 - a. Wiremen engaged in stripping the outer jackets shall demonstrate their ability to properly remove the outer jackets using T-CA Magic Cable Strippers as manufactured by DLW Industries without damaging the inner conductors.
 - b. Wiremen stripping wire ends shall demonstrate their ability by using Ideal Stripmaster Wire Strippers 45-092 (for #14-#16-#10 AWG wire) and Ideal Cable Strippers (for #6 AWG wire) to properly remove the required amount of insulation without nicking the copper conductor.
 - c. Wiremen installing wire eyelets shall demonstrate their ability to properly install the eyelets by using new factory calibrated AMP crimping tools designed for the particular eyelet used.
5. All cable and wire strippers shall be purchased new and shall of be the highest quality available on the market. Ten percent (10%) spare tools shall be available in case of damage to the tools in daily service. These tools shall be factory calibrated and shall be checked periodically in accordance with manufacturer's recommendations for wear or damage.
6. Tools for crimping on the eyes shall be new and factory calibrated at least every six (6) months. Calibration stickers shall be required on each tool.
7. To ensure that the proper tools are used, kits will be set-up and identified by kit number. All tools in each kit must also be numbered. Each wireman shall be assigned a number kit. The kit number and employee's name shall be recorded on a Cable Termination Report and submitted to the MBTA. The DB Entity shall inspect these kits daily, prior to the start of cable termination work, and shall immediately remove the kit from service if a discrepancy is found.
8. The DB Entity shall not proceed with any wiring work if there is a noticeable problem with the tools or cable.
9. Any tools referenced above may be substituted with approved equals upon receiving written acceptance from the MBTA.
10. The conductor terminations shall be made by experienced personnel and be in conformance with the cable manufacturer's recommendations. Submit for approval the cable manufacturer's termination recommendations.
11. Splices in signal cables are not allowed.
12. The MBTA has the right to inspect any tools, materials or work, in conjunction with or independently of the DB Entity. The MBTA has the right to stop work should any deficiencies be found and to only allow work to continue once the deficiencies have been resolved to his sole satisfaction.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8, the DB Entity shall submit the following for acceptance:

- A. Signal Wire and Cable:
 1. List of each cable manufacturer's railway signal installations;
 2. Each cable manufacturer's Quality Assurance Program, including the manufacturer's testing procedure;

3. Manufacturer's technical information describing the cable and its electrical and mechanical characteristics including a cross-section drawing to include cable shape, construction, number of conductors, size, insulation thickness and type, jacket thickness and type, approximate weight per foot and outside diameter for each type of cable the DB Entity proposes to use.
4. The DB Entity shall furnish sample specimen of a four-foot length, if requested, for each proposed cable type. The samples shall remain the property of the MBTA;
5. Certified factory cable test reports which shall include:
 - a. Report Number,
 - b. Date and location of test,
 - c. Description of test, including the testing conditions,
 - d. Complete cable or wire description,
 - e. Lot, batch, and reel identification number,
 - f. Quantitative test results including a completed, signed and notarized standard wire and cable test report sheet,
 - g. Summary of the test results,
 - h. Information on the components of the cable tested to include batch numbers and physical and electrical properties.
6. The DB Entity shall submit two certified copies of the following for acceptance:
 - a. Cable test reports for all demonstration tests required by the MBTA,
 - b. Cable test and inspection reports for tests and inspections required and described by these Mandatory Specifications,
 - c. Test reports of cable tests conducted in the field in accordance with accepted testing procedures,
 - d. Certification that each cable supplied complies with the requirements of these Mandatory Specifications.
7. The DB Entity shall submit two copies of complete, signed and notarized standard Wire and Cable Test Report Sheet as part of each cable test report.
8. The DB Entity shall furnish to the MBTA ten copies of the cable manufacturer's instructions and procedures together with one sample end seal specimen for pot heading of each type of cable to be furnished and installed for this Project.
9. Cable jacket removal and termination procedures;
10. Sample sheet showing format for Cable Termination Report Forms;
11. Cable Termination Report Forms when work is completed;
12. Cable pot heading method and product manufacturer;
13. Submit five copies of detailed installation plans, showing all hardware to be used, methods of attachment, cable routing through conduits, troughs and pull boxes, etc. and including fill percentages, for approval prior to construction/installation, including but not limited to:
 - a. Detailed cable routing plans.
 - b. Pulling plans, including pulling tension calculations and DB Entity's proposal for

monitoring pulling tension during wire and cable installation.

- c. Cable bending radius plans demonstrating minimum bending radius compliance during installation and after installation is complete.
14. Submit for approval messenger attachment, size, usage, sag and tensions and cable pulling calculations for each individual cable run. The maximum pulling tensions shall be recorded for each cable pull and submitted to the MBTA.
15. Provide a final as built copy in the case adjacent to the cable run. Submit to MBTA Final as-builts in electronic format.
16. Splicing of signal wire and cable will not be allowed.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Ship all wire and cable on reels, adequately protected by heavy wrapping or wood lagging from damage during shipment. The DB Entity shall be responsible for any defect in wire or cable occurring in transit. External protective wrapping shall be secured to reels to protect cable during shipment.
- B. Provide reels designed and constructed to withstand handling and so both ends of wire or cable are secured and accessible but protected from injury. If the inner end of the wire or cable projects through the flange of the reel, protect the inner end with a suitable cover of metal with rounded ends and sides and securely fastened in place to protect the wire or cable end. Secure both ends of wire or cable on the reel in place, to prevent their becoming loose in transit or during handling of the reel.
- C. Provide reel drums with a radius larger than the minimum bending radius of the cable to prevent damage to wire or cable during reeling. The arbor hole shall admit a spindle 2-1/2 (two and one-half) inches in diameter without binding. Ship wire and cable in non-returnable reels.
- D. After acceptance of factory tests, seal wire or cable against the entrance of moisture. Protect both ends of each length of wire or cable with wrappings of rubber tape and plastic tape, or an effective boot taped or sealed into place, or by other suitable means accepted by the MBTA. The use of friction tape, other than as an external mechanical protection over an adequate rubber and/or plastic tape, will not be accepted. The wire or cable end protection shall be adequate to protect wire or cable in shipment and for prolonged external storage.
- E. Wind each layer of wire or cable closely and tightly on the reel in a uniform manner.
- F. Paint an arrow on one head of each reel pointing to the opposite direction from the outer end of the wire or cable, with the words "Roll This Way", using letters not less than 3/4-inch in height and arrow not less than six inches in length and 1/2-inch in width.
- G. Requirements for shipping, storage, and handling shall also be in accordance with AREMA C&S Manual, Parts 10.4.1, Recommended Instructions for Wire and Cable Installation and Maintenance and 10.3.16, Recommended Design Criteria for Signal Cable, Non-Armored as well as other provisions established throughout these Mandatory Specifications.

PART 2 - PRODUCTS

2.1 SIGNAL WIRE AND CABLE

- A. Provide the wire and cable for this Project for signal, communication and electrical applications to meet the requirements of the MBTA wire and cable specifications contained within the Technical Appendix A of this section.
- B. The standard cable make-ups shall be as follows:
 - 1. Generally, No. 14 AWG solid used as line circuits between points, to junction boxes and snowmelter control/indication cable to heater cases.
 - 2. Electric Switch Machines: 15 conductor composite cable consisting of (3) #6 AWG stranded and #14 AWG stranded, installed between CIH to the switch machine junction box.
 - 3. Wayside Signals: 12 conductor #14 AWG solid installed between CIH to signal.
 - 4. Track Circuits: 2 conductor #6 AWG stranded twisted from CIH or junction box to track.
 - 5. AVI: 2 conductor #12 AWG solid shielded from CIH to tuning unit (if not located in CIH); #8 AWG stranded twisted from tuning unit to track.

2.2 CABLE MAKE-UP

- A. General
 - 1. If any cables are required beyond those shown above, the DB Entity shall determine size of conductors and cable make-up to meet design requirements. DB Entity shall also increase conductor sizes, as necessary, to be in accordance with the National Electrical Code requirements.
 - 2. If the DB Entity's proposed signal system equipment requires use of shielded cable, the price of such shielded cables shall be included in the bid. Provide shielded cables meeting all requirements of these Mandatory Specifications.
 - 3. The DB Entity will be required to supply all cables, wires and ancillary materials and equipment for this project in sufficient quantities and qualities as prescribed by the MBTA Cable Specification Technical Appendix A of this section.
- B. Spare Requirements
 - 1. The DB Entity shall provide spare conductors in all multi-conductor cables. Express cables originating at a CIH shall contain a minimum of 20 percent spare conductors. Local distribution cables shall contain a minimum of ten percent spare conductors or minimum of one spare conductor.
- C. Where more than one cable is used between the same locations, the quantity of spare wires/pairs shall not be less than 20 percent of the total number of working wires/pairs, but in no case shall the total quantity of spare wires/pairs be less than the quantity of spare wires/pairs required in the largest cable in the group.

2.3 SEALING OF CABLE ENTRANCES

- A. Any voids remaining, where cables enter housings, cases, junction boxes, signals, switch machines, or any other apparatus, shall be made water-tight with cold sealing compound in accordance with AREMA C&S Manual, Part 15.2.15, Recommended Functional Guidelines for Cold Application Sealing Compound

- B. After cable installation, seal all conduit ends, whether above or below ground with “Duxseal” as manufactured by OZ Gedney, “Flame-Safe” as manufactured by T&B, or any approved expanding foam filler.
- C. All cable entrance openings in equipment enclosures and junction boxes shall be sealed with either a compression type fitting or pliable sealing compound after the cable is in place. Dry sand shall be used to fill openings, chutes, risers. (Digging below the riser will release the sand) Sealing compound shall be used to seal the area around cable where the cable emerges from the end of a conduit, pipe, or duct bank. All spare conduits shall be sealed or plugged in an approved manner. Spare conduits will have a pull string installed and taped off on both ends for future use.

2.4 WIRE – INTERNAL

- A. Internal wire and cable shall be as required in specification Section 16855 – INTERNAL WIRE AND CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM.

2.5 TAGS

- A. Tags for identification of individual wires and cable conductors and field-installed wire shall be the sleeve type as manufactured by TYCO Electronics, RAYCHEM RPS-1K-8-4/2.0-9, or approved equal. Sleeve size shall vary as required for different wire sizes.
- B. Tags for cables shall be the PANDUIT flag type, or approved equal.
- C. Back-wired terminal boards in CIHs, and cases shall be provided with factory-printed strip tags with wire nomenclature adjacent to the wire entrance hole on the terminal board. Front-wired terminal boards in junction boxes shall have sleeve tags affixed to each individual conductor. Plastic cable tags as described in Section 16897 - MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM shall be supplied to identify individual cables entering each house, case or junction box in accordance with the DB Entity’s installation drawings, as accepted by the MBTA. All wires and cables shall be equipped at both ends with an approved tag.
- D. All strip and sleeve tags shall be machine printed.
- E. Three-line sleeve type tags shall state the conductor identification with "FROM", "NOMENCLATURE", and "TO" destinations
- F. Spare conductors shall also be identified as “Spare” in the “NOMENCLATURE” line of the tag.
- G. Submit catalog cuts or samples of each type of cable, wire, and equipment identification tags to be installed.
- H. Additional information regarding tagging is presented in Section 16897 - MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

PART 3 - EXECUTION

3.1 WIRE AND CABLE INSTALLATION

- A. General

1. The installation of wire and cable shall conform to AREMA C&S Manual Part 10.4.1, Recommended Instructions for Wire and Cable Installation and Maintenance, except as modified herein.
2. The DB Entity shall give the MBTA 24 hours' notice prior to installing cables.
3. Cables shall not be bent to a radius less than 10 times the diameter of the cable during installation or as finally installed. Express cables and fiber optic shall be installed with a minimum radius of curvature of 25 feet.
4. All signal cable runs shall be continuous without splices between cable terminating locations. Every effort shall be made for continuous runs without breaks. Junction boxes are required where a continuous length exceeds the reel length obtainable and all terminated cable wires within junction boxes will be identified by tags as previously explained within the section and requires the MBTAs acceptance. If it is determined that junction boxes are required for this purpose the DB Entity shall design furnish and install these junction boxes at no additional cost to the MBTA.
5. Inspect wire and cable carefully prior to installation to be certain that the wire and cable is free from defects. It is suggested that the DB Entity megger test the cable on the reels prior to installation for continuity and cross-meggering. This does not relieve the DB Entity from final cable testing and results when both cable ends are dressed within their final terminating points.
6. Any instance of damage to existing, operating wire and cable facilities which occurs during construction, or is discovered subsequent to construction activities, shall be immediately reported to the MBTA. MBTA personnel will promptly make necessary repairs with all necessary assistance by the DB Entity. All additional costs are the responsibility of the DB Entity. All MBTA related costs incurred for the repairs are to be paid by the DB Entity to the MBTA within 60 days. In the case of damage to any new wire and cable facilities installed for this Project, the DB Entity shall be solely responsible to provide repair or replacement of such wire and cable, depending on the nature of repair and correction of any damage shall be as prescribed by written instruction from the MBTA.
7. When pulling cable, an approved wire cable grip, extending not less than 18 inches back from the end of the cable, shall be used. Clutch on the pulling device shall be set to slip at 50 percent of the cable manufacturer's allowable maximum. The equipment used for pulling cable shall be equipped with a dynamometer, which shall continuously indicate the pulling force in pounds. The maximum pulling tensions shall be recorded for each cable pull and submitted to the MBTA.
8. A suitable lubricating medium, non-injurious to the cable insulation, shall be used when pulling cables into conduit, pipe, or duct bank.
9. Cables shall not cross one another when they are placed in a trench, or pulled into a conduit or pipe and care shall be taken not to have the conductors pulled tight or kinked. All cables to be installed in the same conduit shall be pulled and installed simultaneously.
10. The track bed and ballast shall be protected from contamination during cable installation, and shall be restored to the existing condition after cable installation. Plastic tarps and plywood shall be used to prevent ballast contamination. Comply with Section 16806 - EXCAVATION FOR THE LIGHT RAIL SIGNAL SYSTEM of the Mandatory Specifications.
11. Where buried cables enter a concrete foundation, junction box, signal house, or case, five feet of slack for each cable shall be left in the trench below the foundation or pedestal. Do not coil the cable slack used with electronic equipment. The conduit end shall be sealed to

prevent water penetration and the cable shall be encased in a minimum of four (4) inches of sand. Cable marker tape shall also be installed over top of the cable coil at a depth of one (1) foot below the finished grade.

12. Where signal, communications or track cables are installed in the same trench as, or are required to intersect low voltage power cables, these cables shall be installed such that the distance between such cable and the low voltage power cable shall not be less than 12 inches, while maintaining the cover depth of not less than 36 inches for the cable. The 12 inches between any intersecting direct burial cables of different voltages as specified herein shall be filled with sand to a distance of two feet from each cable from the point of intersection.
13. Cable carrying 480V or more shall not be installed in the same trench, conduit, trough, or other raceway as signal cable.
14. The DB Entity shall provide appropriate special protection for wire and cable in areas where the cables are unavoidably exposed to hazardous conditions such as vibration or sharp corners on equipment. The DB Entity shall be responsible for the replacement, at no additional cost to the MBTA, for any cable that is subsequently damaged as a result of a failure to provide such special protection.
15. Cables shall be protected by conduit across bridges, culverts, thru rock cuts, under tracks, where minimum cover depths cannot be maintained, where minimum side clearances cannot be maintained. DB Entity shall provide drawings indicating where minimum cover depth could not be achieved and cables are protected in conduit.
16. Where cable leaves the ground at other than buildings or in foundations, it must be protected by a bootleg or other covering extending above the ground line. Top of such protective coverings shall be filled with a sealing compound.
17. Restoration of backfill and ballast shall be in accordance with the construction methods outlined in Section 16806 - EXCAVATION FOR THE LIGHT RAIL SIGNAL SYSTEM.
18. Cable marker tape shall be installed over top of all underground cables at a depth of one (1) foot below finished grade for the length of the entire run.
19. Where cable transfers from trays or troughs into a conduit, the ends of the conduit shall be fitted with bell ends to prevent damage to the cable.
20. Cables shall enter equipment and foundations through cable entry openings, chase ways, etc. that have been specifically designed and approved for cable entrance or through cable entrance pipes, as specified in 16897 - MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
21. All wires shall be terminated in conductor order. Individual cable conductors shall be identified at each cable termination with plastic tags as specified above. All spare conductors in each cable shall be terminated and identified as spare.
22. All cable entrance openings in equipment enclosures and junction boxes shall be sealed with either a compression type fitting or pliable sealing compound after the cable is in place. Dry sand shall be used to fill openings, chutes, and risers. (Digging below the riser will release the sand) Sealing compound shall be used to seal the area around cable where the cable emerges from the end of a conduit, pipe, or duct bank. All spare conduits shall be sealed or plugged in an approved manner.
23. All cables shall be potheaded, tagged and terminated. Tags to identify cables shall be of plastic material. Tags shall be lettered to correspond with the cable destination and number of conductors in the cable. The tag shall be applied at the cable entrance in a manner to be

easily read. In addition, all cables shall be tagged within each manhole, each enclosure, and on each side of any barrier the cable passes through. Cables shall also be tagged at aerial exits from conduit risers. The type of tag to be used shall be as described in Section 16897 - MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

24. Wherever multiple conductor cables are terminated, the outer jacket of the cable shall be carefully removed to the point of cable entrance. Only approved cable jacket cutting tools, specifically designed for the purpose, with a positive means of setting and controlling the depth of cut into the jacket will be permitted. Razor instruments shall not be used. All conductors shall be inspected for damaged insulation immediately after removal of outer jacket and before tape is applied.
25. Cables shall be potheaded at termination points. The outer sheath shall be carefully removed to within 3"-12" of the cable entrance. Any bronze or metal type shielding, not used for grounding shall be nipped off and the edges bent outward away from the conductors. This shall be followed with several wrappings of 30 mil rubber tape (Scotch 130C) and two layers of 8.5 mil vinyl tape (Super 88) as manufactured by the 3M Company or an approved equal.
26. Excess cable slack shall not be left at terminal boards. Cable shall be cut so any wire within the cable can reach the furthest terminal designated for that cable then neatly trained back into its allotted terminal. Provide sufficient slack in wire or cable conductors at all terminating posts to enable three re-terminations of the conductor due to broken eyelets without re-servicing or re-potheading the cable.
27. In certain types of installation, the cable cannot be constrained; therefore, ample cable slack shall be provided for additional flexibility due to vibration of such equipment.
28. Wires and cables shall be installed (Dressed) in a neat, workman-like manner. Wires and cables in trays or in troughs shall be laid therein and not pulled into same. The cables shall be arranged to allow free access to all cables for maintenance. Wires and cables shall be installed with a minimum amount of cross-over in the trays and troughs and shall not be pulled tightly around bends. All wires and cables shall be protected from abrasion and sharp edges.
29. All conductors shall be eyed (solid only), or terminated as specified in Section 16897 - MISCELLANEOUS COMPONENTS FOR THE LIGHT RAIL SIGNAL SYSTEM insulation shall be removed carefully to ensure the conductor is not nicked or damaged.
30. All conductors including spares shall be identified (tagged) and terminated. The type of tag used for identification shall be as described in Section 16897 - MISCELLANEOUS COMPONENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
31. Fiber optic cable shall be looped behind the main terminal board for future termination into a fiber slack enclosure located on the adjacent wall - leave sufficient slack of at least 50 feet. The inner duct shall be cut within 3-12 inches of the cable entrance.
32. Seal all openings in equipment housings during construction and upon completion to prevent weather and rodents from entering.

B. Underground Buried Installation

1. Underground cable installation shall be in FRE conduit, buried a minimum of 36 inches below top of tie and 36 inches minimum cover depth outside of the tie area.
2. Cables shall not cross one another when they are pulled into a conduit or pipe and care shall be

taken not to have the conductors pulled tight or kinked in conduit fittings or boxes. All cables to be installed in the same conduit shall be pulled and installed simultaneously.

3. The track bed and ballast shall be protected from contamination during cable installation, and shall be restored to the existing condition after cable installation. Comply with specification Section 16806 – EXCAVATION FOR THE LIGHT RAIL SIGNAL SYSTEM.
4. Where buried cables enter a concrete foundation, junction box, or case, the DB Entity shall coil five feet of slack for each cable below the foundation or pedestal. The conduit end shall be sealed to prevent water penetration and the cable coil shall be encased in a minimum of four (4) inches of sand. Cable marker tape shall also be installed over top of the cable coil at a depth of one (1) foot below the finished grade.
5. Where signal, communications or track cables are installed in the same trench as, or are required to intersect low voltage power cables, these cables shall be installed such that the distance between such cable and the low voltage power cable shall not be less than 12 inches, while maintaining the cover depth of not less than 30 inches for the cable. The 12 inches between any intersecting direct burial cables of different voltages as specified herein shall be filled with sand to a distance of two feet from each cable from the point of intersection.

C. Non-Buried Installation

1. Installation in Cable Trays or Prefabricated Cable Troughs - Cable installed in cable trays or prefabricated cable troughs shall be laid and not pulled in place. Cables installed in trays and troughs shall have a minimum amount of crossover and shall not be pulled tightly around bends.

D. Above Ground Installation

1. All above ground conduit shall be galvanized rigid steel (GRS). When GRS conduit risers transition into the ground, GRS to FRE conduit adapters are to be installed 3-inch (minimum) to 5-inch (maximum) above grade.
2. Cables shall not cross one another when they are pulled into a conduit or pipe and care shall be taken not to have the conductors pulled tight or kinked in conduit fittings or boxes. All cables to be installed in the same conduit shall be pulled and installed simultaneously.

3.2 TESTS

- A. All installed external cable shall be tested in accordance with requirements of Section 16898 - SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM of these Mandatory Specifications.

END OF SECTION

APPENDIX A

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY (MBTA)

Power and Signals Department SIGNALS AND

COMMUNICATIONS DIVISION

Specification S—114—B

Date: May 13, 2009

SPECIFICATION FOR LOW SMOKE, NO HALOGEN, SIGNAL WIRE AND CABLE

I

1. GENERAL

This Mandatory Specification shall be in accordance with AREMA C&S MANUAL PARTS 10.3.13, 10.3.16 AND 10.3.22 that establishes the criteria for low smoke, no halogen ethylene propylene rubber insulated and low smoke no halogen cross—linked flame retardant polyolefin jacketed wire and cable.

This Mandatory Specification is for the purpose of providing for cables of high quality and long life, which are to be installed under adverse conditions of direct burial in earth, in ducts, or by aerial suspension, in circuits subjected to voltages of 0 to 1000 volts.

- (a) The wire and cable shall be in accordance with the requirements of the current AREMA C &S MANUAL 10.3.16 AND 10.3.23
- (b) When there is a difference between the requirements of this Mandatory Specification and other specifications mentioned herein, the requirements of this Mandatory Specification shall govern.

2. CONDUCTORS

- (a) The conductors shall meet AREMA 10.3.16 Type I to V.
- (b) Unless otherwise specified in-the purchase order, conductor sizes No. 9 AWG and smaller shall be meet AREMA 10.3.16 IV. Conductors larger than No. 9 AWG shall meet AREMA 10.3.16 type 1,2,3,5.

3. INSULATION

- (a) Conductors insulation shall meet AREMA 10.3.16. E. Type 1
- (b) The insulation shall also meet AREMA 10.3.19. B
- (c) The thickness of the insulation shall be in accordance with AREMA 10.3.16 TABLE 10316-2
- (d) The average thickness shall meet AREMA 10.3.16. E.5
- (e) The insulated conductors intended for assembly, into multi—conductor

cables shall be color—coded by means of printed color, name, and number according to ICEA Method 1 or 3 color coding. Printed legend shall be duplicated on Opposite sides of each conductor.

- (f) In addition, the low smoke EPR Insulation when tested at the thickness of 100 mils, for smoke generation, shall not exceed the value in Table III.
- (g) Testing voltages for the conductors shall be in accordance with Table 1 and Table 2 herein.

TABLE I

Insulation Thicknesses and Test Voltages for Single Conductor Wire Prior to Sheath Application

Rated Size of Circuit <u>Voltage</u>	Insulation Conductor- <u>A.W.G.</u>	<u>Test Voltages</u> Thickness <u>64th Inch</u>	<u>AC Volts,</u>	<u>DC VolTS,</u>
			<u>5 Minutes</u>	<u>5 Minutes</u>
0—1000	14 to 8	5	8,000	25,000
	7 to 2	6	10,000	30,000
	1 to 0000	7	11,000	33,000

The test voltages for Tandem Extruded insulation and jacket for Single Conductor wire are as follows:

Test Voltage for Composite Thickness — Table 1 Modified

Insulation <u>mils</u>	Thickness	AC (1) <u>Test Voltage</u>	DC <u>Test Voltage</u>
62.5	(4/64)	9.5kV	26kV
78.0	(5/64)	12.0kV	31kV
94.0	(6/64)	13.0kV	34kV

TABLE I-A

Insulation Thicknesses and Test Voltages for Individual Conductors of Multi—conductor Cable

Rated Circuit <u>Voltage</u>	Size of Conductor <u>A.W.G.</u>	Insulation Thickness <u>64th Inch</u>	<u>Test Voltages</u>	
			AC Volts, <u>5 Minutes</u>	DC Volts, <u>5 Minutes</u>
0—1000 19	to 16 3	6,000	18,000	
	16 to 8	5	10,000	30,000
	7 to 2	6	11,000.	33,000
	1 to 0000	7	12,500	37,500

- (h) A.C. Test — Each length of conductor, insulated with prime insulation, prior to application of any outer jacket and prior to cabling or twisting, shall be random—wound on spools and immersed in water for a minimum of twenty—four (24) hours, then subjected to test voltages given above for five (5) minutes, without showing signs of puncture, overheating, or self— healing of punctures. Voltage to be applied between conductor and water (ground).

- (i) Insulation Resistance Test — Immediately after the AC test specified above and while still submerged, an insulation resistance test shall be made on each length of conductor. The insulation resistance constant shall not be less than 25,000 megohms — 1000 ft when corrected to 60°F.
- (j) D.C. Test — the D.C. test may be done either following an insulation resistance test or at least eight (8) hours prior to the A.C. test, providing the insulated conductor has been continuously immersed for a period not less than sixteen (16) hours prior to the D.C. voltage application. Each length of insulated conductor, while submerged, shall withstand, without failure, the high voltage D.C. test for five (5) minutes at the potentials given in Tables I and I—A.
- (k) Single Conductor Sheaths — Individual insulated conductors not intended for assembly into multiconductor cables shall be covered with a low smoke cross—linked polyolefin compound sheath in accordance with the properties in Table III, applied over the primary thickness of insulation specified above and after the tank—testing of the primary insulation. The average thickness of sheath compound shall be not less than the value specified for single conductors in Table II of Paragraph 5.
- (l) Single Conductor Identification — The sheath of single conductor cables shall be surface—printed with a legend identifying the manufacturer, year of manufacture, conductor size, and voltage rating in a contrasting ink; durable surface colors are required.
- (m) In addition, the low smoke cross—linked Polyolefin sheath when tested at the thickness of 100 mils, for smoke generation, shall not exceed the values in Table III.

4. ASSEMBLY OF MULTI—CONDUCTOR CABLES

- (a) Multiple conductor cables shall be made by assembling individually insulated, printed conductors into a tight cylindrical form. Individual conductors in a cable having two (2) or more conductors shall be assembled helically and with adjacent layers wound in opposite directions.
- (b) When fillers are required to make the cable round, they shall be non—hygroscopic and flame retardant. Cable tape shall be applied round the cable core of multiple—conductor cables, and shall also be non—hygroscopic and flame retardant.
- (c) Cable tape shall conform to Section 4.4 of ICEA, except that compound—filled tape shall be treated on both sides and thoroughly filled with a rubber compound. Where colored tapes are called for, the colors shall be clear, durable, and of easily distinguishable shades; they shall have no harmful effect on any part of the cable.
- (d) A waterproofed marker tape indicating the name of the manufacturer and year of manufacture shall be inserted in cables for identification purposes. The information shall be present at no less than one—foot intervals. The marker tape shall be so located as to be readily identifiable.

5. **OUTER SHEATH**

- (a) A continuous tubular sheath of high tensile strength moisture and flame—resistant properly cured base product of low smoke cross—linked polyolefin compound shall be tightly formed around the insulated conductor(s) to provide protection against mechanical damage and the entrance of moisture, earth acids, and alkalis into the cable. It shall not adhere to the insulated conductors of multiple—conductor cables and shall conform to Table III. It shall be applied by the continuous tube method, without joints, and shall be properly cured to meet test requirements.
- (b) Average thickness of sheath compound for single conductor and multi—conductor cables shall be not less than values specified in AREMA 10.3.16 Table 10316-4.
- (c) In addition, the low smoke, cross—linked polyolefin sheath, when tested at a thickness of 100 mils, for smoke generation, shall not exceed the values in Table III.
- (d) The Minimum thickness of the sheath shall meet AREMA 10.3.16.E.5
- (e) Manufacturer’s Identification Marker

A waterproofed marker tape bearing the name of the manufacturer and year of manufacture shall be inserted in wires and cables for identification purposes. The identification marking shall be placed at such intervals that all information may be obtained without destroying more than one foot of cable. This information shall be inserted as follows:

- 1. Multiple—conductor cables shall have the marker tape so located as to be readily identified.
- 2. For all cables not included in Item 1, above, the manufacturer’s color tracer threads shall be inserted between the conductor and the insulation or among the strands of a stranded conductor.

(f) Outside Diameter

The maximum outside diameter or finished wire and cable shall not exceed the nominal outside diameter by more than the following tolerances:

Nominal Diameter — Inch	Tolerance— Inch
0 to 0.600	0.030
0.601 to 2.000	5%

* Note: Smoke Generation values also apply to the EPR Insulation. All smoke tests are on 3-inch x 3-inch square slabs of material having a thickness of 100 rails.

6. **FINISHED CABLE TESTS**

Except as otherwise stated herein, tests shall be in accordance with AREMA 10.3.16 AND 10.3.22

- (a) Each completed multiconductor cable, when on the shipping reel, shall be subjected to and successfully pass 2.0 times the AC test voltage levels given in Table I—A for one minute. This voltage to be applied to each conductor against all others grounded, or between conductors utilizing a mid—point grounded test transformer to assure that each conductor is tested against each adjacent conductor in its layer and conductors in adjacent layers. This required repeat application of test voltage should be done by reversing voltage combinations between layers. Cable shield, if any, shall be connected to ground.
- (b) The insulation resistance test shall be made in accordance with Section 6.23 of ICEA, using a well—insulated and sensitive galvanometer. When the temperature at which the cable is tested differs from 60 F, the insulation

resistance shall be corrected to that at 60°F.

The insulation resistance constant shall not be less than 25,000 megohms—
—1000 feet when corrected to 60°F.

- (c) Tests shall be made at point of production. The manufacturer shall give notice when cable is ready for test, and the purchaser shall have the option to witness the tests.
- (d) All completed cable must pass the IEEE — 383 70,000 BTIJ/Hr. Vertical Tray Flammability Test.
- (e) Certified copies of all test results, both electrical and physical, which are required to assure compliance with this Mandatory Specification, shall be furnished to the MBTA. A Certificate of Compliance certifying that the cable has been manufactured in accordance with this Mandatory Specification must be included with the certified test results. Two (2) copies of each of the above documents must be signed by the manufacturer's chief engineering officer, notarized and forwarded, for acceptance by the MBTA, prior to the shipment of any cable.

7. PACKING

Packing shall be in accordance with AREMA 10.3.10

Cable shall be shipped on reels per AREMA 10.3.10 G, and H, and AREMA 10.3.16. H. All reels shall be numbered and lengths to be shipped on each reel shall be worked out in advance, subject to approval by the DB Entity.

**MASSACHUSETTS BAY TRANSPORTATION AUTHORITY (MBTA)
SIGNALS AND COMMUNICATIONS DIVISION
SPECIFICATION S-115
Date: September 15, 2000**

**SPECIFICATION FOR LOW SMOKE, NO HALOGEN, TWISTED PAIR SIGNAL
WIRE AND CABLE**

1. GENERAL

This Mandatory Specification establishes the criteria for low smoke, ethylene propylene rubber insulated and low smoke, no halogen; cross-linked flame retardant polyolefin jacketed wire and cable.

This Cable shall be a twisted pair suitable for the transmission and reception of electrical signals from DC to 10KHz.

Twisted pairs shall be formed from two individually insulated conductors, suitably marked for identification, cabled with a length of lay as short as good construction will permit but no longer than six (6) inches. Multiple pairs shall be constructed such that the length of lay of adjacent pairs shall differ by at least one-half (1/2) inch.

The cables provided for under this Mandatory Specification shall be of high quality and long life. This cable will be installed under adverse conditions of direct burial in earth, in ducts, or by aerial suspension, in circuits subjected to voltages of 0 to 1000 volts DC or AC.

(a) The wire and cable for this Mandatory Specification shall be in accordance with the requirements of the current AREMA (AAR), Signal Manual Part 10.3.17, where applicable, and shall conform to the latest editions of ICEA 5-68-5 16 Standard Publication Rubber Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy except where otherwise specified herein.

(b) When there is a difference between the requirements of this specification and other Mandatory Specifications mentioned herein, the requirements of this specification shall govern.

(c) Pair counts will be covered by the purchase order starting from one twisted pair.

2. CONDUCTORS

(a) The conductors shall be annealed copper; concentric stranded bare or coated and conforming to the requirements of the latest issue of ASTM B-8.

(b) Unless otherwise specified in the purchase order, all conductors shall be concentric lay, Class B or C stranding. Conductors shall have no welds of any kind.

3. INSULATION

- (a) Conductors shall be insulated with a highly moisture and ozone-resistant low smoke EPR compound, which has demonstrated, either through actual field experience and/or through comparable valid aging tests, that the cable offered shall have a minimum life expectancy of forty (40) years. Substances which are injurious to the conductor or insulation shall not be included in the compound.
- (b) The insulation shall be properly vulcanized, homogeneous in character, tough, elastic, and applied concentrically about the conductor, and shall fit tightly thereto. The insulating compound shall be clean and free stripping, leaving the coated conductor, upon stripping, unimpaired and ready for soldering.
- (c) The minimum thickness of the insulation shall conform to Tables land 1-A.
- (d) The average thickness of insulation shall be no less than the specified thickness. The minimum thickness at any point shall not be less than 90% of that specified.
- (e) The insulated conductors intended for assembly into a twisted pair multi-conductor cables shall be color coded by means of printed pair numbers, printed color, (i.e. 1black, 1 white, 2 black, 2white...) All print to be white ink on neutral color compounds. This is a variation of ICEA Method 3 color-coding.
- (f) In addition, the low smoke EPR insulation when tested shall meet the physical characteristic in Appendix A.

4. INSULATION QUALIFICATION TEST:

The insulation shall be consistently uniform, and established suitable for service at potentials to 15,000 volts.

Voltage aging: The dielectric strength stability shall be demonstrated by voltage-aging a minimum often feet between terminals of a single conductor #14 AWG or larger size with 80 mil or thicker insulation, suitably finished. The cable shall be tested in free air with the ends appropriately terminated.

The Laboratory qualification tests must include one of the following stresses to the voltage aged sample:

- (a) 225 V/mil for two years.
- (b) 180 V/mil for three years.
- (c) 135 V/mil for five years.

A sixty (60) Hz voltage in 10kV steps for 5 minutes at each step until breakdown. This test must be started immediately after the voltage aging test above.

No cable breakdown shall occur during the voltage-aging test and the same sample shall withstand

the voltage aging test minimum test stress of 350 Volts/mil on the thermal aging test.

Thermal Aging: The insulation shall be tested in a circulating air oven on 80 mil thick slabs and shall have an elongation not less than 50% after a minimum; aging time of 25 hours at 136°C and 100 hours at 121°C.

Moisture Resistance: A single conductor #14 AWU or larger size with 80 mils or thicker insulation wall, shall have at least 10 feet immersed in water at room temperature. The insulated conductor without any coverings over insulation shall be continuously energized with dc voltage as follows; 325 V/mil for two months, or 280 V/mil for 3 months, or 240 V/mil for four months, or 200 V/mil for six months. No insulation failures shall occur during the test period. The manufacturer must certify that there was no water infiltration during this test.

5. ASSEMBLY

5.1. The insulated conductors shall be twisted into pairs. The average twist length of any pair in the finished cable shall be designed to meet ICEA S56-434 Fifth Edition and shall not exceed six inches

5.2. The insulated pairs shall be twisted into specified combinations to provide pair identification as well as low susceptibility to noise pick-up, and, with varying lay lengths to minimize cross-talk.

6. ARMOR TAPE

The assembled core shall be covered with a rubber impregnated fabric tape to hold the assembly together and to provide a protective bedding for the overlying metallic armor. A waterproof marker tape indicating the name of the manufacturer and year of manufacture shall be inserted in cable for identification purposes. The information shall be present at no less than one-foot intervals. The marker tape shall be so located as to be readily identifiable.

A 1 0-mil bronze tape shall be applied over the bedding tape.

7. COMMUNICATION CHARACTERISTICS

The manufacturer shall certify that the proprietary pair lay-up used shall not exceed the following crosstalk parameters:

<u>CABLE MAKE-UP</u>	<u>ALLOWABLE MUTUAL CAPACITANCE</u>	<u>MINIMUM CHARACTERISTIC IMPEDANCE.+ -20%</u>	<u>CROSSTALK ATTENUATION</u>
2C Twisted #16	.065 MFD/mile	180 ohm @2khz 125 ohm@10hz	Per A below
2CTwisted #14	.065MFD/Mile	180 ohm @2khz 124ohm@10khz	Per A below
Multi conductors	.065 MFD/Mile	160 ohm @2khz 105 ohm @ 10khz	Per B below

Configuration A

Minimum crosstalk attenuation between adjacent pairs or between two individual pair cables, shall not be greater than 90dB per one thousand (1000) feet for all frequencies between 2 kHz and 10khz. The crosstalk attenuation between adjacent pairs will apply to a multipair cable except only one pair will be allowed to have a lower crosstalk attenuation equal or greater than 80dB per one thousand (1000) feet for all frequencies between 2 kHz and 10khz

Multi-conductors of this configuration shall be one hundred (100) percent tested for crosstalk attenuation on all pairs with data supplied indicating crosstalk attenuation and pair identification.

Configuration B

The MBTA can request cables to satisfy configuration B, where the cable shall be twisted and designed to minimize crosstalk between pairs with a crosstalk attenuation between adjacent pairs of multi-pair cable shall be 75dB per 1000ft. nominal for all frequencies between 2khz and 10khz.

8. PRELIMINARY TESTS:

AC Test: Each length of conductor, insulated with prime insulation, prior to application of any outer jacket and prior to cabling or twisting, shall be random-wound on spools and immersed in water for a minimum of twenty-four (24) hours, then subjected to test voltages given in Table 1 for five (5) minutes, without showing signs of puncture, overheating, or selthealing of punctures. Voltage to be applied between conductor and water (ground). Each length of insulated conductor, while submerged shall withstand, without failure, the high voltage AC test for five (5) minutes and the potentials given in Tables I and I-A.

Insulation Resistance Test: Immediately after the AC test specified above and while still submerged, an insulation resistance test shall be made on each length of conductor. The insulation resistance constant shall not be less than 35,000 Megohms -one thousand (1000) feet when corrected to 60° F.

DC Test: The DC test may be done either following an insulation resistance test or at least eight

(8) hours prior to the AC test, providing the insulated conductor has been continuously immersed for a period not less than sixteen (16) hours prior to the DC voltage application. Each length of insulated conductor, while submerged shall withstand, without failure, the high voltage DC test for five (5) minutes and the potentials given in Tables I and I-A.

Insulation Thickness and Test Voltages for Single Conductor Wire Prior to Sheath Application

Rated Circuit Voltage	Size of conductor A.W.G.	Insulation Thickness 64th Inch	Test Voltages	
			AC Volts 5 Minutes	DC Volts, 5 Minutes
0-1000	14 to 8	5	8,000	25,000
	7 to 2	5	10,000	30,000

The test voltages for Tandem Extruded insulation and jacket for Single Conductor wire are as follows:

Test Voltage for Composite Thickness. Table 1 Modified

Insulation Thickness Mils	AC (1) Test Voltage	DC Test Voltage
62.5 (4/64)	9.5kV	26kV
78.0 (5/64)	12.0KV	31KV
94.0(6/64)	13.0KV	34KV

TABLE I-A

Insulation Thickness and Test Voltages for Individual Conductors of Multi-conductor Cable

Rated Circuit Voltage	Size of Conductor A.W.G.	Insulation Thickness 64th Inch	Test Voltages	
			AC Volts 5 Minutes	DC Volts 5 Minutes
0-1000	19 to 16	5	6,000	18,000
	14 to 8	5	10,000	35,000

In addition, the low smoke cross-linked Polyolefin sheath when tested at the thickness of 100 mils, for smoke generation, shall not exceed the values in appendix B.

9.0 OUTER SHEATH:

The outer covering shall be a Crosslinked Polyolefin (XLPO) low smoke compound, a mechanically rugged, thermosetting low-smoke compound which is resistant to most oils, acids and alkalies. It is flame and moisture resistant. The jacket shall meet the physical and electrical properties shown in Appendix B. The overall jacket thickness shall be in accordance with AREMA (AAR) Manual part 10.3.17 as shown in Table 2 below. The minimum thickness at any one point shall not be less than

90% of the minimum average value.

Common Overall Jacket of Twisted Pair Cable

Calculated Diameter of Cable Under Jacket Inches	Jacket Thickness Mils ^(64th~5)
0.425 or less	62 (4)
0.426 .0.700	78 (5)
0.701 .1.050	94(6)
1.051 .1.500	109 (7)
1.501 -2.000	140(9)
2.001 —3.00	156 (10)

10.0. IDENTIFICATION

Following is an example of how the identifying legend shall be printed on the outer jacket, with contrasting ink repeated every two feet:

- (A) (N)/PR #C AWG CU EPR 1000 Volts (Year)
- (A) =Manufacture and Plant Number.
- (N) = Number of Pairs
- (C) = Wire size

11.0. FINISHED CABLE FINAL TEST:

Except as otherwise stated herein, tests shall be in accordance with AAR Signal Specification 240-58.

(a) Each completed multi-conductor cable, when on the shipping reel, shall be subjected to and successfully pass two (2.0) times the AC test voltage levels given in Table I-A for one minute. This voltage to be applied to each conductor against all others grounded, or between conductors utilizing a mid-point grounded test transformer to assure that each conductor is tested against each adjacent conductor in its layer and conductors in adjacent layers. This required repeat application of test voltage should be done by reversing voltage combinations between layers. Cable shield, if any, shall be connected to ground.

(b) The insulation resistance test shall be made in accordance with Section 6.23 of ICEA, using a well-insulated and sensitive galvanometer. When the temperature at which the cable is tested differs from 60°F. the insulation resistance shall be corrected to that at 60°F.

The insulation resistance constant shall not be less than 35,000 Megohms .1000 feet when corrected to 60°F.

(c) Tests shall be made at point of production. The manufacturer shall give notice when cable is ready for test, and the purchaser shall have the option to witness the tests.

(d) All completed cable must pass the IEEE .383 70,000 BTU/Hr. Vertical Tray Flammability Test.

12.0. QUALITY ASSURANCE

The manufacturer shall function under a nationally recognized Quality Assurance Program. Independent audits demonstrating compliance with programs such as; IOCFRSO Appendix B or ANSI N45.2 or an ISO 9000 system shall be certified to prior to production.

Certified copies of all test results, both electrical and physical shall be furnished to the MBTA. A Certificate of Compliance stating the cable has been manufactured in accordance with this Mandatory Specification must be included with the certified test results. Two copies of each of the above documents must be signed by the manufacturer's Chief Engineering Officer, notarized and forwarded, for acceptance by the MBTA, prior to the shipment of any cable.

APPENDIX A EPR Insulation

PHYSICAL AND ELECTRICAL CHARACTERISTICS When tested per ICEA S-68-516, Part 6, where applicable the (EPR) insulation shall meet the following guaranteed values:

Properties tested for control of product.

Physical Requirements before Aging	Guaranteed Value
Tensile Strength, mm. psi	1000
Tensile Stress at 200% Elongation, mm., psi	600
Elongation at Rupture, mi. %	300

Physical Requirements after Aging

After 168 hours in Air oven Test at 121°C

Tensile Strength, % of Unaged Value	90
Elongation, % of Unaged Value	85

Properties demonstrated by qualification testing, that are inherent to the formulation. Physical Requirements after Aging

After 168 hours in Air Oven Test at 150°C

Tensile Strength, mm. % of Unaged Value	85
Elongation, mm., % of Unaged Value	60

Ozone Resistance

SECTION 16811

POWER SWITCH AND LOCK MOVEMENT LAYOUTS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the procuring and installing of 110 volt DC dual control power switch-and-lock movement layouts including all required hardware to form a complete track switch layout as shown on the Contract Documents.
- B. Power switch-and-lock movement layouts shall include an electric switch-and-lock movement, pedestal mounted junction box, throw rod, insulated hinged front rod, point lug, lock rod, detector rod, shims, identification numbers and letters, all required screws, nuts, washers, pins, grease fittings, cotter keys, plates, adjusting brackets, extension plates, saddle plates, and all hardware to mechanically couple the power switch-and-lock movement layout to the track switch points and to mount the movement on the ties.
- C. The DB Entity shall be responsible for providing miscellaneous items such as flexible conduit, fittings, etc., to facilitate a complete layout for installation. The DB Entity shall also furnish and install tie straps, gauge, extension, and saddle plates for each power switch-and-lock movement layout as indicated on the Contract Documents and the accepted layout drawings.
- D. The DB Entity shall mount adjust, and maintain the complete power switch-and-lock movement layout as hereinafter described until accepted by the MBTA.

1.2 QUALITY ASSURANCE

- A. Power switch-and-lock mechanisms shall meet the requirements established by AREMA C&S Manual, Part 12.2.1 where the AREMA requirements do not conflict with any requirement specified in this Section.
- B. The DB Entity shall inspect each power switch-and-lock movement layout after it has been installed and correct any deficiencies. This inspection shall be conducted in conformance with the requirements of the DB Entity's installation inspection procedure as accepted by the MBTA.
- C. The DB Entity shall coordinate with the MBTA and perform final operational tests of the switch-and-lock movements that shall be performed as described in Section 16898 – Signal System Tests for the Light Rail Signal System. The DB Entity shall also have the required personnel on-site to make adjustments and modifications as directed.

1.3 SUBMITTALS

In accordance with the requirements of Section 2.7 and 2.8, the DB Entity shall submit a description of materials and methods of installation to be furnished under this section. This shall include but not be limited to:

- A. Assembly (product) drawings of each type of power switch and lock movement identifying all the components required for a complete layout. Also provide installation drawings showing the mounting details of the layout including the connections to the track switch points.
- B. Factory test procedures and manufacturers certification of factory tests prior to shipment

- C. Installation Inspection and Test procedures
- D. Field testing procedures and completed Field Test Reports

1.4 DELIVERY, STORAGE AND HANDLING

- A. Prior to shipment, all parts of the power switch-and-lock movement layout that are not painted, or made of non-corroding material, shall be coated with an approved grease to prevent corrosion. All unused threaded outlets shall be suitably plugged or capped.
- B. Switch-and-lock movements and their component layout parts shall be protected against damage during handling and shipment, and shall be secured against loss during storage.

PART 2 - PRODUCTS

2.1 MATERIAL

- A. Power Switch-and-Lock Movements
 1. Power switch and lock movements shall be gear driven from the motor. Movements shall be furnished with double adjustable type lock rods and detector rods. Movements shall be provided with dual operation hand throw lever capable of being locked at the “power/hand” selector lever.
 2. Power switch-and-lock movements shall be as manufactured by Alstom (GRS), Model 5F, or equivalent.
 3. Power switch-and-lock movement motors shall be suitable for continuous normal operation at 90 to 130 volts dc and shall not be damaged when operated intermittently at 130 to 150 volts dc. Each switch-and-lock movement shall sustain a 150 volt factory test operation without damage to diodes or other components.
 4. Power switch-and-lock movements shall throw from normal to the reverse position, or vice versa, within the time specified by the approved technical manuals while driving a load meeting the requirements shown on reference drawing from AREMA C&S Manual, Part 12.2.5.
 5. The hand throw selector lever, when in the hand throw position, shall disengage the clutch assembly and all energy from the motor for hand throw operation of the switch-and-lock movement in either direction and provide indication of the disengagement.
 6. Fifteen watt internal heaters shall be provided in the contact compartment and in the motor compartment of each power switch-and-lock movement.
 7. Heater type, location, and mounting details shall be included as part of the submitted layouts.
- B. Rods and Hardware
 1. The power switch-and-lock movement layouts shall not require offsets in the track connecting rods.
 2. Ample threaded area, equal on either side of the adjusting nut(s) shall be provided on each rod to accommodate wide latitude in operating adjustments.
 3. All front rods shall be of the vertical, hinged type, insulated and adjustable.

4. Two malleable cast metal letters, "N" and "R", at least three inches high, painted white, shall be furnished to denote the normal and reverse position of the switch points for each layout. Each letter shall have four holes drilled to receive No. 12 brass wood screws.
 5. Four, one and one-half inch No. 12 brass, flathead wood screws shall be furnished for each letter.
 6. Each power switch-and-lock movement mechanism shall be supplied with identification letter-numbers 6" high stenciled with white paint on the switch and lock movement cover. Where two switches are operated by one lever, the number of the switch will be supplemented by the letter "A" or "B" centered on the mechanism cover.
 7. Switch tie rods shall be drilled in place during installation at the location of final placement.
 8. The DB Entity shall install extension or saddle plates and tie straps for each power switch-and-lock movement layout.
- C. Junction Box - Each power switch-and-lock movement layout shall include a cast iron, pedestal mounted junction box, suitable for terminating the interconnecting wires and cable. Junction boxes shall be manufacturer's standard for use with layout.
- D. Electrical Fittings - The DB Entity shall furnish all connectors, and electrical fittings, as required for each power switch-and-lock movement layout.
- E. Hose and Clamps - Hose and clamps shall be provided to form a complete layout.
- F. Switch Adjustment Wrenches – DB Entity shall provide a complete set of adjustment wrenches for each interlocking location.
- G. Painting - All equipment described in this Section shall be painted in accordance with requirements of AREMA. The finish color shall be black.
- H. Security – DB Entity shall provide all proprietary and standard signal padlocks of appropriate design as follows:
1. To restrict entry to the inside of the power switch-and-lock movement;
 2. To restrict entry to the inside of the motor compartment;
 3. To restrict entry to the inside of the hand crank selector lever, where applicable;
 4. To secure the selector lever and the hand-throw lever.
 5. The DB Entity shall ensure pad locks are applied.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. New switch timbers shall be installed as part of each switch installation. The DB Entity shall verify that the track switch layout is in accordance with the dimensions indicated accepted installation drawings prior to commencement of installation work.
- B. Prior to mounting the power switch-and-lock movement the DB Entity shall align the switch headblock ties (T1 and T2) at right angles to the straight stock rail, and space the ties in accordance

with the accepted installation drawing, and condition the switch points to move without binding. The DB Entity shall install the tie straps as indicated and in accordance with the accepted installation drawing.

- C. Whenever the DB Entity drills, adzes, or daps ties, the cut surfaces shall be thoroughly saturated with copper naphthenate, or other type of wood preservative, as accepted by the MBTA. Limit of cutting or dapping shall not exceed two inches.
- D. The DB Entity shall be responsible for removing any stone ballast necessary for the installation of each power switch-and-lock movement layout and for replacing and tamping the ballast after the installation has been completed. Excess ballast shall be spread evenly between ties in the vicinity of the power switch-and- lock movement layout. The DB Entity shall take care not to contaminate the ballast in the area of his work.
- E. The DB Entity shall be responsible for any costs incurred by the MBTA in restoring track alignment and surface as a result of the DB Entity's work on track switches.
- F. The DB Entity shall assist the MBTA in making a preliminary adjustment of the power switch-and-lock layout at the time of installation and a final adjustment when placing in service, which shall result in the adjusting nuts being centered on the threads, plus or minus 30% of the thread length.
- G. The adjustment shall be such that when the switch point is obstructed 1/4-inch or more and the switch and lock movement is manually or electrically operated, the obstruction will not allow the switch-and-lock movement to lock up. The DB Entity shall also verify that the power switch-and-lock movement circuit controller contacts will be made when the switch point is within one-eighth inch closed. Measurements shall be made over the No. 1 switch rod for both the normal and reverse positions of the track switch points. The DB Entity shall use the MBTA standard (floating the lock rod method) for adjustment of mechanical and electrical locking when making these adjustments.
- H. Underground cables terminating in the switch junction box shall be dressed as specified in Section 16808 – EXTERNAL SIGNAL CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM. The individual conductors shall be fanned, tagged and terminated. Wiring between the switch junction box and the power switch-and-lock movement shall be accomplished using insulated flex wire, No. 14, 19-strand minimum and No. 10 27-strand minimum. These wires shall also be tagged and terminated. The wires between the switch junction box and the power switch mechanism shall be installed in an appropriate length of approved flexible hose. The hose shall be fastened to the switch junction box and switch mechanism with two, three-inch stainless steel hose clamps, as approved. The maximum length of the hose shall not exceed 21-inches unless otherwise accepted by the MBTA.
- I. Once the DB Entity receives the power switch-and-lock movement layouts, and after installation, the power switch-and-lock movement layouts shall be properly lubricated and maintained by the DB Entity on a regular timed program until accepted by the MBTA.
- J. The DB Entity shall exercise care that the switches, including switch tie plates, are thoroughly lubricated at all lubricating points, that all machined surfaces susceptible to rusting, both external and internal, are thoroughly coated with an approved grease, and that threaded portions of switch rods and nuts are similarly coated and protected.
- K. The switch tie plates shall be lubricated with an approved lubricant used by the MBTA. The DB Entity shall periodically renew the protective coating until such time as the MBTA assumes responsibility for maintenance of the equipment.

3.2 IDENTIFICATION

- A. Each power switch-and-lock movement shall bear a number corresponding to the number of the controlling operation number of the switch. (IA, IB, 3A, 3B, 5 etc.) These identifications shall be 6” high, stenciled with white paint on the switch and lock movement cover per the MBTA Standards.
- B. The DB Entity shall install, for each layout, the letters "N" and "R" for the purpose of identifying the position of the switch points. The "N" shall be placed on the normally closed point side as shown on the Contract Documents. These letters shall be attached to the first tie adjacent to, but not supporting the switch points, using the four, one and one-half inch No. 12 brass flathead wood screws provided.

3.3 FIELD TESTS

The DB Entity shall assist in testing all functions of each power switch-and-lock movement layout in accordance with the requirements of Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

3.4 PAINTING

All equipment described in this Section shall be painted in accordance with AREMA section 1.5.10, Recommended Instructions for Painting and Protective Coatings. The finish color shall be flat black.

3.5 HEATERS

Heaters for the switch points shall be installed in accordance with the requirements of Section 16850 – SNOW MELTER HEATING SYSTEMS FOR THE LIGHT RAIN SIGNAL SYSTEM.

END OF SECTION

SECTION 16817

SIGNAL, BUS HOLD, START LIGHT, AND TRAIN INDICATOR LAYOUTS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing color light signals, bus hold, start light, and train approach indicator light (TAK) layouts.
- B. The color light signal layouts shall be both wall mount and pedestal mount type. Each signal layout shall be provided with appropriately colored LED lighted lens units, junction boxes with terminal boards, wiring, number plates, hood, padlocks, and mounting hardware. Pedestal mounted signal layouts shall include a foundation, split-base junction box, mast and ladder.
- C. The bus hold light unit, located at Lechmere station, shall be furnished and installed by the DB Entity. The bus hold light will provide a “wait” indication to the bus operators in the station to allow the patrons disembarking from the train enough time to transfer to the bus. The bus hold light layouts shall be of the same material and design as a single signal light unit and be suitable for wall and (under) canopy mounting.
- D. The start light units, located at College Ave and Union Square stations, shall be furnished and installed by the DB Entity. The start light will provide an illuminated “START” indication with associated bell that will light and ring when a train is to depart inbound. This command will be derived from commands given by the OCC scheduling software. The start light layouts shall be of material and design be suitable for wall and (under) canopy mounting.
- E. The DB Entity shall conduct a survey of the entire contract limits and confirm that the signal and TAK layouts proposed for the project do not intrude into the dynamic clearance envelope of the Green Line car equipment. The DB Entity shall modify the proposed layout, in a manner accepted by the MBTA, for any signal that infringes on the dynamic clearance envelope of the vehicle.
- F. All lights, specified in this section shall be internally wired at the factory insofar as practicable and possible.

1.2 QUALITY ASSURANCE

- A. The DB Entity shall inspect each unit prior to shipment. This inspection shall conform to the DB Entity's Factory Inspection Procedure as accepted by the MBTA. Signal, bus hold and TAK layouts and light units shall be in compliance with these Specifications prior to delivery to the MBTA. The DB Entity shall inspect each signal, bus hold and TAK unit prior to accepting delivery. The DB Entity shall be responsible for promptly notifying the MBTA of damaged or unsuitable material. Once accepted, the DB Entity shall be responsible for storage and handling until final installation and acceptance.
- B. The DB Entity shall inspect each layout after it has been installed in the field. This inspection shall conform to the DB Entity's Installation Inspection Procedure as accepted by the MBTA. Installation will not be considered complete until the DB Entity has corrected all installation defects to the satisfaction of the MBTA.

- C. Signals shall meet the requirements of AREMA C&S Manual, Part 7.1.1, Recommended Design Criteria and Functional/Operating Guidelines for a Color-Light Signal, Doublet-Lens Type, where the requirements of the AREMA Specifications do not conflict with these Specifications.
- D. The final operating tests to determine the acceptability of each complete signal layout shall be performed as described within Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM of these Specifications.

1.3 SUBMITTALS

- A. Prior to the manufacture or procurement of the signal, bus hold, start light, and TAK layouts, the DB Entity shall submit complete drawings for each type of layout and configuration for each location. A complete keyed parts and material ordering reference number list shall be provided for each type of signal, bus hold, start light, and TAK layout.
 - 1. Submit specifications and other product information for all components of the layout(s).
 - 2. Provide information for all relevant lighting applications, e.g: LED units for under canopy vs. outdoors and the use of additional lenses or roundels.
- B. The DB Entity shall submit a Factory Test and Inspection Procedure for each type of signal layout prior to factory test.
- C. Prior to the installation, the DB Entity shall submit a complete set of installation drawings for each type of signal, bus hold or TAK layout, unit, and configuration, for all locations. The drawing(s) shall indicate that each layout does not infringe upon the dynamic clearance envelope of the vehicle and include site specific mounting details and installation dimensions for each different type of location.
- D. The DB Entity shall submit an Installation Inspection Procedure for each type of layout prior to installation.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Signal, bus hold, start light, and TAK layouts and their component parts shall be properly crated at the manufacturer's point of shipment. The DB Entity shall be responsible for all damage incurred in transit and/or caused by mishandling or improper storage. Comply with all provisions of Section 16801 – Basic Technical Requirements.

PART 2 – PRODUCTS

2.1 MATERIALS

- A. Signal Units - Signals shall be color light type as manufactured by Alstom (GRS), Ansaldo-STC (US&S), or approved equal for transit application with the capability of LED lighting. Signal housings shall be manufactured so that all light compartment doors of each layout permanently operate as a single door.
- B. Bus hold, start light and TAK light units shall be as described above. It is the MBTA's preference to utilize LED lighting. The color for bus hold, and TAK application shall be clear or lunar white and will be subject to acceptance of the MBTA.

C. Lenses and Hoods

1. Signal lenses shall meet AREMA Signal Section standards for performance with regard to sighting and chromatic properties.
2. Lenses shall be uniform in shade and density for the respective color. Lenses shall be provided with neoprene gaskets to provide a weatherproof and dust-proof seal between the lenses and signal housing.
3. Lenses that have hot spots or “cat’s eyes” will not be acceptable. The DB Entity shall submit the type of lens proposed for MBTA acceptance.
4. Each signal unit lens opening, for signals to be installed outdoors, shall be equipped with a nine inch hood. Shorter hoods will be acceptable for “under-cover” locations.

D. Lamp (Lens Unit) Compartments

1. The housing for each signal shall be made of cast aluminum and shall have individual lamp (lens unit) compartments. The lamp compartments shall be separated from each other by partitions that shall prevent the passage of light between the compartments.
2. Each signal shall have a single cast aluminum hinged, removable door, which provides access to all lamp compartments simultaneously. The door shall also be provided with two ventilating openings, top and bottom, which shall be covered with fine mesh stainless steel, copper or brass screen on the inside and protected with hoods to keep precipitation out. Doors shall have gaskets as specified in AREMA C&S Manual, Part 15.2.10, Recommended Functional Guidelines for Gasket Material Suitable for Circuit Controllers, Signal Cases and Other Signal Apparatus Housings.
3. Doors shall be secured by standard MBTA hex-keyed padlocks. The locking arrangement of the doors shall be so arranged that the door cannot be locked until fully closed. All doors for lamp compartments shall have a stop at 90 degrees that shall prevent them from swinging out into the train’s dynamic clearance envelope.
4. Each lamp compartment shall be provided with means to pass wiring between units.
5. Each lamp compartment shall be of proper size to provide ample space for LED lens units, terminals and such adjusting devices as are necessary.
6. Provide for a “backlight” indication on the rear of each signal compartment. The backlight shall provide the ability to determine which lamps are illuminated from behind the unit. The indicator light shall appear as clear or white when used with any aspect other than red. With a red aspect the backlight indicator shall also appear as red.

E. LED Light/Lens Units

1. LED light/lens units shall be available in all required colors and be of the same type and available from the same manufacturer. GE Lighting Solutions (Gelcore), Alstom, Ansaldo-STS, Siemens (Safetran), and others may be approved as suppliers provided they satisfy the required criteria and can provide all the colors as required.
2. LED light/lens units shall operate on nominal voltage 115V AC.
3. LED light/lens units have a rated life of 35,000 hours or more.
4. LED light/lens units shall be mounted so that a proper display of the aspect for optimum preview can be readily made and maintained. Mounting within the signal head shall be of a standard arrangement consistent with lens unit manufacturer’s requirements and as accepted by

the MBTA. No customized mounting/assembly arrangements shall be allowed.

F. Painting

1. The inside of the lamp compartment(s) shall be painted non-reflective black.
2. Each signal, bus hold, and TAK layout shall have one primer coat of rust preventive paint and one finish coat of paint at the point of assembly prior to shipment. The finish coat of paint for the exterior of the lamp compartment housing shall be dull (non-reflective) black.

G. Signal/TAK Number Plates

1. Number plates for signals and TAK lights shall be enameled sheet steel. The enamel shall be baked on the sheet steel in such a manner as to ensure that every part of the metal has a smooth, durable, and permanent covering, free of any imperfections.
2. All number plates shall have black synthetic enamel lettering on a white reflex-reflecting background.
3. The number plate shall be bracket mounted under the lowest signal lens in the assembly and shall be fastened by four brass screws, with lead and brass washers under the screw heads and under the enameled plate. The lead washers shall be installed adjacent to the enamel.
4. Each number plate shall meet the requirements of AREMA C&S Manual, Part 14.6.1, Recommended Design Criteria for Signs Other Than for Highway-Rail Grade Crossings where the requirements of the AREMA C&S Manual do not conflict with the requirements established in this Section.

H. Signal, Bus Hold, Start Light, and TAK Mounting

1. Wall mounting

- a. Wall-mounted signals, bus hold, start light, and TAK lights shall be provided for locations as required by the DB Entity's design.
- b. Mounting design shall conform to the DB Entity's accepted submittal.
- c. The DB Entity shall measure all proposed locations where wall mounted signal units are to be installed, prior to submitting details or ordering equipment, to ensure that the train's clearance envelope is not adversely impacted.

2. Pedestal Mounting

- a. Pedestal-mounted signals and TAKs shall be provided for locations as required by the DB Entity's design. A mast for a pedestal-mounted signal or TAK shall consist of a four- inch aluminum pipe post suitably equipped at the top to accommodate the light unit and provided at the bottom with an approved junction box base. The dimension of the bolt hole centers in this base shall be eleven and eleven-sixteenth inches by eleven and eleven-sixteenth inches.
- b. The base shall be a split base junction box type with AREMA terminals for all pedestal mounted signals and TAKs. The terminals are to be made accessible by a cover or door, with provisions for padlocking, without removing any other part of the signal assembly.
- c. The DB Entity shall provide foundations for all pedestal mounted signals and TAKs as shown on the Contract Documents. Foundations shall conform to the requirements of Section 16807 – Concrete and Other Foundations.

I. The DB Entity shall provide access to all pedestal-mounted signals. Ladders shall be furnished by

the DB Entity if the height of the signal is such that there is more than six feet - six inches between the center line of the uppermost lens and top-of-rail. Ladders shall have horizontal (flat bar) rungs and be complete with an approved ladder base, all required bolts, nuts, washers and associated mounting hardware.

PART 3 – EXECUTION

3.1 INSTALLATION

- A. All signal, bus hold, start light, and TAK layouts shall be installed in accordance with installation drawings accepted by the MBTA. All units shall be installed with a hood of an appropriate size unless otherwise directed by the MBTA. The DB Entity shall show proposed locations of all layouts on the design plans and the installed layouts on the as-built plans.
- B. Each signal lens configuration must be distinct and unmistakable when viewed with the centerline of the bottom red aspect 7' above the top of rails at a minimum distance of 1,000'. The DB Entity shall furnish all labor, equipment, and material, including shims or special tools, required to properly focus and align the signals both horizontally and vertically to obtain specified sighting distance.
- C. Lens/light unit voltage shall be set at manufacturer's recommended voltage level for optimum viewing and maximum life expectancy.
- D. All equipment described in this Section shall be painted in accordance with AREMA C&S Manual, Part 1.5.10, Recommended Instructions for Painting and Protective Coatings. One coat of paint shall be applied after installation and prior to placing in service. The paint shall be of the same quality and texture as the manufacturers finish coat.
- E. The DB Entity shall provide 10% spare for each lens/light unit utilized.

3.2 FIELD TESTS

- A. For proper operation and setting of LED/lamp operating voltages and sighting shall be performed in accordance with Section 16898 - Signal System Tests of these Specifications. The DB Entity shall assist in the testing as directed by the MBTA.

END OF SECTION

SECTION 16818

NEXT TRAIN SIGNS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies basic requirements applicable to furnishing and installing next train signs.
- B. Next Train signs will indicate the approach of a train and the track or platform it is to arrive on and be located at all turn back stations.

1.2 RELATED WORK SPECIFIED ELSEWHERE:

Section 09900 – PAINTING

Section 16742 – VARIABLE MESSAGE SIGN SYSTEM

1.3 SUBMITTALS

- A. Shop Drawings:
 - 1. Submit shop drawings of all work of this Section. Do not order materials or begin fabrication until obtaining MBTA's acceptance.
 - 2. Show sizes and thicknesses of all members, types of materials, methods of connection and assembly, complete dimensions, hangers, brackets, anchorage, relationship to surrounding work by other trades, shop finishes, sign designs, layouts, and lettering, and other pertinent details of fabrication and installation.
- B. Samples: Submit samples in duplicate of all materials under this Section, as follows:
 - 1. Samples of bronze color opaque back-lit panel.
 - 2. Samples of chimes proposed with different sound for each track.
 - 3. Samples of all colors proposed for use on signs, and lettering.
 - 4. Full-size paper proofs of all signs, with proposed colors marked thereon.
 - 5. After approval of color match and lettering proofs, submit for MBTA's acceptance one full-size sign, as selected by the MBTA, complete in all respects and ready for installation. Submit as many times as necessary until obtaining MBTA's acceptance. Sample sign, upon approval, shall serve as a standard to be equaled by all other work.
- C. Submit design plans showing proposed locations of all next train signs and as-built plans that detail installed locations.

PART 2 – PRODUCTS

2.1 SCHEDULE OF SIGN

- A. Next Train signs shall be installed on both platforms at all turn back stations.

2.2 FIELD MEASUREMENTS

- A. The sign fabricator shall obtain all measurements in the field required to fabricate the work to proper dimensions. See Section 16742.

2.3 BACK-LIT ELECTRONICALLY ACTIVATED NEXT TRAIN SIGN

- A. Next train signs shall be a factory-fabricated single-sided unit.
- B. Materials
 - 1. Sign face materials
 - a. ¼” translucent mar-resistant polycarbonate sheet plastic in colors as indicated.
 - b. Porcelain enamel on 16-gauge steel laminated to polywood backing as indicated.
 - 2. Sign frame: all exposed steel shall be painted as specified in Section 09900 - PAINTING.
 - 3. Illumination: Provide an LED type lamp with illumination capacity at least equivalent to a 120V 60 Watt incandescent lamps.
 - 4. Audible Warning: Provide an audible warning chime device with differing sounds for inbound and outbound train arrival.
 - 5. Lamp and chime device shall be wired in accordance with the Next Train Sign circuit drawings developed for each location.
 - 6. All electrical components shall be UL approved.

2.4 FASTENINGS AND ANCHORS

- A. The sign fabricator shall design a complete system of fastenings and anchorage devices for the various signs, as required for attachment to the various supporting structures. These may include, but are not limited to, concealed clip systems, face screws, epoxy adhesives, etc. Wherever reasonably possible, fastenings and anchorage devices shall be fully concealed, and shall be vandal proof. The DB Entity is responsible to provide safe and secure installations in strict conformance to the governing laws and building code.
- B. Fully describe proposed fastenings and anchorage devices for each sign type on the shop drawings.

PART 3 – EXECUTION

3.1 PROTECTION AND TEMPORARY COVERS

- A.** Completed sign panels shall be properly protected and maintained in good condition, free from dirt, scratches, hand marks or other blemishes. The panels shall be shipped in such a manner as to insure their arrival on the job site in an undamaged condition.
- B.** Subsequent to erection, if directed by the MBTA, any exterior signs may be required to be covered until the actual use thereof is desired. Material used to temporarily cover any sign panel shall effectively conceal the message and be non-injurious to the panel, its finish, or its structural integrity.

3.2 INSTALLATION

- A.** Erection of all work under this Section shall be performed by experienced sign erectors. Signs shall be installed true, plumb and level, located as shown on the Drawings. No field cutting of any sign work will be allowed. Exercise extreme care in all handling and stacking of signs to avoid chipping. The DB Entity shall approach the MBTA to determine exact location of signs in the field.
- B.** All work shall be rigidly anchored to the supporting construction, as indicated on the accepted shop drawings. Fastenings, except those for the anchorage of supporting members to the structures, shall be concealed.

3.3 CLEAN-UP

- A.** Surfaces of sign work shall be cleaned as recommended by the sign manufacturer after installation and left in a condition satisfactory to the MBTA.
- B.** All defective work, including that exhibiting cracked, chipped, scratched, abraded, or otherwise damaged finishes, shall be removed and replaced with work conforming to the specified requirements.

END OF SECTION

SECTION 16819

TRAIN DETECTION FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. The work to be done under this Section consists of providing 100Hz, steady energy, single rail and double rail Track Circuits.
1. Track Circuits shall be Siemens SE-3 or approved equal.
 2. Track Circuits shall provide immunity to both conductive and inductive vehicle electrical emissions.
 3. Track circuits shall be single or double rail as shown on the Contract Documents.
 4. Track circuits shall be designed to detect insulated joint failure and to tolerate the effects of current imbalance without reliability failure.
- B. Insulated Joints and Rail Bonding
1. The work defined under this section also includes furnishing and installing all necessary material for signal and power bonds on the track running rails for proper operation of the train detection and traction negative return systems.
 2. The requirements for running rail bonding for rail joint, rail expansion joints, frog and switch fouling connections, track cross bonding and yard track bonding connections are further described in Section 16829 – INSULATED JOINTS FOR THE LIGHT RAIL SIGNAL SYSTEM and Section 16830 – RUNNING RAIL BONDING FOR THE LIGHT RAIL SIGNAL SYSTEM of these Specifications.
 3. The requirements for impedance bonds are further described in Section 16823 – IMPEDENCE BONDS FOR THE LIGHT RAIL SIGNAL SYSTEM.

1.2 QUALITY ASSURANCE

- A. Track circuit equipment shall be provided in accordance with the applicable requirements and recommendations of the AREMA C&S Manual, Section 8 – Track Circuits, where the manual does not conflict with these Specifications.

1.3 SUBMITTALS

- A. In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”, the DB Entity shall submit the following for approval:
1. Mechanical and circuit drawings for track circuits;
 2. Complete performance data of each track circuit based on actual cut-over test values. In addition to actual test data provide nominal values and operating ranges/limitations for each type of track circuit.
 3. Factory test procedures;

4. Field Test Procedures including any schemes to facilitate phased testing and/or cut-over method;
5. Installation drawings;
6. System Failure Modes and Effects Analysis, Quality Control standards for inspectors and system components including pass/fail criteria for the system. Manufacturers assurance of testing to maintain quality standard.
7. Ten (10) copies of product information and service manuals for each type of track circuit;
8. For Insulated Joints and Rail Bonding:
9. Material composition, electrical and mechanical characteristics for power bonds, signal bonds, and track circuit connectors;
10. Mechanical and operating data for the tool(s) required to install the track circuit connections;
11. Field installation & test procedures for insulated joints, welded signal and power bonds;
12. All mechanical devices for securing and protecting running rail bonding;
13. Installation drawings showing/verifying final layouts for bonding of special trackwork to ensure that all pieces of the special trackwork are properly connected electrically.

PART 2 – PRODUCTS

2.1 MATERIALS

A. General Track Circuit Requirements

1. Single and double rail, 100 Hz, steady energy, power frequency track circuits shall be SE-3 as manufactured by Siemens (Safetran) or approved equal.
2. Circuits shall operate on ungrounded, 105 - 125 Volts, AC 100 +/- 2 Hz power. This power shall be phase synchronized between adjacent CIH's to ensure polarity staggering for failed insulated joint detection.
3. Single and double rail circuits shall be vital and applied as indicated on the Contract Documents.
4. Track circuits shall be immune to 600V DC traction power and shall not require external filters for operation.
5. The design of power frequency track circuits shall ensure that any single failure shall not result in an indication of false unoccupancy in any track circuit. Insulated joint failures shall be self- detecting. The failure of an insulated joint shall cause adjacent track relay(s) to give indication of track circuit occupancy.
6. Track circuits shall be totally immune to improper operation due to crossed or grounded wires or any other influences such as capacitive and inductive coupling or stray currents.
7. With the exception of cabling, junction boxes, matching transformers and associated fuses, all track circuit elements shall be located in the Central Instrument Houses (CIH).
8. Track circuits shall have a rated shunting sensitivity of 0.25 to 0.5 ohms at any point in the circuit. Final adjustments shall be performed with a 0.06 ohm shunt.
9. Track circuit components shall consist of a tapped feed step-down transformer and series feed reactor at the transmit end, with a track transformer, receiver and a biased-neutral track relay at

the receive end. The use of matching transformers to overcome line impedance shall be as required by the DB Entity's design.

10. All components shall be rack or wall mountable and utilize AREMA binding posts for terminations.
11. The track circuit product shall have an in service history on the MBTA or similar transit lines in a similar application for a minimum of 5 years.
12. Circuit components shall have a dielectric breakdown rating (circuit to chassis, circuit to circuit) of 3000V AC, 60Hz.
13. All circuit components shall be rated to perform in an environment consistent with the AREMA C&S Manual part 11.5.1, Recommended Environmental Requirements for Electrical and Electronic Railroad Signal System Equipment, for a Class C environment.
14. Track circuit shall provide broken rail detection on all rails with the exception of the negative return rail on the single rail applications. Broken rails shall be indicated by the de-energizing of the track relay for the track circuit containing the broken rail.

B. Power Bonds

1. All power bonding shall be bonded to the web of the rail. Bonding material shall be manufactured to use the exothermic process, Cadweld or approved equal. Bonding material and molds shall be MBTA accepted.
2. All non-insulated joints in single or double rail track circuit territory including guard-rail joints in curved track areas, shall use 250 kcmil size, 14" bonds, two for each joint, as manufactured by Erico Products, Inc.; Dwight and Wilson Company; United States Steel; or approved equal.
3. Power bonds for frog and switch fouling connections and expansion joints shall be made up with 2-500 kcmil extra flexible bonds.

C. Guardrail Bonds and Signal Rail Bonds

1. Guardrail bonds and signal rail bonds on the signal rail side in single rail track circuit areas shall be rail-head type manufactured bonds prepared for welding. The bonds shall be 7/32" by 6-1/2" and two for each joint, as manufactured by Erico Products, Inc.; Dwight and Wilson Company; United States Steel; or approved equal.
2. These bonds shall be manufacturer's bonds prepared for welding by the exothermic process. Bonds, bonding materials and types of molds shall be as accepted by the MBTA.

D. Other Bonds

1. Impedance bond connections to the rail shall be welded to the base of the rail as accepted by the MBTA. The cable for these connections shall be 2-500 kcmil extra flexible conductors as shown on the Contract Documents and specified in Section 16808 – External Signal Cable of these Specifications. 2-1000 kcmil extra flexible conductors shall also be used for impedance bond connections at traction power substation negative return connection locations as shown on the Contract Documents.
2. Frog jumpers, switch jumpers, and end-of-storage-track cross-bonds shall be welded to the base of rail as accepted by the MBTA. The cable for frog and switch jumpers, and end of storage track cross-bonds shall be 2-500 kcmil extra flexible as shown on the Contract Documents and specified in Section 16808 – External Signal Cable of these Specifications.

PART 3 – EXECUTION

3.1 INSTALLATION

- A. Track Circuits – power frequency track circuit components and track relays shall be rack mounted and factory tested prior to delivery of the CIHs to the job site. Upon delivery to the final location, the DB Entity shall re-insert relays and components and make connections, adjustments and test, as required, to effect a working field installation.
- B. Rail Bonding
1. Power bonds shall be installed at non-insulated rail joints as specified herein.
 2. Guardrail bonds shall be installed at all guardrail joints in curved track areas.
 3. Frog, switch jumper, and cross-bonding shall be installed at locations as required by the DB Entity's design. All pieces of the special trackwork shall be bonded in accordance with the accepted plans in order to establish electrical continuity and conductive capacity for traction power return and signal track circuits.
 4. Signal rail bonds in single rail track circuit areas shall be installed at locations as required by the DB Entity's design.
 5. For all rail-joint bonds, impedance bond connections to the running rails, switch and frog bonds, and expansion joint bonds, the surfaces of the rails where the bond is to be applied shall be ground clean with a reinforced grinding wheel, of a type as recommended by the bonding material manufacturer. The use of vitrified grinding wheels will not be allowed. After grinding, the surface shall be cleaned with an approved non-toxic solvent to remove all traces of grease and dirt.
 6. After the surface has been ground and cleaned, the surface shall be heated to drive out any moisture. The cable bond shall then be welded by exothermic process in such a manner as to ensure a thorough mechanical and electrical connection.
 7. The welding material shall consist of a copper exothermic mixture employing tin in an amount to effectively constitute 4.5 percent to 5.5 percent of the resulting weld metal. The resulting weld metal shall be of high electrical conductivity and shall have a minimum tensile strength of 39,000 pounds per square inch. The tensile strength shall be determined by tensile tests performed on ½" nominal diameter tensile specimens (without flaws) cast in graphite molds.
 8. The casting of test specimens shall be by the direct reduction of the exothermic mixture and the flowing of the weld metal into a graphite mold to form the ½" diameter specimens.
 9. Before beginning work on these bonds, the DB Entity, at his expense, shall require each welder to weld in the field under conditions similar to those of regular installation, not less than three complete rail connections, and as many more as the MBTA considers necessary to determine that the welds are being made satisfactorily. Such welds shall be subject to inspection and test by the MBTA, and his approval as to method and quality of workmanship will depend on the results of these inspections and tests.
 10. It is of great importance that each rail connection be thoroughly welded to the rail and, to reduce the possibility of any of these welds breaking while in service, the MBTA reserves the right to require a test of each weld by hammer and striker, or in any other manner which in the opinion of the MBTA is reasonable.

3.2 TESTS

- A. Track Circuit and Rail Bonding tests shall be performed in accordance with the manufacturer's approved factory and field test procedures and with requirements of Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

END OF SECTION

SECTION 16821

AUTOMATIC VEHICLE IDENTIFICATION AND PUSH BUTTON SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies basic requirements to provide Automatic Vehicle Identification (AVI) equipment for the MBTA's Green Line light rail system.
- B. This Section also specifies the requirements for application of Motorperson's Push Button boxes for the MBTA's Green Line light rail system.
- C. The AVI equipment will provide train routing requests at certain locations as well as augment the train tracking capability of the OCC systems by providing information from new locations installed as part of this contract. The locations for new AVI equipment are detailed in the project technical requirements. The DB Entity shall provide AVI equipment from an established supplier of AVI systems or equipment, and shall develop 'as-built' final drawings and design documentation based on the design philosophy of these Specifications and the Contract Documents.
 - 1. The AVI equipment will communicate with the existing operations control center (OCC) via the new fiber optic backbone being installed under this contract.
 - 2. The AVI equipment shall be functionally equivalent to the existing AVI equipment, and will be able to replace existing equipment without requiring changes to any equipment on board the Light Rail Vehicles (LRVs) or the Green Line wayside signal system, and without requiring changes to the existing OCC software and message formats.
 - 3. The AVI antenna equipment shall interoperate with existing AVI interrogator units, and existing AVI antennas shall interoperate with AVI interrogator logic units (ILUs) provided under this Contract.
 - 4. AVI antennas provided shall be fully interoperable with existing AVI antennas. Supplemental antennas shall be able to communicate with existing AVI interrogator units without imposing intermediate devices or modifying the existing interrogators units. Existing antennas shall be able to communicate with the supplemental AVI ILUs without imposing intermediate devices.
 - 5. The AVI equipment shall not affect or interfere with the operation of any existing MBTA systems or equipment.
 - 6. AVI route numbers required for use in non-vital application logic shall be supplied by the MBTA during construction.
- D. The DB Entity shall provide ancillary equipment such as junction boxes for the termination of antenna leads, bandpass filters, cables, and cases.
- E. The Motorperson's Route Select Push Button boxes will provide train routing requests, from the train operator, at certain Home Signal locations, and installed as part of this contract. The DB Entity shall provide all equipment from an established supplier of wayside signal system equipment, and shall develop 'as-built' final drawings and design documentation based on the design philosophy of these Specifications and the Contract Documents.

1. Furnish and install Motorperson push buttons at locations as required by the DB Entity's design. Locate train Operator's pushbuttons at home signals approximately eight feet in approach of the home signal. Train Operator's push buttons shall provide capability of selecting all routes which can be obtained at a particular Home Signal location.
 2. Install Motorperson's push buttons at a height of 5' measured between the base of rail and the bottom of the push button unit. Push Button Boxes shall be of adequate size for the equipment contained therein without crowding, and include a full complement of AREMA Standard terminal posts for terminating cables. Train Operator's push button boxes shall be NEMA 4X with padlock hasp sized for standard MBTA's hex keyed lock, and manufactured of type 304 stainless steel as shown on the Contract Documents. All Train Operator push button boxes shall be the same size. The mounting bracket or cantilevered support shall be rated to withstand 600 pounds of load.
 - a. The Push Button Boxes shall be furnished with push buttons in a vertical row and route indication lights mounted in a vertical row directly across from the corresponding route request Push Button. The box shall be hinged at its side with a 180-degree locking point.
 - b. Pedestal mounted Push Button boxes shall be as shown on the Contract Documents and accommodate a pedestal having a 4" diameter.
 - c. The pedestal unit shall have a 4" inside diameter and fit properly with pedestal junction box.
 3. The push button panel, push buttons, illuminating light and LED shall be vandal-resistant and vibration proof. All mounting hardware shall be secured by application of "Lock-tite" or product accepted by the MBTA.
 4. Locate the push buttons so as not to block any signal indications, and install at a height and distance to permit operation by the train operator without leaving the cab.
 5. Furnish and install laminated phenolic plastic tags indicating the button required for the route path desired and the lamp indicating the approved route. All characters on the tags shall be WHITE letters or numbers on a BLACK background, and be a minimum of 8 mm in height and 6 mm spacing between letters. A similar laminated phenolic plastic nameplate shall be provided identifying the Push Button name and location.
 6. Within the request circuitry that will be inputted to the NVMIS, the design shall ensure that the train operator has held the push button for sufficient time to initiate the routing feature.
 7. Each push button shall have an LED that illuminates when the push button is operated.
 8. The LED within the request Push Button shall be GREEN in color, or white with a green lens. The LED within the route indication shall be WHITE in color.
 9. If required for trackside visibility, the push button should be illuminated by method and location as accepted by the MBTA. In outdoor areas, the illumination light shall be lit at night only. In subway areas, the illumination light shall be on continuously.
- F. Furnish and install various arrangements of push button mounting for the layouts, as indicated on the Contract Documents, and as specified herein.
- G. Push Button Mounting
1. Outdoor Type - Pole-mount push buttons on split-base pedestals fastened to concrete foundations. Support for pedestal mounted push buttons shall consist of an approved 4" mast

suitably equipped at the top to accommodate the push button box and provided at the bottom with an approved split-base pedestal.

1.2 SITE CONDITIONS

- A. Dust, dirt, and electrical interference shall be considered and reflected in the design of all equipment provided. Equipment shall be able to operate as required either in the Green Line's underground sections or under prevailing exterior climatic conditions.

1.3 QUALITY CONTROL

- A. Material and equipment provided under this Contract shall be produced subject to a formal Quality Assurance Program, for which the DB Entity will provide certificates as requested by the MBTA.
- B. The DB Entity shall comply with the requirements of Volume 1 DB Contract Terms and Conditions Section 4 "Quality Control and Quality Assurance" and Volume 2 Technical Provisions Subsection 2.5 "Quality Management"
- C. The DB Entity shall inspect all AVI antenna site equipment prior to shipment. This inspection shall be conducted in conformance with the requirements of the DB Entity's Factory Inspection Procedure as accepted by the MBTA.
- D. DB Entity shall inspect each AVI wayside equipment unit prior to assembling it and installing it in a CIH.
- E. The DB Entity shall perform a Factory Acceptance Test of the AVI ILU, UPS system in conjunction with the factory test of the CIH system.
- F. All AVI antenna site equipment shall be inspected after it has been delivered and the DB Entity shall correct any deficiencies noted. This inspection shall be conducted in conformance with the requirements of the DB Entity's Delivery Inspection Procedure as accepted by the MBTA.
- G. The DB Entity's Delivery Inspection Procedure shall require the DB Entity to provide the MBTA with a written report upon receipt of all materials and equipment and shall note the condition of the shipment including any deficiencies.
- H. Only equipment that has passed the associated Factory and Integration tests shall be installed.
- I. The DB Entity shall inspect all Motorman's Route Select Push Button equipment prior to shipment. This inspection shall be conducted in conformance with the requirements of the DB Entity's Factory Inspection Procedure as accepted by the MBTA.
- J. DB Entity shall inspect each Motorman's Route Select Push Button unit prior to assembling it and installing it in its designated wayside location.
- K. All Motorman's Route Select Push Button equipment shall be inspected after it has been delivered and any deficiencies noted shall be corrected by the DB Entity. This inspection shall be conducted in conformance with the requirements of the DB Entity's Delivery Inspection Procedure as accepted by the MBTA.
- L. The DB Entity's Delivery Inspection Procedure shall require the DB Entity to provide the

MBTA with a written report upon receipt of all materials and equipment and shall note the condition of the shipment including any deficiencies.

M. Only equipment that has passed the associated Factory and Integration tests shall be installed.

1.4 SUBMITTALS

A. Unless expressly specified otherwise, submittals shall be made in accordance with the requirements of Volume 2 Section 2.7 and Section 2.8.

B. The DB Entity shall submit the following:

1. Drawings showing the typical layout, construction, mounting and grounding arrangement of the AVI antenna equipment at a surface (outdoor) location.
2. Drawings showing the cabling arrangements for each of the antenna sites including locations of junction boxes and cable routes between the antennas and junction boxes.
3. Drawings showing installation details for all AVI antenna site equipment. These drawings shall include, but not necessarily be limited to, layout of antenna loops, antenna lead configuration relative to track structures, junction box installation details, cable connections and terminations; and locations of any bandpass filters that may be necessary.
4. Schematic diagrams showing the manner in which AVI wayside equipment components are to be connected to each other internally, to the AVI antenna equipment, and to field communications externally.
5. Drawings showing the location, type, and arrangements of all interface terminations to Wayside Equipment, Antenna Site Equipment, external 120V AC 60Hz power, and the patch panels for the two network switches and terminal servers for the fiber optic backbone communication system.
6. Sizes and types of internal and external wire proposed for use.
7. Manufacturers' specifications for AVI ILU and supporting equipment.
8. Manufacturers' specification of UPS system's components including, but not limited to, AC to DC converter, charger, DC to AC inverter, transfer switch and batteries.
9. Power calculations demonstrating the proposed UPS system's ability to adequately serve the load demands of solid state equipment for each system with the required additional operating margins.
10. Schematic diagram of UPS system components including, but not limited to, AC to DC converter, battery charger, inverter, and transfer switch. Also include schematic diagrams showing manner of connection between components, including batteries, to form a viable UPS system.
11. A Factory Inspection Procedure for the AVI Antenna, and for the ILU and the UPS prior to assembly. Following approval of the Factory Inspection Procedures, furnish six certified copies upon satisfactory completion of the inspections.
12. A Factory Acceptance Test Procedure for the AVI antenna, and for the ILU, UPS system, and supporting hardware installed in the CIH's.
13. Following approval of Factory Acceptance Test procedures, six certified copies upon satisfactory completion of the Factory Acceptance Tests.

14. A Delivery Inspection Procedure to assure that all furnished equipment meets the requirements of these Specifications.
 15. Installation test procedures.
 16. An Antenna Interface Test Procedure.
 17. A Proof of Performance Test Procedure.
 18. A Site Integration Test Procedure.
 19. Ten (10) copies of all maintenance manuals.
 20. Drawings showing the typical layout, construction, mounting and grounding arrangement of the Motorman's Route Select Push Button equipment at a surface (outdoor) location.
 21. Drawings showing the cabling arrangements for each of the Motorman's Route Select Push Button sites including locations of junction boxes and cable routes between the boxes, and CIH locations.
 22. Drawings showing installation details for all Motorman's Route Select Push Button site equipment. These drawings shall include, but not necessarily be limited to, layout of positioning configuration relative to track structures, junction box installation details, cable connections and terminations.
 23. Schematic diagrams showing the manner in which Motorman's Route Select Push Button wayside equipment components are to be connected internally, and to CIH locations.
- C. All drawings submitted by the DB Entity shall be in conformance with Section 16804 – DRAWINGS FOR THE LIGHT SIGNAL RAIL SYSTEM, and shall include the drawing number, title, issue date, revision number or letter, date of revision, the initials of the DB Entity's responsible MBTA authorizing and checking the revision, a description of the change, the reason for making the change, contract number, reference to next higher assembly, and relevant DB Entity's approval signatures.

