- C. Bury detectable labeled warning tape plumb over and within 12 inches of protected services within the building and to a point 10 feet outside the building.

PART 4 - MEASUREMENTS AND PAYMENTS

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 15084
PLUMBING EQUIPMENT INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Volume 1 DB Contract Terms and Conditions and Volume 2 Technical Provisions.

1.2 SUMMARY

- A. Section includes insulating the following plumbing equipment:
1. Domestic water storage tanks.
- B. Related Sections:
1. Volume 2 Technical Provisions Exhibit 2I “Additional Project Requirements”
SUSTAINABILITY REQUIREMENTS
 2. Section 15085 - PLUMBING PIPING INSULATION
 3. Section 15062 – HANGERS AND SUPPORTS FOR PIPING AND EQUIPMENT
 4. Section 15074 – VIBRATION AND SEISMIC CONTROLS FOR PIPING AND EQUIPMENT
 5. Section 15077 – IDENTIFICATION FOR PIPING AND EQUIPMENT
 6. Section 15400 – PLUMBING FIXTURES
 7. Section 15485 – ELECTRIC WATER HEATERS

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory and field applied, if any).
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
 2. Detail attachment and covering of heat tracing inside insulation.
 3. Detail removable insulation at equipment connections and access panels.
 4. Detail application of field-applied jackets.
 5. Detail application at linkages of control devices.
 6. Detail field application for each equipment type.
 7. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.
- C. Field quality-control reports.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- B. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84 by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 - 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.7 COORDINATION

- A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 15062 "HANGERS AND SUPPORTS FOR PIPING AND EQUIPMENT."
- B. Coordinate clearance requirements with equipment Installer for equipment insulation application.
- C. Coordinate installation and testing of heat tracing.

1.8 SCHEDULING

- A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.
- B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

- A. Comply with requirements in "Equipment Insulation Schedule" articles for where insulating materials shall be applied.
- B. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
- D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
- E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