1.5 DELIVERY, STORAGE AND HANDLING

- A. The DB Entity shall provide all equipment and accessories specified herein and all accessories not specifically identified but which are necessary or reasonably required for the AVI and Motorperson Route Selection Push Button equipment to perform its functions when connected to the OCC via the new fiber optic backbone.
- B. The DB Entity shall comply fully with the requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- C. The DB Entity shall assure that all equipment is protected from damage during shipment.
- D. Shipment of all equipment shall be trackable and the MBTA shall be provided the ability to monitor the status of the shipment.
- E. The DB Entity shall provide identification nameplates, tags and/or markings for items as specified in this Section.
- F. The DB Entity shall replace any equipment damaged in transit or caused by mishandling by the DB Entity at no additional cost to the Contract.

1.6 TESTING

- A. The DB Entity shall provide testing of equipment as specified herein and in Section 16898, Signal System Tests.

1.7 WARRANTY

- A. The DB Entity shall provide warranty on equipment provided under this Contract, in accordance with Section 16801 - BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

PART 2 – MATERIALS

2.1 EQUIPMENT

- A. All equipment provided by the DB Entity shall be new and free of manufacturing defects. The equipment will consist of:
 - 1. AVI Antenna Site Equipment, including AVI antennas, bandpass filters as warranted and interconnection cables.
 - 2. AVI Wayside Equipment, including ILUs, uninterrupted power supply (UPS), AVI support equipment, and connections to patch panels for the new fiber optic backbone.
 - 3. Motorman’s Route Select Push Button wayside site equipment, including split base junction boxes, masts, mast caps, and box mounting hardware.
 - 4. Any and all equipment and accessories required to make the furnished equipment meet the requirements of these Specifications.
- B. All equipment provided by the DB Entity, including cables, connections, and accessories, shall be able to operate as required outdoors in weather conditions, including precipitation and temperature and humidity variations according to data published by the National Oceanic and Atmospheric Administration for Boston and surrounding areas. Equipment shall operate as required in an outdoor environment without requiring protection other than enclosure in the CIH itself. Comply and adhere to AREMA Class C.
- C. All original equipment provided by the DB Entity, including cables and connections, shall be accepted by the MBTA prior to procurement or use. For this purpose, the DB Entity shall provide to the MBTA satisfactory evidence that the equipment is appropriate for the intended use, including manufacturer’s specifications or other technical characteristics.

2.2 AVI ANTENNA SITE EQUIPMENT

- A. Provide AVI antennas consisting of a double loop of wire, in a ‘figure 8’ configuration, to be installed between the running rails.
- B. The loops shall be formed of #8 stranded, insulated wire.
- C. The antenna(s) shall be designed to reflect an RF field upward as installed.
- D. The AVI antennas shall be provided pre-installed in frames fabricated of Cordura hose or an approved equal, compatible with the existing AVI antenna location support structures.

- E. The outside dimensions of the antenna loop frame shall be approximately 4' by 16'.
- F. The antenna loops shall have a mean time between failures (MTBF) no less than 40,000 hours.
- G. Junction Boxes
 - 1. The DB Entity shall furnish junction boxes to terminate the leads from individual antennas and effect links to the associated ILU in the CIH.
 - 2. Junction boxes shall satisfy the NEMA 3R standard, and shall be watertight and provide for the intended connections to be made reliably in the EMI conditions prevalent in the Green Line's Central Subway.
- H. Interconnecting Cables at Antenna Sites
 - 1. The DB Entity shall furnish and install the interconnecting cables as specified herein. The following cable interconnections are required at each AVI antenna site:
 - a. Antenna leads from individual antenna loops to junction boxes;
 - 2. All interconnecting cables will run in trough or conduit. The DB Entity shall provide conduit sufficient for the length of all interconnecting cables, and such that each connection can be made without requiring mechanical connections. These conduits shall be metallic and shall shield the interconnecting cables against RFI/EMI interference, shall be grounded appropriate to provide such shielding, and shall be of waterproof construction.
- I. All conduits shall be of an ANSI-approved type and shall be classified by UL as suitable for the purpose specified.
- J. All conduits shall be free of burrs and projections, circular in cross-section, of uniform wall thickness, and shall conform to the requirements of ANSI Standard C-80.1.
- K. Grounding
 - 1. The DB Entity shall furnish equipment necessary to ground the antennas in accordance with Section 16871 – GROUNDING FOR THE LIGHT RAIL SIGNAL SYSTEM, and Section 16876 – GROUNDING OF SIGNAL SYSTEM EQUIPMENT FOR THE LIGHTH RAIL SIGNAL SYSTEM.

2.3 Wayside Equipment

A. AVI Interrogator Logic Unit (ILU)

- 1. The DB Entity shall provide ILUs compatible with the MBTA's existing or "legacy" Green Line units as manufactured by Vapor Corp.
- 2. The function of the ILU shall be as follows:
 - a. Upon activation by the approach of an LRV, continuously interrogate each connected antenna loop for transponder messages. Every 24 millisecond (ms), output a 100KHz signal of 2 ms duration, and wait for a response from a transponder;
 - b. Process all messages received from up to four (4) connected antennas in such a way as to have output indistinguishable from the 'legacy' units, without requiring any additional external processing;
 - c. Format and output the messages for transmission to the OCC at 45 High Street via the

fiber optic backbone communications. The MBTA will develop code at the OCC to interpret the DB Entity's data format.

- d. As required by its configuration, decode the route number in a message from an LRV and operate interface relays to initiate a corresponding route request with the existing wayside signal system. This functionality shall interface with the VMIS to the wayside signal system for route requests.
3. The ILUs shall be installed in the CIH prior to factory integration testing and delivery.
 4. The ILUs shall be configured so that the route selection capability can be enabled, disabled, and properly set in the field without requiring the unit to be removed from the CIH.
 5. The ILUs shall be configured so that the route decoding can be modified to accept new or changed route codes from LRVs in the field without requiring the unit to be removed from the CIH.
 6. ILUs shall operate on 120V AC or at a common voltage with all other devices in the CIH requiring electric power. Any other voltage shall be accepted by the MBTA. ILU's shall be fed by the CIH signal power, not utility power.
 7. Each ILU shall have two serial data ports receiving/sending the same data concurrently through redundant fiber optic links with the OCC. In the event that control is switched from one ILU to the other within the CIH, the two serial data connections will be switched to follow the ILU in control. The ILU shall have a mean time between failures (MTBF) no less than 40,000 hours.
- B. AVI Supporting Equipment
1. The DB Entity will provide a bandpass filter device where necessary to suppress any interference signals which may be present in the antenna loops. The DB Entity shall install these filters in the correct AVI equipment cases for the required locations, in such a way that the antenna leads terminate directly in the equipment case.
 2. The DB Entity shall furnish and install termination points for the fiber patch cables between the CIH and the fiber patch panels of the fiber optic backbone.
 3. The DB Entity shall furnish and install termination points for cables originating from the AVI antenna site, which includes the potential for four (4) antenna loops connected to the equipment in each CIH.
- C. Interconnecting Cables at AVI Sites
1. The DB Entity shall furnish and install interconnecting cables and wires as specified in this Section and as required to form a complete and operable system. The following cable interconnections are required at all AVI sites:
 - a. Four (4) fiber patch cables to run from the CIH to a fiber patch panel, the interface point for communications to the OCC at 45 High Street.
- D. Grounding and Lightning Protection
1. Internal ground bus arrangement shall be as specified in Sections 16876 – GROUNDING OF SIGNAL SYSTEM EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM and 16871 – GROUNDING FOR THE LIGHT RAIL SIGNAL SYSTEM.
 2. The DB Entity shall design and make provisions to minimize the susceptibility of equipment to lightning strikes, including provisions to equalize or discharge the resulting energy.

E. Labeling

1. The DB Entity shall install a laminated phenolic plastic nameplate on each AVI antenna and junction box. The nameplate shall be 450 mm x 70 mm with white lettering 50 mm high on a black background. The lettering shall have an 8 mm letter stroke width and 6 mm spacing between letters. Letters shall be generated by an engraving machine. The nameplate shall be fastenable with four stainless steel self-tapping screws, with 'Robertson' No. 2 (red) heads.
 - a. All labels mounted on equipment installed outdoors shall be treated to prevent degradation from sunlight.
 - b. The information content of the required labels shall be as accepted by the MBTA for each type of component, and the DB Entity shall confirm the nameplate information with the MBTA prior to manufacturing the labels.
2. Labeling for connecting cable shall be mechanically printed. Painting, stenciling or hand printing is not acceptable. Cables shall be labeled on each end and labeling shall repeat no greater than every thirty (30) linear feet where cable is exposed. Except for cable ends which are to have plastic labels with a mechanical strap, adhesive backed labels are acceptable, but only if the label wraps around the entire circumference of the cable and adheres to itself. Otherwise, mechanical fastening with a strap is required.

PART 3 – EXECUTION

3.1 GENERAL REQUIREMENTS

- A. The DB Entity shall fabricate all AVI equipment according to the MBTA accepted fabrication drawings and factory test according to the MBTA accepted factory Inspections and test Procedures. The DB Entity shall progress and update, as required, the development of all required drawings into a final “as-built” package that is consistent with the equipment provided. The DB Entity shall be responsible for providing final as-built drawings incorporating all changes and all revisions.
- B. The DB Entity shall thoroughly review the Contract Documents and shall resolve any questions with the MBTA prior to initiating the development of design documents.
- C. AVI wayside equipment will be installed in the CIHs by the DB Entity prior to on-site delivery in accordance with this Section.
- D. The DB Entity shall furnish and install mounting and fastening hardware, insulating covers, cable lugs, conduit, copper grounding strips, grounding, and miscellaneous hardware required for the AVI wayside equipment components and AVI Antennae.
- E. The DB Entity shall monitor the installation of each AVI location and each antenna location and shall certify that each installation has been performed correctly.
- F. The DB Entity shall perform field testing in accordance with the requirements of Section 16898 - SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

16821 APPENDIX A: DESCRIPTION OF EXISTING MBTA GREEN LINE SYSTEM

- A. The MBTA's Green Line (shown schematically in Figure 1) consists of the following portions or 'territories':

The 'Central District' which combines underground (Central Subway) and surface portions, and extends from Lechmere Station in the northwest to subway portals on Commonwealth Avenue ('B' branch west of Kenmore Station), Beacon Street ('C' branch west of Kenmore), Fenway ('D' branch west of Kenmore Station), and Huntington Avenue ('E' branch west of Symphony Station).

The surface routes from the portals running out to Boston College ('B'), Cleveland Circle ('C'), Riverside (D), and Heath Street ('E').

FIGURE 1: GREEN LINE MAP

- B. The Green Line does not have a consistent operating environment across the different territories described above. The following are the different operating environments on the Green Line:
1. In the Central District and on the Riverside 'D' branch operational control is achieved by a wayside Automatic Block Signal (ABS) system.
 2. Operations along the surface portions of the Boston College ('B'), Cleveland Circle ('C'), and Heath Street ('E') branches are subject to on-street traffic signal control with safe train separation being the responsibility of the train operator.
- C. Throughout the Green Line, each track used in revenue operation has a normal direction of travel, and operations almost always follow this convention. Trains can change tracks at control points (CPs) where track switches are located. Merging or diverging train movements at junctions in the Central District and on the 'D' branch occur at interlocking CPs, where the wayside signal system prevents the display of signals permitting conflicting routes, and requires the power-operated switches to be lined and locked in the correct position before a signal indication for the corresponding route can be displayed.
- D. Centralized dispatching and operations control over the MBTA rapid transit system (Red, Blue and Orange lines), and the MBTA's light rail system (Green and Mattapan- Ashmont lines) is

maintained from the OCC at 45 High Street, Boston. Green Line dispatchers at the OCC track the real-time movements of Green Line trains mainly with the help of train passage and route selection indications received from an Automatic Vehicle Identification (AVI) system. Additional information on train movements is available in the OCC via voice communications received from field officials and operators, and from CCTV coverage of certain key locations.

- E. The existing AVI system was introduced in 1992 to replace overhead pan contacts as a means of route selection by Green Line vehicle operators. As part of this system, a number of CPs are equipped with AVI trackbed loop detector antennas and associated wayside interrogators, with a capability to request route selection from the wayside signal system. AVI devices are also deployed at other locations to improve vehicle tracking. Eleven of the total of thirty-nine existing AVI sites (antenna loops and associated interrogators) are deployed at wayside locations where there is no route selection, and serve only to facilitate vehicle tracking.
- F. Each Green Line light rail vehicle (LRV) is equipped with an AVI Code Control Box and two transponders, one at each end (designated 'A' and 'B'). The transponders transmit the following information to the wayside AVI interrogator through the AVI antenna loop when they pass over a keypoint:
 - 1. LRV ID.
 - 2. Route identifier (set by operator in the lead LRV).
 - 3. Coupling status of the LRV end (coupled or uncoupled).
 - 4. LRV orientation (A or B end leading).
- G. The information read by the interrogators is used by the wayside AVI equipment to convey route selection requests to the wayside signal system (where so equipped), and is also conveyed from all AVI sites to the OCC, where it is used for monitoring train locations.
- H. At points where route selection is to be accomplished, the routing received by the wayside AVI interrogator from the lead transponder unit on the lead LRV is used locally to request the wayside signal system to set the switch in accordance with that routing, and to display a signal for the corresponding route.
 - 1. All the information received by wayside interrogators at all keypoints is brought into the OCC using modems and leased lines. Software at the OCC compiles this information and uses it to:
 - a. Derive the train consist (as a sequence of LRV identifying numbers).
 - b. Derive the sequence of trains that have passed over keypoints.
 - c. Track the location of trains as they pass over keypoints.
 - d. Calculate vehicle mileage.
 - e. Run reports against train data.

END OF SECTION

SECTION 16823

IMPEDANCE BONDS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This section specifies furnishing and installing impedance bond layouts and cross bonding layouts, complete with all associated mounting hardware and all connecting cables.

1.2 QUALITY ASSURANCE

- A. Impedance bonds shall comply with the applicable requirements and recommendations of Section 8.4.5 of the AREMA C&S Manual where the manual does not conflict with these Specifications.

1.3 SUBMITTALS

- A. In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 Construction Submittal Requirements”, the DB Entity shall submit the following for approval:
 - 1. Impedance bond layout installation drawings showing the physical dimensions of the bond, associated mounting hardware, mounting ties, and cables.
 - 2. Impedance bond electrical characteristics.
 - 3. Factory test procedures.
 - 4. Installation test procedures.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage throughout delivery, storage and handling. Materials shall comply fully with the requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Damage to material resulting from improper storage or handling by the DB Entity shall result in replacement of all damaged material with new material by the DB Entity at no additional cost to the Contract.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. All impedance bonds shall be tuned to operate specifically with 100 Hz double rail steady energy AC track circuits. The DC resistance of the impedance bond, from track lug to track lug, shall not be less than 1 ohm.
- B. The track winding of each impedance bond shall be rated to carry 2500 amperes per rail continuously. The impedance bond shall function properly with a traction current imbalance of up to at least 12 percent.
- C. Two track winding terminal lugs shall be provided on each impedance bond. Each track winding lug shall accept two 500 kcmil cables or two 1000 kcmil cables. One center tap terminal lug shall be provided on each impedance bond. The center tap lug shall accept up to four 1000 kcmil cables.

- D. When it is necessary to terminate cross bonding cables, substation return cables, or DC negative returns from other equipment to the center connection between two impedance bonds, the DB Entity shall provide a copper plate of sufficient physical size and electrical capacity to accommodate all terminations necessary, including all center tap cables between the bond pair, to be installed in the middle of the center tap cables. The copper bus plate shall be mounted on ties between adjacent impedance bonds and shall be insulated from the ties.
- E. The size of the impedance bond shall permit mounting on the ties between the rails as shown on the Contract Documents. Mounting height shall be at least one-half inch below the plane of the top of rails.
- F. Side lead, center tap cables, and exothermic connections to the rails shall be as specified in Section 16830 – RUNNING RAIL BONDING FOR THE LIGHT RAIL SIGNAL SYSTEM and as shown on the Contract Documents.

PART 3 – EXECUTION

3.1 INSTALLATION

- A. The DB Entity shall relocate and space crossties at locations where bonds are to be installed in accordance with the accepted installation drawings.
- B. Following installation, the DB Entity shall re-tamp and redress the ballast in the area of the new impedance bond installation to restore the pre-installation quality of the track structure and tolerances.
- C. The impedance bond shall be mounted on the ties between the rails as shown on the Contract Documents and in accordance with the accepted installation drawing. Mounting height shall be at least one-half inch below the plane of the top of rails.
- D. Impedance bonds shall be shock mounted to effectively isolate them from the shock and vibration normally encountered in the area in which they are mounted.
- E. Impedance bonds mounted between the rails shall be protected against dragging equipment in both directions by steel ramps.

3.2 TESTS

- A. Impedance bond layouts shall be tested per the accepted installation test procedure as specified in Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

END OF SECTION

SECTION 16826

CABLE RACEWAYS AND AERIAL CABLE SUPPORT SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies requirements for design, furnishing and installation of cable raceways, outdoor cable tray, outdoor cable trough (polymer concrete or stainless steel), conduit and aerial cable support systems.
- B. The DB Entity shall furnish and install all new cable raceways, outdoor cable trough, pre-cast concrete vaults, polymer concrete pullboxes, conduit and aerial cable support systems for the Green Line Extension Project.
- C. The DB Entity shall develop work plans for the installation work covered in this Section. These plans shall detail the period of work, number and size of crews, anticipated work hours, and number of track shutdowns. The work plan shall conform to all other Contract requirements and limitations such as quantity and type of flagperson. The work plan shall be submitted to the MBTA for acceptance and updated periodically as specified elsewhere in these Specifications. Reference the Volume 1 DB Contract Terms and Conditions Subsection 2.3 "Commencement of Work" and Subsection 4.4 "Completion Milestones, Project Schedule" and Section 16801 - BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM, Section 16803 - STAGING AND IMPLEMENTATION FOR THE LIGHT RAIL SIGNAL SYSTEM, and other applicable sections for detail reporting and phasing requirements.
- D. Installation of all cable raceway, conduit, outdoor trough and aerial cable support systems shall be in accordance with requirements listed in the latest revision of the National Electrical Code (NEC) and National Electric Safety Code (NESC).
- E. The prefabricated cable trough system provided shall be complete with all necessary right angle corners, single "T" intersections, horizontal and vertical deviations, cable exits, lockable cover system, special junctions, end plugs, heavy load covers and other special fittings as required to permit proper cable installation and to provide secure protection of installed cables.

1.2 QUALITY ASSURANCE

- A. Material, equipment and systems provided for this Contract shall be produced under control of a formal Quality Assurance Program to ensure an acceptable level of quality for the equipment provided.
- B. Comply with the requirements of Volume 1 DB Contract Terms and Conditions Section 4 "Quality Control and Quality Assurance" and Volume 2 Technical Provisions Subsection 2.5 "Quality Management".

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements", the DB

Entity shall submit the following to the MBTA for acceptance:

- A. Outdoor Cable Trough Systems, including pre-cast concrete cable vaults and polymer concrete pullboxes
 1. Submit certification that manufactured materials meet specification requirements;
 2. Manufacturer's drawings and catalog cuts of all trough system components to be installed on the project (including special vertical and/or horizontal offset fittings, special junctions, end plugs, adapters, covers, etc.);
 3. Detailed installation/routing drawings and installation procedures for the cable trough system components. The drawings shall include:
 - a. Physical layout of new cable trough, cable vaults and pullboxes, dimensioned to the gauge, or centerline, of adjacent track(s) and wayside structures.
 - b. Installation details showing the transition between trough and other raceways, such as conduit penetrations and vault/pullbox installations.
 - c. Provide detailed steel fabrication and installation drawings for any specialized steel support members, and associated materials, that may be required. Steel support members shall be galvanized.
 4. Provide percent fill calculations, cable bend radius determination for all trough, pullboxes and hand holes.
 5. Following acceptance of the installed cable trough system, as-built tracings of the cable trough routing signed and stamped by the registered land surveyor, shall be submitted as part of the DB Entity's final as-built drawing submittal.
- B. Outdoor Cable Tray, Accessories and Associated Hardware.
 1. Catalog cuts and product data for all types of cable tray to be provided, cable tray shall be ladder type;
 2. Catalog cuts for all cable tray support system components and accessories;
 3. Detailed installation plans for tray routing system, including tray fill calculations and cable installation methods. Plans shall show location, size, fasteners, connections, grounding, and general configurations of tray installation. Plans shall also include installation details for the transitions between cable tray and any other cable routing system for both typical and particular or special applications
- C. Stainless Steel Pull Boxes and Fabricated Steel Supports.
 1. Stainless steel pullboxes and associated hardware, if required, shall be fabricated of 304 stainless. Detailed fabrication and installation drawings shall be provided by the DB Entity.
 2. The DB Entity shall provide detailed fabrication and installation drawings of all galvanized support steel member and materials that are need to secure the stainless steel pullboxes.
- D. Stainless Steel Cable Trough and Associated Materials.
 1. Stainless steel cable trough if required shall be provided with detailed fabrication and

installation drawings. The trough shall be constructed from new 304 stainless steel.

2. Detailed fabrication and installation drawings of all galvanized support steel member and materials that need to be attached to support the trough system shall be provided.
3. Detailed installation methods for field drilling existing structures for mounting, field-galvanizing procedures, support steel installation and stainless steel trough installation.

E. Conduit and Associated Materials:

1. Catalog cuts and product data for galvanized rigid steel (GRS), fiberglass reinforced (FRE), flexible metallic conduit and proposed fittings;
2. Catalog cuts and product data for galvanizing repair compound;
3. Catalog cuts for all conduit support system components and accessories;
4. Detailed installation plans for conduit, including conduit fill calculations and cable pulling calculations. Plans shall show location, size, fasteners, connections, grounding, and general configurations of conduit installation. Plans shall also include installation details for the transitions between:
 - a. Conduit to wayside junction boxes;
 - b. Conduit to overhead cable tray;
 - c. Conduit to aerial messenger;
 - d. Exposed GRS conduit to underground FRE;
 - e. Conduit installation details to all wayside equipment.

F. Aerial Cable Support System:

1. Installation drawings showing the number of messengers at specific stationing location, as well as indicating all cables that are supported on each messenger.
2. Messenger wire, automatic compression fitting, preformed wire fitting, dead-end materials, messenger clips, cable straps, strain insulators, and all other proposed aerial cable support hardware for the project.
3. Sag and tension calculations for messenger's initial and final loaded conditions per the National Electric Safety Code (NESC).
4. All wood pole and pole line materials and installation details for all wood pole construction.
5. Installation drawings and procedures for all messenger attachments and aerial cable installations. The installation plans may include cable placement and details with bill of materials. Typically, shall show, as a minimum, cable attachments, mounting height, and cable clearances. Special areas or construction not covered by typical drawings shall have site specific pertinent clearance details.
6. Installation drawings showing transitions from aerial messenger to conduit risers and cable tray.
7. Fabrication drawings for messenger dead-end structural steel.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage during delivery, storage and handling. Comply fully with the requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Damage to material, resulting from improper handling by the shipper or the DB Entity shall require the DB Entity to replace all damaged material with new material at no additional cost to the Contract.

PART 2 - PRODUCTS

2.1 CABLE TROUGH, AT-GRADE PULLBOXES, CABLE VAULTS AND COVERS

- A. Prefabricated Outdoor HDPC Cable Trough
 - 1. Traversable Cable Trough
 - a. Traversable Cable Trough shall be utilized as a pedestrian egress path and installed at the locations indicated on the Contract Documents.
 - b. Non-traversable Cable Trough shall be utilized in areas not accessible to pedestrians where a smaller trough is specified at locations indicated on the Contract Documents.
 - c. Traversable cable trough unit shall consist of (1) 10’ HDPC body and (3) HDPC dielectric 39” covers. Reference Oldcastle Enclosure Solutions – Synertech Plastibeton Model 2012 or approved equal.
 - d. Non-Traversable cable trough unit shall consist of (1) 10’ HDPC body and (3) HDPC dielectric 39” covers. Reference Oldcastle Enclosure Solutions – Synertech Plastibeton Model 1216 or approved equal.
 - e. HDPC trench and body shall meet the material of construction and performance specifications detailed below.

TABLE 1: HDPC Cable Trough Cover Dimensions & Weight

Type	Width (in.)	Length (in.)	Depth (in.)	Maximum Cover Weight	
				LB	KG
Model 1216	14”	39 ¼”	2 ¼”	82	37.2
Model 2012	22”	39 ¼”	2 ¼”	115	52.2

TABLE 2: HDPC Cable Trough Body Dimensions & Weight

Type	Width (in.)	Length (in.)	Height (in.)	Maximum Body Weight	
				LB	KG
Model 1216	17 ¼”	118 1/8”	19 3/8”	813	368.8
Model 2012	25 ¼”	118 1/8”	15 ¾”	821	372.4

- f. HDPC cable trough shall have the following internal dimensions:

Nominal Sizes	Model 1216	Model 2012
Interior Height under cover	16"	12”

Interior Width

12"

20"

- g. HDPC cable trough system provided shall be complete with all leveling blocks, protection rods, cover plugs, end plates, internal dividers (as required), attachment plates as required to permit proper cable trough installation and provide secure protection of installed cables.
- h. HDPC cable trough systems shall be sized by DB Entity to accommodate 20% future expansion.
- i. HDPC cable trough shall afford cable installation through laying cables into trench without any interference or the need to thread cable through supportive cross supports or other interfering trench structural support components.
- j. HDPC cable trough body side wall shall be set at finish grade to avoid creation of a tripping hazard.
- k. HDPC cable trough bodies shall come in standard 10' sections.
- l. The interior of HDPC cable trough body shall be factory formed as a smoothly finished, U-shaped channel, which is free of burs, sharp edges and shall have no interior angles that increase the pulling resistance on cables.
- m. HDPC cable trough sidewalls shall be a minimum 1.25" thick HDPC across the full side wall area. No cored-out sidewall areas less than 1.25" thick will be accepted.
- n. HDPC cable trough shall have a solid bottom provided with conduit access holes. Bottom conduit openings shall be cast within the trench during manufacture.
- o. SMC dividers may be required and should be installed at the factory at time of trough body manufacture. Field installation of dividers will not be accepted.
- p. HDPC cable trough flush covers shall sit inside the trough to allow flush to grade installation. No T-Cover designs will be accepted.
- q. HDPC cable trough covers shall be provided with a means for manual lifting.
- r. Any special tools required for lifting HDPC cable trench & covers shall be the
- s. DPC cable trough covers shall be manufactured with an anti-skid surface. Addition of an anti-skid surface coating or treatment after manufacturing is not acceptable.
- t. HDPC cable trough covers shall resist ice formation on cover top and sides.
- u. Non- metallic, light weight carbon fiber "protection rods" shall be provided to protect against covers falling into trough during cover removal. Protection rods cannot have a structural lateral load support role in the integrity of the trench body. The protection rods cannot be used to aid in the elevation of cover vertical load capacity. Rebar shall not be used.
- v. If locking covers are required, locks shall utilize L-Bolt anchor design for keyed or standard style locks. No threaded nuts or bolts will be accepted on HDPC cable trough.

2. Cable Trough Performance Requirements

- a. HDPC cable trough and covers shall be suitable for both indoor and outdoor placement.
- b. Trench covers and bodies shall conform to all applicable AASHTO, ASTM, NFPA and OSHA standards as detailed below.

- c. HDPC cable trough shall be of the self-supporting type equipped with easy access flush covers. No T-Cover designs shall be utilized due to the potential for inadvertent dislocation or removal due to heavy tire or snow plough horizontal shear force.
- d. HDPC cable trough and covers shall be compliant with the AASHTO HS20-44 – Standard Specification for Highway Bridges, Sixteenth Edition, Section 3, Loads, Service Factors and their Application. (Per ASTM C-857 & C-497 Section 5).
- e. Proof of trough Body/Cover Design Load compliance shall require manufacture to demonstrate through testing, ability for trough and cover (unit) to meet a 20,800# (design load w/impact factor) load cycled 50 x (10"x 10" 1" thick plate) with the 51st cycle taken to failure. A minimum failure load of 40,000 pound is required.
- f. No internal supports or cross-braces may be used during testing.
- g. Proof of trough Body/Cover Lip Strength compliance shall require manufacture to demonstrate through independent testing, ability for trough and cover lip area to meet a 20,800 lb. (design load w/impact factor) load cycled 10 x (10"x 10" 1" thick plate) with the 11th cycle taken to failure. A minimum failure load of 40,000lb is required.
- h. Proof of trough Body Lateral Load compliance shall require manufacturer to demonstrate through independent testing, ability of trench body side wall to meet 800lb./sq.ft. cycled 10 x (18" x 24" x 1" thick plate) with a minimum of 1200 lb./sq.ft. failure load. This test confirms trench body's ability to handle vehicular and mechanical lateral loads typically seen during installation and maintenance operations. Testing shall be done free-standing without cover installed and no secondary cross supports to simulate an opened trough.
- i. Proof of trough Body/Cover Fit compliance shall require manufacture to demonstrate through independent testing, ability for cover insertion and removal with 440lb. dead weight loaded onto the first 2" of the cover/body lip sidewall. This test insures the lid will fit inside the trough and will not be locked in or out of position during installation, after maintenance of way operations.
- j. HDPC cable trough cover weight shall not exceed OSHA's allowable handling weights as specified in the OSHA Technical Manual, Volume 1, Section 7, Appendix VII: 1-2, Evaluation Of Lifting Tasks.
- k. HDPC cable trough shall comply with confined space (building area, tunnel) use in accordance with ASTM C-542 Flame Propagation & NFPA 130, Chapter 2-1, Standard for Fixed Guideway Transit and Passenger Rail System – 2006 Ed.).
- l. HDPC cable trough shall comply with ASTM E-662 & NFPA-258 Non-Flaming (no flaming drips) standard, no smoke generation per performance ratings detailed in material specification chart below.
- m. HDPC cable trough, covers shall be suitable for both indoor & outdoor confined space (tunnel) use in accordance with ASTM E84-99 "Standard Test Method for Surface Burning characteristics of Building Materials".

3. Cable Trough Material Specifications

- a. HDPC cable trough, covers and related hardware shall be made from materials that are low-smoke, zero-halogen, and are in compliance with approved noncombustible construction as defined in NFPA 220, as specified in 2-2, Construction and 2-4.2.

- b. Material used for the manufacture of HDPC cable trough body & cover shall be minimum 18,000 PSI – compressive strength - High Density Polymer Concrete (HDPC).
- c. HDPC cable trough and cover material is nonporous (closed cell) and shall resist the degrading action of freeze/ thaw cycles. The material shall also resist degradation from acids, hydrocarbons, and salts.
- d. HDPC cable trough body shall be compression molded high density polymer concrete reinforced with welded wire.
- e. HDPC covers shall be compression molded high density polymer concrete reinforced with Sheet Molding Compound (SMC).
- f. HDPC cable trough covers shall resist Ultra Violet deterioration and be tested in accordance with ASTM G154.

HDPC cable trough and covers shall comply with ASTM C 267 for chemical resistance and shall demonstrate no significant change when exposed to:

- a) Sulfuric acid (50%) b) Sodium Hydroxide (5%)
- c) Sodium Sulfate (10%) d) Sodium Chloride (26%)

TABLE 3: HDPC Cable Trough Body and Cover Material Specifications

Characteristic	Performance Rating	Testing Standard
Compression Strength	18,000 PSI minimum	ASTM C 170
Direct tensile strength	1,800 PSI minimum	ASTM D 2936
Modulus of rupture	6,400 PSI minimum	ASTM C 99
Impact strength	34 in-lb.	ASTM F 736
Modulus of elasticity in flexure	4.2x10 ⁶ PSI	ASTM C 120
Water absorption maximum	0.15%	ASTM C 97
Density	153 lb./ft ³ minimum	ASTM C 128
Fire resistance max	10	ASTM E 84
Freeze/Thaw resistance	2,500 cycles of no change	ASTM C 666
Flame Spread Index	4	ASTM E 162
Flame Propagation	Pass No Flaming Drips	ASTM C 542 (NFPA-130 2006)
Smoke Generation (Non-Flaming)	Ds 1 @ 1.5 min Ds 8 @ 4.0 min (No Flaming Drips)	ASTM E 662 (NFPA-258)

B. Stainless Steel Cable Trough and Associated Materials

- 1. The stainless steel cable trough and all integral components shall be fabricated from 12 gauge, type 304, stainless steel. It shall have minimum internal dimensions of 8” x 8” and a hinged cover. Stainless steel trough shall have a ¼” thick x 2” wide x 11”+/- long integral mounting plate to secure the trough to the new fabricated steel supports.
- 2. The stainless steel shall be supported by new fabricated, hot-dipped galvanized, steel angles. These new steel supports are to be secured to the existing structures. New steel supports shall be factory fabricated in accordance with American Welding Society (AWS) standards and hot-dipped galvanized in accordance with ASTM- 123.
- 3. The DB Entity is required to perform detailed measurements and installation layout of the

existing field conditions and detail all stainless steel trough sections and galvanized steel supports.

4. DB Entity shall install suitable bolts, washers, lock washers and LockTite 271 to all bolted connections used to support the fabricated steel supports to the existing structures and the stainless steel cable trough to the support steel.

C. Polymer Concrete Pull Boxes

1. Pull boxes and cable vaults shall be constructed of polymer concrete consisting of an aggregate matrix bound together with a polymer resin. Internal reinforcement may be provided by means of steel, fiberglass, or a combination of the two. The use of chopped fiberglass strands applied with a "chopper gun" or the use of high density polyethylene or high density polystyrene is prohibited. To assure consistent production from part to part, only matched metal tooling is to be used to manufacture the product.
2. Pull boxes, vault and covers shall be gray and of the sizes required by the DB Entity's design. Covers shall be provided with stainless steel bolts. The logo shall be permanently recessed in the cover.
3. The installed enclosure shall be rated for a minimum test load of 33,852 lbs., and be suitable for installation in railroad environment.
4. Pull boxes shall be equipped with pulling eyes.
5. Boxes may be stackable to achieve depth indicated on the Contract Documents. All pull boxes shall have a solid bottom.
6. All pull boxes installed at grade level shall be heavy-duty Quazite Style PG boxes, as manufactured by Strongwell, or MBTA accepted equal. Covers for the pull boxes and vaults shall be the heavy duty variety with 2 bolts (Strongwell/Quazite HA00 series for PG style pull boxes or MBTA accepted equal).
7. Imprinted logos shall be provided that properly reflect the respective cables that they house/protect.

D. Pre-Cast Concrete Cable Vaults

1. Pre-cast concrete cable vaults shall have minimum inside dimensions of 36"W x 60"L x 48"D. Cable vaults shall be provided with a base, along with a recessed area for a sump. The DB Entity may provide the pre-cast concrete cable vaults in sections, such as base section, layer 1 section, layer 2 section and cover section, to facilitate installation. Sections shall be properly water proofed to prevent water ingress into the cable vault.
2. Cable vaults shall be provided with pulling eyes on each wall, and located in an area that will not be adversely affected by future conduit penetrations.
3. Pre-cast concrete cable vaults shall be capable of withstanding soil surcharges from a loaded MBTA Green Line Transit Vehicle (100,000 lbs. (total weight), representing a 25,000 axle load). The DB Entity shall submit a pre-cast cable vault that is suitable for these loads.
4. Cable Vaults shall have steel covers with hinges as shown on the Contract Documents. (minimum H20 loading).

2.2 OUTDOOR CABLE TRAY

- A. Cable Tray shall be 304 type stainless steel ladder with 9" rung spacing, have a width of 24" with side rail height of 5". Tray shall be B-Line # 358-SS4-09-24-144 or approved equal.
- B. All cable tray vertical and horizontal offset fittings shall have a minimum 24" radius and also be 304 type stainless steel.
- C. All cable tray support systems and associated hardware shall be stainless steel.

2.3 CONDUIT AND ASSOCIATED MATERIALS

A. Galvanized Rigid Steel (GRS) Conduit

- 1. Galvanized rigid steel conduits (GRS) shall be used where conduits are exposed except as below:
 - a. EXCEPTION: FRE conduit shall be used for all 600V DC circuits.
- 2. Conduit, couplings, elbows, offset and nipples shall be UL approved and meet requirements of ANSI C80.1.
- 3. For conduit trade sizes 2" and below, conduit elbows shall have a minimum 30" radius, all others shall have a minimum radius of 36". Field-made conduit offsets shall conform to the same minimum radius requirements as noted above.
- 4. Provide fittings and accessories as follows:
 - a. Galvanized rigid steel conduit hubs, with gasket and separate nylon insulated throat and a case hardened locknut;
 - b. Nylon insulated metallic type bushing;
 - c. Conduit clamps with back spacers shall be made of galvanized malleable iron;
 - d. Conduit with standard pipe thread, along with coupling and ship with thread protector;
 - e. Compound for field galvanizing repairs shall be Subox, Galvanox or other approved equal.
- 5. All strut type conduit support hardware shall be 304 type stainless steel (Strut, nut, bolts, washers, strut conduit clamps, etc.).
- 6. All other conduit materials/fittings shall be suitable for outdoor use.

B. Fiberglass Reinforced Epoxy (FRE) Conduit

- 1. FRE conduit shall be suitable for direct burial, concrete encasement, suspended from walls or ceilings without regard to outdoor environment.
- 2. FRE Conduit and fittings shall bear nationally accepted testing laboratory approval from C.S.A. (C22.2 No.211.3-M1984) and Underwriters Laboratory (E53373N, 44G7).
- 3. All conduit shall be manufactured to the dimensions and tolerances listed in the ANSI/NEMA Standards Publications TC-14B. The thickness of the wall shall be 0.066" (nominal) for 2" through 4" size conduits and 0.095" (nominal) for 4-1/2" through 6" conduit. The inside dimension shall be full, actual trade size.
- 4. For conduit trade sizes 2" and below, conduit elbows shall have a minimum 30" radius,

all others shall have a minimum radius of 36". Conduits carrying 2000kcmil negative return cables shall have a minimum radius of 48".

5. The conduit shall have a resin surface that shall be impregnated with carbon black for protection against ultraviolet degradation. The conduit shall be marked at least once every 10' with the manufacture's name, size and type of conduit.
6. Use only approved fittings, adhesives and sealants recommended by the conduit manufacturer.
7. FRE Conduit shall contain no halogens above trace amounts and shall be fire resistant to UL94. In addition, conduit for subway (interior) use shall conform to the requirements of MBTA specification no. P-138E while conduit for outdoor use shall conform to MBTA specification no. P-175.

C. Flexible Metallic Conduit

1. Flexible metallic conduit shall be Hydotite type "Saf-T-Flex" as manufactured by Eastern Wire and Conduit, or MBTA accepted equal.
2. All flexible metallic conduit shall have a "Zero Halogen" outer jacket.
3. Outer jacket material shall exceed ASTM 162 surface flammability tests, be ultra violet radiation resistant, water resistant, and resistant to petroleum products.
4. Flexible metallic conduit shall be CSA Certified and UL Approved.

D. Cordura Hose and Fittings

1. Cordura hose shall be provided at locations as required by the DB Entity's design.
2. Orange colored Cordura hose shall be used at locations where carrying 600V DC circuits, such as switch heater cables.
3. Black colored Cordura hose shall be used at all other locations, such as AVI Prefabricated Loop bond locations, etc.
4. Suitable liquid-tight hose fittings and adapters shall be provided to properly install hoses as required.

2.4 STAINLESS STEEL PULL BOXES

- A. NEMA 4X, 12 gauge, 304-type stainless steel pull boxes shall be provided required by the DB Entity's design.
- B. The required dimensions for these pull boxes shall be as required by the DB Entity's design.
- C. At certain pull box locations, hot-dipped galvanized steel supports may be provided. They shall be fabricated in accordance with American Welding Society standards/practices and hot-dipped galvanized in accordance with ASTM-123.

2.5 AERIAL CABLE SUPPORT SYSTEM

- A. Messenger and Guy Wire

1. Messenger and guy wire shall meet ASTM A363-55T. Messenger and guy wire shall be 3/8" Extra High Strength (EHS), 7-strand construction, Type C galvanized. Guys shall be made of the same material as the messenger wire.
 2. Strandwise type dead ends, suitable for 7-strand type wire, shall be installed to dead-end messenger/guy wire. A preformed-type wire fitting may be used at one end of a messenger run in order to terminate messenger or guy wires. Preformed-type wire fittings may be used to splice messenger wire. Acceptable fittings shall be specifically for the size and type application intended and shall not degrade the overall strength or longevity of the wire.
 3. Messenger/cable diameter shall not exceed 4 1/2". Additional messenger runs shall be installed if the overall messenger/cable diameter will exceed 4 1/2".
- B. Aerial cables shall be attached to their respective supporting messengers by cable straps.
1. Cable straps shall be as manufactured by Thomas & Betts # TYD5270M, or approved equal. The overall equivalent diameter of cabling supported on a common messenger shall not exceed 4 1/2". Spacers shall be Thomas & Betts # TCP5255, or approved equal.
 2. Wherever cables depart from or join a messenger system at a junction box, signal case, or other wayside housing drop points, the cables shall be securely fastened and anchored to the messenger with extra cable straps and extra cable straps and spacers to prevent cable from slipping and sagging.
- C. Multi-messenger support brackets and steel support stanchions shall be fabricated in accordance with American Welding Society standards/practices and hot-dipped galvanized in accordance with ASTM-123.
- D. Dimensions for Multi-messenger support brackets shall be determined by the DB Entity's design.
- E. Cable guards shall be provided to prevent cable bundles from rubbing and/or chafing against supports, columns, and/or other similar potential problem areas.
- F. Wooden Poles shall comply with ANSI 05.1, Specification and Dimensions for wood Poles, latest revision for kiln dried Southern Pine, ANSI code SP. Machine or hand trimmed poles are acceptable. All poles shall be Class 2, 35' in length.
- G. All poles shall be treated with a preservative agent meeting cited reference specifications. All treatment methods shall be submitted and are subject to the MBTA's acceptance.
- H. Poles shall be roofed prior to preservative treatment, field cut poles shall be treated by an MBTA accepted process. All unused holes shall be plugged.

2.6 MISCELLANEOUS MATERIALS

- A. All concrete anchoring hardware for securing equipment, conduits, pullboxes and supports shall be 304 type stainless steel and suitable to safely support the intended equipment.
- B. Hilti adhesive anchors, type and size shown on the Contract Documents for particular installation, shall be utilized at locations shown on the Contract Documents.
- C. Drop-in type or quickbolt-type anchors may also be used in areas where concrete is not exposed

to wet/freezing conditions.

PART 3 – EXECUTION

3.1 GENERAL

- A. This Section covers installation of prefabricated cable troughs, conduit and aerial cable support systems.

Each type of cable support system shall be installed as recommended by the manufacturer and as shown on the Contract Documents and the installation drawings as accepted by the MBTA.

- B. All backfill material shall be power tamped and compacted in accordance with the Section 16806, Excavation of these Specifications. Fill material shall be in accordance with these Specifications and with manufacturer's recommendations and shall not be placed on frozen ground.
- C. Trenches shall be kept free of construction debris, rock, or earth. Foreign material shall be removed out of trough, conduit, and raceways prior to placing cables and covers.
- D. The track bed and ballast shall be protected from contamination during excavation, and shall be restored to the existing condition after excavations have been completed. Plastic tarps and plywood shall be used to prevent ballast contamination.
- E. Troughs shall be protected against damage in areas of working cranes, backhoes, front end loaders, or any other heavy equipment, by coverings of wood, steel or other material in a manner as accepted by the MBTA.
- F. Care shall be used to select correct accessories when transitioning from one cable support system to another, such as aerial to conduit risers. The cables shall be properly protected at these transitions and recommended bending radius shall not be compromised.
- G. Manufacturer's recommending installation procedures shall be followed for all materials.

3.2 CABLE TROUGH, PULL BOXES AND CABLE VAULTS

- A. Cable trough, pull boxes and cable vaults shall be installed in accordance with the manufacturers' recommended procedures.
- B. Trenches for cable troughs shall be excavated to provide 12" of free access to both sides of trough. Trench excavations shall be accepted by the MBTA prior to backfilling operations.
- C. Prior to placing the cable troughs in the trench, the trench shall receive a crushed stone base, compacted to a depth of not less than six inches as specified in Section 16806, Excavation, of these Specifications and as per manufacturer's recommended installation procedure.
- D. A transit or other suitable approved instrument or method, shall be used to establish line grade of the trough system. Line grade shall follow the contour of the site.
- E. Assemble multiple trough sections and lower them to the prepared bedding material. Complete

assembly by installing lids. Lids shall be securely in place prior to backfilling of crushed rock.

- F. When forming a 90 degree bend or a “tee” intersection, a handhole shall be installed at the point of bend or “T” intersection if the approved trough manufacture does not have a preformed 90 degree or preformed “T” fitting. The DB Entity is to take care that the minimum bending radius of future cable, as well as the trough’s capacity, will not be compromised as a result of field installed “tee” intersections or other trough layout scenarios.
- G. All exposed trough ends shall be equipped with end plugs of the same material as the trough and sealed as per the manufacturer’s recommendation.
- H. Upon completion of each section of trough, the trench shall be backfilled with 1 1/2 to 2” crushed rock in layers of 4” and compacted between layers. Backfilling shall be done simultaneously on both sides of the duct in successive layers of 4”.
- I. Covers shall be installed and sealed after the MBTA has accepted the cable installation.
- J. Polymer Concrete pull boxes shall be installed no closer than 4’ from the edge of railroad tie, and the top of pull box and/or vault shall not be placed at an elevation below the bottom of railroad tie, without MBTA’s acceptance. The DB Entity shall inform the MBTA immediately of the locations where this 4’ clearance requirement cannot be obtained.

3.3 CONDUIT AND ASSOCIATED MATERIALS

- A. All exposed conduit work shall be run true, plumb, and in straight lines parallel with, or at right angles to buildings, walls, floors, ceilings or structure members and present an orderly, neat and workmanlike appearance. Where a number of conduits are run together, they shall be grouped in a neat and logical manner. Supports for conduit shall be in accordance with NEC, Article 346.
- B. All exposed steel conduit and fittings that have field cut edges, tool marks or other breaks in the finish shall be given a protective coating. Use an electrically conductive anti-seize compound on GRS joints. All GRS conduit terminations shall have metallic insulated bushings.
- C. Conduit bends shall not be flattened by more than five (5) percent of the outside diameter of the conduits. Where required, conduit offsets shall be made. The offsets and bends, where they are installed in parallel, shall be made symmetrical.
- D. Conduit shall be supported immediately on each side of a bend and not more than 18” away from an enclosure.
- E. All cable to be installed in the same conduit shall be pulled and installed simultaneously. Extreme care shall be used during the installation of the cables so as to avoid twisting, kinking, or in any way injuring cable or its sheath.
- F. Conduit shall be cleaned before and after installation. All ends shall be reamed free of burrs and inside surfaces shall be free from imperfections.
- G. Glycerized liquid lubricant or other approved lubricant shall be applied to the cable when installing cables in conduits or ducts.
- H. Where cable enters or leaves conduit, the ends of the conduit shall be fitted with approved

bushings to prevent damage to the cable.

- I. Cables shall not be pulled into conduits until the conduits have been cleaned and swabbed, and free from obstruction.
- J. All underground conduit shall be installed 36” below the top of tie, at a minimum.
- K. Multiple conduits shall be rigidly supported by stainless steel unistrut, with stainless steel conduit clamps. For single conduit installation, hot dipped galvanized conduit straps with back spacers shall be used. All nuts, bolts, concrete anchors, washers, hardware, etc., shall be stainless steel.
- L. After cable installation, conduits shall be sealed with expanding foam or other approved weather sealer.
- M. Spare conduits shall be capped/sealed in an approved manner.
- N. In no case shall deformed, split or defective conduit be installed. All joints shall be made with standard threaded or approved coupling.
- O. Field cuts in conduit shall be square and made with a hand or power band saw. All threads on GRS conduits shall be cut accurately and all burrs shall be removed.
- P. Conduit pull boxes, sized in accordance with the NEC, shall be installed wherever necessary to avoid excessively long pulls or an excessive number of bends.

3.4 AERIAL CABLE SUPPORT SYSTEM

- A. The work shall consist of installing messenger for the support of new cables as shown on the Contract Documents, and not exceed sag or tension values for the specified loading.
- B. The DB Entity shall perform field measurements to ensure that the mounting of the new messenger support hardware and proposed cable bundles does not impact the train’s clearance envelope.
- C. Cables shall be installed within a reasonable time after the strand is installed and tensioned. The DB Entity shall submit tension values for approval, prior to messenger installation. The DB Entity shall record applied messenger tension, temperature and weather at time of installation, for submission to the MBTA.
- D. When tensioning messenger the cable suspension clamps shall be loose enough to allow free movement of the strand.
- E. The DB Entity shall use extreme care to prevent the messenger wire from coming into contact with the third rail or running rails.
- F. All guys shall be installed and tightened before the messengers are tensioned.
- G. Aerial cable shall be supported on a messenger wire by cable straps as necessary.
- H. Recommended hardware shall be used when cable transitions from a messenger wire to a conduit or other cable support system.

- I. Generally, messenger/cable system shall be supported by messenger brackets attached to the subway tunnel wall, or steel support stanchions placed approximately 20' apart.
- J. Cables shall be strapped snug against the messenger with a suitable lay along the span length but shall have sufficient slack to prevent the cable from chafing on the messenger clamps and to permit future access to the cable by others.
- K. Where the cable is pulled around an outside corner, or where it may come into contact with an object not designed for cable installation, it shall be protected by means of a protective mat or pad to eliminate any abrasion to the outer jacket.
- L. Holes for wooden poles shall be of sufficient diameter to permit the pole to settle freely to the bottom of the hole without trimming the butt and still have sufficient space between the pole and the sides of the hole to permit proper tamping of the backfill at every point around the pole, and throughout the entire depth of the hole.
- M. Setting depths for the 35', Class 2 poles shall be 8' minimum. Measurement for the depth of hole shall be from existing ground level, on sloping ground measure from the low side of the pole. Where a steep slope (i.e. >30% grade) is encountered or where soil erosion is a consideration or at the discretion of the MBTA, set the pole one foot deeper to 9'.
- N. The bottom of the hole shall be thoroughly tamped to compact any loose earth prior to setting the pole.
- O. Backfill holes with soil or small rock. Backfill shall be thoroughly tamped to the full depth of the pole hole, in 6" lifts. Ears shall be banked around the pole to a minimum height of 6" above the grade level.
- P. Ground shall be installed at each pole location to ground the messengers. Pole butt grounds or ¾" x 10' copper clad ground rods shall be installed.

3.5 OUTDOOR CABLE TRAYS

- A. The cable tray system and supports shall be installed as shown on the Contract Documents in accordance with NEC Article 392, and so as to be rigid, level, and straight.
- B. Tray supports hardware shall be stainless steel.
- C. Cable tray runs shall be made up of straight sections, bends, dropouts etc. as required. Each run shall be structurally supported to counter the loads due to weight of cables and trays. Cable loads shall be calculated prior to determining the location of tray supports.
- D. Recommended accessories shall be used for horizontal tees, crosses, bends, drop etc. Splice plates shall be used to extend the length of the tray. All tray sections, fittings, connectors, fasteners, and bolts shall be installed so that there will be no sharp burrs to damage cables.
- E. The cable tray shall be supported at intervals not exceeding 5', except where shown otherwise on the Contract Documents. Each end of the tray run shall be supported.
- F. Raceway grounding shall be assured by installing copper ground conductor sized in accordance with NEC table 250-122, properly attached to the cable tray in the manner recommended by the tray manufacturer and as required by NEC Article 250.

END OF SECTION

SECTION 16829

INSULATED JOINTS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. The work to be done under this Section consists of the manufacture, inspection, factory testing, delivery and installation of bonded insulated joint plug rails in welded rail. The work also includes thermite field welds.
- B. The work to install and field weld all insulated joint plug rails required in this Contract shall be performed by a qualified and approved track installation subcontractor.
- C. Insulated joints shall be installed at all locations as required by the DB Entity's design.
- D. Additional insulated joints may be required for track circuit polarity management in order to keep polarities staggered at each insulated joint, it shall be the DB Entity's responsibility for the design, furnishing, and installation of any additional insulated joints and transposition wires required.

1.2 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements", the DB Entity shall submit the following to the MBTA for acceptance:

- A. Calibration certificates for all testing equipment used to perform the tests specified herein;
- B. The proposed method of packaging, handling and loading all track appurtenances and other track material for approval;
- C. Working drawings showing the proposed method and equipment for handling and installing bonded insulated joint plug rails, and conventional plug rails showing locations of field cuts in existing track, and locations of field welds in CWR, and length of rails, for review and acceptance prior to the commencement of work;
- D. Prior to the initiation of thermite welding, submit detailed specifications showing the proposed quick preheat thermite kit, method and procedure for thermite welding. The specifications shall comply with these Specifications and that of the weld kit manufacturer, and shall include the name of the weld kit manufacturer and details of the following operations:
 - 1. Rail preparation;
 - 2. Rail end spacing, tolerances, and procedure to maintain rail gap during the welding operation including the type of hydraulic rail puller and profile rail grinder;
 - 3. Rail alignment, including the type of alignment beam system;
 - 4. Placing and securing of prepared molds;

5. Preheating of rail, including method, temperature, and time;
 6. Crucible tapping procedures, including duration of weld and cooling time;
 7. Trimming and grinding of weld.
- E. Submit a complete and current record of all field welds showing the following for each weld:
1. Location by station, track designation and rail;
 2. Date and time;
 3. Rail weight and section, mill brand, year rolled, heat number;
 4. Name of manufacturer of field weld kit used;
 5. Air temperature, rail temperature and approximate weather conditions;
 6. Rail gap to nearest 1/16 “;
 7. Track alignment and construction (curve, tangent, grade, etc.);
 8. Name of Engineer or authorized representative present;
 9. Name of DB Entity's foreman present.
- F. Submit for approval procedures for adjustment of CWR and rail anchoring prior to commencing work.
1. Also, provide a site specific record of work on a daily basis which shall include the following:
 2. Location by engineering station, track designation, and rail;
 3. Date and time;
 4. Air temperature, rail temperature and weather conditions;
 5. Rail gap at time of anchoring to nearest 1/16”;
 6. Adjustment applied (type and movement).
- G. Submit the following for review and approval by the MBTA:
1. Ample thermite field welds and their certified qualification test and inspection results;
 2. Supervisor and field welder's qualification certifications for each welder who will perform work on this Contract. Weld supervision and all welders shall be required, upon request of the MBTA, to submit their qualifications during the duration of the project;
 3. Certification that persons who shall perform ultrasonic testing of field welds have previously tested a minimum of 250 welds;
 4. Certified ultrasonic inspection results for all field welds;
 5. Design of bonded insulated joint plug rails.

1.3 QUALITY CONTROL

H. General

1. Perform all field weld hand testing and inspection at no additional cost to the Contract.
2. All field weld hand testing and inspection shall be performed by an approved certified independent testing laboratory. The MBTA may audit the operations to ensure that the inspection and test are being performed in accordance with approved procedures and in compliance with these Specifications.
3. To be accepted, all rail, welds, and track must fulfill all the requirements of these Specifications.

I. Field Weld Qualification Inspection and Testing

1. Prior to field welding, the welds, and each welding crew shall be qualified as specified below. Welding crews shall prepare, in accordance with the methods and procedures for thermite field welding submitted and approved under Article 1.2 of this Section, at least three samples of each type of thermite weld; heat treated rail welded to heat treated rail, heat treated rail welded to control cooled rail, and control cooled rail welded to control cooled rail. Each welding crew shall perform at least one of each type of the sample welds. The sample welds shall join two pieces of rail a minimum of 30" in length each.
2. Test three sample welds from each type of rail, if required by the MBTA, as follows:
 - a. Perform the Rolling Load Test as specified in Article 1.3.2 of this Section on one sample weld from each type of rail.
 - b. Perform the Slow Bend Test specified in Article 1.3.2 of this Section on a second sample weld from each type of rail.
 - c. Perform the Hardness Test specified in Article 1.3.2 of this Section on a third sample weld from each type of rail.
3. Rolling Load Test
4. Test one sample weld from each type of rail on a 12" stroke rolling load machine.
5. Welds tested under this Article shall sustain without failure not less than 2 million cycles of repeated loadings of a 44,000 pound wheel load.
6. Slow Bend Test
 - a. Subject a second sample weld from each type of rail to the Slow Bend Test described in the Proceedings of the AREA, Volume 68.
 - b. The acceptance criteria for this test shall be a minimum deflection of 1" and 100,000 pounds per square inch modulus of rupture.
7. Hardness Test
 - a. Longitudinally cross-section a third sample weld of each type of rail for a distance of one foot each side of the weld, micro-etch and test by the Brinell Hardness Testing method using a 150 kgf diamond sphero-conical penetrator.
 - b. Test the rail for hardness on the sectioned face at points on a grid pattern of 1/8" increments for one inch on each side of the centerline of the weld, and on a grid pattern of 1/2" increments beyond until the hardness readings coincide with the hardness of the

parent rail metal.

- c. Inspect the micro-etched section for compliance with field weld requirements of full penetration, complete fusion and internal defects specified herein.
 - d. The weld materials and the rail one foot away from the weld shall have Brinell hardness numbers between 248 and 280.
8. Approval of the weld kit, welding process, and welding crews will depend upon all sample welds satisfying the specified requirements. Should any sample weld fail to satisfy the specified requirements, the welding process, the welding crew, or both, will not be qualified for the work.
 9. Employ a supervisor and welders for each welding crew, trained and certified for the performance of thermite field welds by the manufacturer supplying the weld kits. Should any supervisor of the welding crew be replaced during the work the welding crew shall be re-qualified under the new supervisor. Welding supervision or the welders shall be required to show proof of certification as requested by the MBTA.
 10. Prior to performing welds in specified work, satisfactorily qualify the welds and welding crew as specified herein.

J. Field Weld "In-Track" Testing

1. During field welding, the DB Entity shall hand test and inspect all field welds as specified herein to ensure compliance of all field welds daily to the requirements of these Specifications.
2. Each field weld shall have full penetration and complete fusion with no evidence of surface or internal fissures, cracks, porosity or slag type defects.
3. Ultrasonic Testing
4. Inspect all field welds ultrasonically and daily in accordance with the recommendations of the Nov. 29-30 1983 Proceedings of Association of American Railroads (now AREMA) entitled "Railroad Rail Welding" pages 191-205. Weld quality shall meet the requirements of Article 3.4 of this Section.
5. Identify each ultrasonic test including the engineering station and track and rail identity. Submit a letter of identification with each test to the Engineer, giving comments on any irregularities found in the weld, whether the weld passes or fails the above recommendations and the requirements of Article 3.4 of this Section.
6. Physical Inspection - Visually and dimensionally, inspect each field weld daily to determine conformance with the alignment and finishing tolerances specified herein.
7. Defective Welds - Any defective welds detected by the above testing and inspection shall be removed by saw cutting in a new rail not less than 19'-6" in length and installing two thermite welds. All corrective procedures, as above, for the removal of defective welds shall be at the DB Entity's expense.

K. Tolerances - After insertion of bonded insulated joint plug rails, the final established gauge, cross level, super-elevation and vertical and horizontal alignment for the affected track shall be within the following tolerances:

1. The deviation from zero cross level at any point on tangent or from designated elevation on

- curves between spirals may not be more than 1/8",
2. The variation in cross level on spirals in any 31' shall not be more than 1/8",
 3. The difference in cross level between any two points less than 62' apart on tangents and curves between spirals may not be more than 1/8",
 4. The deviation from designated elevation on spirals may not be more than 1/8",
 5. The deviation from uniform profile on either rail at the mid-ordinate of a 62' chord may not be more than 1/4",
 6. The variation of track gauge shall not exceed plus or minus 1/16" unless otherwise directed by the MBTA.

L. Factory Qualification Tests - Bonded Insulated Joints - Plug Rails

1. Electrical Resistance Test - A rail joint shall be assembled in accordance with manufacturer's recommendations and supported on non-conducting material. With 500V DC applied to the rail across the bonded insulated joint for a duration of three minutes, the current flow through the joint should be measured to the nearest 0.01 micro ampere. The minimum acceptance resistance for the test shall be 10 megohms. With 50V AC applied to the rail across the bonded insulated joint for a duration of three minutes, the impedance shall be measured with an accuracy of plus or minus 2%. This test shall be repeated three times, once with a frequency in the range from 20Hz to 100Hz, again with a frequency in the range from 200Hz to 1000Hz and again in the range from 2000Hz to 10KHz. The minimum acceptable impedance for any of these tests shall be 10,000 ohms.
2. Rolling Load Test - The rail joint used in the Electrical Resistance Test shall be mounted on a 33" stroke rolling load test machine supported on 36" centers with the joint centered between the supports. Apply a 44,400 pound wheel load on the rail for 2,000,000 cycles and measure and record to the nearest 0.001 in. the deflection of the rail at the centerline of the joint. The deflection at the ends of the joint shall also be measured at every 500,000 cycles. The wheel path shall travel from a point 6 in. from the center of the joint to a point 9 in. outside the opposite end of the joint. Total range of deflection of the joint shall not exceed 0.065" during the test and the joint shall show no evidence of failure by bending. The electrical resistance test shall then be repeated and the test results shall be within the acceptance criteria specified.
3. Longitudinal Compression Test - The assembled joint shall be sawn in half where the rails are joined together in a manner which will prevent overheating and damage to the epoxy bond. The cut shall be perpendicular to the centerline of the top of rail.
4. A fixture or device shall be used so that the reaction at the sawn ends occurs only on the face of the joint bars when a load is applied to the centroid of the rail at the opposite end. The load shall be applied in increments of 25,000 pounds, maintaining each load increment until the deflection of the rail stops before increasing the load. The load shall be increased to 650,000 pounds and a record of loading and differential movement of the rail measure to 0.00" shall be measured for each increment. The joint shall show no indication of slippage prior to reaching a compressive load of 650,000 pounds and the movement shall be less than 1/8" in any direction. The relative position of the rail and joint bar shall be within 1/32" of its original value when the load is removed.
5. The DB Entity shall submit certification and test results that an insulated joint has passed the qualification testing specified herein.

1.4 RAIL

- A. Shipping. - Load rail and bonded insulated joint plug rails only into rail cars or specially equipped vehicles which are in good order.
- B. Handling - Handle rail, bonded insulated joint plug rails and other track material in a manner that will not damage the material in any way.

PART 2 - PRODUCTS

2.1 MATERIAL

- A. New control cooled carbon steel rail in 78' or longer lengths, shall be furnished in sufficient quantity for the completion of work as indicated.
- B. The materials shall be loaded, transported, unloaded and distributed by the DB Entity.
- C. Furnish quick preheat thermite weld kits.
- D. Furnish bonded insulated joint-plug rails, as follows:
 - 1. Provide bonded insulated joints shop fabricated into plug rails for installation into CWR. Plug rails shall be 39'-0" in length.
 - 2. All rail furnished for plug rails shall be fully heat treated.
 - 3. The joint bars shall be 36", full face contact design.
 - 4. Material. Fabricate joint bars from quenched carbon steel conforming to AREMA Manual for Railway Engineering, Chapter 4, Specification for Quenched Carbon-Steel Joint Bars.
- E. Configuration. Provide full-face contact joint bars conforming to the configuration of the rail, as required. Joint bars shall be smooth and straight. The inside face of the joint bars shall have insulating material pre-bonded, and be smooth with no branding or stamping.
- F. Fabrication Tolerances
 - 1. Finishing Height. Within plus or minus 1/64" of the dimension shown on the approved shop drawings.
 - 2. Straightness. All portions of the joint bars adjacent to the rail shall be straight within a tolerance of plus or minus 1/32", measured with a 36-inch straight edge.
 - 3. Length. Within plus or minus 1/8" of the dimension shown on the approved shop drawings.
- G. Insulating Material
 - 1. All insulating materials shall be of high pressure, laminated design, impervious to oil, grease and water, and shall have electrical resistance characteristics equal to or greater than fiber

insulation meeting the requirements of the AREMA Manual for Railway Engineering Chapter 4 Section 3.8, Specifications for Bonded Insulation Rail Joints. End posts shall project 1/4", plus or minus 1/16" below base of rail and shall be 3/16" thick.

2. Bonded insulated joint to be cemented together with adhesive and bolted together with six high strength, 1" diameter bolts. Provide bolts, nuts and flat washers conforming to the chemical and mechanical requirements of ASTM Designation A490, Quenched and Tempered Alloy Steel Bolts for Structural Steel Joints, and having Class 2A and 2B thread fit. Provide a positive means for maintaining the tension in the bolts through in-service vibrations by a prevailing lock nut complying with Industrial Fastener Institute Standard IFI-100 and IFI-101, or approved equivalent. Locate and size the bolt holes in conformance to the drilling as specified in AREMA Specifications. Flat washers, if required, shall be hardened A-325 or A-490 and tempered carbon steel.

- H. Provide new Pandrol Modified "e" clips for all insulated joints.

PART 3 – EXECUTION

3.1 INSTALLATION OF BONDED INSULATED JOINT PLUG RAILS

- A. The DB Entity shall install bonded insulated joint plug rails at the required locations within CWR territory.
- B. Bonded insulated joints shall be installed as suspended joints and existing crossties shall be re-spaced as necessary to achieve this requirement.
- C. Joints created by installation of the insulated joint plug rails shall be field welded by an approved thermite process.
- D. Bonded insulated joints at resilient fasteners shall be secured with the modified "e" clips.
- E. Rail removed for the installation of the insulated joint plug rails shall be salvaged as specified in this Section.

3.2 REMOVAL OF BONDED EXISTING INSULATED JOINT PLUG RAILS

- A. The DB Entity shall remove existing insulated joint plug rails and install standard rail at required locations within CWR.
- B. Removal of an existing insulated joint plug rail shall be accomplished by cutting the plug rail with a rail saw or an abrasive cutting disk only, 1'- 6" inside both existing thermite welds, which shall result in the proper salvage of a 36' long bonded insulated joint plug rail.
- C. The installation of standard running rail shall be accomplished by cutting out the existing thermite welds with a rail saw or an abrasive cutting disk only, 1'- 6" outside both existing thermite welds and installing a 42' minimum length of rail which shall be field welded in track by an approved thermite process.
- D. Bonded insulated joint plug rails removed from track shall be salvaged as specified.

3.3 ADJUSTMENT OF CONTINUOUS WELDED RAIL

A. Rail Temperature

1. Determine rail temperature by an AREMA standard rail thermometer as specified in the current AREMA Manual for Railway Engineering, Chapter 5, Plan Number 34-71.
 - a. Determine the temperature of the rail by placing the rail thermometer on the shaded side of the rail base next to the web and leaving it there for not less than five minutes and until no change in its reading is detected.
 - b. Record rail temperature readings of CWR at the time of rail laying.

B. Adjustment of CWR

1. The DB Entity shall obtain records from the MBTA of the installation temperature of CWR at locations where CWR is to be cut.
2. When the rail is cut and the rail temperature is less than the rail temperature when originally installed or if the records are not available, the CWR must be adjusted for thermal expansion.
3. Adjustment of CWR shall include removal of rail anchors for 1/4 mile in both directions of cut and expanding rail by either natural or applied heat to obtain zero thermal stress. The MBTA shall approve any methods for obtaining zero thermal stress.
4. Before allowing rail to expand, an appropriate length of rail shall be removed to allow for expansion. This rail end gap (G) shall be determined by the formula:

$$G = (t-T) LK$$

where:

G = Rail end gap in inches

t = Zero Thermal Stress temperature (95°Fahrenheit)

T = Rail temperature in degrees Fahrenheit

L = Length in feet of rail to be expanded

K = Coefficient of thermal expansion for steel rail = 0.000078

5. Any alternate method for allowing rail to expand shall be submitted to the MBTA for review and approval.
6. After rail is thermally expanded, weld rail ends, re-apply anchors immediately, recording new adjusted temperature on form to be forwarded to the Authority. Such form shall identify:
 - a. Location of cut by mile post to the nearest tenth.
 - b. Location of cut by rail as N.S.E. or W.
 - c. Temperature of rail before cutting.
 - d. Temperature of adjusted rail.
 - e. Air temperature.
 - f. Length of rail expanded in either direction.
7. Once thermally expanded, joints in CWR shall be field welded immediately.

C. Rail Anchoring Temperature

1. The DB Entity shall anchor rail when the temperature is within the zero thermal stress temperature range. When zero thermal stress temperature is obtained, begin anchoring immediately. Rail temperature shall remain within the specified zero thermal stress range until the rail is fully anchored. If the rail temperature deviates from the specified zero thermal stress range, cease anchoring until the rail temperature returns to within the specified range.
2. When rail temperature is below the zero thermal stress temperature range, an approved rail heating device may be used for expanding the CWR to make proper adjustment.
3. During anchoring, it is important to ensure uniform expansion. To control this, mark the quarterpoint of strings on a rail and tie plate so the amount of expansion can be accurately determined then make sure the rail expands as follows:
 - 1/4 Point - 1/4 of Required Expansion
 - 1/2 Point - 1/2 of Required Expansion
 - 3/4 Point - 3/4 of Required Expansion
 - a. In the event the first half of the heated CWR string does not have the required expansion at each quarter point, when heating artificially back the heater over the heated portion, without applying heat and then reheat the rail until the necessary expansion is obtained.
 - b. The rail shall be fully clipped immediately behind the heater and must be clipped while the rail is within the zero thermal stress temperature range.
4. The temperature of a rail, when being clipped opposite an anchored rail, shall be within plus or minus five degrees Fahrenheit of the temperature of the anchored rail when the anchored rail was anchored.
5. Record the rail temperature and related information during the rail anchoring process. Record the rail temperature every 30 minutes during the anchoring process at the anchoring location.

D. Zero Thermal Stress

1. The DB Entity shall install, anchor, join, and field weld CWR to produce zero thermal stress in the rail at 90 degrees Fahrenheit, to 110 degrees Fahrenheit.
2. Zero thermal stress may be achieved by heating. Rail pulling shall not be allowed. All methods for artificially obtaining zero thermal stress must be acceptable to the MBTA. Take care to prevent any damage to trackwork components during any heating process. If any damage occurs, make repairs at no additional costs to the Authority.
3. Vibrate rail during thermal adjustment to relieve internal rail stresses. Continue vibration during the full period of rail length correction. Mechanical vibrators used for relieving internal rail stress shall be of a type acceptable to the MBTA and shall not damage the CWR. Continuous welded rail shall be vibrated whether installed at ambient temperature or distressed artificially.

3.4 THERMITE FIELD WELDING

A. General

1. The DB Entity shall join strings of CWR laid in tracks together by the thermite welding process except where insulated joints, are located.
2. Field welds shall not be located within the following area unless approved, or directed, by the MBTA:
 - a. Within ten feet of a field weld in the opposite rail;
 - b. Within 18' of a field weld in the same rail;
 - c. Within 18' from the center of any bolted joint;
 - d. Within 3' of a shop weld;
 - e. Within 10' of a bridge deck;
 - f. Within 20' of a highway crossing;
 - g. On a tie plate.

B. Weld Quality - Each field weld shall have full penetration and complete fusion with no evidence of surface or internal fissures, cracks, porosity or slag type defects.

C. Welding Requirements

1. The DB Entity shall use approved weld kits that are self-tapping, and require minimum preheating.
2. Rail ends shall be saw cut at right angles to the rail. The DB Entity shall clean the surface of the rail for a length of approximately six inches from each end, free of all grease, dirt, loose oxide, scale and moisture. All burrs and lipped metal that would interfere with the proper fit of the molds shall be removed. Torch cutting of rails is prohibited.
3. Prior to field welding strings of CWR, the DB Entity shall adjust the length of the CWR strings for zero thermal stress temperature, vibrate the rail to relieve internal rail stresses, and fully anchor the rail.
4. At the time of field welding, the rails shall be aligned to produce a weld which, with respect to alignment, shall be in accordance with current ARMEA Specifications for Fabrication of Continuous Welded Rail modified to require a slight crown in the running surface to assure a flat surface after the weld has cooled. The maximum vertical offset permissible is 0.015" using a 36" straightedge. The maximum horizontal offset in the rail head using a 36" straightedge is 0.060". The maximum combined vertical offset and crown camber determined using a 36" straightedge shall not exceed 0.060".
 - a. Negative camber or dip shall not be permitted.
 - b. The proper rail end alignment shall be achieved by the use of an approved alignment device designed and manufactured for this purpose. In no case will the use of track jacks or track spikes be allowed for rail end alignment.

D. At the time of field welding the rail gap shall be as specified by the manufacturer of the weld kit.

If the rail gap is not within the recommended tolerances for field welding, the DB Entity shall un-anchor the CWR strings for 300' each side of the rail gap and readjust each CWR string for 300' within the specified zero thermal stress range. The DB Entity shall re-anchor the CWR before performing a field weld. Should the rail gap on anchored CWR be larger than the manufacturer's recommended gap after the CWR strings have been readjusted for zero thermal stress, the DB Entity shall saw a length of rail from one end of one of the anchored CWR's and insert a rail not less than 19' long to provide the manufacturer's recommended gap for field welding. At locations where the rail gap is smaller than the manufacturer's recommended gap, the recommended gap shall be obtained by sawing a piece from the rail.

1. Thermite field welding is prohibited when the rail temperature is below 32 F., measured on the shady side of the rail.
 2. When the rail temperature is between 32 F. and 50 F., a hydraulic rail puller, designed and manufactured for this purpose, must be used to maintain proper rail end gap. The puller shall be left in place until the rail has cooled to below 700 F. Any movement of the rail before the weld has cooled to at least 700 F. will result in the weld failing. It is important that the weld is not subjected to a sudden strain by releasing the hydraulic pressure too quickly.
 3. The hydraulic rail puller shall not be used to establish the proper rail end gap.
- E. The DB Entity shall trim and grind weld to meet the following requirements and as otherwise specified by the manufacturer:
1. Finish the top and sides of the weld at the rail head to within plus 0.005" or minus inch of the parent section.
 2. If the field weld is located within three inches of the edge of a rail support finish the weld at the rail base to within plus 0.01" or minus 0.00" of the parent section.
 3. Finish the web zone and the remainder of the rail weld to within plus 0.375" or minus inch of the parent section. Finish grind the weld to eliminate visible cracks.
 4. Eliminate notches created by offset conditions by grinding to blend the variations. Remove all protrusions or gouges in the welded area and blend the weld area into the rail contour by grinding in a manner which will eliminate fatigue crack origins. The DB Entity shall remove, by grinding, all defects visible to the unaided eye, except if removal by grinding cannot be accomplished without damaging the rail, the DB Entity shall remove the weld. The DB Entity shall take precautions to avoid excessive pressure during grinding of the weld in order to prevent overheating of the rail surface.
 5. The DB Entity shall complete all heavy grinding after the weld has reached the ambient rail temperature, or as recommended by the manufacturer. Removal of the weld upset by the use of a saw or other such device is prohibited.
 6. Finish rail grinding shall be completed prior to the operation of trains over the weld. Finish grinding of the weld shall be accomplished with an approved rail profile grinder. The use of hand held grinders is prohibited.
 7. Thermite field welds shall be made in accordance with, and shall not deviate from, the manufacturer's recommendations and AREMA Chapter 4. Short cuts in the recommended preheating process are prohibited.
 - a. Welding during inclement weather such as rain, mist, snow, etc. is prohibited.

3.5 TRACK ALIGNMENT AND GAUGE

- A. The installation of plug rails shall not disturb existing vertical, horizontal track alignment, or track gauge. Should the DB Entity alter or disturb track alignment or gauge while conducting the work the track shall be repaired to the required Authority tolerances at no additional cost to the Authority.

3.6 SALVAGE

- A. The DB Entity shall recover all bonded insulated joint plug rails and conventional lengths of rail removed from track. This material shall be properly loaded, transported, unloaded and neatly stockpiled at a location to be determined by the MBTA.

3.7 TRACK USAGE

- A. No work under this Section shall be performed without proper authorization from the MBTA.

END OF SECTION

SECTION 16830

RUNNING RAIL BONDING FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the provision of all necessary material and labor to bond the running rails for optimum performance of the negative return system and (signal) track circuits.
- B. Typical running rail bonding details for rail connections, track cross bonding and signal bonding connections shall be as stated herein and as shown on the Contract Documents.

1.2 QUALITY ASSURANCE

- A. Material, equipment and systems procured for this Contract shall be produced under control of a formal Quality Assurance Program to ensure an acceptable level of quality of the equipment provided. Comply with the provisions of Volume 1 DB Contract Terms and Conditions Section 4 "Quality Control and Quality Assurance" and Volume 2 Technical Provisions Subsection 2.5 "Quality Management". Furnish certificates of compliance for Quality Assurance Programs as requested by the MBTA.
- B. The DB Entity shall install and test each welded bond and mechanical connector in accordance with the requirements of this Section and other sections of these Specifications.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements", submit catalog cuts and descriptive literature for the following:

- A. Material composition, electrical and mechanical characteristics for power bonds, signal bonds, and track circuit split bolt connectors,
- B. Field installation procedures for welded signal and power bonds,
- C. Field test procedures for welded signal and power bonds,
- D. All devices for securing and protecting running rail bonding,
- E. Plan showing detailed final design for bonding to assure that all impedance bonds, crossbonding and signal bonds are properly connected electrically.

PART 2 – PRODUCTS

2.1 MATERIALS

- A. Provide bonding materials and track circuit connectors, as manufactured by Stanley Brazing

Systems, Dwight and Wilson Co., United States Steel, or approved equal. Provide bonds and materials manufactured for welding by the exothermic process. The MBTA shall approve all bonds, bonding, materials and types of molds. The type of bonding required shall be selected for the correct application as follows:

1. Power Bonds

- a. Installing impedance bond and crossbond connections to the running rail shall be made with two-500 kcmil extra flexible cables as shown on the Contract Documents.
- b. Provide power bonds for frog and switch fouling connections and expansion joints of 2-500 kcmil extra flexible cables.
- c. Provide 500 kcmil extra flexible cable for frog and switch jumpers, and end of storage track crossbonds where required for welding to the base of the rail as accepted by the MBTA.
- d. Where bond-to-bond or bond-to-return cable (splice) application is required, use of 1000 kcmil cables and mechanical connectors is acceptable, as accepted by the MBTA.

2. Guardrail Bonds and Signal Rail Bonds

Provide guardrail bonds and signal bonds for signal rail sections using rail-head type manufactured for welding application. The bonds shall be 7/32" x 6 1/2" and of required length.

- B. Furnish welding material consisting of copper exothermic mixture employing tin-metal in an amount to effectively constitute 4-1/2 percent to 5-1/2 percent of resulting weld metal. Resulting weld metal shall be of high electrical conductivity with minimum tensile strength of 39,000 pounds per square inch. Determine tensile strength by performing tensile tests on 1/2" nominal diameter tensile specimens (without flaws) cast in graphite molds.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Crossbonding shall be installed at locations as required by the DB Entity's design. All components of the trackwork shall be bonded in accordance with the approved plans in order to establish electrical continuity and conductive capacity for proper operation of traction power return system and signal system track circuits.
- B. For all rail-joint bonds, impedance bond connections to the running rails, the surfaces of the rails where the bond is to be applied, shall be ground clean with a reinforced grinding wheel, of a type as recommended by the bonding material manufacturer. The use of vitrified grinding wheels will not be allowed. After grinding, the surface shall be cleaned with an approved non-toxic solvent to remove all traces of grease and dirt.
- C. After the surface has been ground and cleaned, the surface shall be heated to drive out any moisture. The cable bond shall then be welded by the approved exothermic process in such a manner as to ensure a thorough mechanical and electrical connection.
- D. The casting of the test specimens shall be by the direct reduction of the exothermic mixture and the flowing of the weld metal into a graphite mold to form the one-half (1/2)" diameter specimens.
- E. At the DB Entity's expense and before beginning work on these bonds, the DB Entity shall

require each welder to weld in the field under conditions similar to those of the regular installation, not less than three complete rail connections, and as many more as the MBTA considers necessary to determine that the welds are being made satisfactorily. Such welds shall be subject to inspection and test by the MBTA, and his approval as to method and quality of workmanship will depend on the results of these inspections and tests.

- F. It is of great importance that each rail connection be thoroughly welded to the rail. To reduce the possibility of any of these welds breaking in service, the MBTA reserves the right to require a test of each weld by hammer and striker, or in any other manner which in the opinion of the MBTA is reasonable.
- G. No cable larger than 500 kcmil shall be weld connected to the rail without acceptance of the MBTA.

3.2 TESTS

- A. The DB Entity shall demonstrate that the bonding is in accordance with the requirements of this Section, those as shown on the Contract Documents, and as specified in AREMA C&S Manual, Section 8, Track Circuits.
- B. Bonds, welds, or connections installed by the DB Entity which are found to be defective prior to acceptance, shall be removed and a new bond shall be installed as part of the work.

END OF SECTION

SECTION 16835

SIGNAL AND UTILITY POWER SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies providing equipment, installation, wiring and testing for signal and house utility power for the new Green Line central instrument houses (CIHs) on the GLX. CIH signal power is required for supplying 120V AC isolated (ungrounded) power to signal equipment. House power is required for CIH air conditioning (AC), lighting, receptacles and other CIH auxiliary equipment.
- B. Work to be performed under this Section consists of supplying, installing and testing at both the factory and in the field the following major electrical components in each CIH:
 - 1. Non-fused disconnect switches;
 - 2. Automatic transfer switches (ATS);
 - 3. Panelboards;
 - 4. Isolation transformers;
 - 5. General purpose transformers;
 - 6. Fused disconnect switches;
 - 7. Contactors;
 - 8. Air conditioning system disconnect switches
 - 9. Conduit, wire and miscellaneous devices required for installation and connection of CIH power equipment.
- C. Utility power at each CIH shall consist of a 480V, three phase four wire grounded feed from the station transformer to a 480V to 240/120V single phase transformer located in the CIH. One fused disconnect switch shall terminate the 240/120V single phase, four wire incoming CIH feeder cables.
- D. Signal power at each CIH shall consist of dual 480V single phase two wire ungrounded feed from two separate signal power substation transformers. Each 480V source shall have a separate 480V to 240/120V transformer located in the CIH. The signal power shall come into the CIH as a 240/120V three wire ungrounded system.

1.2 QUALITY ASSURANCE

- A. The DB Entity shall comply with the requirements of all national, state and local codes, laws and ordinances, and all rules and regulations of public administrative authorities having jurisdiction over the work.
- B. Workmanship shall conform to the best modern practices for a rugged, long-lived, safe installation required for a public transportation system. Materials to be installed shall be new and

of the highest industrial grade as specified, designed and configured to operate in an atmosphere containing conductive metallic particulates (rail dust).

- C. All equipment specified in this Section shall be capable of operating at 125% of equipment rating.

1.3 COORDINATION STUDY

The DB Entity shall perform a coordination study for all electrical equipment provided under this Specification Section to ensure proper protection and coordination of upstream and downstream devices; the coordination study shall be included in Article 1.4.1 below. Electrical ratings and settings of the proposed equipment shall be selected to ensure coordinated operation under both normal and worst case conditions.

1.4 SUBMITTALS

- A. Within 180 days from the Notice-to-Proceed, the DB Entity shall submit load calculations based on the total peak and continuous demand signal system loads (VA) that will exist at each CIH 120V bus, and total auxiliary CIR loads (KVA). The calculations shall also include the normal and worst case conditions assumed in the load determination.
- B. Prior to the procurement or manufacture of distribution equipment, the DB Entity shall submit the following for review and approval.
 - 1. Schematic diagram of the proposed system, showing equipment and protective device ratings and wire and cable types and sizes.
 - 2. Catalog cuts, shop drawings, or other descriptive information for the wire and cable, disconnect switches, power transformers, circuit breakers, switchboards, panelboards, conduit, fuses, and miscellaneous hardware. Information shall include electrical ratings, protective device coordination curves and recommended settings, physical dimensions, and manufacturer's recommended installation instructions.
 - 3. Equipment layout plans showing the proposed location of the electrical equipment and cable routings between equipment locations.
 - 4. Switchboard panel layout diagrams showing the proposed arrangement and labeling of circuit breakers and disconnect switches for CIH 240/120V utility power and 240/120V signal power equipment.
- C. The DB Entity shall submit, 60 days prior to factory testing, a Factory Test Procedure for testing of the factory installed CIH/CIR power equipment specified in this Section (field installed power equipment will require field testing based on an accepted procedure and schedule). This shall include:
 - 1. Procedure of testing.
 - 2. Equipment tested.
 - 3. Description of test.
 - 4. Test results and conclusions. (To be added to test report at conclusion of testing)
- D. Provide complete "As-Built" drawings, prior to MBTA acceptance, including full-line and schematic

diagrams and point-to-point wiring drawings for all electrical equipment, which reflect the status of the equipment up to and including final factory acceptance testing.

PART 2 - PRODUCTS

2.1 CIH EQUIPMENT FINISH

- A. All electrical CIH equipment specified herein shall be finished as follows:
1. All metalwork shall be carefully finished to remove sharp edges and burrs.
 2. All surfaces shall be cleaned and treated with rust inhibiting phosphatized coating prior to painting, then finished with two coats of semi-gloss ANSI-61 light gray paint, unless otherwise specified.

2.2 AUTOMATIC TRANSFER SWITCHES

- A. Automatic transfer switches are required in each CIH and shall be two pole, double throw, with fully rated overlapping neutral transfer contacts, having the following ratings:
1. Rated voltage: 240V
 2. Rated continuous current: 100A
 3. Number of phases: 1 phase – 3wire
 4. Rated frequency: 60 Hz
 5. Transfer time, maximum: 0.2 Sec.
- B. The available fault supply at the automatic transfer switch terminals shall be taken as 10,000A with system X/R ratio of four.
- C. The specified current ratings of the transfer switch shall be for continuous duty when enclosed in an unventilated sheet metal enclosure and applied for all classes of loads, including UL-1008 classifications. The ratings shall not be affected by cumulative operations (6000 cycles minimum) over the entire life of the transfer switch.
- D. Operation Requirements
1. Automatic transfer switch shall be mechanically held, electrically operated by a single solenoid or motor-driven stored energy type, with quick make, quick break mechanism. Mechanical interlocks shall be provided to insure that the load cannot remain simultaneously disconnected from or connected to both the normal and standby supplies when either or both supplies are available. The mechanism and interlocking system shall be designed to prevent transfer in either direction in the event of welding of one or more contacts in the power circuits. The interlock circuit wiring shall be factory connected and located entirely within the transfer switch enclosure. All parts of the mechanical interlock shall be electrically dead. Molded plastic parts shall not be used as part of the operating linkage between the electrical operator and the main operating shaft of the switch.

2. A manual operator shall be provided to transfer the switch to either position with the same contact-to-contact operating speed as the electrical operator. The manual operator shall be so located with respect to other components that it is accessible without subjecting the operator to a shock or an accident hazard. Means shall be provided to prevent automatic operation during the manual transfer.

E. Following mode of operation shall be provided:

1. The voltage of the "normal" supply shall be monitored continuously so that when it drops to 85 percent of rated, or lower, for a preset period of time between 1 to 10 seconds, the switch shall automatically transfer the load to the "stand-by" source, provided that the voltage of the "stand-by" source is 90 percent of rated or higher.
2. Upon restoration of "normal" source voltage to 95 percent of rated, the switch shall automatically re-transfer the load to the normal supply after a preset time delay of 3 to 30 minutes. If the "stand-by" source should fail while carrying the load, retransfer to the "normal" source shall be made instantaneously upon restoration of the "normal" source.
3. A selector switch shall be provided for selecting either of the two supply circuits as the "normal" source. The circuits of the green and red indicating lights and the two auxiliary contacts for remote indication shall be interlocked with the source selector switch so that their functions will correspond with the source selection. The selector switch shall be provided with two nameplates to indicate the supply source that has been selected as the "normal" source.

F. Enclosure

1. The transfer switch and all control components shall be assembled in a sheet steel NEMA Type 1 enclosure, suitable for wall mounting.
2. A full height, full access door, shall be provided in front of the enclosure. Door shall be formed of sheet steel and shall be properly reinforced against distortions by suitable flanges and stiffening members. Hinges shall be of heavy duty, of a type accepted by the MBTA. Door shall be securely fastened in the closed position with a minimum of two latches easily opened without the use of tools. Door shall be provided with stop to hold it securely in the open position.

G. All surfaces of the enclosure shall be finished in accordance with Section 09900 - PAINTING.

H. Transfer Switch Assembly

1. All current carrying components of transfer switch shall be fabricated of high conductivity copper or copper alloy designed to carry the specified rated current continuously without exceeding the hottest-spot temperature rise of 65 degrees C above a building ambient of 40 degrees C.
2. Switch contacts shall be silver alloy or silver plated. Contacts shall be individually adjustable and located for convenient examination and maintenance. Arc barriers shall be provided to protect the operator in the event of an inadvertent operation of the switch under load.

I. Sensing and control relays shall be industrial type, rated for continuous duty, having accurate response, positive contact pressure and wiping action. Contact shall be rated 10A, minimum.

- J. All switch and relay contacts, coils, springs and control elements shall be replaceable parts as individual units, accessible from the front without removing the switch panel from the enclosure or disconnecting operating linkage or power conductors.
- K. Control and terminal blocks shall be provided. No. 16 AWG wiring will be acceptable for low-voltage, low-energy circuits.
- L. Wiring associated with the interlock circuit shall be protected from possible damage during any servicing of the switch.
- M. Circuits requiring external connections shall be factory-wired to terminal blocks for connection to field wiring entering from the top. Sufficient number of terminals to satisfy all external connection requirements and 20 percent additional unassigned terminals shall be provided.
- N. Control circuit shall be designed to operate on 120V, 60Hz.
- O. Accessories furnished shall include, but not be limited to, the following:
 - 1. One test switch mounted on the door of enclosure to simulate normal source failure.
 - 2. One pushbutton to bypass time delay on re-transfer to normal source,
 - 3. One selector switch on the door of enclosure for selection of "normal" source,
 - 4. One selector switch on the door of enclosure to permit or block automatic re-transfer,
 - 5. One green pilot light to indicate switch in "normal" position,
 - 6. One red pilot light to indicate switch in "stand-by" position,
 - 7. Two pilot lights to indicate the source which has been selected as "normal",
 - 8. Time delay relay with an adjustable time delay adjustable between 1.5 and 15 seconds, connected to the output circuit, for sensing loss of voltage, with two contacts (one N.C. and one N.O.) wired to external terminal block for remote alarm. Contacts shall be rated for 125V DC,
 - 9. Two auxiliary relays that monitor the presence of CIH feeder voltage shall be supplied. They shall have auxiliary contact(s), rated 125V DC, to close when the load is transferred from "normal" to "stand-by" position, wired to external wiring terminal block for remote indication,
 - 10. Time delay relay, adjustable between 1 and 10 seconds, for the transfer circuit,
 - 11. Time delay relay, adjustable between 3 and 30 minutes, for the retransfer circuit,
 - 12. Transfer control voltage relays, set for 95 and 90 percent pickup and 85 percent dropout,
 - 13. Handle to facilitate manual transfer to either position,
 - 14. Wiring diagram. Diagram shall be laminated in plastic and fastened to the inside of the door,
 - 15. Nameplates, identifying each control device, switch and indicating light,
 - 16. Power circuit and ground terminations.
 - 17. Source terminals and load terminals of Device 83A, automatic selective/ control transfer relay, shall each be furnished with heavy duty bolted type terminal lugs, one copper cable per phase and neutral. Terminal lugs shall be sized to fit the appropriate size cable as indicated on the Contract Documents.

2.3 TRANSFORMERS

A. CIH 480V to 120/240V Isolation Transformers

1. Insulation: resin-encapsulated dry-type, UL 220 Degree C. class.
2. Electrical Ratings
 - a. Primary Voltage: 240V line-to-line
 - b. Secondary Voltage: 120V line-to-line, ungrounded
 - c. No. of Phases: 1
 - d. No. of Wires: 2
 - e. Continuous Load: as determined by the load calculations
 - f. Frequency: 60Hz
 - g. Temperature Rise: 80 Deg. Cover 40 Deg. C ambient
 - h. Insulation Rating: 220 Deg. C operating temperature
 - i. Impedance: Manufacturer's standard impedance
3. Windings all copper.
4. Core Steel: Grain-oriented high grade electrical steel.
5. Load Taps: 4 taps, $\pm 2\frac{1}{2}\%$, and $\pm 5\%$.
6. Provide wall-mount, indoor, non-ventilated NEMA Type 4 enclosure.
7. Provide electrostatic shield between primary and secondary windings.
8. Design, manufacture, and test in accordance with the following standards:
 - a. NEMA ST 20, Requirements for Dry-Type Transformers for General Applications.
 - b. UL 506 and 1561.
9. Warrantee: free from defects in material and workmanship for a period of five (5) years from the in-service date.
10. Acceptable Manufacturers
 - a. ACME Electric Corp.
 - b. Square D.
 - c. Siemens Energy & Automation.
 - d. or Approved Equal.
11. The 480V to 120/240V isolation transformers shall be indoor rated and mounted on the wall inside the CIH.

B. General Purpose Transformers

1. Furnish, install, and connect single phase power transformers as required by the DB Entity's design. Transformers shall conform to NEMA, IEEE and ANSI Standards and shall be UL

listed. Transformers shall be suitable for continuous operation and rated kVA, 24 hours a day, 365 days a year with normal life expectancy as defined in IEEE Standards.

2. Transformers shall be non-ventilated dry type for outdoor installation. Transformers shall be pad mounted type with rigid drip-proof and rodent-proof enclosure. Provision for lifting shall be provided so as to facilitate handling and installation without removal of enclosure components.
3. Winding insulation shall be class H rated for minimum end temperature of 220 degrees C. Average winding temperature rise by resistance from continuous operation at full load shall not exceed 150 degrees C at maximum ambient temperature of 40 degrees C.
4. High voltage windings shall be of copper, single phase, 60Hz, 480V nominal. High voltage winding insulation class shall be 1.2kV, minimum.
5. Low voltage winding shall be of cooper, single phase, 60Hz, 240/120V nominal, for 3-phase, 4-wire service. Low voltage insulation class shall be 1.2kV, minimum.
6. Six 2-1/2% no load capacity taps shall be provided in the high voltage winding, two above and four below the rated primary voltage.
7. Terminal boards shall be made of strong fiberglass with terminals clearly marked for identification. Terminals and wiring compartment shall be completely front accessible.
8. Terminations and wiring compartment shall be arranged to facilitate entry and connection of primary and secondary cables.

2.4 LOAD DISTRIBUTION PANELBOARDS

- A. Furnish, install and connect panelboards for distributing 240/120V single phase, four wire CIH service supplies as required by the DB Entity's design.
- B. Panelboards shall be factory assembled, distributed type, to supply CIH loads as shown on the accepted drawings. Panelboards shall be dead front type with bolt-on molded case circuit breakers, sized, as a minimum, for the quantity and rating of main and branch circuit breakers shown on the accepted drawings.
- C. Panelboard interiors shall consist of a steel backplate structure holding the bus, terminal, and neutral assemblies. The backplate shall be removable and shall be adjusted in depth unless the assembly of the panelboard is specifically designed to ensure proper depth positioning of the panel interior without adjustment. All spaces shall be fully bussed and equipped requiring no modification for the addition of future breakers. Unused spaces shall be covered to preclude accidental access to the bus. All bus bars and bus connections to breakers shall be sequence phased, such that all poles of multi-pole breakers shall be connected to different phase legs regardless of location in the panelboard.
- D. Bus shall be copper, silver plated, braced to withstand a short circuit equal to the largest short circuit capacity of any breaker installed in the panel. Bus bar cross-section shall be uniform and contact surface area shall be based on tests similar structures. Panel shall be equipped with insulated neutral and uninsulated ground bar.
- E. Panelboards shall have main and branch circuit breakers of molded case bolt-on type, having trip ratings shown on the accepted drawings, and subject to the MBTA's acceptance. Multi-pole circuit breakers shall have common trip arrangement. Trip elements shall be thermal-magnetic

type. Single pole circuit breakers shall be rated 240V. The minimum interrupting rating of the circuit breakers 10,000A, rms symmetrical, on 240V for panelboards. Circuit breakers shall be quick make, quick break, manually operated, ambient compensated provided with trip free mechanism and trip indication.

- F. Circuit breakers shall be UL listed and shall conform to NEMA Standard Publication No. AB1.
- G. Panelboard shall be furnished with NEMA type 1 general purpose surface mounting cabinet. Cabinet shall be of a gauge not less than that specified by applicable UL Standards. Wiring gutters shall conform to the requirements of the National Electrical Code and the applicable UL Standards, but in no case shall be less than six inches. Box shall be furnished with single size knockouts of sizes required or may be field drilled. Spare knockouts or combination knockouts will be acceptable.
- H. Panelboard front trim and door shall be of gauge not less than specified by the applicable UL standard and shall be cold rolled or other suitable steel with concealed hinges, concealed trim clamps, flush catch and lock with two keys. A typewritten directory with plastic covering shall be installed on the interior of the door.
- I. Terminal lugs shall be suitable for terminating the quantity and size of cable shown on the accepted drawings.
- J. Detachable threaded hubs shall be provided for terminating the incoming and outgoing conduits at the panel.

2.5 600V CLASS DISCONNECT SWITCHES

- A. Furnished disconnect switches shall be 600V class, three-pole, single throw, quick-make, quick-break, suitable for heavy-duty application. Ampere ratings shall be as required by the DB Entity's design.
- B. Switches mounted inside substations or CIHs shall be housed in grounded steel NEMA Type 12 enclosures. Switches utilized for the ungrounded signal power distribution system and mounted outside substations or CIHs shall be housed in fiberglass NEMA Type 4X enclosures.
- C. Provide provision for padlocking in the "off" position.
- D. Provide two normally open and two normally closed Form C contacts per switch, operated from the switch mechanism.

2.6 NAMEPLATES

Furnish and install nameplates for all devices, including those integrally-mounted. Nameplates shall be of black laminated plastic composition bearing permanent; white-engraved lettering, with beveled edges and fastened to panels by means of round-head screws.

2.7 INSTRUMENT AND CONTROL SWITCHES

All instrument and selector switches shall be of the rotary type, heavy-duty, rear-connected for semi-flush mounting, rated for not less than 20A at 600V.

2.8 INDICATING LAMPS

All indicating light lamps assemblies shall be of the low drain switchboard type with integrally mounted resistor that is compatible with the circuit voltage involved.

2.9 SWITCHBOARD METERS

Furnished meters shall be analog voltmeters and ammeters, 250-degree scale, rear-connected, 4.5 in. long switchboard type.

PART 3 - EXECUTION

A. General

1. This DB Entity shall formulate overall factory test program for all new CIH equipment identified in this Section. The factory test program shall include tests that ensure equipment compliance with relevant standards, this Specification and reliable performance of the intended operation. This factory test program shall be submitted to the MBTA 60 days prior to testing.
2. Factory tests shall include but not be limited to:
 - a. Tests as listed in this Specification.
 - b. Tests per relevant NEMA, IEEE, NETA and ANSI Standards.
 - c. Any other tests to ensure satisfactory performance of equipment.

B. Each item of electrical equipment shall be subjected to the manufacturer's routine factory tests and other tests as specified below. The factory test equipment, test methods and procedures shall conform to all applicable standards.

C. The signal and auxiliary power distribution systems installed in CIHs shall be factory tested for continuity, isolation, grounding, and proper operation and conform to all applicable standards.

D. Conditions for Tests

1. The DB Entity prepared test procedure has been accepted by the MBTA.
2. The DB Entity shall assume full responsibility during the field testing of all supplied equipment and installation provided. Should there be any loss or damage to such equipment as result of these tests, the DB Entity shall be fully responsible for replacing the damaged equipment.
3. When a piece of equipment or a component failed to withstand tests or meet specified test values, that equipment or the component shall be replaced at no cost to the MBTA.
4. New equipment or component that has replaced the damaged or failed equipment shall be subjected to same requirements of tests as those of the similar existing equipment or the failed equipment.
5. Test reports shall be submitted as described in the Submittal section of this Specification.

END OF SECTION

SECTION 16838

CENTRAL INSTRUMENT HOUSES FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the requirements for procurement and fabrication of factory-wired Central Instrument Houses (CIH).
- B. CIHs shall be provided with all vital and non-vital circuitry, equipment and components required to comprise a safe and reliable signal system and shall also include a local control panel and maintainer's panel.
- C. The CIHs shall be provided with an approved means of event recording to record status changes for both vital and non-vital functions at each location.
- D. The size of the CIH shall be determined by the DB Entity as being adequate to house all equipment and provide spare space as described within these Specifications. Each CIH shall be a minimum ten (10)' in width.
- E. Within the CIH, a separate room shall be provided at one end, for access to the local control panel. A locked door shall be provided between this local control room separating it from the signal equipment area of the CIH.
- F. Work to be done under this Section shall also include the preparation of "as-built" detail drawings for the CIH, the rack arrangements, panel arrangements, and equipment arrangement.
- G. The DB Entity shall be responsible for arranging transport of the CIHs from the manufacturer's factory to their final field sites along the right-of-way. Prior to transport, the DB Entity shall prepare each site for CIH installation by providing foundations including cable vaults, cable routing systems and electrical power service, etc.
- H. Upon delivery the DB Entity shall commence with CIH field installation. Field installation shall include, but not be limited to, termination of the wayside cables on the entrance rack(s), connection of local electrical power, final hook-up for HVAC, communications and fire alarm systems, and interconnection with other locations.
- I. The CIH's shall be mounted on foundation piers as shown on the Contract Documents. The DB Entity shall submit, for approval, a method for installing a skirt around the base of the CIHs.
- J. HVAC units are to be provided with an automatic thermostat feature to maintain an ambient room temperature between 60°F and 70°F.
- K. The DB Entity shall make a site survey and confirm the adequacy of the proposed CIH locations and submit a report to the MBTA noting concurrence or any discrepancy. The DB Entity shall also assess and report on the means and methods for transporting the CIH to its final location. Based on the results of the site survey, including the transportation assessment, the MBTA may require that the DB Entity perform a "clearance survey" to determine that placement of the CIH structure along the right-of-way shall not infringe on the dynamic clearance envelope of Green Line car equipment.

1.2 QUALITY ASSURANCE

- A. All equipment and materials provided shall conform to the requirements of Volume 1 DB Contract Terms and Conditions Section 4 “Quality Control and Quality Assurance” and Volume 2 Technical Provisions Subsection 2.5 “Quality Management” and other applicable references as stated within this Specification.
- B. Factory test of the CIH for the functioning of the equipment contained within the house shall be conducted in accordance with the DB Entity's Factory Test Procedure as accepted by the MBTA. The DB Entity shall inspect the CIH as part of the test procedure and correct any deficiencies.
- C. All electrical components, unless otherwise specified herein, shall be rated to operate at power, voltage, current and temperature levels 25% above that level which the components will be subject to in normal service.
- D. The DB Entity shall inspect the CIH after it has been installed and correct any deficiencies. This inspection shall be conducted in conformance with the requirements of the DB Entity's Installation Inspection Procedure as accepted by the MBTA.
- E. FM-200 chemical agent suppression system shall be included within each CIH and comply with the guidelines contained in the National Fire Protection Agency (NFPA) Standard 2001.

1.3 SUBMITTALS

- A. In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”, the DB Entity shall submit the following for approval prior to the manufacture and assembly of the CIH:
 - 1. Catalog cuts and descriptive literature for all CIH equipment and material as specified herein and as shown on the Contract Documents;
 - 2. Drawings showing the construction details, proposed size, layout, grounding arrangement and detailed bills of material for the CIH;
 - 3. Drawings of the relay, instrument and entrance racks showing the arrangement and description of the mounted equipment and the proposed method of inter- and intra-rack wiring. These shall also include the numbering system used for identifying the rack and components by coordinates;
 - 4. Drawings showing the location, size and mounting arrangement of each maintainer and/or local control panel, plan file/rack and plan table;
 - 5. Drawings showing the local control panel and maintainer's panel screen configurations, including types of icons, plug couplers, terminals and workstation components that the DB Entity proposes to furnish. These drawings shall show how the panel aligns with respect to the actual track configuration;
 - 6. Drawings and descriptive information, including manuals, of the HVAC, fire detection, fire extinguishing and the intrusion detection systems proposed;
 - 7. Calculations for the sizing of the HVAC equipment for each location;
 - 8. Drawings of the cable entrance provisions, final arrangement of apparatus and details of wire/cable raceways and entry to and through the CIH;

9. Drawings showing the size, battery & tray arrangement, wiring details;
 10. Drawings showing the desktop cabinet housing the control panel.
- B. Factory Test and Inspection Procedure(s) for the CIHs shall be submitted in a timely manner, sufficient to accommodate the approved CPM (schedule) and all other time requirements referenced herein.
 - C. A Field Test and Inspection Procedure for each CIH shall be submitted not later than six weeks prior to scheduled cut-over.
 - D. Within 180 days of Notice-to-Proceed the DB Entity shall provide a plan for the installation of the CIH(s) along the right-of-way. The plan shall include the means of delivering and transporting the CIHs. The DB Entity shall utilize a template the size of which is determined by the actual size of the CIH to determine if the housing can be installed without fouling the track or other equipment.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Conform to the requirements of Section 16801 - BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM for delivery, storage & handling. All equipment shipped within the CIHs shall be properly fastened and braced to prevent damage during transit.
- B. It shall be the DB Entity's responsibility to replace any material or equipment damaged, lost or stolen at no additional cost to the Contract.
- C. Relays and printed circuit boards shall be removed from their receptacles following acceptance of factory testing and prior to CIH shipping. Relays and other equipment, as designated by the MBTA, shall be re- packaged in an approved manner for separate shipment to the designated storage site at a designated time.
- D. The DB Entity shall be responsible for coordination of delivery routes and provision of an acceptable storage site to accept delivery. The DB Entity shall obtain all necessary permits required for transport and delivery.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All equipment and materials provided shall conform to the requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM and other applicable references as stated within this Specification.
- B. All equipment described in this Section shall be painted in accordance with the requirements of Section 16897 – MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM and other applicable sections of these Specifications.
 1. Terminal, apparatus boards and shelves shall be painted with fire retardant gray, ANSI 61 or approved equal.
 2. The manufacturer is to apply approved corrosion resistant under coatings to metal parts of the CIHs.

3. The battery trays shall be painted with two coats of an approved acid resistant black paint.
- C. All equipment, materials and components shall be new and free of manufacturing defects.
- D. The CIHs shall be dust-tight and insulated to provide maximum heating and cooling system efficiency.
- E. The testing plan for all systems and equipment contained within the CIH shall be in accordance with the requirements of Section 16898 –SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

2.2 MATERIALS

- A. Central Instrument House Design and Fabrication
 1. CIHs shall be of modular construction of 12 gauge sheet steel, unless otherwise accepted by the MBTA.
 - a. The house shall comply with the applicable Standards of ASTM E-84 for exterior walls. The interior paneling shall comply with a flame spread of 0-25 in accordance with ASTM E-84.
 - b. Top, floors and sides shall be lined with fire resistant insulating material with a minimum insulation value of R-19 complying with a flame spread of 0-25 and a fire rating of 7 in accordance with ASTM E-84.
 - c. The interior walls shall be paneled. Roof and side ventilation openings shall be provided, if required, for the size of the CIHs.
 - d. CIHs shall be constructed to provide access for underground and aerial cable knock-out entrances to the main terminal rack.
 - e. The free floor space shall be covered with vinyl tile, 12" by 12" squares or as accepted by the MBTA.
 - f. Hoist bars shall be provided to facilitate the movement of the CIH.
 - g. Removable covers shall be provided inside the CIH to provide access to the foundation bolts.
 - h. CIH design drawings shall be stamped by a registered professional engineer.
 2. As shown on the Contract Documents, there shall be two rooms in the CIH. The larger area shall accommodate the signal equipment, and a smaller area shall house the local control panel. An inner door shall separate the signal equipment area from the vestibule and an outside lockable access door shall be provided for each area.
 - a. The interior common wall(s) and door shall be constructed to allow total room ventilation with a single, common HVAC system. Provide the interior door with a lock arranged for access from the signal equipment side only.
 - b. CIHs shall be equipped with two doors as shown on the Contract Documents. The doors of the CIHs shall be hinged and gasketed to provide a dust-proof and airtight seal. Doors shall be provided with cast iron handles, welded to a three-point locking device that shall ensure the door cannot be locked until it is in the fully closed position. Doors shall be provided with a two-position retaining device to secure the door when open. Door mechanism shall allow the door to be opened from the inside even if the padlock is

applied to the outside of the door mechanism.

- c. Hinges shall be separate castings welded to the housing and door. The hinges shall be equipped with bronze hinge pins and shall be lubricated by the manufacturer before the house is shipped.
3. The local control panel area shall be equipped with a desk/console for the operator's use while operating the panel and with an adjustable swivel chair on rollers of correct height to operate panel. The area shall also have 3 wall mounted coat hooks.
4. Overhead cable trays as shall be provided and factory installed for all intra-rack and inter-room wiring.
5. The size of the CIHs shall be sufficient in capacity to house all the equipment required by this Contract. Spacing between instrument racks shall be as indicated in the guidelines, as shown on the Contract Documents, and according to the accepted layout drawings.

B. Cable Entrance Facilities and Utilities

1. Cable entrance knockouts in the floor and the upper walls shall be provided for full flexibility in arrangement of entrance racks such that cables entering shall not require undue bending for proper termination.
2. A dedicated cable entrance knockout or sleeve access shall be provided for the signal power line cable.

C. Fire Alarms and Suppression System

1. Fire alarms and suppression system shall be furnished and installed in the CIH and shall be composed of the following principal components:
 - a. The system shall be a total flooding FM-200 chemical agent extinguishing system designed to provide early warning detection and automatic release of FM-200 providing a uniform concentration of 8% in 10 seconds in the area. The design shall take into consideration such factors as enclosure openings (if any) "run-down" time of fans, time required for dampers to close and requirements for any additional dampers and any other feature of the facility that could affect concentration.
 - b. The system shall be activated by cross-zoned or dual-loop system of ionization, photo-electric or a combination of ionization and photo-electric products of combustion smoke detectors. Automatic operation in each separate protected area shall be as follows:
 - 1) Activation of one detector in either zone or loop shall:
 - a) Illuminate the respective zone circuit lamp in the control panel;
 - b) Energize the pre-alarm audible device associated with the area;
 - c) Transmit a signal to the control center as shown on the Contract Documents;
 - d) Light an individual lamp on the alarm annunciators;
 - e) Activate external horn and light unit.
 - 2) Activation of a second detector in the same area, but on the second zone or loop shall:
 - a) Illuminate the respective zone circuit lamp in the control panel;

- b) Activate and release the FM-200;
 - c) Energize the FM-200 discharge visual indicating light;
 - d) Shut-down the air conditioning system, fans, and close all dampers;
 - e) Shut-down ac power equipment within the protected areas.
- c. The system shall transmit a health indication to the control center to indicate system trouble status.
- d. The system shall be capable of being activated manually, discharging the FM-200 which shall cause alarm and shutdown devices to operate the same as if the system had operated automatically. Manual discharge devices shall be provided at each protected area.
- e. The system shall include emergency power backup. Upon loss of power supplying the control unit, the system shall automatically transfer to stand-by battery power supplied by the control unit for a minimum of 24 hours.

D. Control Panel

1. Control panel shall consist of a zone non-coded system, manual and automatic, fully supervised, U.L. listed, local and auxiliary type as described herein. It shall contain an automatic type battery charger capable of recharging the batteries within 14 hours. All switches and controls shall be provided inside a locked cabinet with windows on the hinged door to view visual displays. Cabinet shall be of 14 gauge steel, painted red, with pin and tumbler type lock, provided with 6 sets of keys. Locks shall be keyed the same on all panels. Control shall include the proper number of initiating circuits, indicating circuits, relay control circuits, supervisory circuits and power supplied as required. All end of line devices shall be located in control panel, Class A preferred.

To prevent the panel from inadvertently being left in silence condition, the trouble signal and indicating signal silence switch shall be of the self-restoring type that cannot be left in an abnormal position. The Control panel shall have adequate 4-wire Class A wiring detecting circuits and zones including two spare zones. Systems that cannot receive an alarm from all detectors even though there is a single-fault condition in the detection loop, shall not be acceptable. Power for all ionization detectors shall be provided by the detection 4-wire Class A wiring. Systems that power detectors from power source separate from the detector circuit with Class A wiring shall monitor the power source and independent wiring to each zone so "true" trouble and alarm by zone is achieved for reliability and ease of maintenance.

The control panel shall have a trouble and an alarm lamp for each detection circuit. Systems that have a common trouble lamp only, or rely on a combination of indicators that require operator interpretation to determine if there is an alarm or trouble, or which zone has given an alarm condition, shall not be acceptable.

120V AC primary power shall be monitored and a power-on lamp shall be provided. Upon power outage the system shall light a power trouble condition lamp and automatically change to standby batteries. The control panel shall also monitor the batteries and upon a low battery condition, light the low battery trouble lamp and indicate a trouble condition. Fire system ground detection shall be provided for the alarm system. Upon ground detection, the

ground detection lamp shall light and a trouble signal indicated. The DB Entity shall provide a lamp test switch to test all alarm lamps on the control panel.

All alarms shall lock-in until both the initiating device has been restored to normal and the system control unit is reset. Alarm may be silenced, but subsequent alarms from another zone shall cause the signals to re-sound. When system is restored and horn silenced, a system trouble signal shall be indicated. Any fault on the system that would prevent the transmission of an alarm signal shall cause the trouble signal to operate. The audible trouble signal may be silenced by operating a momentary silencing switch, but the visual trouble signal shall remain lighted. After the fault has been corrected, the trouble circuit shall automatically restore to normal. All remote trouble indicating devices shall operate identically, including the self-restoring feature. Faults on any zone shall cause an individual zone trouble indicator to light. Control unit shall include a momentary lamp test switch which shall light all visible indicators in the control unit when operated. The system shall indicate trouble when horns are silenced and alarm circuits are in non-alarm condition.

2. The control unit shall be a solid-state modular assembly mounted on channels facilitating easy removal for repair and ease of expansion.

Zone Module shall have four zones of supervised initiating circuits with a trouble alarm lamp for each zone. Detection circuit wiring shall be 4-wire Class A and shall power all ionization detectors. A common trouble and common alarm relay output and voltage output shall be provided.

Control Module shall supply the necessary power for the control panel and all detectors and shall contain a battery charger to charge the batteries. An AC power-on lamp shall be provided to indicate the normal condition of the panel. Individual supervisory lamps shall be provided for AC power failure and indication, ground fault detection, municipal-trip disconnect and low battery. All controls shall be behind a key-locked door to prevent unauthorized operation. The enclosure shall be surface mounted with module termination drawings mounted on the inside of the panel cover.

Accessory Relay Module shall provide the necessary relays or devices for functions such as releasing door holders, remote annunciation, closing hampers, shut down fans, etc. All relays shall be of high quality fitted with dust tight plastic covers and plug-in basis, UL listed and rated for a minimum of 5A at 115V AC.

3. Detectors and Initiating Devices

Fire Detectors - The photoelectric fire detector shall operate on the photoelectric principle. It shall have a response sensitivity of 1.2% per foot or will alarm when the smoke in the chamber reaches the fixed sensitivity setting of 1.5%. The detector sensitivity shall be expressed in percent per foot of light obscuration caused by smoke. Each detector shall also have a visual indicator to indicate its initiation of an alarm. The detector shall be calibrated and adjusted for sensitivity at the manufacturer's factory to known standards. The detector shall have a LED (Light Emitting Diode) light source and operate on the multiple cell concept. LED intensity shall be controlled by a regulating photocell circuit matched to the smoke detection circuit, or use a light source and photocell arranged such that smoke particles which have entered the chamber shall be illuminated and the scattered light from

such particles reach the photocell and generate a voltage which is amplified, causing the ignition of the cold cathode tube to initiate the alarm. The detector shall be UL listed as an automatic smoke and fire detector for open area protection.

Ionization Detectors - The ionization detectors shall be activated by products of combustion. They shall have a sensitivity of not less than the minimum required by Underwriters' Laboratories, Inc. and shall be listed and approved by Underwriters' Laboratories. Further, the ionization detectors shall not be subject to alarm as the result of rapid changes of humidity nor shall they contain material which will require licensing by the Nuclear Regulatory Commission for this application.

4. Alarm Indicating Devices

a. FM-200 Release Indicating Light

Above the entrance door to the room or bungalow, the DB Entity shall furnish and install on the outside wall, an indicator light. Upon release of any FM-200, the indicator light shall flash to warn that FM-200 has been released. This warning light shall remain activated until turned off manually.

b. Alarm Horn

The alarm horn shall indicate the detection of smoke or heat. This same alarm horn shall be sounded in the event of an intrusion detection.

The horn shall operate from a timer capable of being adjusted from 1/2 minute to 20 minutes.

Alarm horns shall be suitable for indoor or outdoor application with the appropriate 4x4 in. electrical box. All horns shall be 24V DC polarized. The minimum sound level shall be 95dB at 10'. Horns shall be semi-flush or flush mounted. Single and dual projectors are to be supplied.

c. Combination Horn and Light

Audio-visual alarm devices may be combination horn/lamp units with built-in alarm flasher. Lamp bulbs shall be replaceable only from the rear, shall be vibration proof mounted, and shall be protected by a red lens. Units shall be red with legend "FM-200 Discharge" in white letters on both sides of the lens. Audio-visual devices can have trumpet horn projectors and shall be compatible with existing system. Outside flashing light shall be weatherproof, and shall have a cast aluminum housing with a red polycarbonate lens.

Contact closures shall be provided for: indication of alarms to the control and indication panel, future remote control, and indication to the DB Entity supplied alarm panel for MBTA's Operations Control Center.

5. Electromagnetic Door Holders and Damper Closers

Door and damper holders when required, shall be of the electromagnetic type to hold the door or damper open, and automatically release the door or damper upon alarm condition by the interruption of the holding current from the fire alarm control unit or approved pressure operated released by the FM-200 discharge. The holder shall consist of a wall or floor mounted unit with electromagnetic assembly and cover plate and a swivel door mounted armature or

other approved assembly.

6. FM-200 Supply

- a. Each protected area shall have its own separate supply of FM-200, and shall be a total-flooding, high pressure system which shall conform to all applicable sections of NFPA Standard 2001.
- b. Each supply shall be located within the hazard area or as near to it as possible so that a minimum of distribution piping is used.
- c. Each system shall be single-hazard, one-bank, or multi-bank system capable of being electrically triggered by the fire detection and alarm system or manually triggered as defined below.
- d. The FM-200 shall be stored in cylinders of high strength alloy steel construction that complies with the Department of Transportation regulation type 4BW500 or 4BA500. Each cylinder shall also have a pressure gauge and pressure switch to facilitate visual and electrical supervision of the container pressure.
- e. Cylinders shall be shipped fully charged with FM-200, superpressurized with nitrogen to 360 pounds per square inch. The filling weight of the internal material shall be consistent with the required discharge rate and the volume of the protected location. All cylinders shall be permanently marked to identify the pressurization, the internal chemical composition by weight, and the serial number. When a multiplicity of cylinders is required to provide the proper protection, all cylinders shall be identical. The capacity of the cylinder bank shall be so chosen that, upon release, the area to be protected shall be flooded to achieve a concentration of six percent in ten seconds or less.
- f. The cylinders shall be installed on a level hard surface in a dry location. The DB Entity shall install rugged supports designed to maintain the cylinder securely upright with approved clamps or straps. An electrical interlock shall be provided which shall indicate the cylinder is properly seated in place and is capable of discharging its contents. When there is any impediment which will prevent the cylinder from discharging its contents, the condition shall indicate at the Control Center as being a trouble in the fire detection and alarm system.
- g. Cylinders shall be located such, that they may be easily removed for recharging or replacing without special tools or handling devices, also they shall not interfere with existing or any future equipment, general maintenance, or operations of the signal or communication equipment.
- h. Each system shall be discharged when triggered from either the electrical command from the Smoke/Fire Detection System or the manually operated actuator assembly. A solenoid valve shall be employed to initiate discharge of the system electrically and shall contain interlocking contacts to indicate when the actuator has operated.
- i. A pressure operated vertical flood valve shall be attached to the cylinder neck. A quick release discharge head shall be mounted on the vertical flood valve. The FM-200 shall be discharged through nozzles. The nozzles shall be sized and located to provide the rates of discharge and the coverage required to assure a minimum concentration by volume of 8% in 10 seconds or less. Nozzles shall be fabricated of corrosion resistance materials.
- j. An abort switch shall be provided in the protected area. By operating this switch, the discharge mechanism shall be disabled and the audible trouble alarm shall sound. This trouble alarm shall continue until the abort, or disconnect switch is returned to normal.

This trouble indication shall appear on the system control unit.

- k. To detect the flow of FM-200, a three pole, double throw toggle type pressure-operated switch shall be used to indicate that FM-200 has been discharged. This switch shall be manually reset.
7. Piping - The manifold and discharge piping shall be fabricated of galvanized steel pipe and fitting or shall be welded and then plated with corrosion-resistant metal.
 - a. Discharge piping 4" and smaller shall be Schedule 40; if piping larger than 4" is used, it shall be Schedule 80. Galvanized steel pipe shall meet the requirements of ASTM A-53 and A-120. Pipe fittings shall be galvanized and shall meet the requirements of ASTM A-197, A-445, or A-234 and shall have a minimum bursting pressure of 6000 psi.
 - b. Any piping through building walls, partitions, floor slabs, roof slabs, etc. shall be run through sleeves of Schedule 40 pipe at least two sizes larger than the pipe being run and not smaller than one inch. Sleeves shall be packed with oakum and asphaltum, or equal, so as to be dust tight. Sleeves through floor slabs shall extend at least two inches above the floor. Sleeves through roof slabs shall extend above the roof 6 to 10" and shall be flashed in accordance with local building requirements.
 - c. Pipe supports and parts shall be of steel. Conduit, beam and "C" clamps shall not be used. Piping shall be anchored to rigid members, such as walls, ceilings and columns, to prevent longitudinal or lateral sway. Nozzle piping shall be well braced. Hangers and supports shall be of rugged design and shall be installed so that they will not be loosened by movement of the supported pipe. "U"-bolts with double nuts shall be used where appropriate. Pipe supports shall be installed to avoid interference with other piping, conduit structure, and equipment. Pipe lines shall not be supported from other piping lines.
 - d. Control tubing under continuous pressure shall be 3/8" soft copper with 0.065" wall. Forged steel compression fittings shall be used in sections under continuous pressure. SAE flare fittings shall be used on sections not under continuous pressure. Tubing shall be formed with a copper tubing bender. Tubing ends shall be cut square and reamed. Tubing shall be assembled with true alignment to the center line of fittings without distortion or tension. Tubing shall be supported with straps or brackets to prevent sagging.
 8. Instructions - The system shall include permanent type name-plates and condensed instruction plates to identify the system and instruct in its use under emergency conditions. Six copies of operating and maintenance instructions shall be provided.
- E. Vandal Protection and Security - An intrusion alarm shall be installed at each entrance to protect against unauthorized entrance to the CIH. A pushbutton reset or switch mounted within an instrument rack, location to be accepted by MBTA, shall be provided for re-setting of the alarm. The intrusion alarm shall be provided with contact closures which shall indicate at the local control panels and the MBTA's Operations Control Center.
 - F. Equipment Racks
 1. Channel racks as specified in Section 16853 – Instrument Racks shall be the

manufacturer's standard for the type equipment furnished and accommodate standard 19" mounting for equipment. Equipment racks shall include all necessary supports for wire and equipment.

2. The CIHs shall contain spare equipment racks or space on racks to accommodate 20% expansion.
3. Racks shall be oriented as shown on the Contract Documents.

G. Relays, Modules and Component Mounting

1. Relays and mounting shall be as specified in Section 16858 - Relays. The top and bottom relay rack rows shall not be utilized for this Contract and shall not be considered as available "spare" space. Relay mounting bars shall be provided for these rows.
2. In laying out the racks, panels and other equipment within the Central Instrument House, the DB Entity shall utilize the layout as shown on the Contract Documents, grouping the rows of racks and the instruments thereon so that similar types of equipment or functions of a similar nature are together.
3. Relay Plugboards shall be designed for insertion of removable type contacts. The method of attaching the wires to the removable contacts shall be a solderless connection. Unless otherwise accepted by the MBTA, or proven by type acceptance testing, the plugboard shall be designed so that the removable contact will have a direct connection with the relay coil and the contact prongs. Plugboards provided shall be in accordance with the requirements of the applicable sections of AREMA C&S Manual, Part 6.2.2, Recommended Design Criteria for Vital Plug-in Relay Plugboards.
4. At the end of each row of racks, or as specified by the MBTA, a 120V AC, 15A ground fault interrupter (GFI) duplex outlet wired to the CIH breaker panel shall be provided.

H. Identification

1. A white identification rack number shall be stenciled at the top of the front and rear of the frames of each rack or panel. The numbering and system used to identify rack and equipment coordinates shall be submitted for approval prior to implementing. Each row shall also be identified with an approved stencil designation.
2. There shall be an identifying nameplate for each relay and/or other instrument mounted on the racks or panel.
3. Wire and cable conductor identification tags for terminal board mounting shall be as specified in Section 16897 –MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

I. Cable Entrance Racks (Terminal Boards) shall be as specified in Section 16854 –ENTRANCE RACKS FOR THE LIGHT RAIL SIGNAL SYSTEM.

J. Apparatus Boards. A full complement of apparatus boards shall be furnished on the side(s) of each CIH and shall be three-quarter inch, Type AB exterior plywood securely fastened to the walls in such a manner to permit mounting of battery charging equipment, transformers, terminals, fuses, etc.

K. Batteries. - The DB Entity shall furnish and install batteries and associated equipment as required. Batteries shall be installed on wood battery trays mounted on steel racks of a design and

size suitable for the batteries supplied. Unless otherwise approved, the design shall provide for batteries to be mounted on battery racks having a single tier.

- L. Grounding Material. Grounding material shall be as specified in Section 16876 – GROUNDING OF SIGNAL SYSTEM EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM.
- M. Wiring shall be in accordance with the requirements of Section 16855 – INTERNAL WIRE AND CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM.
- N. Plan Rack and Plan Table. The DB Entity shall provide plan files and/or rack for the storage of plans and a plan table to be used when reading plans in the Central Instrument House. The location of the plan rack and table shall be situated in a convenient location within the CIHs.
- O. Painting. The exterior of the CIH shall be painted aluminum in accordance with the applicable standards of AREMA C&S Manual and applicable sections of these Specifications.
- P. Telephones shall be provided in accordance with Section 16710 – TELEPHONE SYSTEMS AND INSTRUMENTS.
- Q. Indicating fuse systems shall use FNA type fuses as manufactured by Bussman or approved equal. All associated holders and associated material and equipment for an indicating fuse system shall be supplied by the same manufacturer.
- R. Power frequency track circuits shall be as shown in the Contract Documents and as specified in Section 16819 – TRAIN DETECTION FOR THE LIGHT RAIL SIGNAL SYSTEM.
- S. Vital microprocessor interlocking systems shall be as specified in Section 16859 – VITAL MICROPROCESSOR INTERLOCKING SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- T. Rectifiers shall be as specified in Section 16860 – RECTIFIERS, BATTERIES, AND BATTERY CHARGING EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM.
- U. Direct current power supplies shall be as specified in Section 16861 – DC POWER SUPPLIES FOR THE LIGHT RAIL SIGNAL SYSTEM.
- V. Transformers shall be as specified in Section 16863 – SIGNAL TRANSFORMERS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- W. 100Hz static frequency converters shall be provided as specified in Section 16862 – 100 HZ FREQUENCY CONVERTERS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- X. Local control and maintainer’s panels shall be as specified in Section 16866 – NON-VITAL SUPPORT SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- Y. Provide fiber optic cable and terminations as specified in Section 16749 – FIBER OPTIC CABLE SYSTEM.
- Z. Provide miscellaneous components and products as required and as specified in Section 16897 – MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

2.3 CIH UTILITY POWER

- A. Each CIH shall be provided with a lighting and appliance branch circuit panelboard for utility power supply conforming to the requirements of Section 16835 – SIGNAL AND UTILITY POWER SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Lighting - The CIH shall be provided with fluorescent lights as required to provide complete illumination of 30 footcandles (at minimum) in all areas at floor level between rows of racks and at the end of rows. The lighting shall be operated from switches conveniently placed near each door.
- C. Convenience Outlets (Receptacles) – GFI Convenience outlets shall be furnished and installed at the end of each rack and along the perimeter walls of the CIH, four feet above the floor and spaced not more than six feet apart.
- D. Environmental Requirements
 - 1. The environment in the CIH shall be regulated by thermostatically controlled heating/air conditioning/ ventilating combination units. Heating units shall be sized based on 4 watts per cubic foot of area of the CIH. Cooling units shall be based on 60 BTU per hour per square foot minimum. The thermostat shall be provided with functions for "auto heat or cool" and "fan auto-on". The thermostat shall automatically regulate heating and cooling equipment that shall maintain a room temperature not to exceed 70°F nor go below 60°F.
 - 2. Air conditioning units shall utilize single-phase power.
 - 3. Openings in the walls or roof for the combination units shall be sealed against penetration of moisture and outside air and arranged to be secure from vandalism.
 - 4. Heating and air conditioning units shall be disabled when the fire suppression system is enabled.
- E. Branch Circuit Wiring
 - 1. Branch circuit wiring for the CIH utilities shall conform to the requirements of The Massachusetts Electric Code (MEC) and shall be installed within Electrical Mechanical Tubing (EMT). Wire sizes, EMT conduit and liquid tight flexible conduit shall be sized in accordance with the MEC.
 - 2. EMT shall not be connected directly to the Heating Ventilating & Air Conditioning Units. Liquid-tight flexible conduit shall be furnished between the unit and the EMT, for a distance of no less than two feet.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. CIHs shall be constructed for mounting on a foundation as described herein. Access shall be provided to the foundation bolts from inside the CIH. CIHs shall be mounted on a foundation as shown in the Contract Documents. CIHs shall not be installed less than 8' - 6" from the centerline of tracks at any point.
 - 1. The CIH shall be mounted level and plumb on piers as shown on the contract documents.

2. The CIH shall be grounded as specified in Section 16876 – GROUNDING OF SIGNAL SYSTEM EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM.
 3. Cables shall enter the CIH through entrance knockouts and fittings and entrance pipes as required. Cables shall be dressed, tagged, sealed airtight and terminated as specified in Section 16808 – EXTERNAL SIGNAL CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Relays shall be provided as specified in Section 16858 –RELAYS FOR THE LIGHT RAIL SIGNAL SYSTEM.
1. Relays shall be installed on the relay plugboards corresponding to the relay nomenclature and securely fastened in place with the hardware and identification tagging provided.
 2. After acceptance of factory testing and prior to shipment of the CIHs, all relays, printed circuit boards and other equipment as designated by the MBTA shall be removed and re-packed in approved containers for separate shipment to the approved storage site.
- C. Batteries and chargers shall be provided as specified in Section 16860 – RECTIFIERS, BATTERIES, AND BATTERY CHARGING EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM.
1. Batteries shall be installed on trays and located as shown on the Contract Documents. Battery posts shall be coated with an approved grease and battery connectors shall be securely fastened to the battery posts.
 2. After acceptance of factory testing and prior to shipment of the CIHs, all batteries shall be removed and re-packed in approved containers for separate shipment to the approved storage site.
- D. Indicating fuses shall be mounted at eye level in a standard instrument rack for ease of troubleshooting.
- E. Internal wiring shall be provided as specified in Section 16855 – INTERNAL WIRE AND CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM.
- F. Printed circuit boards and other electronic components shall be installed in accordance with manufacturer’s recommended practices as outlined in the approved installation procedure.
- G. Track Circuits shall be installed as specified in Section 16819 – TRAIN DETECTION FOR THE LIGHT RAIL SIGNAL SYSTEM.

3.2 CIH UTILITY POWER

- A. CIH utility power shall be installed in accordance with the requirements of the Massachusetts Electric Code and the requirements included in these project Specifications.
- B. Refer to Section 16835 – SIGNAL AND UTILITY POWER SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM.

3.3 TESTS

- A. All of the systems and equipment contained within the CIHs shall be factory tested in accordance with the requirements of Section 16898 – SIGNAL SYSTEMS TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM and the DB Entity’s Factory Test Procedures as accepted by the MBTA.

- B. All of the systems and equipment contained within the CIH shall be tested in accordance with the accepted Installation & Test Procedures, other applicable references of this Specification and on schedule according to the approved CPM.
- C. All of the systems and equipment contained within the CIHs shall be factory tested and field tested in accordance with the approved CPM (schedule) and other applicable references of this Specification.

3.4 PAINTING

- A. All equipment described in this Section shall be painted in accordance with the recommendations of AREMA C&S Manual, Part 1.5.10, Recommended Instructions for Painting and Protective Coatings, and the applicable references of these Specifications.
- B. Terminal, apparatus boards and shelves shall be painted with fire retardant gray, ANSI 61 or approved equal.
- C. The DB Entity shall apply approved corrosion resistant under coatings to metal parts of the CIHs.
- D. Battery trays shall be painted with two coats of an approved acid resistant black paint.

END OF SECTION

SECTION 16840

JUNCTION BOXES FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies requirements for furnishing and installing junction boxes for signal cable and other related small equipment items as required.
- B. Generally, two types of signal junction boxes are to be installed on the project. Typically, wall mounted type junction boxes are to be installed when in a confined areas and pedestal mounted type junction boxes at all other locations.
- C. These junction boxes shall be used as a termination/break-out point for signal cables from the CIH to service wayside equipment with individual runs of local cabling and individual express cable runs to/from adjacent CIH's. These shall include, but not be limited to, field devices such as signals, bus hold, and TAK light units, AVI loops, 100Hz track circuits, and switch machines.
- D. The DB Entity shall submit junction boxes locations to the MBTA for acceptance.

1.2 QUALITY ASSURANCE

- A. Comply with the requirements of Volume 1 DB Contract Terms and Conditions Section 4 "Quality Control and Quality Assurance" and Volume 2 Technical Provisions Subsection 2.5 "Quality Management".

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements", the DB Entity shall submit the following to the MBTA, for all junction box types, for his acceptance:

- A. Manufacturer's drawings and catalog cuts for junction boxes.
- B. Detailed/scaled internal junction box layout showing all internal accessories, aisle space for dressing/running wire conductors, methods/materials for securing wiring and components to backboard/terminals.
- C. Typical installation drawings and installation procedures for junction boxes.
 - 1. Drawings or lists describing the number and locations of junction boxes shall be submitted for acceptance prior to cable installation.
 - 2. Additional installation drawings/procedures are to be submitted in instances where the typical details do not apply.
- D. For Pedestal Mounted Junction Box - Detailed installation drawings showing cabling between cable raceway and wayside junction box.

- E. For Wall Mounted Junction Box - Detailed installation drawings showing local cabling from junction box, down conduit to track level signal equipment.
- F. All associated junction box hardware and installation materials.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage during delivery, storage and handling. Comply fully with the requirements of Section 16801 – Basic Technical Requirements.
- B. Damage to material, resulting from improper handling by the shipper or the DB Entity shall require the DB Entity to replace all damaged material with new material at no additional cost to the Contract.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Junction boxes shall be equipped with ¾” A/B marine plywood backboard, primed and then painted ANSI 61 gray.
- B. Each junction box shall be stenciled with the junction box name from the as-built drawings for field identification purposes.
- C. Terminals for wires and cables:
 - 1. Terminal Blocks shall be in accordance with the recommendations contained in the AREMA C&S Manual, Part 14.1, Recommended Wire Connectors, Terminals.
 - 2. Insulated test links shall be used for all terminations. Insulated test links shall be Siemens Part No. 024620-1X, or approved equal.
 - 3. All stranded copper wire shall be fitted with an approved type of crimp terminal at all points where the wires are to be terminated on terminal binding posts.
 - 4. Terminals shall be of the solderless crimp-on type. Spade lug, forked lug or Faston type terminals shall not be used. Only eye-type terminals with nylon insulation shall be used. Eye-type terminal shall be sized properly for wire insulation diameter and stud size of terminal post.
 - 5. Terminals shall be attached to the wire with approved tools and methods. See Section 16808 – External Signal Cable for requirements of termination equipment and procedures.
 - 6. Sleeve tags shall be installed on individual cable conductors. Plastic tags shall be installed to identify individual cable entering each junction box. See Section 16808 – External Signal Cable and Section 16897 – Miscellaneous Components and Products for additional tagging information/requirements.

2.2 WALL MOUNTED JUNCTION BOXES

- A. The typical wall mounted junction box shall be NEMA 4X with padlock hasp sized for standard MBTA's hex keyed lock, and manufactured of type 304 stainless steel.
- B. Wall mounted junction boxes are to be installed to wall with stainless steel hardware.
- C. All Wall mounted junction boxes shall be equipped with a vent to help prevent condensation.

2.3 PEDESTAL MOUNTED JUNCTION BOXES

- A. Pedestal mounted junction boxes shall be provided in accordance with the recommendations of the applicable sections of the AREMA C&S Manual.
- B. All Pedestal mounted junction boxes shall be equipped with a vent to help prevent condensation.

PART 3 - EXECUTION

3.1 GENERAL

- A. Signal cable junction boxes shall be furnished and installed at the locations as required by the DB Entity's design.
- B. A minimum of 8" of slack shall remain secured within the junction box for each individual conductor.
- C. For pedestal mounted junction boxes, a minimum of 6' of cable shall be left coiled around the base of the pedestal. This underground cable coil shall be encased in 4" of sand on all sides with caution tape laid over the coil.
- D. Wall mounted junction boxes shall be installed plumb and level and shall not interfere with the train envelope.
- E. Conduit/cable entrances into junction boxes shall be sealed with expanding foam filler or other approved method.

END OF SECTION

SECTION 16850

SNOW MELTER HEATING SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. The work to be done under this Section consists of furnishing and installing heater elements and snowmelter control cases for the field control and indication of track switch snowmelter heating. Each control case layout shall consist of a fiberglass housing containing all the components specified herein to control and indicate the operation of the heating elements assigned to that case, and the equipment required to mount the case as specified.
- B. The DB Entity shall provide new snowmelter layouts consisting of electric-type heater units functioning in a manner to keep the switch points free and clear of snow or ice to the extent necessary to permit free and unobstructed operation under all weather conditions.
- C. Each switch snowmelter layout as installed shall be complete with heating elements, external cable, conduit, rail connections, and other miscellaneous hardware required to mount and interconnect it to the rail and the associated snowmelter control case.

1.2 QUALITY ASSURANCE

- A. Factory Test
 - 1. Each control case shall be factory tested as prescribed in a test procedure accepted by the MBTA to assure mechanical, electrical, and operational conformance with the requirements of these Mandatory Specifications. The DB Entity shall record the results of these tests on the prescribed Factory Test Report forms for submittal to the MBTA. Only those cases for which Factory Test Reports have been approved shall be shipped to the job site.
 - 2. Each snowmelter heating element shall be factory tested. The factory tests for these items shall be conducted in accordance with procedures previously submitted by the DB Entity and accepted by the MBTA. As part of its factory test, each snowmelter heating element must withstand a potential of 1500 Volts DC, applied between conductor and sheath, for 30 seconds.
- B. Field Inspection
 - 1. Each control case shall be inspected after it has been delivered to the job site. Only those cases which have sustained neither external nor internal damage during shipment and handling shall be installed.
 - 2. Each snowmelter heating element and contact rail fuse box shall be inspected immediately prior to installation of the snowmelter layouts. Only those heating elements and fuse boxes which have suffered no damage due to shipment and handling shall be installed.
- C. Final Operational Test

The final operational test for each control case shall be conducted as part of the field testing of snowmelter layouts as specified in Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.

- D. All equipment provided shall perform satisfactorily under the following environmental requirements:
1. Ambient Operations Temperature: minus 22 degrees F to plus 158 degrees F.
 2. Relative Humidity: 0 to 100 percent.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following to the MBTA for acceptance:

A. Control Cases

1. Drawings and product information of the fiberglass control case proposed to be furnished under this Project;
2. Mechanical and layout plans of the proposed control case housing and all major components contained therein, including the internal arrangement plan, mounting hardware, and wiring diagram;
3. Catalog cuts, and complete performance data for the proposed control contactors and all other electrical/electronic components comprising the control panel and case;
4. Power feed fused disconnect installation details, catalog cuts, and bill of materials;
5. Drawings showing control case wiring;
6. Factory test procedure;
7. Installation inspection and test procedure;

B. Heater (Element) Layouts

1. Assembly drawings and a bill of materials for the type of switch snowmelter layouts to be furnished. The MBTA's acceptance of the snowmelter layouts is required prior to their shipment to the job site;
2. Drawings showing field mounting arrangement for the switch heater elements. The drawings shall illustrate the details of the mounting hardware and the method of installation;
3. A factory test procedure for snowmelter elements;
4. The following reports and manuals upon delivery of the track switch snowmelter layouts:
 - a. One copy of factory test reports of the snowmelter layouts prior to shipment.
 - b. Ten manuals for snowmelter layouts furnished describing the installation, operation, and maintenance procedures.
5. An installation inspection and test procedure;
6. "As-Built" drawings, prior to MBTA acceptance.

- C. Factory test results for all items shall be submitted five days after completion of tests, and prior to shipment of equipment.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Heaters and cases shall be properly braced to prevent damage during shipment. Individual crating/packing as well as protected inside storage shall be provided for any equipment not ready for immediate installation upon delivery to the site.

- B. Fully comply with all requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- C. Any and all heating elements and control cases damaged during the course of shipment, handling, or installation shall be replaced by the DB Entity at no additional cost to the MBTA.

PART 2 - PRODUCTS

2.1 CASE DESIGN

- A. General Description - The heater control case, including its monitoring panel shall be used for the control and monitoring of resistive heater elements. The panel will support a maximum of (6) fused outputs switched from one main breaker. The control-monitoring panel shall be of a proven design, acceptable to the MBTA, based on proven (submitted) record of satisfactory transit system service for a minimum of one year. System control and indication shall be accessible by local or remote means.
- B. Each of the (6) fused outputs can control two heaters elements per MBTA standards, resulting in 12 heaters total per case.
- C. Enclosure - The housing for all control cases shall be of weatherproof, gasketed design and single-door, molded fiberglass construction. The thickness of the housing sides and door shall be one-quarter (1/4) inch minimum, with the bottom and back being three-eighths (3/8) inch thick. The housing shall comply with the applicable standards of ASTM-E-84 for exterior walls. Interior paneling shall comply with a flame spread of 0-20 and a fire rating of 7 in accordance with ASTM-E-84. The fiberglass shall have ultra-violet ray protection by special additives. The outside color shall be gray. The inside color shall be white.
- D. Size - The housings for snowmelter control cases shall be all the same size. External dimensions shall be as submitted by the DB Entity and accepted by the MBTA.
- E. Door and Hinge - Each door shall be fastened to its housing with a minimum 16-gauge stainless steel hinge continuous over the full height of the door. The hinge fastenings shall be concealed when the door is closed. The door shall swing through an angle of 180 degrees in line with the track structure.
- F. Door Latch and Interlock - The door shall be equipped with a latching mechanism of a three-point lock design. The handle for this mechanism shall be designed for the use of a standard MBTA padlock. The housing shall be equipped with a heavy duty interlock device that shall, whenever the door of the control case is opened, disconnect both sides of the circuit that remotely controls the snowmelter contactors. A bypass switch shall be provided to permit testing when the door is open. When the switch is in "bypass" position, the door shall be prevented from being fully closed by a mechanical means.
- G. Vents - Each housing shall be equipped with at least two vents. Each of the vent openings shall be hooded or protected by a rain guard on the outside and shall be covered with a fine mesh screening of stainless steel, copper, or brass, on the inside. These vents shall be so designed and located that an object cannot be inserted through the vent and make straight line contact with energized components inside the housing.
- H. Backboard - A non-metallic, fire resistant backboard panel shall be mounted on fiberglass channels inside the housing to support the snowmelter control and indication equipment.

- I. The enclosure shall include suitable outdoor lighting fixture for “HEATER ON” indication. Fixture wiring shall penetrate the side of the main enclosure.

2.2 CONTACTORS

- A. Each control case shall be equipped with one main contractor. The main contractor shall be single pole rated not less than 1000V and 150A. Contactor shall operate on 120V AC control voltage with necessary aux. contacts for “HEATER ON” indication. All snowmelter contactors provided shall be identical in size and rating.
- B. Coils - The coil of each contactor shall be designed for operation at 120V AC, 60 Hertz power, but shall be capable of successful continuous operation without resultant damage at voltages from 90 to 130V AC. The coil of each contactor shall be equipped with arc suppression.
- C. Contacts
 - 1. Each contactor shall have a sufficient number of main contacts and a sufficient number of auxiliary contacts to accommodate the circuit requirements of each case.
 - 2. The main contacts shall be able to make, break, and carry a 50,000- Watt heater element load continuously without resultant damage at 550 to 800 Volts DC.
 - 3. The contactor shall be so designed that arcing between the contacts shall be suppressed. Voltage breakdown between coil and contacts must be precluded.

2.3 CASE HEATERS

- A. Each control case shall be equipped with one 50- Watt, 650- Volt rated, 1000V DC maximum, heater resistor, mounted on the lower portion of the backboard panel to control moisture condensation within the housing.
- B. The case heater shall be controlled by a 1,000-Volt manual switch mounted in the case.

2.4 FUSES

- A. All fuses used in rail heater control cases for DC circuit protection shall be of the non-renewable, fiber case, time lag, fusion type, rated for 1,000 Volt DC operation.
- B. One fuse, sized for the load, shall be provided for each snowmelter heating element controlled from the case. The case heater shall be protected by a fuse sized as required by the DB Entity.
- C. Fuses sized for protection of the contactor control circuit shall be as required by the DB Entity’s design.

2.5 WIRE

- A. All control case internal wiring shall be insulated for 1,000 Volts and shall meet the applicable requirements specified in the Section 16855 – INTERNAL WIRE AND CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specification.
- B. Low voltage control, indication, and communication wiring shall be run separately from the 650-Volt heater element wiring.

2.6 TERMINALS

Terminals for connection to snowmelter elements must be capable of securing No. 6 field wires or larger as required for operation. Terminals for connection to 650-volt DC supply shall be capable of securing a field wire properly sized for that housing and load.

2.7 WIRING

Wiring for the contactor control and indication circuits shall be trained and run separately from snowmelter element wiring. Low voltage and snowmelter element circuit terminations are to be kept separated. Flashover between adjacent circuits or classes of wiring must be precluded. All heater control wiring shall be sized for maximum load requirements.

2.8 INDICATIONS

- A. Indications are to be provided locally and remotely, interfacing with the non-vital system.

2.9 HEATER CONTROL CASE

Switch heating system control cases shall be designed and fabricated as a complete unit provided by a single manufacturer with a proven record of satisfactory service for this application. Control cases are to be provided fully functional, ready-for-use without the need of additional components or modification within the case itself.

2.10 TRACK SWITCH SNOWMELTER LAYOUTS

- A. The track switch rail heater elements shall be of the tubular type rated for 1000-Volt DC service and normally operable at 650 Volts DC, and 350 Watts/foot of effective heating length.
- B. The snowmelter heater elements shall conform to the length of the switch rail. The effective length of the switch heater elements shall be designed to extend at least one foot beyond the point of switch. The flexible wire leads of the snowmelter elements shall be 10 feet in length.
- C. Cover guard heater elements shall meet the electrical requirements as specified herein for the switch rail heater elements.
- D. Track switch snowmelter layout hardware and fittings shall be furnished by the DB Entity.

2.11 SNOWMELTER POWER FUSE BOX

- A. One snowmelter power fuse box shall be provided for each control case layout.
- B. Snowmelter power fuse boxes shall be constructed of fiberglass and rated for maximum service voltage of 750 Volts DC.
- C. The snowmelter power fuse box shall be so constructed that the lifting of the cover shall open the circuit by disconnection and removal of the fuse. The fuse shall be rated for the size of the load.
- D. Both sides of the snowmelter power fuse box shall be permanently and prominently labeled, "DANGER HIGH VOLTAGE".
- E. The fuse box handle shall be permanently labeled "DO NOT OPERATE UNDER LOAD".

2.12 WIRE AND CABLE

- A. Snowmelter power cable shall conform to MBTA Specification S-112E.
- B. The negative end of the element, where connected to the impedance bond, or negative propulsion rail, shall be permanently and prominently labeled, "DANGER-HIGH VOLTAGE".

2.13 CONDUIT

- A. Fiberglass conduit shall be provided for protection of the external snowmelter wire and cable connections, as shown on the Contract Documents. Conduit shall conform to requirements as stated in section 16826 – CABLE RACEWAYS AND AERIAL CABLE SUPPORT SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.

2.14 MISCELLANEOUS HARDWARE

Electrical connectors, electrical tape, identification tags, and all necessary appurtenances to install the Snowmelter Layout shall be as specified within these Mandatory Specifications, or as accepted by the MBTA.

2.15 SNOWMELTER JUNCTION BOXES (SMJBs)

Junction boxes in ballast shall be fiberglass, hot-molded of high impact, long fiber, prepregated glass fiber reinforced polyester to ensure uniform strength. Fiberglass shall have ultraviolet ray protection by special additives. Seals will be molded with oil resistant neoprene gaskets. They shall be a NEMA Type 4X enclosure and shall have a hinged cover with padlock hasp. Hinge and hasp shall be 316 stainless steel. Box and cover thickness shall be ¼ inch.

PART 3 - EXECUTION

3.1 GENERAL

- A. Each control unit shall be installed at the locations as required by the DB Entity's design to ensure coverage of all track switches installed under this Project.
- B. Control cases shall be located at least 10 feet from other electrical equipment and signals, unless otherwise accepted by the MBTA.
- C. Separate FRE cable entrance risers shall be provided through the bottom of the housing for entrance of the "high" and "low" voltage wire and cable.
- D. The cases shall be installed in such a manner that their doors shall open, close, seal, and lock without binding.
- E. Upon installation, each control case shall be locked with a padlock of the standard MBTA hex key type.

3.2 IDENTIFICATION

- A. The identification number for each control case shall be stenciled on both the inside and outside of the case door.
- B. The case identification number shall correspond to an approved scheme utilizing the numbers of

the switches for which snowmelters are designated.

- C. The door shall be permanently and prominently labeled, "DANGER-HIGH VOLTAGE".

3.3 TRACK SWITCH RAIL HEATER ELEMENTS

- A. Track switch rail heater elements shall be installed on the outside of the bent and straight stock rails of the switch layout. The outside of the heating element shall be in direct contact with the rail to the extent practicable. The heating element shall be installed under dry conditions to eliminate the entrance of moisture into the heater system.
- B. The heating element shall be located on the neutral axis of the rail, as shown in the Contract Documents. The element shall be enclosed with one-inch minimum of thermal insulation encased in an aluminum alloy shield. The shield shall be held in place by rail clips.
- C. The heating element shall be where the rail is supported by track braces.
- D. Power feed, cable leads to the heating element shall be installed in one inch (inner diameter) cordura flexible hose or approved equal with water-tight compression fittings and placed underneath the rails. Interconnections between the elements shall be thermally and electrically insulated from the rail. Connections shall be thoroughly dry during installation to eliminate the entrance of moisture.

3.4 SNOWMELTER JUNCTION BOXES

Snowmelter junction boxes shall be installed at the locations as required by the DB Entity. Each junction box shall be level and plumb. The top of the junction boxes, with the covers on, shall be even with the top of finished grade/ballast.

3.5 CONNECTIONS

- A. Dedicated conduit runs shall be provided for high voltage cables.
- B. Sufficient slack shall be left in all connection wires to allow for running of the rail.
- C. Connection from the heating element lead to the control case feeder shall be tap spliced with an approved type service connector. The connection shall be sprayed with an approved sealant before and after taping with electrical plastic tape.
- D. Connection from the heating element leads to the impedance bond neutral or the negative propulsion rail, shall be as shown in the Contract Documents.

END OF SECTION

SECTION 16853

INSTRUMENT RACKS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing the following:
 - 1. Sectional type signal instrument racks. Signal instrument racks shall be free standing open frame weldments and shall include not only relay racks, but other racks such as signal power racks, rectifier racks, and racks containing track circuit equipment.
 - 2. Control system computer and communication equipment racks. These racks shall be fully equipped with the required numbers and types of processor chassis, network equipment, carrier equipment, status indication panels, keyboards, track balls, slide out (keyboard) trays, busses, terminals, and all miscellaneous electrical and mechanical components required by the DB Entity's design.
- B. The work to be done under this Section shall also include the preparation of detail drawings for each instrument rack, the equipment arrangement thereon and circuits associated with it.

1.2 QUALITY ASSURANCE

Each instrument rack shall be tested and inspected prior to shipment. Tests and inspections shall conform to the DB Entity's Factory Testing and Inspection Procedure(s) as accepted by the MBTA.

1.3 SUBMITTALS

The DB Entity shall submit the following to the MBTA for acceptance:

- A. Approval of equipment layout and detail arrangement on instrument racks is required prior to the assembly of the equipment and the central instrument houses (CIH) and cases. The DB Entity shall take the arrangements as shown in the Contract Documents and make his own determination of the number of racks that can be assembled as a row with due allowance for the means of access based on the particular equipment being provided. The MBTA's acceptance of instrument rack layouts is required prior to the manufacture of the equipment.
- B. Drawings shall show the proposed arrangement of the instrument racks, including a drawing to show methods of grounding, and the relation to other equipment in the room.
- C. Factory Test and Inspection Procedure(s) for instrument racks shall be submitted not later than six weeks prior to final assembly.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Instrument racks shall be properly braced to prevent damage to other racks and equipment installed in the CIH during shipment. Individual crating/packing and protected inside storage shall be provided for racks not already mounted within the CIH for delivery to the site
- B. Vital relays shall be shipped separately and identified for the racks and the particular slot in which they are to be used. Relays shall be stored in a protected area until installed in the racks.

- C. Printed circuit cards shall be shipped separately and identified for the racks in which they are to be used. Card locations shall be recorded to facilitate re-insertion into their proper location (same slots as during factory testing) upon delivery to the field site. Cards shall be stored in a protected area until final installation in the racks.
- D. Fully comply with all requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

PART 2 - PRODUCTS

2.1 INSTRUMENT RACKS

- A. Signal instrument racks shall be open frame weldments designed to accommodate mounting of standard 19-inch panels. The frame shall be constructed of 14-gauge minimum cold rolled steel. The width shall not exceed 24 inches. The panel mounting angles shall be constructed with the standard EIA hole spacing.
- B. The racks shall be shock mounted and secured to 12-gauge minimum cold rolled steel bases. The base shall be the same width as the racks, with a height of three and one-half inches.
- C. Chassis supports or guides shall be provided for auxiliary support of heavy equipment such as power supplies, CPUs and carrier chassis. The chassis supports shall be made of 11-gauge minimum cold rolled steel, capable of being mounted directly to the panel-mounting angles, and shall permit side-to-side guide adjustment. Support bars shall be provided for each row of apparatus. Slide trays shall be utilized for keyboard shelf and trackball shelf.
- D. Relay plugboard support bars shall be provided for each row of relays and be of sufficient strength to support the manufacturer's equipment to be mounted thereon without flexing due to the pressure exerted during wiring termination.
- E. The terminal, plug connector, and power panel shall be located on the upper portion of the rack for connecting wires and cables. The panel material shall be fire retardant. A minimum of 10% spare terminals shall be provided on each instrument rack.
- F. Rows of racks shall be oriented to have adjacent rows either front-to-front or back-to-back. Row to row and row to wall spacing shall be a minimum of three feet, measured at the base of the racks, unless otherwise accepted by the MBTA.
- G. Each instrument rack shall be fully equipped with the required numbers and types of power supplies, transformers, relay plugboards, buses, terminals, and all miscellaneous electrical and mechanical components specified. Terminals and resistors for energy busses where required, shall be located on the upper portion of the rack. Vital inter-rack wiring shall be direct from relay to relay. Insulated terminals shall be as specified in the AREMA C&S Manual Part 14.1.5, Recommended Design Criteria for Molded Terminal Blocks.
- H. Wire supports which form interior wire raceway on instrument racks shall be fabricated from steel or other approved material of non-flammable composition.
- I. In designing the detail layout of the racks and other equipment, the DB Entity shall group the rows of racks and the instruments thereon so that similar types of equipment or functions of a similar

nature shall be together.

- J. Relays or components shall not be mounted at a height of more than six feet - six inches from the floor of the room, or closer than 10" to the floor. The overall height of the rack shall not exceed 7'-6".
- K. A minimum of 20 percent spare space on each group of instrument racks for additional relays for each rack required to be equipped with plug couplers shall be provided.
- L. Plug-in relays, transformers, rectifiers, ground detectors, and other rack-mounted components shall conform to the requirements as described elsewhere within these Mandatory Specifications.
- M. Approved types of resistors, capacitors, arresters, electronic components, and fuses shall be connected into track, line, and power circuits as required by the DB Entity. These components shall be of such design and capacity to protect the equipment and provide positive and safe operation.
- N. All fuses shall be locally and remotely alarmed or indicated except for main power fuses and power frequency track circuit fuses.
- O. Plugboards for plug-in relays shall be designed and furnished for insertion of removable type contacts. The method of attaching the wires to the removable contacts shall be a solderless connection and shall be subject to approval by the MBTA. Unless otherwise accepted by the MBTA, or proven by type acceptance testing, the plugboard shall be designed so that the removable contact will have a direct connection with the relay coil and the contact prongs. In general, the plugboards shall be in accordance with the requirements of applicable sections of AREMA C&S Manual Part 6.2.2, Recommended Design Criteria for Vital Plug-in Relay Plugboards. The wiring to each removable contact shall carry an approved tag indicating the relay name and contact number, wire name, and termination of the other end of the wire. All wires shall be of sufficient length to permit them to be moved to any contact on the same relay. Plugboards for vital relays shall be equipped with a (type) registration plate to prevent relays of the wrong style, contact arrangement, or operating characteristics from being inserted.
- P. Components shall be protected from damage in the event a plug connector or plug-in unit is removed while equipment is energized.
- Q. Convenience type outlets shall be mounted at the end of each row of racks. Convenience outlets shall be supplied from the utility panel and those inside the signal equipment room area shall be GFI protected.

2.2 PLUG CONNECTING CABLES

- A. Plug Connectors shall be as specified in Section 16857 – PLUG CONNECTORS FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.
- B. Cable and wire for plug connecting cables shall be in accordance with Section 16855 – INTERNAL WIRE AND CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.
- C. Plug couplers shall not be used between instrument racks within a CIH.
- D. Equipment mounted in the instrument racks shall not utilize “plug-in” power. All equipment such as monitors, power supplies, etc. shall be hard-wired to terminals and shall include an individual fuse for that particular device in the circuit.

2.3 GROUNDING POSTS

Grounding posts and ground jumpers shall be furnished with each rack. These posts shall be of the bolted type to permit isolation of the rack from all ground sources for testing by removal of the ground wire connections.

2.4 IDENTIFICATION

- A. A white identification (rack) number shall be stenciled at the top of the front and rear of the frame of each rack. Also, approved vertical coordinate lettering shall be stenciled from top to bottom.
- B. There shall be an identifying nameplate for each relay, rectifier, transformer, or unit of equipment to be mounted on instrument racks. Nameplates shall be used front and back where the device or its connections are on both sides.
- C. The back of the plugboard shall be equipped with a tag, or other approved means of identification, to indicate the nomenclature of the relay for which it is wired.
- D. The contact numbering system shall be uniform for each type of relay used.
- E. The wiring to each removable contact shall carry an approved tag indicating the relay name and contact number, wire name, and termination of the other end of the wire.
- F. Signal power racks shall have special high voltage labels affixed in the color, format and size accepted by the MBTA.

2.5 PAINTING

Entrance racks shall be painted in accordance with Section 16897 – MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM. Racks shall be painted gray, ANSI-61, or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Instrument racks shall be factory-installed within the central instrument houses. The racks, equipment, and all necessary mounting and fastening materials to mount the racks shall be installed as required. All interconnecting cables, wiring, and connections to power sources and entrance racks shall be installed as shown on the Design Documents, including interconnections to self-contained, rack mounted equipment units. Interconnecting cables shall be the same cables used in the factory test of the instrument racks.
- B. Signal instrument racks shall be electrically insulated from each other and from the supporting framework. Grounding of the racks shall be as specified in Section 16876 – GROUNDING OF SIGNAL SYSTEM EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.
- C. Wiring of instrument racks shall be as specified in Section 16855 – INTERNAL WIRE AND CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications. Wires and cables shall be installed in a neat, workmanlike manner. Wires and cables in ducts shall be laid therein and not pulled in. Wires and cables shall be installed with a minimum amount of crossover in the duct and shall not be pulled tightly around bends. All exposed wires and cables entering or

leaving equipment racks shall be protected from abrasion and sharp edges. Slack shall be provided for each interconnecting cable or wire.

- D. Energy buses shall be located at the top of the rack and shall not be wired with positive and negative energy on the same vertical terminal section.
- E. A reference voltage test point shall be provided on each rack for all energy busses used on that instrument rack.
- F. Insulated nuts shall be provided when terminating voltages in excess of 55 volts.
- G. Where wire and cable transfers from ducts to open wiring, the ends of the duct shall be fitted with bell ends to prevent damage to the wire or cable.
- H. Wire and cable shall be permanently tagged by a white sleeve tag with permanent black 1/8" minimum lettering.

3.2 TESTS

Instrument racks and the equipment mounted thereon shall be tested and inspected in accordance with the requirements of the Factory Test and Inspection Procedure as accepted by the MBTA.

END OF SECTION

SECTION 16854

ENTRANCE RACKS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing sectional type racks in central instrument houses (CIHs) for terminating incoming wire and cable and making interconnections to the internal wiring on instrument racks, except for second range, or higher, voltage signal power wires.
- B. The work to be done under this Section shall also include the preparation of detail drawings for each entrance rack in each housing showing terminal block arrangement and both working connections and spare terminals.

1.2 QUALITY ASSURANCE

- A. The DB Entity shall inspect each entrance rack prior to installation in its permanent location. This inspection shall conform to the DB Entity's Factory Inspection Procedure as accepted by the MBTA.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following to the MBTA for acceptance:

- A. Drawings for each CIH showing the proposed arrangement of entrance racks and their relation to other equipment in the room or housing. DB Entity shall make his own determination of the number of racks that can be assembled as a row with due allowance for the means of access. These drawings shall be coordinated with the drawing submittal required in Section 16853 – INSTRUMENT RACKS FOR THE LIGHT RAIL SIGNAL SYSTEM and the drawing submittal required in Section 16838 – CENTRAL INSTRUMENT HOUSES FOR THE LIGHT RAIL SIGNAL SYSTEM where instrument racks are located within the same housing.
- B. MBTA's acceptance of entrance rack arrangement plans is required prior to the manufacture and assembly of the equipment.

1.4 DELIVERY, STORAGE AND HANDLING

Entrance racks, shall be properly braced and protected to prevent damage to the racks and other equipment during shipment. Comply fully with the requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

PART 2 - PRODUCTS

1.5 MATERIALS

- A. Entrance racks shall be open frame weldments with a maximum width of 24 inches. The frame shall be constructed of 14-gauge (minimum), cold rolled steel. The panel mounting angles shall be constructed with the standard EIA hole spacing.

- B. The racks shall be shock-mounted on and secured to 12-gauge minimum cold rolled steel bases. The rack base shall be the same width as the racks, with a height of three and one-half inches.
- C. Entrance Rack Accessories
1. All incoming wires, including spare wires, shall be terminated on binding posts and molded terminal blocks conforming to the recommendations as set forth in the AREMA C&S Manual, Part 14.1. Insulated test links shall be used for all terminations. The entrance racks shall be fully equipped with the required number of terminal blocks, tags, rack and row identification, and accessories. Lighting arrestors shall be provided on the entrance racks. Refer to Section 16897 – MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM for additional information/requirements on tagging, terminals and lightning arresters.
 2. Terminal Mounting
 - a. The terminal blocks and spacing of terminals shall be so arranged as to permit each internal wire and its field wire interconnection to be separated on an individual basis without removing either wire from its terminal. This shall be accomplished by use of insulated test links in accordance with Section 16897 – MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
 - b. Ten percent of the total number of terminals spare binding posts shall be provided.
 - c. All materials needed to assemble the racks one to another to form complete sections shall be furnished.
 - d. Communication type terminals shall be provided for terminating communication cables. Ten percent spare communications terminals shall be provided.
 3. Wiring - Cable and single wire terminations shall be as specified in Section 16808 – EXTERNAL SIGNAL CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM and Section 16855 – INTERNAL WIRE AND CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.
 4. Grounding Post - A grounding post shall be furnished with each rack. This post shall be of the bolted type to permit removal of the ground wire connection for testing.
 5. Identification
 - a. A white identification number shall be stenciled at the top of each entrance rack on both the front and rear of the frame. The minimum size of the identification figures shall be one and one-half inches. Also, vertical coordination letters shall be stenciled on both sides from top to bottom of each rack.
 - b. Each terminal and terminating wire shall be identified or tagged in accordance with the circuit nomenclature and in a manner as specified in Section 16897 – MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
 6. Painting - Entrance racks shall be painted in accordance with Section 16897 – MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM. Racks shall be painted gray, ANSI-61, or approved equal.

PART 3 - EXECUTION

1.6 INSTALLATION

- A. Entrance racks shall be installed with all the necessary fittings mounting and fastening material as required.
- B. Entrance racks shall be installed in such a manner as to be insulated from ground and from each other and from any supporting framework or wire troughs.
- C. Entrance racks shall only be electrically connected to each other by the ground connection as specified in Section 16876 – GROUNDING OF SIGNAL SYSTEM EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM.
- D. DB Entity shall install all interconnecting cables, wiring and connections and terminate all cables.
- E. DB Entity shall provide insulated nuts when terminating wiring with voltages in excess of 55 volts.
- F. Energy busses shall be located at the top of the rack(s) and shall not be wired with positive and negative energy on the same vertical terminal section.
- G. DB Entity shall provide a reference voltage for all energy busses used on the entrance rack.

1.7 TESTS

Entrance racks and the equipment mounted thereon shall be tested and inspected in accordance with the requirements of the Factory Test and Inspection Procedure as accepted by the MBTA.

END OF SECTION

SECTION 16855

INTERNAL WIRE AND CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing wire and cable in the Central Instrument Houses (CIH's), wayside cases, equipment, devices and in enclosures where it will not be exposed to the elements. All intra-rack and rack-to-rack wire and cable shall conform to the requirements of this Section. All required wiring materials shall be accepted by the MBTA. Internal wiring for vital circuits shall be in accordance with applicable sections of the AREMA C&S Manual unless otherwise specified herein.
- B. Stranded wire, including individual conductors of multi-conductor cables covered by this Section, shall be TEFZEL® (ETFE) or E-CTFE per Military Specification, MIL-W-22759 and these Mandatory Specifications.

1.2 QUALITY ASSURANCE

- A. Quality Assurance provisions of the applicable Military Specifications shall be followed in the manufacture of wire covered by this Section. The DB Entity shall be responsible for witnessing and reporting the results of any and all required qualification tests. One-half of each qualification sample shall be retained for the DB Entity's evaluation and the remaining one-half shall be forwarded to the MBTA for final acceptance. The DB Entity shall be responsible for monitoring the manufacturer's conformance to the quality assurance requirements and the MBTA reserves the right to audit conformance in accordance with the MBTA Standard Specifications.
- B. All other work covered by this Section shall be accomplished in compliance with a Quality Assurance Program that meets the intent of ANSI/ASQC C1-1996 (ANSI Z1.8-1971): Specifications of General Requirements for a Quality Program.
- C. Multi-conductor cables shall be tested to verify conformance with the requirements of this Section as follows:
 - 1. Individual conductors shall be tested per the requirements specified herein for Stranded Wire for General Use, prior to cable assembly.
 - 2. All finished cables shall be placed in water at room temperature. After 48 hours immersion and while still immersed, all conductors shall be tested for breakdown at a voltage of 2,500 Volts (rms) for five minutes.
 - 3. Samples of finished cable fabricated from each batch of cable outer sheath material shall be flame-tested per IEEE Standard 383-1974.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following for the MBTA's acceptance:

- A. Complete technical data verifying that the internal wire and cable which the DB Entity proposes to furnish is in compliance with the requirements of this Section;

- B. Qualification samples;
- C. Reports of all qualification tests witnessed by the DB Entity;
- D. Certified test reports of all breakdown tests conducted on finished cable;
- E. Certified test reports of all flame tests conducted on finished cable;
- F. Submit a Certificate of Compliance to the requirements these Mandatory Specifications. The certificate shall list all requirements and shall show a confirmation for each item. The certificate is to be signed by the DB Entity's quality control officer.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage throughout delivery, storage and handling. Comply fully with the requirements of Section 16801 - BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Damage to material resulting from improper handling by the DB Entity shall require the DB Entity to replace all damaged material with new material at no additional cost to the MBTA.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Stranded Wire for General Use
 - 1. General Requirements
 - a. Internal wire shall conform to this Section and the issue in effect of Military Specification MIL- W-22759 in effect at award of this Project. Where there is a discrepancy between this Section and the requirements of the applicable Military Specification, the requirements of this Section shall govern. The requirements of this Section shall also be used where the Military Specification refers to ".the requirements of the applicable military specification sheet."
 - b. Wire and cable provided under this Section shall be from a wire and cable manufacturer with proven experience in the Railroad/Rail Transit industry.
 - c. All internal stranded wire furnished and installed under this Project shall be subject to the following requirements:
 - 1) Conductor: Concentric-Lay-Stranded, Annealed Copper per ASTM B8
 - 2) Coating: Tin or Lead per ASTM B33 or B189
 - 3) Insulation: ETFE – Ethylene-Tetrafluoroethylene or E-CTFE - Ethylene-Chlorotrifluoroethylene per MIL-W-22759
 - 4) Chlorotrifluoroethylene per MIL-W-22759
 - 5) Construction: per Table 1.
 - 6) Performance: per Tables 2. and 3.

TABLE 1.
Construction Details

Wire Size (AWG)	Conductor Stranding (Strands x Size)	Maximum Diameter Stranded Conductor (Inches)	Conductor Resistance Maximum @ 20 C (Ohms/1000 Ft.)
22	19 x 34	.033	16.2

2.2 Special Requirements for Stranded Wire

A. Vertical Flame Test

1. Single Wire. The test specimen shall be 18" in length, and shall be placed vertically within a chamber approximately 2' by 1' by 1', open at the top and one vertical side (front), which allows a sufficient flow of air for complete combustion, but which is free from drafts. The upper end of the specimen shall be fastened in the chamber by means of a clamp and a weight shall be attached to the lower end of the specimen to hold the specimen taut during the flammability test. The weights shall be the same as those used for the life cycle tests. The specimen shall be marked at approximately 7" above the floor of the chamber to indicate where the flame is to be applied.
2. A flame from a Bunsen burner shall be applied for 15 seconds to the specimen. The Bunsen burner shall be positioned below the test mark on the specimen and at an angle of 20 degrees to the vertical plane of the specimen. The Bunsen burner shall have a 1/4" inlet, a nominal bore of 3/8", and a length of approximately 4" from the top to primary inlets. The burner shall be adjusted to produce a 3" high flame with an inner cone approximately one-third of the flame height. The temperature of the hottest portion of the flame, as measured by a thermocouple pyrometer, shall be not less than 955 degrees C ±30 degrees C. The burner shall be positioned so that the hottest portion of the flame is applied to the approximate position of the test mark on the wire. The time of burning and the flame travel after removal of the flame shall be recorded. Breaking of the wire specimens in sizes 24 and smaller shall not be considered as a failure.
3. Bundles. The test specimens shall be prepared by assembling seven single wire specimens, each

14" long, into a bundle tied in two places with glass cord or equivalent non-metallic, noncombustible material, 3" from each end. The bundles shall be suspended vertically in the test chamber described above. A flame from a Bunsen burner shall be applied vertically to the base of the bundle for 15 seconds. The burner flame shall be adjusted as described for the single wire flame test. The time of burning and flame travel after removal of the flame shall be recorded.

B. Dynamic Cut-Through

1. The dynamic cut-through test shall be performed at room temperature using a tensile testing machine equipped with a recorder which shall be suitable for recording the force in pounds necessary to force a tungsten carbide cutting tool through the insulation of a finished wire specimen. This cutting tool shall have a cutting edge of 0.005" radius of curvature on a 90 degree wedge. The testing machine shall also be equipped with a 12-Volt detection circuit designed to stop the testing machine when the cutting edge cuts through the wire insulation and contacts the conductor.
2. One inch of insulation shall be removed from one end of an 18" finished wire specimen. The specimen shall be placed on a hard, flat surface and the cutting edge oriented perpendicularly to the axis of the wire specimen. The cutting edge shall be forced through the insulation at a constant rate of 0.2" per-minute until contact with the conductor occurs. The force measured at the time of contact with the conductor shall be recorded. Four tests shall be performed on each specimen with the specimen being moved forward one-inch (minimum), and rotated clockwise 90 degrees between each test. The cut-through resistance shall be the average of the four test result values.

C. Identification

1. Each stranded wire shall be marked with the following information:
 - a. Manufacturer's name
 - b. Year in which wire is manufactured
 - c. Size of conductor
 - d. Type of insulation.

D. The identifying markings shall be permanent and shall be easily readable and understandable.

E. Stranded wires used in multi-conductor cable shall be numbered or color-coded in addition to the basic four-part identification.

1. Internal Multi-Conductor Cable
2. The outer jacket shall be fabricated of TPR - thermoplastic rubber and shall comply with the requirements of IEEE Standard No. 383 latest revision. The jacket shall be stabilized for outdoor exposure. The outer sheath shall have a nominal thickness in accordance with ICEA S-95-658 / NEMA WC70. The barrier tape shall be 0.005 inches thick, with a minimum 25 percent overlap. The individual conductors shall be sized to meet 150 percent of the load requirements, but shall be no smaller than size 19 AWG, stranded.
3. Cables shall be made by assembling the individual or twisted pairs of insulated wires into a tight, cylindrical form. Individual or twisted pairs shall be assembled helically and with adjacent layers wound in opposite directions.

4. The makeup of multi-conductor cables specified by this Section shall not exceed thirty or fifty conductors for use with vital or non-vital plug connectors respectively.
5. Multi-conductor cables shall have 10% spare conductors. Reduction in the number of spares is not allowed unless otherwise directed by the MBTA in writing. All spare conductors are to be terminated unless otherwise directed by the MBTA.
6. The cable outer sheath shall be marked with the following information repeated at intervals no greater than 36 inches:
 - a. Manufacturer's name
 - b. Year of cable manufacture
 - c. Number and size of conductors
 - d. Type of insulation on wires
 - e. Type of outer sheath insulation
 - f. Voltage rating.
7. The identifying markings shall be permanent and shall be easily readable and understandable.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

Internal wire and cable shall be installed in accordance with the applicable requirements of AREMA C&S Manual Part 10.4.1, Recommended Instructions for Wire and Cable Installation and Maintenance, and as specified herein.

1. Wires and cables shall be installed in a neat, workmanlike manner. Cables in trays or in troughs shall be laid therein and not pulled in. Cables shall be installed with a minimum amount of crossover in the trays and troughs and shall not be pulled tightly around bends. All exposed wires and cables entering or leaving equipment racks or housings shall be protected from abrasion by sharp metallic edges.
2. Nylon straps shall be provided and installed for bundling and cabling of conductors where two or more single conductors are exposed in internal rack bundles, cable trays or cable troughs, or whenever wires are to be bundled. Tape shall not be used for this purpose. Straps shall be installed at intervals not greater than five feet along the cable run. Wires of multi-conductor cables exposed by stripping the cable jacket for termination shall be trained in a neat, workmanlike manner and tied approximately every three inches with nylon straps.
3. There shall be no point-to-point redundancy of wires for increased current capacity.
4. Single conductor No. 14 stranded wire shall be used for interconnecting signal junction boxes and lamp compartments and other miscellaneous equipment, unless other size is shown on the Contract Documents.
5. Internal Ground wires are to be run separately and shall be colored green.
6. Low-voltage wiring, less than 50 Volts shall be separated, from wiring carrying more than 50 Volts, by a minimum of six inches. Where wiring of less than 50 Volts crosses wiring of more than 50 Volts it shall do so at right angles. Individual ground wires shall be separated from all wiring by a minimum of 6".

B. Rack Wiring

1. Vital Racks

Unless otherwise accepted by the MBTA in writing, all vital rack wiring shall be accomplished with approved solderless connections. Wire for vital rack wiring shall be stranded wire as specified herein, minimum size No. 16 AWG or multi-conductor cables as specified herein.

2. Non-Vital Racks

Unless otherwise accepted by the MBTA in writing, all non-vital rack wiring shall be accomplished with approved solder less connections. Wire for non-vital rack wiring shall be stranded wire as specified herein, minimum wire size No. 19 AWG or multi-conductor cables as specified herein.

3. Rack wiring shall be neatly tied into compact bundles. The main bundles and branches shall be secured to the racks in a manner which shall preclude physical damage due to pressure of abrasion and prevent the wire weight from being supported by the wire terminations, connections, or plug connection. The arrangement of the wire bundles and cables shall be such that they do not interfere with visual inspecting, troubleshooting, or repair of the rack-mounted equipment.

C. Rack-to-Rack Wiring

All rack-to-rack wiring shall be routed via the overhead cable trays with one foot of slack between the cable tray and each rack to which the cable or wire is connected.

1. Vital Racks

Unless otherwise accepted by the MBTA in writing, all rack-to-rack wiring for factory wired housings shall be accomplished using single conductors tied into bundles to form unjacketed multi-conductor cables. Unjacketed multi-conductor cables shall consist of individual conductors of size 16 AWG or larger wire and shall have a maximum tie spacing of six inches. Internal wiring for vital circuits shall be in accordance with applicable Sections of the AREMA C&S Manual unless otherwise specified herein. No. 16 AWG 19-strand single conductor flexible wire minimum shall be used for all circuits.

2. Non-Vital Racks

Unless otherwise accepted in writing by the MBTA, all rack-to-rack wiring for non-vital racks shall be accomplished using single wire and multi-conductor cables as specified herein. Non-vital plug connectors use shall be minimized and only as required and as specified within these Specifications.

3. Non-Vital Racks to Vital Racks

Unless otherwise accepted in writing by the MBTA, all wiring between non-vital racks and vital racks shall consist of single conductors, tied into bundles, between the non-vital rack and the vital rack connection points. These individual conductors shall consist of size 16 AWG or larger wire and shall have a maximum tie spacing of six inches. Unless otherwise accepted by the MBTA in writing, all wiring for non-vital circuit energy distribution shall be accomplished using single conductor 19 strand No. 16 AWG. Non-vital intra-rack wiring shall be minimum size No. 20 AWG 19 strand single conductor. Non-vital rack-to-rack wiring shall be single conductor minimum size No. 16 AWG 19 strand wire.

D. Entrance-to-Instrument Rack Wiring

Wiring from entrance racks to instrument racks shall be accomplished using stranded wire, as specified herein, minimum size No. 16 AWG 19 strand wire, and as accepted by the MBTA. Larger flexible stranded wire (No. 14 AWG 19-strand minimum) and (No. 10 AWG 27 strand single conductor flex minimum) shall be used for wiring to switch machines as specified herein and as shown on Contract Documents.

E. High-Voltage Wiring

Internal wire used in circuits directly connected to the rails and internal wire used in circuits which operate at voltages in excess of 600 Volts shall meet the requirements of Section 16808 – EXTERNAL SIGNAL CABLE FOR THE LIGHT RAIL SIGNAL SYSTEM, as specified herein.

F. Energy Distribution

1. Vital Racks

Unless otherwise accepted by the MBTA in writing, all wiring for energy distribution shall be accomplished using single conductor stranded wire as specified herein. Rack wiring shall be accomplished with solderless connections using stranded wire, minimum size No. 14 AWG. Rack-to-rack wiring shall be accomplished with solderless connections using stranded wire, minimum size No. 14 AWG.

2. Non-Vital Racks

Unless otherwise accepted by the MBTA in writing, all wiring for energy distribution shall be accomplished using single conductor stranded wire as specified herein. Rack wiring shall be accomplished with solderless connections using stranded wire, minimum size No. 16 AWG. Rack-to-rack wiring shall be accomplished using solderless connections using stranded wire, minimum size No. 14 AWG.

G. Conductor Sizing

All conductors must be sized per the National Electrical Code and to satisfy the load requirements of the equipment and systems provided, but shall not be smaller than the minimum conductor sizes specified herein.

3.2 TESTS

Internal wire and cable shall be tested as specified herein and in accordance with the requirements of Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.

END OF SECTION

SECTION 16856

CABLE TRAYS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section consists of furnishing and installing approved fireproof cable trays adjacent to racks, complete with associated material, in each Central Instrument House.

1.2 QUALITY ASSURANCE

The completed cable tray layout shall be inspected after it has been installed. This inspection shall be conducted in conformance with the requirements of the DB Entity's Installation Inspection Procedure as accepted by the MBTA.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following for the MBTA's acceptance:

- A. Drawings showing design and details of the entire cable tray layout for each Central Instrument House shall be submitted for acceptance by the MBTA. These drawings shall also show the proposed method of installing the overhead cable tray assembly;
- B. Detailed drawings of any required fiberglass support arms for cable trays shall be submitted. The strength, electrical and flame retardant properties of the fiberglass shall be included as a part of the submittal;
- C. An Installation Inspection Procedure for cable trays shall be submitted.

1.4 DELIVERY, STORAGE AND HANDLING

The trays shall be properly braced and protected with padding prior to shipment to prevent damage.

PART 2 - PRODUCTS

2.1 CABLE TRAYS

- A. Cable trays shall be of open ladder type, aluminum or other suitable material commercially available and provide spacing support and strength of material characteristics equal to or greater than the aluminum.
- B. The aluminum ladder type cable tray shall be as manufactured by Husky Products, Inc., "Ventray," Type A6, or MBTA accepted equal, with the following minimum requirements:
 - 1. Ladder rung spacing shall be approximately 6".
 - 2. Side stringer section shall be 0.094".
 - 3. Top and bottom flange section shall each be 0.094".

4. Flange width shall be 0.75”.
 5. Height of rail shall be 3.375”.
 6. Rung thickness shall be 0.062”.
 7. Rung bottom width shall be 2.20”.
 8. Rung top width shall be 0.75”.
 9. Loading, with four foot mounting support:
Six-inch width: 450 lbs., with maximum deflection of 0.20”. Eighteen-inch width: 305 lbs., with maximum deflection of 0.14”.
- C. If the cable tray material is conductive in nature and the layout includes any support mounting to the instrument and entrance racks, such mounting shall be by means of MBTA accepted fiberglass arms or stand-offs in order to insulate the cable tray assembly from the instrument and entrance racks.
- D. Each cable tray shall be designed and fabricated with sufficient capacity to provide 50 percent of the cross-sectional area as free air space after the full number of cables and wires are installed. Corners shall be a minimum radius of six inches, for either horizontal or vertical turns. Sufficient overhead space shall be available after installation to permit wires and cables to be inspected.
- E. Where practicable, the tray shall be constructed in straight sections joined with approved couplers.
- F. Using the manufacturer's standard, the tray shall be laid out using a minimum number of sections, but providing maximum continuous runs without gaps.
- G. All fittings, supports, and accessories shall be furnished in accordance with the manufacturer's recommendations.
- H. Insofar as practicable, cable trays shall be supported by cantilever type brackets in order that the cables can be laid into the tray without pulling.
- I. Where the width of the tray, or the loading of cables is such that cantilever supports are impracticable, other approved suspension methods may be used, but such application shall be kept to a minimum.
- J. At least three supports shall be provided for each length of tray. Supports shall be evenly spaced insofar as possible; in no case shall the spacing between adjacent supports exceed five feet.
- K. To prevent damage to cables, no metal edges of any description shall protrude and no sharp corners shall exist in the completed layout.

2.2 FIBERGLASS SUPPORT ARMS

Fiberglass support arms, where required to insulate the cable tray from the equipment racks, shall be flame retardant, reinforced polyester laminate Class "B", 130°C electrical sheet, meeting NEMA GPO-2, and ASTM D709 requirements and as accepted by the MBTA.

2.3 PRODUCT, PACKAGING AND SHIPMENT

The trays shall be braced properly prior to shipment and covered with padding, as required, to prevent damage.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. The installation work shall include any preparatory work required in connection with the placement of the wire chases and cable trays. Aluminum shall be installed so that it does not come into contact with concrete.
- B. The overhead cable tray assembly for the Central Instrument Houses shall be suspended from the ceiling.
- C. Sufficient support shall be provided to limit the loaded cable tray deflection to a maximum of one-quarter inch at mid-span. Tray supports and trays shall be mounted plumb and level.
- D. Where cable tray splice joints occur in a run, trays shall be supported immediately adjacent to and on both sides of the splice fitting. Trays shall be bolted to support members. Precautions shall be taken to prevent anchoring bolts from damaging cables placed in the trays. All cable trays shall be bonded and grounded. The method of installation shall be in such a manner as to minimize ground loops. All cable trays shall be insulated from all walls, ceilings, instrument racks and terminal racks, prior to grounding as described in Section 16876 – GROUNDING OF SIGNAL SYSTEM EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM.
- E. The DB Entity shall round all edges of the cable tray and cover all edges and angles with rubber protection for the cables or wires run in any cable tray.

END OF SECTION

SECTION 16857

PLUG CONNECTORS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing plug connector assemblies required for connecting multiconductor cables or individual wires to the internal wiring of panels, specified plug-connected racks, or equipment modules. Use of plug couplers shall be strictly limited to those applications where equipment interface requirements provide no other option. It is the intent of this Project to minimize the use of plug couplers.
- B. These assemblies shall hold and insulate individually mated extractable pin-and-socket contacts that shall be mechanically crimped to individual wires or wire wrap pins. The connector assemblies shall be easily connected and disconnected by hand and shall be provided with mechanical locking and keying devices.
- C. Two basic types of connectors shall be furnished; a vital circuit type and non-vital circuit type. The number of contacts in a vital circuit plug connector shall not exceed 30 contacts. Non-vital circuit plug connectors shall not exceed 50 contacts.
- D. The connector assemblies shall be easily connected and disconnected by hand and shall be provided with mechanical locking and keying devices.

1.2 QUALITY ASSURANCE

- A. Each plug connector assembly shall meet the applicable requirements for the documents as listed below, where these documents do not conflict with the requirements of this Specification:
 - 1. MIL-M-14 Molding Plastics and Molded Plastic Parts; Thermosetting
 - 2. MIL-C-8384B Connectors; Plug and Receptacle - Electrical Rectangular Type, Molded Body
 - 3. MIL-W-1687D Wire, Electrical Insulated, Copper
 - 4. MIL-STD-202 Test Methods for Electronic and Electrical Component Parts
 - 5. MIL-STD-454 General Requirements for Electronic Equipment and for solderless pin and socket contacts:
 - 6. MIL-G-45204 Gold Plating, Electrodeposited
 - 7. MIL-C-50 Copper Alloy Number 260 (Cartridge Brass)
 - 8. FS QQ-S-766 Steel, Corrosion Resistant
 - 9. FS QQ-N-290 Nickel Plating; Electrodeposited

| 14. | ASTM-B-36 | Cartridge Brass |
| 15. | ASTM-B-140 | Commercial Bronze |

B. The following tests shall be made on six or more randomly selected plug connector assemblies at the start of the production run for this Project. The same tests shall be repeated on additional samples selected at intervals of no more than 500 plug connector assemblies as the production run continues.

1. Each half of the plug connector assembly shall withstand for one minute a dielectric strength test of 900 Volts AC (RMS) applied between adjacent contacts and between the contacts and the other metallic parts of the connector assembly.
2. A minimum of six randomly selected contacts shall be tested to have not less than ten pounds of retention after each contact has been inserted and extracted ten times using the applicable extraction tool. The force to dislodge the aged contacts from their cavities shall be measured and recorded after the eleventh insertion.
3. The durability of the connector assemblies shall be measured by subjecting fully wired assemblies having a full complement of contacts to 500 cycles of mating and unmating, with the connectors being fully locked and unlocked during each cycle. After cycling, the connector assemblies shall show no evidence of mechanical damage or missing parts.
4. The mated connectors shall be vibrated in accordance with Method 204, Condition A of MIL-STD-202 with arrangements to monitor a test circuit with 100 ma flowing through the contacts. When tested, the connector assemblies shall show no evidence of cracking or breaking and there shall be no loss of continuity of any circuit greater than one microsecond.
5. The mated connectors shall show no evidence of mechanical damage after being subjected to a shock test in accordance with Method 205, Condition C of MIL-STD-202, repeated three times, for a total of 18 drops.
6. The mated connectors shall show no evidence of mechanical damage after being subjected to temperature cycling in accordance with Method 107, Test Condition B of MIL-STD-202 with a minimum operating temperature of minus 55 degrees C and a maximum operating temperature of plus 150 degrees C.
7. The unmated connectors shall show no evidence of corrosion and shall be capable of being mated and unmated after being subjected to a moisture environment in accordance with Method 106 of MIL-STD-202, except that 7b is not required.
8. The DB Entity shall provide a complete certified test report for each of the plug connector tests prescribed. These reports shall include the date, location, number and origin of specimens, type of test, test conditions, and results of the test.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection

2.8, the DB Entity shall submit the following for the MBTA's acceptance:

- A. Submit an application description evaluating alternate termination methods that shall be subject to the MBTA's final acceptance. No plug couplers shall be utilized prior to acceptance by the MBTA for both product and application.
- B. Complete drawings for each type of plug connector. These drawings shall include complete parts lists and information required for ordering replacement parts. Drawings shall be required for the following components:
 - 1. Molded plug connector blocks,
 - 2. Protective shells for blocks,
 - 3. All locking and keying devices,
 - 4. Strain-relief clamping devices,
 - 5. Extractable pin-and-socket contacts.
- C. Submit three certified copies of all plug connector test reports within seven days of test.
- D. Submit complete reference information for each type of plug connector tool to be used. This includes insertion, extraction, wire crimping and all other tools used in performing installation of a finished wiring system. This information shall include parts lists complete with ordering reference numbers for all replacement tools and parts provided.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Each plug connector assembly shall consist of the following:
 - 1. A two-part molded plastic connector block equipped to hold an appropriate number of solderless, pin-and-socket contacts,
 - 2. Devices for the mechanical locking and keying of the connector block halves,
 - 3. Protective shells for both block halves of the connector,
 - 4. A strain relief device for the external wiring portion of the connector assembly,
 - 5. Solderless, extractable pin-and-socket contacts,
 - 6. Where required, embedded wire-wrap terminals for the internal wiring portion of the connector block.
- B. Connector Blocks
 - 1. The connector blocks shall consist of molded dielectric plastic, shaped to accept the required number and types of contact pins, contact sockets and locking, keying and mounting devices. The dielectric material shall exhibit a minimum insulation resistance of 100 mega-ohms as measured between adjacent pairs of contacts and between the accessory hardware and the closest contacts in each connector assembly half.
 - 2. The contact cavities shall be arranged in a rectangular grid configuration. The opening for each contact shall be uniquely identified by a coordinate molded into both the mating and wiring faces of each part of the connector block.

3. The vital plug connector blocks shall provide a surface leakage distance of not less than 1/4 inch between contacts and between the contacts and any other metallic part of the connector assembly.

C. Locking and Keying

1. Each plug connector assembly shall include a device for mechanically locking the two mated parts together.
2. Mechanical devices and facilities shall also be provided to allow the mating parts of connector assemblies to be keyed in such a manner that they cannot be coupled except when in the correct position relative to each other and cannot be coupled to the mating parts of other coupler assemblies keyed in a different pattern.

D. Protection and Strain Relief

1. Each half of the plug connector block shall be protected by a metal shield that shall extend beyond the mating surface. These two shields shall overlap when the connector halves are coupled.
2. The external wiring portion of each plug connector assembly shall be equipped with a device to grip the external wiring firmly in order to prevent strain on the plug connector contacts.

E. Pin-and-Socket Contacts

1. The pin-and-socket contacts shall be fabricated from commercial bronze or brass and plated with gold over nickel underplate. The retention springs of the pin-and-socket contacts shall be fabricated from stainless steel.
2. The contacts shall be fabricated and classified in the required selection of sizes to accept wire sizes 16 through 22, AWG.
3. Contact current rating and termination resistance shall meet the requirements of the following table with properly sized contacts applied to the wire sizes specified.

	Wire Size (AWG)			
	16	18	20	22
Minimum Current Rating (Amperes)	13.0	10.0	7.5	5.0
Maximum Termination Resistance (Milliohms)	1.7	2.0	2.7	4.0

4. Contact termination resistance shall be measured in accordance with Method 307 of MIL-STD-202 at the rated current specified for each wire size.

2.2 TOOLS

Tools used to apply plug connector contacts to wire and tools used to extract contacts from the plug connector blocks shall be the size and type recommended by the manufacturer of the plug connector assemblies. Two complete sets of plug connector tools shall be provided within a lockable wall mounted cabinet in each CIH furnished.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. The vital plug connector assembly shall be required where any vital circuits are to be interconnected and the non-vital plug connector assembly shall be used where non-vital circuits are to be interconnected, as accepted by the MBTA.
- B. For plug connectors dedicated to single multiconductor cables, 20 percent of the wires and connector contacts shall be reserved for future working circuits. Plug connectors used for made up, unjacketed, cables, 20 percent of the connector contacts shall be reserved for future working circuits.
- C. For plug connectors assembled to a multiconductor cable, the strain relief device shall grip the cable outer sheath.
- D. For vital or non-vital plug connectors dedicated to a cable, each wire of the cable shall be terminated properly on a connector contact.
- E. In each case, a uniform scheme shall be followed in assigning specific cable wires to specific connector contacts.
- F. Where a full hand grasp is required to connect or disconnect a plug connector, a minimum of two inches of clear space shall be provided around the connector. A minimum of three-quarters of an inch of clear space shall be provided around connectors that can be connected or disconnected with thumb and fingertips only.
- G. Plug connectors shall be located and installed in such a manner that no part of the plug connector or its cable will extend beyond the wire routing as defined by the wire supports and in no circumstances shall the connector or its cable be permitted to protrude into an aisle-way.
- H. Each plug connector assembly, as finally installed, shall be marked in such a manner that its mating halves shall be distinctly identified as being related to each other, but to no other plug connector assembly within the immediate area. These identification markings shall be applied in such a manner that they will not be obscured or worn off in normal use.

END OF SECTION

SECTION 16858

RELAYS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the provision of all required relays. Relays shall be plug-in type. Relays of each type shall be uniform in design and contact assembly.
- B. A sufficient number of contacts for the number of circuits to be controlled plus spare contacts shall be provided. Each relay or relay repeater combination shall have at least two spare dependent front-back contacts, or one spare independent front and one spare independent back contact.
- C. All relays and equipment specified shall be capable of rated performance through an operating temperature range of minus 40 degrees F to plus 160 degrees F.
- D. All relays shall be in dustproof enclosures, except, where required, a provision shall be made for ventilation for heat dissipation.
- E. Vital relays shall be equipped with a registration plate to prevent relays of the wrong style, contact arrangement, or operating characteristics, from being inserted into the plugboard.

1.2 QUALITY ASSURANCE

- A. Vital relays shall meet the requirements of AREMA C&S Manual, Part 6.2, Recommended Plug-In Vital Relays, except as specified herein.
- B. Non-vital relays shall meet the requirements of AREMA C&S Manual Part 6.3, Recommended Non-Vital Relays, except as specified herein.
- C. The factory testing of each relay shall be the manufacturer's standard and as accepted by the MBTA.
- D. Relays must be tested in the field after delivery and prior to in service activation.
- E. Prior to use of any relay, the DB Entity shall obtain the MBTA's written approval. Approval will be based on such evidence and tests as the MBTA may require to be carried out, without additional costs to the MBTA.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following for the MBTA's acceptance:

- A. Catalog cuts and descriptive literature for all material as specified herein, as shown on the Contract Documents and proposed for use;
- B. All relay and plugboard specifications, identification tags, and any special mounting or supporting arrangements, and contact stacking arrangements, for all relay types which he proposes to furnish. The submittal shall include any arc suppression where arc suppression is required;

- C. Applicable test form for each vital relay furnished for this Project. The use of typewritten characters shall be used to fill in all information requested on the form and then verified in the field in its final configuration, for accuracy of relay serial number, location and relay identification. Indexing of form cards shall be by serial number, and turned over to the MBTA upon equipment delivery by DB Entity.
- D. Ten relay manuals and ten copies of relay specifications and calibration sheets for each type of relay furnished;
- E. In the event of excessive long relay nomenclature on relay identification tags, the method of identifying such relays;
- F. MTBF data for all types of relays proposed.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Vital relays shall be shipped separately from the wired racks in which they are to be used. They shall be packaged individually, each in a sturdy corrugated cardboard carton with the drawing number of the relay printed on the outside of the carton.
- B. Relays shall be protected against damage during shipment and shall be secured against loss and damage during storage.

PART 2 - PRODUCTS

2.1 VITAL DC RELAYS

- A. General
 - 1. Vital DC relays shall be of the plug-in type and rack-mounted. They shall have a transparent dust cover made of a non-flammable composition that will not support combustion.
 - 2. Vital relays, with a nominal operating voltage of 10-16 Volts, shall be capable of operating continuously without resultant damage with a minimum voltage range of 7 to 21 Volts inclusive applied to their operating circuits.
 - 3. Biased neutral vital relays shall be designed so that gravity alone will prevent the armature from picking up if the permanent magnet is de-energized or if no current is applied to the coil due to interruption of the normal magnetic circuit. Biased neutral vital relays shall be designed so that up to at least 50 times working energization applied for two seconds at both normal and reverse polarity will not affect their operating characteristics by more than 2%, and will not pick up their armature on reverse polarity.
 - 4. Vital DC relays, unless otherwise indicated on the Contract Documents, shall have coil resistance values of 500 ohms or less.
 - 5. Each vital relay shall have a minimum of four dependent front-back contacts, two independent front contacts and one independent back contact. All front contacts shall be silver-to-metalized carbon, except for heavy duty, extra heavy duty, or special application relays.
 - 6. When three DC vital relays suppressed as specified herein are connected in parallel and operated, as a test load from normal working voltage, a vital relay front or back contact that breaks this load shall be capable of at least five million operations at this load without the contact resistance, measured with a 10 ma current, exceeding five ohms.
 - 7. Arc suppression for vital relays shall be built into the relay or into its plugboard.

8. Contact arrangements shall be identical for similar types of relays, exceptions made for special function relays only.
9. All vital plug-in relays, except vital time-element relays and special application relays shall be equipped with front current testing facilities. Where required by the MBTA facilities shall be provided to enable the testing of voltage from the front of the relay.
10. Plugboards shall be manufacturer's standard for the relays provided and as accepted by the MBTA.

B. Track Circuit Relays

1. Track Circuit Relays shall be biased neutral type with high drop away/pick up ratio compatible with the steady energy train detection equipment provided for this Project.

2.2 NON-VITAL RELAYS

- A. Each non-vital relay shall be equipped with a minimum of six front-back contacts. Stationary contacts shall be bifurcated silver, palladium, or approved equal. Movable contacts shall be bifurcated silver, palladium with gold overlay, or approved equal.

- B. Non-vital relays shall meet or exceed the following requirements:

1. Maximum Temperature Rise: 175 degrees F at 30V DC
2. Insulation Resistance: 1.5×10^{10} ohms
3. Ambient Operating Temp.: minus 60 to 160 (degrees F)
4. Dielectric Strength: 500 Volts RMS, 60 Hz between all mutually insulated parts
5. Mechanical Life: 100 million cycle operations
6. Electric Life: 10 million operations (0.5 ampere resistive load at 77 degrees F)
7. Contact Resistance:
 - a. Before Life 100 milliohms max. at 6V DC, 100 ma
 - b. After Life: 200 milliohms max, at 6V DC, 100 ma.

- C. Non-vital relays shall be mounted in dust-proof cabinets having transparent front plates which shall not support combustion. These cabinets shall be mounted in racks as specified. As an alternate these relays may be furnished with individual transparent covers that will not support combustion and shall be rack mounted.

- D. The design of the individual relay covers and of the cabinet in which several relays are mounted shall permit viewing the relays without disassembly or other mechanical manipulation to determine whether each relay is in the picked up or dropped out position.

- E. Non-vital relays shall be plug-in DC neutral, biased, or diode-suppressed relays with a typical, nominal operating voltage of 24 Volts. Where other voltages are required, the relay and application shall be submitted and acceptance will be at the sole discretion of the MBTA. These relays shall pick up with 18 volts or more applied to their operating circuit, and must drop out when

this voltage decreases below two volts. These relays shall be capable of operating continuously up to a maximum of 42 volts applied to their operating circuit. Non-vital relays shall pick up in less than 25 milliseconds when energized with 18 volts, and shall drop out when de-energized from 28 volts in less than 50 milliseconds. These times shall be measured as a front contact closure or opening from the instant the switch applying the voltage closes and from the instant the switch removing the voltage opens.

- F. Contact resistance of non-vital relay front and back contacts shall not exceed five ohms after 10 million operations when breaking a test load equivalent to three non-vital relays connected in parallel and suppressed as required in these Mandatory Specifications. Operating voltage for this test shall be 24 volts. Contact resistance shall be measured with a 10 ma current. All non-vital relays shall be identical by type and class, or function.
- G. Relay coils that are wired to solid state equipment shall have their coils suppressed such that transient voltage spikes are minimized to protect electronic equipment.

2.3 IDENTIFICATION

- A. DB Entity shall mount an approved typed or machine printed relay name tag for each relay on the relay cabinet front plate, if this is not possible, upon acceptance from the MBTA the tag can alternately be applied to the relay cover. The name tag shall be easily replaceable, but shall not come off during normal service. Proposed excessively long relay identification tag nomenclature shall be submitted by the DB Entity for approval.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. The DB Entity shall ensure that all AC and DC power buses are open while installing relays and shall not reconnect these buses until all relays have been installed.
- B. Relays for track circuits shall be mounted in the upper-half of the relay rack.
- C. Relays or components shall be mounted at a height of no more than six feet or less than one foot from the floor of the room. The overall height of the rack shall not exceed seven feet - six inches.
- D. Power feeds through switch mechanism control relays shall be closed only during testing, prior to in- service operation.

3.2 TESTS

- A. The DB Entity shall test all relays in accordance with the recommended practices as established in AREMA C&S Manual Part 6.4.1, Recommended Instructions for Direct-Current Relays, and all requirements of Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

END OF SECTION

SECTION 16850

VITAL MICROPROCESSOR INTERLOCKING SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. The work to be done under this Section consists of the furnishing, installation and testing of vital microprocessor interlocking systems (VMIS) to control all Vital functions at each interlocking in accordance with all applicable sections of the AREMA C&S Manual, except as specified herein.

1.2 QUALITY ASSURANCE

- A. The DB Entity shall provide for system testing, documentation, training and quality assurance as specified within these Mandatory Specifications.
- B. Processor systems and equipment provided shall be in accordance with latest requirements of the AREMA C&S Manual in effect at the time of award, where the manual does not conflict with these Specifications. The system shall be provided to operate in accordance with all applicable AREMA recommendations/requirements for the control and indication of interlocking Vital functions.
 - 1. The DB Entity shall certify and provide documentation to demonstrate that the system provided has been successfully tested and operated after being exposed to conditions as specified in AREMA C&S Manual, Part 11.5.1 – Recommended Environmental Requirements for Electronic Railroad Signal System Equipment for a Class C environment.
 - 2. The methodology for quality assurance, maintainability, software revision control and reliability assurance shall comply with the recommended practices of the AREMA C&S Manual, Part 17.
- C. DB Entity shall submit to having a representative sample of VMIS Class I printed circuit boards evaluated by an independent third party laboratory to determine quality assurance compliance at the point of manufacture. The laboratory inspection shall require a minimum microscopic examination level of 15X and shall conform to the standards of IPC-A-610. A minimum 10% of the proposed printed circuit boards to be utilized for this Project shall be submitted for evaluation. Further examination of the remaining printed circuit boards will be at the discretion of the MBTA upon review of the independent test results. Independent inspection will be conducted at a laboratory facility within 50 miles of Boston, MA.
- D. The design of the system shall also comply in every respect with the Rules and Regulations Governing Railroad Signal and Train Control Systems as issued by the office of Safety, Federal Railroad Administration, latest publication at the time of award, and of any supplements thereof that become effective before Notice to Proceed.
- E. The DB Entity shall certify that the entire VMIS that he proposes to furnish has been tested to successfully operate in the high EMI noise environment of an operating DC traction power system. The system shall comply with the requirements of MIL STD 461 where applicable to a transit/railroad type environment.
- F. The DB Entity shall have a recommended process for change control, verification and retest of

vital software to be implemented for all vital software changes during and after cut-over and testing.

- G. The DB Entity shall have a recommended minimum retest process for the replacement of various parts of the VMIS including which is not limited to the CPU Board, Power Supplies, Input/Output Boards, serial and network communications boards, etc. This process shall ensure the safety and integrity of the system if all recommended tests are completed after the part of component is replaced.
- H. The modules of the system shall have demonstrated Mean Time Between Failure (MTBF) of no more than one failure in every 35000 hours (or 4 years) of operation when applied at a typical interlocking with two crossovers.
 - 1. The system in the design configuration shall have a Mean Time to Restore (MTTR) of 30 minutes maximum. This does not include travelling time, only the time to return the equipment to normal operation.
- I. Complete calculations of the predicted Reliability and Maintainability (R&M) shall be furnished. Actual performance data for a like system for which reliability records have been maintained for a period of not less than 5 years may be used to support or substantiate the submitted R&M calculations.
- J. The system and equipment shall be designed such that spare parts and software support will be available for a minimum of 20 years. This provision shall require that written certification is furnished to the MBTA prior to delivery.
- K. The DB Entity shall advise the MBTA immediately of any changes or upgrades to the interlocking system software and the reasons for such upgrades. Changes to the system software which affect train safety shall be provided to the MBTA at no additional cost. If, during phased testing (factory and/or field), the DB Entity upgrades the executive software, all locations shall receive an identical upgrade. Also, those systems for which testing has been completed shall be re-tested with the DB Entity at no additional cost to the MBTA.

1.3 SUBMITTALS

- A. In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and 2.8, the following plans and information shall be submitted for approval prior to fabrication and factory wiring of the system. Procurement or fabrication of the VMIS shall be at the DB Entity's risk until acceptance has been received from the MBTA for all relevant submittal documents herein specified.
 - 1. Complete schematic drawings for all systems and subsystems,
 - 2. Complete application circuit plans for all input and output functions performed by each location/system,
 - 3. Complete software application logic (in relay equivalent format) for each location/system fully commented in plain English,
 - 4. Complete power distribution circuit drawings and schematics,
 - 5. Complete power calculations for all power sources energizing the vital controllers or controlled, or switched, by vital controllers. Where specific ripple or regulation specifications exist for the vital controllers or associated equipment, compliance with such ripple or regulation specifications shall be demonstrated to the satisfaction of the MBTA,
 - 6. Complete rack layout and arrangement of equipment,

7. Complete equipment plans and installation drawings showing all components of the system. These drawings shall include complete keyed parts lists for all components of the system, circuit board layouts, keying methods, racks, terminal boards, plug connectors, other interconnecting devices, cable boots, mounting hardware, and all other rack-mounted equipment and hardware,
8. Complete predicted Reliability and Maintainability (R&M) calculations. Actual performance data for a like system for which reliability records have been maintained for a period of not less than five years may be used to support or substantiate the submitted predicted R&M calculations.
9. A complete Factory Test Procedure for testing each location in the factory prior to shipping to the field,
10. Subsequent to qualification testing and factory witness testing, and prior to shipment, certified factory test reports shall be submitted for acceptance,
11. Complete and comprehensive manufacturer's recommended Installation and Inspection Procedures,
12. Field Test Procedures & Test Reports designed to verify that the installed system at each location meets all safety and operational requirements of this Mandatory Specification,
13. One copy of all manuals and documentation required by this specification. Upon approval of the content, organization and format all documentation required by this Section shall be delivered to the MBTA.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Equipment furnished under this Section shall not be shipped until the Factory Test Reports have been accepted, in writing, by the MBTA Comply fully with the requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEMS.
- B. Each item of the VMIS shall be inspected by the DB Entity and MBTA (or an MBTA representative) for shipping damage prior to installation.

PART 2 - PRODUCTS

2.1 GENERAL

- A. General Requirements - VMIS systems and equipment shall be provided in accordance with the requirements of this Section and other sections of these Specifications and shall also include, but not be limited to the following:
 1. The product used for this application shall be Ansaldo's Microlok II or MBTA accepted equivalent designed and applied in a hot standby redundant configuration.
 2. In addition to the "Normal" and "Standby" units, a third cold standby unit will be rack installed complete with all (same count) boards specific to the VMIS units installed and running at that location. The cold standby system will include two processor units with application and executive logic preloaded and matching those running in the normal and standby VMIS units. Additionally, the cold standby will include any boards that have site specific IC chips.
 3. Provide a system, which has a proven record of implementation and operation within a 13.8KVAC and 600VDC electrified rail environment for a period of at least five years;
 4. A complete Office Development System that allows programming development and

- simulation to create, edit and generate all application software systems and logic;
5. A complete Field Diagnostic System suited for field environments that allows for real time monitoring of logic execution and analysis of hardware/software operation;
 6. Complete system documentation and user manuals;
 7. Licenses to use all furnished system software;
 8. Other apparatus including, but not limited to, modems, chassis, cables, power supplies, test equipment and all circuit boards;
 9. Engineering including but not limited to, all application, software, hardware and support engineering;
 10. A minimum of 100% spare capacity will be provided for normal and standby systems for future expansion of the application logic. A minimum of 20% spare capacity will be provided for normal and standby systems for future expansion of I/O. This spare capacity requirement applies to the VMIS system in each CIH.
 11. Equipment and software shall be the most recent proven versions.
- B. All microprocessor equipment shall be mounted complete with necessary accessories on standard 19- inch racks to accommodate equipment utilizing standard EIA hole spacing. Racks and/or cabinets shall be furnished with provisions for EMI mitigation and ventilation as required for optimum performance. No forced air ventilation shall be used.
- C. The VMIS and all components associated therewith must have a demonstrable history of safe and reliable use in revenue operation in a similar operating environment to that of the existing MBTA Green Line.
- D. Unless otherwise specified, all systems shall operate without any degradation over the temperature and humidity range specified in the environmental requirements recommended in AREMA C&S Manual, Part 11.5.1, for Class C environment.
- E. Within the system furnished, like functions shall be performed by identical units. In no case shall the hardware or equipment used in one portion of the system be different from that used in another portion to perform the same function under identical operation and environmental conditions.
- F. The application of special custom assemblies shall be confined to those required to comply with the Specification. Every effort shall be made to minimize custom design and minimize the number of unique chassis or modules.
- G. The vital microprocessor interlocking system shall consist of a number of vital processor units and the associated cables, plugs, wire connectors, terminal boards, power conditioning equipment, instrument racks and hardware.
- H. All plug connectors, power supplies, power conditioning devices, terminal boards, wire connectors and other equipment required to achieve a complete, stand-alone subsystem shall be mounted on the instrument rack along with the associated vital processor units.
- I. Each vital processor unit shall be provided with vital serial communication capabilities. The number of vital ports shall be sufficient to allow inter-connection of the vital processor units to adjacent systems.

- J. Each vital processor unit cardfile(s) or pair of cardfiles shall contain printed circuit boards of the types described herein. Additional types of printed circuit boards required for the operation of the vital processor units shall be furnished and installed as required. Combination of functions among the board types shall be allowed only as specified herein.
1. The printed circuit boards shall be housed within a cardfile and be of the plug-in type. Keys shall be provided on the cardfile to prevent insertion of improper printed circuit board types.
 2. The cardfiles shall be factory mounted in a standard rack designed to accommodate standard EIA hole spacing. All wire connections to the cardfiles shall be via plug connected cables. The vital processor cardfile units, when mounted in the rack, shall have access from the rear.
 3. All I/O, including spares, shall be wired through Din Rail mounted terminal blocks installed within the same rack as the I/O points which they are connected for ease of access.
 4. No forced air ventilation shall be allowed.
- K. The VMIS shall not use any custom or semi-custom integrated circuits.
- L. The design shall provide that all cables or wiring leaving the instrument racks shall be routed through rubber boots or some other form of anti-chafing mechanism at the top of the racks and be provided with means to be neatly routed and securely fastened with tie straps.
- M. The hardwire DC inputs of the vital processors shall not respond to AC of any voltage level. The hardwire inputs shall be biased and shall not, under failure condition, respond to any voltage of improper polarity. Hardwire inputs shall be optically isolated from the 5 volt logic of the VMIS.
- N. The vital hardwire outputs of the vital processors shall provide security equal to, or greater than, conventional double-break relay circuits. The hardwire outputs shall be optically isolated from the logic of the VMIS.
- O. A hardware and firmware shall use a keying method rendering it impossible for any vital processor to operate with application dependent firmware designed for any other vital processor.
- P. Plug connectors shall comply with all of the requirements of Section 16857 – PLUG CONNECTORS FOR THE LIGHT RAIL SIGNAL SYSTEM.

2.2 DESIGN REQUIREMENTS

- A. The VMIS system will perform all vital functions for the location for which it controls. Non-vital functions will be performed in the NVMIS. Non-vital outputs to the vital application logic (Signal and switch controls) shall have the ability to be forced for the purposes of performing vital locking functional tests without interference from non-vital application logic checks. Functions or equipment related to the NVMIS shall not interfere with the safe operation of the vital processor.
- B. The vital microprocessor interlocking system (VMIS), as herein specified, shall be designed on the basis of closed circuit/loop principles, software diversity and use of proven vital hardware design techniques to achieve safety.
- C. Provide a system that is immune to levels of internal and external electrostatic and electromagnetic conducted or radiated interference including MBTA's radio system equipment and commercial broadcast frequencies such as used for television, radio, CB etc., that may have transmitters or other equipment operating in close proximity to MBTA's right-of-way.

- D. The physical and mechanical configurations of equipment and rack assemblies shall give high priority to the ease with which the units may be inspected, maintained, and removed. Location of all equipment shall be on racks as shown in the Contract Documents.
- E. All circuit boards shall have internal as well as external data and power surge protection, as required.
- F. The VMIS design shall be based upon solid-state microprocessor technology and shall not require any off-line storage devices for operation or start up. The processor proposed shall be a widely accepted design. The operation of the system shall be programmed in solid-state memory. In addition, other requirements as specified herein, shall be part of this system.
- G. System outputs shall be positively sampled using independent current/voltage sensors and compared to the requested value. The application software shall re-evaluate all software instructions for integrity based on most recent logic states. The processor shall continually retest all input and output states for any change of status and shall constantly test for proper instruction execution.
1. A vital relay shall be provided to de-energize all outputs and affect a systems shutdown in the event that any output fails to correspond to the requested state or through the sensing of a critical systems error. In such an event, it shall be ensured that the wayside interlocking signals will display a double red aspect and automatic signals display a single red aspect.
 2. The system shall attempt an automatic restart executing safety checks when shutdown is caused by an input/output failure. No automatic restart shall take place in the event of a processor failure after failover.
- H. The operating instructions for the VMIS shall be divided into application and executive portions.
1. The executive instructions shall be stored in solid-state read only memory (ROM) or solid-state programmable read only memory (PROM) devices and shall be referred to as the Executive Firmware. The application instructions shall be stored in solid-state EEPROM devices and use a jumper configuration method, as approved, and shall be referred to as the Application Firmware.
 2. The Executive Firmware and Application Firmware shall reside in separate memory devices.
 3. The system software shall draw a secure distinction between the executive and the application software such that it shall be impossible through the implementation of the application software to overwrite or otherwise modify the executive software.
- I. The system shall be capable of interconnection to a PC, via serial link or network connection that will permit observation of internal logic bits during testing and normal operation.
- J. Vital Processor Units shall be equipped with on-board diagnostics. These diagnostics shall quickly and reliably identify failed printed circuit cards.
1. Indications shall isolate a failure to a particular function, or to the interface between two functions.
 2. All on-board diagnostics shall be available for access by an external PC via serial link.
 3. Any diagnostics or monitoring of the system shall not have the ability to change executive or application software routines.
- K. Visual indications, such as LED lamps, shall be used to demonstrate that the system is

functioning properly and to indicate faults, state of individual I/O, serial/network links, etc.

- L. The unit shall be designed with convection cooling such that heat generating components (e.g., transistors with heat sinks and large wattage resistors) shall not be located next to other components that are affected by temperature.
- M. No failure of any component of the VMIS shall cause the vital interlocking system to fail in a less restrictive mode.
- N. Each unit shall have a unique site identification code. This code and any other site specific information shall be resident on either the unit's CPU board, the mother board (back plane), or a separate device connected securely to the unit. Where hardware settings are required, the hardware shall be located where the unique ID code cannot be inadvertently changed.
- O. All equipment shall be designed in a modular fashion to the greatest extent possible.

2.3 POWER REQUIREMENTS

- A. Equipment requiring non-interruptible power supply system will not be acceptable. The processor system source shall be 12 volts DC ungrounded supplied by a traditional battery-rectifier supply. If commercial AC power is required as input to racks, the voltage shall not exceed 120 VAC. Protection against surges, spikes and over-voltage shall be provided. The DB Entity shall protect all power feeds, input and output leads, and all other auxiliary equipment with lightning and surge protection as necessary.
- B. All connections to external circuits shall be designed to interface to standard signal equipment operating at normal voltages for the type of equipment. Any modifications or additions to the system to operate any device shall be the responsibility of the DB Entity.
 - 1. The units shall be designed for operation from a nominal input voltage of 12 VDC, and shall operate over the range of 9.5 VDC to 16.5 VDC. Equipment shall operate over the specified input voltage range without requiring any adjustment.
 - 2. The unit shall provide automatic restart of operation after a DC power failure. As the battery voltage gradually increases, the equipment shall not try to resume normal operation until the battery voltage reaches the lower limit of the operational voltage range.
- C. The DB Entity shall provide all internal logic level power supplies. All DB Entity supplied power supplies shall provide DC isolation and indicator LEDs.
- D. Each chassis, cabinet or sub-system shall have its own dedicated power supply. The DB Entity shall supply all such devices to include, but not be limited to, the power supply, power switches, fuses and surge protection.
- E. The DB Entity shall be responsible for selecting and supplying devices that shall not create electromagnetic interference that may affect any other MBTA system or that will be affected by any other EMI or radio systems.
- F. The power supplies selected shall have a proven reliable record in the application within the transit environment.
- G. All power supplies shall be designed for easy removal and replacement and not require any de-

soldering to remove or replace.

- H. The DB Entity shall provide for indication fusing and lightning and surge protection as the power enters the rack. Separately fuse power to each CPU (normal & standby) and to each of normal & standby input and output boards. An individual fuse shall be supplied for the energy to individual input and output circuit boards.

2.4 ARCHITECTURE REQUIREMENTS AND REDUNDANCY

- A. A second on-line operative unit shall be furnished and installed to provide a “hot” standby i.e. no requirement for running time before offline unit can take over, in the event of primary unit failure. The units shall be labeled “Normal” and “Standby.”
 - 1. The transfer from the normal to standby unit shall be seamless and automatic without special commands or programs. The transfer of control between normal and standby units shall not compromise continuity or protection of the operator controlled functions. These functions shall be designed in a fail-safe mode to prevent the clearing of signals into a protected section of track.
 - 2. There shall be no preference or default normal state in the transfer logic for normal or standby operation.
 - 3. Only one unit shall be enabled to output at any given time, this unit will be indicated as the “on- line” unit. The offline unit shall receive all inputs and execute all logic, but will have its outputs disabled. Transfer of control between the on-line and offline units shall only occur when the status and control panel is in the “Auto” mode and shall be seamless and instantaneous so as to not cause signals to go to stop or cleared routes to unlock. Only when the executive transfer logic determines that conditions are not favorable for instantaneous transfer of control, shall the system be required to place all signals to stop and run the longest approach time in order to enable its outputs and take control.
 - 4. The system shall include a status and control panel for bi-directional manual transfer and enable/disable of automatic transfer capabilities. The panel shall also include health and on-line indication for each unit as shown in the Contract Documents.
 - 5. Control of hot standby redundancy shall be implemented in executive software with no need for application software to address redundancy other than that required for proper interface and operation of the status and control panel.
 - 6. The redundant VMIS units shall execute the exact same logic/application when in their final configuration to support operations. There shall be no difference between the two systems.
 - 7. The power feeds to the redundant VMIS systems shall be isolated and separately fused so that a failure in one unit shall not affect the partner unit. The input/output circuits of each VMIS unit shall be separately fused and isolated so that the failure of either system will not impact the other.
- B. Each unit in the redundant VMIS system shall interface to an AC lamp module through vital direct outputs to control signal lighting energy to each LED unit in the wayside signals and TAK’s.

2.5 INPUT/OUTPUT REQUIREMENTS

- A. Inputs and outputs to the VMIS shall interface via direct input boards, direct output boards, and/or serial/network interface communications. The voltage type/level and vitality of the interface shall be as shown in the Contract Documents and implemented to comply with the requirements of these specifications and in accordance with applicable, recommended practices of the AREMA C&S

Manual.

- B. External apparatus requiring VMIS outputs via the hardwire interfaces shall include, but not be limited to, the following:
 - 1. Switch and Lock Movements,
 - 2. VMIS Transfer,
 - 3. Line Circuits,
 - 4. Lock Relay.

- C. External apparatus requiring VMIS inputs via the hardwire interfaces shall include, but not be limited to, the following:
 - 1. Track Relays,
 - 2. Switch Position and Locking (Back) Repeater relays,
 - 3. Line Relays (Lechmere to Science Park),
 - 4. VMIS Transfer,
 - 5. Vital Power Off Stick Relays,
 - 6. Maintenance PC,
 - 7. Status and Control Panel.

- D. Each input and output printed circuit board shall be equipped with a lighted status indicator on each port. The indicator shall be lighted when the respective port is energized.

- E. The vital processor units shall be provided with both double break vital output printed circuit boards, double break vital input printed circuit boards as specified herein. A sufficient number of these types of printed circuit boards shall be installed in each vital processor unit to accommodate the DB Entity's design. All inputs shall be double broke.

- F. The use of external relays as interface devices between the vital processor units and external circuits shall be as required by the DB Entity's design. Where proposed equipment requires external relays or other external devices, the DB Entity shall provide them at no additional cost to the MBTA.

- G. All input/output and interface wiring for either VMIS system (normal and standby) shall be designed to be completely isolated so that a failure of any component affecting one of the VMIS units will not impact the other system.

- H. Equipment shall operate normally and reliably, and accept inputs from standard vital relays in accordance with applicable, recommended practices of the AREMA C&S Manual. The unit shall provide outputs that operate standard plug-in vital, regular release relays of 500 ohms or less resistance from Alstom (GRS), Siemens (Invensys/Safetran), and Ansaldo (US&S). Equipment shall not normally require biased relays.

- I. The unit shall have isolated lamp driver outputs to power the signal lighting (LEDs - nominal 130 VAC operating voltage).

- J. Output and input functions shall be provided on different circuit boards. Any variations from this

shall be only as accepted by the MBTA.

- K. The dielectric requirements of the equipment shall be designed and manufactured to comply with recommendations as per AREMA C&S Manual, Part 11.5.1.
- L. All terminals shall be provided with independent surge and lightning protection so that each input and output is protected.
- M. The output circuit boards shall drive the vital relay loads directly and shall be proven in this application in not requiring any additional apparatus at the vital relay end of the circuit.
- N. All input circuit boards shall use opto-isolation on each input to the board.
- O. Wiring to all input circuit boards shall be double break as shown in the Contract Documents.
- P. Labels shall be provided for each input and output that clearly denote the respective function of each for ease of maintenance and troubleshooting. These shall be provided for all wiring and terminals and be complete with nomenclature and include a "to/from" designation.
- Q. All I/O points shall be clearly documented in the location book of plans, grouped by board.

2.6 OFFICE DEVELOPMENT SYSTEM

- A. The DB Entity shall provide a system that includes all tools, software and hardware systems that will permit the MBTA to maintain, modify, expand or reduce the system. This includes but is not limited to the modification of all aspects of the system such as changes to the design of the logic governing the interlockings, code systems address, baud rate, word count, number of input or output elements, circuit board expansion, or local control panel modifications.
- B. The DB Entity shall provide a complete and separate set of software and firmware that permits the complete development, simulation and debugging of the system and application software with real time monitoring capability.
- C. The software supplied shall be on an approved media with an unlimited site license.
- D. It is the intent of the MBTA to utilize graphical relay equivalents in the design change processing using the maintenance computer and/or laptop with the required programming equipment including but not limited to EEPROMs in the VMIS.
- E. The development system shall provide for modifications of signaling elements within each location. Each location's data and source code shall be partitioned into separate files. Each location's application and source code shall be supplied on both hard copy (4 copies) and an approved electronic media (4 copies).
- F. Development system software prepared by the manufacturer of the vital controller shall be provided. The development system shall be designed so that a signal engineer with no programming experience may modify or create the logic or data functions. The development system shall have a proven record of reliability with signal engineers in transit/railroad applications for a 5-year period.
- G. Training for the development system shall be included with that referenced in Section 16894 – TRAINING AND TRAINING MATERIALS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- H. The office development software shall include the required PROM/EPROM drivers required to

program the PROM/EPROMs.

- I. The DB Entity shall supply two sets of the required EPROM programmer hardware, EPROM eraser, software and cables required to operate from a standard PC.
- J. The office development system shall be capable of producing files that may be used by the Field Diagnostic System to program EPROMs.
- K. All hardware and software supplied with the development system shall be demonstrated to be completely compatible with the hardware and software system provided for this Project.
- L. One complete development system shall be provided for the MBTA's use and one complete development system shall be maintained in perfect working order on-the maintenance PC's at the specific location.

2.7 FIELD DIAGNOSTIC SYSTEM

- A. The DB Entity shall provide a complete and separate system that contains all required software that permits the complete diagnostic and debugging of the field system and application software. The software shall be installed and capable of operating on the maintenance PC's and with the laptop computers provided for this Project.
- B. The Field Diagnostic System shall be capable of easily performing the following functions:
 - 1. Monitoring data line errors,
 - 2. Monitoring CPU status,
 - 3. Real time diagnostic of each input/output port as to the status and condition,
 - 4. Determining the version of software running,
 - 5. Determining the status of any internal equation or bit state with actual nomenclature labels,
 - 6. Determining the system status.
- C. The Field Diagnostic System shall be capable of displaying dynamic real time data on the display screen. The displays shall include the name of each internal equation or input/output and the logic value for each. The system that is in service shall continue to operate on-line while the Field Diagnostic System is connected and operating.
- D. Field diagnostic system hardware shall include, but not be limited, to providing the following as a minimum: 3 laptop computers as described in Section 16899 – TECHNICAL SUPPORT MATERIALS FOR THE LIGHT RAIL SIGNAL SYSTEM and 2 maintenance PCs per CIH location as described in Section 16866 – NON-VITAL SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM;
- E. The Field Diagnostic System shall be capable of programming EPROM chips for the system.

2.8 EXECUTIVE FIRMWARE

- A. The Executive Firmware shall be stored on a ROM, PROM, or EPROM device and shall be replaceable without disturbing application dependent firmware.
- B. The Executive Firmware shall continuously test for a loss of control over the state of the hardwired outputs/inputs, a loss of control over RAM, a loss of vital data communications, and a

spontaneous change in the application dependent firmware.

- C. The Executive Firmware shall log all failures directly related to the VMIS and identify the faulty printed circuit card or function.
- D. All functions related to the hot standby redundancy shall be controlled by the Executive Firmware. Specialty application code related to hot standby management and control shall not be required.
- E. All functions required for system integrity evaluation, error logging, hardwire interface, timing, data communications, application logic execution, and the application of power to the vital controller shall be fully interleaved and executed by the Executive Firmware. Failure to pass any of the system integrity tests shall cause the system to cease all data communications and remove power, in a completely fail-safe manner, from the hardwire outputs.
- F. The vital microprocessor shall not allow invalid information to be transmitted to any external devices or subsystems that can create a hazardous condition. In no case may invalid information persist long enough to allow an unsafe condition to occur. Serial data transmission between subsystems shall incorporate approved data checking techniques and check sum values to ensure data integrity.
- G. Diagnostics shall act on current data only. Memory locations used to determine the proper state of inputs and outputs shall be cleared or overwritten prior to being reused during each cycle test to ensure the integrity of the check. The diagnostic checks shall be incorporated in the executive system's software and shall operate independent of the user application software for the system.
- H. Background diagnostic tasks shall run during application software wait states and shall serve to monitor and verify the integrity of the software execution. Synchronized tasks shall execute in the proper order. Checks shall be included to shut down the system in the event of an executive microprocessor overload.
- I. PROMs and/or EPROMs used shall be checked to ensure they have been unaltered during microprocessor execution. Check words and/or check sums shall be created for blocks of memory and/or logic equations to implement these tests.
- J. It shall be impossible through the implementation of the application software to overwrite or otherwise modify the executive software.

2.9 APPLICATION FIRMWARE

- A. The application firmware shall define the operation of the VMIS; the operation of the individual functions shall be as indicated on final designs and shall include, but not be limited to:
 - 1. Route Check,
 - 2. Signal Clearing,
 - 3. Signal Lighting,
 - 4. Time/Approach Locking,
 - 5. Route Locking,
 - 6. Switch Locking,
 - 7. Switch Control,

8. Switch Correspondence & Indication,
 9. Loss of Shunt Protection,
 10. All necessary data communication conditioning including the building of repeaters.
-
- B. The application firmware shall be keyed to the vital controller hardware rendering it impossible for any application dependent firmware to be executed in any vital controller other than the intended vital controller.
 - C. The application firmware shall be stored on an EPROM device and shall be replaceable without disturbing the executive firmware.
 - D. All application software shall have complete identification on the individual ROMs or other storage devices stating the software number, revision number, location, and all other information required to prevent the application of software to the wrong location.
 - E. The program shall be modularized in a logical and easily understood manner. Each module of the programs shall be fully annotated, including revision blocks, with plain English explanations of the function of each module and the methods and means it uses to accomplish its tasks. This shall include references to all related modules, required to take part in the execution of the instructions.
 - F. The internal states of each logic element shall be established by the system at power on or start-up reflecting real time field conditions without requiring any manned intervention at the location of the system.
 - G. The VMIS shall be capable of being programmed in Boolean and relay equivalents.
 - H. The application software listing for the system shall be provided in a readable hard copy printed in relay equivalent format.

2.10 CHASSIS CABINETS

- A. Any unused chassis slots shall be fully covered by blank removable plates or by a single piece cover made of the same material as used for the working circuit boards. All chassis shall have a solid protective cover on the front to protect the circuit boards and any switches or push buttons from accidental operation. The protective cover shall be removable. Provisions shall also be made to protect the backplane in an approved manner. The top portion of processor units shall be arranged so it prohibits its use as a shelf and having items such as tools, manuals, etc. placed upon it.
- B. The chassis or cabinet material shall be steel or aluminum or other non-corroding material as approved. Chassis shall be supplied with hinged rear panels that permit easy access to rear edge connectors.
- C. All chassis or cabinet internal edge connector to edge connector wiring shall be Tefzel wiring, unless approved otherwise.
 1. All backplane wiring methods and material are to be submitted for approval. This shall include, but not be limited to, wiring, connectors or motherboard.
 2. All wiring shall be twisted pairs where required to provide maximum isolation to EMI noise.

3. All support devices and internal chassis or cabinet elements shall be protected with an approved material to prevent wires from being cut or damaged.
- D. All chassis shall be flush mounted to the face of the rack unless otherwise approved.
- E. Any ventilation screens shall be easily removable for cleaning.
- F. All chassis or cabinets shall be completely covered or enclosed to prevent the entry of rodents. A complete detail of each chassis or cabinet shall be submitted for approval.
- G. Each chassis shall be grounded to the rack with a #10 AWG stranded green wire. No ground loops or series ground wires are permitted.

2.11 CIRCUIT BOARDS - GENERAL

- A. All circuit boards shall have a unique serial number clearly marked on each board. The board manufacturer's part number shall also be clearly marked on each board. All markings shall be of a permanent type.
- B. Each circuit board shall have all components clearly identified by a silk screening process. All markings shall be clear and easily readable. The markings shall include, but not to be limited to, polarity, switch position numbers, resistor identifications or integrated circuit identifications.
- C. Each circuit board shall be secured in the chassis in a secure manner such as captive screws or latching ejector tabs. Both the top and bottom of each board shall be secured.
- D. Each circuit board shall be coated with a moisture sealant after manufacture and testing.
- E. All boards will be newly manufactured for the purpose for which they are being utilized. The use of "re-worked" boards that change the original design or function of the board to fit the needs of this Project is prohibited.
- F. The DB Entity shall supply a minimum of one each of any extender card required to match each type of circuit board.
- G. The circuit boards shall be removable and be mounted on guide-ways or channels for ease of removal or insertion. The removal of any wire shall not be required to replace a circuit board.
- H. All circuit boards using any indicator LEDs shall have the LEDs mounted on the front edge of the board. The colors of the LEDs shall be as approved. Each LED shall be labeled on the circuit board in a permanent method.
- I. Each differing type of circuit board shall be uniquely keyed. The chassis slots for circuit boards of the same type shall be keyed to match the board and reject others. The keying methods shall be modifiable and submitted for approval.
- J. Each circuit board and chassis slot shall be provided to withstand a minimum arc-over potential of 600 volts between conductor and ground.
- K. All circuit boards shall have internal surge and polarity protection for power, data, control and indication inputs and outputs.

- L. All circuit boards and components shall be new. The use of refurbished material is not permitted.

2.12 SPECIFIC VITAL PROCESSOR UNIT PRINTED CIRCUIT CARDS

- A. Each vital processor unit shall be equipped with one central processing unit printed circuit card (CPS PCC). CPS PCCs throughout the VMIS shall be identical with the exception of the instructions stored in the Application Dependent Firmware EPROM and a keying system that shall prevent operation of the vital processor units when a CPS PCC from another vital processor unit is installed. This keying system shall be demonstrated to be designed according to accepted fail-safe principles. The CPS PCCs shall conform to the requirements shown below:
 - 1. The CPS PCCs shall contain the microprocessor, clock, random access memory (RAM), Executive Firmware, Application Dependent Firmware, data bus, address bus, and all other components of the computing portion of the system. Other printed circuit cards comprising the system shall be input-output adapters and interfaces only.
 - 2. The CPS PCCs may contain the hardware for the vital serial interface printed circuit cards as specified herein.
 - 3. The CPS PCCs shall not perform any of the functions or effect any of the connections to external devices specified for the input/output printed circuit cards.
 - 4. The Application Dependent Firmware EPROMs shall be mounted to the CPU printed circuit boards via sockets, the contacts of which shall be fabricated from commercial bronze or brass and plated with gold over nickel underplate.
 - 5. Wire jumpers and piggy-back boards shall not be permitted.
- B. Each vital processor unit shall be provided with vital serial/network data communication printed circuit boards (VSDC PCBs) as specified herein. The number of VSDC PCBs shall be sufficient to allow interconnection with the vital networks for communications with adjacent microprocessor units as allowed by these specifications and indicated in the Contract Documents.
 - 1. Each VMIS shall be equipped with VSDC's with enough capacity to be able to exchange individual parameters of vital information in an amount of 120% of the number required by the design without degradation in the performance of the system.
 - 2. A map of the parameters of vital information exchanged shall be contained in the application firmware.
- C. Each vital processor unit shall be equipped with vital input printed circuit boards (VI PCBs) as specified herein and as shown in the Contract Documents.
 - 1. VI PCBs shall be furnished and installed in sufficient number to accommodate all vital inputs within the vital processor units' scope of control including, but not limited to inputs as shown in the Contract Documents.
 - 2. The VI PCBs shall be capable of accepting inputs without the use of external or board mounted interface relays. Energy for the inputs shall flow directly from the relay contacts, line circuits, or signal equipment as described herein, through the specified cables, termination points and internal instrument house wiring.
- D. Vital timers shall be field settable and shall be selectable by means other than by modification to the application software designed for the interlocking. Vital timer selection switches shall be covered

and sealed to provide and insure the integrity of the settings and prevent accidental contact. Vital timers shall be furnished in a sufficient number to accommodate all vital timing functions within the vital processor unit's scope of control including, but not limited to:

1. Loss of shunt time for track repeater relays (TPSRs),
2. Approach/time locking timers: 30 sec to 10 minutes (TER),
3. Operate or release lag for the internal relays,
4. Output Enable timer for system transference.

2.13 COMMUNICATIONS PORTS

- A. Network data between vital microprocessors and other vital microprocessors shall be of a vital nature. Each VMIS shall be provided with vital serial/network communication ports. The use of external converters is prohibited, except as accepted by the MBTA.
- B. The system shall default to the most restrictive state unless a valid transmission of data is received.
 1. Transmitted data between subsystems shall be updated regularly to ensure the integrity of the communications link. Vital executive software in each microprocessor shall detect corrupted or inconsistent data received.
- C. Visual LED indicators shall be provided to indicate the status of communications between multiple vital microprocessors.

2.14 MANUALS AND DOCUMENTATION

- A. All required documentation shall be delivered to the MBTA upon final acceptance of submittals. All documentation shall be delivered in the form of 10 bound hardcopies (6 for the maintenance and engineering department and 4 for the training facility) and two (2) electronic copies on CD (.PDF format). The electronic copies shall come with the necessary software for viewing and updating the documentation by the MBTA.
- B. Deliver complete documentation of software development subsystems for applications programming to allow the MBTA to perform in-house modifications to the applications logic by personnel with a signal engineer classification.
- C. Deliver complete integrated circuit drawings of all boards to a component level and supply trouble-shooting procedures to a component level.
- D. Deliver complete copies of all maintenance manuals for the installed VMIS system, including specialty component/module documentation, complete with troubleshooting procedures and detailed parts lists. These manuals shall consist of two types, manufacturer generic and application specific. Both types shall be written so that an average, qualified technician is enabled by the reading thereof to maintain, repair, test and adjust the equipment. The application specific manuals shall include a complete description of the system operation, installation, alignment and adjustment procedures, and troubleshooting tables/logic charts to assist in locating malfunctions and locating failed components.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Instrument racks shall be arranged and mounted in central instrument houses as indicated in the Contract Documents in accordance with the accepted installation plans.
- B. The cardfiles shall be mounted in shock mounted instrument racks sized to accept standard 19-inch modular components. All wire connections to the cardfiles shall be via plug connected cables.
- C. All cables or wiring leaving the instrument racks shall be routed through rubber boots at the top of the racks and shall be neatly routed and securely fastened with tie straps.
- D. All I/O, including spares, shall be wired through Din Rail mounted terminal blocks installed within the same rack as the I/O points which they are connected for ease of access.
- E. The mounting of cardfiles and associated equipment shall provide for easy access to all test points, indicators, and adjustments.
- F. The normal and standby units shall be in the same row and shall be on adjacent racks.
- G. Mounting height of microprocessor equipment within a central instrument house or room shall be restricted to an area between 1.5 feet and 5.5 feet above the finished floor.
- H. Provisions for EMI mitigation (shielding) shall be made as determined by results of the DB Entity's investigation to ensure proper operation of equipment relative to the environment.

3.2 IDENTIFICATION

- A. Card files shall be supplied with a printed label which identifies the input and output ports on the PCB by the name assigned to the port in the application firmware.
- B. Ports shall be identified by the slot number of the PCB and the port number on the PCB.
- C. A method, as accepted by the MBTA, shall be used to mount a typed, or printed, name tag on a front plate of each rack or cabinet.
- D. All wiring and wire terminals shall be tagged in an approved manner.

3.3 FACTORY TESTING

- A. The VMIS shall undergo qualification testing in accordance with Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM and manufacturer's recommendations.
- B. The VMIS and all subsystems shall be tested in accordance with the approved Factory Test Procedure.
- C. The entire central instrument house shall be set up at the point of assembly, with all equipment installed. The racks and cabinets shall be pre-wired in accordance with the Design Documents. Simulate functions external to the CIHs where required for both interim and final (in-service) arrangements. All functions of the system shall be tested to determine that each function of the system operates as required.
- D. Make adjustments and correct defects in the CIH's wiring as necessary to obtain proper operation and satisfactory test results.

- E. All design changes found necessary to obtain proper operation shall be submitted to the MBTA for acceptance.
- F. The unit shall be subject to acceptance by the MBTA in respect of both hardware and software based on the provisions of this Section. Initial acceptance will be resultant from successful factory testing. The second and final acceptance will result from successful in-service operation as described herein.
- G. The DB Entity shall prepare and provide a complete and comprehensive system acceptance test procedure. The system acceptance test shall be sufficient for the MBTA to determine to its reasonable satisfaction that the unit performs properly as a whole, including but not limited to, all operational functions.
- H. The final system acceptance test shall commence after both the hardware and software have been successfully installed in the field.
- I. The final system acceptance (in-service) test shall be deemed passed only if and when:
 - 1. The system acceptance test has been successfully completed and no problems remain and all modifications, as a result of testing, are made final.
 - 2. The MBTA has successfully operated the unit for a period of not less than 30 consecutive days during which time a series of tasks and verification procedures have been performed as determined by the MBTA to be sufficient to enable the MBTA to determine that the unit operates in accordance with its functional specifications and its design specifications.
 - 3. Throughout the period specified in the above item, the unit has not failed and no problems have been discovered.
 - 4. In the event that problems are discovered during the system acceptance period or during any additional test period as provided herein, the time shall be extended an additional 30 consecutive days from the “acceptance date” date from which the DB Entity has notified the MBTA and said problems have been corrected.
- J. The “final acceptance date” shall be the day the system acceptance test has been passed pursuant to items H and I above.

3.4 FIELD TESTING

- A. The VMIS and subsystems shall be tested in accordance with Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM and manufacturer’s recommendations.
- B. The latest type test unit for testing vital microprocessor interlocking equipment, as recommended by the manufacturer, shall be provided to assist diagnosing the components, software and proper system operation.

3.5 CONFIGURATION CONTROL PROCEDURE

- A. The DB Entity shall follow a strict revision control procedure for VMIS software. This procedure shall be submitted for acceptance. At a minimum this plan shall include:
 - 1. Revision number structure and log to track revisions, reasons for revision, and review/acceptance status.
 - 2. Procedure and documentation for comparison and review of software changes to ensure that

- only intended changes were made to the application software including review and verification by independent checkers.
3. Procedure and documentation for limited retest of software revisions with required tests, procedures and test data sheets.
 4. Procedure and documentation for installation of software and verification of successful install of the proper version prior to testing.
- B. The DB Entity shall follow a strict revision control procedure for VMIS hardware. This procedure shall be submitted for acceptance. At a minimum this plan shall include:
- C. At the beginning of the factory test, the hardware configuration of the VMIS system and all components shall be recorded. The information recorded shall include the following for each component:
1. Description and number
 2. Serial number and revision level
 3. Rack location
- D. The hardware configuration information shall be maintained as comments in the program listing as well as on a plan in the plan books. It shall be updated with any changes and each update shall include a clearly worded reason for the change.

3.6 GUARANTEE

- A. For a period of 12 months commencing on the “final acceptance date,” the DB Entity shall guarantee that the unit is free from defects in design, material and workmanship and that the unit shall operate in the manner intended as described in these Mandatory Specifications, including but not limited to, the compatibility of the hardware with the software. The DB Entity’s guarantee hereunder shall extend to all elements of the unit supplied pursuant to this Mandatory Specification, whether supplied directly by the DB Entity or not.
- B. For the purpose hereof, a “design defect” shall include, but not be limited to the selection and arrangement of hardware, software and other related to similar elements of the system, whereby such inadequacies or weaknesses prevent a component of the system from providing fully satisfactory performance as intended by the design represented in the Contract Documents.
- C. Depending upon the nature of the defect and the equipment concerned, it shall be rectified promptly by the DB Entity on site, free of any cost to the MBTA, or returned to the DB Entity for repair or replacement free of any charge whatsoever, or at the option of the MBTA, it may be rectified by the MBTA in accordance with the DB Entity’s instructions. In this latter event, direct labor and material costs will be charged to the DB Entity.
- D. Work performed by the DB Entity, or items replaced by him under his guarantee, shall be similarly under guarantee for an additional 12-month period.
- E. Changes made to hardware or software under the guarantee shall also be made to spare items furnished or subsequently ordered from the DB Entity.
- F. Normal maintenance of the unit and repair of components by the MBTA, or under maintenance contract, in accordance with the DB Entity’s instructions or accepted practice, shall under no

circumstances relieve the DB Entity of these responsibilities under this guarantee.

- G. Where there is any conflict with the DB Entity's standard guarantee, the guarantee statements in this Mandatory Specification shall govern.

END OF SECTION

SECTION 16860

RECTIFIERS, BATTERIES AND BATTERY CHARGING EQUIPMENT FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing rectifiers, disconnect switches, batteries and battery charging equipment as specified herein.

1.2 QUALITY ASSURANCE

- A. Test each rectifier and battery charger before shipping to the job site. This factory testing shall be conducted in accordance with the DB Entity's Factory Test Procedure for rectifiers and battery chargers as accepted by the MBTA. Prior to shipment, a copy of the manufacturer's certification of compliance with factory tests shall be forwarded to the MBTA.
- B. Inspect each rectifier after it has been installed and correct deficiencies.

1.3 SUBMITTALS

- A. In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following for approval:
- B. Load calculations of each DC load. The calculations shall identify normal and worst case conditions for each load. Include results of testing for minimum five-day period under simulated load, 4 hours on-charge and 4 hours off-charge in calculations to ensure capability of battery bank to maintain connected load for 4 hours;
- C. Complete product and performance data for each type and size of rectifier, disconnect switch, storage battery and battery charger to be furnished. The submittal must show that the charging equipment is designed to work as a system with the batteries (type, size, etc.) being provided;
- D. Factory Test Procedure for each type of rectifier, disconnect switch, storage battery and battery charger to be furnished;
- E. Prior to installation of rectifiers, disconnect switches, storage batteries and battery chargers, certification of compliance with factory test requirements shall be submitted to the MBTA.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Rectifiers, disconnect switches and battery chargers shall be properly crated or securely mounted in the CIHs as determined by the DB Entity to prevent damage throughout delivery, storage and handling.
- B. Storage batteries shall be furnished, in a fully charged condition. Each storage battery shall be equipped packaged to prevent spillage of the electrolyte. Storage batteries shall be shipped separately from the CIH and enclosures.
- C. The DB Entity shall replace any equipment damaged, lost, or stolen at no additional cost to the Project.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Battery Chargers

1. Battery charging equipment shall be designed for continuous operation. Provide battery chargers suitable for operation with the number and types of batteries required for operation of the signal equipment being furnished.
2. All battery charging equipment as specified herein shall meet the applicable requirements of AREMA C&S Manual, Parts 9.2.1, Recommended Functional/Operating Guidelines for a Constant Voltage Battery Charger, and 9.2.5, Recommended Functional/Operating Guidelines for a Constant Current Battery Charger where applicable requirements of the AREMA Manual do not conflict with any requirements specified in this Section.
3. Provide chargers that deliver a stabilized output voltage, are temperature compensating, and output current limiting. Furnish chargers that automatically adjust their output current according to the load and the demand on the battery. Battery charging equipment shall be designed to deliver rated outputs for the batteries with input voltage of 100 to 130 Volts AC at 60 Hz, single-phase, two wire input.
4. Determine charger size and capacity based on submitted and approved load calculations. Normal and reserve chargers shall be provided in a load-sharing configuration. Individual battery chargers shall be capable of handling the entire calculated load plus 50%.
5. Chargers shall be equipped with appropriate filtering to maintain ripple voltage within manufacturer's recommended limits for the solid state equipment that it feeds with, or without, batteries connected.
6. Each charger shall be provided with an adjustment device to change the rate of output current.
7. Terminal markings for AC and DC terminals shall be permanent.
8. Indications shall be provided as shown in the Contract Documents.

B. DC Switch-and-Lock Movement Rectifiers

1. The DB Entity shall furnish and install 120 Volt AC to 120 Volt DC rectifiers to provide the required switch-and-lock movement motor control voltage. The switch-and-lock movement rectifiers shall be the manufacturer's standard for the type of switch-and-lock movement layout that the DB Entity proposes to furnish.
2. One switch-and-lock movement rectifier shall be provided for each switch-and-lock movement layout.

C. Disconnect Switches

Provide disconnect switches to operate signal power circuits as shown in the Contract Documents and for other approved devices as the signal design may require. Disconnect switches provided shall comply with all local codes.

D. Storage Batteries

1. The DB Entity shall furnish sealed lead acid gel filled storage batteries for all applications as specified herein.
2. The battery case shall be molded from flame retardant polypropylene, with separators of spun

glass microporous matrix

3. All batteries as specified herein shall meet the requirements of AREMA C&S Manual, Part 9 for lead acid batteries where the AREMA recommendations do not conflict with any requirements specified in this Section.
4. Storage batteries shall be sized to provide a minimum 4-hour standby capacity. The DB Entity shall calculate the loads based upon the equipment that the DB Entity proposes to furnish.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

1. The DB Entity shall provide all mounting hardware, terminals, terminators, etc. for the installation of wall-mounted rectifiers, disconnect switches and battery charger units in the central instrument house.

B. Storage Batteries

1. The storage battery cells shall be placed in the battery enclosures on wooden trays and mounted on steel racks of a design and size that allows for visual inspection of each cell and easy access to terminal connections.

3.2 TESTS

Tests shall be performed in accordance with the requirements of this Section and those of Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

3.3 PAINTING

Paint wooden trays and steel racks with two coats of approved acid resistant paint.

END OF SECTION

SECTION 16861

DC POWER SUPPLIES FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing redundant, direct current regulated power supplies of various voltages to supply energy to all signal system equipment as required.
- B. Power supplies for line battery (LB), B12, and B24 shall be provided in a Normal/Reserve configuration. Individual supplies shall be capable of supplying the entire calculated load plus 50%.
- C. The power supply output shall be isolated from ground to permit grounding of either positive or negative output terminals.
- D. Wiring shall be of sufficient size to carry the rated loads with a voltage drop of not more than 5% for secondary side circuits and 10% for signal power mains. The size of the wiring shall be rated to carry a load equal to 150% of the total load that can be reasonably imposed by the portion of the signal system to be fed.

1.2 QUALITY ASSURANCE

- A. The power supplies furnished under this Project shall undergo all tests and inspections required to ensure compliance with this Section.
- B. The factory test of power supplies or power supply components shall be the manufacturer's standard. Transformers shall meet the requirements of the latest revisions of AREMA C&S Manual Part 14.2.10, Recommended Design Criteria for Transformer, Dry-Type, Air-Cooled, where applicable and where the AREMA recommendations do not conflict with any requirements specified in this Section.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following to the MBTA for acceptance:

- A. Complete mechanical and circuit drawings of DC power supplies and protection to be furnished,
- B. Complete product and performance data of each type and size of DC power supply and related equipment to be furnished,
- C. Proposed location and method of mounting DC power supplies and storage batteries,
- D. Complete circuits for power alarms,
- E. Factory test procedures and forms,
- F. A signed certification of compliance with factory test requirements, prior to installation of the DC power supplies,
- G. Drawings for the complete power layout of feeders, transfer switches, fuses, busses indicating the size

of the individual units and their locations,

- H. Calculations to verify that the sizes of wiring shown on the Contract Documents, or proposed, are sufficient. Any variation in sizes of wiring from that shown on the Contract Documents must be approved, in writing, prior to the manufacture of the power supply equipment.
- I. Calculations to verify that the size of the DC signal power supplies required for the equipment are adequate. If the power calculations are found to be incomplete or inaccurate, they will be returned for completion, or correction, and will require re-submittal.

PART 2 - PRODUCTS

2.1 DESIGN REQUIREMENTS

- A. All semiconductors shall be silicon type with JEDEC numbers.
- B. Power supplies shall be designed so that the filter capacitors can be replaced without removing the supply from the rack on which it is mounted.
- C. Transformers shall not emit audible noise in excess of 45 db, referenced to 0.0002 dynes/cm² at a distance of two feet, at rated voltage and current.
- D. The power supplies shall be capable of withstanding 600 Volts, 60 Hertz applied for one minute between both input leads connected together and the case; between both output leads connected together and the case; and between both input leads connected together and both output leads connected together.
- E. The power supplies shall be designed for continuous operations.
- F. Input voltage shall be 120V AC plus or minus 15% , 60 Hz plus or minus 0.5Hz, single-phase, two-wire input.
- G. Failure detection circuitry shall include the alarming of failures that affect the ability of the power supply to deliver the rated load. A normally closed independent contact shall be provided for connection of external circuitry for alarm indication. The power supply front panel shall contain one voltage failure light, one output ammeter and output voltmeter. Meter accuracy shall be plus or minus 2% with nominal voltage readings at center scale.
- H. Dual power supplies located within the same enclosure shall be designed and installed so that a failed supply can be removed and replaced without causing the operating supply to be de-energized.
- I. All power supplies shall be clearly and permanently labeled with the manufacturer's name, serial number, part or model number, and the input and output rating.

2.2 PROTECTION REQUIREMENTS

- A. The power supply shall be so designed that it will not be damaged by operating at an input voltage range between zero and 140 V AC.
- B. A separate output filter and high frequency by-pass capacitor shall be located on the load side of the isolating diode.
- C. Reverse output current protection shall be provided to prevent shorting or sagging of tandem power

supplies in the event of filter capacitor failure.

- D. The power supply output terminal shall contain a non-conducting device or insulated safety shield to protect personnel from electrical hazards. The device shall protect and be rated not less than four times the output of the power supply.

2.3 MECHANICAL REQUIREMENTS

- A. The power supply shall be a panel/chassis combination with a perforated protective cover. The design shall be such as to provide natural convection cooling.
- B. The front mounting shall be designed to mount in a standard, 19-inch rack space with E.I.A. hole spacing.
- C. Terminal binding posts for input and output and alarm circuits shall be provided. Each terminal shall be insulated from the frame of the unit.

2.4 12V DC POWER SUPPLIES - GENERAL

- A. Output voltage shall be 12V plus or minus 1% with 120V AC plus or minus 1% input at a temperature of 25 degrees C. The output voltage shall be adjustable within a plus or minus 0.5V DC range of nominal by means of an adjustment control within the supply.
- B. The output voltage at 50% load shall not vary more than plus or minus two for an input line change of plus or minus 15% over a temperature range of minus 30 degrees C to (plus) 70 degrees C.
- C. The output voltage shall not vary more than the values as specified below due to load variation at constant input voltage and ambient temperature as referenced to the output voltage at 50% load:
 - 1. Plus 7% from 0% to 10% of maximum load,
 - 2. Plus 3% from 10% to 25% of maximum load,
 - 3. Plus or minus 2% from 25% to 75% of maximum load,
 - 4. Minus 3% from 75% to 100% of maximum load.
- D. With the worst combination of line, load and temperature variation as specified above, the output voltage shall not be less than 10.8 volts nor more than 13.5 volts.
- E. During the warm-up period to achieve power supply stabilization, output voltage shall not be greater than 14.5V DC. Warm-up time shall not exceed 20 minutes.
- F. Power supply output ripple shall not exceed 0.12V RMS and the noise shall be limited to 1.40 Volts peak-to-peak, at any frequency. During warm-up, ripple shall not exceed 0.9V RMS and the noise shall be limited to two Volts peak-to-peak.

2.5 TRANSFER SWITCHES

- A. The DB Entity shall furnish and install automatic transfer switches for each normal and alternate power supply except for those supplies that are operated in parallel or are equipped with internal transfer switches with redundant supplies.
- B. Transfer switches shall operate when they sense failure on the DC output.

PART 3 - EXECUTION

3.1 APPLICATION

- A. A means shall be provided to isolate each DC power supply for maintenance purposes, without interrupting the supply of power to the loads.
- B. Fuses providing overload protection for the DC power supplies shall be of the electrical indication type and shall be circuited to provide fuse failure alarm.

3.2 TESTS

- A. All power supply equipment shall be tested for rated output voltage and grounds in conjunction with the factory testing procedures, as accepted by the MBTA. Also, the DB Entity shall perform complete testing and adjustment of the total installed power systems as specified in Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Each alarm circuit shall be tested individually to assure that it indicates the proper alarm condition as shown on the Design Documents.

END OF SECTION

SECTION 16862

100 HZ FREQUENCY CONVERTERS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. The work to be done under this Section shall consist of furnishing, installing, and testing 60 Hz to 100 Hz frequency converters and related frequency-synchronizing equipment.
- B. Equipment supplied shall be rugged, designed for high-reliability and long life in a transit system environment containing significant amounts of conductive rail dust and other airborne particulates.
- C. The equipment supplier shall have successfully manufactured and placed in-service similar equipment for railway application.

1.2 QUALITY ASSURANCE

Installation and equipment provided shall comply with the latest published issues in effect at the date of Project Award of the following applicable standards, codes, recommendations or requirements of the following organizations.

- A. American National Standards Institute (ANSI),
- B. American Railway Engineering and Maintenance-of-Way Association,
- C. American Society for Testing and Materials (ASTM),
- D. Institute of Electrical and Electronic Engineers (IEEE),
- E. Insulated Cable Engineers Association (ICEA),
- F. National Electrical Manufacturers' Association (NEMA),
- G. National Electric Code (NEC),
- H. Underwriters Laboratories, Inc. (UL).

1.3 SUBMITTALS

- A. Prior to the submittal of shop drawings, the DB Entity shall submit proposed manufacturers' product data for approval. The submitted product data shall include catalog and other descriptive information sufficient to assess the suitability of the proposed equipment for its intended purpose. Descriptive information shall include electrical ratings, features, environmental requirements, and approximate dimensions. Product submittals shall be clearly marked with dark ink so that the equipment and accessories being proposed are identified; "highlighting" of proposed items is not acceptable. Product submittals shall be clearly identified in transmittals as being Product Submittals.
- B. Prior to the purchase of the equipment, the DB Entity shall submit complete shop drawing and performance data specific to the equipment to be furnished and installed. The shop drawings shall include one-line, schematic, control and indication circuit and point-to-point wiring diagrams, arrangement drawings, dimensions, typical installation details and a complete parts list. Protective device ratings and time-coordination curves shall be provided for all protective devices to be

supplied (circuit breakers and fuses). Separate sets of shop drawings shall be provided for each different type and rating of equipment being supplied. The shop drawings shall be prepared in accordance with Section 16804 – DRAWINGS FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications. Title block information shall include the name and number of the Project for which the drawings are being prepared, and the intended location for each piece of equipment.

- C. Prior to factory testing of the converter(s), the DB Entity shall submit a Factory Test Procedure for acceptance to the MBTA. Factory testing shall not commence until the Factory Test Procedure has been accepted in writing.
- D. Prior to delivery of the converter(s), the DB Entity shall submit five copies of the Certified Factory Test Report for acceptance by the MBTA.
- E. Also, prior to delivery of the converter(s), the DB Entity shall submit to the MBTA for acceptance a Field Test Procedure for on-site testing of the frequency converter(s) and connected circuits.
- F. Prior to delivery of the converter(s), the DB Entity shall submit five sets of converter operation and maintenance (service) manuals to the MBTA for acceptance. The manuals will contain, at minimum:
 - 1. Most recent versions of electrical schematics;
 - 2. Instructions for converter installation, synchronizing, start-up, operation, and maintenance;
 - 3. Instructions for servicing or replacing removable parts;
 - 4. Control settings;
 - 5. Troubleshooting instructions;
 - 6. Complete parts listing;
 - 7. Manufacturer telephone number for parts and service.

PART 2 - PRODUCTS

2.1 STATIC FREQUENCY CONVERTER

- A. Ratings
 - 1. Input
 - a. Nominal Voltage: 115 V AC $\pm 10\%$
 - b. Phases: One
 - c. Wires: Two
 - d. Frequency: 60 Hz (signal supply frequency)
 - 2. Output
 - a. Nominal voltage: 120 V AC, user-adjustable at least $\pm 10\%$
 - b. Phases: One
 - c. Wires: Two (floating)

- d. Maximum load regulation: \pm %, for a no-load to full-load change
 - e. Continuous (full) load rating at nominal input and output voltage: 4000 V AC
 - f. Two-hour overload capacity: 110% of continuous load rating at nominal input and output voltage
 - g. Frequency: 100 Hz, fixed, crystal-controlled with max. 0.1% accuracy
 - h. Minimum efficiency: 75% at full load
 - i. Harmonic distortion: less than 2% voltage and current THD (sinewave)
 - j. Power factor: rated full load shall be delivered to a power factor of 0.7 leading or lagging
3. Ambient Conditions for Converter Operation:
- a. Temperature Range: comply with AREMA Class C requirements unless otherwise accepted by MBTA.
 - b. Humidity Range: 0 to 95% non-condensing
4. Other Requirements
- a. Audible noise shall not exceed 45 dB at a distance of 10'.
 - b. The converters shall be capable of operating in the configuration as shown on the Contract Documents.
 - c. The converters shall automatically reset to normal operation after exposure to a momentary power outage, such as due to an upstream automatic transfer switch operation.

2.2 Additional Features

- A. Provide equipment for mounting with standard 19-inch rack and chassis with heavy-duty sliders.
- B. Front panel-mounted input on-off circuit breaker: fast-acting, 2-pole circuit breaker with 22,000 Ampere min. interrupting rating at 120 V AC.
- C. External Synchronization - Provide equipment having the following synchronization capabilities/features:
 - 1. Provide two wire, transformer-isolated input terminals for a 120 V nominal 100 Hz synchronizing signal.
 - 2. When a 120 V, 100 Hz reference signal is applied to the synchronizing terminals, the output of converter shall lock onto and track the reference signal.
 - 3. With no 120 V, 100 Hz reference signal, control of converter output frequency shall automatically switch to an internal 100 Hz crystal-controlled oscillator.
- D. Overload Protection
 - 1. Provide automatic current-limiting feature for sustained overloads in excess of the 110% two-hour rating. Current-limiting shall be a constant-current mode which provides maximum load current without distortion of output waveform. Converter shall automatically reset to normal operation after overload has been removed.
 - 2. Provide internal temperature sensor for activating over temperature shut-down of converter on

damaging over temperature.

- E. Short circuit protection: provide electronic short circuit protection which automatically opens converter output circuit upon detection of a short circuit, and auto reset upon removal of short circuit.
- F. Provide three front panel-mounted digital multimeters for output frequency (Hz), true-RMS voltage (V) and true RMS current (A), meter accuracy shall be 1% full-scale (± 1 digit) or better.
- G. Provide alarm contacts and panel lamps to indicate:
 - 1. Loss of converter output,
 - 2. Loss of 120 V AC reference signal,
 - 3. Over temperature condition,
 - 4. Out-of-phase condition between the 120 V, 100 Hz reference and the converter output
- H. Provide easily-accessible, removable filters for filtering of rail dust and other airborne particulates.
- I. All PC boards shall be conformally-coated (environmentally sealed).
- J. Cooling fans: any fans required for cooling of critical components shall be redundant, such that failure of a single fan will not cause over temperature shut-down of the converter.
- K. Provide transformer-isolated input and output stages with surge protection.
- L. All internal components where wires originate or terminate shall be identified by unique markings.
- M. All internal wiring shall be labeled and/or color-coded at all points of origination and termination.
- N. Large capacitors shall be automatically discharged through a resistance upon shut-down of converter.

PART 3 - EXECUTION

3.1 TESTING

A. Factory Testing

The following minimum tests shall be conducted at the factory in accordance with the accepted Factory Test Procedure. Each converter, identified by a unique serial number, shall be tested. The results of these tests shall be documented in the certified factory test report.

1. Point-To-Point Wiring Checks

The origin and termination points for all converter wiring shall be verified against the equipment shop drawings. Wire tags and color coding at wire origin and termination points shall be in agreement with the shop drawings.

2. Mechanical Inspection Checklist

All components and connections shall be inspected for proper markings and installation, and shall

be in agreement with the shop drawings.

3. Vibration Testing

Each converter shall be subjected to testing on a vibration table. After a period of five minutes of continuous vibration, the converter shall be inspected for loose parts and connections. Loose parts and connections shall be tightened.

4. Load Tests

- a. Each converter shall be tested at no-load and 10%, 25%, 50%, 75%, 100% and 110% of full rated output. For each load level, the following values shall be measured with laboratory-grade, calibrated precision instruments:

Input and output voltage, current, and watts,
Input and output frequency,
Output voltage distortion (%THD),
Efficiency (output Watts/input Watts).

- b. At each of the above load levels, the readings of the panel meters shall be recorded. The accuracy of the meters shall be calculated at each of the load levels.
- c. The output load regulation shall be calculated at each of the load levels.
- d. Provide verification of current-limiting operation mode by briefly subjecting the converter to a load in excess of 110%. Record input and output voltage, current, watts and frequency, and compare against expected values.

5. Burn-In Tests

Each converter shall be subjected to a continuous 100% rated load test for a duration of at least eight (8) hours without shutdown, current-limiting operation, damage, or failure.

The MBTA retains the right to witness the factory testing. Frequency converter tests shall be included as part of the overall factory test item included in the approved CPM as submitted by the DB Entity.

B. Field Testing

1. Field tests shall be performed in accordance with the accepted Field Test Procedure. Field tests shall include mechanical inspections, and operational checks for all converter functions.
2. All operational tests and circuit checks shall be recorded in accordance with the accepted Installation, Inspection & Field Test Procedures and the requirements of Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.

END OF SECTION

SECTION 16863

SIGNAL TRANSFORMERS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the procurement of signal transformers as specified herein.
- B. All transformers shall be air-cooled unless otherwise accepted by the MBTA.
- C. Transformers shall be provided for signal power isolation purposes, 100 Hz AC track circuits, signal lighting, and general purposes as required by the DB Entity.
- D. All transformers shall be rated to carry 125% of the total load continuously.
- E. Additional requirements for transformers are referenced in Section 16872 – TRANSFORMERS FOR THE LIGHT RAIL SIGNAL SYSTEM, and shall be followed where they do not conflict requirements of this Section.

1.2 QUALITY ASSURANCE

- A. Inspect and test each transformer prior to shipment. This inspection shall conform to the DB Entity's Factory Inspection and Testing Procedure as accepted by the MBTA.
- B. Transformers shall be in accordance with the latest revision of AREMA C&S Manual, Part 14.2.10, Recommended Design Criteria for Transformer, Dry-Type, Air-Cooled for single-phase transformers, where the AREMA recommendations do not conflict with any requirements specified in this Section.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following to the MBTA for acceptance:

- A. Drawings, wiring diagrams and catalog cuts with information regarding performance data of all the transformers being provided under this Project;
- B. A factory inspection and test procedure;
- C. Calculations for the sizes of transformers required for the loads created by the equipment being furnished and installed under this Project. One copy of these calculations shall be forwarded to the MBTA prior to shipment of the transformers.
- D. A field installation inspection and test procedure.

1.4 DELIVERY, STORAGE AND HANDLING

- A. 1.4.1 Transformers shall be protected from damage throughout delivery, storage and handling in accordance with the requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM, and all other applicable provisions of these

Specifications.

- B. Damage to material resulting from improper storage or handling by the DB Entity shall result in replacement of all damaged material with new material by the DB Entity at no additional cost to the MBTA.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Basic Consist

1. Transformers shall be provided with sufficient primary and secondary voltage taps to adjust for varying feeder voltages between 90 and 125 Volts.
2. Transformers shall not emit audible noise in excess of 45 dB, referenced to 0.0002 dynes/cm² at a distance of ten feet, at rated voltage and current.
3. The primary and secondary taps shall be brought to terminals mounted inside the transformer case. An AREMA terminal connection for each primary and secondary tap shall be provided external to the transformer. All terminals shall be identified in an approved manner.

B. Track Transformers

1. The track feed transformers required for the power frequency track circuits shall be equipped with AAR terminal boards containing terminals for the primary and secondary leads.
2. The track secondary windings shall be arranged to provide for varying the voltage in one-volt steps up to a maximum of 18 Volts. The primary excitation shall be 120 Volts, 100 Hertz.
3. All track feed transformers shall have a volt-ampere rating sufficient to handle 125% of the maximum calculated operating load.
4. Track transformers shall not be susceptible to DC saturation by propulsion currents.

C. Signal Power Transformers

1. Transformers for signal power shall be single-phase with 480 or 208 Volt, 60 Hertz, primary windings; 120 Volt, 60 Hertz, secondary windings and with isolation properties as required.
2. The transformer windings shall contain Class H insulation with four 2-1/2% full capacity taps, two above normal voltage and two below normal voltage.
3. The transformer enclosures shall be of drip-proof construction and furnished complete with provisions for rack or wall mounting.
4. Signal power transformers required for each central instrument house location shall be rated for 125% of the calculated normal load. If required for wayside case locations, they shall be sized in accordance with the approved load calculations.

D. Housing Power Transformers

Housing power transformers for lights, receptacles, etc. in the central instrument houses shall be single-phase, rated for 125% of the calculated normal load with 60 Hertz primary windings for voltages as required and 120-Volt, grounded, 60 Hertz secondary windings.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Transformers shall be installed as shown on the Design Documents.
- B. Track transformers shall be rack- or wall-mounted and in accordance with the Design Documents.

3.2 TESTS

- A. The DB Entity shall test and inspect each transformer with its associated system in accordance with the approved factory test and inspection procedures.
- B. Prior to energizing for operations, all electrical equipment shall be rechecked for proper rating and operation. Cables and equipment shall be checked for circuit continuity and isolation. Ground connections shall be checked for ground resistance values.
- C. All operational tests and circuit checks shall be recorded in accordance with the accepted Installation, Inspection & Field Test Procedures and the requirements of Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.

END OF SECTION

SECTION 16866

NON-VITAL SUPPORT SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the final design, furnishing and installing of non-vital support systems at each CIH location under the Project. The major components specified herein are as follows:
 - 1. Microprocessor based Non-Vital Microprocessor Interlocking Systems (NVMIS) and associated hardware,
 - 2. Maintenance PC's,
 - 3. Ethernet Switches,
 - 4. Status and Control Panels,
- B. The MBTA preference is for an architecture that combines the VMIS and NVMIS from the same manufacturer to limit the hardware requirements. The DB Entity may however, propose an alternative or variations to this architecture.
- C. All equipment supplied shall be fully compatible with all other non-vital and vital equipment shown in the Contract Documents and as specified herein. If the DB Entity's proposed equipment requires the use of additional equipment not shown in the Contract Documents or specified herein to meet the requirements of the Project, said equipment shall be submitted for acceptance and, if accepted, shall be provided at no additional cost to the MBTA.
- D. Other work to be done under this Section shall include the preparation of design drawings for the various intersystem circuits and software models that integrate the NVMIS, Control and Indication Panels, Status and Control Panels, NVMIS I/O, Remote I/O, VMIS, Maintenance PC, Event Recorders and various data links.

1.2 QUALITY ASSURANCE

- A. The DB Entity shall certify, via environmental testing or test data therefrom, that all components of the non-vital system the DB Entity proposes to furnish will successfully operate, in an environment consistent with the AREMA C&S Manual of Recommended Practices Section 11.5.1 for a Class C environment without the use of environmental controls. If the DB Entity's proposed equipment is presently in service on the MBTA, in an identical application, this requirement (with the exception of EMI testing) shall be waved.
- B. All non-vital system components, assemblies and sub-assemblies, shall be fully factory tested in accordance with accepted Factory Test Procedures. A DB Entity's representative with intimate knowledge of the systems used and the specific application being tested shall conduct all testing as required by the MBTA.

1.3 SUBMITTALS

- A. The following plans and information shall be submitted for acceptance prior to fabrication and factory wiring of the vital and non-vital systems equipment:

1. A comprehensive systems diagram (block diagram) describing all major components, functions interfaces, links, and associated software;
 2. Catalog cuts and descriptive literature for all materials the DB Entity proposes to use to implement the design as specified herein and as shown in the Contract Documents. As a minimum, this information shall be provided for each block in the systems diagram;
 3. A detailed data communications matrix describing the type of data, origin, destination, medium, and communication format for all functions performed by the vital and non-vital systems;
 4. A fail-over/fault matrix describing the self-detectable faults for each component supplied and the DB Entity's recommended actions based on these faults.
 5. Complete wiring and cabling drawings with all interfaces and data links including remote input/output functions and the equipment required for the interfaces and/or data links clearly indicated;
 6. A complete and comprehensive operational description;
 7. Plans showing arrangement and assembly with complete keyed part lists;
 8. A complete Qualification Test Procedure for each component of the system that fully demonstrates that the equipment proposed meets all functional and environmental requirements;
 9. A Factory Test Procedure designed to demonstrate that the system will be tested to verify that it performs all functions in accordance with these Specifications and Contract Documents;
 10. A Field Test Procedure designed to demonstrate that the system will be tested to verify that it performs all functions in accordance with these Mandatory Specifications and Contract Documents after installation;
- B. Submit, for approval all manuals and documentation required by these Mandatory Specifications. Upon approval of the content, organization and format all documentation required by these Mandatory Specifications shall be delivered to the MBTA.
- C. Factory test reports complete with results for all tests shall be submitted for review and approval prior to shipping equipment to the site.
- D. Field test reports complete with results for all field tests shall be submitted for review and acceptance prior to final acceptance.
- E. Provide submittals of all software to be supplied for the Maintenance PC's.

1.4 DELIVERY, STORAGE AND HANDLING

- A. The non-vital support systems shall be properly installed in the rack and CIH at the manufacturer's point of shipment.
- B. The DB Entity and the MBTA or MBTA representative shall inspect each item for shipping damage prior to installation. All damage incurred in transit or caused by mishandling or improper storage shall be repaired or replaced at the MBTA's option with no additional cost to the MBTA.

PART 2 - PRODUCTS

2.1 GENERAL

- A. The non-vital support systems equipment shall be designed to be rack mounted inside the Central

Instrument House (CIH). The DB Entity shall design, furnish and install intersystem circuitry and equipment to affect an operable interface with the systems specified herein and as shown in the Contract Documents.

- B. The electrical components, unless otherwise specified herein, shall be rated to operate at power, voltage and current levels twenty percent above and below that level which the components will be subject to in normal service.
- C. Miscellaneous Equipment: All internal wiring, plug connectors, terminal boards, mounting hardware, special tools and apparatus required to effect a complete installation shall be furnished in accordance with applicable sections of these Mandatory Specifications.
- D. All hardware furnished under these Mandatory Specifications shall consist of rigid components designed specifically for electrified rapid transit or similar harsh industrial environments.
- E. All hardware and software provided shall be of a consistent and identical version and/or revision level from location to location throughout the entire Project.

2.2 NON-VITAL MICROPROCESSOR INTERLOCKING SYSTEM (NVMIS)

- A. The NVMIS systems shall consist of normal and hot standby (redundant) microprocessor units physically located on racks in each of the CIH's.
- B. In addition to the "Normal" and "Standby" units, a third cold standby unit will be rack installed complete with all (same count) boards specific to the NVMIS units installed and running at that location.
- C. The NVMIS system shall be modular with all components being housed in structurally secure racks or backplanes. Each module shall consist of one or more printed circuit boards attached to a durable plastic face assembly. The units shall be available for installation directly in a standard 19-inch rack.
- D. Each NVMIS system shall, as a minimum, contain modules of the types described herein and as further required by the DB Entity's design. Wherever possible, all modules performing similar functions shall be interchangeable in order to minimize spare parts inventory. In all cases, both the normal and stand-by units shall have identical hardware configurations.
- E. The NVMIS backplane shall support two different backplane busses per module slot:
 - 1. High speed, PCI-based for fast throughput of advanced I/O
 - 2. Serial backplane for serial modules.
- F. The system shall be so designed that disconnection of field wiring is not necessary for replacement of assemblies. Universal removable terminal strips shall be utilized to connect field wiring to the individual circuit board assemblies.
- G. The NVMIS shall be protected against all types of power surges as specified in Section 16897 – MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- H. The NVMIS shall utilize solid-state microprocessor technology and shall not require any off-line storage devices for operation or start-up. The operation of the system shall be programmed in solid-state memory. The processor shall perform and the design shall be based upon the recognized

signal industry entrance-exit functions as commonly supplied for a route-setting system. In addition, other functions as specified herein shall be part of this system.

- I. The NVMIS shall receive inputs from the various control devices on the Local Control Panels and from OCC, and shall process control outputs to the VMIS for routing to the field equipment. The NVMIS shall also receive inputs from the VMIS and process outputs for indications on the Local Control and Maintainer Panels as well as OCC.
- J. The NVMIS shall include, but not be limited to, I/O processing for controls and indications as specified herein and as shown in the Contract Documents.
- K. All hardware and software supplied with the development system shall be demonstrated to be completely compatible with the actual hardware supplied. Demonstration of compatibility must include backup documentation from the vendor of each type of hardware and software.
- L. All NVMIS modules shall be accessible from the front of the cabinet and be easily replaceable. Each module shall contain its own identity.
- M. NVMIS Communications:
 - 1. The NVMIS shall communicate with the MBTA Operations Control Center (OCC) via normal and stand-by fiber optic, serial communications links, utilizing the MODBUSRTU protocol for this link. The DB Entity's equipment will be required to utilize or emulate this protocol for serial communications with OCC. If the DB Entity chooses to emulate this protocol, the emulator shall not introduce communications issues that would adversely affect the operation of or require custom modifications to OCC or the field equipment as it presently operates.
 - 2. Each NVMIS will be required to communicate via Ethernet network with all nodes on the networks as required by the DB Entity's design and as specified herein. Each network connection (two system-wide Ethernet busses) shall be via a dedicated Ethernet card. Therefore, each NVMIS shall be equipped with a minimum of two Ethernet cards.
 - 3. Each NVMIS (on-line and off-line) will be responsible to monitor the health of each Ethernet bus to which it is connected. Utilizing the diagnostic bits of the ethernet adapters, network health shall be monitored at the application level by setting up a "heartbeat". If an unhealthy state is detected, then the on-line NVMIS shall indicate the defective bus as "unhealthy" on the status and control panel for that particular network and initiate a local network fail-over to the off-line bus. If the system-wide bus shows some failure, then the on-line NVMIS shall indicate the defective bus as "unhealthy".
- N. NVMIS Software:
 - 1. The application logic shall be developed in relay or ladder logic in the NVMIS.
 - 2. A logic development application shall be provided that shall enable the MBTA to design, test, simulate and execute changes to the NVMIS application logic as well as adjusting the NVMIS configuration from the Maintenance PC via Ethernet connection or from a laptop via serial link. No special communications boards shall be necessary in the Maintenance PC or PC compatible laptop to communicate with the NVMIS, with the exception of the required network and serial cards. The software package shall be prepared, assembled and delivered with a site license for each NVMIS location furnished under this Project. The DB Entity shall install the software on the laptops provided under this Project and on each of the Maintenance PC's in each CIH.
 - 3. Programming equipment, location specific ladder logic lists and comprehensive user

friendly manuals and maintenance/troubleshooting manuals shall be included in the software package.

4. Training for the use of the development application shall be as specified in Section 16894 – TRAINING AND TRAINING MATERIALS FOR THE LIGHT RAIL SIGNAL SYSTEM.
5. Application Program Logic:
 - a. The logic shall be a collection of programmed routines and functions necessary to perform the functions as specified herein and as shown in the Contract Documents.
 - b. Logic contacts shall be capable of being referenced any number of times within the application logic.
 - c. Logic shall provide for multiple programmable timers and counters. Each timer shall have selectable time bases of 1.0 seconds, 0.1 seconds, or 0.01 seconds. The timer and counters shall have limits so as to avoid the need for cascading in order to implement the design.
 - d. Single precision, double precision, relational and floating-point arithmetic operations shall be provided by the program logic.
 - e. Table, move, conversion, bit and bit matrix data operations shall also be provided by program logic.
 - f. The ability to “dump” blocks of logic states with their associated time and date stamps to the Maintenance PC shall be provided. The implementation of this “dump” shall occur during each scan cycle and shall have a minimal effect on the scan time.
- O. Non-vital event recording shall be performed by each NVMIS individually base on the following requirements:
 1. Each NVMIS unit will be responsible to date and time stamp its own event data and transmit the data to the Maintenance PC via the system-wide Ethernet bus. Recording of events shall be implemented in such a way as to not excessively burden the available NVMIS processor time with overhead for event recorder communications operations.
 2. The data shall be stored in segregated data structures (one for normal and one for standby) on a dedicated hard disk drive resident in the Maintenance PC. The data structure shall be first in first out (FIFO) and events shall be stored and not overwritten for a minimum period of 7 days.
 3. Data format shall be such that access, reporting and analysis can be performed utilizing the latest version of Microsoft Access or approved equal.
 4. All functions in the NVMIS applications software, shown as coils in the equivalent logic, as well as all external Non-Vital Relays that may be required by the DB Entity’s design shall be recorded. The DB Entity shall recommend any additional points for recording based on the specifics of the equipment supplied and any additional application logic required by this equipment (including fail-over logic).
 5. Sizing of all event recorder related hardware and software shall be calculated based on the requirements stated herein and shall include a minimum of 20% spare capacity. The DB Entity shall base the number of trains/day on 30-second headways for 21 hours per day.
 6. Once per day a baseline recording of all event recorder inputs shall be performed. In between baseline recordings, only changed states shall be recorded.
- P. The NVMIS fail-over logic shall be designed by the DB Entity to meet or exceed the following requirements;

1. Logic shall not give preference to either unit as a “default” nor shall it utilize any form of master- slave configuration
2. Fail-over initiation shall be based on the DB Entity’s recommendations as submitted and accepted by the MBTA.
3. Upon power up, an off-line unit, shall interrogate the on-line unit and perform redundancy checks to determine the logic is equal between each unit by transferring I/O states and data values in each CPU scan to determine that it is ready for a “hot” fail-over should one occur.

Q. Power Supply Modules

The NVMIS system, if separate from the VMIS architecture, shall operate from a nominal 24 V DC battery system. The NVMIS power supply shall be multi-purpose 40 watt supply that operates under a voltage range of 18 V DC to 30 V DC.

R. Central Processor Unit (CPU)

1. CPU shall be modular and shall not occupy more than two available slots when mounted in the system cabinet. The CPU module shall solve all application logic, store the application program and numerical values related to the application processes and logic, and interface to all I/O systems.
2. The central processing units shall contain the master clock/calendar function and clock/calendar shall be accessible by the application logic for date and time stamping of events.
3. Memory shall contain solid-state memory circuits programmed with the instructions for the system operation. The register values and application program shall be stored on battery backed Complementary Metal-Oxide Semiconductor (CMOS) static RAM. All timing functions shall be handled by the central processing unit from the stored program in CMOS. The memory module shall also be equipped with adequate Random Access Memory (RAM) for temporary data storage and retrieval.
4. The CPU shall have two independent, onboard serial ports accessed by connectors on the front of the module. These ports shall provide serial interface to external devices.
5. The CPU at a minimum shall have LED indication status lights for the following functions:
 - a. CPU OK
 - b. Outputs Enabled
 - c. I/O Faults
 - d. Battery Status
 - e. System Faults
 - f. I/O Force
6. A minimum of 1 MB of application memory shall be available for the user program. Executive level operations performed by the CPU shall not consume application memory.
7. There shall be a long life lithium battery used to maintain the contents of the CMOS memory in the CPU. The battery shall have a minimum life of six months while maintaining the memory status (loaded) and 6 years minimum while power is applied to the CPU and memory. An external battery or combination of energy packs and flash memory can be utilized provided it allows for the same life cycle.
8. Visual indication of the battery condition shall be supplied as well as an entry in the fault table for

the CPU.

- S. System Diagnostics - Each NVMIS shall be equipped with extensive self-diagnostic capabilities. These capabilities shall include but not be limited to:
 - 1. Information on the status of the CPU, Memory, Communications, and I/O,
 - 2. The ability to time stamp and log system and I/O faults into dedicated fault tables,
 - 3. Faults shall have the ability to be configured in two levels: fatal or diagnostic. Fatal faults shall be logged and initiate fail-over while diagnostic shall only be logged,
 - 4. All diagnostic information shall be accessible from the Maintenance PC or through a serial communications (maintenance) port for access by a laptop. The information available shall include the nature of the fault, the address and the timestamp,
 - 5. The diagnostic information shall also be available to the application logic.
- T. Security - Passwords to provide differing levels of access privilege for the NVMIS shall be available.
 - 1. Four levels of access privilege shall exist.

TABLE 1

Access Level	Access Description
4	Change Password
3	Write Logic/Configuration, Override I/O
2	Write Data, Clear Fault Tables
1	Read PLC Only

2.3 MAINTENANCE PC's

- A. The DB Entity shall provide rack mountable industrial grade PC's with rack mountable flat panel monitors for use as the Maintenance PC's. Two of these units shall be installed in each CIH and shall be identical in make and manufacture.
- B. The minimum criteria for the hardware is as follows:
 - 1. Two Flat Panel Monitors, one for each Maintenance PC
 - a. Class I Division 2 Rated
 - b. 17" minimum viewable area Color TFT Display (1280 X 1024)
 - c. NEMA 4/4X/12 sealed front panel
 - d. Rack Mounted
 - 2. Latest Generation Intel, AMD or approved equal processor operating at fastest clock speed available
 - 3. 8 GB RAM
 - 4. 2 – 1 TB Solid State Drives (second drive to be used for long term storage of event recorder data).
 - 5. 4 USB ports (minimum of front access port, either on the front of the PC or the monitor)

6. 2 - 10/100 Base-T Ethernet Cards
 7. 2 Serial Ports
 8. 1 DVI video port to drive flat panel display
 9. 120 V AC power
 10. UL listed for hazardous locations
- C. All Maintenance PC's provided under this Project shall be provided with a standard optical track ball.
- D. All Industrial PCs provided under this Project shall be provided with a standard keyboard.
- E. The keyboard and track ball shall be installed on a rack mounted slide out tray beneath the associated computer.
- F. The interconnection and communications of the Maintenance PC shall be specified herein.
- G. All PCs shall be configured with the same software, unless otherwise noted. The DB Entity shall provide a licensed copy of all software necessary to support, maintain and implement changes to the systems provided. The minimum software requirements are as follows:
1. A version of Windows or current equivalent as accepted by the MBTA that is compatible with all supplier proprietary software that will be utilized under this Project.
 2. Latest Version of Microsoft Office
 3. Latest Version of PC Anywhere or current equivalent
 4. Network troubleshooting and maintenance software
 5. VMIS and NVMIS Maintenance & Troubleshooting Software
- H. Maintenance PCs shall be the primary troubleshooting and maintenance tool in each CIH. They will serve as a maintenance and programming tool for the logic controllers and shall have the capability to interface directly to the event recorders.

2.4 ETHERNET SWITCHES

- A. Ethernet Switches for all field applications shall be Moxa EDS-510A series or approved equal.
- B. The unit shall be equipped with a minimum of 3 single mode fiber Ethernet ports with SFP modules and 7 copper Ethernet ports.
- C. The switch shall support the MSTP(IEEE 802.1s) protocol to allow for redundancy at the VLAN level.
- D. Units shall be din rail mounted in the same rack as the maintenance PC.
- E. Units shall comply with AREMA Class C environmental requirements.

2.5 STATUS AND CONTROL PANELS

- A. Status and Control Panels as shown in the Contract Documents shall be provided to indicate the health and on-line status of normal and standby logic controllers and ethernet networks, as well as control the fail- over of the normal and standby logic controllers.
- B. These panels shall be equipped with LED health and on-line indications and a three-position control

knob as shown in the Contract Documents and as specified herein. The function of the LED's and switches shall be as indicated in the Contract Documents.

2.6 MANUALS AND DOCUMENTATION

- A. All required documentation shall be delivered to the MBTA upon final acceptance of submittals. All documentation shall be delivered in the form of 10 bound hardcopies (4 for the maintenance and engineering department and 6 for the training facility) and two (2) electronic copies on CD (.PDF format). The electronic copies shall come with the necessary software for viewing and updating the documentation by the MBTA.
- B. Deliver complete documentation for all software provided for the Maintenance PCs.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Instrument racks shall be arranged and mounted in central instrument houses as indicated in the Contract Documents and in accordance with the accepted installation plans.
- B. All equipment shall be mounted in standard 19-inch shock mounted instrument racks. If rack mounting is not an option, the equipment shall be shelf mounted within the rack.
- C. The mounting of equipment shall provide for easy access to all test points, indicators, and adjustments.
- D. Maintenance PCs monitors shall be mounted at eye level with their associated keyboard and track ball at standard shelf height (34-36 inches from finished floor).
- E. All of the Status and Control Panels shall be rack mountable and installed in the rack with the redundant logic controllers.
- F. Each major component specified herein shall have a typed, or printed, name tag on a front plate of each rack and cabinet to clearly identify the component using the same wording as that appearing in the contract documents.
- G. Provisions for EMI mitigation (shielding) shall be made to ensure proper operation of equipment relative to the environment.
- H. All wiring and wire terminals shall be tagged in an approved manner.

3.2 FACTORY TESTING

- A. The non-vital support systems shall be tested in accordance with the accepted Factory Test Procedure.

3.3 FIELD ACCEPTANCE TESTING

- A. The non-vital support systems shall be tested in accordance with the accepted Field Test Procedure and meet the requirements of Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM, of these Mandatory Specifications.

END OF SECTION

SECTION 16869

MAINTAINER AND LOCAL CONTROL PANELS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies requirements for furnishing and installing Maintainer's Panels and Local Control Panels as required for the Project.
- B. Panels shall be mosaic tile panels with levers and LED indicators as shown on the contract plans.
- C. Maintainer's Panels shall be provided at non-interlocking locations and shall provide only the indications for the area within the limits of CIH control, and also various system and power health indications. Faceplate configurations will reflect the actual physical track configurations for the local area.
- D. Local Control Panels shall be provided at interlocking locations and shall provide controls and indications for the area within the limits of CIH control, and also various system and power health indications. Faceplate configurations will reflect the actual physical track configurations for the local area.

1.2 QUALITY ASSURANCE

Comply with the requirements of Volume 1 Section 4 and Volume 2 Subsection 2.5.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and 2.8, the DB Entity shall submit the following to the MBTA, for both panel types, for his acceptance:

- A. Manufacturer's drawings and catalog cuts for panel housings.
- B. Detailed/scaled internal panel layouts showing all internal accessories, wall space for dressing/running wire conductors, methods/materials for securing wiring and components to backboard/terminals.
- C. Typical installation drawings and installation procedures for Maintainer's and Local Control Panels.
 - 1. Additional and/or alternate locations for panel placement may be required to suit the DB Entity's design and/or installation method. Drawings describing the locations where non-standard placements shall be submitted to the MBTA for acceptance prior to mounting within the CIH.
 - 2. Additional installation drawings/procedures are to be submitted in instances where the typical details do not apply.
- D. All associated panel hardware and installation materials.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage during delivery, storage and handling. Comply fully with

the requirements of Section 16801 – BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

- B. Damage to material, resulting from improper handling by the shipper or the DB Entity shall require the DB Entity to replace all damaged material with new material at no additional cost to the MBTA.

PART 2 - PRODUCTS

2.1 GENERAL

A. Terminals:

1. The Maintainer's and Local Control Panel enclosures shall be hard-wired to Wago or approved equal terminals to enable connection of the cabling from the panels to I/O points located within the CIH. Interconnecting cables shall be in accordance with these Specifications.
2. The hardwired panel shall interface with remote I/O controlled form the redundant NVMIS through means as determined by the DB Entity's design.

B. Panels:

1. The Maintainer's and Local Control Panels will be hardwired mosaic tile panels manufactured by Mauell Corporation or an approved equal.
2. The panel shall be mosaic grid tiling, using 24MM tile that snaps into a solid steel grid.
3. The background color of the mosaic tiles shall be light gray.
4. The track diagram, symbols and lettering are to be engraved and filled in solid black.
5. Letters inside LEDs that indicate color are not to be engraved.
6. The panel(s) shall be oriented to match the actual field location when facing the panel(s).
7. The panels shall be capable of being completely powered-off and disabled when not in use.
8. The panels are to be wall mounted.
9. The panels shall be constructed with a continuous hinge on the bottom edge to facilitate access to internal components when the panel is opened.
10. The Local Control Panel shall have a hinged and lockable glass cover that is able to be locked.
11. The panels shall include LED Indicator Lamps, Lamp Boxes and Terminal Blocks.
 - a. Light Emitting Diodes (LEDs) shall be directly compatible with the lamp boxes utilized within the panels and shall provide sufficient illumination to be visible under ambient CIH lighting conditions. Replacement shall be accomplished from the rear of the hinged panel faceplate. There are to be no special tools required to perform LED replacements.
 - b. Lamp boxes shall be an integral part of the panel.
 - c. Wire and cable terminating blocks shall be terminated as described in these Specifications.
 - d. A panel light "On/Off" toggle switch shall be provided on the panel. The "On/Off" toggle switch shall be used to extinguish all panel indication lights.
 - e. A lamp test button shall be provided for each panel. Upon initiation of the test button,

all lamps shall be lit. The test routine shall cycle through each color, turning off indications of other colors while the cycled color is lit.

12. Indicators

All illuminated indicators shall be designed, provided, and installed as required in these Specifications. Displays shall be provided by means of individual unit type LEDs that shall display the colors defined in these Mandatory Specifications and Contract Documents.

13. Track Indicator

- a. Track indicators shall display a line-of-light along align route. There shall be two indicator colors for each interlocking track indicator. Panel lights shall indicate all operations as noted below, when panel light "On/Off" toggle switch is activated. Panel indications shall be as follows:
 - 1) ABS Track Circuit indicators shall normally be DARK. When track circuit occupancy is detected, or if track circuit relay drops from a connection or equipment failure, the indication shall illuminate RED.
 - 2) Approach and Exit Track Circuit indicators shall normally be DARK. The indicator shall function as an approach or exit indicator to and from the adjacent locations. The track circuits between locations that are not located within the CIH where the panel exists shall be grouped together to form one indication. When track circuit occupancy is detected, or if a track circuit relay drops from a connection or equipment failure, the indication shall illuminate RED.
 - 3) Interlocking Track Circuit indicators shall normally be DARK with no route aligned. When a route is aligned, the indicators shall illuminate WHITE such that the indicators display a line of white lights along the aligned route. When track circuit occupancy is detected, or if a track circuit relay drops from a connection or equipment failure, the indication shall illuminate RED.
 - 4) When a route is called by requesting an entrance at a signal, the entrance signal indicator shall illuminate RED, the track indicator adjacent to the entrance lever shall illuminate WHITE and all available exit points shall be indicated by illuminating FLASHING-WHITE indicators located in the track circuits adjacent to exit point signals. When an exit signal has been selected all other available exit indicators shall extinguish. After the switches are in correspondence and the route is established, all interlocking track circuit indicators in the route shall illuminate WHITE to display a line-of-lights along the aligned route. The entrance signal indicator shall change from RED to GREEN. The interlocking track circuit indicators that display a line of WHITE indicators along the aligned route shall change to RED when track section is occupied. This RED indicator shall extinguish when the track section becomes unoccupied. When a route is canceled, the WHITE indicator shall remain illuminated until expiration of time locking.

14. Signal Indicators

- a. Signal indicators shall operate as follows:

The indicator located in the head of each signal shall normally be RED with signal at Stop. The indicator shall illuminate GREEN when the signal is cleared with the route established. The indicator shall return to RED when the signal has been set to Stop by either passage of a train, canceling the route, or after time has expired for a canceled route. While signal time is running the indicator shall illuminate FLASHING-RED.

- b. Signal Fleeting indicators shall normally be DARK when fleeting is off. The indicator shall illuminate FLASHING-GREEN when fleeting is requested. The indicator shall illuminate GREEN when fleeting is turned on. The indicator shall return to DARK when fleeting is canceled.

15. Switch Indicators

- a. Lock Indicator shall normally be DARK when associated switch is unlocked. When associated switch is locked the indicator shall illuminate RED.
- b. The indicator associated with switch position shall be illuminated WHITE when switch is in correspondence in either the Normal or Reverse position.
- c. The indicator associated with switch position shall be illuminated FLASHING-WHITE when switch is out of correspondence in either the Normal or Reverse requested position.
- d. When a switch or a crossover is controlled by hand operation in signal territory, the WHITE indicator associated with the switch shall FLASH WHITE indicating the switch is not in correspondence.

16. Terminal Operation Mode Indicators (Local Control Panel)

- a. The Manual indicator shall illuminate RED when the interlocking is operating in Manual Control Mode and be DARK when operating in Automatic Control Mode.
- b. The Auto indicator shall illuminate WHITE when the interlocking is operating in Automatic Control Mode and be DARK when operating in Manual Control Mode.

17. Platform Service Mode Indicators

- a. The In indicator shall illuminate WHITE when Platform In-Service Mode is active and be DARK when Platform Out-of-Service Mode is active.
- b. The Out indicator shall illuminate RED when Platform Out-of-Service Mode is active and be DARK when Platform In-Service Mode is active.

18. Control Transfer Mode Indicators (Local Control Panel)

- a. The Local indicator shall illuminate WHITE when the interlocking is operating in Local Control Mode and be DARK when operating in Remote Control Mode.
- b. The Remote indicator shall illuminate WHITE when the interlocking is operating in Remote Control Mode and be DARK when operating in Local Control Mode.

19. Blocking Mode Indicators

- a. The Switch Block indicator shall normally be DARK. The indicator shall be illuminated BLUE while switch blocking is in effect for the associated switch.
- b. The Signal Exit Block indicator normally be DARK. The indicator shall be illuminated BLUE while signal exit blocking is in effect for the associated signal.

20. Alarm Indicators

- a. Alarm indicators shall normally be DARK. When an alarm is detected the corresponding indicator shall illuminate RED. Alarm indicators are shown on Contract Drawings for indicating the following conditions:
 - 1) AC Power
 - 2) DC Charger
 - 3) Fire / Smoke
 - 4) Intrusion
 - 5) Blown Fuse
 - 6) LB12 Power (Normal)
 - 7) LB12 Power (Reserve)

21. Condition Indicators

- a. Starting Lights
The Starting Lights indicator shall be illuminated WHITE when starting lights are on and DARK when starting lights are off.
- b. Maintainer Call
The Maintainer Call indicator shall be illuminated WHITE when the maintainer call is on and DARK when the maintainer call is off.
- c. Switch Heater
The Switch Heater indicator shall illuminate WHITE when all switch heaters are on. The indicator shall illuminate FLASHING-WHITE when at least one switch heater is on but not all switch heaters are on. The indicator shall be DARK when all switch heaters are off.
- d. Wayside Push Button Disable
The Wayside Push Button Disable indicator shall normally be DARK. The indicator shall illuminate RED when the wayside push buttons are disabled.
- e. AC Power (Normal)
The AC Power (Normal) indicator shall normally be illuminated WHITE. In the event that normal AC power becomes unavailable, the indicator shall go DARK.

- f. AC Power (Reserve)
The AC Power (Reserve) indicator shall normally be illuminated WHITE. In the event that reserve AC power becomes unavailable, the indicator shall go DARK.
- g. NVMIS Health (Normal)
The NVMIS Health (Normal) indicator shall normally be illuminated WHITE. If the normal NVMIS becomes unhealthy, the indicator shall go DARK.
- h. NVMIS Health (Standby)
The NVMIS Health (Standby) indicator shall normally be illuminated WHITE. If the standby NVMIS becomes unhealthy, the indicator shall go DARK.
- i. VMIS Health (Normal)
The VMIS Health (Normal) indicator shall normally be illuminated WHITE. If the normal VMIS becomes unhealthy, the indicator shall go DARK.
- j. VMIS Health (Standby)
The VMIS Health (Standby) indicator shall normally be illuminated WHITE. If the standby VMIS becomes unhealthy, the indicator shall go DARK.
- k. VMIS Ethernet Health (Normal) (Maintainer's Panel only)
The VMIS Ethernet Health (Normal) indicator shall normally be illuminated WHITE. If the normal VMIS Ethernet becomes unhealthy, the indicator shall go DARK.
- l. VMIS Ethernet Health (Standby) (Maintainer's Panel only)
The VMIS Ethernet Health (Standby) indicator shall normally be illuminated WHITE. If the standby VMIS Ethernet becomes unhealthy, the indicator shall go DARK.
- m. NVMIS Ethernet Health (Normal) (Maintainer's Panel only)
The NVMIS Ethernet Health (Normal) indicator shall normally be illuminated WHITE. If the normal NVMIS Ethernet becomes unhealthy, the indicator shall go DARK.
- n. NVMIS Ethernet Health (Standby) (Maintainer's Panel only)
The NVMIS Ethernet Health (Standby) indicator shall normally be illuminated WHITE. If the standby NVMIS Ethernet becomes unhealthy, the indicator shall go DARK.

C. Panel Enclosure:

1. Panel enclosure shall be constructed of minimum 16-gauge steel.
2. Frame shall be reinforced to provide rigidity required to maintain alignment.
3. Accurately machined surfaces shall be provided to assure proper positioning.
4. Steel shall be accurately rolled and have a smooth finish. Joints shall be formed to a tight fit with abutting edges flush and securely welded. Joints shall be welded their full length and dressed flush on exposed surfaces. Spot welding shall be used when practicable in preference to screws or rivet fasteners.
5. Screw or bolt holes shall be drilled and countersunk. All bolts, nuts, washers and screws shall

be chromate zinc plated. The finished work shall be strong, rigid and neat in appearance. Surfaces shall be smooth and free from warp and buckles.

6. Terminal mode operation controls and indications shall be incorporated in the Local Control Panel, with indications only in the Maintainer's Panel.

D. Unit Levers:

1. All control panel levers shall be of the unit type. The term "unit type" shall be understood to mean that each unit may be completely and easily removed from the control panel without interfering with operation of any other unit.
2. In order to facilitate quick replacement of unit levers, all contacts on each lever assembly shall be connected to the plug portion of a locked, quick-detachable, keyed connector in order that all like units shall be interchangeable. Only the required wires shall be provided in the wiring tree and connected to the other side of the connector. Plug portion of the connector shall be an integral part of the lever assembly. Each plug portion assembly shall be protected by a dust cover. Material used in fabrication of dust covers shall not support combustion.
3. All control panel unit levers shall be push-pull, turn right, turn left, and center return type. The same lever type shall be provided for all applications unless otherwise specified. Blocking devices shall be provided to prevent operation of levers, one for every lever.
4. Unit levers shall be provided for all controls except as noted in these Mandatory Specifications and Contract Documents.

E. Transfer of Control Lever:

1. The Transfer of Control lever shall be provided on the Local Control Panel to enable transfer of control to/from remote (OCC) and local (LCP) control.
2. The lever shall operate as follows:
 - a. Lever is turned to the LEFT: a request for local control is initiated.
 - b. Lever is turned to the RIGHT: the request for the local control is canceled.

F. Switch Control Lever:

1. The Switch Control lever shall be provided on the local control panel as shown on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. Control inputs from the Local Control Panel shall be enabled only when the interlocking is in local control.
3. The lever shall operate as follows:
 - a. Lever is turned to the LEFT: a normal switch call is requested.
 - b. Lever is turned to the RIGHT: a reverse switch call is requested.
 - c. Lever is PULLED: the switch call is canceled.

G. Terminal Operations Control Lever:

1. The Terminal Operations Control lever shall be provided on the Local Control Panel as shown

on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.

2. Control inputs from the Local Control panel shall be enabled only when the interlocking is in local control.
3. The lever shall operate as follows:
 - a. Lever is turned to the LEFT: the interlocking shall operate in Automatic Control Mode.
 - b. Lever is turned to the RIGHT: the interlocking shall operate in Manual Control Mode.

H. Signal Control Lever:

1. The Signal Control lever shall be provided on the Local Control Panel as shown on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. Control inputs from the Local Control Panel shall be enabled only when the interlocking is in local control.
3. The lever shall operate as follows:
 - a. Lever is PUSHED: signal request or exit is initiated.
 - b. Lever is PULLED: signal request is canceled.
 - c. Lever is turned to the LEFT: signal fleeting is enabled.
 - d. Lever is turned to the RIGHT: signal fleeting is canceled.

I. Switch Heater Control Lever:

1. The Switch Heater Control lever shall be provided on the Local Control Panel as shown on the Contract Drawings or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. Control inputs from the Local Control Panel shall be enabled only when the interlocking is in local control.
3. The lever shall operate as follows:
 - a. Lever is turned to the LEFT: switch heater request is initiated.
 - b. Lever is turned to the RIGHT: switch heater request is canceled.

J. Maintainer Call Lever:

1. The Maintainer Call lever shall be provided on the Local Control Panel as shown on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. Control inputs from the Local Control Panel shall be enabled only when the interlocking is in local control.
3. The lever shall operate as follows:
 - a. Lever is turned to the LEFT: Maintainer Call request is initiated.
 - b. Lever is turned to the RIGHT: Maintainer Call request is canceled.

K. Blocking Control Lever (Switch and Signal Exit):

1. The Blocking Control lever shall be provided on the Local Control Panel as shown on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. Control inputs from the Local Control Panel shall be enabled only when the interlocking is in local control.
3. The lever shall operate as follows:
 - a. Lever is PUSHED: block is activated.
 - b. Lever is PULLED: block is canceled.

L. Platform Service Control Lever:

1. The Platform Service Control lever shall be provided on the Local Control Panel as shown on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. Control inputs from the Local Control Panel shall be enabled only when the interlocking is in local control.
3. The lever shall operate as follows:
 - a. Lever is turned to the LEFT: the platform is placed out-of-service.
 - b. Lever is turned to the RIGHT: the platform is placed in-service.

M. Emergency Release Push Button:

1. The Emergency Release push button shall be provided on the Local Control Panel as shown on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. The push button shall be red in color and have a lockable cover.
3. The Emergency Release push button allows local control to take control of the interlocking without OCC acknowledging the request for local control.

N. Next Train Control Switch:

1. The Next Train Control switch shall be provided on the Local Control Panel as shown on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. Control inputs from the Local Control Panel shall be enabled only when the interlocking is in local control.
3. The switch shall be a three-position toggle switch that controls the Next Train Sign at the station platform. The switch shall function as follows:
 - a. In the CENTER position the Next Train Sign will function automatically.
 - b. In the UP position the Next Train Sign will illuminate for platform two.

c. In the DOWN position the Next Train Sign will illuminate for platform one.

O. Train Start Light Control Switch:

1. The Train Start Light Control switch shall be provided on the Local Control Panel as shown on the Contract Documents or the DB Entity may submit an alternate placement to the MBTA for acceptance.
2. Control inputs from the Local Control Panel shall be enabled only when the interlocking is in local control.
3. The switch shall be a two-position toggle switch that controls the Start Lights at turn back locations. The switch shall function as follows:
 - a. In the UP position the Start Lights will be on.
 - b. In the DOWN position the Start Lights will be off.

P. Local Control and Maintainer's Panel:

1. The control panel shall be wired with single conductor, not smaller than No. 22 AWG, 19 strand, insulated 600-volt service wire. Wiring harness shall allow clear access to all levers, pushbuttons, switches and indicators.
2. Panel enclosure shall be completely finished using an enamel or lacquer paint. Finish color of console cabinet shall be Gray ANSI-61, or MBTA accepted equal.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Local control and indication panels shall be located in the central instrument house.
- B. Location of panel shall permit convenient use by an operator sitting in front of it.
- C. The panels shall be mounted with sufficient space so that the access doors can be opened without interference with house structure or wall-mounted equipment.
- D. Any damage caused during installation shall be repaired. Restored finish shall be equivalent to factory finish and performed in a manner satisfactory to the MBTA.

3.2 TESTING

- A. Local control and indication panels shall be tested in accordance with these Mandatory Specifications.
- B. Local control and indication panel tests shall consist of controlling wayside functions from the local control panel. All controls and indications on the respective panel shall be tested.

END OF SECTION

SECTION 16870

BASIC MATERIALS AND METHODS FOR ELECTRICAL WORK FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies basic materials and methods of installation applicable to signal electrical work.
- B. The electrical work required for the Project electrical systems shall include, but not be limited to the following:
 - 1. Furnish and install 480 V ac three phase 3 wire with ground from the station substation to utility transformer to each CIH; and 2 each 480 V ac single phase two wire from separate wayside signal power feeds to two separate 480 V single phase to 240/120 V ac single phase transformers. The transformers feed redundant 120/240 V ac single phase two wire signal power services to each CIH.
 - 2. Furnish and install 2 wire ungrounded power feeds from the Overhead Contact System to distribute 600V dc power to the snowmelter control cases.
 - 3. Furnish and install snowmelter control cases and track switch heaters including conductors, raceways and associated appurtenances.
 - 4. The DB Entity shall coordinate with the MBTA to identify service locations prior to signal equipment installation. The DB Entity shall install all equipment and provide all cabling from source to load for all signal equipment.

1.2 SUBMITTALS

- A. The submittals required for the materials and methods for electrical work to be performed are specified within the respective sections of these Mandatory Specifications.

1.3 REGULATORY REQUIREMENTS

- A. The DB Entity shall comply with the requirements of all national, state and local codes, laws and ordinances, and all rules and regulations of public administrative authorities having jurisdiction over the work where the requirements do not conflict with these Mandatory Specifications.
- B. The latest published issues of the standards, codes, recommendations or requirements of the following listed organizations in effect at the date of the Notice-To-Proceed where the requirements do not conflict with these Mandatory Specifications. In case of a conflict, the more stringent shall apply.

AASHTO	American Association of State Highway and Transportation
Officials ANSI	American National Standards Institute
AWS	American Welding Society
ASTM	American Society for Testing and Materials
ICEA	Insulated Cable Engineers Association
IEEE	Institute of Electrical and Electronic Engineers
IES	Illuminating Engineering Society

MEC	Massachusetts Electrical Code
NEC	National Electrical Code
NEMA	National Electrical Manufacturer's Association
NESC	National Electrical Safety Code
NFPA	National Fire Protection Association
OSHA	Occupational Safety and Health Administration
UL	Underwriter's Laboratories, Inc.

1.4 QUALITY ASSURANCE

- A. The DB Entity shall repair or replace any equipment damaged; lost or stolen prior to Contract Final Acceptance by the MBTA, at no additional cost to the MBTA.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. All equipment, devices, material, etc. shall be new and of the most modern type, including latest improved designs to provide the highest degree of safety and reliability capable of being integrated into the system and subsystems specified within these Mandatory Specifications.
- B. The material and apparatus required for the work to be performed is specified within the respective sections of these Mandatory Specifications.

PART 3 - EXECUTION

3.1 GENERAL

- A. Work shown on the Contract Documents and defined in these Mandatory Specifications shall be performed by the DB Entity and shall include all work complete from the final detailed design to furnishing, installing and testing of the specified electrical equipment and systems.

3.2 INSTALLATION

- A. The installation of the various equipment and materials specified herein shall be in accordance with the respective Sections of these Mandatory Specifications.

END OF SECTION

SECTION 16871

GROUNDING FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing a complete system neutral and equipment grounding system for electrical systems.
- B. The intent of this section is to provide a grounding system and materials for both electrical and signal power applications with a completely operable electrical system to support the new signal system.
- C. Equipment grounding includes snowmelter control cases, power service equipment manholes and handholds and other electrical apparatus.

1.2 SUBMITTALS

- A. The DB Entity shall submit the following for approval:
 - 1. Catalog cuts and descriptive literature for all materials as specified herein.

1.3 QUALITY CONTROL

- A. Electrical equipment such as snowmelter control cases, power service equipment, electrical manholes and hand holes and other electrical apparatus requiring grounding shall meet the resistance test value specified below.
 - 1. Resistance Test Value. The maximum allowable value for electrical apparatus specified above shall be 25 ohms or less. If it is found that the resistance value exceeds 25 ohms, the DB Entity shall install additional ground rods in series until the resistance value reaches 25 ohms or less. Additional ground rods shall be spaced no less than 10' apart.
- B. If a conflict arises between this Section and referenced Standards, the most restrictive shall apply as determined by the MBTA.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage throughout delivery, storage and handling. DB Entity shall comply fully with the requirements of Section 16801 - BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM
- B. Damage to material resulting from improper handling by the DB Entity shall require the DB Entity to replace all damaged material with new material at no additional cost to the MBTA.

PART 2 – MATERIALS

2.1 MATERIALS

- A. Ground rods - Copperweld Corp, or approved equal.

1. Ground rods shall be copper-clad steel. The rod shall be at least a 10' x 3/4" ground rod.
- B. Ground wire
1. Sizing of ground wire shall be in accordance with the MEC, except where sizes specified herein are larger than those required by MEC; UL listed, Label A for lightning protection conductors. Grounding cable shall be continuous without joints or splices throughout its length. Ground wire shall be minimum bare, soft-drawn #6 copper wires.
- C. Cadweld connections - Erico Corp., or approved equal.
1. All ground wire connections to ground rods will be of the exothermic weld type, no mechanical connections are permitted.

PART 3 – EXECUTION

3.1 EQUIPMENT GROUNDING

- A. Ground Electrodes (Rods)
1. Ground rods shall not protrude above finished grade to prevent a tripping hazard.
 2. Separate grounding conductors shall be provided for all circuits as required by these Mandatory Specifications.
- B. Electrical Manhole and Hand hole Frames
1. Electrical manhole and hand hole frames shall be grounded.
- C. Signal Houses and Snowmelter Control Cases
1. All signal houses, cases and snowmelter control cases shall be grounded.
- D. Fencing
1. Fencing shall be grounded.
- E. Metering Cabinet
1. Metering cabinet if required for the primary power service shall be grounded in accordance with the Power Company's requirements.

END OF SECTION

**SECTION 16872
TRANSFORMERS FOR THE LIGHT RAIL SIGNAL SYSTEM**

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing general purpose transformers for general purposes, for signal power and for signal house utility power.
- B. Transformers shall be in accordance with this Section and Section 16835 – SIGNAL AND UTILITY POWER SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- C. Transformers to be furnished and installed shall consist of dry-type, self-cooled shielded isolation transformers for house utility power and signal power feeds.

1.2 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and 2.8, the DB Entity shall submit a description of materials and methods of installation to be furnished under this Section.

1.3 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage throughout delivery, storage and handling. Materials shall comply fully with the requirements of Section 16801 - BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Damage to material resulting from improper storage or handling by the DB Entity shall result in replacement of all damaged material with new material by the DB Entity at no additional cost to the MBTA.

PART 2 - MATERIALS

2.1 GENERAL PURPOSE TRANSFORMERS

- A. General Requirements. This Article specifies the general requirements for furnishing general purpose, dry-type transformers for miscellaneous requirements as specified herein and as shown on the Contract Documents.
- B. Ratings
 - 1. Voltage: Primary, 480 V AC single-phase. Secondary, 120/240 V AC single-phase four wire grounded, as required by the DB Entity's design.
 - 2. KVA Rating: Single-phase 60 Hz sized as required by the DB Entity's design. KVA ratings shall be sized for 125% above peak demand load plus 25% spare capacity for future expansion.

2.2 SIGNAL POWER TRANSFORMERS

- A. General Requirements. This article specifies the general requirements for furnishing transformers for signal equipment housings for signal power and auxiliary power supply as specified herein.
 - 1. Transformers shall be designed, manufactured and tested in accordance with all applicable ANSI,

NEMA and IEEE standards.

2. Transformers shall be UL listed and bear the UL label.
3. Transformer core shall be constructed with high-grade, non-aging, silicon steel with high magnetic permeability and low hysteresis and eddy current losses.
4. Primary and secondary windings shall be copper. Secondary windings shall be isolated from the primary windings.
5. The complete core and coil assembly shall be provided with a UL and CSA recognized 200 degrees C insulation system, using a vacuum-pressure impregnation process. The impregnated coils shall be free of corona up to 150 percent of rated operating voltage.
6. Transformers shall be factory equipped with solderless pressure terminals suitable for copper wires. Terminals shall be two-hole NEMA type. A visible ground wire shall connect the core to a solderless pressure-type ground lug on the enclosure.
7. Transformers shall be of the non-ventilated exterior pad mounted type suitable for the dust and environment of an operating rail transit system
8. Transformers shall be thoroughly inspected and tested before shipping. Tests shall be performed in accordance with ANSI/IEEE C57.12.91 and shall include resistance measurement, voltage ratio and polarity, phase rotation, no-load losses and excitation current, applied voltage dielectric test (hi-pot) and induced voltage dielectric test (double voltage).

2.3 **TRANSFORMER SAFETY LABELING**

- A. Signs which read “DANGER 480 VOLTS – KEEP OUT” shall be affixed to each 480 V AC transformer enclosure door in accordance with NEMA ST 20 Standards.

2.4 **TRANSFORMER NAMEPLATES**

- A. Nameplates shall be affixed to each transformer enclosure with information as specified in NEMA ST 20 Standard.

PART 3 - EXECUTION

3.1 **GENERAL**

- A. Transformers shall be installed in accordance with the DB Entity’s Design Documents, manufacturer’s recommendation and the MEC.

END OF SECTION

SECTION 16873

DISTRIBUTION AND BRANCH CIRCUIT PANEL BOARDS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies basic requirements applicable to installing wiring and materials for branch circuit panel boards.
- B. The intent of this Section is to provide branch circuit panel boards to supply and distribute both electrical power and signaling power associated with installation of the new signal system furnished under this Project.
- C. See Section 16835 – SIGNAL AND UTILITY POWER SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM, for additional requirements.

1.2 SUBMITTALS

- A. In accordance with the requirements of Volume 2 Technical Provisions Subsections 2.7 and 2.8, the DB Entity shall submit a description of materials and methods of installation to be furnished under this Section.

1.3 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be protected from damage throughout delivery, storage and handling. Materials shall comply fully with the requirements of Section 16801 - BASIC TECHNICAL REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Damage to material resulting from improper handling by the DB Entity shall require the DB Entity to replace all damaged material with new material at no additional cost to the MBTA.

PART 2 - PRODUCTS

2.1 CIRCUIT BREAKERS

- A. Circuit breakers for the various panel boards shall be the thermal magnetic, molded case, bolt-in type with voltage ratings for the intended use. The number of poles and ampere ratings shall be sized and verified by the DB Entity.
- B. Lighting and Appliance Branch Circuit Panel Board Circuit Breakers
 - 1. Circuit breakers for lighting and appliance branch circuit panel boards furnished for signal equipment housings for 120 V AC signal and utility power shall be of the thermal magnetic, molded-case type, two-pole, rated at 240 V AC. The DB Entity shall verify Ampere ratings.
- C. 480 V AC Applications
 - 1. Circuit breakers if utilized for 480 V AC signal and utility power feeds shall be of the thermal magnetic, molded-case, bolt-in type, two-pole, rated at 480 V AC. Circuit breakers shall be

self-contained in a NEMA enclosure suitable for the environment. The DB Entity shall verify Ampere ratings.

- D. Circuit breakers shall be of the indicating type, providing “on”, “off” and a “tripped” position of the operating handle. When the breaker is tripped automatically, the handle shall assume a middle position between “on” and “off”. All multi-pole breakers shall be of a design that an overload on one pole automatically causes all poles to open.

2.2 ENCLOSURES

- A. Enclosures shall be provided according to the environment, and shall be NEMA Type 12 minimum with a continuous stainless-steel hinge.
- B. Enclosure Labeling
 - 1. Panel board doors shall be labeled with the equipment name. Labels shall be stenciled on adhesive-type decals.
 - 2. Panel board door interior shall be provided with an attached card or other approved label by which to identify the branch circuit and the corresponding equipment to which it is connected.

2.3 PANEL BOARDS

- A. Panel boards shall be provided with 25% (minimum) spare circuit breaker spaces for future expansion.

2.4 BRANCH CIRCUIT PANEL BOARDS

- A. General
 - 1. Each CIH and wayside signal case shall be provided with one-branch circuit panel board properly sized and provided with the appropriate branch breakers for the utility power supply. Small cases upon acceptance from the MBTA may be exempt from the utility power panel board requirement.
 - 2. Each CIH and wayside signal case shall be provided with one-branch circuit panel board properly sized and provided with the appropriate branch breakers for the signal power supply. Small cases upon acceptance from the MBTA may be exempt from the utility power panel board requirement.
- B. Panel boards shall be rated for 120/240 V AC single-phase three wire and shall contain thermal magnetic, molded case, circuit breakers. Panel boards shall contain 25% (minimum) spare circuit breaker spaces for future expansion.

PART 3 - EXECUTION

3.1 ENCLOSURES AND PANEL BOARDS

- A. Enclosures and panel boards shall be installed in accordance with the DB Entity’s Design Documents, manufacturer’s recommendation and the latest edition of the MEC.

3.2 CIRCUIT AND CIRCUIT BREAKERS

- A. DB Entity shall ensure the proper function and coordination of trip for each circuit and circuit breaker.

END OF SECTION

SECTION 16876

DISTRIBUTION AND BRANCH CIRCUIT PANEL BOARDS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing a grounding system for CIH's, signals, wayside signal cases, junction boxes, and any other wayside equipment or apparatus as hereinafter specified or shown on the Contract Documents.
- B. The grounding system shall preclude any closed loop grounding arrangement.
- C. Ground connection to the track rails or use of the neutral conductors of the power company or AC signal supply system shall not be permitted.
- D. Related work: see Section 16871 – GROUNDING FOR THE LIGHT RAIL SIGNAL SYSTEM.

1.2 QUALITY ASSURANCE

- A. All grounding systems furnished and installed as herein specified shall be inspected and any deficiencies noted shall be corrected. The inspection shall be conducted in conformance with the requirements of the DB Entity's factory test installation and inspection procedures as described in Section 2.7 accepted by the MBTA.
- B. Tests of the grounding system shall be in conformance with the requirements of Section 16871 – GROUNDING FOR THE LIGHT RAIL SIGNAL SYSTEM and any other relevant sections of these Specifications.

1.3 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following to the MBTA for acceptance:

- A. Circuit and schematic drawings showing design details of CIH and wayside signal and case grounding.
- B. Factory test, installation and inspection procedures for grounding of all equipment.
- C. Field installation, inspection and testing procedures for grounding of all equipment.

PART 2 - PRODUCTS

2.1 MATERIALS FOR WAYSIDE HOUSINGS AND SIGNALS

- A. Ground rods, clamps, and ground wire shall be as specified in Section 16871 – GROUNDING FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. Ground bus bars for the central instrument houses and wayside cases shall be made of hard drawn pure copper having a minimum conductivity of 98% per ASTM B187-73. The minimum cross-section dimensions of this bus shall be eight inches by eight inches by one-half-inch thick.

- C. The bus bars as installed shall be free from sharp edges.

PART 3 - EXECUTION

3.1 EQUIPMENT GROUNDING

- A. Each instrument rack and entrance rack in the CIH's shall be grounded to overhead grounding bus bars that shall be installed continuously along each row of racks. The grounding bus bars shall be mechanically and electrically attached to all cable trays. Each rack shall be connected to a grounding bus bar by means of a copper strap. Grounding studs shall be provided on both the grounding bus bar and each rack to allow for easy individual disconnection of any rack from the grounding system. Each grounding bus bar in the CIH's and wayside cases shall be directly connected to the prime ground bus by means of No. 6 AWG copper connector without any intermediate termination.
- B. A prime ground bus bar, equipped with sufficient facilities to make all the grounding connections specified, shall be furnished and installed in the central instrument houses. This prime ground bus bar shall be approximately one (1) foot long and shall be mounted on insulating stand-offs on a wall of the central instrument house approximately four (4) feet above the floor. The DB Entity shall connect this prime ground bus bar by means of a No. 6 insulated wire between the bus bar and the (temporary) prime ground to accommodate factory testing.
- C. Run ground conductors separately from other conductors in tray or wireway. Where AC power conductors exist, the equipment ground conductors shall be bundled with them. Signal reference grounds, if required, shall be run separately from equipment and other grounds.
- D. All insulated ground wires shall have green insulation, unless otherwise approved.
- E. For testing of surface grounds refer to Section 16898 – SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- F. The DB Entity shall make a ground connection for each CIH, item of signal equipment and cable messenger. The connection shall be made to a DB Entity furnished and installed ground or an MBTA accepted connection determined on a location specific basis.

END OF SECTION

SECTION 16894

TRAINING AND TRAINING MATERIALS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies training for personnel as designated by the MBTA. The training shall be sufficient to cover all systems and equipment provided under this Project and shall be based on a working model using the Union Square CIH location as a reference base. Training shall concentrate primarily on the operation and maintenance aspects associated with, but not limited to, the track circuit, vital and non-vital aspects of the VMIS, and application specific equipment furnished under this Project.
- B. Classes shall be scheduled to accommodate MBTA work schedules (day as well as night-shift). Training shall be scheduled in accordance with the milestones of the approved CPM to offer technical classes. The training schedule shall incorporate the following:
1. Engineering Training - One technical course shall be prepared and structured for the comprehensive training of eight engineers over a one-week period. This course shall be scheduled in accordance with the approved CPM.
 2. Maintenance Training - Another technical course shall be prepared and structured for maintenance/troubleshooting training of eight students (per session) over a one-week period. Four (4) of these week-long sessions shall be scheduled to provide training prior to the first location being placed in service.
 3. Operations Training - A general signal system course shall be prepared to instruct/inform operations department and management personnel in the capabilities and operation of the new signal system. This two-day course offering shall be provided for two classes of up to ten people and shall be scheduled in accordance with the approved CPM prior to commissioning of the system for full in-service operation.
- C. The quality of the training program shall be such to ensure competence in the operation and maintenance of the new signal system being provided. Training shall reference as guidelines:
1. FRA "Rules, Standards and Instructions for the Installation, Inspection, Maintenance and Repair of Automatic Block and Interlocking Systems", as set forth by the Office of Railroad Safety of the Federal Railroad Administration, and any supplements thereto which shall become effective before this Project is awarded,
 - a. Industry standards and recommendations as written in the AREMA C&S Manual.

1.2 SUBMITTALS

- A. Submit the initial draft of the training program(s) schedule and training program plan for review within sufficient time to accommodate the milestone dates in the approved CPM (including the provision of accommodating contractual requirement review & approval time).
1. Show all major training activities in chart form, including submittal of instructor and student materials and training reports.

2. Support the schedule with narrative description as necessary to fully convey its impact and relationship to other Project events, including the factory/field/interim installation and testing of such system.
 3. Submit the training program plan in narrative form, supported with tables, charts, schedules and graphs, as are necessary to fully convey and describe the DB Entity's plan for accomplishing the training.
 4. Schedule training times so as not to interfere with MBTA operations.
- B. Submit to the MBTA, 90 days prior to the start of the training classes, all course outlines, syllabus and manuals required to describe the content (systems, subsystems and components covered) and requirements of the training program for approval
 - C. Submit the student materials containing a quality photocopy and an electronic copy (PDF format) of all software and visual training aids to be used by the instructor.
 - D. Submit the names of the competent engineers familiar with the application and design of the system provided to be used as instructors in the training program.
 - E. Submit for approval the proposed equipment and rack layout for training equipment to be provided.
 1. Submit a factory test procedure for the training equipment and system to be provided under this Project at the MBTA's training facility.
 2. Submit an on-site field test procedure for the training equipment and system to be provided under this Project at the MBTA's training facility.
 - F. Submit training reports in accordance with the training program schedule. Submit each report following the last day of the training session to which the report applies.

1.3 QUALITY ASSURANCE

All changes or modifications to field equipment during testing and installation shall be reflected in the training facility equipment and/or design.

PART 2 - PRODUCTS

2.1 CLASSROOM TRAINING EQUIPMENT

- A. The DB Entity shall furnish each of the following as a complete system, in working order, for demonstration of the new signal systems in the MBTA training facility:
 1. Redundant Vital/non-vital microprocessor interlocking systems as specified in Section 16859 – VITAL MICROPROCESSOR INTERLOCKING SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM,
 2. One local control panel, maintainer's panel and one maintenance PC as specified in Section 16866 – NON-VITAL SUPPORT SYSTEMS FOR THE LIGHT RAIL SIGNAL SYSTEM and 16869 – MAINTAINER AND LOCAL CONTROL PANELS FOR THE LIGHT RAIL SIGNAL SYSTEM,
 3. One rack complete with the amount of 100 Hz, phase selective track circuits included within the representative interlocking prescribed in this training specification as specified in Section 16819 – TRAIN DETECTION FOR THE LIGHT RAIL SIGNAL SYSTEM, power supplies,

relays, network equipment, and other components required to build and integrate the above systems into a training module resembling a working GLX field location.

4. Other equipment recommended by the DB Entity that is necessary for form a complete and comprehensive training program for the Project system.
 5. Provide one laptop PC of a type as described in Section 16899 – TECHNICAL SUPPORT MATERIALS FOR THE LIGHT RAIL SIGNAL SYSTEM.
- B. The design shall include all control and indicating facilities so that the instructor can easily manipulate all equipment as well as induce/simulate failures. Provide simulation panel/board to facilitate control and indicating operations of signals, switches, track circuits, etc. This simulator shall be a portable unit designed for testing and creating field and track related operations/failures. It shall be a half rack set-up, with wheels and a 100' plug coupler cable to connect to the permanent rack set-up or external track. This unit shall use toggle switches, microprocessor controls, and status indications to simulate track circuit failures, signal failures, power failures, open circuits, and microprocessor failures.
- C. Provide two complete sets of test equipment required to perform diagnostics of the track circuit, power supplies and specialty systems furnished with this Project. One set shall be supplied for permanent use at the training facility and the other for portable use.
- D. One copy of the most current version of each AREMA Signal and Communications Manual (on CD and Hardcopy) and a bound copy of FRA part 236.

PART 3 - EXECUTION

3.1 GENERAL

- A. The DB Entity shall provide all engineering, materials, software, drawings and labor necessary to facilitate the pre-fabricated construction of the training module at the factory. Installation and operation of the training program at the MBTA training facility will require simple interconnection of training components of the pre-tested training system with minimal wiring. This training program shall, at minimum, provide instruction relating to the processor systems and track circuit systems being furnished and their integration with each other to provide a complete application/site specific signal and interlocking control system.
- B. As stated previously, the Union Square location shall be used as a reference base for the instruction course material. The course shall be structured to emulate the actual Union Square as much as practicable. Any major change/revision to system interface, design, application, etc. for the design of the overall Project shall be reflected in the training program. The DB Entity shall be required to provide training updates (re-instruction) at the discretion of the MBTA in the event of a significant design change.

3.2 TRAINING (ON MBTA PREMISES)

- A. Training Aids - Provide a video-based set of signal instructional aids for the maintenance of each major subsystem or piece of equipment compatible with present MBTA training facility audiovisual equipment.
- B. Training Program Plan Development - Develop a training program plan responsive in all respects to this Section. Provide for the following:

1. Develop student and instructor materials including course outlines and objectives, lesson plans, training aids, and student manuals (including site specific troubleshooting manuals);
 2. Develop training schedules including dates, location, and equipment requirements of each course to be presented, jointly with the MBTA;
 3. Present training to the MBTA, and to others as designated by the MBTA. Provide training sufficient to ensure that proper installation, operation and maintenance may be performed by the trainees.
- C. Training Program Course Development - Develop courses of instruction in system familiarization, operation, and maintenance as follows:
1. Design a course to provide maintenance and engineering personnel with a functional understanding of the complete signal system. Cover the functions of all subsystems. Give particular emphasis to system operation with respect to the integration of each system element within the total signal system.
 2. Design a course to provide maintenance and engineering personnel with the knowledge and skills required in the performance of reprogramming, troubleshooting, adjusting and re-testing signal equipment. Provide instruction in the use of all special test equipment provided, whether portable or stationary, including built-in features.
 3. Design a separate, abbreviated course for instruction of MBTA Operations and/or management personnel. This course shall be designed to be less technically intensive and of shorter duration than that being provided for the engineering and maintenance personnel. This course shall provide an overall understanding of the signal system, its capabilities and limitations and focus on its use as an operational tool for management of train traffic and customer service.
- D. Training Material Development
1. Provide a course outline with learning objectives. Provide a topic outline for each subsystem and include a section devoted to system fault analysis and troubleshooting. State the learning objectives for each topic.
 2. One complete set of plans for the Union Square interlocking location for reference in the Training Facility.
 3. Develop a set of lesson plans for each subsystem corresponding to the topic outline containing the following information:
 - a. Lesson title,
 - b. Time,
 - c. Objectives,
 - d. Training aids required,
 - e. Instructing sequence (outline),
 - f. Summary.
 4. Operations and maintenance class instruction shall utilize visual aids as well as operational equipment, test equipment, and associated documentation. Also, the DB Entity shall utilize troubleshooting and fault isolation charts developed for training purposes.
 5. The primary source of student instructional material shall be the applicable system operation and maintenance manuals. Develop specific student notebooks for each course containing such material as: additional drawings, descriptive information, and laboratory procedures

necessary to ensure that all learning objectives are met in an orderly and timely manner. Arrange student notebook material by subsystems and sequenced according to the topic outlined.

6. The DB Entity shall provide five (5) hardcopies and two (2) electronic copies (PDF) of all student instructional materials.

E. Training Program Presentation

1. Conduct training by qualified DB Entity instructors at facilities provide by the MBTA.
2. Conduct maintenance laboratory training utilizing installed system equipment provided by the DB Entity that has been accepted. Restore such equipment to normal operating condition at the end of each training day. Use of the system equipment for training purposes shall not void or otherwise modify any equipment warranty provision.
3. In the event system equipment is not in operating condition at the scheduled time for training requiring such equipment, the MBTA shall have the right to delay or reschedule training sessions or reduce the duration of the training sessions. Equitable adjustments for delay or reduction in training will be determined in accordance with the provisions of the Contract Documents.
4. Training normally provided by the DB Entity at the DB Entity's facilities shall not be construed to satisfy the training requirements specified herein.
5. MBTA supervision personnel will have the right to monitor training sessions. Evaluations of course and instructor shall be made for analysis, of instructor critiques, coverage of materials in time allotted.
6. Prepare and submit a training report to the MBTA subsequent to the completion of each training session. This shall be a narrative explaining who attended, the material covered, and the instructor evaluation results.
7. Perform all training at MBTA facilities that will be made available without charge to the DB Entity.

END OF SECTION

SECTION 16897

MISCELLANEOUS COMPONENTS AND PRODUCTS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 SCOPE

- A. The work to be done under this Section consists of the furnishing and/or installing miscellaneous components and products to be used on this Project. The DB Entity shall not install any item without the MBTA's acceptance.

1.2 QUALITY ASSURANCE

- A. All miscellaneous components and products used on this Project shall be:
 - 1. New and free of manufacturing defects;
 - 2. Clearly and permanently labeled with value or type identification.
- B. All electrical components shall be rated to operate at power, voltage, and current exceeding by 20-percent those which the components will be subject to in service, unless otherwise specified herein.
- C. All electrical components shall be rated to operate in a Class C environment as specified in the AREMA C&S Manual Section 11.5.1.

1.3 SUBMITTALS

- A. Performance data or a sample of each type of component or product proposed as an equivalent to those herein specified shall be submitted.
- B. The DB Entity shall obtain the MBTA's written acceptance obtained for any such equivalent type component or product he proposes to use.

1.4 DELIVERY, STORAGE, HANDLING

- A. Make provisions and be responsible for delivery, storage, and handling of all materials and equipment required of this Project in accordance with the requirements of these Mandatory Specifications.
- B. Properly package all material, equipment, and their components at the manufacturer's factory before shipment. Replace any material or equipment damage, lost or stolen, at no additional cost to MBTA.
- C. Protect all miscellaneous components and products from damage, throughout the delivery, storage and handling.

PART 2 - PRODUCTS

2.1 PRINTED CIRCUIT CARDS

- A. Printed circuit (PC) cards shall be of glass epoxy construction. Card material shall meet the requirements of NEMA Type FR-4. Cards shall have sufficient thickness to permit easy insertion and

removal, and shall be physically keyed to protect against incorrect interchange. Circuits shall be formed by etching. Conductor material shall be copper and shall be protected from exposure to air.

- B. PC cards containing components that may be damaged in the event a plug connector or plug-in unit is removed while the equipment is energized shall be clearly marked or labeled with a warning note and means provided to remove power to the PC cards.
- C. Components mounted on the PC card, weighing more than one-half ounce or with a displacement of more than one-half cubic inch, shall have a mechanical supporting attachment to the card which is separate from all electrical connections.
- D. Stacking or piggy-backing of printed circuit card sections in order to accomplish changes or modifications to wiring or components on printed circuit cards shall not be allowed.

2.2 PRINTED CIRCUIT CARD CONNECTORS

- A. Connectors shall have gold plating a minimum thickness of 0.000050 inch.

2.3 CIRCUIT BREAKERS, FUSES AND FUSE CLIPS

- A. Fuses and circuit breakers shall be of suitable capacities to protect the various pieces of signal apparatus from the effects of short circuits or overloads. All circuit breakers and fuses required for the equipment and systems shall be in accordance with these Mandatory Specifications.
- B. Circuit fuses shall be non-renewable, and shall be of the fiber-case, time-lag, fusion type. The circuit breakers and fuses shall be the correct size and rating for circuit current interruption and shall protect the electrical equipment and circuits from short-term and long-term overloads.
- C. In dc branch circuits, where fusing is impractical, a protective resistance unit shall be furnished. All fuses shall be centrally located on the power distribution panel and power racks.
- D. Fuse clips shall be so constructed that they shall retain their resilience under all installation and service conditions to assure a positive contact between the clips and the fuse.

2.4 DIODES

All diodes to be furnished under this Project shall carry a JEDEC number or shall be available from more than one manufacturer and shall be used within the published Mandatory Specifications for such number. All diodes shall be silicon type, unless otherwise accepted by the MBTA.

2.5 RESISTORS

All resistors, other than those required for electronic circuits, shall be in accordance with AREMA Signal Manual Part 14.2.15.

2.6 REACTORS

All reactors, other than those required for electronic circuits, shall be in accordance with AREMA Signal Manual Part 14.2.20.

2.7 SIGNAL MOLDED TERMINAL BLOCKS

Signal System terminal blocks shall be in accordance with the applicable requirements of AREMA Signal Manual Part 14.1.5.

2.8 SIGNAL TERMINAL BINDING POSTS

Signal System Terminal binding posts, other than those required for supervisory control circuits, shall be in accordance with AREMA Signal Manual Part 14.1.10.

2.9 TERMINAL POST INSULATORS

- A. All terminal posts, located on terminal boards in the wayside cases and central instrument house used to terminate 120V or greater shall be provided with a protective insulator.
- B. The type of insulator shall be individual for each terminal post, and shall be fire-resistant.

2.10 INSULATED TEST LINK

- A. Insulated test links shall be the gold nut type that does not require the sliding of links to open.

2.11 LIGHTNING ARRESTERS AND EQUALIZERS

- A. Lightning arresters and equalizers shall be mounted on three post porcelain or approved type base and shall be in accordance with AREMA Signal Manual Part 14.1.9.

2.12 TERMINALS FOR WIRES AND CABLES

- A. All solderless terminals shall be in accordance with AREMA Signal Manual Part 14.1.1, or as specified herein.
- B. Terminals shall be of the solderless crimp-on type. Samples of all solderless terminals shall be submitted for approval.
- C. All stranded copper wire shall be fitted with an approved type of terminal at all points where the wires are to be terminated on terminal binding posts.
- D. The terminating means shall be of five types:
 - 1. A lug for terminating heavy wires or signal power wires;
 - 2. A solderless insulated terminal similar to AMP, Inc. Catalog No. 35628, Hubbel, Thomas & Betts or approved equal, for terminating No. 16 and No. 14 AWG stranded wires;
 - 3. A solderless insulated terminal similar to AMP Catalog No. 35627, Hubbel, Thomas & Betts or approved equal, for terminating insulated wires Nos. 12-10;
 - 4. A solderless insulated terminal similar to AMP Catalog No. 150247, Hubbel, Thomas & Betts, or approved equal for terminating other stranded vital circuit insulated wires No. 20-16 AWG having a maximum diameter of 0.200 inches;
 - 5. A solderless insulated terminal, similar to AMP Catalog No. 320554, Hubbel, Thomas & Betts or approved equal, shall be furnished for No. 8 studs and similar to AMP Catalog No. 320571 Hubbel, Thomas & Betts or approved equal, shall be furnished for one-quarter inch studs for non-vital circuit insulated stranded wires No. 22 - 16 AWG having a maximum diameter of 0.125 inches.

- E. Where flag type terminals are required they shall be similar to AMP Catalog No. 322313, or approved equal, for terminating No. 16 and No. 14 AWG stranded wires. Other pre-insulated terminals shall be similar to those shown in AMP Product Bulletin No. 109-1.
- F. The terminals shall be for attaching to the ends of the conductor in such a manner that the flexibility of the conductor will not be destroyed and the possibility of breakage at the terminal will be reduced to a minimum.
- G. Terminals shall be for attaching to the wire with a tool made by the manufacturer of the terminal and recommended by him for the terminals being furnished.
- H. The tool shall be equipped with a ratchet device to insure proper indentation of the terminal and which will not release until proper indentation is complete. The DB Entity shall furnish three such tools.

2.13 TAGGING FOR CABLES, WIRES AND EQUIPMENT

- A. Except as otherwise specified in this Section, both ends of each cable and each cable wire and all single wires that terminate in the wayside cases, junction boxes, switch mechanisms, central instrument housings on entrance racks, and any equipment of the signal system outside of such locations shall be permanently identified with a tag. Tags shall not obscure connecting links used between terminal binding posts. Tags shall be installed so that they may be read with a minimum of disturbance of the tags and wiring. Each conductor of the cable shall be rung out and identified before applying the tag.
- B. Tags for wire and cable identification and for identification of transformers, resistors, reactors and other components shall meet the following requirements and shall be subject to the acceptance of the MBTA:
 - 1. Sleeve Type Tags:
 - a. Tags for identification of individual cable conductors and field-installed wires within the wayside cases and central instrument housings, switch mechanisms, switch layout junction boxes, base of signal junction boxes and similar applications shall be the sleeve type similar to those as manufactured by TYCO Electronics or Raychem Corporation, RPS-1K-8-4/2.0-9, Brady, Panduit or an approved equal. The application of the conductor nomenclature shall be in accordance with the manufacturer's instructions and shall result in a permanently bonded and legible identification.
 - 2. Tags for cables shall be similar to the PANDUIT flag type, or approved equal.
 - 3. Flat Plastic Tags:
 - a. Tags for identification of vital relay plug boards, individual transformers, resistors, reactors, terminals, and other miscellaneous components within the wayside cases, central instrument housings and outside terminal cases and snowmelter cases shall be the flat plastic laminated type.
 - b. These tags shall be one and one-half inches long by three-quarter inch wide with one, five--six-tenth inch hole located in the center of the width. The distance from the edge of tag to the hole shall be approximately nine thirty-seconds of an inch. The untreated tag shall be milk white "vynilite", or approved equal.
 - c. The identifying nomenclature space shall allow for three rows of lettering, and the tag material shall be capable of receiving typed-on characters by conventional means. The height of the lettering shall be not less than one-eighth inch.

4. After lettering, both the face and back side of the tag shall be covered with a clear plastic coating, "vinylite", or approved equal, of at least one hundredth of an inch thick.
 5. The nomenclature applied to tags to go on entrance racks and boards shall show the terminal post identification on the top line. The functional nomenclature shall appear on the bottom line, or, if required, on the middle and bottom lines. The terminal posts shall be identified by geometry coordinates, such as rack, row and post number.
- C. Wrap Around Tags. Tags for identification of the individual wires of plug-in relays, within the signal instrument house and the wayside cases shall be the split sleeve or wrap around, self-adhesive type.
- D. Flag Marker Tags. Tags for identification of wires and conductors in junction boxes shall be flag marker tags of the miniature locking type.

2.14 PRESSURE SENSITIVE LABELS

- A. The rows and columns on entrance racks shall be identified by pressure-sensitive labels bearing the geometric coordinates.

2.15 HARDWARE

- A. All mounting hardware exposed to the elements and used for signal equipment, cases, conduit, hangers, brackets, clamps, etc., shall be hot-dip galvanized, except as otherwise accepted by the MBTA.

1. Galvanizing:

- a. The hot dip process of galvanizing shall be used. All parts shall be pickled so that all scale and adhering impurities will be removed. The zinc coating shall be of commercially pure zinc, and shall be continuous and thorough. It shall not scale or blister or be removable by any of the processes of handling or installation. The finished surface shall be free from fine line cracks, holes, or other indications of faulty galvanizing. It shall be smooth and free from adhering flux and other impurities. The edges and ends of parts shall be free from lumps and globules. Parts shall be coated with at least two ounces of zinc per square foot of galvanized surface, after all bending, cutting, drilling, and final fabrication.
- b. In order to avoid destruction of resilience encountered in the hot dip process of galvanizing, all lock-washers shall be cadmium plated.

2. Cadmium Plating

- a. All nuts, bolts, and washers used for the mounting of equipment within finished enclosures shall be cadmium plated or stainless steel. As an alternate, the DB Entity may submit another type of plating or non-corroding metal for the MBTA's acceptance.
- b. Cadmium plating shall be an impervious, dense, hard, fine grained, continuous, closely adhering coating of commercially pure cadmium, free from capillaries and shall completely cover the surface of the part in a smooth, bright layer. Plating on raised or prominent portions shall show no evidence of blackness or loose crystalline structure. It shall have a minimum thickness of six ten thousandths of an inch and shall withstand the salt spray test for at least 1,000 hours or an equivalent test accepted by the MBTA.

2.16 FLEXIBLE CONDUIT AND HOSE

- A. Hose for track circuit leads, switch and lock movements, cc boxes and electric locks shall be braided cordura rayon, vari-purpose hose, internal tube neoprene cover or MBTA accepted equal. The hose shall be clamped at both ends with stainless steel clamps. Clamps are not required for track risers.
- B. Flexible conduit: Where the MBTA permits the use of flexible conduit it shall be type UA or approved equal.

2.17 STAINLESS STEEL CLAMPS

Clamps for clamping hose at each end shall be stainless steel.

2.18 SECURITY

Enclosure doors for CIH's, cases, etc. shall be provide with a padlocking handle and a three-point latch mechanism to ensure that the doors cannot be locked until completely closed. Doors shall be provided with a two-position retaining device to secure door(s) when open.

2.19 CAM LOCKS, PADLOCKS AND KEYS

- A. Cam locks, and keys shall be with key change in accordance with MBTA standard for signal equipment requiring locks. A minimum of 12 keys shall be included for cam locks.
- B. Padlocks for signal apparatus requiring padlocks shall be as follows, or MBTA approved equal:
 - 1. Switch Padlock:
 - a. Model 0880 as manufactured by Sargent and Greenleaf for the MBTA complete with 13-1/2" chain.
 - 2. Signal and Miscellaneous Padlocks:
 - a. RACO type locks as accepted by the MBTA.

2.20 SEALING COMPOUND

Sealing compound for use in sealing cable entrances shall be in accordance with AREMA Signal Manual Part 15.2.15.

2.21 PAINT AND FINISH

All paint and painting procedures shall be in accordance with applicable requirements of AREMA 1.5.10., where the AREMA requirements do not conflict with any requirement of these Mandatory Specifications.

2.22 CABLE ENTRANCE PIPES

- A. Cable entrance pipes for ground-mounted wayside signal cases or junction boxes shall be galvanized steel, three feet-six inches (3'-6") long, threaded on one end, reamed and chamfered and shall be furnished complete with one (1) locknut and one (1) bushing for each such pipe. One spare entrance pipe assembly shall be furnished for each ground mounted wayside case. Cable entrance for CIH shall be as shown on the Contract Documents.

2.23 GROUND RODS AND WIRE

- A. Ground rods shall be copper-clad steel, of the non-rusting type as manufactured by Copperweld Corporation, or approved equal. The rod shall be at least eight feet in length and at least five-eighths inch diameter for signal equipment. Ten feet in length and at least three-quarters inch diameter minimum for service equipment.
- B. Internal ground wire, from the equipment to the ground bus shall be insulated No. 6 or 10 AWG stranded copper wire, as specified within the detail sections of the Specification. Insulated ground wire shall be colored green.
- C. A grounding bus of nickel plated hard drawn pure copper shall be provided in each signal instrument house and wayside instrument case. The minimum dimensions of this bus shall be eight inches by eight inches by one-half inch thick. A minimum of twelve, three-eighths inch holes shall be drilled and tapped in the bus and twelve, three-eighths inch by one-half inch long hex head nickel plated bronze studs with one washer each shall be installed.

2.24 RUBBER MATS

Rubber mats shall be furnished for installation in the Signal Instrument House. Rubber mats shall meet the applicable sections of ANSI-STANDARD C-37-14 and NEMA-Standard ICS-1970.

2.25 SWITCH CIRCUIT CONTROLLER LAYOUTS

- A. Switch Circuit Controllers shall be Alstom (GRS) Model 7, Ansaldo (US&S) Model U-5, Siemens SSC-402, or approved equal.
- B. The DB Entity shall submit drawings of his proposed switch circuit controller layout for approval. If such switch circuit controller layout comprises a portion of a larger layout, requiring a drawing submittal, the switch circuit controller layout submittal may be considered as a part of the total drawing submittal.
- C. Switch circuit controller layouts shall be furnished and installed complete with connecting rod, switch point lug, cable entrance, and all bolts, nuts, washers, and fastenings.

2.26 CABLE LASHING WIRE

Cable lashing wire shall be required to lash the aerial cable to the messenger wire as specified in Section 16808. Cable lashing wire shall be constructed of galvanized steel and have a diameter of 0.091”.

2.27 LUBRICATION

Lubrication for switch tie plates for all switch-and-lock movement layouts installed by the DB Entity shall be an approved lubricant, similar to the soy-bean oil presently used.

2.28 ENVIRONMENTAL PROTECTION

Projection as hereinafter specified, for machined- finished surfaces, threaded rods and nuts and other parts that are susceptible to rusting, shall be a corroding preventive compound, NO-OX-IDE No. 90918, Sanchem, Ideal, or MBTA accepted equal. The product shall have sufficient body to resist weather and rusting for at least six (6) months. Two gallons or equivalent weight shall be furnished by the DB Entity.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. All material and apparatus specified herein shall be installed in accordance with the detail of respective technical sections of these Mandatory Specifications and in accordance with the Contract Documents.

END OF SECTION

SECTION 16898

SIGNAL SYSTEM TESTS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the minimum tests and inspections that the DB Entity shall perform to demonstrate that systems, subsystems, assemblies, subassemblies, and components supplied under this Project are in compliance with the Mandatory Specifications. In addition to the signal systems these tests also include, but are not limited to: testing of the electric service, the HVAC system, the fire alarm system, and integration testing with the track, traction power, and communication systems.
- B. The work shall include the costs of the DB Entity's personnel and any special equipment and assistance required to conduct all tests and complete the required documentation.
- C. In the event that the system does not meet the Contract Documents, necessary corrections shall be made and any and all tests or re-tests to prove compliance shall be included in the work, without any additional costs to MBTA.
- D. Test work specified elsewhere in these Mandatory Specifications shall be construed as related to and inclusive with the testing described herein.
- E. The DB Entity shall notify the MBTA sixty days in advance of any major cut-over and two weeks prior to field tests that require the presence of the MBTA, their designated representatives, and/or any other regulatory agency. Where requirements for notification may vary or conflict within these Mandatory Specifications, the longer advance time for notification will take precedence.
- F. Factory testing shall be complete and comprehensive to the point, that upon completion of the cable terminations during field installation, the CIH, all interfaces (including OCC), and other equipment provided shall operate as designed and require no re-wiring, re-programming, or unusual adjustment. Factory testing shall be complete so that field adjustment shall be required solely in the areas of setting up track circuits and making the mechanical adjustments to switch, signal and other wayside equipment.
- G. Tests and inspections shall be made both during the factory assembly/installation and the field installation phases. These tests shall consist of, but not be limited to, circuit breakdown tests, wiring verification tests, continuity tests, resistance tests, voltage and current tests, time tests, operating tests, simulation tests, and other electrical and mechanical tests and inspections.
 - 1. The MBTA reserves the right to witness any or all tests and inspections in the DB Entity's plants or other manufacturing facilities. The MBTA shall be advised a minimum of sixty days in advance of each factory test.
 - 2. All accepted system and subsystem tests to demonstrate that the assembly/installation meets these Specifications and design requirements shall be completed prior to any operational testing of systems or subsystems.
- H. The work shall include necessary disconnecting and re-connecting required for testing purposes.
- I. The DB Entity shall ensure that qualified technical assistance is provided during testing, cut-overs and other designated milestones identified in the CPM during the field installation phase of the Project.

- J. Testing plans and procedures shall account for and incorporate any interim signaling arrangements as required by phased or partial installation schemes.

1.2 STANDARDS AND REGULATIONS

- A. Standards – AREMA C&S Manual, Part 2.4.1 "Instructions for Inspection and Test of Signal Installations Before Placing in Service".
- B. Regulations - Federal Railroad Administration, Rules, Standards and Instructions for Railroad Signal Systems, Part 236.

1.3 QUALITY ASSURANCE

- A. All test procedures and inspection procedures shall be subject to the acceptance of the MBTA and shall comply with all FRA rules and regulations and AREMA recommendations.
- B. Provide a listing (matrix) of all testing required for each component of the procedures as accepted for all testing required for acceptance. The DB Entity shall design the matrix in a manner that shall allow an immediate reference to the status of the testing and the remaining time to complete. One matrix shall be provided for factory testing and another for field testing. Tests to be included in the matrices shall include, but not be limited to, the following:
 - 1. Preliminary Verification Tests,
 - 2. Ground Resistance Tests,
 - 3. Pre-Test Inspection,
 - 4. Cable Resistance tests,
 - 5. Vital Relay Tests,
 - 6. Point to Point and Mechanical Inspection Test,
 - 7. Energy Distribution Tests,
 - 8. Vital and Non-vital Circuit Breakdown Tests,
 - 9. Impedance Bond Checkout Test,
 - 10. Switch Machine Adjustment & Operational Test,
 - 11. Power frequency Track Circuit Adjustment & Test,
 - 12. Signal/TAK Adjustment & Check-out Test,
 - 13. Line Circuit Verification,
 - 14. Interlocking Functional Tests – Vital & Non-Vital,
 - 15. Control & Indication Panel Test,
 - 16. Wayside Aspect verification Test,
 - 17. OCC Functional Test
 - 18. Snowmelter Check-out Test,
 - 19. Power Test,
 - 20. Failover Tests,
 - 21. Event Recorder Check-out Tests – Vital & Non-Vital,

22. Fire Suppression Discharge Test.

- C. Satisfactory performance of the factory testing will not waive the requirement for performance of the same or similar tests as part of the field installation testing procedures without specific written authorization from the MBTA.
- D. Test equipment of the proper type, capacity, range and accuracy shall be supplied by the DB Entity to perform the required tests and inspections. This equipment shall be in good working order and properly calibrated within 180 days of the time the tests or inspections are conducted. The calibration of each instrument shall be certified by a recognized testing facility. Instruments, not calibrated within the last 180 days will be considered as non-certified. Tests conducted with non-certified instruments will be rejected.
- E. Each component and unit of the wayside signal system shall have an inspection performed at its point of manufacture and evidence of this inspection and acceptability shall be indicated on the item where practicable.
- F. The work shall include all tests required to ensure the proper and safe operation of all systems and subsystems and to prove the adequacy and acceptability of the total assembly/installation specified herein. The tests to be performed shall cause each system and subsystem to be sequenced through its required operations, including the imposition of simulated conditions to prove that the assembly/installation complies with all specified fail-safe requirements.
- G. The MBTA will have the right to witness any or all field tests conducted. The MBTA shall be notified in writing prior to each field test. No part of the signal system shall be placed in service without an authorized representative of the MBTA witnessing and certifying successful completion of the in-service test procedures by signoff on the completed test forms.

1.4 SUBMITTALS

In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and Subsection 2.8, the DB Entity shall submit the following:

- A. Within 180 days after receipt of Notice to Proceed, submit:
 - 1. An outline and initial (draft) procedures for the factory tests to be performed on each type of component or unit and a matrix showing each test and the equipment to be checked, together with samples of test record forms and matrices as hereinafter specified.
 - 2. The numbers of each type of component or unit to be tested to demonstrate the adequacy of design and quality control.
- B. At least 60 days prior to the scheduled factory testing of the first location, and in accordance with the approved CPM, submit detailed test procedures for acceptance of the MBTA. The detailed test procedures submittal shall also include all pertinent information regarding the simulating devices and the methods of simulation to be employed in effecting a complete functional/operational series of tests.
 - 1. Provide a complete set of “test data sheets” as part of the detailed test procedures submitted. These data sheets shall contain all information required to successfully perform the tests, including identifying acceptable ranges of test results and pass/fail criteria.
- C. Within 360 days after receipt of Notice to Proceed, the following shall be submitted:
 - 1. An outline of the field tests and their specific detailed procedures to be performed at each

- location and a matrix showing each test and the equipment to be checked, together with samples of test record forms and matrices as hereinafter specified;
2. A line diagram showing the grouping and sequencing of system and subsystem tests identifying individual field tests. This line diagram shall also show time relationships for all activities and indicate relative manpower (staffing) requirements.
- D. At least 90 days prior to the scheduled performance of each test a detailed test schedule(s), as described herein, shall be submitted for acceptance of the MBTA.
1. The detailed test schedule(s) for significant cut-over and testing activities shall outline the DB Entity's activities by task, expected duration and associated manpower requirements;
 2. Within the projected schedule, a description of expected transportation impact should be addressed. Requests for track & power outages, flagging, etc. should be identified in sufficient detail.
- E. The results of each test as herein specified, both factory and field shall be recorded and the completed data package including all forms and marked plans shall be furnished to the MBTA within 5 days of completion of the test. Certified test results shall also be furnished for tests performed by any subcontractors when such tests are required within this Section.
- F. All test reports shall be checked and approved by the DB Entity prior to submittal to the MBTA.
- G. Test reports shall document the calibration date of each instrument used during the test.
- H. Upon completion of all tests specified herein, the DB Entity shall submit a letter signed by an authorized representative, certifying that all tests have been performed and passed.

PART 2 - PRODUCTS

2.1 SITE TEST EQUIPMENT AND MATERIALS

- A. The DB Entity shall have all test instruments and equipment necessary to conduct the required tests, including two spare sets of all equipment, available and ready for use not less than one week in advance of test need. "Ready for use" shall mean properly matched for test parameters, properly calibrated, properly programmed, sufficiently supplied with leads, probes, adapters, stands etc. necessary to conduct the particular test in a completely professional manner.
- B. All temporary or interim test related materials, special tools, connections, jumpers, etc. shall be furnished and available not less than one week in advance of the test need. This shall also include all versions of software, programming (PROMs, EPROMs, etc.), hardware, relays, etc. required to accommodate temporary or interim signaling arrangements.

PART 3 - EXECUTION

3.1 FACTORY TEST PROCEDURES

- A. Confirmation shall be provided by the DB Entity that all required factory tests of systems, subsystems, assemblies, subassemblies, and components supplied under these Contract Documents have been performed. These tests shall verify design and nameplate ratings and adequate and proper performance.
- B. All systems, subsystems, and equipment shall be inspected and tested. These tests will include at a minimum: breakdown, functional and operational testing. Simulation shall be required to

facilitate complete operational testing.

- C. When test results are not recorded on a test data plate affixed to the equipment or unit, certified test reports shall be furnished for each item at the time of delivery in a form and format suitable for regular office file record keeping.
- D. Each component and unit shall be inspected at its point of manufacture and evidence of this inspection and acceptability shall be indicated on the item where practicable.
- E. All tests shall comply with and reference the appropriate sections of the FRA and AREMA manuals.
- F. Prior to conducting testing, the DB Entity shall have identified any test(s) requiring a simulator and shall provide documentation within the submittal package relating to the circuit logic within the simulator and the operation of the simulator in the circuit under test.
- G. Confirmation shall be provided by the DB Entity that all required factory and product tests of trough systems, cable, and cable system components supplied under this Project have been performed. These tests shall verify design and specified ratings as well as adequate and proper performance. The DB Entity shall be responsible for maintaining such records and having them available for inspection until such time as they are turned over to the MBTA upon Contract Final Acceptance.
- H. Certified test reports shall be furnished for each item at the time of delivery in a form and format suitable for regular office file record keeping.

3.2 FACTORY TESTS AND INSPECTIONS

Factory tests and inspections shall include as a minimum the following:

- A. Vital Relay Tests
 - 1. All DC and AC vital relays and logic shall be factory tested and inspected in accordance with AREMA C&S Manual, Parts 6.4.1. and 6.4.5, respectively.
- B. Central Instrument Houses and Wayside Cases
 - 1. Each central instrument house and wayside case shall be wired complete at the point of assembly, with all equipment installed.
 - 2. An operational and wiring verification test shall be made in accordance with the approved circuit plans. The DB Entity shall use green for verified circuits, brown for contact verification, red for added changes and yellow for deletions.
 - 3. Functions external to the housing shall be simulated where required.
- C. Point to Point and Mechanical Inspection Test

All circuitry shall be checked for accuracy against the accepted circuit drawings. Tests may be done with energy on or off and shall verify the following:

- 1. Point to Point wiring;
- 2. During wire verification test, a wire count on each terminal, relay contact, etc. shall be taken to ensure that only the number of wires called for on the accepted circuit plans is present at each terminal, relay contact, etc. Any discrepancies found shall be corrected;

3. Verify tags and nomenclature;
4. Verify that all components, relays, resistors, etc. are the same as called for on the accepted circuit drawings and located in proper positions;
5. Verify that each plug coupler connection is the proper plug location from end to end using an electrical continuity check;
6. Verify each component or device is installed in the proper location per the layout plans and Manufacturer and part numbers match material references in the accepted book of plans.

D. Energy Distribution Tests

1. "Energy-Off" tests shall include but not be limited to the following:
 - a. All fuses shall be removed;
 - b. Verify that circuit breaker size compares to that of the accepted circuit plans;
 - c. All energy distribution shall be checked using resistance test instrument acceptable to the MBTA, to verify agreement with the accepted plans;
 - d. Verify wire gauge with that called for on the accepted circuit drawings. All discrepancies shall be corrected and accepted by the MBTA;
 - e. Each energy bus shall be tested to all energy buses to ensure that no crosses exist.
2. Energy-On" Tests - Upon completion of the energy-off tests, the following checks and tests which shall be performed. These tests shall include but not be limited to:
 - a. Insert fuses for power supply feeds and verify proper size according to the accepted circuit drawings;
 - b. Turn on energy feeds and test operation of power transfer for proper operation;
 - c. Each AC voltage input shall be measured and recorded;
 - d. Each power supply or charger output voltage shall be measured and recorded;
 - e. Verify that the proper voltage is present at all distribution points;
 - f. Check circuit power failure alarms, and all other alarms that indicate to Central Control;
 - g. Check battery fluid level and specific gravity of all cells, if applicable and based on manufacturer's recommended installation/maintenance instructions.

E. Vital and Non-Vital Circuit Breakdown Tests

1. This test shall verify that internal wiring is installed in accordance with the accepted plans and that the result of each circuit is as intended (i.e. relay picks, input energizes, etc.). The test shall check each vital or non-vital circuit, when energized, will become de-energized with the breaking of each contact point in the circuit.
2. Where applicable, all vital circuits shall be tested to ensure that the opening of each contact in a control circuit cuts off the control current under the conditions shown on the accepted plans following through all multiple circuits and cut arounds. When a circuit is broken by a relay contact twice or when it is broken by some other relay contact, whose coil circuit is opened by opening the relay, the wires in the circuit shall be disconnected in addition to opening the relay.
3. Adjustments and corrections of defects in the house wiring shall be made as necessary to obtain proper operation. All design changes found necessary to obtain proper operation shall be

submitted in writing to the MBTA for acceptance.

F. Interlocking Operational Tests

1. This operational test shall verify all interlocking functions versus the approved location Route and Aspect Chart as well as all controls and indications on the local control panel. Interlocking functions to be verified include route setting, signal aspects, and locking functions. Operation of adjacent locations, wayside signals, switch machines, and train movements will be verified or modeled through the use of simulators.
2. The Interlocking Processors shall be tested using the manufacturer's recommended procedures and test equipment as accepted by the MBTA. Interactive diagnostics shall be performed to monitor interlocking logic operation and system parameters (input and output states, logic expression results, non-vital controls and indications, vital timing functions, etc.). The test shall verify that the correct output or function is executed (turned on) when the controlling input is operated.

G. Control and Indication Panels

1. The factory tests to be performed shall include:
 - a. Local Functional Factory Test – A comprehensive operational test to verify each control and indication to and from the control and indication panels in the CIH are functioning as intended by the accepted design. The DB Entity shall submit a written test procedure and completed test forms for approval prior to this test.
 - b. Configuration Control/Revision Test – Prior to each test procedure the DB Entity, with MBTA representatives shall prove that the hardware and software configuration of each interlocking processor is consistent with the last entry in the revision control log. The DB Entity shall submit a written test procedure and completed test forms for approval prior to this test.
2. Adjustments and correction of defects found in the control panel(s) necessary to obtain proper operation shall be made.
3. Perform all network tests required to simulate final "in-service" operation. These tests shall include verification that the serial links and other communications are functioning properly.

H. Wayside Aspect Verification Test

Perform all tests required to test and demonstrate the proper function the design to display the proper wayside aspects under all realizable field conditions.

I. Fail-Over Tests

Perform all tests required to test and demonstrate the proper function of the fail-over of all normal/standby vital and non-vital redundant systems.

J. Event Recorder Test

Perform tests and simulation to verify all bits are recorded and time stamped properly in each event recorder. Also that each event recorder is set up properly and all available reports can be accessed and downloaded.

K. Other Factory Tests

Factory tests and inspections of other components, products and subsystems may be found in the respective technical sections of these Mandatory Specifications.

3.3 FIELD TEST PROCEDURES

- A. The quality of the installation shall be demonstrated by field tests for continuity, insulation resistance, resistance of ground connections, circuit breakdown, visual inspection, and any other tests required by these Specifications. These tests shall be performed prior to any operational testing of systems or subsystems.
- B. The DB Entity's test procedures package shall include pre-approved, pre-printed data sheets and/or inspection sheets for each test. When completed by the field test personnel and checked for accuracy and completeness, the sheet shall be submitted as the test report.
- C. When tests require specific meter or test instrument readings, the pre-printed data sheet shall show the allowable range of values, for each part of the test. The test report shall also contain a check-off system for each action and a blank space adjacent to the expected value in which to record the test readings.
- D. The test report shall also contain a final description sheet on which the DB Entity shall record discrepancies found and action taken. This documentation shall be furnished to the MBTA.
- E. All test reports shall be dated and signed by the responsible employee of the DB Entity or subcontractor on the day the test is performed. Space shall also be provided for the signature of the witnessing inspector.
- F. The report shall show the specific test instruments used on each test, with the instruments identified by name, type, serial number, and calibration due date.
- G. Should an error be discovered during field testing, due to field wiring and connections that do not agree with the accepted circuit plans, the DB Entity may correct such errors without prior acceptance of the MBTA. The DB Entity shall not, however, make any changes that affect safety of operation of the approved circuit(s), as designed, without prior written acceptance of the MBTA.
- H. The MBTA will make all final determinations as to whether or not the entire test, shall be re-run when any specific field test does not meet the requirements specified for the test.
- I. Any changes made after completion of test procedure shall be re-tested in accordance with the applicable test procedure.

3.4 FIELD TESTS AND INSPECTION

Field Tests shall include as a minimum the following:

- A. Preliminary Verification Tests

The DB Entity shall use the accepted drawings to confirm all existing circuitry at tie in locations is up to date and accurate on the as-in-service plans. The scope of this test may be limited to the areas that will be impacted or changed by the interface to the Project systems. This documented examination shall utilize MBTA provided as-in-service plans and/or pre-approved forms and be conducted by the DB Entity. The process shall include the inspection of existing CIRs, wayside signals,

junction boxes and cases required to be interfaced with or requiring modified wiring and confirm that:

1. All individual wiring is terminated as indicated by the provided documentation package;
2. The terminated wires contain the number of conductors on each terminal as indicated by the approved documentation package;
3. That all cables include the number of wires and are the wire gauge indicated by the approved documentation package;
4. That the existing nomenclature tags are in conformance with the approved documentation package;
5. Availability of spare components, space, or relay contacts;
6. That the number of cables entering and leaving is in conformance with the approved documentation package.

B. Resistance of Ground Connections

All grounding connections shall be tested to determine that the ground resistance is not greater than 15 ohms using the approved Ground Resistance test method. All ground connections shall be tested.

C. Pre-Test inspection

The DB Entity shall verify all field installed equipment is installed per the approved material location and installation plans.

D. Cable Resistance Tests

The test procedure for testing of insulation resistance shall include tests to verify the following:

1. All wire and cable installed along the right-of-way and the wire and cable entering or leaving wayside instrument cases and houses shall be tested after installation, including termination, to ensure that insulation of wires and cable and connected equipment meet the specified resistance value. A direct reading instrument, having a 0-Megohm to 200- Megohm scale range and a self-contained DC power supply rated 500 Volts (minimum) to 1000 Volts (maximum), shall be used to measure the insulation resistance. Resistance between individual conductors and conductors to ground shall not be less than 1 Megohm for 600V-class cable and no less than 100 Megohm , for 1000V-class cable. Power sources, made grounds and connections to the rails shall be disconnected from the circuits during testing;
2. The point used as ground shall be the most convenient ground available;
3. Insulation resistance test values shall be recorded on approved Insulation Resistance Record Forms and turned over to the MBTA upon acceptance of this test requirement.

E. Vital Relay Tests

All DC and AC vital relays and logic shall be factory tested and inspected in accordance with AREMA C&S Manual, Parts 6.4.1. and 6.4.5, respectively.

F. Point to Point and Mechanical Inspection Test

All field installed circuitry or portions thereof shall be checked for accuracy against the accepted circuit drawings. Tests may be done with energy on or off and shall verify the following:

1. Point to Point wiring;
2. During wire verification test, a wire count on each terminal, relay contact, etc. shall be taken to ensure that only the number of wires called for on the accepted circuit plans is present at each terminal, relay contact, etc. Any discrepancies found shall be corrected;
3. Verify tags and nomenclature;
4. Verify that all components, relays, resistors, etc. are the same as called for on the accepted circuit drawings and located in proper positions;
5. Verify that each plug coupler connection is the proper plug location from end to end using an electrical continuity check;
6. Verify each component or device is installed in the proper location per the layout plans and Manufacturer and part numbers match material references in the accepted book of plans.

G. Energy Distribution

These tests shall be conducted on all energy busses:

1. Energy-Off Tests

- a. With all power to wayside instrument house or case off, the following checks and tests shall be performed. These shall include but not be limited to:
- b. All fuses shall be removed.
- c. Verify that circuit breaker size compares to that of accepted circuit plans.
- d. All energy distribution shall be checked using resistance test instrument acceptable to the MBTA, to verify agreement with the accepted plans.
- e. Compare wire gauges with those called for on the accepted circuit drawings. All discrepancies in wire sizes shall be replaced with the proper size wire.
- f. During energy distribution breakdown, a wire count on each terminal, relay contact, etc. shall be taken to ensure that only the number of wires called for on the accepted circuit plans is present at each terminal, relay contact, etc. Any discrepancies found shall be corrected and additional wires, if found, shall be removed.
- g. Tags shall be verified for proper nomenclature and terminal location.
- h. Each energy bus shall be tested to all other energy busses to ensure that no crosses exist.

2. Energy-On Tests

Upon completion of the energy-off tests, the following checks and tests which shall be performed. These tests shall include but not be limited to:

- a. Insert fuses for power supply feeds and verify proper size according to the accepted circuit drawings.
- b. Turn on energy feeds and test operation of power transfer for proper operation.
- c. Each AC voltage input shall be measured and recorded.
- d. Each power supply or charger output voltage shall be measured and recorded.
- e. Verify that the proper voltage is present at all distribution points.
- f. Check circuit power failure alarms, and all other alarms that indicate to Central Control.

- g. Check battery fluid level and specific gravity of all cells as applicable per manufacturer's recommended installation/maintenance procedures.

H. Vital and Non-vital Circuit Breakdown

All circuits not checked during factory test or modified after factory test shall be checked for accuracy against the accepted circuit drawings. The vital circuit breakdown test consists of three major steps; wire counts, continuity and finally, contact verification. A copy of applicable drawings shall be used as data sheets for this test. Green and brown colored pencils are required for documenting this test on the data sheet. Green circled numbers indicate wire counts at connection points. Green tracing on circuit conductors indicate continuity verifications. Brown check marks indicate contact verifications.

1. **Wire Counts:** The first step is to make a physical count of number of wires connected at each point in the circuit, for all circuit points worked on by personnel for the maintenance or modification being tested. The number of wires connected at each point must agree with the drawing. For each verified connection point, write and circle the number of wires found connected to that point next to it on the data sheet. Resolve any discrepancies before proceeding to the next step;
2. **Continuity:** The second step is to verify continuity of the circuit conductors as drawn, one conductor at a time. If, according to the drawing, a conductor is electrically connected to more than two points and it is impractical to separate those multiple terminations, verify the continuity to each of those points. Perform this test on each conductor that is connected to any of the circuit points worked on by personnel for the maintenance or modification being tested. To perform this portion of the test, all relay contacts, slider straps and termination points to which the conductor(s) is connected must be verified open. (Removing vital relays from their plug boards may simplify the opening of relay contacts, however, this method may become complicated when processor I/O circuits are involved.) Also, confirm that no energy is present on the conductor. Verify the continuity of the conductor from one end to the other. For each conductor so verified, trace the conductor on the data sheet for its entire length using green pencil. Resolve any discrepancies before proceeding to the next step;
3. **Contact Verification:** The third step of the vital circuit breakdown test consists of applying the vital circuit's normal energy under the conditions required to energize the vital component. Some of the conditions may have to be simulated. If conditions are simulated, as much as possible they should be simulated outside the circuit being tested by forcing relays or other devices to the desired state. Specific details of each method used to simulate conditions must be approved and documented in the logbook, immediately, during the tests. One at a time; each relay contact, circuit controller contact, slider strap and test link in the circuit, must be opened to interrupt the circuit current and verified to de-energize the vital relay or device.

In cases where a contact under test is intended to provide a circuit shunt, such as that of a circuit controller shunt contact, an ohmmeter must be used at the relay coil or other vital device to verify the circuit makes and breaks the shunt as intended. In cases where the circuit load is a motor or other high current device, a voltmeter may be used to simulate the motor. When a meter is used in place of the normal load, it should be placed as close as practical to the load device, and never in the portion of the circuit that was modified or repaired.

This contact verification test must be performed for all circuit points worked on by personnel for the maintenance or modification being tested and one circuit point further into each circuit branch. As each contact is verified, write a brown pencil checkmark next to the

contact on the drawing. Resolve any discrepancies before proceeding to the next step. Immediately following the test, review the logbook and verify that all simulations used during the test have been restored to normal configurations. After the vital circuit breakdown test verifies that the circuit is wired as it is drawn, perform all applicable functional tests to verify the circuit functions in a safe manner.

3.5 Impedance Bond Checkout Test

Test per the manufacturer's recommended procedures, as accepted by the MBTA. Tests shall include mechanical verification of all connections.

A. Switch-and-Lock Movement

Tests shall be performed by the DB Entity on all switch-and-lock movements. These tests shall include, but not be limited to the following:

1. Check continuity of field wires to switch-and-lock movements to verify proper nomenclature in junction boxes and switch circuit controllers;
2. Adjust throw bar so that proper tension is placed on switch points in both directions;
3. Manually crank switch machine normal and adjust lock rods and point detector rods to allow switch machine to lock up with no obstruction. Repeat above for switch machine in reverse position;
4. Turn on switch machine power and call switch machine normal and observe in field that switch machine corresponds to position called and observe in wayside instrument housing that proper switch correspondence is energized/TRUE;
5. With switch machine called normal, check gaps on circuit controller contacts to see that they meet equipment specifications. Operate machine reverse and repeat;
6. Break down each contact in switch circuit controller and observe that proper switch correspondence "relay" drops. Repeat this procedure for both positions of the switch;
7. Place ammeter in series with motor control energy and adjust clutch such that it causes overload relay to pick up in conformance with the manufacturer's specification with 1/4-inch obstruction in switch point;
 - a. With a 1/4-inch or greater obstruction in the switch point ensure the overload relay energizes in less than ten seconds but greater than 7 seconds.
 - b. Record current reading.
 - c. Repeat for opposite position.
 - d. Confirm that overload relay will not pick with a 1/8-inch obstruction.
8. Insert the hand crank and observe switch mechanism cannot be operated by power. Remove crank, restore latch and verify that switch mechanism can be powered;
9. With the switch machine in the hand-throw mode place a 1/4" obstruction in the open point.
10. Using the hand throw lever move the switch point against the obstruction and assure the hand-throw lever cannot be moved to the full normal or reverse position. This test shall be made for the normal and reverse position;
11. Dog leg test for crossovers. Have crossover called for normal. Observe crossover is actually normal in the field. Observe that normal correspondence relays are up and reverse

correspondence relays are down. Go to the far end and crank switch over to the reverse position, observe both normal and reverse correspondence relays are down. Restore crank contact and observe that switch goes normal in field and observe normal correspondence relays are up and reverse correspondence relays are down. Repeat this procedure for the near end machine and repeat procedure for the reverse position;

12. Floating locking test. Ensure that the point detector will detect an obstruction independently from the lock rod. This shall be conducted with the locking rod floating so as not to cause the circuit controller to fail while the point detector is tested.

B. Power Frequency Track Circuits

Tests shall be made to assure that all power frequency track circuits are properly installed and the complete circuit is adjusted in accordance with the accepted detail test procedure and MBTA standard test forms. Each track circuit shall be tested in accordance with the manufacturer's accepted test procedure and shall include tests to verify the following:

1. Each track circuit shall be tested for defective insulated joint protection;
2. Each track circuit shall be tested for shunting sensitivity. A 0.25-ohm shunt strap shall be placed across the rails at the transformer end, midpoint, relay end, and all fouling points. The track circuit shall meet the requirement of FRA Rule 236.56, except with the track relay to be in the de-energized position with the 0.25-ohm shunt. This test shall be performed after the final track circuit adjustment has been made. Value of current required to pick up the track relay shall be recorded;
3. Each track relay shall be tested to assure that the proper phase relationship exists between the track energy being received and the local source used for comparison using the methods accepted by the MBTA.

C. Signal and TAK Layouts

Tests shall be performed on all signal and TAK layouts. These tests shall include, but not be limited to the following:

1. Check continuity of field wires and verify all nomenclature;
2. Apply energy to signal lighting circuits and adjust all LED unit voltages to 10% less than the nominal rating;
3. A functional test of signal lighting circuits must be performed after appropriate megger and circuit breakdown test(s) are complete, and whenever any signal lighting circuit conductors in the train control room, CIH, junction box or signal head are disconnected/connected during maintenance or modification. The signal lighting test must verify that the correct signal head illuminates with the proper color with voltage applied to the entrance rack for each head;
4. Verify all TAK control lines through manipulation of available controls and simulation of track circuit occupancies;
5. Sight signals for maximum visibility from a distance of 1000' at a height of 7' above top of rail, adjust as required.

D. Line Circuits

The purpose of this test procedure shall be to verify the integrity of line circuits (including vital serial data) between central instrument locations. These tests shall include, but not be limited to,

the following:

1. All nomenclature shall be verified and circuit based line circuits tested for continuity.
2. Each circuit or line equation shall be tested by manipulating the feed end and observing the proper result on the receive end. Manipulation of line circuits/equations shall be through real world facilities (shunting track circuits, clearing/cancelling of signals, alignment of switches, etc.)

E. Interlocking Functional Tests

The purpose of this test procedure shall be to verify the integrity of all routes and all vital interlocking functions. These tests shall include, but not be limited to, the following:

1. Loss of shunt tests;
2. Switch correspondence;
3. Detector locking;
4. Approach Locking;
5. Route Locking;
6. Indication locking.

F. Local Control and Indication Panels

A comprehensive operational test to verify each control and indication to and from the control and indication panels in the CIH are functioning as intended by the accepted design. The DB Entity shall submit a written test procedure and completed test forms for approval prior to this test.

1. The DB Entity, with MBTA representatives present in the CIH (field) and at OCC, shall perform a field test of each location to the OCC;
2. The field tests to be performed shall include:

a. Wayside Aspect Verification Test

- 1) For controlled signals, each possible route must be established and the signal aspects observed and verified to be correct for the established route from the wayside track location. After the correct aspect for the route is verified, verify that de-energizing the appropriate relay(s) or inputs causes the signal aspect to change to Red-over-Red.
- 2) Wayside automatic signal aspects shall be verified through manipulation of available controls and simulation of track circuit occupancies.
- 3) All tests shall be compared versus the approved Route and Aspect Charts.

b. OCC Functional Test

The DB Entity shall work with the MBTA to completely test the OCC interface, controls and indications. This test shall include but not be limited to:

- 1) Configuration Control/Revision Test – Prior to each test procedure the DB Entity, with MBTA representatives shall prove that the hardware and software

configuration of each locations interlocking processor is consistent with the last entry in the revision control log. The DB Entity shall submit a written test procedure and completed test forms for approval prior to this test.

- 2) OCC Bit Verification Test (Bit Bang) – Each indication/control bit shown on the CBA sheets shall be forced to ensure proper indication/control at the OCC and in the Normal and Standby interlocking processors. The DB Entity shall submit a written test procedure and completed test forms for approval prior to this test. The CBA sheets included in the Contract Documents for each location shall be used as a base for the test forms.
- 3) OCC Functional Field Test – A comprehensive operational test to verify each control and indication to and from OCC is functioning as intended by the accepted design. The DB Entity shall submit a written test procedure and completed test forms for approval prior to this test.

G. Track Switch Snowmelter Layouts

Tests shall be required on all electric track switch snowmelter layouts. These tests shall include but not be limited to the following:

1. Check continuity of all field wires as shown on the approved plans and verify proper nomenclature.
2. Check indications at (contactor) control cases by manually picking up all contactors and observing the indication relay in central instrument house. Open each contactor, one at a time, observing that the indication relay drops out when each contactor is open.
3. Apply energy to control relay and observe that it picks up.
4. Turn on controls and verify that the heating elements are operating and that all the current indications are functional as shown on the accepted plans. Perform these tests from the CIH and also from the OCC.
5. Test all safety devices included in the snowmelter layout.

H. Power Tests

The following power tests shall be made and recorded:

1. The voltage of the main power feeders shall be measured and recorded;
2. Perform functional tests of the automatic transfer switching arrangements;
3. Check all power supplies, battery chargers, and batteries for correct setting and quantities and include arrangements for testing various load sharing scenarios. Test the backup time on battery backed up systems.

I. Fail-Over Tests

Perform all tests required to test and demonstrate the proper function of the fail-over of normal/standby vital and non-vital redundant systems.

J. Event Recorder Test

Perform tests and simulation to verify all bits are recorded and time stamped properly in each event recorder. Also, that each event recorder is set up properly and all available reports can be accessed and downloaded.

K. Fire Suppression Discharge Test

Fire suppression or the environmentally approved equal discharge test for the CIH fire detection system shall be performed in accordance with the manufacturer's recommendation and accepted test procedure.

END OF SECTION

SECTION 16899

TECHNICAL SUPPORT MATERIALS FOR THE LIGHT RAIL SIGNAL SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies providing technical support materials required for this Project. Materials such as replacement parts for switch and signal layouts as well as printed circuit cards and other electronic components associated with track circuits and microprocessor logic systems shall be provided to enable immediate replacement so that operation of revenue service may be maintained in the event of component failure(s).
- B. Other materials such as vital & non-vital processors, track circuit equipment and control panels shall be provided complete with installation to comprise a training module for use at the MBTA's Signal Training Facility. See Section 16894 – TRAINING AND TRAINING MATERIALS FOR THE LIGHT RAIL SIGNAL SYSTEM for additional description of that work.
- C. Test equipment, including such items as laptop computers, shall also be provided for monitoring, troubleshooting and implementing logic changes.

1.2 QUALITY ASSURANCE

The quality of the technical support materials shall meet the requirements and be of the same quality as specified within the applicable sections of these Mandatory Specifications.

1.3 SUBMITTALS

- A. In accordance with the requirements of Volume 2 Technical Provisions Subsection 2.7 and 2.8, submit for acceptance of the MBTA, a list of recommended technical support material items where the items included are by DB Entity recommendation.
 - 1. The DB Entity shall also furnish apparatus tabulation sheets and include a complete list of all assemblies such as relays, printed circuit cards, impedance bonds, transformers, rectifiers, power supplies, switch machines, heater cases, etc.
 - 2. This list shall consist of forms listing the items by line, part number, part location, field location, and according to use (with) referencing other assemblies.
 - 3. In addition to the replacement components and parts, the listing shall also contain the items required and recommended for testing and troubleshooting. Diagnostic equipment and extender cards shall be included.
- B. Submit schematic drawings and component lists associated with manufacturer produced test equipment.

1.4 DELIVERY, STORAGE AND HANDLING

- A. All technical support materials described herein shall be packaged to prevent deterioration of the product from environmental conditions as well as protecting them from the hazards of transport. Any items having a limited shelf life shall be clearly identified on the storage container with the expiration date. Comply fully with the requirements of Section 16801 – BASIC TECHNICAL

REQUIREMENTS FOR THE LIGHT RAIL SIGNAL SYSTEM.

- B. All computer equipment as described within this Section (three laptops) is to be delivered at the end of the Project.

PART 2 - PRODUCTS

2.1 SUPPORT MATERIALS

- A. The following support materials shall be furnished upon approval:
 - 1. For the type of plug-in relays furnished, both vital and non-vital, provide 20 of each special tool for inserting or extracting contacts;
 - 2. Two impedance bonds;
 - 3. Seven of each type of vital and non-vital processor unit printed circuit board and two power supplies provided with the interlocking processor systems;
 - 4. Two sets of equipment comprising a complete AC Double Rail Track circuit;
 - 5. Three rugged duty laptop computers configured with minimum criteria as follows:
 - a. Processor - Intel Core i7-6700HQ; Clock Speed – 3.5 Ghz.
 - b. Memory – 16 GB
 - c. Ports – HDMI, 1 serial, 2 USB, 10/100/1000 Ethernet (RJ-45)
 - d. 1 TB Solid State Drive
 - e. Cache – 6MB cache.
 - f. Display – 15.6" LED Display
 - g. Software - Latest release of Microsoft Windows 10 Professional, Microsoft Office 2016 Professional.
 - h. All software for maintenance and programming of interlocking processors and other electronic equipment provided under this Project.
 - i. Docking Station
 - j. Carrying Case
- B. The DB Entity shall provide all pertinent reference material or manuals for all of the above.
- C. The DB Entity shall also prepare a list of technical support materials recommended by him in addition to the required materials specified above, complete with prices for MBTA acceptance.

2.2 TOOLS AND TEST EQUIPMENT

- A. Standard Tools and Test Equipment. Provide the required assortment of tools, gauges, and other equipment for testing, adjusting and repairing relays as normally used in a relay repair shop.
- B. Special Tools and Test Equipment
 - 1. Provide all special tools and test equipment to be used on equipment furnished under this Project, including but not limited to, the interlocking processor and a relay test fixture.

2. Furnish as a minimum the following items as special tools and test equipment:
 - a. One complete set of switch-and-lock movement adjusting tools for each pair of switch-and-lock movements provided, including point gauge;
 - b. One pole mounted storage case for each set of switch-and-lock movement adjusting tools specified herein. Provide an approved pole mounted storage case and foundation capable of being installed adjacent to a switch-and-lock movement;
 - c. The required assortment of tools for removing plugboard contacts, for removing plug-in relays and for applying cylindrical tags on wires in quantities sufficient for use in testing the signal system prior to placing it in operation.
 - d. Four adjustable shunt straps (0.06 - 0.25 ohm).

PART 3 - EXECUTION

3.1 DB ENTITY TASKS

- A. Prepare the manufacturer's recommended list of technical support materials, including the required items, as described in this Section.
- B. Hardware
 1. All special tools shall be contained in sturdy, weather resistant, portable (if applicable), nonmetallic bags or cases.
 2. Indelibly mark with an identifying name or number all bags or cases.
 3. Place a detailed list of the contents of each tool kit in a waterproof enclosure inside each case or bag.
 4. Provide tools to be used on electrical equipment with insulated handles.

3.2 DELIVERY

- A. All technical support materials shall be delivered concurrently with the first items delivered under this Project and in accordance with the schedules as derived from the CPM milestones.
- B. The number of crates, packages, and packing lists shall be submitted to the MBTA for acceptance prior to shipment.
- C. Technical support materials shall be shipped to a site as designated by the MBTA.

3.3 TESTS

- A. All applicable factory and field tests for replacement systems, parts and components shall be conducted in exactly the same manner as for other like items furnished under this Project.

END OF SECTION

Exhibit 2A.2

MBTA Base Specifications

Exhibit 2A.2

BASE SPECIFICATIONS PREFACE

The Base Specifications are provided as pdf and word electronic files in the Exhibit 2A.2 – Base Specification.

The amendments listed herein apply to the Base Specifications. The DB Entity shall amend the Base Specifications as necessary, as part of the Design Documents and/or Construction Documents in order to demonstrate how the design and construction shall be completed. The DB Entity shall not amend any warranty requirement or the quality management sections in the MBTA Base Specifications.

These revised specifications shall be submitted, in redline/strikeout format, as well as blackline/clean versions, to the MBTA, who will review the proposed edits for any changes to the design intent or construction delivery process. The MBTA's comments shall be incorporated by the DB Entity before formal issuance of the documents at the next design development per Volume 2 Section 2.7.

Where calendar day milestones are shown in the Base Specifications and are not in accordance with another Contract Document, that other Contract Document shall govern.

The following amendments apply to the Base Specifications:

- A. All contact with MBTA staff or offices except for personnel assigned to the Project shall be through the MBTA's Authorized Representative;
- B. The word "Authority" shall be replaced by MBTA;
- C. References to "plans" or "contract plans" shall mean those Design Documents and/or Construction Documents prepared by the DB Entity, such as site plans, detour plans, materials sampling plans, utility relocation plans etc.;
- D. References to "Proposal" or "proposal" shall be interpreted to mean the Contract Documents;
- E. Unless specifically stated otherwise in the Contract Documents, sampling, testing and inspections specified to be done by the Engineer or other MBTA staff, shall be performed by the DB Entity's QA Engineering Firm;
- F. "Submission" or "submittal" used in the Design Documents and/or Construction Documents shall be subject to review and acceptance per Volume 1 Contract Documents;
- G. All references to "the Engineer" or "the Engineer-in-Charge" shall mean the DB Entity's Engineer of Record;
- H. All references to "Contractor" shall mean DB Entity / Design-Builder;
- I. References to "Contract Award" shall mean Notice to Proceed;
- J. In each Specification delete Part 4 Measurement and Payment;
- K. Where calendar day milestones are shown in the Base Specifications and are not in accordance with another Contract Document, that other Contract Document shall govern.

Table of Contents

Section Number	Exhibit 2A.2 Base Specifications	RFP Release Date
Division 2	Site Work	
02015	Geotechnical Instrumentation	3/14/17
02052	Maintenance of Traffic Through Work Areas	3/14/17
02060	Erosion and Sedimentation Control	3/14/17
02080	Asbestos Removal	3/14/17
02081	Hazardous Materials Abatement	3/14/17
02090	Lead Abatement	3/14/17
02091	Removal of Contaminated Fixtures	3/14/17
02092	PCB Bulk Product Waste Abatement	3/14/17
02100	Site Preparation	3/14/17
02150	Underpinning	3/14/17
02195	Ground Improvement - Aggregate Piers	3/14/17
02196	Geotextile Materials	3/14/17
02202	Mechanically Stabilized Earth Retaining Walls	3/14/17
02205	Retaining Wall Rehabilitation	3/14/17
02220	Demolition for Roadway Bridges	3/14/17
02221	Demolition	3/14/17
02223	Segregation of Demolition Debris and Waste Transportation and Disposal	3/14/17
02240	Dewatering	3/14/17
02250	Stormwater Pollution Prevention	3/14/17
02260	Excavation Support and Protection	3/14/17

Section Number	Exhibit 2A.2 Base Specifications	RFP Release Date
02270	Slope Protection	3/14/17
02282	Handling, Transportation, and Disposal of Excavated Materials	3/14/17
02283	Handling and Disposal of Contaminated Groundwater	3/14/17
02296	Traffic Decking	3/14/17
02298	Temporary Pedestrian Facilities	3/14/17
02300	Earthwork	3/14/17
02310	Fine Grading	3/14/17
02356	Soldier Pile and Lagging Retaining Walls	3/14/17
02357	Cast In Place Concrete Retaining Walls	3/14/17
02358	Soil Nail Retaining Walls	3/14/17
02359	Modular Precast Block Retaining Walls	3/14/17
02360	Driven Piles	3/14/17
02362	Steel Sheet Pile Retaining Walls	3/14/17
02369	Drilled Mini-Piles	3/14/17
02370	Drilled Shafts	3/14/17
02400	Drainage and Sewer Systems	3/14/17
02401	Stormwater Pump Station Controls	3/14/17
02402	Stormwater Treatment and Disposal Systems	3/14/17
02444	Chain Link Fence and Gates	3/14/17
02451	Guard Rail	3/14/17
02470	Site Improvements	3/14/17
02509	Pavement Base Courses	3/14/17
02513	Bituminous Concrete Pavement	3/14/17
02524	Curbs, Gutters, and Walks	3/14/17

Section Number	Exhibit 2A.2 Base Specifications	RFP Release Date
02525	Granite Curbs	3/14/17
02526	Detectable Warning Strips	3/14/17
02577	Pavement Marking	3/14/17
02615	Ductile Iron Pipe and Fittings for Stormwater Pump Stations	3/14/17
02632	Stormwater Bypass Pumping Systems	3/14/17
02633	Wastewater Bypass Pumping Systems	3/14/17
02650	Existing Site Utilities	3/14/17
02713	Exterior Water Distribution Systems	3/14/17
02714	Relocated MWRA Water Main	3/14/17
02756	Storm Drain Lining	3/14/17
02800	Exterior Conduit Systems	3/14/17
02852	Trackway Demolition and Salvage	3/14/17
02866	Direct Fixation Track Construction	3/14/17
02868	Direct Fixation Fasteners	3/14/17
02889	Asphaltic Underlayments	3/14/17
02890	Traffic Signal Systems	3/14/17
02891	Traffic Signs	3/14/17
02910	Exterior Storage Facilities	3/14/17
02920	Seeding	3/14/17
02930	Planting	3/14/17
02932	Planting Soils	3/14/17
02970	Landscape Maintenance	3/14/17
Division 3	Concrete Work	

Section Number	Exhibit 2A.2 Base Specifications	RFP Release Date
03371	Shotcrete	3/14/17
03410	Plant-Precast Structural Concrete	3/14/17
03460	Noise Barrier Assemblies	3/14/17
03600	Non-Shrink Construction Grout	3/14/17
03601	Post Installed Anchors	3/14/17
03930	Concrete Rehabilitation and Repair	3/14/17
Division 4	Masonry	
04800	Masonry	3/14/17
Division 5	Metals	
05041	Hot Dip Galvanizing	3/14/17
05120	Structural Steel for Stations and Buildings	3/14/17
05123	Structural Steel for Roadway Bridges	3/14/17
05124	Bridge Rails	3/14/17
05125	Bridge Bearings	7/28/17
05126	Structural Steel for Retaining Walls	3/14/17
05210	Steel Joists	3/14/17
05310	Steel Deck	3/14/17
05411	Light Gauge Metal Framing	3/14/17
05420	Temporary Steel Utility Bridges	3/14/17
05500	Miscellaneous Metals	3/14/17
05510	Process Metal Work	3/14/17
05511	Metal Stairs	3/14/17

Section Number	Exhibit 2A.2 Base Specifications	RFP Release Date
05720	Metal Railings and Gates	3/14/17
05810	Expansion Joint Cover Assemblies	3/14/17
Division 6	Wood and Plastics	
06100	Carpentry	3/14/17
06400	Architectural Woodwork	3/14/17
06502	Countertops	3/14/17
06610	Fiberglass Grating	3/14/17
Division 7	Thermal and Moisture Protection	
07115	Bituminous Dampproofing	3/14/17
07116	Bituminous Dampproofing for Roadway Bridges	3/14/17
07117	Membrane Waterproofing and Protective Course	3/14/17
07131	Sheet Waterproofing	3/14/17
07141	Cold Fluid-Applied Waterproofing	3/14/17
07142	Hot Fluid-Applied Waterproofing	3/14/17
07160	Crystalline Waterproofing	3/14/17
07162	Spray-On Waterproofing	3/14/17
07170	Bentonite Waterproofing	3/14/17
07190	Water Repellents	3/14/17
07210	Building Insulation	3/14/17
07215	Closed Cell Sprayed Foam Insulation	3/14/17
07220	Roof Deck Insulation	3/14/17
07270	Air and Vapor Barrier Systems	3/14/17

Section Number	Exhibit 2A.2 Base Specifications	RFP Release Date
07420	Metal Wall Panel Systems	3/14/17
07423	Rain Screen Systems	3/14/17
07550	Modified Bitumen Built-Up Roofing	7/28/17

SECTION 02015

GEOTECHNICAL INSTRUMENTATION

PART 1 - GENERAL

1.1 ORGANIZATION OF SECTION

A. Layout and Scope of Document

The specification is divided into four sections:

PART 1 – GENERAL
PART 2 – PRODUCTS
PART 3 – EXECUTION
PART 4 – MEASUREMENT AND PAYMENT

Part 1 presents requirements for geotechnical instrumentation and construction monitoring. Part 1 also provides general description and the requirements for providing instrumentation services including qualifications, contractors, quality assurance, submittals, schedules, and other information. Part 2 provides descriptions and specifications for the monitoring instruments. Part 3 presents requirements for installation methods of monitoring instruments. Part 4 presents measurement and payment requirements for the work.

1.2 PRE-CONSTRUCTION SURVEY

- A. The Design-Builder shall conduct pre-construction surveys including photography (video and image), measurements, and examination of the existing structures in accordance with Volume 2 Technical Provisions Exhibit 21 “Additional Project Requirements”.

1.3 DESIGN OF GEOTECHNICAL INSTRUMENTATION PROGRAM

- A. Design-Builder shall engage the services of a qualified Geotechnical Instrumentation Engineer to design the geotechnical instrumentation program. The Design-Builder shall prepare and submit to the MBTA, a design submittal describing the geotechnical instrumentation program for review and approval. The design submittal shall be submitted 60 calendar days before start of construction. The design submittal shall include drawings showing the planned location and type of instrumentation, details of instrumentation installation and protection, an instrumentation schedule, quantities, threshold and limiting values to protect work and property, and contingency plans presenting required actions for exceedances of threshold and limiting values,

1.4 CONSTRUCTION MONITORING STAGE

- A. The Design-Builder shall conduct monitoring during construction in accordance with the geotechnical instrumentation program designed by the Geotechnical Instrumentation Engineer.
- B. Monitoring shall be performed to:
1. Record the influence of construction on adjacent structures.
 2. Enable activation of a plan of action in response to the monitoring in order to mitigate risk.

3. Examine ultimate and serviceability limits of existing and constructed structures.
4. Control construction fill impacts to allow for a safe rate of progress.
5. Install and use instruments aimed at the post construction, long term monitoring of the constructed facilities (such as settlements and inclination).

C. Method of Approach

Settlement – Acceptable instruments include:

1. Mechanical settlement plates,
2. Electro-Mechanical (vibrating wire measuring change in pressure) settlement plates,
3. Surveying reference points.

Deflections / Lateral Deformations

1. Inclinometer casing for inclinometer probe readings (vertical and horizontal),
2. In-place single or multi-directional inclinometers (e.g. change in longitudinal or transverse track geometry),
3. Displacement transducers for continuous high accuracy monitoring,
4. Surveying reference points.

Pore Water Pressure – Pore water pressure measurements are required for establishing the construction influence on the state of water pressure and, hence, knowledge of both shear strength and settlement rate. Acceptable instruments include:

1. Standing pipe piezometers for manual reading,
2. Single or multiple vibrating wire piezometers that can be read manually, discretely or continuously (at specified time intervals).

Strain / Force – Acceptable instruments include:

1. Strain transducers that can be attached in various ways (e.g. weldable, rebar elements, and stand-alone concrete placed elements),
2. Load cell, direct force measuring elements in line with the measured load and the applied element.

Vibrations – Design-Builder shall monitor vibrations at locations where impact (e.g. pile driving) or large machinery vibrations (e.g. movement, compaction) may affect adjacent structures. Acceptable instruments include seismographs and geophones depending on the sensitivity and purpose (e.g. data loggers, strip charts, or manual periodic readings).

1.5 POST CONSTRUCTION MONITORING STAGE

- A. The Design-Builder shall conduct post-construction monitoring where impacts are expected to continue beyond the construction completion.

1.6 DESCRIPTION

- A. The Work of this Section includes furnishing, installing and maintaining geotechnical instrumentation, protecting instrumentation from damage, and collecting, reducing, processing, plotting, interpreting and reporting instrumentation data. The Work includes maintaining and monitoring existing

instrumentation installed by others, and also includes any additional instrumentation required as part of the response actions covered under section 3.23 “Interpretation of Data and Response Values”.

B. Responsibilities of the Design-Builder.

1. The responsibilities of the Design-Builder shall include:
 - a. Prior to commencing work, the Design-Builder shall perform a building condition survey as outlined in Volume 2 Technical Provisions Exhibit 21 “Additional Project Requirements”.
 - b. Furnish components of instrumentation and data acquisition system (DAS) that are to be installed during construction.
 - c. Furnish portable readout units for the Design-Builder’s use.
 - d. Install instruments and data acquisition systems.
 - e. Protect from damage and maintain instruments and DAS installed by the Design-Builder, and existing instruments installed by others. Repair or replace damaged or inoperative instruments.
 - f. Maintain and calibrate portable readout units for the Design-Builder's use.
 - g. Collect, reduce, process, plot, and report data from instruments installed by the Design-Builder, and existing instruments installed by others. These tasks are referred to herein as the Design-Builder’s monitoring program.
 - h. Provide access to the Design-Builder’s Geotechnical Instrumentation Engineer for data collection.
 - i. Coordinate with the Geotechnical Instrumentation Engineer to verify consistency of collected data.
 - j. Implement remedial measures based on Geotechnical Instrumentation Engineer’s interpretations of monitoring program data.

C. Qualifications of the Design-Builder’s Independent Geotechnical Instrumentation Subcontractor

1. Geotechnical instrumentation work involves highly specialized tasks. The Design-Builder shall engage an independent instrumentation subcontractor who shall be responsible for furnishing and installing all geotechnical instrumentation, maintaining and calibrating instrumentation as required, collecting, reducing, processing, plotting, interpreting and reporting data to the Lead Geotechnical Engineer. The Design-Builder’s independent instrumentation subcontractor shall meet the qualifications specified herein.
2. The independent instrumentation subcontractor’s staff shall include a qualified Geotechnical Instrumentation Engineer who is a registered Professional Engineer in the Commonwealth of Massachusetts, who has a minimum of a Bachelor of Science degree in civil engineering, and who has at least five years of direct field experience in installation and monitoring of the types of instruments specified herein. The Geotechnical Instrumentation Engineer shall:
 - a. The Geotechnical Instrumentation Engineer shall coordinate all activities with the Design-Builder’s Lead Geotechnical Engineer during all phases of the geotechnical instrumentation program.
 - b. Prepare detailed step-by-step procedures for all instruments used including installation, data collection, and removal or decommissioning procedures.
 - c. Review and sign all submittals.
 - d. Be on site and supervise at least the first two installations of each type of instrument.

- e. Conduct at least the first two activities of each of the following tasks for each instrument specified herein: pre-installation acceptance tests, post-installation acceptance tests, field calibration, data collection, data reduction, processing, plotting, and interpreting.
 - f. Supervise the preparation of submittals.
3. The staff of the Design-Builder's instrumentation subcontractor shall include a Superintendent who shall be in responsible charge full-time on site during the geotechnical instrumentation program. The Superintendent shall have at least 4 years of direct field experience in installation and monitoring of the types of instrumentation specified herein, and shall have supervised instrumentation programs of similar magnitude in similar subsurface conditions.
 4. The person in responsible charge of the surveyors shall be a Registered Land Surveyor in the Commonwealth of Massachusetts with a minimum of 3 years of experience in deformation measurements of the types and accuracies specified herein. The field survey party chief shall have a minimum of one year of experience in deformation survey measurements of the types and accuracies specified herein.
 5. Acceptance of the Design-Builder's instrumentation subcontractor and surveyors, including the Geotechnical Instrumentation Engineer, the Superintendent, the field survey party chief, and all other field and office personnel shall be subject to the review of the Lead Geotechnical Engineer.

D. Quality Assurance

1. A factory calibration shall be conducted on all instruments prior to shipment. Provide certification to indicate that the test equipment used for this purpose is calibrated and maintained in accordance with the test equipment manufacturer's calibration requirements and that, where applicable, calibrations are traceable to the National Institute of Standards and Technology.
2. Make a final quality assurance inspection prior to shipment. During the inspection, complete a checklist to indicate each inspection and test detail. Provide a completed copy of the checklist with each instrument.

Design-Builder shall provide the manufacturer's warranty for each portable readout unit furnished for the MBTA's monitoring program, and such warranty shall be in place for the contract duration.

E. Submittals

1. All submittals shall be in digital format (e.g. PDF). Within 3 weeks after the Notice to Proceed, the Design-Builder shall submit to the MJBTA's for review.
 - a. Qualifications of the independent instrumentation subcontractor to include relevant experience on projects of this type and magnitude.
 - b. Resumes of Geotechnical Instrumentation Engineer and Superintendent, sufficient to define details of direct site experience.
 - c. Resumes of person in responsible charge of surveyors and field survey party chief, sufficient to define direct site experience.
 - d. Resumes of other field and office geotechnical instrumentation and survey personnel to be assigned to the project, other than clerical staff.

- e. Manufacturers' product data, including instruction manual and including any requests for consideration of substitutions, as specified herein, and warranty provisions.
2. At least 45 days prior to commencing installation of the first of each type of instrument, the Design-Builder shall submit to the MBTA for review the following items pertaining to that instrument type:
 - a. Sample pre-installation acceptance test record sheet.
 - b. A monitoring schedule, if different from Table 1 in Section 3.19.I.
 - c. Detailed step-by-step procedure for installation, including post-installation acceptance test, together with a sample installation record sheet. The procedures shall be bound and indexed. The installation procedures shall include, as applicable:
 1. The method to be used for cleaning the inside of casing or augers.
 2. Specifications for proposed grout mixes, including commercial names, proportions of admixtures and water, mixing sequence, mixing methods and duration, pumping methods and tremie pipe type, size and quantity.
 3. Drill casing or auger type and size.
 4. Depth increments for backfilling boreholes with sand and granular bentonite.
 5. Method for overcoming buoyancy of instrumentation components during grouting.
 6. Method of sealing joints in pipes and inclinometer casing to prevent ingress of grout.
 3. Within 2 weeks prior to installation of support of excavation submit excavation sequence and monitoring schedule for in-place inclinometers. It is intended that the in-place inclinometers monitor the initial condition prior to installation.
 4. Within 5 workdays after receipt of each instrument at the site, the Design-Builder shall submit to the Geotechnical Instrumentation Engineer, copy of factory calibration, manufacturer's test equipment certification, completed copy of quality assurance checklist, and warranty for each portable readout unit furnished for the monitoring program.
 5. Within 2 weeks after receipt of each instrument at the site, the Design-Builder shall submit to the Geotechnical Instrumentation Engineer results of each pre-installation acceptance test and test record sheet.
 6. At least 30 days prior to installing each instrument, the Design-Builder shall submit to the MBTA for review, the proposed location, installation schedule and monitoring schedule for that instrument. The Design-Builder shall submit the proposed grout mixes associated with instrumentation installations.
 7. Within 5 days of installing each instrument, the Design-Builder shall submit to the MBTA, the as-built instrument location as specified for individual instruments and its corresponding installation record sheet.
 8. Response Values for changes in measured parameters are to be developed by the Design-Builder, as specified in Section 3.23. When readings indicate that a change has occurred as, the Design-Builder shall initiate the response action(s) specified therein.
 9. The Design-Builder shall submit to the MBTA, raw, reduced and plotted data in accordance with the schedule detailed in Section 3.20. The submittals shall be bound and indexed and shall include:

- a. Raw and reduced data for the week.
 - b. Updated plots of data as specified in Section 3.20. On plots of data versus time, key construction activities and other events that could influence changes in the data shall be shown, as specified in Section 3.20. Threshold Values shall also be shown.
 - c. Plots of the location of the existing and future construction of each relevant retaining structure and/or deep foundation versus time on a plan showing the building footprints and column pile caps. Each heading location shall be labeled by date.
 - d. A statement to indicate whether any Response Value has been reached.
10. The Design-Builder shall submit to the MBTA details of the work performed according to the schedule specified in Section 3.20. The submittal shall include items as described in section 3.20.
 11. Within 5 days of performing a field calibration, submit results of the calibration to the MBTA.
 12. The Design-Builder shall submit to the MBTA, all new data in electronic format via a mutually accessible web connection in accordance with the schedule specified in Section 3.20. All data files shall be compatible with Microsoft Excel spreadsheet file format.

F. Scheduling of Work

1. Install instruments in accordance with the following schedule:
 - a. Observation wells and vibrating wire piezometers shall be installed and formal initial readings agreed on at least 30 days prior to the start of any construction filling.
 - b. Deformation monitoring points (DMPs), Utility Monitoring Points (UMPs) Borros Point Anchors, and Tiltmeters on existing ground and facilities shall be installed and formal initial readings agreed on at least 21 days prior to any excavation or excavation support wall installation operations within 200 feet of the instrument location, except of DMPs installed immediately on support of excavation after its installation.
 - c. Inclinometers in soil and Inclinometer Probe Extensometers shall be installed and formal initial readings agreed on at least 21 days prior to drilled foundation and/or excavation support wall construction within 200 feet of the inclinometer location.
 - d. Inclinometers in controlled density fill shall be installed after controlled density filling is complete.
 - e. Seismographs shall be installed to allow a minimum of seven days of background readings prior to the commencement of any vibration-producing construction activity within 300 feet of the seismograph location.
 - f. Vibrating wire strain gages shall be installed a minimum of five work days before a gaged strut or brace is used in the excavation support system.

Variations in the above schedule require the review of the MBTA.

G. Storage of Instruments

1. All instrumentation materials after receipt at the site and prior to installation shall be stored in an indoor, clean, dry and secure storage space. Instruments shall not be exposed to temperatures outside the manufacturer's stated working temperature range.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Whenever any product is specified by brand name and model number, such specifications shall be deemed to be used for the purpose of establishing a standard of quality and facilitating the description of the product desired. The term "acceptable equivalent" shall be understood to indicate that the "acceptable equivalent" product is the same or better than the product named in the Specifications in function, performance, reliability, quality, and general configuration. This procedure is not to be construed as eliminating from competition other suitable products of equal quality by other manufacturers. The Design-Builder may, in such cases, submit complete comparative data to the MBTA for consideration of another product which shall be equivalent in every respect to that so specified. Substitute products shall not be ordered, delivered to the site, or used in the work unless accepted by the MBTA in writing. The MBTA will be the sole judge of the suitability and equivalency of the substituted product.
- B. Any request from the Design-Builder for consideration of a substitution shall clearly state the nature of the deviation from the product specified.
- C. The Design-Builder shall furnish portable readout units, for use during the Design-Builder's monitoring program. If the Design-Builder requires more than one primary readout unit for each instrument type to achieve the specified data collection schedule, it shall furnish additional readout units to achieve the schedule, at no additional cost to the MBTA. The Design-Builder's Geotechnical Instrumentation Engineer shall be available within 24 hours to take reading in the presence of the MBTA and for verification purposes. Readout units shall be furnished no later than two weeks before commencing installation of the first of each type of instrument. Portable readout units shall be identical to the units used by the Design-Builder.
- D. The Design-Builder shall furnish all installation tools, materials and miscellaneous instrumentation components.
- E. Grout mixes shall be submitted to the MBTA for all grouts associated with instrument installations.
- F. Surface protection shall be flush with the ground surface in paved or other areas. For all instruments except inclinometers, surface protection shall consist of a Morrison Bros. Co. model 418XA roadway box, or acceptable equivalent. Roadway boxes for inclinometers shall either have a diameter adequate to allow attachment of cable support assembly, or shall allow for attachment of an inclinometer casing extension while readings are being taken.
- G. For each instrument type, provide an instruction manual that includes the following:
 - 1. A description of the purpose of the instrument.
 - 2. Theory of operation.
 - 3. Step-by-step procedures for;
 - a. Pre-installation acceptance test when instruments are received on site, to ensure the instruments are functioning correctly prior to installation.
 - b. Calibration of readout units.
 - 4. A list of calibration equipment required, and recommended frequency of calibration.
 - 5. Step-by-step instrument installation procedure including materials, tools, spare parts and any borehole requirements, and post-installation acceptance tests.

6. Maintenance procedures.
7. Step-by-step data collection procedure.
8. Data reduction, processing, and plotting procedures.

H. All graduations shall be in U.S. Customary Units, for example feet, inches, pounds.

2.2 OBSERVATION WELLS

- A. Provide observation wells with slotted pipe, bottom caps and vented top caps. The slotted pipe shall be 5 feet long, 1¼ inch Sch. 80 PVC pipe with 3 rows of 0.01-inch-wide slots on 120° centers, with a slot length to leave 0.25 inch between rows. The riser pipe shall be 1¼ inch Sch. 80 flush-joint PVC pipe.
1. Filter sand shall conform to ASTM C-778-13, Standard Specification for Standard Sand, for 20-30 sand.
 2. Water level indicator shall have a 100-foot-long graduated cable, with graduations at 0.02 foot or smaller intervals. A minimum of one indicator shall be provided for the Design-Builder's monitoring program, and two for the Geotechnical Instrumentation Engineer's monitoring program.
 3. Granular bentonite shall be Enviroplug Medium, as manufactured by Wyo-Ben, Inc., Billings, MT, or Holeplug, as manufactured by Baroid Division, Halliburton, Houston, TX, or acceptable equivalent.

2.3 VIBRATING WIRE PIEZOMETERS

- A. Provide vibrating wire piezometers: model 4500S, as manufactured by Geokon Inc., Lebanon, NH; model PWS as supplied by Roctest Inc., Saint-Lambert, Quebec Canada; or model M-610 as supplied by Geonor Inc., Augusta, NJ, or acceptable equivalent. Piezometers shall have documented long-term stability over a five-year period. Piezometers shall have a range of 50 psi, an over-range rating of twice the rated pressure, ± 0.2% full scale accuracy, and 0.025% full scale resolution, and shall be fitted with a low air entry filter.
1. Piezometers shall be produced with a single continuous cable. In case of extension, provide cable. Cable shall be from the same commercial source as the piezometers, and shall either be 4-conductor, 22 gage, with two shielded twisted pairs, a common drain wire, and a sheath of 0.065-inch-thick pressure-extruded vinyl with an outside diameter of 0.25 inch, or shall be Geonor model P-540. Cable shall be attached to the piezometers through an integral bulkhead seal, consisting of an interior waterstop seal and a cable entry seal. Seals shall be either O-rings or hermetic seals. The seals shall be tested and certified for water-tightness over the specified pressure range of the piezometers.
 2. Provide readout and other terminal units, from the same commercial source as the piezometers. The readout unit shall be capable of reading both the vibrating wire and thermistor reading, shall have a minimum of memory for 6 months of independent readings storage, and shall display readings in engineering units.
 3. Filter sand shall conform to ASTM C-778, Standard Specification for Standard Sand, for 20-40 sand.

4. Granular bentonite shall be Enviroplug Medium, as manufactured by Wyo-Ben, Inc., Billings, MT, or Holeplug, as manufactured by Baroid Division, Halliburton, Houston, TX, or acceptable equivalent.
5. Special grout Type A shall consist of uniform sized fine ground or powdered non-drilling mud grade bentonite, for use in sealing and grouting well casings. A polymer-based thixotropic additive may also be added to the mix if recommended by the manufacturer. Special grout Type A shall have a mixed specific gravity, prior to placement within the instrument borehole, of between 1.03 and 1.10.
6. Cylindrical sounding hammer shall be a steel cylinder with outside diameter 0.3 to 0.5 inch less than the inside diameter of the casing or augers, an inside diameter 0.15 to 0.25 inch larger than the outside diameter of the cable, a length of not less than 2 feet, and a weight of 10 to 20 pounds. When used above the upper piezometer, when two piezometers are installed in the same borehole, sounding hammer shall have two axial holes to ensure that the two piezometer cables are separated by a clear distance of at least 0.75-inch.
7. Provide 2-inch diameter Schedule 80 flush jointed PVC sleeve pipe, for use during installation of vibrating wire piezometers inside the excavation

2.4 DEFORMATION MONITORING POINTS

- A. Deformation monitoring points (DMPs) shall be used to monitor vertical and/or horizontal deformation of various facilities and ground at selected locations shown on the Instrumentation Plan. All DMP's shall be monitored for vertical deformation. Monitoring of horizontal deformation shall be performed where indicated on the instrumentation schedule in the Instrumentation Plan.

The following seven types of DMPs shall be used to monitor deformation:

1. DMP-Type 1 shall consist of a 2-inch long masonry nail with an identification tag. The nail shall be manufactured from hardened, zinc-plated steel. The nail shall have ribbed threads along its shank and a conical point. It shall also have an indent in the center of its head to receive a surveyor's plumb bob. The identification tag shall be 1½ inch diameter × 3/32-inch-thick with a punched number for identification. The masonry nail shall be placed through the central hole in the identification tag and driven into an asphalt-covered surface such that the identification tag lies directly between the asphalt-covered surface and the head of the masonry nail.
2. DMP-Type 2 shall consist of a ¾ inch diameter × 2-inch-long stainless steel socket-head cap bolt, screwed into a ¾ inch diameter × 1½ inch long tamp-in screw anchor. A 4 inch (or longer) bolt may be used at locations where overhanging obstructions prevent the placement of the level rod on the DMP. The longer bolt shall be replaced by a 2-inch-long bolt when readings are not being taken. DMP-Type 2 shall typically be installed into vertical surfaces of buildings and structures. Where removal and patching is not required after construction, the bolts may be installed with epoxy or polyester adhesive in lieu of tamp-in screw anchors. Where the DMP Type 2 is installed in steel column members the Design-Builder may install by drilling and tapping.
3. DMP-Type 3 shall consist of a ¾ inch diameter × 2-inch-long punch marked stainless-steel round head bolt screwed into a ¾ inch diameter × 1½ inch long tamp-in screw anchor (removable installation), or a ¾ inch diameter × 2-inch-long punch marked stainless steel

carriage bolt installed with epoxy or polyester adhesive (permanent installation). DMP-Type 3 shall typically be installed into horizontal concrete and rock surfaces (e.g. sidewalks, granite curbstones). Where the DMP Type 3 is installed in steel column members the Design-Builder may install by drilling and tapping.

4. DMP-Type 4 shall consist of a 5-foot-long, $\frac{3}{4}$ inch diameter steel rod and a surface roadway box. Top of rod shall be rounded and punch marked at its center. DMP-Type 4 shall typically be installed in soil.
5. DMP-Type 5 shall consist of an observable point punch marked on the top horizontal surface of steel sheeting or a soldier pile. The steel surface within 3 inches of the point shall be cleaned by wire brush to permit easy identification of the exact point. The point shall also be clearly identified using fluorescent spray paint adjacent to the point.
6. DMP-Type 6 shall consist of a settlement platform or settlement plates, see Section 4.6 for description.
7. DMP-Type 7 shall consist of settlement cells/sensors as manufactured by Geokon model 4600 or RocTest model SSG or acceptable equivalent.

2.5 BORROS POINTS

- A. Provide Borros anchor, as manufactured by Slope Indicator Co., Mukilteo, WA; Geokon Inc., Lebanon, NH; Geonor Inc., Augusta, NJ; or acceptable equivalent.
 1. Provide $\frac{1}{4}$ inch standard steel pipe, threaded and coupled, ASTM A 53, Grade B. Couplings shall have 45 degree tapered shoulders across the full coupling wall thickness, at both ends.
 2. Provide 1-inch standard steel pipe, threaded and coupled, ASTM A 53, Grade B.
 3. Provide plastic or rubber tubing, to fit and slide in annulus between 1-inch and $\frac{1}{4}$ inch pipes. The radial clearance between the $\frac{1}{4}$ inch pipe and inside of the tubing and between the 1-inch pipe and outside of the tubing shall not be more than 0.07 inch.
 4. Provide 18-inch x 18-inch x $\frac{1}{4}$ inch steel plate with 1.5-inch diameter central hole.
 5. Provide steel pipe clamp to fit 1-inch standard steel pipe. Steel plate and pipe clamp assembly shall be capable of transferring the total weight of the 1-inch standard steel pipe to the soil underlying the steel plate. The assembly shall also be capable of maintaining its position on the 1-inch standard steel pipe.
 6. Provide oakum.
 7. Special grout Type A shall consist of uniform sized fine ground or powdered non-drilling mud grade bentonite, for use in sealing and grouting well casings. A polymer-based thixotropic additive may also be added to the mix if recommended by the manufacturer. Special grout Type A shall have a mixed specific gravity, prior to placement within the instrument borehole, of between 1.03 and 1.10.

2.6 CONVERGENCE GAGES

- A. Provide tape extensometers and carrying cases, as manufactured by RS Technical Instruments Ltd., Maple Ridge, BC, Canada, model 51811510 as manufactured by Slope Indicator Co., Mukilteo, WA, model 1610 as manufactured by Geokon Inc., Lebanon, NH, or acceptable equivalent. Tape length shall be at least 75 feet.
1. Provide anchorage points, from the same commercial source as the tape extensometers, for installation on facilities as shown on the Instrumentation Plan.
 2. Provide calibration frame from the same commercial source as the tape extensometers. Calibration frame shall consist of a 5 ft length of a C6×8.2 steel channel, with a 10 inch × 6 in. × ¼ inch thick steel plate welded to the channel at each end. The channel and the plate shall be made from black A36 steel. All corners shall be rounded. Provide an anchorage point fixed to each plate, with sufficient clearance above the channel to mount the tape extensometer.

2.7 INCLINOMETERS

- A. For probe inclination measurements, provide inclinometer casing, probe, cable, readout unit and accessories, as manufactured by Slope Indicator Co., Mukilteo, WA or Geokon Inc., Lebanon, NH, or acceptable equivalent.
1. Inclinometer casing shall be 2.75 inch O.D. ABS or 2.4 inch O.D. PVC with broached internal keyways, and twist tolerance better than one degree per 10 feet length. Couplings shall be of the telescoping type.
 2. Probe shall be Digitilt Classic Inclinometer System as manufactured by Slope Indicator Co. or model GK-604D as manufactured by Geokon Inc., Lebanon, NH, or acceptable equivalent. Probe shall be biaxial, consisting of two force balance accelerometers mounted at 90°, with a 2-foot wheelbase. Probe shall be supplied in a carrying case.
 3. Cable shall be at least 135 feet long, sheathed with neoprene or polyurethane, with vulcanized rubber or metal markers, and an internal wire rope or kevlar strain core. Minimum cable O.D. shall be 0.4 inch.
 4. Readout unit shall be Digitilt DataMate II as manufactured by Slope Indicator Co. or model CR1000 data logger as manufactured by Campbell Scientific, or data loggers by Geokon Inc., or acceptable equivalent. The time interval between recordings two feet apart in the casing shall be such that the reading stabilizes to within ± 1 unit of display within 8 seconds. Readout unit shall include a battery charger.
 5. Provide accessories, consisting of end caps, tools and materials for attaching couplings, and taking readings.
 6. A minimum of one probe, cable, readout unit and carrying case shall be provided for the Design-Builder's Independent Geotechnical Instrumentation Engineer's monitoring program.
 7. Provide two sets of inclinometer software as supplied by Slope Indicator Co., or Geokon Inc., Lebanon, NH, or acceptable equivalent.

8. Special grout Type B shall include cement, bentonite and water, and shall have approximately the same shear strength and compressibility as the surrounding ground.
9. Surface protection shall have a diameter adequate to allow attachment of cable support assembly, or shall allow for an inclinometer casing extension while readings are being taken. The length of the inclinometer casing extension shall not vary by more than 0.05 inch.
10. In-place inclinometer system as manufactured by Slope Indicator Company, Mukilteo, WA, or by Geokon Inc., Lebanon, NH including IPI IDA-Sensor, wheel assembly gage, extension tubes, placement tubes and fittings, bus cable extensions, data logger, and inclinometer software. Provide one in-place inclinometer system for the Design-Builder's Independent Geotechnical Instrumentation Engineer's monitoring program.
11. Provide a minimum of one in-place inclinometer system readout unit for the Design-Builder's Independent Geotechnical Instrumentation Engineer's monitoring program.

2.8 PROBE EXTENSOMETERS

- A. Provide magnetic extensometer system as supplied by Slope Indicator Co., Mukilteo, WA, or model 1900 magnetic extensometer by Geokon Inc., Lebanon, NH, or acceptable equivalent, amended to conform to the requirements in this section.
 1. Access tube shall be PVC, 1-inch nominal diameter.
 2. Telescoping joints shall be provided at all connections in the access tube to allow for vertical compression.
 3. Magnetic settlement targets shall be pneumatically or mechanically actuated spider magnets, with 6 leaf springs, suitable for installation in a 4.5 to 5.5-inch diameter borehole. The stiffness of the leaf springs shall be such that a force of at least 5 pounds is required to move an 8-inch long leaf spring from its extended position to the longitudinal axis of the target. The extended diameter of the leaf springs shall be at least 9 inches. One datum ring shall be provided for each installation. The profiles of the spider magnet bodies and actuation devices shall be tapered such that there is no possibility of actuation devices hanging up on magnet bodies during retrieval. The actuation devices shall be designed such that there is a clear and reproducible signature to verify that the leaf springs have been released. If pneumatically actuated cutters are used, the connection between the cutter and pneumatic tubing shall sustain a tensile force of not less than 45 pounds.
 4. Reed switch probe and reel shall have at least 100 feet of nylon-coated tape with integral conductors. Tape shall be graduated in feet, tenths, and hundredths of a foot.
 5. Special Grout Type A shall consist of uniform sized ground or powdered non-drilling mud grade bentonite, for use in sealing and grouting well casings. A polymer-based thixotropic additive may also be added to the mix if recommended by the manufacturer. Special grout Type A shall have a mixed specific gravity, prior to placement within the instrument borehole, of between 1.03 and 1.10.

2.9 VIBRATING WIRE STRAIN GAGES

- A. Provide vibrating wire strain gages and cables, model 4000 as manufactured by Geokon Inc., Lebanon, NH, model SM-5A as manufactured by RocTest Inc., Saint-Lambert, Quebec Canada, or model VWSG-E(L) as manufactured by Geonor Inc., Augusta, NJ, or acceptable equivalent. Gages shall have documented long-term stability over a five-year period, and shall be proof tested by submersion in water for 24 hours at 100 lb/in². Strain gages shall have end blocks arranged for arc welding or bolting to steel, with a minimum center-to-center spacing of 3.6 inches, and shall be fitted with a thermistor.
1. Provide readout and other terminal units, from the same commercial source as the strain gages. Terminal units shall be clearly marked with each strain gage number. A minimum of one readout unit shall be provided for the Design-Builder's monitoring program and two for the Geotechnical Instrumentation Engineer's monitoring program.
 2. Provide protective covers for gages.
 3. Provide protection over all exposed gage cables, consisting of steel pipe, channel, angle or flexible steel conduit.

2.10 SEISMOGRAPHS

- A. Provide portable seismographs for monitoring the velocities of ground vibrations resulting from construction activities. Provide model 3000LCP as manufactured by Geosonics of Warrendale, PA or acceptable equivalent. The seismograph shall have the following minimum features: (to be modified later).
1. Seismic range: 0.01 to 8 inches per second with an accuracy of 5% and no more than a 3 db roll off at the low frequency end.
 2. Flat frequency response: 2 to 200 Hertz.
 3. Three component sensor.
 4. Fourth channel for air blast monitoring.
 5. Two power sources: Internal rechargeable battery and charger and 115 volts AC. Battery shall be capable of supplying power to monitor vibrations continuously for up to 24 hours.
 6. Capable of internal dynamic calibration.
 7. Data logging of readings.
 8. Continuous monitoring mode shall be capable of recording peak velocities.
 9. Capability of wirelessly downloading data remotely.

2.11 CRACK MONITORS

- A. Provide calibrated crack monitors as manufactured by RST via Geonor Inc., Augusta, NJ, or Avongard Products USA Ltd. of Los Angeles, CA, or acceptable equivalent.

2.12 TILTMETERS

- A. Provide biaxial tiltmeters, model EL tilt sensor or MEMS tiltmeter 57803102, as manufactured by Slope Indicator Co., Seattle, WA, model 6350 as manufactured by Geokon, Inc., Lebanon, NH, or acceptable equivalent.
1. Provide biaxial tiltmeter brackets from the same commercial source as the tiltmeters.

2. Provide 100 feet of cable from the same commercial source as the tiltmeters. Cable shall be as specified by the manufacturer of the instrument and shall be a shielded cable with a waterproof jacket.
3. Provide readout and other terminal units, from the same commercial source as the tiltmeters.
4. Provide protective boxes, NEMA 4, or equivalent, waterproof and locking, of appropriate size to enclose tiltmeter and allow for connection of readout unit to tiltmeter.

2.13 UTILITY MONITORING POINTS

- A. Provide materials to construct utility monitoring points including: steel pipe flange, 1-inch diameter, ASTM A 403.
 1. Extra strong steel sleeve pipe, threaded and coupled, ASTM A53 Grade B.
 2. Extra strong steel riser pipe, threaded and coupled, ASTM A53 Grade B.
 3. PVC centralizers. Centralizers shall consist of a schedule 40 PVC pipe conforming to ASTM D 1785, sized to provide a tight fit on the riser pipe, and spring-formed to a larger diameter to provide a loose fit in the sleeve pipe.
 4. 18-inch x 18-inch x 1/4-inch. steel plate with 4.25-inch diameter central hole.
 5. Steel pipe clamps and pipe flanges. Steel plate and pipe clamp assembly shall be capable of transferring the total weight of the 3-1/2-inch extra strong pipe to the soil underlying the steel plate. The assembly shall also be capable of maintaining its position on the extra strong steel pipe over time.
 6. Oakum.
 7. Pipe cap with 1/4-inch diameter round head stainless steel bolt set securely in cap.

2.14 DEEP BENCHMARKS

- A. Provide materials to construct deep benchmarks including:
 1. NW Schedule 40 steel casing, ASTM 53.
 2. Schedule 80 steel pipe, ASTM A53.
 3. PVC or nylon centralizers, tight fit on pipe, loose fit in casing.
 4. Bentonite Slurry consisting of a mixture of powdered bentonite and potable water in proportions to yield a thick slurry that can be placed by tremie methods.

2.15 FACTORY CALIBRATION

- A. A factory calibration shall be conducted on all instruments at the manufacturer's facility prior to shipment. Each factory calibration shall include a calibration curve with data points of the applied quantity (e.g. pressure, displacement, force) versus the measured quantity clearly indicated, and a tabulation of the data. Each instrument shall be marked with a unique identification number.

1. Factory calibrations of vibrating wire piezometers shall be made against a pressure gage traceable to the National Institute of Standards and Technology. The accuracy of the pressure gage shall not be less than twice the specified accuracy of the piezometers. Calibrations shall be made to full scale in two complete cycles, recording the reading in 10 equal increments during two loading and two unloading cycles. The thermal factor of each piezometer shall be determined in a precision test chamber, at 0, 10, 20, and 30 degrees C. The calibration record shall include gage factor, thermal factor, and zero reading with corresponding temperature and barometric pressure.
2. Factory calibrations of convergence gages shall be made by attaching the gage to its calibration frame, taking a reading, removing the gage from the frame, repeating the procedure five times, and reporting each reading and the average.
3. Factory calibrations of inclinometers shall include comprehensive calibrations of the force balance accelerometers prior to assembly in the probe. A final calibration shall include measurements made at 10° intervals from -30° to +30° with respect to vertical, and a comprehensive repeatability check over a smaller zone near vertical.
4. Factory calibration of probe extensometers shall be made by verifying that an audible signal is emitted as the probes pass through each magnet. Each magnet shall be supplied with a label or sticker confirming that it has been checked as specified. The tape attached to the probe shall be checked against a standard traceable to the National Institute of Standards and Technology, to an accuracy of ± 0.05 in.
5. Factory calibration of seismograph vibration monitors shall be performed using a shake table and a reference sensor traceable to the National Institute of Standards and Technology. Factory calibrations of overpressure sensors shall be performed using a calibrator traceable to the National Institute of Standards and Technology.
6. Factory calibration of the tiltmeters shall consist of calibrations in a mechanical tilting table within the range of ± 2000 micro-radians, in a minimum of 10 equal increments.

2.16 OPEN STANDPIPE PIEZOMETERS

- A. Provide open standpipe piezometers with slotted pipe, bottom caps and vented top caps. The slotted pipe shall be 1.5 feet long, 1¼ inch Sch. 80 PVC with 3 rows of 0.01-inch-wide slots on 120° centers, with a slot length to leave 0.25 inch between rows. The riser pipe shall be 1¼ inch Sch. 80 flush Joint PVC pipe. The joints shall either have modified pipe threads or O-rings such that they sustain an internal water pressure of 50 lb/sq. inch.
 1. Sand filter shall conform to ASTM C-778-13, Standard Specification for Standard Sand, for 20-30 sand.
 2. Granular bentonite shall be Enviroplug Medium, as manufactured by Wyo-Ben, Inc., Billings, MT, or Holeplug, as manufactured by Baroid Division, Halliburton, Houston, TX, or acceptable equivalent.

PART 3 - EXECUTION

3.1 PRE-INSTALLATION ACCEPTANCE TESTS

- A. When instruments are received at the site, the Design-Builder's instrumentation personnel shall perform pre-installation acceptance tests to ensure that the instruments and readout units are functioning correctly prior to installation. Pre-installation acceptance tests shall include relevant items from the following list:
1. Examine factory calibration curve and tabulated data, to verify completeness.
 2. Examine manufacturer's final quality assurance inspection check list, to verify completeness
 3. Check cable length.
 4. Check tag numbers on instrument and cable.
 5. Check, by comparing with procurement document, that model, dimensions, materials. are correct.
 6. Bend cable back and forth, at point of connection to instrument, while reading the instrument, to verify connection integrity.
 7. Perform resistance and insulation testing, in accordance with criteria provided by the instrument manufacturer, using a gage insulation or circuit tester that applies 2 volts or less for resistance testing and 15 volts or less for insulation testing.
 8. Verify that all components fit together in the correct configuration.
 9. Check all components for signs of damage in transit.
 10. Check that quantities received correspond to quantities ordered.
- B. During pre-installation acceptance testing of each instrument the Design-Builder's instrumentation personnel shall complete a test record sheet. The test record sheet shall include appropriate items from the following list:
1. Project name.
 2. Instrument type and number.
 3. Identification of any testing or readout equipment used during testing.
 4. Personnel responsible for testing.
 5. Date and time of test.
 6. Measurements and observations made during testing, as specified in above, items 1 thru 10.
 7. Test results, pass or fail.

3.2 INSTALLATION - GENERAL

- A. The Design-Builder shall install, monitor, and interpret data from instrumentation to ensure the safety of personnel and the work, at no additional cost to the MBTA. Raw data collected by the Design-Builder from any such additional instrumentation proposed by the Design-Builder's Geotechnical Instrumentation Engineer and approved by the MBTA, shall be collected in the same manner as for the specified instrumentation. Raw, reduced and plotted data shall be made available to the MBTA.
1. Installation procedures for instruments in boreholes shall be such that all steps in the procedure can be quality assured. Volumes of each increment of backfilling with sand and granular bentonite shall be small enough such that no bridging occurs, and the depth to the top of each increment shall be checked after placement.
 2. Grout shall be placed using a tremie method with side discharge ports on the tremie pipe.

3. Prior to installing any instrument through drill casing or augers, all material adhering to the inside of the casing or augers, and all cuttings, shall be removed thoroughly.
4. Whenever withdrawing drill casing or augers during instrument installation in a borehole, care shall be taken to minimize the length of unsupported borehole and the rate of casing or auger withdrawal. Collapse of the borehole shall not be allowed to occur. Backfill material shall not be allowed to build up inside the casing or auger such that the instrument is lifted as the casing or auger is withdrawn. The casing or auger shall be withdrawn without rotation. The casing or auger may be omitted only where it can be shown that instrument installation without the casing or auger will not cause collapse of the borehole or in any way adversely affect instrument installation.
5. The Design-Builder shall notify the MBTA at least 24 hours prior to installing each instrument.
6. Approximate quantities and locations of all instruments shall be shown on the Instrumentation Plan prepared by the Design-Builder's Geotechnical Instrumentation Engineer and approved by the MBTA. Exact locations shall be determined in the field, by the Geotechnical Instrumentation Engineer in cooperation with the Design-Builder's Lead Geotechnical Engineer, to minimize interference to other construction work.
7. The Design-Builder shall extend installed instrumentation and reinstall roadway boxes as necessary as grade changes occur, and revise instrument reference elevations as necessary.
8. As each instrument is installed, an installation record sheet (paper and electronic record) shall be prepared, including appropriate items from the following list:
 - a. Project name.
 - b. Contract name and number.
 - c. Instrument type and number, including readout unit.
 - d. Planned location in horizontal position and elevation.
 - e. Planned orientation.
 - f. Planned lengths and volumes of backfill.
 - g. Personnel responsible for installation.
 - h. Equipment used, including diameter and depth of any drill casing or augers used.
 - i. Date and time of start and completion.
 - j. Spaces on record sheet for necessary measurements or readings required at hold points during installation to ensure that all previous steps have been followed correctly, including instrument readings made during installation.
 - k. A log of subsurface data indicating the elevations of strata changes encountered in the borehole. Strata soil nomenclature shall be based on profiles and boring logs contained in the Geotechnical Data Report.
 - l. Type of backfill used.
 - m. As-built location in horizontal position and elevation.
 - n. As-built orientation.
 - o. As-built lengths and volumes of backfill.
 - p. Result of post-installation acceptance test.
 - q. Weather conditions at the time of installation.
 - r. A space on record sheet for notes, including problems encountered, delays, unusual features of the installation, and details of any events that may have a bearing on instrument behavior.

An instrument that fails the specified post-installation acceptance test shall be replaced by an identical instrument at no cost to the MBTA.

3.3 INSTALLATION OF OBSERVATION WELLS

- A. Observation wells shall be installed at the locations and depths shown on the Design-Builder's approved Instrumentation Plan, in accordance with the manufacturer recommendations and instructions, and as directed by the Geotechnical Instrumentation Engineer. Bentonite drilling mud shall not be used. The general installation procedure is as follows.
1. Using a wash boring or rotary drilling method, install HW or larger flush-joint casing to 6 inches below the planned elevation of the bottom of the slotted pipe, taking a split-spoon soil sample at the bottom of the borehole, and wash until the water runs clear. Maximize cutting removal by using the reverse circulation method, with the wash pipe as the intake, its lower end a few inches from the bottom of the borehole.
 2. Pull the casing 6 inches and pour in enough filter sand to fill the borehole below the bottom of the casing. Check the borehole depth.
 3. Lower the slotted pipe, with attached riser pipe, to the top of the sand.
 4. Pull the casing 12 inches and pour sand to fill the borehole below the bottom of the casing. Repeat until the borehole is filled with sand, and the casing is removed, checking the depth of the sand after each pour.
 5. Install granular bentonite plug and surface protection.
 6. Determine as-built location in horizontal position to an accuracy of ± 0.1 foot and in elevation to an accuracy of ± 0.01 foot.
- B. After completion of installation, the as-built location in horizontal position shall be determined to an accuracy of ± 0.1 foot, and in elevation to an accuracy of ± 0.01 foot.

3.4 INSTALLATION OF OPEN STANDPIPE PIEZOMETERS

- A. Open standpipe piezometers shall be installed, one per borehole, at the locations and depths shown on the Design-Builder's approved Instrumentation Plan, in accordance with the manufacturer recommendations and instructions, and as directed by the Geotechnical Instrumentation Engineer. Bentonite drilling mud shall not be allowed. The general installation procedure is as follows.
1. Using a wash boring or rotary drilling method install HW or larger flush-joint casing to 1 foot below the planned elevation of the bottom of the piezometer, taking a split-spoon soil sample at the piezometer elevation, and wash until the water runs clear. Maximize cutting removal by using the reverse circulation method, with the wash pipe as the intake, its lower end a few inches from the bottom of the borehole.
 2. Pull the casing 6 inches and pour in enough filter sand to fill the borehole below the bottom of the casing. Check the borehole depth.
 3. Repeat step 2. Lower the porous point, with attached riser pipe, to the top of the sand.
 4. Pull the casing 6 inches and pour sand to fill the borehole below the bottom of the casing. Repeat until the sand and casing are 1 foot above the top of the porous point, checking the depth after each pour.
 5. Pull the casing 6 in and pour granular bentonite very slowly to fill the borehole below the bottom of the casing. Repeat until a 4-foot layer of granular bentonite is in place, checking the depth after each pour using a cylindrical sounding hammer. Do not tamp the granular bentonite.

6. Fill the casing with special grout Type A, using a tremie method with side discharge ports on the tremie pipe. Withdraw all casing, without rotation, and top up the borehole with special grout Type A.
 7. Perform post-installation acceptance test by conducting a falling head permeability test to verify seal integrity.
 8. Install surface protection.
 9. Determine as-built location in horizontal position to an accuracy of ± 0.1 foot and in elevation to an accuracy of ± 0.01 foot.
- B. After completion of installation, the as-built location in horizontal position shall be determined to an accuracy of ± 0.1 foot, and in elevation to an accuracy of ± 0.01 foot.

3.5 INSTALLATION OF VIBRATING WIRE PIEZOMETERS

- A. Vibrating wire piezometers shall be installed, one or two per borehole, at the locations and depths shown on the Design-Builder's approved Instrumentation Plan in accordance with the manufacturer recommendations and instructions, and as directed by the Geotechnical Instrumentation Engineer. Bentonite drilling mud shall not be used. The general installation procedure is as follows.
1. Using a wash boring or rotary drilling method, install HW or larger flush-joint casing to 1 foot below the planned elevation of the bottom of the piezometer, taking a split-spoon soil sample at the piezometer elevation, and wash until the water runs clear. Maximize cutting removal by using the reverse circulation method, with the wash pipe as the intake, its lower end a few inches from the bottom of the borehole.
 2. Pull the casing 6 inches and pour in enough filter sand to fill the borehole below the bottom of the casing. Check the borehole depth.
 3. Repeat step 2.
 4. Fully saturate the piezometer filter and cavity between filter and diaphragm with clean water.
 5. While maintaining saturation of the piezometer filter, lower the piezometer, with attached cable, to the top of the filter sand.
 6. Check that the piezometer reading agrees with the water head.
 7. Record the elevation of the diaphragm.
 8. Pull the casing 6 inches and pour sand to fill the borehole below the bottom of the casing. Repeat until the sand and casing are 1 foot above the top of the piezometer, checking the depth after each pour.
 9. Pull the casing 6 inches and pour granular bentonite very slowly to fill the borehole below the bottom of the casing. Repeat until a 4-foot layer of granular bentonite is in place, checking the depth after each pour using a cylindrical sounding hammer. Do not tamp the granular bentonite.

10. Fill the casing with special grout Type A, using a tremie method with side discharge ports on the tremie pipe. Withdraw all casing, without rotation, and top up the borehole with special grout Type A.
 11. Perform post-installation acceptance test by verifying that the piezometer reading agrees with the piezometric head.
 12. Install surface protection.
 13. Determine as-built location in horizontal position to an accuracy of ± 0.1 foot and in elevation to an accuracy of ± 0.01 foot.
- B. Prior to insertion of the piezometer in the borehole, the piezometer and cavity between filter and diaphragm shall be saturated with clean water. Saturation shall be maintained throughout the installation.
 - C. The piezometer shall be lowered to between 24 and 26 feet above its specified installation depth, allowed to achieve thermal equilibrium by waiting for a sufficient time, as stated by the manufacturer, and readings taken of piezometer pressure and temperature, and barometric pressure. Corrections shall be applied in accordance with factory calibration data. The actual water head over the piezometer diaphragm shall be determined by direct depth measurement. The piezometer shall then be lowered to between 4 and 6 feet above its specified installation depth, allowed to achieve thermal equilibrium, and readings taken and corrections made as specified herein. The calibration of the piezometer shall be checked by comparing the actual difference in water head with the difference between the two piezometer readings. If the two values differ by more than 1.0% of the specified range of the piezometer, the piezometer shall be replaced by an identical instrument at no additional cost to the MBTA. If the two values agree to within 1.0 % of the specified range of the piezometer, the piezometer shall be lowered to the specified installation depth and the elevation of the diaphragm shall be recorded.
 - D. Depth to the top of each increment of granular bentonite shall be checked using a cylindrical sounding hammer. The granular bentonite shall not be tamped.
 - E. After completion of installation a post-installation acceptance test shall be performed to verify that the piezometer functions correctly.
 - F. After completion of installation, the as-built location in horizontal position shall be determined to an accuracy of ± 1 foot, and the elevation of the top of the roadway box to an accuracy of ± 0.01 foot. The elevation of the piezometer diaphragm shall also be determined, to an accuracy of ± 0.1 foot.

3.6 INSTALLATION OF DEFORMATION MONITORING POINTS

- A. Deformation monitoring points (DMPs) shall be installed at the locations shown on the Design-Builder's approved Instrumentation Plan, or as directed by the MBTA. Where the DMP is being installed in masonry construction the Design-Builder shall locate the DMP in the grout between masonry units. After installation of a DMP, determine as-built location in horizontal position to an accuracy of ± 0.03 foot, and in elevation to an accuracy of ± 0.01 foot. Deformation Monitoring Points shall be installed in accordance with the manufacturer recommendations and instructions, if available, and as directed by the Geotechnical Instrumentation Engineer. The general installation procedure is as follows.

1. DMP-Type 1 shall be driven with a hammer into asphalt-covered surface. The identification marker shall be installed directly between the asphalt-covered surface and the head of the PK nail.
2. DMP-Type 2 shall be installed in holes drilled into vertical surfaces of building foundations as follows:
 - a. Drill hole in masonry or stone surface.
 - b. Insert tampin screw anchor with conical end first. (The tampin screw anchor consists of threaded steel screw anchor and a lead casing).
 - c. Use setting tool supplied by manufacturer to expand lead sleeve into masonry.
 - d. Cap hole with 5/16-inch diameter x ¾ inch long carriage bolt.
 - e. To take a reading, replace ¾ inch long carriage bolt with 4 ½ inch long (or longer) machined and certified bolt.
3. DMP-Type 3 shall be installed in holes drilled into horizontal concrete and rock surfaces. The monitoring points shall be installed as described for DMP-Type 2, except that the 5/16-inch diameter x ¾ inch long carriage bold shall be punch-marked and kept permanently fixed in the anchor hole with thread-locking compound, and the 4 ½ inch long (or longer) hex bolt is not used.
4. DMP-Type 4 shall be installed by excavating a hole adequate for the roadway box, driving the rod to the required depth, and installing the roadway box. If the rod cannot be driven to the required depth, it shall be withdrawn, and reinstalled by advancing a borehole to the full depth of the rod, and grouting the annulus with cement grout.
5. DMP-Type 5 shall be installed on the top horizontal surface of steel sheeting or a soldier pile. The steel surface within 3 inch of the point shall be cleaned by wire brush to permit easy identification of the exact point. The point shall also be clearly identified using fluorescent spray paint adjacent to the point.

3.7 BORROS POINT ANCHORS

- A. Borros points shall be installed at the locations and depths shown on the Design-Builder's approved Instrumentation Plan or as directed by the MBTA. Borros Point Anchors shall be installed in accordance with the manufacturer recommendations and instructions, and as directed by the Geotechnical Instrumentation Engineer. The general installation procedure is as follows.
 1. Using a wash boring or rotary drilling method, install NW or HW flush-joint casing to 1 foot above the depth shown on the Instrumentation Plan. Maximum borehole size shall be 4.5 inches. Wash until the water runs clear.
 2. Assemble Borros anchor, left hand thread, greased garden hose, ¼ inch and 1 inch pipes, with left hand thread greased and hand-tight, and lower to bottom of boring. Grease heavily the outside of all couplings on ¼ inch pipe. At the same time insert a grout tremie pipe to bottom of boring. Drive on 1-inch pipe until Borros anchor is at required depth.
 3. Extend anchor prongs by driving on ¼ inch pipe. Record driving distance, to ensure full extension.
 4. Disconnect the left hand thread and raise the 1 inch pipe 1 foot or a different distance as determined by the Geotechnical Instrumentation Engineer. Relative depths of couplings on ¼

inch and 1 inch pipes shall be planned such that there will be no possibility of them being alongside each other at any time as settlement or heave takes place.

5. Fill the boring with special grout Type A, withdraw the drill casing and tremie pipe, topping up with special grout Type A.
6. Fill top 3 inches of space between ¼ inch and 1 inch pipes with oakum.
7. Place the steel plate over the 1-inch pipe and directly on the soil subgrade. Install the pipe clamp on the 1-inch pipe such that the clamp rests directly on the steel plate.
8. Install surface protection.
9. After completion of installation, determine as-built location in horizontal position to an accuracy of ±0.1 foot, and in elevation to an accuracy of ±0.01 foot.

3.8 INSTALLATION OF CONVERGENCE GAUGES

- A. Convergence gage anchorage points shall be installed at the locations shown on the Design-Builder's approved Instrumentation Plan, or as directed by the Geotechnical Instrumentation Engineer.

3.9 INSTALLATION OF INCLINOMETERS

- A. Inclinator casings shall be installed at the locations and depths shown on the Instrumentation Plan, or as directed by the Geotechnical Instrumentation Engineer. After installation, the bottom 10 feet of inclinometer casing shall be within a stratum suitable for providing base fixity, such as bedrock or glacial till. Inclinator casings shall be installed in accordance with the manufacturer instructions, and as directed by the Geotechnical Instrumentation Engineer. The general installation procedure is as follows.
 1. Prior to drilling, the drill rig shall be plumbed to within one degree of vertical. Using a wash boring or rotary drilling method, install HW or PW flush-joint casing to the specified depth of the bottom cap, plus any additional depth needed to accommodate any required bottom weight. Maximum borehole size shall be 5.5 inches. If drilling in bedrock is required, the boring in bedrock shall be 3.75 inches minimum diameter. Wash until the water runs clear. Maximize cutting removal by using the reverse circulation method, with wash pipe as the intake, its lower end a few inches from the bottom of the borehole.
 2. If the boring extends into bedrock, verify that special grout Type B does not run into the bedrock by using the following method. Add drill casing so that the top is 10 feet above the ground surface. Fill the drill casing with water, and observe the level. If the level remains at the top of the casing for five minutes, proceed with step 3. If the level falls, tremie special grout Type B into the bottom 10 feet of the borehole, redrill, regout and redrill as necessary until, with the water-filled casing 10 feet above the ground surface and the borehole drilled 10 feet into bedrock, water remains at the top of the casing for five minutes.
 3. Install the bottom cap on the inclinometer casing. Verify that the drill casing is free to move. Using a tremie method, fill the drill casing with special grout Type B.

4. Add sufficient weight to the bottom of the inclinometer casing to overcome buoyancy caused by the grout, and lower coupled inclinometer casing throughout the borehole, filling with water, sealing joints to prevent grout ingress. Casing groove orientation shall be maintained throughout installation.
5. When all inclinometer casing is installed, withdraw drill casing without rotation, and top up with special grout Type B.
6. After completion of installation, but before the grout has set, a post-installation acceptance test shall be performed to verify that there is no grout in the inclinometer casing, that groove orientation is correct and that the inclinometer probe tracks correctly in all four orientations. After the grout has set, a check shall again be made to verify that the inclinometer probe tracks correctly in all four orientations.
7. Flush inclinometer casing with clean water. Allow grout to set. Repeat flushing and post-installation acceptance test.
8. Install surface protection.

3.10 INSTALLATION OF IN-PLACE INCLINOMETER (IPI) SENSOR STRING

- A. Install IPI sensor string within acceptably installed inclinometer casing in accordance with the manufacturer's recommendations.
 1. Gage lengths shall be 5 feet from the top of the inclinometer casing to a depth of 50 feet below the top of the casing and 10 feet from a depth of 50 feet below the top of the casing to the bottom of the casing. Provide sufficient IPI sensors for the longest inclinometer casing to be monitored with an IPI.
 2. IPI system shall be installed a minimum of two days prior to the construction of each adjacent slurry wall panel and removed no sooner than two days after the panel is poured.
 3. The IPI data collection shall be closely coordinated with the slurry wall panel construction sequence.

3.11 INSTALLATION OF PROBE EXTENSOMETERS

- A. Probe extensometers shall be installed at the locations and depths shown on the Design-Builder's approved Instrumentation Plan or as directed by the Geotechnical Instrumentation Engineer. After installation, the bottom 10 feet of the access tube shall be within a stratum suitable for providing base fixity, such as bedrock or glacial till. Probe Extensometers shall be installed in accordance with the manufacturer recommendations instructions, and as directed by the Geotechnical Instrumentation Engineer. The general installation procedure is as follows.
 1. Prior to drilling, the drill rig shall be plumbed to within one degree of vertical. Using a wash boring or rotary drilling method, install HW or PW flush-joint casing to the specified depth of the bottom cap, plus any additional depth needed to accommodate any required bottom weight. Maximum borehole size shall be 5.5 inches. If drilling in bedrock is required, the boring in bedrock shall be 3.75 inches minimum diameter. Wash until the water runs clear. Maximize cutting removal by using the reverse circulation method, with the wash pipe as the intake, its lower end a few inches from the bottom of the borehole.

2. Prior to completion of the boring, prefix spider magnets and datum magnets to the access tube, using nylon line to hold the magnet legs in their inward position. Spider magnets shall be held adequately on the access tube so that they do not slide during installation, but are free to slide subsequently. The access tube shall be coated with heavy grease to fill the annular space between each spider magnet and the access tube, and for a distance of 2 inches above and below each magnet location. For a further distance of 12 inches above and below each magnet location, the access tube shall be coated with silicon grease. Spider magnets shall not be installed within 2 feet above or below telescoping joint in the access tube.
3. Fit a pneumatic cutter and tube to each spider magnet, identifying each tube at its upper end. Install the bottom cap on the access tube.
4. The telescoping couplings shall be installed in a two-thirds extended position. No more than one pop rivet shall be used at each end of each telescoping coupling.
5. If the boring extends into bedrock, verify that cement grout does not run into the bedrock by using the following method. Add drill casing so that the top is 10 feet above the ground surface. Fill the drill casing with water, and observe the level. If the level remains at the top of the casing for five minutes, proceed with step 4. If the level falls, tremie cement grout into the bottom 10 feet of the borehole, redrill, regrout and redrill as necessary until, with the water-filled casing 10 feet above the ground surface and the borehole drilled 10 feet into bedrock, water remains at the top of the casing for five minutes.
6. Verify that the drill casing is free to move. Using a tremie method, fill the bottom of the boring with a measured volume of cement grout sufficient to fill the annulus between the bottom 10 feet of access tube and the ground. Fill the remainder of the boring with special grout Type A.
7. Add sufficient weight to the bottom of the access tube to overcome buoyancy caused by the grout, and lower coupled access tube throughout the borehole, filling the access tube with water, and sealing joints in the access tube to prevent grout ingress. Ensure that telescoping couplings are in the fully extended position.
8. When all access tube and magnets are installed, withdraw drill casing without rotation to 2 feet above the lowest spider magnet, release the magnet legs, and retrieve the pneumatic cutter.
9. Repeat step 9 for each spider magnet in turn, topping up with special grout Type A as the installation proceeds, withdrawing all drill casing.
10. During installation, the access tube shall not be rotated, and connections to actuation devices shall not become intertwined. All actuation devices shall be retrieved, to demonstrate that spider magnets have been actuated.
11. After completion of installation, a post-installation acceptance test shall be performed to verify that there is no grout in the access tube, that telescoping couplings are in the two-thirds extended position, that no spider magnet varies from its specified position by more than 9 inches and that no spider magnet is nearer than 24 inches above or below the end of the coupling in the access tube.
12. Flush the access tube with clean water. Fit the top cap to the access tube.
13. Allow grout to set. Repeat flushing and post-installation acceptance test.

14. Install surface protection.
15. After completion of installation the as-built location in horizontal position shall be determined to an accuracy of ± 1 foot and the elevation of the top of the access tube to an accuracy of ± 0.01 foot.

3.12 INSTALLATION OF VIBRATING WIRE STRAIN GAUGES INSTALLATION - GENERAL

- A. Installation of vibrating wire strain gages shall be completed a minimum of 5 work days before a gauged strut or brace is installed in an excavation support system. Gauges shall be installed at the locations shown on the Design-Builder's approved Instrumentation Plan, or as directed by the Geotechnical Instrumentation Engineer. Vibrating wire strain gauges shall be installed in accordance with the manufacturer recommendations and instructions, and as directed by the Geotechnical Instrumentation Engineer. The general installation procedure is as follows.
 1. Weld or thread end blocks or posts to member, using a positioning jig. If threaded posts are used, threads shall be covered with a thread locking compound, and a locknut shall be attached to each post.
 2. Stress relieve welded end blocks by lightly tapping with a hammer, or posts by flexing with the fingers several times in all directions. The later procedure shall be repeated after gauge attachment.
 3. Attach the gauge to the end blocks or posts, and set to an initial reading as determined by the Geotechnical Instrumentation Engineer.
 4. Attach coil assembly and cable.
 5. If posts are used, again flex them with the fingers to exercise the gauge as far as possible within its range.
 6. Perform post-installation acceptance test, by reading the gauge, to ensure correct functioning.
 7. Install cover plate over gauge, without reinforcing member. Paint cover plate with white paint.
 8. Coil and protect cable, in preparation for member installation.
- B. After member is installed, route cable to terminal location, install terminal and switch box or datalogger (identify which), and install protection over cable and terminal. Record as-built location in relation to member number and gauge location on member.

3.13 INSTALLATION OF SEISMOGRAPHS

- A. The Design-Builder shall install seismographs where shown on the Design-Builder's approved Instrumentation Plan, or as directed by the Geotechnical Instrumentation Engineer. These locations shall include: (select one or more of the following options: the ground at points between three and six feet from the faces of buildings; the structure of buildings; the floor slab near the closest exterior face of the buildings).

1. Seismographs shall be firmly mounted on the surface slab of concrete or asphalt, firmly set in undisturbed soil, or rigidly attached to the structure of buildings.

3.14 INSTALLATION CRACK MONITORS

- A. Crack monitors shall be installed by the Design-Builder at locations determined by the Design-Builder's Geotechnical Instrumentation Engineer. Crack monitors shall typically be installed in horizontal and vertical surfaces of structures. Installation by the Design-Builder of additional crack monitors shall utilize means and methods that avoid or minimize damage to building materials in general, and in particular, to historic materials. Drilled holes shall be located to avoid historically and architecturally significant design features of the structure.
 1. After completion of installation of additional crack monitors, the Design-Builder shall perform a post-installation acceptance test, by verifying that the monitors are firmly fixed in place.
 2. After completion of installation of additional crack monitors, the Design-Builder shall submit to the Geotechnical Instrumentation Engineer a sketch showing the as-built locations in horizontal position and elevation, measured from permanent physical features in the field, to an accuracy of ± 1 foot.

3.15 INSTALLATION OF TILTMETERS

- A. Tiltmeters shall be securely mounted to interior walls of the structures. The tilt meters shall be installed on the top floor of the buildings, at the locations shown on the Design-Builder's approved Instrumentation Plan or as directed by the Geotechnical Instrumentation Engineer. The bi-axial brackets shall be securely mounted to the structure as directed by the manufacturer. The sensitive axis of the tilt sensor shall be mounted perpendicular to the face of the building.
 1. Tiltmeters shall be connected by cable to terminal units where they can be monitored with the readout box. The terminal units shall be located in areas such that access by the Design-Builder's instrumentation subcontractor will not interfere with the Building Owner or occupants.
 2. After tiltmeter installation, perform post-installation acceptance by reading the tiltmeter to ensure correct functioning.
 3. The threshold limits and signal functions on the readout box shall be set as directed by the Geotechnical Instrumentation Engineer.
 4. After the tiltmeter is installed, record as-built location.

3.16 INSTALLATION OF UTILITY MONITORING POINTS

- A. Utility monitoring points shall be installed at the locations and depths shown on the Design-Builder's approved Instrumentation Plan, or as directed by the Geotechnical Instrumentation Engineer. Utility monitoring points shall be installed in accordance with the manufacturer recommendations and instructions, and as directed by the Geotechnical Instrumentation Engineer. The general installation procedure is as follows.

1. The location and top of the utility in plan shall be determined using vacuum excavation methods. The Design-Builder shall be responsible for any damage to the utility during installation of the utility monitoring point.
2. Vacuum excavation methods shall be used to locate the top of the utility. Approach the top of the utility very slowly, to avoid risk of damage.
3. Install the sleeve pipe to the top of the utility.
4. Attach the steel flange to a length of riser pipe within the sleeve pipe, with centralizers every 10 feet, until the flange rests on top of the utility. Record the total length of flange and riser pipe to an accuracy of ± 0.01 foot.
5. Raise the sleeve pipe a distance of 1 foot keeping it in place as necessary by supporting the top.
6. Attach the pipe cap to the top of the riser pipe.
7. Fill the top 3 inches of space between the riser pipe and sleeve pipe with oakum.
8. Place the steel plate over the sleeve pipe and directly on the soil subgrade. Install the pipe clamp on the sleeve pipe such that the clamp rests directly on the steel plate.
9. Install surface protection.
10. After completion of installation, the as-built location in elevation shall be determined to an accuracy of ± 0.01 foot.

3.17 INSTALLATION OF DEEP BENCHMARKS

- A. Deep benchmarks shall be installed at the locations and depths shown on the Design-Builder's approved Instrumentation Plan, or as directed by the Geotechnical Instrumentation Engineer. Deep benchmarks shall be installed in accordance with the manufacturer recommendations and instructions, and as directed by the Geotechnical Instrumentation Engineer. The general installation procedure is as follows.
 1. Prior to drilling, the drill rig shall be plumbed to within one degree of vertical.
 2. The boring shall be drilled and permanently cased from the ground surface to a minimum one foot into bedrock.
 3. Core minimum of 10 feet of bedrock below the bottom of the permanent casing using an NX-sized core barrel.
 4. Add casing so that the top of the casing is 10 feet above ground surface. Fill the casing with water and observe the level. If the level remains within one foot of the top of the casing for five minutes, proceed with next step. If the level drops more than one foot below the top of the casing, tremie grout the bottom 10 feet of the borehole. Allow the grout to setup then drill out the bottom 10 feet. Repeat the process until water drops less than one foot from the top of the casing.

5. Tremie grout the bottom 10 feet of the borehole.
6. Lower the 1-½ inch steel pipe into the casing.
7. The length of the 1-½ inch pipe shall be adjusted as required so that the final location of the round head reference screw fitted to the steel cap is approximately four inches below ground surface.
8. A steel pipe cap fitted with a stainless steel round head reference screw shall be attached to the 1-½ inch pipe by welding.
9. Install the protective casing at the ground surface. The bottom of the protective casing shall extend to a minimum depth of 30 inches below the ground surface. The protective casing shall be secured in concrete.
10. The annulus between the permanent casing and the protective casing shall be filled (for corrosion protection) with bentonite slurry.

3.18 FIELD CALIBRATION AND MAINTENANCE

- A. The Design-Builder's instrumentation personnel shall conduct regular field calibrations and maintenance of readout units used for the Design-Builder's monitoring program, and regular maintenance of field terminals and accessible instrument components, following the guidelines included in the manufacturers' instruction manuals, and as detailed in the reviewed submittal. Regular field calibrations of readout units shall be made on a frequency not exceeding three months. Maintenance shall include both instruments installed by the Design-Builder and existing instruments installed by others. The Design-Builder shall conduct regular calibration and maintenance of readout units.
 1. On each day during which convergence gage readings are to be made, the Design-Builder's instrumentation personnel shall, before any readings are made, verify that the convergence gage is in calibration by attaching the gage to its calibration frame and verifying that the reading has not varied by more than ± 0.005 inch. from all previous such values.
 2. On each day during which inclinometer readings are to be made, the Design-Builder's instrumentation personnel shall, before any readings are made, verify inclinometer repeatability by lowering the probe to a stable depth in one selected inclinometer casing, at a depth where verticality of the casing is within 0.5% of vertical, waiting for temperature stabilization, taking a reading on both axes, repeating after rotating the probe 180 degrees, and determining the algebraic differences for both the A- and B-axes. The standard deviation of this A-axis difference and all the previous such A-axis differences shall not be greater than 0.0002 foot over a 2-foot interval. The standard deviation of this B-axis difference and all such B-axis differences shall not be greater than 0.0006 foot over a 2-foot interval. If no installed inclinometer casing satisfies the specified criteria for verticality and stability, the Design-Builder's instrumentation personnel shall construct a test length of inclinometer casing that satisfies these criteria, and shall use the test length for field calibration.
 3. Prior to their use during the Work of this Contract, seismographs shall be calibrated by the manufacturer, on a shake table. Shake table calibrations shall also be performed at least once a year. A certificate of calibration shall be submitted to the Geotechnical Instrumentation Engineer within 5 work days of performing each calibration.

3.19 DATA COLLECTION

- A. The Design-Builder's independent instrumentation subcontractor and surveyors shall collect data for the Design-Builder's monitoring program, following the guidelines included in the manufacturers' instruction manuals, and as detailed in the reviewed submittal. Data collection shall include both instruments installed by the Design-Builder and existing instruments installed by others.
- B. Immediately after taking a reading, the reading shall be compared with the previous reading of that instrument. When a reading indicates that a threshold or limiting value has been exceeded as specified in Section 3.23, the Design-Builder shall initiate the response action(s) specified therein.
- C. The Design-Builder's Instrumentation subcontractor and surveyors shall meet with the Geotechnical Instrumentation Engineer at least once each week to examine data, resolve any incompatibilities, and to discuss any issues associated with the Design-Builder's monitoring programs.
- D. No instrument will be accepted or paid for until satisfactory formal initial readings are obtained, as specified herein. Formal initial readings shall be agreed upon between the Design-Builder and the Geotechnical Instrumentation Engineer by taking readings and agreeing on their consistency.
- E. Data shall be recorded on field electronic and manual data records, which shall include at least the following:
 - 1. Project name.
 - 2. Contract name and number.
 - 3. Instrument type.
 - 4. Date and time.
 - 5. Observer.
 - 6. Readout unit number.
 - 7. Instrument number.
 - 8. Readings.
 - 9. Remarks.
 - 10. Visual observations.
 - 11. Other casual data including weather, temperature, and construction activities.
- F. Data shall be recorded in U.S. Customary Units, for example feet, inches, pounds.
- G. Instrumentation shall be monitored in accordance with the Monitoring Schedules in Table 1 of this Specification. The Geotechnical Instrumentation Engineer may at any time instruct the Design-Builder to collect data supplementary to the frequencies given in Table 1.
- H. The Design-Builder shall collect data, in addition to the monitoring frequencies given in Table 1, and the supplementary readings directed by the Geotechnical Instrumentation Engineer, to ensure the safety of personnel and the work, at no additional cost to the MBTA. The Design-Builder's Geotechnical Instrumentation Engineer may propose alternative reading frequencies in their instrumentation plan, for approval by the Design-Builder's Lead Geotechnical Engineer.
- I. The Design-Builder shall provide access to the instrumentation and the Data Acquisition systems for the Geotechnical Instrumentation Engineer to observe and complete verification readings.
- J. A formal initial observation well or open standpipe piezometer reading shall consist of the average of three readings with the water level indicator. The indicator shall be removed from the riser pipe between these three readings. Each reading other than the formal initial reading shall be a single reading with the water level indicator. Reading accuracy shall be ± 0.05 foot.

Table 1: Monitoring Schedule of Manual Readings

INSTRUMENT	SCHEDULE
All instruments	(1) Minimum of three readings prior to formal initial reading with additional readings as necessary to verify that changes resulting from the installation process have ceased. (2) Formal initial reading. (3) Weekly until any construction of the associated facility. (4) One reading immediately prior to start of construction of the associated facility. Thereafter, the reading frequency shall follow the schedule given below.
Observation Wells and Piezometers	Daily during dewatering or excavation within 200 feet of observation well location. Weekly after dewatering has stopped or excavation is backfilled, until equilibrium is reached. Thereafter, monthly until the completion of contract.
Deformation Monitoring Points	One daily reading or every five (5) vertical feet of excavation within 200 horizontal feet of the DMP location, or weekly, whichever is more frequent, until excavation has been backfilled or permanently braced by the completed structure. Thereafter, monthly until completion of contract. Readings shall be taken daily if threshold values in section 3.23 are exceeded and until the readings have stabilized to the satisfaction of the Geotechnical Instrumentation Engineer.
Vibrating Wire Strain Gages	Daily from brace installation until brace removal.
Inclinometers/Extensometers	Twice a day or one reading every five (5) vertical feet of excavation within 200 horizontal feet of the inclinometer location, or weekly, whichever is more frequent, until excavation has been backfilled or permanently braced by the completed structure. Thereafter, monthly until completion of contract. Readings shall be taken daily if values in section 3.23 are exceeded and until the readings have stabilized to the satisfaction of the Geotechnical Instrumentation Engineer.
Seismographs	Continuously with a strip chart recording during vibration-producing construction activities within 300 feet of seismograph location.
Utility Monitoring Points	Same Reading Schedule as Deformation Monitoring Points and Borros Points
Convergence Gages	Twice a day during construction activity within 150 ft of the building limits. Weekly when construction is completed. Thereafter, monthly until end of project.
Crack Monitors	Twice a day during construction activity within 150 ft of the building limits. Weekly when construction nearby is completed. Thereafter, monthly until end of project or until the readings have stabilized to the satisfaction of the Geotechnical Instrumentation Engineer.
Tiltmeters	Twice a day when excavating/constructing within 150 ft of the building limits. Weekly when construction nearby is completed. Thereafter, monthly until end of project.

- A. A formal initial vibrating wire piezometer reading shall consist of the average of three readings. Each reading other than the formal initial reading shall be a single reading. Readings shall be corrected for

changes in barometric pressure, as determined in accordance with data provided by the Geotechnical Instrumentation Engineer.

- B. A formal initial set of readings on a deformation monitoring point (DMP) of Borros Point shall consist of the average of two survey measurements of elevation or horizontal offset with two independent set-ups. Each reading other than the formal initial reading shall consist of a single set of survey measurements. All elevation readings shall be referenced to a deep benchmark. Reading accuracy shall be ± 0.01 foot. Reading accuracy for horizontal position shall be ± 0.03 foot.
- C. A formal initial convergence gage reading shall consist of the average of three readings with the gage attached to the anchorage points. The gage shall be removed from the anchorage points between each of these three readings, and shall be un-tensioned and re-tensioned. Each reading other than the formal initial reading shall consist of the average of two readings, with removal and un-tensioning as specified herein. A previous or subsequent convergence gauge reading shall be a single reading. Reading repeatability shall be ± 0.005 inch.
- D. An inclinometer reading is defined as a set of readings at 2 foot intervals throughout the casing, and a second set at 180 degrees to the first set. A formal initial inclinometer reading shall consist of the average of three readings as defined above, involving six complete traverses along the casing. Each reading other than the formal initial reading shall be a single reading. Check-sums (sum of two readings at the same depth but 180 degrees apart) shall be examined in the field. Except where obvious imperfections in the casing have affected the check-sums, the standard deviation of A- and B-axis check-sums over a 2-foot interval shall not exceed 0.0003 foot and 0.0005 foot, respectively.
- E. A formal initial probe extensometer reading shall be selected from three sets of readings with the probe alongside each magnetic settlement target, starting from the bottom upwards, so that the reed switch closes as it enters the bottom of the magnetic field. The probe shall be removed from the access tube between each of these three sets of readings. A formal initial probe extensometer reading shall also consist of two reading of the elevation of the top of the access tube, using surveying methods referenced to a deep benchmark, using two independent set-ups, to an accuracy of ± 0.01 foot. Each reading other than the formal initial reading shall be a single set of readings with the probe, starting from the bottom upwards. Reading accuracy shall be ± 0.01 foot.
- F. A formal initial set of vibrating wire strain gage readings shall consist of three readings of strain and temperature at each of the following four times:
 - 1. Within two days prior to installing the structural member and after no part of it has been exposed to direct sunlight for a minimum period of two hours.
 - 2. Immediately before lifting the structural member for installation in the excavation.
 - 3. With the member in place in the excavation and ready for prestressing.
 - 4. Immediately after prestressing.
- G. Each reading other than the formal initial reading shall consist of a single reading of strain and temperature. Such readings shall be taken after no part of the structural member has been exposed to direct sunlight for a minimum period of two hours, to minimize extraneous effects caused by non-uniform temperature.
- H. Formal initial background seismograph readings shall be taken prior to the beginning of blasting, pile-driving or other vibration-producing construction activity. Initial readings shall consist of a minimum of 7 days of continuous monitoring of peak particle velocities, which shall be printed to a strip chart. During this period, particle velocities shall be read with a minimum sensitivity of 0.002 inch/second.

- I. Prior to the beginning of blasting, pile-driving or other vibration-producing construction activity, determine peak particle velocity and corresponding frequencies produced by single hammer blows or blasts or other vibration-producing activities to establish the maximum energy which can be used without surpassing acceptable vibration levels in nearby structures.
- J. A formal initial crack monitor reading shall consist of the average of three readings. Each reading other than the formal initial reading shall be a single reading. Reading accuracy shall be ± 0.02 inch.
- K. Tiltmeter readings shall be made by connecting the portable readout unit to the terminal unit, and reading the measurements. A formal initial tiltmeter reading shall consist of the average of three readings of tilt.

3.20 DATA REDUCTION, PROCESSING, PLOTTING AND REPORTING

- A. The Design-Builder shall provide data to the Geotechnical Instrumentation Engineer from the Design-Builder's Monitoring Program in accordance with the following schedule:
 - 1. All manual data, in the form of daily electronic data reports, except survey data, shall be provided no later than 16:00 on the day following the day on which the data are collected.
 - 2. Survey data shall be provided no later than 24 hours after the time specified in item 1 above.
 - 3. The Design-Builder's Geotechnical Instrumentation Engineer shall provide an electronic data summary reports and summary plots within one week of collecting data, for data that the Geotechnical Instrumentation Engineer anticipates are affected by construction activities.
- B. The Design-Builder's Geotechnical Instrumentation Engineer and surveyors shall reduce, process, plot and report data for the Design-Builder's monitoring program, following the guidelines included in the manufacturers' instruction manuals, as detailed in the reviewed submittal, and in the reviewed format. All data shall be submitted to the Design-Builder's Lead Geotechnical Engineer in accordance with Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements".
- C. Raw, reduced and plotted data resulting from the Design-Builder's monitoring program shall be submitted to the Design-Builder's Lead Geotechnical Engineer in accordance with submittal, and in the reviewed format. All data shall be submitted to the Design-Builder's Lead Geotechnical Engineer in accordance with Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements".
- D. When data resulting from the Design-Builder's or Geotechnical Instrumentation Engineer's monitoring program indicate that threshold or limiting values have been exceeded as provided in the Design-Builder's Instrumentation Plan, the Design-Builder shall notify the MBTA and initiate the response action(s) provided in the Instrumentation Plan.
- E. The Design-Builder shall submit, to the Geotechnical Instrumentation Engineer, descriptions of the work performed according to the following schedule: daily during active tunneling operations otherwise, weekly. Descriptions of work performed are to include:
 - 1. A description of groundwater control and temporary pressure relief operations, including pump locations, times and duration of operations, and estimated quantity of flow from dewatering operations as well as metered quantities of flow from each well.

2. A summary of support system and other relevant construction activities, including location, time and narrative indicating any excavation or construction activities, amount of soil excavated per unit excavated depth, underpinning progress, piles installation and obstructions removal, slurry wall installation, pile driving, installation and prestressing of support elements.
 3. A summary of excavation or filling activities, including location plan and description of where excavation has occurred with plots of the elevation of the bottom of the excavation or top of the fill vs. station together with plots of the previous three reports.
 4. A description of any construction activities other than excavation support system, excavation, and filling, including any surcharge caused by temporary construction loads.
 5. A report of any unusual events that may have affected the instrumentation readings, including any remedial or precautionary measures that were implemented in response to geotechnical instrumentation or other data during the period covered by the report. The report is to include when, where, and why the measures were implemented. The report is to include a description of any future remedial or precautionary measures that are planned in response to existing geotechnical instrumentation.
- F. Each week the Design-Builder shall also submit to the Geotechnical Instrumentation Engineer a cross section, at each inclinometer/probe extensometer location, using a vertical scale of 1 inch = 20 feet, showing the key construction activities and other events that could influence changes in the data.
- G. If the Geotechnical Instrumentation Engineer determines that data resulting from the monitoring program indicate that a threshold or limiting value has been exceeded as provided in the Design-Builder's Instrumentation Plan, the Design-Builder and MBTA shall be notified immediately.
- H. Readings shall be taken daily by the Design-Builder if values threshold or limiting values are exceeded and until the readings have stabilized to the satisfaction of the MBTA.
- I. All plots shall conform to the following guidelines:
1. Choose scales so that observations fill the space available, but do not use exaggerated scales that would magnify minor changes to make them appear alarmingly large.
 2. Plots shall be slightly darker than the underlying grid so that when copied both are visible but the plots stand out. Data points shall be visible.
 3. Plot elevations and depths on the vertical axis.
 4. Plots shall be self-explanatory. Show project name, contract name and number, the type of instrument, the scale and units of measurement, and the time of measurement. Use U.S. Customary Units, for example feet, inches, pounds.
 5. Sketches shall be provided to show the locations of the instruments relative to the construction activity and the geology.
 6. For each instrument, maintain consistency of scales so that plots can be compared.
 7. On plots of data versus time, show key construction activities and other events that could influence changes in the data. These key construction and other events shall include weather, elevation of the bottom of the excavation or top of the fill at the same station as the instrument,

tunnel excavation support system construction, groundwater control and temporary pressure relief operations with pump locations and estimated quantities of flow, and surcharge caused by temporary construction loads. On plots of data versus time, Threshold Values shall also be shown.

8. Use symbols to distinguish between different instruments or different times.
9. All plots shall show the full name of the person responsible for their preparation.
- J. Plots of observation well data shall show groundwater table elevation versus time.
- K. Plots of vibrating wire piezometer data shall show piezometric elevation versus time. Vibrating wire piezometer data shall be corrected for changes in barometric pressure, and referenced to the barometric pressure at the time of the initial reading. A plot of barometric pressure shall be included on the same axes.
- L. Plots of deformation monitoring point and Borros point data shall show absolute vertical or horizontal deformation versus time.
- M. Plots of convergence gage and crack monitor data shall show change with respect to the initial reading, versus time.
- N. Plots of inclinometer data shall be "cumulative change" data, showing absolute horizontal deformation versus depth. Multiple plots shall be on the same sheet to provide a time history, each labeled with the date. When requested by the MBTA, additional plots shall be prepared to show horizontal shear deformation across a given depth interval versus time.
- O. Plots of probe extensometer data shall show "cumulative change" data, showing absolute vertical deformation versus depth, and also absolute vertical deformation versus time. The lower datum ring magnet shall be used as a datum for determination of vertical deformation. Each plot shall be on an 8-½ inch x 11-inch sheet.
- P. Plots of vibrating wire strain gage data shall show axial load, bending moment, and maximum stress at each cross section (composite of data from four gages at the cross section), versus time, and shall show location of the maximum stress. Plots of strain gage data shall also show temperature versus time.
- Q. The Design-Builder's Geotechnical Instrumentation Engineer shall provide the MBTA with the results of daily vibration monitoring, one work day after the readings are taken. Upon completion of the construction operations for those locations requiring vibration monitoring, the daily submittals shall be synthesized into a final report prepared by the Design-Builder's Geotechnical Instrumentation Engineer. Each report shall include the time-histories of all seismograph readings.
- R. Plots of tiltmeter data shall show change with respect to initial reading degree of tilt versus time.

3.21 DAMAGE TO INSTRUMENTATION

- A. The Design-Builder shall protect all instruments and appurtenant fixtures, leads, connections, and other components of instrumentation systems from damage due to construction operations, weather, traffic, and vandalism.

If an instrument is damaged, including an existing instrument installed by others, the Design-Builder's instrumentation personnel shall repair or replace the damaged instrument at no additional cost to the MBTA. The MBTA will be the sole judge of whether repair or replacement is required. The MBTA may impose a work stoppage in the vicinity of the damaged instrument until it is again operational, at no additional cost to the MBTA.

3.22 DISCLOSURE OF DATA

- A. The Design-Builder shall not disclose any instrumentation data to third parties and shall not publish data without prior acceptance and written consent of the MBTA.

The Design-Builder transmits the instrumentation data collected by the Design-Builder to the MBTA. Any data relevant to the MBTA that is collected by the Design-Builder shall be transmitted to the MBTA by the MBTA within 24 hours of receiving the data from the Design-Builder.

3.23 INTERPRETATION OF DATA AND RESPONSE VALUES

- A. The Design-Builder shall make its own interpretations of the data resulting from the monitoring programs. The Design-Builder shall develop Threshold and Limiting Values for the geotechnical instruments based on their specific use and provide the values and basis of the values in the Instrumentation Plan.
- B. If the Threshold Value is reached the Design-Builder shall:
1. Immediately notify the MBTA.
 2. Meet with the MBTA to discuss response action(s).
 3. Provide the MBTA with an up-to-date report within 24 hours of obtaining a reading indicating that the Threshold Value has been reached. The report shall include raw, reduced and plotted data for all instruments for which the Threshold Value has been reached, as well as on any other instruments requested by the MBTA. The report shall contain the same information as specified for the weekly submittal. The Design-Builder shall subsequently provide a daily report as specified in this sub-article, until all instrument readings fall below the specified.
- C. Upon notification by the Design-Builder, the MBTA will notify the Building Owner if a threshold value relevant to the building or structures is reached and will report to those parties the results of the meeting with the Design-Builder to discuss implementation of a response action.
- D. If the Threshold Value is reached, the Design-Builder may also be required to initiate one or more of the following response actions, as directed by the MBTA.
1. Increase instrument monitoring frequencies.
 2. Install and monitor additional instruments.
 3. Modify construction procedures.
 4. Implement the reviewed plan of action, in the event the Threshold Value is reached, so that the Limiting Value is not exceeded.

- E. The Design-Builder shall take all necessary steps so that the Limiting Value is not exceeded. Design-Builder may be directed to suspend activities in the affected area with the exception of those actions necessary to avoid exceeding the Limiting Value.
- F. If the Limiting Value is reached, the Design-Builder shall:
 - 1. Immediately notify the MBTA.
 - 2. Meet with the MBTA to discuss response action(s).
 - 3. Implement the reviewed plan of action, in the event the Limiting Value is reached.
- G. Upon notification by the Design-Builder, the MBTA will notify the Building Owner if a limiting value relevant to the building or MBTA structures is reached and will report to those parties the results of the meeting with the Design-Builder to discuss implementation of a response action.
- H. The MBTA will also interpret data resulting from both the Design-Builder's and MBTA's monitoring programs, and make interpretations available to the Design-Builder as soon as practicable. This does not relieve the Design-Builder from the requirement to make its own interpretation, notify the MBTA, and take steps to protect persons and property. The Design-Builder shall not wait for or rely on receipt of the MBTA's interpretation to identify when threshold or limiting values have been exceeded, or to begin preparations for response actions.
- I. The MBTA is not responsible for guaranteeing the safety of the work based on data from the Design-Builder's monitoring program.

3.24 DISPOSITION OF INSTRUMENTS

- 1. Remove salvageable instruments only when directed by the MBTA.
- 2. All portable readout units, used for both the Design-Builder's and MBTA's monitoring programs, except for seismographs, shall become the property of the MBTA.
- 3. All salvaged instruments shall become the property of the MBTA.
- 4. Boreholes for the instruments shall be grouted as directed by the MBTA.
- 5. All surfaces affected by installation of instruments shall be restored to their original condition prior to completion of the Work. This shall include instruments installed both by the Design-Builder as well as instruments installed by others and monitored by the Design-Builder.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02052

MAINTENANCE OF TRAFFIC THROUGH WORK AREAS

GENERAL

1.1 DESCRIPTION OF WORK

A. All practices and traffic control devices shall conform to the relevant provisions of Section 850 of the Massachusetts Department of Transportation (hereinafter called State) Standard Specifications for Highways & Bridges (latest edition) and the Manual on Uniform Traffic Control Devices (MUTCD), including latest amendments and addenda.

B. Work Included: The work under this section includes the following items:

Furnishing all Engineering, materials, labor, and equipment required for traffic management and maintenance on the municipal roadways within the limits of construction under this contract.

Furnish adequate notice to police and fire departments, public transportation authorities, and school departments/districts of the proposed traffic maintenance plan including, but not limited to, detours, lane closures, and alternate routes.

Furnish, erect and maintain traffic control devices, as required by the traffic maintenance Approved Plan. The Design-Builder shall provide traffic control devices including lights, markings, barricades, warning signs, and all other safety precautions necessary to protect streets, sidewalks, access to adjoining property, and the traveling public within the area of the construction. Reference is made to traffic management Approved Plan drawings for guidelines for typical traffic control devices and their placements. These do not necessarily include all possible warning devices, control devices, or police details which may be required by the project.

Remove, replace, and/or reposition all traffic control devices, as necessary.

C. Related Work:

Section 01570 – VOLUME 2 TECHNICAL PROVISIONS EXHIBIT 2I “ADDITIONAL PROJECT REQUIREMENTS”

Section 02296 - TRAFFIC DECKING

Section 02298 - TEMPORARY PEDESTRIAN FACILITIES

1.2 JOB CONDITIONS

A. The Design-Builder shall notify the MBTA, state, local, and/or jurisdictional agencies well in advance of commencing construction. The Design-Builder shall arrange all detours, partial road closures, and alternate traffic patterns. The Design-Builder shall inform emergency departments on the daily status of project roadways.

B. The Design-Builder shall arrange for the services of uniformed police officers, as required to protect and facilitate the flow of vehicular and pedestrian traffic through the construction work zone.

C. During winter months, the Design-Builder shall be responsible for snow removal and prevention of icing conditions within active construction work zones, and shall assist local or state agencies in clearing roads used as detour routes to facilitate uninterrupted movement of traffic.

1.3 SUBMITTALS

- A. Submit copies of the Traffic Management Plan and a list of certified flaggers to the MBTA prior to start of site preparation work.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All devices required under this Section shall meet the quality standards set forth in the Quality Standards of Work Zone Traffic Control Devices compiled by the American Traffic Safety Services Association (ATSSA). Any devices that, in the judgment of the MBTA, are unsatisfactory in appearance, and/or performance shall be removed and immediately replaced by acceptable devices. The work to be done under these items shall conform to the relevant provisions of Section 850 of the State Standard Specifications and the following:

2.2 ROADWAY FLAGGER

- A. The Design-Builder shall provide the number of flaggers required in either the appropriate Traffic Control Plan (TCP) template (see MassDOT's website at (<http://www.massdot.state.ma.us/>) or that the MBTA deems necessary for the direction and control of traffic within the site. A flagger shall be used as directed by the MBTA in accordance with 701CMR 7.00, this section, and the TCP. Any flagger determined by the MBTA to be ineffective in controlling traffic may be removed at the discretion of the MBTA. If a flagger is directed to be removed, the Design-Builder shall immediately comply with the directive from the MBTA and shall suspend operations as necessary until a qualified replacement can be provided. Such a suspension of operations shall not be considered as a basis for a claim or an extension of time. Flaggers used during the performance of the Work shall be at least eighteen (18) years of age.
- B. Flaggers used during the performance of the Work shall possess a current certificate of satisfactory completion from a Department-approved flagger training program within the previous two (2) years. Prior to the start of work, the Design-Builder shall provide to the MBTA a written list of certified flaggers to be used, including the most recent date of certification or re-certification for each person listed. All flaggers shall carry their approved flagging training program certification card with them while performing flagging duties. Flagger certifications shall remain valid for the duration of the project or the flagger shall be removed from the project.
- C. Flaggers used during the performance of the Work shall have completed a First Aid training course according to the standards and guidelines of the American Heart Association or the American Red Cross. Flaggers shall carry their First Aid certification cards with them while performing flagging duties.
- D. Each flagger shall be equipped with the following high visibility clothing, signaling, and safety devices:

1. A white protective hard hat with a minimum level of reflectivity per the requirements of ANSI, Type I, Class E&G;
2. A clean, unfaded, untoned lime/yellow reflective safety vest and safety pants meeting the requirements of ANSI 107 Class 3 with the words "Traffic Control" on the front and rear panels in minimum two (2) inch (50 millimeter) high letters;
3. A twenty-four (24) inch "STOP / SLOW" traffic paddle conforming to the requirements of Part 6E.03 of the Manual on Uniform Traffic Control Devices (MUTCD), a weighted, reflectorized red flag, flagger station advance warning signage, and two-way radios capable of providing clear communication within the work zone between flaggers, the Design-Builder, and the MBTA. The traffic paddle shall be mounted on a pole of sufficient length to be seven (7) feet above the ground as measured from the bottom of the paddle.
4. A working flashlight with a minimum of 15,000 candlepower and a six (6) inch red attachable wand, a whistle with an attached lanyard, and a First Aid kit that complies with the requirements of ANSI Z308.1.
5. An industrial/safety type portable air horn that complies with the requirements of the U.S. Coast Guard.

2.3 SAFETY CONTROLS AND SIGNING FOR CONSTRUCTION OPERATIONS

- A. All signs and safety controls including but not limited to signs, cones, drums, barricades, pavement markings, lighting, and attenuators shall conform to the relevant provisions of the 2009 Manual on Uniform Traffic Control Devices and the MassDOT Standard Specifications, all as amended.
- B. All signs, barricades, and drums shall have reflective sheeting, in accordance with Subsection M9.30.0 of Division III, Materials of the State Standard Specifications.
- C. The Design-Builder shall use sandbags or provide other suitable means to weigh down Portable Breakaway Barricades Type III, to minimize the disturbance of barricades by vandals.
- D. Warning and directional signs used on the project shall be furnished, erected, and maintained throughout the construction period by the Design-Builder.
- E. Traffic control devices not conforming in type, composition, and size to the standards specified herein shall not be used under this contract.
- F. All erected signs not consistent with the use of the roadway shall be removed or covered each day by the Design-Builder.

2.4 TEMPORARY CONCRETE BARRIER

- A. Temporary Concrete Barriers shall conform to Section 629 of the State Standard Specifications for Highways and Bridges.
- B. The Design-Builder shall furnish, set up, move, maintain, and remove Temporary Concrete Barriers, when positive traffic barriers are needed for traffic control and safety in construction zones.
- C. Each run or bay of Temporary Concrete Barrier units shall be installed and fastened together to form a continuous chain, in accordance with the requirements of the state or local agencies having jurisdiction.

2.5 PORTABLE BREAKAWAY BARRICADE TYPE III

- A. Portable Breakaway Barricades, Type III shall be a 4-foot unit and conform to the latest edition of the State Construction Standards and any additional requirements of this specification.
- B. Reflectorized sheeting shall conform to Subsection M9.30.0. of Division III, Materials of the State Standard Specifications. Alternating 6 inch wide stripes shall be orange and white and shall slope downward at 45 degrees toward the end by which traffic is to pass. Pipe shall be Polyvinyl Chloride (PVC) pressure rated SDR 26 conforming to ASTM D2241. Fittings may be PVC conforming to ASTM D2665 or Acrylonitrile Butadiene Styrene (ABS) conforming to ASTM D2661 Drainage Waste and Vent.
- C. The Design-Builder shall furnish, set up, move, maintain (in good and serviceable condition), and remove Portable Breakaway Barricades Type III, as required by the performance of this work or as may be required by jurisdictional authorities, at no additional cost to the MBTA.

2.6 PORTABLE BARRIER FENCE

- A. Construction of Portable Barrier Fences shall be as shown on the plans. The Design-Builder shall include the necessary signs, reflectors, and all incidental equipment in order to provide the portable barrier fence, complete in place.

2.7 REFLECTORIZED DRUMS WITH OR WITHOUT WARNING LIGHTS

- A. Reflectorized drums shall conform to Subsection M9.30.0 of Division III, Materials of the State Standard Specification and shall be placed as shown on the construction drawings and as directed by the MBTA. Other drum-type products providing equivalent target value and stability, and accepted by the State, may be used.
- B. Drums shall be used in the protection of driveways, utility structures, and pedestrian control and safety throughout the construction period.
- C. Warning lights shall conform to the MUTCD Subsection 6F-83 for Type A or Type C. Drums shall be maintained in a satisfactory manner including the removal of dirt or road film that may cause a reduction in reflective efficiency. Type A, Low Intensity Flashing Warning Lights, mounted on drums, shall be used to continually warn drivers that they are approaching or proceeding in a hazardous area. Type C, Steady-Burn Lights, placed in a series on drums, shall be used to delineate the proper vehicle path through construction areas (which require changing patterns of traffic movement).
- D. The Design-Builder shall furnish, set up, move, maintain (in good and serviceable condition), and remove reflectorized drums with or without warning lights as required by the performance of his work or as directed by jurisdictional authorities, at no additional cost to the MBTA.

2.8 SPECIAL LIGHTING UNITS-FLASHING ARROW BOARDS AND PORTABLE CHANGEABLE MESSAGE SIGNS

- A. Flashing Arrow Board shall be as specified in Subsection 850.45 of the State Standard Specifications as amended.

- B. Flashing Arrow Board shall consist of a black background panel meeting the requirements of the MUTCD Subsection 6F-81, Table VI-3 for Type C and shall contain at least 15 No. 4412A (or equal) amber lights with approximately 8000 initial maximum candlepower each. Each Special Lighting Unit shall automatically provide for a minimum of 50% dimming from their rated lamp voltage at night. The flashing rate of the lamps shall not be less than 25 not more than 40 flashes per minute. The arrow panels shall have the capability of the following mode selection: (1) left or right flashing or sequential arrows; (2) left or right sequential chevrons; (3) double flashing arrows; (4) flashing caution and (5) alternating diamond caution.
- C. Minimum mounting height of Flashing Arrow Board shall be seven feet above the roadway to the bottom of the panel, except on vehicle-mounted panels.
- D. Portable Changeable Message Sign shall be as specified in Subsection 850.33 of the State Standard Specifications as amended. It shall consist of furnishing, positioning, repositioning, operating, maintaining, and removing a portable message sign as shown on the drawings and/or directed by the MBTA. All messages displayed shall be approved by the MBTA prior to being displayed.

2.9 TEMPORARY PAVEMENT MARKINGS

- A. Paints, tapes, and glass beads used for temporary pavement markings shall conform to Subsections M7.01.07, M7.01.10, M7.01.11, M7.01.14, M7.01.15 and M7.01.16 of Division III, Materials of the State Standard Specifications. Other material, which will provide satisfactory durability and reflectivity, and are accepted by the MassDOT, maybe used. The reflectivity of temporary pavement markings shall be equal to or better than the MassDOT minimum requirements for a period of 90 days. The colors of the marking materials shall be white, yellow, or black.

2.10 TEMPORARY IMPACT ATTENUATOR

- A. The attenuator shall be designed to safely accommodate a design speed of 40 miles per hour or other such greater additional speed as the manufacturer recommends.
- B. Before installation, the Design-Builder shall provide the MBTA with copies of the Manufacturers documents indicating satisfactory testing in accordance with NCHRP 350 and its subsequent revisions, and of the approval by the FHWA for the use and location of the attenuator as intended.

A. The attenuators shall be capable of redirecting an impacting vehicle. Anchoring of the units to the roadway shall be recommended by the manufacturer for the specific field conditions encountered. The Design-Builder is fully responsible for the design of the attenuator anchoring system.

2.11 TEMPORARY ILLUMINATION

- A. Temporary Illumination shall be as specified in Subsection 850.35 of the State Standard Specifications as amended. The work shall consist of illumination of the work areas and lane drops on a temporary basis as directed by the MBTA.

PART 3 - EXECUTION

3.1 PERFORMANCE

- A. The Design-Builder shall furnish, erect, and maintain suitable barriers, barricades, signs, markings, drums, and all other traffic control devices necessary to protect all roadways, which are partially obstructed or closed to vehicular or pedestrian traffic, as a result of this project.
- B. The MBTA reserves the right to suspend work, if the Design-Builder fails to provide such adequate traffic control devices to control and protect both vehicular and pedestrian traffic.
- C. The Design-Builder shall completely backfill all trenches at the end of each work day and/or when work is suspended for indefinite periods.
- D. The Design-Builder shall be responsible, at his own expense, for all damage to the work, pedestrians or public/private property due to his failure to place or maintain adequate warning or directional signs or other traffic control devices.
- E. The Design-Builder shall furnish, supply, maintain and remove temporary white and/or yellow reflectorized and/or black non-reflectorized pavement markings, as required by the performance of his work or as directed by jurisdictional authorities, at no additional cost to the MBTA. For the purpose of this specification, temporary markings shall mean an effective marking for a 90-day period.
- F. The Design-Builder shall remove existing pavement markings as required by the performance of his work or as directed by jurisdictional authorities, at no additional cost to the MBTA. Pavement marking removal methods used by the Design-Builder shall not cause damage to the pavement or cause significant change in its texture. Any damage to the pavement or surfacing caused by pavement marking removal shall be satisfactorily repaired by the Design-Builder, at no additional cost to the MBTA.
- G. Where required by the project, the Design-Builder shall provide all necessary temporary pavement markings, and/or temporary raised pavement markers following the completion of each day's operation or prior to opening the roadway to traffic. The Design-Builder will be responsible for making all necessary arrangements for this work, as required by the performance of his work.
- H. The Design-Builder shall be responsible for transporting and relocating any or all signs, barriers, barricades, or other safety devices as specified herein, as required or directed during the project.
- I. If the impact attenuators are moved on a daily basis to allow access to the work area, such daily moving shall be considered incidental to the work and for the Design-Builder's convenience.
- J. Upon project completion, the attenuator will become the property of the Design-Builder and will be removed from the project area.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02060

EROSION AND SEDIMENTATION CONTROL

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies (1) furnishing and applying water and calcium chloride for dust control, (2) furnishing, maintaining, and eventually removing erosion control barriers for the control of erosion and sedimentation on the site and adjacent to the site, (3) the installation, maintenance, and eventual removal of the catch basin protection (filter media skirt with knit polyesyster mesh), and (4) other incidental work related to erosion and sedimentation control.

The Design-Builder shall design, layout and install all erosion and sediment controls and provide dust control at all work sites. All work shall be in accordance with MassDOT Standard Specifications, Construction Standard Details and the Project Development and Design Guide. The work must also be in accordance with MADEP Stormwater Management Standards, Erosion and Sediment Control Guidelines and the Conditions of all permits.

The Design-Builder may elect to substitute different materials or methods other than those specified herein. In that instance, it shall be the Design-Builder's responsibility to demonstrate to the MBTA that the proposed design is equal to or greater than these specifications and will comply with all permit and regulatory requirements.

- B. Dust control operations shall meet the requirements of the Commonwealth of Massachusetts Department of Environmental Protection "310 CMR 7.09: Air Pollution Control Regulations."
- C. Erosion control barrier shall consist of staked straw bales and silt fence. Straw bale barriers and filter fabric silt sacks shall be as detailed on the Approved Drawings.
- D. Related work:
1. Volume 2 Technical Provisions Exhibit 21 "Additional Project Requirements".
 2. Section 02100 SITE PREPARATION
 3. Section 02196 GEOTEXTILE MATERIALS
 4. Section 02250 STORMWATER POLLUTION PREVENTION
 5. Section 02270 SLOPE PROTECTION
 6. Section 02282 HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 7. Section 02300 EARTHWORK
 8. Section 02369 DRILLED MINI-PILES
 9. Section 02400 DRAINAGE AND SEWER SYSTEMS
 10. Section 02632 STORMWATER BYPASS PUMPING SYSTEMS

1.2 SUBMITTALS

- A. Submit product information for calcium chloride, silt fence fabric, filter fabric silt socks, and straw bales.

1.3 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. The silt fence fabric shall be furnished with suitable wrapping for protection against moisture and extended ultraviolet exposure prior to placement.
- B. Each roll of fabric shall be labeled or tagged to provide product identification sufficient for field identification, as well as inventory and quality control purposes.
- C. Each roll of fabric shall be stored in a manner that will protect them from the elements. If stored outdoors, they shall be elevated and protected with a waterproof cover.
- D. Straw bales shall be stored in a manner that will protect them from the elements. If stored outdoors, they shall be elevated and protected with a waterproof cover.

1.4 JOB CONDITIONS

- A. Confine construction operations to the limits of work indicated on the Approved Drawings. The Design-Builder shall be responsible for protection of slopes at 2:1 or shallower during the construction period and also during any extended maintenance period. For slopes greater than 2:1, erosion control mats as specified in Section 02270 Slope Protection are required. Where clearing and grubbing, and regrading of such existing slopes is required, provide suitable means for erosion control. Re-grade slopes as necessary.

1.5 QUALITY CONTROL

- A. Erosion control mats shall be installed in accordance with the manufacturer's recommendations. Where manufacturer's recommendations conflict with details shown on the Drawings, the more stringent, in the opinion of the MBTA, shall apply.

PART 2 - PRODUCTS

2.1 MATERIALS AND EQUIPMENT

- A. Calcium Chloride shall conform to the requirements of AASHTO-M144, Type I or Type II. Use mechanical spreader or other approved equipment.
- B. Straw bales shall be individually banded and staked into the ground:
 - 1. Straw bales shall consist of straw for outdoor use be banded with string or nylon cord (minimum two bands per bale) and shall be staked into the ground.
 - 2. Stakes for straw bales shall be standard 2 inch by 2 inch wood stakes or approved equal.
- C. Single compost filter tube tamped in place to ensure good contact with soil. It is not necessary to trench the tubes into the existing grade.
 - 1. The tubes for the compost filters shall be jute mesh or approved biodegradable material.
 - 2. Filter tubes should be 12-inches (minimum) in diameter with an effective height of 9.5 inches.

- D. Silt fence shall consist of a self-supported or wire supported geotextile silt fence with support posts:
1. Fibers used in the manufacture of geotextiles, and the threads used in joining geotextiles by sewing, shall consist of long chain synthetic polymers composed of at least 85% by weight polyolefins or polyesters.
 2. Both the geotextile and threads shall be resistant to chemical attack, mildew, and rot.
 3. Geotextiles for silt fences shall conform to the following physical requirements in accordance with the acceptance criteria required by ASTM D4759. Values shown are minimum average roll values. Strength values are in the weaker principal direction.
 - a. Tensile Grab Strength: ASTM D4632; 90 pounds minimum.
 - b. Elongation at 50% Minimum Tensile Strength: ASTM D4632; 50% maximum for self-supported fences.
 - c. Permittivity: ASTM D4491; 0.010 per second minimum.
 - d. Apparent Opening Size (AOS): ASTM D4751; 0.84 millimeters maximum.
 - e. Ultraviolet Degradation: ASTM D4759; at 500 hours exposure, 70% strength retained for all cases.
 4. Posts for Silt Fence: Either wood, or synthetic posts may be used. Posts shall have a minimum length of 30" plus burial depth and be of sufficient strength to resist damage during installation and to support applied loads.
 5. Wire Support: 12-gauge wire supports at 6-inch maximum spacing each way shall be used when geotextile fabric is not strong enough to support applied loads. Provide hog supports.
 6. Prefabricated fence systems may be used provided they meet all of the above material requirements.

PART 3 - EXECUTION

3.1 DUST CONTROL

- A. Leave existing pavement and/or ground covering in place until the last possible moment prior to final earth excavation for purposes of dust control.
- B. Calcium chloride and water shall be properly applied as required and/or where directed by the MBTA and distributed uniformly at the rate required or ordered. Method and equipment used to distribute the material shall be satisfactory to the MBTA.
- C. The Design-Builder is responsible for keeping dust down at all times, including non-working hours, weekends, and holidays. Sprinkle or treat, with dust suppressors, the soil at the site, and other areas disturbed by construction operations. No dry power brooming is permitted. Instead use vacuuming, wet mopping, wet sweeping, or wet power brooming. Air blowing is permitted only for cleaning nonparticulate debris, such as steel reinforcing bars. No sandblasting is permitted unless dust therefrom is confined. Only wet cutting of concrete blocks, concrete, and asphalt is permitted.

- D. Stop all earthwork when, as determined by the MBTA, dust control procedures have not proved effective in controlling dust. Resumption of work may only begin when site conditions have improved or constructions procedures are modified to the satisfaction of the MBTA.

3.2 TEMPORARY EROSION CONTROL

- A. Method of stripping vegetation shall be such as to minimize erosion. Fills shall be placed and compacted in such a manner that soil sliding and erosion is minimized. Grading shall be done in such a manner as not to divert water onto the property adjoining the MBTA's right-of-way or construction site without expressed written permission of the land owner and the local Conservation Commission. If the Design-Builder fails to employ adequate and acceptable erosion control techniques during construction, the MBTA may order a suspension of the work until implementation of satisfactory techniques are agreed upon and demonstrated, and the Design-Builder shall have no claim for damages or time extension resulting from such delays.
- B. Staked straw bale siltation barriers shall be installed at the following locations:
 - 1. Toe of embankment construction.
 - 2. Toe of abutments/retaining walls and temporary earthwork stockpiles.
 - 3. Across construction ditches prior to entry into any drainage system or waterway.
 - 4. Other locations shown on the Approved Drawings, as dictated by the Order of Conditions or as designated by the MBTA.
 - 5. Toes of temporary earthwork stockpile.
- C. Abut straw bales to form a continuous barrier. Straw bales shall be entrenched 4". Secure bales in place with two stakes per bale.
- D. Silt fence construction shall be adequate to handle the stress from sediment loading. Geotextile fabric at the bottom of the fence shall be buried a minimum of 6 inches in a trench so that no flow can pass under the barrier. Trench shall be backfilled and the soil compacted over the geotextile fabric. Fence height shall be as shown on the Approved Drawings, but in no case shall exceed 30 inches above ground surface. Geotextile fabric shall be spliced together only at a support post with a minimum 6-inch overlap. Posts shall be installed no more than six feet on center and angled slightly toward the embankment or anticipated source of runoff. Where an 18 inch depth is not possible, the post shall be adequately secured to prevent overturning of the fence due to sediment or wind loading.
- E. Sediment controls shall be in place prior to any soil disturbing activities including, but not limited to earthwork, clearing and grubbing, dewatering and excavation.
- F. Any disturbed soils shall be stabilized, either permanently or temporarily, within 2 weeks of disturbance or when directed by the MBTA.

3.3 MAINTENANCE AND CLEANUP

- A. Maintain the integrity of erosion control barriers as long as they are necessary to contain sediment runoff. Promptly repair or replace ineffective barriers.
- B. Inspect all barriers immediately after each rainfall and at least daily during prolonged rainfall. Any deficiencies shall be immediately corrected. Make a daily review of the location of barriers in areas where

construction activities have changed the natural contour and drainage runoff to ensure that the barriers are properly located for effectiveness. Where deficiencies exist, additional barriers shall be installed as directed by the MBTA.

- C. Sediment deposits behind or in the vicinity of erosion control barriers shall either be removed when the deposit reaches approximately one-half of the height of the barrier or a second barrier shall be installed as directed by the MBTA. Sediment shall be removed and disposed of periodically from behind the straw bales and within the silt sacks. Disposal shall be offsite and in accordance with all applicable regulations. In no case shall the accumulated sediment be allowed to rise above the mid height of the bale. All remaining sediment shall be disposed of in an approved manner at the completion of the work.
- D. Erosion control barriers shall remain in place until the MBTA directs that they be removed. Upon removal, remove and dispose of any excess silt accumulations, dress the area to blend in with the existing lines and grades, and vegetate all bare areas in accordance with MBTA Standards.
- E. Erosion control barriers will remain the property of the Design-Builder, may be re-used at other locations provided the materials meet these specifications requirements, and shall be removed and disposed of at the completion of the Project unless directed otherwise by the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02080

ASBESTOS REMOVAL

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies all labor, materials, equipment, services, employee training and testing, permits, waste transportation and disposal (at an approved landfill) required for the removal of all asbestos-containing materials (ACMs) at the MBTA Green Line Extension project. All work shall be performed in accordance with these Specifications; USEPA, OSHA, and Commonwealth of Massachusetts Department of Environmental Protection (MassDEP) and the Massachusetts Division of Labor Standards (DLS) regulations; and all other applicable federal, state and local regulations. Whenever there is a conflict or overlap of the above references, the most stringent provisions are applicable. See Paragraph 1.17 of this Section for Special Considerations.
- B. The DESIGN-BUILDER shall provide all labor, materials and services to perform all the work specified in this Section, including but not limited to the following:
1. Install a temporary power distribution and lighting network. The DESIGN-BUILDER shall provide connection from the local power utility lines and provide an auxiliary generator where needed. The DESIGN-BUILDER shall provide ground-fault interrupt panel boards and installations where needed.
 2. Provide water or make arrangements to use existing water utilities.
 3. Isolate each work area with air-tight barriers, erect temporary staging, containment barriers, Decontamination Facilities (DFs) and waste transfer chambers as required to perform the Work.
 4. Install HEPA-filtered negative air units to exhaust the work area. The DESIGN-BUILDER shall arrange for HEPA units to exhaust directly outside the containment area.
 5. Remove all ACMs indicated in the Project documents, Specifications or on the drawings, and other ACMs as otherwise found at the site during the project.
 6. Perform all other selective demolition as required herein or as is otherwise needed to locate, identify and remove hidden or inaccessible suspect ACM at the Site.
 7. Package and label all asbestos waste for disposal and transport waste to an EPA-approved landfill in accordance with all applicable federal, state and local regulations.
 8. Thoroughly clean each work area and obtain final visual inspection and approval from the CONSULTANT.
 9. Perform all other work noted in the Specifications, directed by CONSULTANT, or as otherwise necessary to remove all dust, debris, ACM, suspect ACMs including potential suspect ACMs that may also include buried debris that is uncovered during the course of the work.
- C. It is the intent of this Specification that the DESIGN-BUILDER remove all ACMs from the entire MBTA Green Line Extension project wherever and in whatever form it exists. All means and methods intended by the DESIGN-BUILDER to accomplish the work are subject to the review and acceptance of the CONSULTANT. The DESIGN-BUILDER shall prepare and submit a detailed work plan for the mobilization of qualified personnel and equipment in the event that ACMs are suspected or encountered.

The work plan shall be acceptable to the AUTHORITY and the CONSULTANT. No additional compensation will be made if the conditions found vary from that indicated in the Specifications, except where provided for in this Section.

- D. The following is a summary of the work items to be performed under the Contract: The Asbestos Abatement DESIGN-BUILDER is required to remove all ACMs (and specified non-ACMs) from any structures that are being removed as part of the project. Nothing in this Section may be interpreted as limiting the scope of work otherwise required by this contract and related documents. Neither the CONSULTANT nor MBTA will be responsible for errors or omissions and/or charges for extra work arising from any bidders' failure to become familiar with the existing conditions of the Site, requirements of the Work and the results to be produced. By submitting a Bid, the Bidder further agrees that the descriptions contained herein and on project documents are adequate and that the bidder will produce the required results (i.e., remove all ACM identified at the Site). By submitting a bid, a bidder agrees and warrants that he is familiar with and will perform all the work required in the Specifications.
- E. If the DESIGN-BUILDER discovers any suspect building components, the DESIGN-BUILDER shall stop all work impacting the suspect materials and notify the CONSULTANT. The CONSULTANT will sample the suspect material and submit them for analysis to a laboratory accredited under the National Institute of Standards and Technology (NIST) "National Voluntary Laboratory Accreditation Program (NVLAP)."
- F. After all indicated ACMs have been removed, perform any exploratory demolition of building components and equipment as directed by the CONSULTANT to confirm that all asbestos materials have been identified and removed. All ACM identified as a result of this exploratory process shall be properly removed and disposed in accordance with this Section.
- G. The DESIGN-BUILDER shall not adversely impact the integrity of structures scheduled to remain during the asbestos abatement process including but not limited to structural supports, etc.
- H. The following is an outline of work requirements and sequencing that provides a minimum level of detail for the overall abatement scope/sequence, and is expected to be adhered to by the DESIGN-BUILDER, except where otherwise stated in the DESIGN-BUILDER's Work Plan. The projected sequence of work in the main asbestos work area(s) that would be acceptable to the CONSULTANT and AUTHORITY is as follows:
1. Work Area Preparation and Pre-Cleaning
Decontamination units and negative air units will be installed as needed to support the Work. Water sources will be identified and utilized or off-site sources of water will be utilized. Electrical power distribution will be provided as needed including transformers and power panels. Walkways shall be maintained clear of debris at all times.
 2. Scaffolding/Staging
During work area preparation and as needed throughout the project, OSHA approved ladders, trench protection and scaffolding/staging shall be installed where needed to perform the Work.
 3. Gross Asbestos Removal
Asbestos and debris on pipes, pipe chases, etc. throughout the work area will be adequately wetted, removed and properly packaged in MassDEP-approved containers (including bulk loads where applicable) and disposed as asbestos waste (as a minimum). Waste packages will be properly labeled for asbestos waste and marked with generator labels.

4. Decontamination and Wash Down/Fine Cleaning

All surfaces shall be cleaned using water, controlled pressure washing, sponges, rags, tools, etc. needed to remove all traces of visible debris, controlling the use of the water as practical. Controlled usage of water includes containment of the water, avoidance of water streaming/splashing. The DESIGN-BUILDER shall assure that all ACM and/or potential ACM is maintained adequately wetted throughout the removal and disposal process.

5. Final Visual Inspection and Air Clearance

The CONSULTANT or CONSULTANT's representative will perform a final visual inspection of the work area(s). The DESIGN-BUILDER shall re-clean the work area(s) as needed until no visible debris remains. Once the area has been accepted by the CONSULTANT, final air clearance testing shall be performed.

1.2 RELATED WORK

A. Other specification sections that relate to the work include but are not limited to the following:

1. Section 01060 – PERMITS AND REGULATORY REQUIREMENTS
2. Section 01560 – TEMPORARY CONTROLS
3. Section 02081 – HAZARDOUS MATERIALS ABATEMENT
4. Section 02091 – REMOVAL OF CONTAMINATED FIXTURES
5. Section 02092 – PCB BULK PRODUCT WASTE ABATEMENT
6. Section 02221 – DEMOLITION
7. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS

1.3 AUTHORITY TO STOP WORK

A. The CONSULTANT has the AUTHORITY to stop the abatement work at any time the CONSULTANT determines that conditions are not in accordance with the Specifications and applicable regulations. The stoppage of work shall continue until conditions have been corrected and corrective steps have been taken to the satisfaction of the CONSULTANT. Standby time required to resolve violations and Specification interpretations or contractual obligations shall be at the DESIGN-BUILDER's expense.

1.4 DEFINITIONS

- A. The following terms are defined in the specific context of asbestos removal as addressed by this Section:
1. Abatement: Any activity which has as its principal purpose the removal, enclosure or encapsulation of asbestos.
 2. Accessible: Any item (including ACM) or surface that can be reached by hand, provided sufficient ladders, lifts, safety lines, shoring, scaffolding and/or staging are installed to reach such item/surface, without performing any demolition of existing structures/items to reach such item/surface.
 3. ACGIH: American Conference of Governmental Industrial Hygienists
 4. AIHA: American Industrial Hygiene Association

5. Airlock: A mechanism consisting of doors and/or curtains that control air flow patterns in doorway such that the air flows only towards the inside of the enclosure to which the decontamination system is attached.
6. Air Monitoring: The process of measuring the fiber content of a known volume of air collected during a specific period of time. The procedure normally utilized for asbestos monitoring follow the NIOSH Method 7400 with analysis by Phase Contrast Microscopy and/or the Transmission Electron Microscopy method.
7. Amended Water: Water to which a wetting agent has been added.
8. Asbestos Project Monitor: The MADLS-certified professional contracted or employed by the AUTHORITY to supervise and conduct air sampling and monitor asbestos abatement activities.
9. Asbestos: The asbestos form varieties of chrysotile, amosite, crocidolite, tremolite, anthophyllite, and actinolite.
10. Asbestos Containing Material (ACM): Any material containing one percent (1%) or more asbestos.
11. Asbestos-Contaminated Objects/Surfaces: Shall mean any objects/surfaces that may be contaminated by asbestos or ACM or water.
12. Asbestos Containing Waste: ACM or asbestos-contaminated objects requiring disposal as asbestos.
13. Certified Industrial Hygienist (CIH): An industrial hygienist certified in Comprehensive Practice by the American Board of Industrial Hygiene.
14. Class I asbestos work: Activities involving the removal of thermal system insulation, surfacing insulation and Presumed ACMs (PACM).
15. Class II asbestos work: Activities involving the removal of ACM that is not thermal system insulation or surfacing material. This includes, but is not limited to the removal of asbestos-containing wallboard, floor tile and sheeting, roofing and siding shingles, and construction mastics.
16. Clean Room: An uncontaminated area or room which is a part of the worker decontamination enclosure system with provisions for storage of worker's street clothes and clean protective equipment.
17. Competent Person: In addition to the definition in Title 29 CFR, Part 1926.32(f), an individual who is capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy for asbestos exposure, and who has the AUTHORITY to take corrective measures to eliminate them. In addition, for Class I and II work, this individual must be trained in a training course which meets the criteria of USEPA's Model Accreditation Plan (Title 40 CFR, Part 763, Subpart E, Appendix C) for Project Designer or Supervisor, or its equivalent.
18. CONSULTANT: Authorized representatives who are under contract with the AUTHORITY to provide asbestos abatement consulting or monitoring services.
19. Curtained Doorway: A device to allow ingress or egress from one room to another while permitting minimal air movement between the rooms, typically constructed by placing two overlapping sheets of plastic over an existing or temporarily framed doorway, securing each along the top of the doorway, securing the vertical edge of one sheet along one vertical side of the doorway and securing the vertical edge of the other sheet along the opposite vertical side of the doorway. Other effective designs are permissible.

20. Decontamination Enclosure System: A series of connected rooms separated from the work area and from each other by airlocks and used for the decontamination of workers and equipment.
21. Demolition: The wrecking or taking out of any load-supporting structural member of a facility together with any related handling operations.
22. Disposal Bag: 6-mil thickness leak-tight plastic bags used for transporting asbestos waste from work and to disposal site. Each bag shall be labeled in accordance with USEPA's NESHAPS, OSHA and USDOT regulations.
23. Encapsulation: The application of a coating or liquid sealant to ACMs to reduce the tendency of the material to release fibers.
24. Enclosure: The construction of an air-tight, impermeable, permanent barrier around ACMs or equipment containing ACM debris.
25. Fixed Items: Equipment, mechanical systems, or other objects which cannot be removed from the work area without cutting/demolition,
26. Friable Asbestos-Containing Material: Material that contains one percent or more asbestos, which when dry, may be crumbled, pulverized, or reduced to powder by hand pressure. The term includes non-friable ACM that becomes damaged to the extent it may be crumbled, pulverized, or reduced to powder by hand pressure.
27. HEPA Filtered Exhaust Units or Fans: A fan equipped with a High Efficiency Particulate Air (HEPA) filter, greater than 99.97 percent efficient by 0.3 micron (μm) DOP test, and complying with ANSI Z9.2 (1979), Local Exhaust Ventilation. It shall be used to create a negative pressure in a work area (reduced with respect to surrounding areas) to prevent the escape of asbestos fibers. It shall also be used to reduce and control the airborne concentration of asbestos fibers.
28. HEPA Filter Vacuum Collection Equipment (or vacuum cleaner): High efficiency particulate air (absolute)-filtered vacuum collection equipment with a filter system capable of collecting and retaining asbestos fibers. Filters shall be of 99.97% efficiency for retaining fibers of 0.3 μm or larger.
29. High-Efficiency Filter: A filter which removes from air 99.97% or more of monodisperse dioctyl phthalate (DOP) particles have a mean particle diameter of 0.3 μm .
30. Industrial Hygienist: A professional qualified by education, training and experience to anticipate, recognize, evaluate and develop controls for occupational health hazards.
31. Isolation Barriers: The construction of partitions, the placement of solid materials, and the plasticizing of apertures to seal off the workplace from surrounding areas and to contain asbestos fibers in the work area.
32. Log: An official record of all activities that occurred during the project and it shall identify the building, agent, DESIGN-BUILDER, workers, and other pertinent information.
33. Negative Pressure Respirator: A respirator in which the air pressure inside the respiratory-inlet covering is positive during exhalation in relation to the air pressure of the outside atmosphere and negative during inhalation in relation to the air pressure of the outside atmosphere.
34. Negative Initial Exposure Assessment: A demonstration by the DESIGN-BUILDER that employee exposure during an operation is expected to be consistently below the Permissible Exposure Limit (PEL).
35. Negative Pressure: Air pressure lower than surrounding areas, generally caused by exhausting air from a sealed space (work area).
36. Permissible Exposure Limit (PEL): An exposure limit that is published and enforced by OSHA as a legal standard.

37. Personal Monitoring: Sampling of the asbestos fiber concentrations within the breathing zone of an employee.
38. Project Designer: An individual who has successfully completed the training requirements for an abatement Project Designer established by Title 40 CFR, MADLS as an Asbestos Abatement Project Designer.
39. Protect Fixed Items: Shall mean to cover with solid enclosures and/or 6-mil thickness polyethylene sheeting, and secure by taping or gluing water and airtight.
40. Protection Factor: The ratio of the ambient concentration of an airborne substance to the concentration of the substance inside the respirator at the breathing zone of the wearer. The protection factor is a measure of the degree of protection provided by a respirator to the wearer.
41. Regulated Area: An area established by the DESIGN-BUILDER to demarcate areas where Class I and II asbestos work is conducted, and any adjoining area where debris and waste from such asbestos work accumulate; and a work area within which airborne concentrations of asbestos exceed, or there is a reasonable possibility they may exceed the PEL.
42. Seal, or Block and Seal: Preparing a space or area such that there is no air movement or passage to and from the area. "Isolation barrier" shall mean the system of seals or other items which prevent air movement to and from any work area.
43. Surface barriers, Protective Coverings or Polyethylene: The plasticizing of walls, floors, and fixed objects within the work area to prevent contamination during subsequent abatement activities.
44. Time Weighted Average (TWA): The average concentration of a contaminant in air during a specific time period.
45. Visible Emissions: Any emissions containing particulate asbestos material that are visually detectable without the aid of instruments. This does not include condensed uncombined water vapor.
46. Wet Cleaning: The process of eliminating asbestos contamination from building surfaces and objects by using cloths, mops, or other cleaning utensils which have been dampened with amended water or diluted removal encapsulant and afterwards thoroughly decontaminated or disposed as asbestos contaminated waste.
47. Work Area: The area where asbestos related work or removal operations are performed which is defined and/or isolated to prevent the spread of asbestos dust, fibers or debris, and entry by unauthorized personnel. Work area is a Regulated Area as defined by Title 29 CFR, Part 1926.1101. A work area is considered a contaminated space between the time preparation begins and the time the area is certified clean.

1.5 SUBMITTALS

- A. The DESIGN-BUILDER shall submit to the CONSULTANT the following listed items within 30 days after notice to proceed.
 1. Name and experience of proposed Supervisors and Foremen (Submittal #1).
 2. Summary of workforce by disciplines, and a notarized statement documenting that all proposed workers, by name, have received all required medical exams and have been properly trained in asbestos removal work, respirator use, and appropriate MADLS, USEPA & OSHA standards (Submittal #2).
 3. Copies of all current training certifications (including original and refresher), MA DLS licenses, fit test clearances and medical clearances to wear a respirator. The DESIGN-BUILDER shall

submit to the Consultant, copies of requested records for new site workers whose certifications have not previously been reviewed.

4. Notarized Certification: Submit notarized certification signed by an officer of the abatement contracting firm that exposure measurements, medical surveillance, and worker training records are being kept in conformance with OSHA, EPA, MA DEP and MA DLS requirements (Submittal #3).
5. Plan of Action & Standard Operating Procedures: Submit a detailed site-specific plan of the procedures proposed for use in complying with the requirements of this Specification. Include in the plan the specific location and layout of decontamination areas and negative air units; location of lighting and power outlets; distribution of amended water; the sequencing of asbestos work; detailed schedules by dates, shift times, and work activities during that shift; the interface of trades involved in the performance of work; methods to be used to assure the safety of occupants and visitors to the Site, and a detailed description of the methods to be employed to control pollution. The Plan shall also include/address the following.
 - a. Proper protective clothing and respiratory protection prior to entering the work space from the outside.
 - b. Safe work practices in the work place, including provisions for inter-room communications; exclusion of eating, drinking, smoking, and application of cosmetics; or use of procedures or equipment that would in any way reduce the effectiveness of respiratory protection or other engineering controls.
 - c. Proper exit practices from the work space to the outside through the showering and decontamination facilities.
 - d. Preventing a fiber release episode.
 - e. Packing, labeling, loading, transporting, and disposing of contaminated material in a way that minimizes or prevents exposure and contamination.
 - f. Emergency evacuation of personnel, for medical or safety (fire and smoke) so that exposure will be minimized.
 - g. Safety from accidents in the work space, especially from electrical shocks, slippery surfaces, and entanglements in loose hoses and equipment.
 - h. Provisions for effective supervision, and OSHA-specified personnel air monitoring for exposure during the work.
 - i. Project sequencing.
 - j. Waste segregation, minimization, decontamination packaging and disposal.
 - k. Any other items as noted in this Specification or as required by the CONSULTANT to be addressed upon submittal review.
1. Provide the following information for exposure controls (Submittal #4):
 1. Number of negative air machines required and the calculations necessary to determine the number of machines for each work area.
 2. Description of projected airflow within each work area and methods required to provide adequate air flow in all portions of the work area.
 3. Pressure differential across work area enclosures anticipated.
 4. Description of methods of testing for correct airflow and pressure differentials.
 5. Manufacturer's product data on the machines to be used.

6. Location of the machines in the work space.
 7. Method of supplying adequate power to the machines.
 8. Description of work practices to reduce worker exposure to airborne fibers.
 9. Manufacturer's product data on equipment used to monitor pressure differential between inside and outside of work area.
- m. Contingency Plan: Submit a contingency plan for emergencies including fire, accident, power failure, negative air system failure, supplied air system failure, or any other event that may require modifications or abridgment of decontamination or work area isolation procedures. Include in plan specific procedures for decontamination or work area isolation. Note that nothing in this Specification should impede safe exiting or providing adequate medical attention in the event of an emergency. Include telephone number and locations of emergency services including but not limited to fire, ambulance, doctor, hospital, police, power company, telephone company (Submittal #5).
 - n. Summary of other proposed materials and equipment (manufacturer, catalog number or model, and description) and method of application or use, including but not limited to wetting agents, personal protective equipment, and test samples of all proposed materials for performing the work (Submittal #6).
 - o. A plan describing the method for exposure monitoring to document compliance with OSHA Asbestos Standard, including frequency of monitoring, equipment and calibration methods, and name of analysis laboratory (Submittal #7).
 - p. All required permits, certifications and licenses (Submittal #8).
 - q. Copies of the completed USEPA, State, and local asbestos removal pre-abatement notification forms (Submittal #9).
 - r. Copies of all proposed daily inspection and record logs, including work area entry data, respirator inspections and maintenance, HEPA-exhaust inspections and maintenance, and other work applicable activities (Submittal #10).
 - s. Name, location, and applicable licenses, operating permits and insurance certificate for primary and secondary landfill for disposal of asbestos-containing or asbestos-contaminated waste. Name and applicable federal and state permits and insurance certificate for transporter of asbestos waste materials. (Submittal #11).
 - t. Respiratory Protection Program: Submit level of respiratory protection intended for each operation required by the Project (Submittal #12).
 - u. Historic Airborne Fiber Data: Submit airborne asbestos fiber count data from an independent air monitoring firm to substantiate selection of respiratory protection proposed. Data submitted shall include at least the following for each procedure required by the work: (Submittal #13)
 1. Name of Testing Laboratory (Must be a Massachusetts State-Certified Lab)
 2. Dates of measurements
 3. Operations monitored
 4. Sampling and analytical methods used and evidence of their accuracy.
 5. Number, duration, and results of samples taken.
 - v. Resume Information: Submit resume and information on training for individual monitoring the operation of supplied air respiratory systems. Submit training certifications where applicable (Submittal #14).

- B. No asbestos removal work activities shall commence until these items are reviewed and accepted by the CONSULTANT. Submittal data shall be in sufficient detail to enable the CONSULTANT to identify the particular product or equipment and to form an opinion as to its conformity to the Specifications. Each submittal item shall be identified with a cover page and/or transmittal sheet containing the listed submittal number. The CONSULTANT may reject the entire submittal package if not submitted in the same order presented above.

- C. The DESIGN-BUILDER shall submit to the CONSULTANT the following items prior to individual workers being allowed to work on the project:
 - 1. Submit copies of the training certificates and current MADLS certificate for each worker.
 - 2. Report from Medical Examination: Submit a copy of Physician's Written Opinion for medical examination conducted within last 12 months as part of compliance with OSHA medical surveillance requirements for each worker who is to enter the work area.
 - 3. Current (within 12 months) respirator fit test record for each employee anticipated to conduct work on the project.

- D. During Abatement Activities:
 - 1. Submit weekly job progress reports detailing abatement activities. Include review of progress with respect to previously established milestones and schedules, major problems and action taken, injury reports, equipment breakdown, and bulk material and air sampling results conducted by DESIGN-BUILDER.
 - 2. Submit each week copies of all transport manifests, trip tickets, and disposal receipts for all asbestos waste materials removed from the work area during the abatement process.
 - 3. Submit each week daily copies of worksite entry logbooks with information on worker and visitor access.
 - 4. Submit each week logs documenting filter changes on respirators, HEPA vacuums, negative pressure ventilation units, and other engineering controls.
 - 5. Submit each week results of air sampling data collected during the course of the abatement including OSHA compliance air monitoring results.
 - 6. Post outside or immediately adjacent to the clean room of the worker decontamination enclosure, a list containing names, addresses, and telephone numbers of the DESIGN-BUILDER, the AUTHORITY, the Asbestos Abatement Project Monitor, the General Superintendent, the testing laboratory, and any other personnel who may be required to assist during abatement activities.

1.6 PROJECT COORDINATION - ASBESTOS ABATEMENT

- A. Minimum administrative and supervisory requirements necessary for coordination of work on the Project include but are not necessarily limited to the following:
 - 1. Administrative and supervisory personnel.
 - 2. Special reports.
 - 3. Contingency Plan.
 - 4. Notifications to other entities at job site.

- B. Administrative and Supervisory Personnel:
 - 1. General Superintendent: Provide a full-time General Superintendent who is experienced in administration and supervision of asbestos abatement projects including work practices, protective

measures for site and personnel, disposal procedures, etc. This person shall generally remain outside the work area, except for daily checks on the quality and progress of work, and be available to the AUTHORITY and the CONSULTANT at all times while work is in progress.

This person is the Competent Person as required by OSHA in Title 29 CFR, Part 1926.1101 for the DESIGN-BUILDER and is the DESIGN-BUILDER's representative responsible for compliance with all applicable federal, state and local regulations, particularly those relating to ACMs. This person must have completed a course at an USEPA Training Center or equivalent certificate course in asbestos abatement procedures, have had a minimum of four (4) years on-the-job training and meet any additional requirements set forth in Title 29 CFR, Part 1926.1101 for a Competent Person.

2. Provide a full-time non-working supervisor/foreman for each work area who is experienced in the supervision of asbestos abatement projects including work practices, protective measures for site and personnel, disposal procedures, etc. This person shall remain inside the work area at all times while work is in progress. This person must have completed a course at an USEPA Training Center or equivalent certificate course in asbestos abatement procedures, have a minimum of two years on-the-job training and meet any additional requirements set forth in Title 29 CFR, Part 1926.1101 for a competent person. This person must also be certified by the Commonwealth of Massachusetts as an Asbestos Abatement Supervisor as required by MADLS regulations located at 453 CMR 6.00.

C. Special Reports: Except as otherwise indicated, submit special reports directly to the CONSULTANT within one day of occurrence requiring special report, with copy to others affected by occurrence.

1. Reporting Unusual Events: When an event of unusual and significant nature occurs at site (examples: failure of negative pressure system, rupture of critical barriers), prepare and submit a special report listing chain of events, persons participating, response by DESIGN-BUILDER's personnel, evaluation of results or effects, and similar pertinent information. When such events are known or predictable in advance, advise the CONSULTANT in advance at earliest possible date.
2. Reporting Accidents: Prepare and submit reports of any accidents, at site and anywhere else work is in progress. Record and document data and actions; comply with industry standards. For this purpose, an accident is defined to include events where personal injury is sustained, or property loss of substance is sustained, or where the event posed a significant threat of loss or personal injury.

D. Contingency Plan:

1. Contingency Plan: Prepare and submit for approval a contingency plan for emergencies including fire, accident, power failure, negative air system failure, supplied air system failure, or any other event that may require modification or abridgment of decontamination or work area isolation procedures. Include in plan specific procedures for decontamination or work area isolation. Note that nothing in this Specification should impede safe exiting or providing adequate medical attention in the event of an emergency.
2. Post outside or immediately adjacent to the clean room of decontamination facility telephone numbers and locations of emergency services including but not limited to fire, ambulance, doctor, hospital, police, power company, telephone company.

E. Notifications to other entities at job site: Notify other entities at the job site of the nature of the asbestos abatement activities, location of ACMs, requirements relative to asbestos set forth in these Specifications and applicable regulations.

- F. Prior to the start of work, the DESIGN-BUILDER will prepare and submit a detailed removal plan to the CONSULTANT for review and approval. This plan must comply with all applicable Federal, State, and local regulations.

1.7 SCHEDULES AND REPORTS

- A. Coordination: Coordinate both the listing and timing of reports and activities required by provisions of this section and other sections, so as to provide consistency and logical coordination between the reports. Maintain coordination and correlation between separate reports by updating at weekly or shorter time intervals. Make appropriate distribution of each report and updated report to all parties involved in the work including the CONSULTANT. In particular provide close coordination of the progress schedule, listing of subcontractor's schedule of submittals, progress reports, and payment requests.
- B. Schedules: Provide proposed detailed schedule including work dates, work shift times, number of employees, dates of start and completion including dates of preparation, removals and final inspection dates. Submit schedule with Plan of Action.
- C. Daily Log: Maintain within the Decontamination Facility a daily log documenting the dates and time of but not limited to, the following items:
 - 1. Visitations; authorized and unauthorized attempts.
 - 2. Personnel, by name and Social Security Number, entering and leaving the work area.
 - 3. Special or unusual events, i.e., Barrier breaching, Equipment failures.
 - 4. Air monitoring tests and test results as required by OSHA.
 - 5. Inspection of work area preparation prior to start of removal and daily thereafter.
 - 6. Removal of any polyethylene barriers.
 - 7. DESIGN-BUILDERS inspections prior to encapsulation.
 - 8. Removal of waste materials from work area.
 - 9. Decontamination of equipment (list items).
 - 10. Final inspection/final air test analysis results.

Provide two copies of this log at final closeout of project for use by the CONSULTANT.

1.8 PRE-CONSTRUCTION CONFERENCE & MEETINGS

- A. Prior to start of any work, the DESIGN-BUILDER shall meet at project site with the CONSULTANT, AUTHORITY, and other entities concerned with asbestos abatement work. The Consultant will record discussions and agreements and furnish copy to each participant as required by the AUTHORITY.
- B. For specific coordination and pre-installation meetings for each element of work, and other regular project meetings for other purposes, the CONSULTANT will hold general progress meetings as required. Each entity then involved in planning, coordination or performance of work is required to be represented properly at each meeting.

1.9 GENERAL APPLICABILITY OF CODES, REGULATIONS AND STANDARDS

- A. Except to the extent that more explicit or more stringent requirements are written directly into the Contract Documents, all applicable codes, regulations, and standards have the same force and effect (and

are made part of the contract documents by reference) as if copied directly into the contract documents, or as if published copies are bound within.

- B. The DESIGN-BUILDER shall assume full responsibility and liability for the compliance with all applicable Federal, State, and local regulations pertaining to work practices and the protection of workers, visitors to the site, and persons occupying areas adjacent to the site. The DESIGN-BUILDER shall hold the CONSULTANT and its representatives harmless for failure to comply with any applicable work, hauling, disposal, safety, health or other regulation on the part of himself, his employees, or his subcontractors.

- C. Federal Requirements: Which govern asbestos abatement work or hauling and disposal of asbestos waste materials include the following:
 - 1. U.S. Department of Labor, Occupational Safety and Health Administration, (OSHA) including but not limited to:
 - a. Asbestos 29 CFR 1926.1101.
 - b. Respiratory Protection Standard, 29 CFR 1910.134.
 - c. Safety and Health Regulations for Construction, 29 CFR 1926.
 - d. Hazard Communication, 29 CFR 1910.1200
 - e. Specifications for Accident Prevention Signs and Tags, 29 CFR 1910.145
 - f. Asbestos General Standard 29 CFR 1910.1101
 - 2. U.S. Environmental Protection Agency (EPA) including but not limited to:
 - a. National Emission Standard for Hazardous Air Pollutants (NESHAPs) 40 CFR, Part 61, Subpart M
 - b. Asbestos Worker Protection Rule (40 CFR Part 763, Subpart G)
 - c. Hazardous Waste Regulations (Resource Conservation & Recovery Act) 40 CFR 260-265
 - 3. U.S. Department of Transportation, 49 CFR 172 - 173:

- D. State Requirements: Which govern asbestos abatement work or hauling and disposal of asbestos waste materials include the following:
 - 1. Massachusetts Division of Occupational Safety Regulations for the Removal, Containment or Encapsulation of Asbestos 453 CMR 6.00.
 - 2. Massachusetts Department of Environmental Protection:
 - a. Air Pollution Control Regulations, 310 CMR 7.00
 - b. Solid Waste Regulations, 310 CMR 18.000, 310 CMR 19.000
 - c. Sewer Use Regulations, 314 CMR 7.00
 - 3. Massachusetts Water Resources Authority
 - a. Discharge permitting requirements, 360 CMR 10.000

- E. Local Requirements: Abide by all local requirements which govern asbestos abatement work or hauling and disposal of asbestos waste materials.
 - 1. City of Boston Department of Health, 1.05 CMR, Section 440.353
 - 2. City of Boston Fire Department, Fire Prevention Code, Article 1, Section 1.05 and Article XX, Section 20.03

- F. Reference Guidelines: Which govern asbestos abatement work or hauling and disposal of asbestos waste materials include the following:
1. American National Standards Institute (ANSI), 1430 Broadway, New York, NY 10018
(212) 354-3300
 - a. Fundamentals Governing the Design and Operation of Local Exhaust Systems, ANSI Publication Z9.2-79
 - b. Practices for Respiratory Protection, ANSI Publication Z288.2-80

1.10 NOTIFICATIONS, PERMITS, AND LICENSES

- A. Once the DESIGN-BUILDER has been selected to perform an asbestos abatement, and a project schedule has been determined, external notifications must be filed. Copies of all notifications must be to the attention of the Engineer.
- B. The DESIGN-BUILDER is responsible for all required notifications of asbestos abatement work prior to the start of the abatement work. MADEP requires notification 10 working days prior to commencement of work involving the removal of any amount of asbestos.
- C. The DESIGN-BUILDER is responsible for the proper notification that must be made using MADEP's "Asbestos Notification Form ANF-001" (also known as BWP AQ-04). Submission of the form satisfies the notification requirements of both MADEP and DLS regulations.
- D. To submit an Asbestos Notification Form ANF-001, do one of the following:
1. File the ANF-001 online via MassDEP's website.
 2. Select "New User" and complete the required steps.
 3. For paper filers, when the ANF-001 is completely filled out, and the appropriate decal is affixed to the form (see Question #6 below), use regular, certified or U.S. Postal Service Express mail to send the form to:

Commonwealth of Massachusetts
Asbestos Program
P.O. Box 120087
 4. Use a private delivery or overnight service and send the ANF-001 to the following address:
Asbestos Notification, 8th Floor, MADEP, One Winter Street, Boston, MA 02108
- E. If the site project is planned for demolition or construction of a building, the DESIGN-BUILDER must notify MADEP. Notifications must be made using MADEP's "BWP AQ 06 Notification Prior to Construction or Demolition." The Construction/Demolition Notification Form and Instructions are available on MADEP's website at www.mass.gov/dep. To submit a Construction/Demolition Notification AQ-06 Form, the DESIGN-BUILDER must do one of the following:
1. File the AQ-06 online via MADEP's website. If you have not already done so, register online with eDEP at <https://edep.dep.mass.gov/DEPLogin.aspx>. Select "New User" and complete the required steps.
 2. For paper filers, when the AQ-06 is completely filled out, and the appropriate decal is affixed to the form (see Question #6 below), use regular, certified or U.S. Postal Service Express mail to send the form to:

Commonwealth of Massachusetts
Asbestos Program
P.O. Box 120087
Boston, MA 02112-0087

3. Use a private delivery or overnight service and send the AQ-06 to the following address:
Asbestos Notification, 8th Floor, Massachusetts DEP, One Winter Street, Boston, MA 02108.

- F. The DESIGN-BUILDER is responsible to confirm with local MADEP regional office, that construction and demolition notification fees might not apply for the Green Line Extension Project. For jobs that are exempt from the notification fee an EXEMPT decal must be obtained from the MADEP regional office and affixed to the notification form. For fee-exempt construction/demolition jobs, EXEMPT notification decals may be picked up (free of charge) at the reception area of MADEP's One Winter Street Boston Office or at any regional MADEP office. Each notification decal contains a unique number that is used to track the notification. Forms without decals will not be accepted.

- G. After the AQ-06 is received it will be reviewed by MADEP. The DESIGN-BUILDER will be contacted only in case of deficiencies in the submitted notification form, in which case the construction/demolition operation may not start.

- H. If MADEP informs the DESIGN-BUILDER of deficiencies in the notification form, the DESIGN-BUILDER will have 30 calendar days from the date of being informed of the deficiencies in which to respond.

- I. If necessary, the DESIGN-BUILDER may make revisions to the construction or demolition by doing either of the following:
 1. File the notification revision online via eDEP (you can do this even if the original notification was a paper copy).
 2. For paper filers, on a copy of the original notification form, write "REVISION" under the notification fee decal, and on the form indicate the revisions being made to the original notification. Mail a copy of the revised form to:

Commonwealth of Massachusetts
Asbestos Program
P.O. Box 120087
Boston, MA 02112-0087

- J. If the DESIGN-BUILDER needs an emergency waiver from the 10 working day notification requirement for abatement of previously unidentified ACM, the DESIGN-BUILDER shall contact the appropriate MADEP regional office to determine if an emergency is warranted, and to receive an emergency waiver number. If MADEP issues an emergency waiver, the construction/demolition operation may proceed. A Construction/Demolition Form and fee must still be submitted to MADEP as noted earlier. The AQ-06 form should be submitted within one working day of the beginning of the construction or demolition operation that received the emergency waiver.

- K. The DESIGN-BUILDER is responsible to notify all local agencies that state such requirements prior to the start of construction.

- L. For All Emergency Asbestos Responses:

Emergency asbestos responses may be arranged in response to unexpected incidents and uncontrolled events. Notification procedures are slightly different when there will be less than a 10 day advance notification period between the request and the abatement.

In the event of an emergency asbestos response, the DESIGN-BUILDER shall notify the AUTHORITY and CONSULTANT of emergency condition. The DESIGN-BUILDER shall provide AUTHORITY or CONSULTANT with the following information:

1. Building name, address, and specific location for the abatement
2. Nature of the emergency and reason for waiver
3. Type and quantity of asbestos to be remove
4. Name of the asbestos abatement DESIGN-BUILDER
5. Name of the environmental CONSULTANT
6. Names of any other DESIGN-BUILDERS performing work at this site.
7. BWPAQ06 Construction / Demolition notification number pertinent to work at this site, if applicable
8. Desired start date of the project

M. The AUTHORITY will contact the MADEP by phone to request an Emergency Waiver:

1. If an Emergency Waiver Number is issued, it will be communicated to the DESIGN-BUILDER along with the name of the Inspector who issued it. (During weekends and late night periods, the DEP on-call representative may be notified via the Massachusetts State Police.
2. The abatement DESIGN-BUILDER will notify DLS and provide them with the DEP Waiver number, and request a DLS Emergency Waiver number.
3. The DESIGN-BUILDER will fill out Form ANF-001, fax it to both the DEP and DLS, and then mail hard copies with the required fees.
4. The DESIGN-BUILDER will be responsible to also notify all appropriate local agencies as required.

N. Licenses: Maintain current licenses as required by applicable state or local jurisdictions for the removal, transporting, disposal or other regulated activity relative to the work of this Contract.

O. Posting and Filing of Regulations: Maintain two (2) copies of applicable federal, state and local regulations above. Post one copy of each at the job site and keep one copy of each regulation file in DESIGN-BUILDER's office.

1.11 AVAILABILITY OF TRAINED PERSONNEL

A. There shall be a sufficient number of trained, licensed and qualified workers, foremen and superintendents to accomplish the work within the required schedule, which may require work to be performed 24 hours a day, seven days a week. No untrained, unlicensed, unqualified, or non-approved person shall be employed to speed up completion of the abatement work.

1.12 RESPIRATORY PROTECTION

A. The DESIGN-BUILDER shall supply workers and supervisory personnel with NIOSH approved protective respirators and HEPA/filters. Appropriate respirator selection shall be determined by the

daily personnel samples being taken and strictly follow the guidelines set forth in the OSHA respiratory program, Title 29 CFR, Part 1910.134, Title 29 CFR, Part 1926.1101 and the Massachusetts DLS Regulations, 453 CMR 6.00. The respirators shall be sanitized and maintained according to the manufacturer's recommendations. Disposable respirators shall not be considered acceptable in any circumstance. The DESIGN-BUILDER shall maintain on site a sufficient supply of disposable HEPA/filters to allow workers and supervisory personnel to change contaminated filters. The DESIGN-BUILDER is solely responsible for means and methods used and for compliance with applicable regulations.

- B. The DESIGN-BUILDER is responsible to instruct and train each worker involved in asbestos abatement or maintenance and repair of friable ACMs in proper respiratory use and require that each worker always wear a respirator, properly fitted on the face in the work area from the start of any operation which may cause airborne asbestos fibers until the work area is completely decontaminated. The DESIGN-BUILDER is responsible to mandate proper respiratory protection appropriate for the fiber level encountered in the work place as required. The DESIGN-BUILDER is responsible to assess any additional respiratory protection requirements for other toxic or oxygen-deficient situations encountered.
- C. Except to the extent that more stringent requirements are written directly into the Contract Documents, the following regulations and standards have the same force and effect. Where there is a conflict in requirements set forth in these regulations and standards, meet the more stringent requirement.
 - 1. OSHA: U.S. Department of Labor Occupational Safety and Health Administration, Safety and Health Standards Title 29 CFR, Part 1926.1101.
 - 2. CGA: Compressed Gas Association, Inc., New York, Pamphlet G-7, "Compressed Air for Human Respiration", and Specification G-7.1 "Commodity Specification for Air".
 - 3. ANSI: American National Standard Practices for Respiratory Protection, ANSI Z88.2-1992.
 - 4. NIOSH: National Institute for Occupational Safety and Health.
 - 5. MSHA: Mine Safety and Health Administration.
- D. Initial Exposure Assessment
 - 1. The DESIGN-BUILDER shall ensure that a "competent person" conduct an exposure assessment immediately before, or at the initiation of work to determine expected exposures during the work. For Class I asbestos work, until the DESIGN-BUILDER conducts exposure monitoring and documents that workers on the job will not be exposed in excess of the PEL, or otherwise makes a negative exposure assessment, the DESIGN-BUILDER shall assume that workers are exposed in excess of the PEL or excursion limit.
 - 2. The DESIGN-BUILDER may demonstrate that worker exposures will be below the PEL (Negative Exposure Assessment) by practices which conforms to the following:
 - a. Objective data which demonstrates that the material containing asbestos cannot release airborne fibers in concentrations exceeding the TWA and excursion limit, or
 - b. The DESIGN-BUILDER has monitored prior asbestos projects for the PEL and excursion limit within one year of this project and the data was obtained during work operations and conditions which "closely resembles" the processes, type of material, control methods, work practices as that on this project and that the operations were conducted by workers whose training and experience are no more extensive than that of the workers who will work on this project; and this data shows that for the conditions present on this project, there is a high degree of certainty that worker exposures will not exceed the TWA and excursion limit; or

- c. The results of initial exposure monitoring of this project for 8-hour TWA and 30-minute short-term exposures of each employee covering operations which are most likely to take place during the entire course of this project result in exposures below the PEL.
- E. The DESIGN-BUILDER shall provide the appropriate respirator to all workers (and ensure that the employee uses the respirator provided) in accordance with the requirements of Title 29 CFR, Part 1926.1101 (h)(3) and Title 29 CFR, Part 1910.134 (d)(3)(i)(A). Respiratory protection as specified herein shall be worn at all times, including preparation of the work areas, loading and unloading of waste containers in the work area or at the transport truck, cleaning of work areas, and performance of glove bag removal work.
- F. Facial hairs, such as beards, long sideburns, and mustaches, which could interfere with the seal of air purifying type respirators, shall not be allowed.
- G. Respiratory protection maintenance and decontamination procedures shall meet the following requirements:
 - 1. Respiratory protection shall be inspected and decontaminated on a daily shift basis in accordance with OSHA Title 29 CFR, Part 1910. 134(b).
 - 2. Respiratory protection shall be the last piece of worker protection equipment to be removed. Workers must wear respirators in the shower when going through decontamination procedures as stated herein.
 - 4. Airline respirators with HEPA-filtered disconnect shall be disconnected in the equipment room and worn into the shower. Powered air-purifying respirator (PAPR) face pieces shall be worn into the shower. Filter/power pack assemblies shall be decontaminated in accordance with manufacturer's recommendations.
 - 5. Respirators shall be stored in a dry place and in such a manner that the face piece and exhalation valves are not distorted.
 - 6. Organic solvents shall not be used for washing of respirators.
 - 7. Whenever respirator design permits, workers shall perform a positive and negative air pressure fit test each time a respirator is worn. PAPRs shall be tested for adequate flow (using the methods specified by the manufacturer) every four (4) hours of use and each time the worker enters or exits the work area. Written logs of these tests shall be maintained by the DESIGN-BUILDER.
 - 8. The DESIGN-BUILDER shall furnish to the CONSULTANT written documentation that each worker is medically approved to wear respirators and has been properly trained in their use, inspection, care, maintenance, and fitting testing pursuant to the DESIGN-BUILDER's written Respirator Plan and applicable regulations.
- H. Air Purifying Respirators:
 - 1. Negative Pressure - Half or Full Face Mask: Supply a sufficient quantity of respirator filters approved for asbestos, so that workers can change filters during the workday. Require that respirators be wet-rinsed, and filters discarded, each time a worker leaves the work area. Require that new filters be installed each time a worker re-enters the work area. Store respirators and filters at the job site in the changing room and protect totally from exposure to asbestos prior to their use.
 - 2. Powered Air Purifying - Half or Full Face Mask: Supply a sufficient quantity of high efficiency respirator filters approved for asbestos so that workers can change filters at any time that flow through the face piece decreases to the level at which the manufacturer recommends filter replacement. Require that HEPA elements in filter cartridges be protected from wetting during

showering. Require entire exterior housing of respirator including blower unit, filter cartridges, hoses, battery pack, face mask, belt, and cords to be washed with a rag or towel each time a worker leaves the work area. Caution should be used to avoid shorting battery pack during washing. Provide an extra battery pack for each respirator so that one can be charging while one is in use.

3. Initial Fitting: Provide initial fitting of respiratory protection during an approved respiratory protection training course. Fit types of respirator to be actually worn by each individual. Allow an individual to use only those respirators for which he has been trained and fit.
4. Upon Each Wearing: Require that each time an air-purifying respirator is put on, it be checked for fit with a positive and negative pressure fit test in accordance with the manufacturer's instructions or ANSI Z88.2 (1992).

I. Type "C" Respirator:

1. Air Systems Monitor: Continuously monitor the air system operation including compressor operation, filter system operation, backup air capacity and all warning and monitoring devices at all times that system is in operation. Assign an individual trained, by manufacturer of the equipment in use or by a Certified Industrial Hygienist, in the operation and maintenance of the system to provide this monitoring. Assign no other duties to this individual which will take this person away from monitoring the air system.
2. The Compressed Air System for Type "C" Respirators (if utilized) shall be high pressure, with a compressor capacity to satisfy the respirator manufacturer's recommendations. The receiver shall have sufficient capacity to allow a 30 minute escape time for the respirator wearers in the event of compressor failure or malfunction. The Compressed Air System shall have compressor failure alarm, high temperature alarm, carbon monoxide alarm, and suitable in-line air purifying adsorbent beds and filters to assure Grade "F" Breathing Air. (See Part 2 -Materials)
3. Where Type "C" Respirators are used, they shall be worn with a belt to minimize possibility of dislodging face mask when hose is snagged in the work area.
4. The DESIGN-BUILDER shall provide at all times a minimum of six spare hoses for the CONSULTANT and authorized visitors and inspectors to connect to their assigned Type "C" Respirator without having to wait for removal of workers from the work area to obtain a hose connection.

1.13 TEMPORARY FACILITIES

- A. The DESIGN-BUILDER shall provide water and electric service sufficient to perform and complete the work of this Specification. Use qualified tradesmen for installation of temporary services and facilities. Locate temporary services and facilities where they will serve the entire project adequately and result in minimum interference with the performance of the work. Relocate, modify and extend services and facilities as required during the course of work so as to accommodate the entire work of the project.
- B. Scaffolding: Provide all scaffolding, ladders and/or staging, etc. as necessary to accomplish the work of this contract. Scaffolding may be of suspension type; or standing type such as metal tube and coupler, tubular welded frame, pole or outrigger type or cantilever type. The type, erection and use of all scaffolding shall comply with all applicable OSHA provisions.
 1. Equip rungs of all metal ladders, etc. with an abrasive non-slip surface.
 2. Provide a nonskid surface on all scaffold surfaces subject to foot traffic.
 3. During the erection and/or moving of scaffolding, care must be exercised so that the contaminated debris on the floor and other surfaces is not disturbed.

4. At the completion of abatement work, clean all construction aids within the work area.
- C. Water Service: All water shall be supplied by the DESIGN-BUILDER. Sufficient water shall be brought on site by the DESIGN-BUILDER or the DESIGN-BUILDER shall make arrangements to use a nearby fire hydrant. Sufficient hot water for all workers shall be supplied by DESIGN-BUILDER at a minimum temperature of 100° F.
1. Temporary Water Service Connection: All connections to the water system shall include backflow protection. Valves shall be temperature and pressure rated for operation of the temperatures and pressures encountered. After completion of use, connections and fittings shall be removed without damage or alteration to existing water piping and equipment.
 2. Water Hoses: Employ heavy-duty abrasion-resistant hoses with a pressure rating greater than the maximum pressure of the water distribution system to provide water into each work area and to each decontamination unit. Provide temporary water heating equipment, branch piping, showers, shut-off nozzles and equipment. Maintain hose connections and outlet valves in leak-proof condition.
 3. Hot Water Heater: Provide UL rated 40 - 80 gallon electric hot water heater to supply hot water for the decontamination unit shower. Activate from 30 amp circuit breaker located within the decontamination unit subpanel. Provide with relief valve compatible with water heater operation; provide piping from relief valve down to drip pan on floor with type L copper. Drip pans shall consist of a 12" x 12" x 6" deep pan, made of 19 gauge galvanized steel, with handles. Wiring of the hot water heater shall be in compliance with NEC, Massachusetts modifications to the NEC, and UL standards.
- D. Electrical Service: Comply with applicable NEC, Massachusetts modifications to the NEC, and UL standard and governing regulations for materials and layout of temporary electric service. Provide a weatherproof, grounded temporary electric power service and distribution system of sufficient size, capacity, and power characteristics to accommodate performance of work during the construction period. Install temporary lighting adequate to provide sufficient illumination for safe work and traffic conditions in every area of work and acceptable to CONSULTANT.
1. Temporary Power: Provide service to decontamination unit sub-panel with minimum 60 amp, 2 pole circuit breaker or fused disconnect connected to the main distribution panel. Sub-panel and disconnect shall be sized and equipped to accommodate all electrical equipment required for completion of the work.
 2. Provide electrical outlets (and extension cords) in the clean room, equipment room, and at locations inside and outside the work area as required by the CONSULTANT for the exclusive use of the CONSULTANT for air monitoring purposes. Since the Regulations will require between 35-50 or more PCM air samples for final clearance purposes for a work area, the outlets and cords must be in sufficient numbers and locations to allow these samples to be taken simultaneously.
- E. Temporary Lighting: Provide sufficient temporary lighting to ensure proper workmanship everywhere; by combined use of daylight and portable plug-in task lighting. Protect lamps with guard cages or tempered glass enclosures, where fixtures are exposed to breakage by construction operations. Provide exterior fixtures where fixtures are exposed to the weather or moisture.
- F. Sanitary Facilities: Provide one self-contained chemical toilet for each ten workers (as a minimum). Toilets shall be located outside the asbestos abatement work areas.
- G. Temporary Heating: Provide temporary heat where indicated or needed for performance of the work. Provide temporary heating units that have been tested and labeled by UL, FM or another recognized

trade association related to the fuel being consumed. Use Type MUH Unit heaters from Qmark or other heating units approved by MBTA Safety Department. No open fires or burning will be allowed.

- H. Fire Extinguishers: Comply with the applicable recommendation of NFPA Standard 10 "Standard For Portable Fire Extinguishers." Locate fire extinguishers where they are most convenient and effective for their intended purpose, but provide no less than one extinguisher in the corner of each work area, one in each Equipment Room, and one outside each work area in the Clean Room.

1.14 DECONTAMINATION FACILITIES (DF)

- A. For Class I work involving less than 25 linear feet or 10 square feet of thermal or surfacing ACM and PACM, and for Class II asbestos work operations where exposures exceed a PEL, or where there is no negative exposure assessment produced before the project, the DESIGN-BUILDER shall provide the following:

1. An equipment room or area adjacent to the regulated area for the decontamination of workers and their equipment which is contaminated with asbestos which shall consist of an area covered by an impermeable drop cloth on the floor or horizontal working surface.
2. The area must be of sufficient size as to accommodate cleaning of equipment and removing personal protective equipment without spreading contamination beyond the area.
3. Work clothing must be cleaned with a HEPA vacuum before it is removed.
4. All equipment and surfaces of containers filled with ACM must be cleaned prior to removing them from the equipment room or work area.
5. The DESIGN-BUILDER shall ensure that all workers enter and exit through the equipment room or area.
6. Provide an air lock leading into the equipment room or area that is physically and visually separated from the equipment room or area.

- B. For Class I work involving more than 25 linear feet or 10 square feet of thermal or surfacing ACM and PACM, the DESIGN-BUILDER shall establish a decontamination area that is adjacent and connected to the regulated area for the decontamination of workers. The decontamination area shall consist of an equipment room, shower area and clean room in series. The DESIGN-BUILDER shall ensure that workers enter and exit the regulated area through the decontamination area. The DESIGN-BUILDER shall provide the following:

1. Equipment Room (Dirty Room): Provide Equipment Room with airlocks to the work area and Shower Room, large enough for all workers to remove and dispose of contaminated protective clothing, and for storage of contaminated DESIGN-BUILDER equipment.
2. Shower Room: Provide a completely watertight operational shower to be used for transit by cleanly dressed workers heading for the work area from the Changing Room, or for showering by workers headed out of the work area after undressing in the Equipment Room. The shower room facilities and size shall be adequate to allow decontamination and thorough washing of all the workers and visitors within the 30 minute escape time allowed under air compressor failure (if Type C Supplied Air Respirators are used).
 - a. Construct room by providing a shower pan and 2 shower walls in a configuration that will cause water running down walls to drip into pan. Install a freely draining wooden floor in shower pan at elevation of top of pan.
 - b. Provide shower head and controls.

- c. Provide temporary extensions of existing hot and cold water and drainage, as necessary for a complete and operable shower.
 - d. Provide a soap dish and a continuously adequate supply of soap and maintain in sanitary condition.
 - e. Arrange so that water from showering does not splash into the Changing or Equipment Rooms.
 - f. Arrange water shut off and drain pump operation controls so that a single individual can shower without assistance from either inside or outside of the work area.
 - g. Provide flexible hose shower head.
 - h. Pump waste water to drain or to storage for use in amended water. If pumped to drain, provide 20 μm and 5 μm waste water filters in line to drain approved by the CONSULTANT or waste water storage. Change filters daily or more often if necessary. Locate filters inside shower unit so that water lost during filter changes is caught by shower pan.
3. Clean Room (Changing Room): Provide a room that is physically and visually separated from the rest of the building for the purpose of changing into protective clothing. Locate so that access to work area from Clean Room is through Shower Room.
- a. Require workers to remove all street clothes in this room, dress in clean disposable coveralls, and don respiratory protection equipment. Do not allow asbestos contaminated items to enter this room. Require workers to enter this room either from outside the structure dressed in street clothes, or naked from the showers.
 - b. Maintain floor of changing room dry and clean at all times. Do not allow overflow water from shower to wet floor in changing room.
 - c. Damp wipe all surfaces twice after each shift change with a disinfectant solution.
 - d. Provide a continuously adequate supply of disposable bath towels.
 - e. Provide posted information for all emergency phone numbers and procedures.
- C. Construction: Decontamination facilities shall be located in areas acceptable to the CONSULTANT and as shown on the DESIGN-BUILDER's approved Work Plan. Construction shall have load-bearing capabilities if required to support workers overhead. DF shall be fully lined utilizing two layers of 6-mil thickness opaque polyethylene sheeting at a minimum. The entire floor of the DF shall be covered with two (2) layers of 6-mil thickness polyethylene sheeting turned up 12" - 16" on the wall layers. The upper layer of floor polyethylene sheeting shall be replaced as wear necessitates (or as determined by the CONSULTANT). The floor of the DF Shower Room shall be sealed and maintained watertight at all times. Leaks shall be immediately cleaned up and then the cause repaired to the satisfaction of the CONSULTANT. The interior surfaces of the walls, floor, and ceiling shall then be covered with an additional two layers of 6-mil thickness polyethylene sheeting sealed water and airtight with duct tape at all overlapping seams.
- D. Air Locks: Shall be constructed by placing three overlapping sheets of plastic over a framed doorway, securing each along the top of the doorway. The first and third sheets shall be secured on one side of the doorway and the middle sheet shall be secured on the other side of the doorway. The distance between doorways must allow enough space for one doorway to be closed before the next doorway is opened (i.e., approximately three (3) feet).
- E. Provide heating and HEPA-filtered exhaust ventilation for all decontamination systems so that air flow will be from the clean outside towards the contaminated workspace.

- F. Cleaning: The decontamination facility shall be cleaned using a HEPA-filtered vacuum at least once every shift, or more frequently if needed to prevent residue accumulation.
- G. Prohibitions: Smoking, drinking, or eating shall not be permitted in the work area, Shower Room or Equipment Room. Personal equipment such as radios or flashlights shall not be permitted in the work area, Shower Room or Equipment Room unless they can be washed in the shower.
- H. The DESIGN-BUILDER shall post or have available the following items in each clean room of the worker decontamination facility.
 - 1. A copy of the USEPA NESHAPs regulations, Title 40 CFR, Part 61 Subparts A and M; and a copy of OSHA Asbestos Regulations, Title 29 CFR, Part 1926.1101;
 - 2. A copy of the MADLS Regulations for Asbestos, 453 CMR 6.00.
 - 3. A list of telephone numbers for local hospital, location of hospital and/or emergency squad, local fire department, and the name and telephone number of the CONSULTANT.
 - 4. A copy of the asbestos abatement Specifications and Drawings.
 - 5. A copy of the respirator protection program which conforms to the requirements of Title 29 CFR, Part 1910.134(b).
 - 6. A listing of all employees, by name, social security number and Massachusetts Asbestos Abatement Worker or Supervisor/Foreperson Certification Number working on the Project.
 - 7. A legible copy of each assigned employee's Massachusetts Certification.
 - 8. A daily sign in/out log which identifies persons by name and Massachusetts Asbestos Certification Number, who are/were at the site, and the length of the time each spent at the site.
- I. A solid, hinged door with a single cylinder dead-bolt lock shall be installed at the outside entrance to each decontamination facility. Provide a shutter which opens on make-up air inflow and seals on air flow cessation. This door shall be closed and locked whenever the work area is unattended. Two sets of keys for the lock shall be distributed to the CONSULTANT.
- J. Ensure that barriers and plastic linings are effectively sealed and taped at all times, and that the Shower Room floor is watertight. Repair damaged barriers, and remedy defects immediately upon discovery. Visually inspect the facility at the beginning of each work period. The CONSULTANT shall also be allowed to use smoke generators to test effectiveness of barriers, flow of air through the DF, and HEPA-exhaust systems.
- K. Maintain emergency and fire exits from the work areas, or establish alternative exits satisfactory to local fire officials and the CONSULTANT. Exits shall be checked daily for exterior blockages or impediments to exiting.
- L. Warning signs as required in Title 29 CFR, Part 1926.1101 shall be posted on the entrance to all work areas
- M. Equipment and Waste DF - Where space allows, provide a separate DF consisting of a serial arrangement of rooms, Holding area, and Wash Room for removal of equipment and material from the work area. Do not allow personnel to enter or exit work area through Equipment DF. Equipment and Waste DF shall be constructed as described above.

1.15 PERSONNEL PROTECTION AND DECONTAMINATION

A. Protective Clothing

1. Coveralls: Provide disposable full-body coveralls and disposable head covers, and require that they be worn by all workers in the work area. Provide a sufficient number for all required changes, for all workers in the work area.
2. Boots: Provide work boots with non-skid soles, and where required by OSHA, foot protection, for all workers. Provide boots at no cost to workers. Do not allow boots to be removed from the work area for any reason, after being contaminated with asbestos containing material. Dispose of boots as asbestos contaminated waste at the end of the work or seal in 6-mil polyethylene bags (with labels) for transportation to another work area.
3. Goggles: Provide eye protection (goggles) as required by OSHA for all workers involved in scraping, spraying, or any other activity which may potentially cause eye injury. Goggles are not required if full face respiratory protection is used.
4. Gloves: Provide work gloves to all workers and require that they be worn at all times in the work area. Do not remove gloves from work area and dispose of as asbestos-contaminated waste at the end of the work.
5. Hard Hats: Provide hard hats to all workers and authorized visitors and require that they be worn at all times in the work area. Hard hats shall be worn over the hood of the coveralls.
6. Additional Protective Equipment: Respirators, disposable coveralls, head covers, and footwear covers shall be provided by the DESIGN-BUILDER for the CONSULTANT, and other authorized visitors who may inspect the job site.

B. Each Time Work Area is Entered: Remove all street clothes in the Changing Room of the Personnel decontamination unit and put on new disposable coverall, new head cover, and a clean respirator. Proceed through Shower Room to Equipment Room and put on work boots.

C. Decontamination Procedures: Require all workers to adhere to current regulations and the project Health and Safety Plan. An overview is provided below of personal decontamination procedures to be followed whenever workers leave the designated work area:

1. When exiting area, remove disposable coveralls, disposable head covers, and disposable footwear covers or boots in the Equipment Room.
2. If wearing breathing protection, keep respirators on while proceeding to the mandatory showering step. Showering will be done with respirator still in place, according to respirator-specific procedures. Care must be taken to follow reasonable procedures in removing the respirator to avoid releasing asbestos fibers while showering. The following general procedures are required at a minimum:
 - a. Type "C" Supplied Air: Thoroughly wash body, including hair and face, and all pieces of respirator. While holding breath, remove respirator and hold it away from face before starting to breath. Carefully wash face piece of respirator inside and out.
 - b. PAPR: Thoroughly wash body, including hair and face, while holding blower unit above head to keep canisters dry. Wash all parts of the respirator except the blower unit and battery pack. Shut down unit in a specified sequence and then thoroughly wash blower unit and hoses. Carefully wash battery pack with wet rag. Be extremely cautious of getting water in battery pack as this will short out and destroy battery.
 - c. Air Purifying-Negative Pressure Respirators: Thoroughly wet body and hair as thoroughly as possible without wetting the respirator filter. Hold breath while wetting face, respirator

and filter and removing respirator. Dispose of wet filters from air purifying respirator. Carefully wash face piece of respirator inside and out.

- D. Within Work Area: Require that workers NOT eat, drink, smoke, chew gum or tobacco, apply cosmetics or use toilet facilities (either existing or temporary) in the work area.
- E. Post written procedures in work place and train all personnel on the procedures for the evacuation of the injured and the handling of potential fires. Provide aid to a seriously injured worker without delay for decontamination. Make provisions to minimize exposure of rescue workers and to minimize spreading of contamination during evacuations and fire procedures.
- F. The DESIGN-BUILDER shall instruct all employees and workers in the proper care of their personally issued respiratory equipment, including daily maintenance, sanitizing procedures, etc.
- G. All respiratory equipment shall be inspected by DESIGN-BUILDER's project supervisory personnel at the beginning of each work period, including breaks and lunch periods. Written records of these inspections shall be maintained for review by the CONSULTANT.

1.16 EXPOSURE CONTROLS AND HEPA-FILTERED EXHAUST VENTILATION

- A. The DESIGN-BUILDER shall install inside each work area portable HEPA-filtered exhaust units to maintain the area, including the Decontamination (and Waste Transfer) Facilities, under negative air pressure, and to reduce and control airborne asbestos fiber concentrations. Exhaust systems shall be operated twenty-four hours per day at all times from the time DESIGN-BUILDER takes control of the Site and during preparation, removal, and cleanup tasks as specified herein; and until acceptable final air clearance is obtained for the work area. In all cases, the units shall exhaust directly to the outside of the containment area.
- B. Each exhaust unit shall be serviced by a dedicated minimum 115V-20A circuit with overload device.
- C. The exhaust system must be capable of providing: 1) at least four (4) full air changes per hour in each work area; 2) an inward velocity through any openings, including the decontamination facilities, of at least 200 feet per minute (fpm); and 3) a static negative air pressure inside the area of a minimum of - 0.02 inches of the water column.
- D. Determine number of units needed by dividing the ventilation requirement cubic feet per minute (CFM) above by capacity of exhaust unit(s) used. Capacity of a unit for purposes of this Section is the capacity, in CFM with fully loaded filters, (pressure differential which causes loaded filter warning light to come on) in the machines labeled operating characteristics. Add a minimum of one (1) additional unit as a backup in case of equipment failure or machine shutdown for filter changing.
- E. All exhaust air shall pass through HEPA-filters before being discharged directly to the exterior of a building. The DESIGN-BUILDER shall securely install (and seal with caulking) a solid window or door insert with cutouts sized for the exhaust air duct from each HEPA-exhaust unit. The exterior exhaust discharge point shall be at least 40 feet from a receptor such as an air intake port, louvers, or entrances to the building or an adjoining building.
- F. Locate exhaust unit(s) so that makeup air enters work area primarily through decontamination facilities and traverses work area as much as possible. This may be accomplished by positioning the exhaust unit(s) at a maximum distance from the worker access opening or other makeup air sources.

- G. If there are multiple sealed areas or partition walls within a work area, the exhaust systems shall be arranged so that air flows from the least to most contaminated area, and to prevent spaces from having poor or dead air movement.
- H. Provide supplemental make-up air inlets where required for proper air flow through the work space in locations approved by the CONSULTANT. Additional make-up air shall be delivered through horizontal shutters which open on make-up air inflow and seal on air flow cessation, or is delivered through a HEPA-filtered supply fan system.
- I. Testing the System: Test the negative pressure system before any asbestos-containing material is wetted or removed. After the work area has been prepared, the decontamination facility set up, and the exhaust unit(s) installed, start the unit(s) one at a time. Demonstrate operation and testing of negative pressure system to the CONSULTANT. Demonstrating and testing the operation of the negative pressure system will include, but not be limited to, the following:
1. Plastic barriers and sheeting move lightly in toward work area.
 2. Curtain of decontamination units move lightly in toward work area.
 3. There is a noticeable movement of air through the decontamination unit. Use smoke tube to demonstrate air movement from Clean Room to Shower Room, from Shower Room to Equipment Room, and from Equipment Room to work area.
 4. Use a differential pressure meter or manometer to demonstrate a pressure difference of at least -0.02 (-0.04 desirable) inches of water across every barrier separating the work area from the balance of the building or outside.
 5. The CONSULTANT may use smoke generators to confirm that air flowing through all open areas is directed into the decontamination facilities and isolation barrier, and good air turnover conditions exist within the work area. If deficient air flows are reported to the DESIGN-BUILDER, the DESIGN-BUILDER shall cease work and promptly correct the deficiency.
- J. Use of System During Abatement Operations:
1. Start exhaust units before beginning work (before any asbestos-containing material is disturbed). After abatement work has begun, run units continuously to maintain a constant negative pressure until final air clearance of the work area is complete. Do not turn off units at the end of the work shift or when abatement operations temporarily stop.
 2. Start abatement work at a location farthest from the exhaust units and proceed toward them. If an electric power failure occurs, immediately stop all abatement work and do not resume until power is restored and exhaust units are operating again.
 3. At completion of abatement work, allow exhaust units to run to remove airborne fibers that may have been generated during abatement work and cleanup and to purge the work area with clean makeup air. The units may be required to run for a longer time after decontamination, if dry or only partially wetted asbestos material was encountered during any abatement work.
- K. On loss of negative air pressure or electric power, all work activities in an area shall stop immediately and shall not resume until power is restored and the HEPA-exhaust systems are operating again. When power failure or loss of negative pressure lasts, or is expected to last, longer than one hour, then the following shall occur:
1. The make-up air inlets in the decontamination facilities shall be sealed airtight.
 2. The decontamination facilities shall be sealed airtight after the evacuation of all personnel from the work area.

3. All adjacent areas shall be monitored for asbestos fiber concentration upon discovery of, and subsequently throughout, the power failure.
- L. Monitoring: Continuously monitor and record pressure differential between the work area and the building outside the work area with a monitoring device incorporating a continuous recorder. Meter shall be equipped with a warning buzzer which will sound if pressure differential drops below -0.02" of water. The monitor will be located at a point acceptable to the CONSULTANT. On a weekly basis, submit printout from pressure differential monitoring equipment. Mark printouts with location, date and start of time for each day.

1.17 SPECIAL CONSIDERATIONS

- A. Selective demolition or exploration may be needed to properly access and remove all the ACM at the site. All such work is part of the Work of Section 02080 and related sections identified in 1.2 "Related Work" above.
- B. The DESIGN-BUILDER is responsible for the integrity and safety of all structural elements to remain during the project wherever their work involves accessing, disturbing, or otherwise has the potential to affect in any way interior/exterior structures. DESIGN-BUILDER is responsible for submitting all scaffolding plans.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. General
 1. Deliver all materials in the original packages, containers, or bundles bearing the name of the manufacturer and the brand name where applicable.
 2. Store all materials subject to damage off the ground, away from wet or damp surfaces, and under cover sufficient enough to prevent damage or contamination. Replacement materials shall be stored outside of the work area until abatement is completed.
 3. Damaged, deteriorating, or previously used materials shall not be used and shall be removed from the worksite and disposed of properly.

2.2 MATERIALS, TOOLS, AND EQUIPMENT

- A. Negative Air Machines: Supply the required number of asbestos air filtration units to the Site in accordance with these specifications. Each unit shall include the following:
 1. Cabinet: Constructed of steel or other durable materials able to withstand damage from rough handling and transportation. The width of the cabinet should be less than 30 inches to fit through standard-size doorways. Cabinet shall be factory sealed to prevent asbestos-containing dust from being released during use, transport, or maintenance. Access to and replacement of all air filters shall be from intake end. Unit shall be mounted on casters or wheels.
 2. Fans: Rate capacity of fan according to useable air-moving capacity under actual operating conditions. Use centrifugal-type fan.
 3. HEPA Filters: The final filter shall be the HEPA type. The filter media (folded into closely pleated panels) must be completely sealed on all edges with a structurally rigid frame.

- a. A continuous rubber gasket shall be located between the filter and the filter housing to form a tight seal.
 - b. Each filter shall be individually tested and certified by the manufacturer to have an efficiency of not less than 99.97% when challenged with 0.3 μm dioctylphthalate (DOP) particles. Testing shall be in accordance with Military Standard Number 282 and Army Instructions Manual 136-300-175A. Each filter shall bear a UL586 label to indicate ability to perform under specified conditions.
 - c. Each filter shall be marked with: the name of the manufacturer, serial number, air flow rating, efficiency and resistance, and the direction of test air flow.
4. Pre-filters: which protect the final filter by removing the larger particles, are required to prolong the operating life of the HEPA filter. Two stages of pre-filtration are required. The first-stage pre-filter shall be a low-efficiency type (e.g., for particles 10 μm and larger). The second-stage (or intermediate) filter shall have efficiency (e.g., effective for particles down to 5 μm). Pre-filters and intermediate filters shall be installed either on or in the intake grid of the unit and held in place with special housings or clamps. Pre-filters shall be checked for accumulation at least twice per shift, and shall be changed as frequently as conditions require, especially during asbestos removal or during times of dust creation.
 5. Instrumentation: Each unit shall be equipped with a Magnahelic gauge or manometer to measure the pressure drop across filters and indicate when filters have become loaded and need to be changed. A table indicating the useable air-handling capacity for various static pressure reading on the Magnahelic gauge shall be affixed near the gauge for reference or the Magnahelic reading indicating at what point the filters should be changed, noting CFM air delivery at the point. Provide units equipped with an elapsed time meter to show the total accumulated hours of operation.
 6. Safety and Warning Devices: The unit shall have an electrical (or mechanical) lockout to prevent fan from operating without a HEPA filter or with a filter installed backwards. Units shall be equipped with automatic shutdown system to stop fan in the event of a major rupture in the HEPA filter or blocked air discharge. Warning lights and audible alarms are required to indicate normal operation, too high a pressure drop across the filters (i.e., filter overloading), and too low of a pressure drop (i.e., major rupture is HEPA filter or obstructed discharge).
 7. Flexible metal hoses (ducts) of sufficient length must be provided to allow the units to discharge outside of buildings (where possible).
 8. Electrical components shall be approved by the National Electrical Manufacturers Association (NEMA) and Underwriter's Laboratories (UL). Each unit shall be equipped with overload protection sized for the equipment. The motor, fan, fan housing, and cabinet shall be grounded.
- B. Respirator Protection Equipment:
1. Air Purifying Respirators:
 - a. Respirator Bodies: Provide half face or full face type respirators. Equip full face respirators with a nose cup or other anti-fogging device as would be appropriate for use in air temperatures less than 32° F.
 - b. Filter Cartridges: Provide, at a minimum, HEPA type filters labeled with NIOSH and MSHA Certification for "Radionuclides, Radon Daughters, Dust, Fumes, Mists including Asbestos-Containing Ducts and Mists" and color coded in accordance with ANSI Z228.2 (1992). In addition, a chemical cartridge section may be added, if required, for solvents, etc., in use. In this case, provide cartridges that have each section of the combination canister labeled with the appropriate color code and NIOSH/MSHA Certification.

- c. Non-permitted respirators: Do not use any single-use, disposable or quarter face respirators.
2. Supplied Air Respirator Systems:
- a. Provide equipment capable of producing air of the quality and volume required by the reference standards applied to the job site conditions and crew size. Comply with provisions of this specification. If more stringent than the governing standard.
 - b. Face piece and hose: Provide a pressure-demand full face piece supplied air respirator incorporating an auxiliary self-contained breathing apparatus (SCBA) which automatically maintains an uninterrupted air supply in pressure demand mode with a positive pressure face piece. Respirator assembly, including hose, shall be NIOSH/MSHA approved. Provide hose approved by respirator manufacturer. Provide sufficient number of hoses for all workers and authorized visitors including regulatory inspectors and CONSULTANT's Representatives.
 - c. Backup air supply: Provide a reservoir of compressed air located outside the work area which will automatically maintain a continuous uninterruptable source of air automatically available to each connected face piece and hose assembly in the event of compressor shut-down, contamination of air delivered by compressor, power loss or other failure. Provide sufficient capacity in the back-up air supply to allow a minimum escape time of one-half hour times the number of connections available to the work area. Air requirement at each connection is the air requirement of the respirators in use plus the air requirement of an average sized adult male engaged in moderately strenuous activity.
 - d. Warning device: Provide a warning device that will operate independently of the power supply. Locate so that alarm is clearly audible above the noise level produced by equipment and work procedures in use, in all parts of the work area and to the compressor. Connect alarm to warn of:
 - 1. Compressor shut down or other fault requiring use of backup air supply.
 - 2. Carbon Monoxide (CO) levels in excess of 5 parts per million (ppm).
 - e. Carbon Monoxide (CO) Monitor: Continuously monitor and record on a strip chart recorder Carbon Monoxide (CO) levels. Place monitors in the air lines between compressor and back-up air supply and between backup air supply and workers. Connect monitors so that they also sound an alarm as specified under "Warning Devices".
 - f. Compressor Shut Down: Interconnect monitors, alarms and compressor so that compressor is automatically shut down and the alarms sounded if any of the following occur:
 - 1. Carbon monoxide (CO) concentrations exceed 5 ppm in the air line between the filter bank and backup air supply,
 - 2. Compressor temperature exceeds normal operating range.
 - g. Compressor Motor: Provide a compressor driven by an electric motor. Do not use a gas or diesel engines to drive compressor. Insure that electrical supply to be provided at the work site is adequate to energize motor.
 - h. Compressor Location: Locate compressor outside of work area in location that will not impede access to the work area, and that will not cause a nuisance by virtue of noise or fumes to the surrounding area.
 - i. Air Intake: Locate air intake remotely from any source of automobile exhaust or any exhaust from motors, or buildings.
 - j. After Cooler: Provide an after cooler at entry to filter system which is capable of reducing temperatures to outside ambient air temperatures.

- k. Self-Contained Breath Apparatus (SCBA): Configure system to permit the recharging of 1/2 hour 2260 PSI SCBA cylinders.
 - l. Air Quality For Supplied Air Respiratory Systems: Provide air used for breathing in Type "C" supplied air respiratory systems that meets or exceeds standards set for C.G.A. type 1 (gaseous Air) Grade H or CSA Z1801.1 whichever presents the most stringent quality standard.
- C. Wetting Materials: For wetting prior to disturbance of ACMs use amended water. The material must be odorless, non-flammable, non-toxic, non-irritating, and non-carcinogenic. It shall be applied as a mist using a low pressure sprayer recommended by the manufacturer. Use a mixture of surfactant and water which results in wetting of the asbestos containing material and retardation of fiber release during disturbance of the material equal to or greater than that provided by the use of one ounce of a surfactant consisting of 50% polyoxyethylene ester and 50% polyoxyethylene ether mixed with five gallons of water.
- D. Lock-Down Encapsulant: Provide penetrating or lock-down type encapsulants specifically designed for the use intended (as permitted). The material shall not contain organic solvents and be non-flammable, non-toxic, non-irritating, and non-carcinogenic.
- E. Polyethylene Sheeting: Provide flame resistant polyethylene film that conforms to requirements set forth by the National Fire Protection Association Standard 701, Small Scale Fire Test for Flame-resistant Textiles and Films. Provide largest size possible to minimize seams, 6.0 mils thick, frosted or black as required by CONSULTANT.
- F. Duct Tape: Provide duct tape in 2" or 3" widths as indicated, with an adhesive which is formulated to aggressively stick to sheet polyethylene.
- G. Spray Cement: Provide spray adhesive in aerosol cans which is specifically formulated to stick tenaciously to sheet polyethylene.
- H. Waste Containers: For asbestos waste, provide 6 mil thick leak-tight polyethylene bags labeled with required USEPA, USDOT, OSHA labels. If the waste material contains sharp edges or may otherwise puncture polyethylene bags, provide drums or other closed containers for storage, transportation, and disposal.
- I. Fans and Leaf Blowers: Provide two leaf blowers and one 20" diameter fan per 10,000 cubic feet of work area volume to be used for aggressive sampling techniques for clearance air testing.
- J. Filters: Provide cascaded filter units on drain lines from showers or any other water source carrying asbestos contaminated water from the work area. Provide units with disposable filter elements as indicated below. Connect so that discharged water passes primary filter and output of primary filter passes through secondary filter.
- 1. Primary Filter - Pass particles 20 microns and smaller
 - 2. Secondary Filter - Pass particles 5 microns and smaller.
- K. Sump Pump: Provide totally submersible waterproof sump pump with integral float switch. Provide unit sized to pump 2 times the flow capacity of all showers or hoses supplying water to the sump, through the filters specified herein when they are loaded to the extent that replacement is required. Provide unit capable of pumping debris, sand, plaster or other materials washed off during decontamination procedures without damage to mechanism of pump. Adjust float switch so that a minimum of 3" remains between top of liquid and top of sump pan.

- L. Warning Signs and Labels shall comply with Title 29 CFR, Parts 1926.1101 and 1926.62, and all other federal, state, or local codes and regulations.
- M. Ladders or Scaffolds shall be OSHA-approved, and be of sufficient dimensions and quantities so that all work surfaces can be easily and safely accessed by the CONSULTANT, workers, and other inspectors. Scaffold joints and ends shall be sealed with tape to prevent incursion of asbestos fibers.
- N. Hand Power Tools shall be equipped with HEPA-filtered local exhaust ventilation if used to drill, cut into, or otherwise disturb ACM.
- O. Pressure-Differential Recorder: provide air pressure sensing devices equipped with recorders for continuous monitoring of work area pressure differential. Provide sufficient quantities of chart paper and maintain devices until completion of work.
- P. Two Way Radios: provide Supervisor and all work area Foremen with compatible two-way radios. Provide three compatible two-way radios for the exclusive use of the CONSULTANT.
- Q. Lumber and Plywood: all lumber and plywood used for temporary barriers and Decontamination Facilities shall be new and of fire retardant grade to comply with the requirement for a flame spread of 25 or less with no evidence of significant progressive combustion when tested for thirty minutes duration under the Standard Test Method for surface burning characteristics of building materials (ASTM E-84, NFPA 255, UL 723 and AWPA C-20 and C-27). Lumber shall have minimum dimensions of 2" x 4" or as specified. Tongue and groove plywood shall be minimum 3/4 inch thickness, other plywood shall be minimum 1/2 inch thickness.
- R. Vacuum Cleaning Equipment shall be industrial type designed for such use, equipped with High Efficiency Particulate Air (HEPA) filters. Separate dedicated vacuum cleaners shall be used for asbestos work and shall be clearly labeled as to their intended use. No other method will be permitted. Vacuuming equipment shall be Model GA72 or GA73 as manufactured by NILFISK of America, Inc.; Model CMP-1500-P as manufactured by Car-Mon Products, Inc.; equipment manufactured by J. D. Brophy, Inc. or approved equal. The equipment shall be properly operated at all times and shall contain no air leaks. The CONSULTANT will inspect all vacuuming equipment prior to its use, and may request verification of the efficiency of the filtration. Each vacuum cleaner shall be emptied and thoroughly cleaned (inside the work area) at the conclusion of the project, or each use.

PART 3 – EXECUTION

3.1 PRE-ASBESTOS ABATEMENT PREPARATIONS

- A. The DESIGN-BUILDER shall prepare each work area as part of mobilization and as described in this section. Preparation work shall be performed according to the following general sequence of steps and procedures to ensure that proper containment and protection systems are installed prior to any work that could disturb ACMs and generate airborne asbestos fibers:
 1. Erect decontamination facilities and install HEPA exhaust units.
 2. Erect any required barriers, coverings, or access platforms/scaffolding; post access restriction signs; seal all openings into the work area; install any temporary access openings; and install polyethylene sheeting on all containment floors and walls.
 3. Provide temporary power and lighting as required for work areas.

4. Obtain CONSULTANT's written approval of all preparation work before starting pre-cleaning or removal of asbestos materials.
5. Clean and remove any non-fixed items to storage areas designated by the CONSULTANT. Items that cannot be cleaned to the satisfaction of the CONSULTANT shall be disposed of as asbestos waste.
6. Carefully clean all surfaces in the work area which may be contaminated with any dust or debris by using a vacuum equipped with a HEPA-filter.
7. Misting of the area shall be conducted throughout all stages of pre-cleaning and general removal to minimize the generation of airborne fibers.

3.2 ISOLATION OF WORK AREAS

- A. The DESIGN-BUILDER shall isolate each work area for the duration of work by completely closing and sealing all openings and doorways into the work area. Critical isolation/sealing shall be accomplished by using two (2) layers of 6-mil thickness plastic sheeting taped securely in place, or by caulking, including temporary construction as noted in Paragraph C below. The work area shall be protected and sealed airtight to the extent possible, and be subject to the inspection of the CONSULTANT.
- B. Emergency and fire exits shall be maintained, or alternative exits shall be established in accordance with applicable codes and regulations. Exits shall be checked daily against blockages or impediments to exiting. Entrances which shall not be used by workers shall be locked against unauthorized entry. Arrange exit door so that it is secure from outside the work area but permits exiting from the work area. Mark outline of door on Primary and Critical Barriers with luminescent paint at least 1" wide. Hang a razor knife on a string beside outline. Arrange Critical and Primary barriers so that they can be easily cut with one pass of razor knife. Paint words "EMERGENCY EXIT" inside outline with luminescent paint in letters at least one foot high and 2" thick. Provide lighted EXIT sign at each exit. Provide battery-operated emergency lighting that switches on automatically in the event of a power failure. Paint arrows on walls and floor with luminescent paint to direct workers to nearest emergency exit.
- C. Isolation Partitions and Barriers Open doorways etc. shall be sealed airtight with temporary structural partitions as follows:
 1. Erect wood or metal studs, 16" off center, and then cover the opening with 1/2" plywood sheeting (or equivalent) on work area side only.
 2. Cover the work side of this partition with a double layer of plastic sheeting with joints staggered and sealed with tape partition at floor, walls, ceiling, and all joints shall be caulked airtight.
- D. Construct rigid enclosures and install Decontamination Facilities as required.
- E. Provide temporary power and lighting to work areas, and ensure safe installation of temporary power sources and equipment per applicable electrical code requirements and OSHA requirements for temporary lighting in the environmental normal to asbestos abatement work areas.
- F. Seal all seams, joints, covers or casings with tape, and enclose fixed objects or equipment with a minimum of two layers of 6-mil plastic sheeting secured and sealed airtight with duct tape.
- G. Cover walls with two (2) layers of 6-mil thickness polyethylene sheeting. Use strapping to secure 6-mil thickness polyethylene sheeting to walls where needed. Joints in plastic sheets shall be taped and glued in a manner to prohibit air movement, and to prevent passage of water or other liquids. Any floor drains or other openings shall be sealed individually with two (2) layers of 6-mil sheeting and tape. Pits,

sumps, and other openings shall be covered with plywood sheathing secured so as to prevent a tripping hazard and then covered with two (2) layers of 6-mil thickness polyethylene sheeting.

- H. Install work area HEPA-filtered exhaust systems as previously specified.
- I. Warning Signs: The DESIGN-BUILDER shall post warning signs in English meeting the requirements of OSHA Title 29 CFR, Part 1926.1101 at the outside doorway to the decontamination facility which shall be the only non-emergency entrance into the work area. The CONSULTANT may also request that the DESIGN-BUILDER post additional warning signs around the work area or at other potential entrances or exposure points. Warning signs shall be readily visible to any person attempting to enter the work area.
- J. Access Restrictions: The DESIGN-BUILDER shall restrict access to work areas to persons who have previously been identified to the CONSULTANT; or persons who have legal jurisdiction over the work. The DESIGN-BUILDER's Supervisor shall at all times monitor the entrance to the decontamination facility to prevent unauthorized people from entering, and to maintain a written log of all people entering the work area.

3.3 APPROVAL OF PREPARATION WORK

- A. After each asbestos removal work area has been prepared as specified above, the DESIGN-BUILDER shall request a formal site inspection by the CONSULTANT. No pre-cleaning, removal, demolition, or other disturbance of ACMs, dust, or debris shall occur until the CONSULTANT has inspected and accepted the site preparation work.

3.4 ASBESTOS REMOVAL UNDER GENERAL CONTAINMENT PROCEDURES

- A. This section covers the removal of ACMs where conducted inside of a removal area which has been isolated and protected with polyethylene coverings, and has a HEPA-exhaust system and 3-room decontamination facility.
- B. Amended water (wetting agent), mixed and carefully applied using an airless sprayer as specified by the manufacturer, shall continuously be used to control the release of asbestos fibers from the friable material prior to and during removal. The amended water shall be applied in sufficient quantity to fully penetrate and saturate the friable material before it is removed. Where necessary, wetting shall commence up to 24 hours before removal work to ensure effectiveness.
- C. Removal:
 - 1. No asbestos removal work shall begin until the work area has been prepared to the satisfaction of the CONSULTANT as summarized in preceding Sections. Removal workers shall wear respirators and protective clothing as previously described throughout all removal, cleanup, and waste handling operations.
 - 2. Small test patches of asbestos material shall be wetted, and then removed and examined to determine degree of saturation prior to removing the bulk of the material. The DESIGN-BUILDER may use removal encapsulants instead of amended water; applied per manufacturer's and federal guidelines. Use of high rpm power equipment pressure washers or hydro-blasters for removal of asbestos materials is not acceptable. Hoses used for wash-down shall be limited to a certain size and pounds per square inch (psi) as specified herein.
 - 3. After large areas of the asbestos material have been fully wetted and tested, the asbestos shall be carefully removed in small sections by hand using scrapers or other suitable tools.

4. As the material is removed, it shall be promptly wetted and packed into impermeable, labeled 6-mil thickness polyethylene disposal bags and/or appropriate disposable drums. When each bag is full, the packaged material shall be sprayed with amended water, sealed, and transported to a temporary storage area inside of the work area. Accumulations of standing or free water shall not be allowed to collect on the work area floor.
 5. If the asbestos material is located on surfaces higher than 15 feet above the floor, the DESIGN-BUILDER shall provide fully-enclosed, dust-free chutes (with maximum incline of 60 degrees from horizontal), or scaffolding for waste containers to prevent dropping material down to the floor during removal.
 6. The DESIGN-BUILDER shall repeatedly mist the work area and spray the friable material to prevent it from drying out. Metal shovels shall not be used to pick up or move waste on a floor.
 7. Once the majority of the asbestos is removed, the DESIGN-BUILDER shall scrub the substrate surface and then thoroughly wash all surfaces to remove all remaining material.
 8. The DESIGN-BUILDER shall not be permitted to seal substrate surfaces from which asbestos material was removed with lockdown encapsulants.
 9. The DESIGN-BUILDER shall minimize contamination of the work floor, the exterior of disposal containers, and all other surfaces within the work area. At the end of each shift, all surfaces shall be cleaned of all materials and then HEPA-vacuumed or wet mopped and all debris packaged in 6-mil polyethylene bags.
 10. The decontamination facility shall be wet cleaned twice per shift using wet cleaning methods upon completion of any waste removal.
 11. Excessive water accumulation or flooding in the work area shall require work to stop until the water is collected and disposed of properly.
- E. After all indicated asbestos materials have been removed, perform exploratory demolition of components and equipment as directed by the CONSULTANT to confirm that all accessible asbestos materials have been identified and removed.

3.5 ASBESTOS REMOVAL USING GLOVEBAG ENCLOSURE

- A. This Section pertains to the removal of asbestos pipe and pipe fitting insulation using the glovebag technique in areas where appropriate.
- B. The DESIGN-BUILDER shall provide and utilize the following materials and equipment for this work: amended water, duct tape, plastic sheeting and waste bags, minimum of half mask passive respiratory protection, disposable coveralls, warning signs, HEPA-filtered vacuum cleaner, utility knife (retractable blade), tin snips as required for aluminum jacket, wire cutters (as required for wire reinforcing), industrial stapler (Bostitch or equivalent), nylon brush, and airless sprayer (equipped with + 3 LF of maximum 3/16" I.D. flexible tubing at end of wand for insertion into glove bag), chisels, etc.
- C. Precautions:
 1. Install critical isolation barriers and decontamination facility as specified herein. Establish negative air pressure within work area as specified herein. Provide one layer of 6-mil thickness fire retardant polyethylene sheeting on floor and fixed items (polyethylene sheeting on walls is not required).
 2. Provide supplementary lighting as required.

3. DESIGN-BUILDER shall provide a crew of two (2) or more well trained persons for each glove bag removal project. One member of the crew shall be dedicated to ensuring that the glove bag is secured to the component.

D. Preparation:

1. Pipe, Small Duct, and other Covered Components: Place necessary tools in bag. Wrap bag on pipe, seal with staples and tape leaving enough sealed space above pipe to allow easy access. Secure bag to pipe to support weight of stripped insulation and water (additional support for the bag may be provided by a chair or ladder, or by suspension).
2. Insert HEPA-vacuum nozzle and flexible tubing of wetting agent sprayer into hole location provided; seal airtight with duct tape.
3. Smoke Test: CONSULTANT shall inject smoke via a small hole and slowly squeeze bag. Repair leaks and holes as required.

E. Removal Procedure:

1. During removal, periodically wet the inside surfaces of bag and any waste for better visibility and fiber control. Use cold water to prevent fogging.
2. During removal, periodically use HEPA-vacuum to compensate for any leaks and to reduce airborne fiber levels.
3. Cut the insulation sharply for neat sealing of exposed insulation. Leave 4" minimum margin at the bag seal point for safety.
4. After removal and brushing, wash down all surfaces to below the levels where the bag will be sealed, and saturate the waste. Look for residue in folds, on the back side of pipe, etc.
5. Gather tools in a glove hand and pull the glove inside out. Seal the arm with + 6" tape and cut through the middle of the tape. Bend and re-tape the ends. Save the "bagged" tools for the next bag operation or clean by placing in pail of water.
6. Collapse the bag with the HEPA-vacuum. With vacuum still applied, seal the bag just above the glove level. Remove the nozzle and tubing. Place a 6-mil thickness waste bag over the glove bag and then carefully remove the glove bag from the component and immediately seal it in the waste bag. Check the component for loose waste and vacuum as required.
7. If no additional removal is planned, the glove-enclosed tools shall be immersed in a pail of water, opened and cleaned. (Rags and/or sponges can be used to clean other tools, but cannot be salvaged.) The water and other debris shall be disposed of as asbestos waste.

3.6 REMOVAL AND DISPOSAL OF ASBESTOS ROOFING AND FLASHING MATERIALS

- A. This paragraph specifies the removal, handling, and disposal of asbestos-containing asphaltic and felt built-up roofing, flashing, tar, and other roofing products. The term roofing materials, as used in this Section, refers to all ACM roofing, flashing, tar etc. products found at the site.
- B. Removal of roofing materials will be in a manner that minimizes overall destruction of the roofing components and ensures that no visible emission of asbestos or other dusts occurs. Roofing materials cannot be drilled, sawed, or mechanically abraded in any fashion.
- C. Once removed from the substrate, roofing materials will be immediately prepared for transportation to the approved landfill. The DESIGN-BUILDER shall remove no more roofing material than can be

transported from the site by the end of daily operations. Stockpiling or roofing materials on site is not permitted.

- D. Roofing materials will be handled in accordance with the following:
 - 1. Roofing materials will be maintained in a wet condition during all handling/removal procedures.
 - 2. Large roofing material components will be placed into approved dumpsters or transport vehicles immediately upon removal from the building.
 - 3. All roofing material debris or rubble (items small enough to be placed into standard asbestos disposal bags) will be bagged and labeled for disposal as asbestos waste.
- E. Transportation and disposal of roofing materials will be as specified in this Section, 310 CMR 18.00-19.00, other applicable regulations, and the following:
 - 1. DESIGN-BUILDER shall provide the following types of waste dumpsters:
 - a. Fully enclosed units for all roofing material that is bagged or wrapped and labeled for disposal as asbestos waste.
 - b. Fully enclosed or covered open-top units for large, unwrapped sections of roofing material.
 - 2. All roofing material that is bagged or wrapped and labeled as asbestos waste will be disposed of at a landfill approved for disposal of asbestos waste. Large, unwrapped sections of roofing material may be transported to an approved landfill and disposed of as general demolition debris, provided the landfill will accept such waste. All open-top dumpsters into which roofing material has been placed will be removed from the work site by the end of the daily operations and transported to the approved landfill site.
- F. DESIGN-BUILDER shall clean-up any remaining debris/residue to the point of no visible debris, as required by CONSULTANT.

3.7 REMOVAL OF PIPE AND PIPE FITTING INSULATION

- A. Removal of asbestos-containing pipe and pipe fitting insulations shall be in accordance with all applicable regulations, including MassDEP's Asbestos Cement Pipe Guidance Document (June 2011). Prior to removal, the DESIGN-BUILDER, in consultation with the CONSULTANT, should determine whether the pipe is damaged, cracked or broken, and then follow the applicable Not Damaged or Damaged procedures as specified in the above guidance document. At a minimum, the following work practices shall apply:
 - 1. Workers shall wear protective clothing and half-mask, dual-cartridge, HEPA-filtered respirator, at a minimum.
 - 2. The work area shall be isolated as required by regulations and to the satisfaction of the CONSULTANT.
 - 3. Place 6 mil (0.006 inch) thick polyethylene sheeting below area where pipe and pipe fitting insulation is being removed.
 - 4. Using wet methods, remove the pipe and pipe fitting insulation in a manner which precludes the pipe and pipe fitting insulation from becoming friable.
 - 5. Properly decontaminate all non-ACM materials in contact with the asbestos-containing pipe and pipe fitting insulation, and dispose of as construction debris. All non-ACM materials in contact with the asbestos-containing pipe and pipe fitting insulation, not properly decontaminated, shall

be wrapped in two layers of 6-mil thickness polyethylene sheeting and disposed as asbestos contaminated waste.

6. Properly wet and double bag all pipe and pipe fitting insulation and associated debris, and all non-ACM materials contaminated with asbestos for disposal as asbestos containing waste material (ACWM).
7. Using a HEPA vacuum clean all residual asbestos-containing pipe and pipe fitting insulation remaining in the work area.

3.8 REMOVAL OF ELECTRICAL COMPONENTS

- A. Removal of asbestos-containing electrical and signal system components shall be in accordance with all applicable regulations. At a minimum, the following work practices shall apply:
 1. Workers shall wear protective clothing and half-mask, dual-cartridge, HEPA-filtered respirator, at a minimum.
 2. The work area shall be isolated as required by regulations and to the satisfaction of the CONSULTANT.
 3. Place polyethylene sheeting below area where electrical fuses are being removed.
 4. Remove the electrical components in a manner which precludes the asbestos material from becoming friable.
 5. Properly decontaminate all non-ACM materials in contact with the asbestos-containing electrical components, and dispose of as construction debris. All non-ACM materials in contact with the asbestos-containing electrical fuses, not properly decontaminated, shall be wrapped in two layers of six-mil thickness polyethylene sheeting and disposed as asbestos contaminated waste.
 6. Properly wet and double bag all electrical components and associated debris, and all non-ACM materials contaminated with asbestos for disposal as ACM debris.
 7. Using a HEPA vacuum clean all residual asbestos-containing material remaining in the work area.

3.9 SELECTIVE DEMOLITION AND REMOVAL OF ADDITIONAL SUSPECT ACM

- A. Selective exploration to check for additional ACM suspected to exist at the Site shall be performed by DESIGN-BUILDER to the extent required by CONSULTANT. DESIGN-BUILDER shall construct a total isolation work area at each point of selective exploration if the work cannot be performed in a manner which would not disturb the suspected materials.
- B. Removal of asbestos (if confirmed by the CONSULTANT's bulk sampling) identified during selective exploration will be performed according to this Specification, applicable regulations, and appropriate work plans acceptable to the AUTHORITY.

3.10 ASBESTOS WASTE DISPOSAL PROCEDURES

- A. The DESIGN-BUILDER shall package, label, and remove all asbestos waste (including asbestos waste contaminated by other hazardous materials) from the work area as specified below. Packaging shall be accomplished in a manner that minimizes waste volume, but insures waste containers shall not tear or break. Transportation and disposal of the containerized waste at a permitted landfill shall be the responsibility of the DESIGN-BUILDER.

- B. Definition: Wastes are defined as all asbestos-containing or potentially contaminated materials or other items which have not been completely cleaned or sealed to the satisfaction of the CONSULTANT while on the work area, and must be removed from the Site. Asbestos wastes may include building materials, insulation, disposable clothing and protective equipment, plastic sheeting and tape, exhaust systems or vacuum filters, DESIGN-BUILDER equipment, or other materials designated by state or local authorities or the CONSULTANT which have been potentially contaminated with asbestos and have not been fully cleaned.
- C. Waste Labeling:
1. Warning labels, having waterproof print and permanent adhesive in compliance with OSHA, USEPA and USDOT requirements, shall be affixed to or printed on the sides of all waste bags or transfer containers. Warning labels shall be conspicuous and legible.
 2. In compliance with NESHAPS, Title 40 CFR, Part 61.150, all waste containers or bags shall be labeled with the following generator information:
 - Name of waste generator.
 - Location of where waste was generated.
- D. Wetting of Waste: A fine water spray shall be used to keep the top layers of waste in containers thoroughly wet at all times. When a waste bag is full, air within the bags shall be evacuated with a HEPA-equipped vacuum and be securely sealed with tape or other secure fastener.
- E. Waste Container Decontamination and Removal Procedures: The following procedures shall be followed whenever containers or equipment are removed from the work area.
1. The clean room shall be considered a holding area only during the period of active waste transfer for the purpose of the loading of carts or drums. Storage of waste and carts (or drums) in the clean room is prohibited.
 2. Waste removal shall not occur during worker shift changes or when workers are showering or changing. Care shall be taken to prevent short circuiting and cycling of air outward through the shower and clean room when used for waste removal.
 3. Workers are to be stationed in each room/area of the decontamination facility to transfer the containers and equipment to or from adjacent sections. These workers shall not cross the airlocks into the adjacent areas/rooms until the waste or equipment transfer is finished for that period and the workers have gone through decontamination as required by these Specifications. The workers in the clean room or holding area shall enter from uncontaminated areas with appropriate personal protective equipment; or prior to the start of waste transfer, these workers shall exit the work area, fully decontaminated, and subsequently don clean personal protective equipment.
 4. External surfaces of contaminated containers and equipment shall be cleaned by wet cleaning and/or HEPA vacuuming in the work area before moving such items into the decontamination facility airlock. Workers shall not enter the airlock during this procedure.
 5. The containers of waste and the equipment shall be removed from the airlock by workers stationed in the washroom during waste removal operations.
 6. Once in the washroom, external surfaces of contaminated containers and equipment shall be cleaned a second time by wet cleaning.
 7. The cleaned containers of waste and equipment shall be placed in uncontaminated leak-tight plastic bags (or 6-mil thickness polyethylene sheeting if physical characteristics necessitate and permit). Air volumes shall be minimized, and the bags or sheeting shall be sealed.

8. The clean re-containerized items shall be moved into the airlock for subsequent transfer to the holding area. The washroom workers shall not enter this airlock or the work area until waste removal is finished for the period.
 9. Re-containerized items and cleaned equipment shall be removed from the airlock to the holding area by workers who have entered from uncontaminated areas with appropriate personal protective equipment.
 10. The re-containerized items of waste and cleaned, bagged equipment shall be placed in closed top, watertight plastic carts or drums. These carts or drums shall be held in the holding area pending removal. The carts or drums shall be HEPA-vacuumed or wet-cleaned following the removal of the containers of waste from them.
 11. The exit from the decontamination facility shall be monitored and secured at all times to prevent unauthorized entry.
 12. The carts or drums may be temporarily stored in a holding area at the work site outside the workplace until a transport vehicle arrives, but such storage areas must be acceptable to the CONSULTANT.
- F. If a separate equipment and waste decontamination unit is provided, take all equipment and waste material from the work area through the decontamination facility according to the following procedures:
1. Thoroughly wet clean contaminated equipment or waste container in work area and pass into Wash Room.
 2. Once inside the wash room, wet clean equipment or waste containers. Place poly bags in a second clean poly bag. Wrap large items in a second layer of 6-mil thickness poly.
 3. When cleaning is complete, pass items into holding area. Worker stationed in Wash Room shall not enter the holding area. This worker shall exit via the work area through the personnel/decontamination facility.
 4. Require worker stationed in holding area to wear full protective clothing and appropriate respiratory protection. These workers shall not enter the waste wash area.
- G. Guidelines for the Use and Decontamination of Fiber Drums: (These procedures apply to the use of fiber drums only.)
1. Prior to fiber drums entering the work area, the drums should be prepared in the following manner:
 - a. Place the drum in a two (2) mil thickness minimum plastic bag
 - b. Fold the top of the bag over the top of, and into the drum.
 - c. Seal the bag to the inside of the drum using tape and/or spray on adhesive.

NOTE: The bag must be sealed entirely to the inside of the drum prior to the drum being brought into the work area.
 2. In the work area, any material which is likely to puncture or tear a 6 mil thickness polyethylene bag (i.e., fire brick, demolition debris) shall be double bagged in 6 mil thickness polyethylene bags, sealed and placed inside the drum.
 3. Prior to removing the filled drum from the work area, the metal lid shall be applied to the top of the drum and fastened either with a locking-ring or with duct tape.
 4. The drum shall be cleaned and wet-wiped in the work area, then passed through the air lock into the waste wash room of the waste disposal decontamination enclosure system.

5. Cut the bag at the top of the drum directly underneath the lid. Remove the drum from the bag and dispose of the bag as ACM.
 6. Wet-wipe the metal lid of the drum and pass it through the air lock into the holding area of the waste decontamination enclosure system.
 7. At this time, the appropriate warning labels shall be applied to the drum and the drum may be removed for disposal.
- H. Use of Gaylord boxes for waste disposal shall only be permitted for asbestos waste where specifically identified in the DESIGN-BUILDER's Work Plan and approved by the MassDEP and CONSULTANT. The Work Plan shall describe in detail the proposed Gaylord boxes and waste loading procedures. Gaylord boxes shall be double lined with 6 mil polyethylene sheeting and be properly sealed, labeled, etc. The CONSULTANT may choose to disallow the use of Gaylord boxes at any time that do not meet the detail provided in the Work Plan, or if the work is found to deviate in any way from the Work Plan, or if damaged boxes are observed being used at the Site, or if the boxes are found to be leaking. If the use of Gaylord boxes is disallowed by CONSULTANT, all waste in such boxes shall immediately be properly repackaged into acceptable containers in the work area at DESIGN-BUILDER's own expense.
- I. Waste Container Storage: The container used for the storage of bagged contaminated waste shall be an enclosed dumpster. Dumpster shall have a solid metal roof, solid metal door with padlock. Line the cargo area with two layers of a 6 mil thickness polyethylene sheeting to prevent contamination from damaged or leaking containers. Floor sheeting shall be installed first and shall extend up the sidewalls 24 inches minimum. Wall sheeting shall be overlapped and taped securely into place. No un-bagged contaminated waste or non-asbestos waste shall be stored in these dumpsters. Ensure that bags placed in dumpsters are undamaged. Warning signs shall be posted on the dumpster in accordance with Sections Title 29 CFR, Part 1926.1101 of the OSHA regulations.
- J. Waste Removal Scheduling: All waste containers shall be decontaminated and removed from the site before final cleanup is started and isolation barriers are taken down. The DESIGN-BUILDER must pre-schedule and obtain the agreement of the CONSULTANT for all time periods DESIGN-BUILDER desires to remove waste bags from the facility. The CONSULTANT must observe removal of all waste containers to verify their condition and estimate the total volume of waste material (to the nearest cubic yard). DESIGN-BUILDER shall then insert the quantity on the Disposal Certificate and a hazardous waste manifest (if required), and arrange for the original of these forms to accompany the waste as it is transported to the landfill.
- K. Waste Transportation and Disposal Regulations: It is the responsibility of the DESIGN-BUILDER to determine and insure that he is complying with: 1) the current waste handling regulations applicable to each work site; and 2) the current regulations for transporting and disposing waste at each ultimate disposal landfill. The DESIGN-BUILDER must comply fully with these regulations; and with all USDOT, state, local, and USEPA requirements. Where required, the DESIGN-BUILDER's waste hauler and disposal DESIGN-BUILDER shall maintain a valid hazardous waste transporter's permit and identification number; and obtain, complete, and fully comply with any other local hazardous waste manifesting requirements. A copy of all shall be sent to the AUTHORITY after disposal is completed and all required data and signatures have been obtained. The DESIGN-BUILDER shall return the original WSR within 10 working days of waste shipment from the site and within the timeframes required by applicable regulations.

3.11 CLEANING AND FINAL DECONTAMINATION

- A. This section applies to cleaning all work areas where asbestos removal work has been performed. After all asbestos-containing (or contaminated) materials have been removed, the DESIGN-BUILDER shall

remove all wastes and perform a thorough final cleaning and decontamination of each work area per the methods indicated below. Final cleaning shall be performed only after all waste is packaged and removed, but prior to dismantling any barrier, decontamination facility, or protective coverings.

- B. Cleaning shall be subject to the CONSULTANT's acceptance based on a visual inspection (including surface dust wipe tests if appropriate) and air sampling performed using NIOSH Method 7400. HEPA-exhaust systems shall operate continuously throughout the cleaning and air testing processes until the CONSULTANT agrees to their shutdown and removal from the site. The DESIGN-BUILDER shall notify the CONSULTANT in writing at least 12 hours in advance of the expected completion time of site cleaning to allow the CONSULTANT to schedule air clearance sampling.
- C. Methods and Approvals: Cleaning methods and approvals shall consist of the following tasks performed in the listed order:
1. Remove all visible accumulations of asbestos debris on the protective coverings on floors, walls, and other surfaces, and then HEPA vacuum all surfaces to pick up excess water and gross saturated debris. A wet-dry shop vacuum, dedicated to asbestos abatement, may be used before HEPA vacuuming.
 2. After HEPA-vacuuming, the work area air shall be lightly misted, and then all protective coverings on ceilings, walls, floors, and other items in the work area shall be wiped thoroughly clean (first cleaning).
 3. After the DESIGN-BUILDER has completed the above steps (1) and (2), DESIGN-BUILDER shall request the CONSULTANT to inspect the site. To facilitate scheduling of this inspection, the DESIGN-BUILDER shall notify the CONSULTANT of the anticipated completion time of the above initial cleaning work 12 hours in advance.
 4. If the CONSULTANT observes any asbestos waste, debris or fibers within the work area during the inspection, the DESIGN-BUILDER shall perform additional cleanup and decontamination.
 5. If the CONSULTANT accepts the first cleaning, the waste bags shall then be removed from the work area using the procedures described herein. The bottom layer of protective poly coverings, the Decontamination Facilities, the HEPA exhaust systems and all barrier walls shall remain in place and in use. The DESIGN-BUILDER shall not apply any encapsulants to any surfaces except where noted herein.
 6. Carefully remove the upper layer of all protective poly coverings on walls and other surfaces and package them in 6-mil thickness waste bags. After these upper protective coverings are removed, the work area shall be completely vacated for at least twelve (12) hours to allow fiber settling while the CONSULTANT collects and analyzes an initial set of air samples according to NIOSH Method 7400 (PCM).
 7. The DESIGN-BUILDER shall then perform a second cleaning of all surfaces in the work area by HEPA-vacuuming and wet washing. Upon the acceptance of the CONSULTANT, all remaining protective poly coverings shall be carefully removed and disposed of as described herein. However, the barrier walls, decontamination facilities, HEPA-exhaust systems, and primary isolation seals shall remain in place and in use. The DESIGN-BUILDER shall then perform a third cleaning of all surfaces in the Work Area.
 8. After successful completion of the final air clearance testing, the DESIGN-BUILDER shall carefully remove the decontamination facilities and any temporary barrier walls or tunnels. The HEPA-exhaust systems shall be removed only after all other items are removed. A HEPA-vacuum shall be kept on-site during this final disassembly work to cleanup any dust or debris.

9. If any of the PCM air sample results are above 0.010 fibers per cubic centimeter of air (f/cc), the DESIGN-BUILDER shall be required to perform additional cleaning and decontamination; and the above inspection and air sampling shall be repeated by the CONSULTANT.
10. Workers shall wear approved respiratory and personal protective equipment throughout all cleaning and waste disposal activities.

3.12 MONITORING, TESTING AND INSPECTION

- A. The performance and execution of the Work will be closely and continuously monitored by the CONSULTANT. Monitoring required to demonstrate compliance with OSHA regulations is the responsibility of the DESIGN-BUILDER. The monitoring work shall be performed both inside the work area and the surroundings to ensure full compliance with these Specifications. The DESIGN-BUILDER shall provide full cooperation and support to the CONSULTANT throughout the work. Monitoring and inspections shall include air samples in the workspace, air samples in the areas surrounding the work area and the outside, checking of the DESIGN-BUILDER's standard operating procedures, engineering controls, respiratory protection equipment, packing, packaging, transporting and disposal of asbestos, decontamination facilities and procedures, and any other aspects of the abatement process that may impact the health and safety of the people and the pollution of the environment.
- B. The AUTHORITY shall bear all cost in connection with the air sampling performed by the CONSULTANT for the initial analyses. However, all costs of all subsequent laboratory analyses and CONSULTANT's labor taken because a final visual inspection was not satisfactory or the limits specified (i.e., 0.010 f/cc) were exceeded on the initial air clearance or other type of sampling and analysis, shall be borne by the DESIGN-BUILDER.

3.13 AIR MONITORING BY CONSULTANT

- A. This paragraph describes air monitoring carried out by the CONSULTANT to verify that the outside environment remains uncontaminated (from asbestos dust and airborne levels of 0.010 f/cc). This Section also sets the action required by the DESIGN-BUILDER if an OSHA PEL is met or exceeded. The CONSULTANT will be conducting air monitoring during the course of the Project. In no way shall this monitoring replace that required of the DESIGN-BUILDER.
- B. All perimeter air sampling and analysis will be performed by the CONSULTANT. A complete record of all air monitoring sampling and analytical results will be furnished to the AUTHORITY.
- C. Personnel air monitoring required by OSHA is work of the DESIGN-BUILDER and is not covered in this paragraph.
- D. Work Area Isolation: The purpose of the CONSULTANT's air monitoring will be to detect faults in the work area isolation such as:
 - Contamination of the environment outside of the work area with airborne asbestos fibers;
 - Failure of filtration or rupture in the negative pressure system

Should any of the above occur, the DESIGN-BUILDER shall immediately cease asbestos abatement activities until the fault is addressed. Work shall not recommence until authorized by the CONSULTANT.

- E. Work Area Airborne Fiber Count: The CONSULTANT will monitor airborne fiber counts inside the work area. The purpose of this air monitoring will be to detect airborne fiber counts which may

significantly challenge the ability of the work area isolation procedures to protect the nearby areas from contamination by airborne fibers.

- F. **Work Area Clearance:** To determine if the elevated airborne fiber counts encountered during abatement operations have been reduced to an acceptable level, the CONSULTANT will sample and analyze air per this Section and 453 CMR 6.00, using either PCM or Transmission Electron Microscopy (TEM) analysis, as determined by the CONSULTANT.

- G. **Airborne Fiber Counts:**
 - 1. **Inside Work Area:** Maintain an average airborne count in the work area of less than 0.5 fibers/cc. If the fiber counts rise above this figure for any sample taken, revise work procedures to lower fiber counts. If the TWA fiber count for any work shift or 8-hour period exceeds 1.0 fibers/cc, stop all work, leave negative air system in operation and notify CONSULTANT. Do not recommence work until authorized in writing by CONSULTANT. If airborne fiber counts exceed 2.0 fibers/cc for any period of time, cease all work until fiber counts fall below 0.5 fibers/cc and notify CONSULTANT. Do not recommence work until authorized in writing by the CONSULTANT.
 - 2. **Outside Work Area:** If any air sample taken outside of the work area exceeds 0.010 f/cc immediately and automatically stop all work.
 - a. Decontaminate the affected area in accordance with these Specifications.
 - b. Respiratory protection shall be worn in affected area until area is cleared.
 - c. Leave Critical Barriers in place until completion of work and insure that the operation of the negative pressure system in the work area results in a flow of air from the balance of the work area into the affected area.
 - d. If the exit from the clean room of the personnel decontamination unit enters the affected area, establish a temporary decontamination facility consisting of a Shower Room and Changing Room as specified herein. After cleaning and decontamination of the affected area remove the Shower Room and leave the Changing Room in place as an air lock.
 - e. After certification of visual inspection in the work area remove critical barriers separating the work area from the affected area. Final air samples will be taken within the entire area.

- H. **Fibers Counted:** The following procedure will be used to resolve any disputes regarding fiber types when a project has been stopped due to excessive airborne fiber counts. "Airborne Fibers" referred to above include all fibers regardless of composition as counted in the NIOSH 7400 Procedure. If work has stopped due to high airborne fiber counts, air samples may be secured in the same area by the AUTHORITY for analysis by TEM. "Airborne Fibers" counted in samples analyzed by TEM shall be only asbestos fibers, but of any diameter and length, and will be analyzed and reported consistent with the applicable regulations and practices.

3.14 AIR MONITORING BY DESIGN-BUILDER

- A. The DESIGN-BUILDER shall perform air monitoring as required to meet OSHA Requirements for maintenance of TWA fiber counts for types of respiratory protection provided. CONSULTANT will not be performing air monitoring to meet these OSHA requirements.

- B. The sampling person and analysis laboratory performing this work shall be an independent party not financially or managerially connected to the DESIGN-BUILDER, acceptable to the CONSULTANT, and shall meet all requirements of 453 CMR 6.00 and this Specification.

- C. The laboratory shall be successfully participating in the AIHA/NIOSH Proficiency Analytical Testing (PAT) program and be certified by the Commonwealth of Massachusetts.
- D. Air sampling materials and equipment requirements are as follows:
 - 1. Sampling for analysis by phase contrast microscopy shall employ cellulose ester collection filters with 0.8 μm pore-size or less. Cassettes shall be loaded with filters under clean laboratory conditions. A 5 μm pore-size multi-cellulose ester backing filter shall be placed behind the collecting filter, followed by the cellulose support pad and the cassette base. A metal cowl or an electrically conductive cowl shall be used in conjunction with the sampling train.
 - 2. The filter assembly shall be upstream of all other components in the sampling train. An air flow measuring device (when used) shall be downstream of the filter and the pump assembly, or integral with the pump assembly.
 - 3. Sampling pumps shall supply constant flow.
 - 4. An air flow measuring/metering device shall be used, and shall be high quality rotometer, mass flow, dry gas meter or critical orifice. Measuring devices shall have a range of at least 1.5 times the desired flow rate and be readable to at least + 5% of the desired flow rate. They shall be calibrated against standards of higher accuracy before and after sampling. The calibrations shall be recorded.
- E. Numbers and frequencies of personal air sampling shall be as required by OSHA regulations but not less than one (1) sample per eight (8) hour work shift during times of asbestos removal work.
- F. Results of sample analysis shall be provided to the CONSULTANT within twenty-four (24) hours of collection.
- G. The DESIGN-BUILDER shall use a pre-approved "chain-of-custody" form for all personal air samples he collected.
- H. Personal sampling, including all costs, shall be the complete responsibility of the DESIGN-BUILDER.

3.15 FINAL VISUAL INSPECTION AND WORK AREA CLEARANCE

- A. Upon completion of removal work, but prior to commencing encapsulation or cleaning of the work area, the DESIGN-BUILDER shall request the CONSULTANT to conduct a final visual inspection for any visible debris.
- B. Following a successful final visual inspection, the final clearance testing shall take place using aggressive air sampling techniques as specified in 453 CMR 6.00. The DESIGN-BUILDER shall supply and operate additional circulating fans and leaf blowers as directed by the CONSULTANT during this final testing to ensure effective air circulation. The final test shall consist of taking PCM or TEM air samples in the work area, and analyzing the samples per 453 CMR 6.00.
- C. Surface wipes and/or bulk samples may also be collected and analyzed at the option of the CONSULTANT to confirm that all microscopically detectable asbestos has been removed. If the results of the final visual inspection or final air sampling are not satisfactory, thorough wet cleaning and/or HEPA vacuuming shall be repeated until the required decontamination levels are achieved. The DESIGN-BUILDER shall bear all costs for additional inspections, sampling, analytical costs and cleaning until the area passes final air clearance air sampling.

- D. After achieving the level of cleanliness and decontamination as specified herein and as confirmed by the final inspections and sampling, the DESIGN-BUILDER shall carefully remove the decontamination facilities and any temporary barriers and DF's. Use HEPA vacuums during final disassemble work to cleaning any dust or debris.
- E. The DESIGN-BUILDER shall, at no additional charge, install and provide AC power, outlets, and extension cords for the CONSULTANT to collect the area and final air clearance samples as required herein.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02081

HAZARDOUS MATERIALS ABATEMENT

PART 1-GENERAL

1.1 GENERAL

- A. This Section specifies all labor, materials, tools and equipment necessary for the transportation and disposal of oil and hazardous materials (OHM) included in this section.
- B. The DESIGN-BUILDER shall be responsible for the characterization, handling, stockpiling, transportation and disposal/reuse/recycling of OHM, including, but not limited to, debris and containerized materials specified under this contract.
- C. All provisions of this Section relating to the health and safety of workers and the general public, as well as protection of the environment are minimum standards. The DESIGN-BUILDER is responsible for determining whether any legal requirements or prudent conservative work practices require any additional and/or more stringent protective measures, and implementing such measures if deemed necessary. Nothing in this Section shall be deemed to relieve the DESIGN-BUILDER from any liability with respect to any such legal requirements or requirements of prudent conservative practice.
- D. All work-site preparations and practices will be conducted in accordance with all Federal, State and appropriate City and other local regulations, standards and codes pertaining to worker health protection, protection of the public health and the environment, and the removal, sampling, transportation, and disposal of oil and/or hazardous materials.
- E. All personnel involved in the removal of potentially hazardous materials shall demonstrate that they are certified to the HAZWOPER requirements in accordance with applicable OSHA requirements for hazardous material handling.
- F. The DESIGN-BUILDER is responsible, subject to review by the AUTHORITY and their Engineer, to completely characterize the OHM in accordance with disposal facility requirements and all applicable laws and regulations and to dispose of the materials in a safe and legal manner.
- G. The DESIGN-BUILDER shall retain an environmental consultant to assist the DESIGN-BUILDER in identifying, managing and disposing of all OHM materials encountered at the Site.
- H. The DESIGN-BUILDER shall retain a laboratory to assist the DESIGN-BUILDER in providing guidance in dealing with all OHM materials encountered at the Site. The DESIGN-BUILDER's selected laboratory shall be certified, as applicable, by the Commonwealth of Massachusetts to perform the analyses required to properly dispose of waste material encountered.
- I. The DESIGN-BUILDER is required to recycle/reuse recovered materials in lieu of disposal if the material is of acceptable physical and chemical quality.

1.2 RELATED WORK

- A. Other specification sections that relate to the work include but are not limited to the following:
 - 1. Section 01060 – PERMITS AND REGULATORY REQUIREMENTS
 - 2. Section 01560 – TEMPORARY CONTROLS
 - 3. Section 01800 – SUSTAINABILITY REQUIREMENTS

- 4. Section 02080 – ASBESTOS REMOVAL
- 5. Section 02090 – LEAD ABATEMENT
- 6. Section 02091 – REMOVAL OF CONTAMINATED FIXTURES
- 7. Section 02092 – PCB BULK PRODUCT WASTE ABATEMENT
- 8. Section 02221 – DEMOLITION

1.3 DESCRIPTION

- A. Work covered by this Section consists of furnishing all labor, equipment, materials, and services to remove and dispose of potentially hazardous materials encountered during the Green Line Extension construction project.
- B. The materials encountered may be discovered in areas where demolition or alterations will take place that will not be described in other sections. These materials may include, but are not limited to, hazardous building materials, PCB-containing or mercury-containing equipment, motors/pumps, batteries, white goods, compressed gas cylinders, containerized paints, oils, and lubricants, miscellaneous cleaning/maintenance products and unlabeled containers. The materials may also include contaminated sediments, debris and/or miscellaneous waste contained within pipes, vaults or other structures. The DESIGN-BUILDER may encounter these potentially hazardous materials when performing Work covered by this Section.

1.4 DEFINITIONS

- A. Oil or Hazardous Materials (OHM)
 - 1. Material defined as OHM in accordance with 310 CMR 40.0000 and 310 CMR 30.000.
- B. Resource Conservation and Recovery Act (RCRA) and State Regulated Hazardous Waste
 - 1. OHM defined as a RCRA characteristic or listed hazardous waste in accordance with Title 40 CFR, Part 261 and/or;
 - 2. OHM defined as a hazardous waste in accordance with 310 CMR 30.000 or 310 CMR 40.0000.
- C. Toxic Substance Control Act (TSCA) Regulated Waste
 - 1. OHM which exceeds the TSCA criteria for Polychlorinated Biphenyls (PCBs) as defined in Title 40 CFR, Part 761, Subpart D.
- D. RCRA/TSCA Regulated Waste
 - 1. OHM which meets the requirements as both a RCRA hazardous waste and a TSCA-regulated waste as defined above.
- E. In-State Lined Landfill - This type of facility shall be approved by the Commonwealth of Massachusetts to accept waste that is not considered a hazardous waste, as defined in 310 CMR 30.000 and 310 CMR 40.0000, is not classified as a RCRA characteristic waste or RCRA listed waste as defined in Title 40 CFR, Part 261 and is not classified as a TSCA regulated waste as defined in Title 40 CFR, Part 761.
- F. Non-Hazardous Special Waste
 - 1. Materials containing OHM not otherwise categorized.

1.5 QUALITY ASSURANCE

- A. The DESIGN-BUILDER shall utilize hazardous waste removal and transportation firms experienced in hazardous waste work similar in material and extent to that indicated for this Project.
- B. Refrigerant Recovery Technicians must be certified by an EPA-approved certification program.
- C. DESIGN-BUILDER shall comply with governing EPA and DEP notification regulations before beginning or removing any hazardous waste materials.
- D. The DESIGN-BUILDER's Environmental Consultant will be knowledgeable in the characterization, removal, transportation and disposal of OHM to provide guidance during the work of this Section.
- E. Manifests/Bills of Lading
 - 1. A uniform hazardous waste manifest, bill of lading, or other applicable documentation is required for the removal from the premises, and disposal of all items included in this Section. The DESIGN-BUILDER shall obtain and prepare all such documents. The DESIGN-BUILDER shall provide the AUTHORITY and the Engineer with a copy of the manifest(s), bills of lading, and any other shipping documents at least 5 business days prior to transport of the material from the Site. The disposal manifests, bills of lading and any other shipping documents will be reviewed, authorized and signed by the AUTHORITY.
 - 2. Each manifest, bill of lading as well as all other documentation required herein, shall be clearly and distinctly marked with the contract number, specific waste origin, and removal and disposal order number as applicable. If blocks are not provided, the contract and removal and disposal order information shall be placed in the upper right hand corner of each document.
 - 3. Each manifest, bill of lading, or other applicable documentation, shall note the truck registration number, state of registration, name of driver, and date of removal of material from the Site.
- F. Inspection:
 - 1. All services shall be subject to inspection by the AUTHORITY or its authorized representatives. The AUTHORITY will have the right, but not the duty, to inspect and obtain copies of all written licenses, training records, permits, and approval issued by any entity or agency to the DESIGN-BUILDER or its subcontractors which are applicable to the performance of services under this contract; to inspect and test, at its own expense, transportation vehicles or vessels, containers, and disposal facilities provided by the DESIGN-BUILDER; and to inspect the handling, loading, transportation, storage and disposal operations conducted by the DESIGN-BUILDER in the performance of this contract.
 - 2. The Engineer will have the right to inspect and obtain duplicates of all samples collected by the DESIGN-BUILDER. If requested by the AUTHORITY or the Engineer, the DESIGN-BUILDER shall collect and supply these samples to the Engineer for analyses by the Engineer's laboratory.
 - 3. The AUTHORITY and its Engineer will be afforded free access to any facility used by the DESIGN-BUILDER in performing services under this contract, including, but not limited to, offices and facilities where contract related records are retained.
 - 4. The DESIGN-BUILDER is solely and exclusively responsible for the quality of all services performed under this contract. The AUTHORITY's right to conduct inspections at DESIGN-BUILDER's facilities does not relieve the DESIGN-BUILDER of this responsibility. Neither the AUTHORITY, nor their authorized representatives' failure to make such inspection, nor

failure to discover nonconforming services, will impose any liability on the AUTHORITY or their Engineer, nor shall it prejudice the rights of the AUTHORITY thereafter to reject services, and shall not relieve the DESIGN-BUILDER of its obligation to perform work strictly in accordance with the contract and applicable local, state and federal regulations.

5. The DESIGN-BUILDER in its agreement with its subcontractors, shall ensure that the inspection rights described herein are afforded to the AUTHORITY by each sub-SUBDESIGN-BUILDER performing services under this contract.
6. If any of the services do not conform with contract requirements, the AUTHORITY will require the DESIGN-BUILDER to perform the services again at no additional cost to the AUTHORITY. When the defects in services cannot be corrected by re-performance, the AUTHORITY may (1) require the DESIGN-BUILDER to take necessary action to ensure that future performance conforms to contract requirements and (2) reduce the contract price to reflect the reduced value of the services performed.

1.6 SUBMITTALS

- A. The DESIGN-BUILDER shall submit the name, address, and qualifications of the Environmental Laboratory which they intend to use for this project. The laboratory shall be certified, as applicable, by the Commonwealth of Massachusetts to perform the required analyses. A copy of any certifications shall be included in the submission.
- B. The DESIGN-BUILDER shall be responsible for obtaining any necessary licenses and permits and for complying with any applicable federal, state and local laws, codes, policies and regulations in connection with the performance of this work. The DESIGN-BUILDER shall provide a copy of all such permits and licenses to the Engineer at least 5 business days prior to the start of work on this contract. Applicable permits pertaining to disposal facilities to be utilized shall also be provided at this time.
- C. The DESIGN-BUILDER shall submit to the Engineer all analytical results including chain of custody records within 5 business days of receipt and at a minimum 5 business days prior to off-site transportation and disposal of the items included in this Section. In addition, the DESIGN-BUILDER shall submit to the Engineer summary tables of all analytical results and identify how the material shall be classified for disposal.
- D. The DESIGN-BUILDER shall submit to the AUTHORITY, for review and approval, completed copies of all waste profiles, applications and questionnaires, prior to forwarding them to the party requiring these documents.
- E. The DESIGN-BUILDER shall submit to the Engineer for approval, a Work Plan including all pertinent information relating to the removal and transportation of hazardous materials from the Site within 15 business days after issuance of the Notice to Proceed. The Work Plan, at a minimum, shall include:
 1. The name(s), address(es), and contact(s) of subcontractors including Environmental Consultant retained for Work of this section.
 2. A detailed description of Work activities and progress schedule for each phase of the Work associated with the removal, transportation, and disposal of hazardous materials.
 3. A summary estimate of the quantities of hazardous materials that will be recycled or re-used, and the destination for those quantities of materials by category.
 4. A statement of compliance, and evidence of said compliance, with applicable Federal, State, Regional, and Local regulations covering such work.

5. Name(s), address(es), and contact(s) of hazardous waste transporter(s) that transport hazardous waste from the Site(s) to a TSD facility, including EPA identification numbers(s) and proof of permit, license, or authorization to transport hazardous waste in all affected states.
 6. Name(s), address(es), and contact(s) of TSD facilities that will accept hazardous waste from the Site and a letter of acceptance indicating that the facilities will accept hazardous waste from the Site.
 7. List and match each TSD facility with the hazardous waste it will accept from the site.
- F. The DESIGN-BUILDER shall complete any manifests, bills of lading or other documents required to transport and recycle or dispose of the items identified in this Section. The DESIGN-BUILDER shall submit the completed forms to the Engineer for review. The DESIGN-BUILDER shall not transport any materials until authorized by the AUTHORITY. Completed copies of all manifests, bills of lading and other applicable documents and certified scale weight receipts or certified liquid quantity measurements, as applicable, must be furnished to the AUTHORITY as attachments to all invoices. The DESIGN-BUILDER shall also be responsible for processing and distributing, as necessary, the completed manifests, bills of lading or other applicable documentation, as required by local, state and federal regulations.
- G. The DESIGN-BUILDER shall prepare and submit, to the AUTHORITY, a report that summarizes and documents the removal and disposal of all hazardous materials which left the Site. The report shall be a prerequisite for payment. At a minimum the report shall include the quantity and origin of each material type, reason(s) that it was deemed unacceptable for recycling/re-use, name of the disposal facility, a summary of materials disposed of at each facility, and a copy of the manifest, bill of lading and other applicable documentation, for each load.

1.7 REGULATORY REQUIREMENTS

- A. The Work of this Section shall be performed in accordance with all applicable Federal, State, and Local regulations, laws, codes, and ordinances governing the removal, handling, transportation, and disposal of materials managed under this contract.
- B. The DESIGN-BUILDER shall obtain all Federal, State and Local permits required for the removal, handling, transport and disposal of materials managed under this contract. The DESIGN-BUILDER shall adhere to all permit requirements.
1. The DESIGN-BUILDER shall document that the disposal facilities proposed have all certifications and permits as required by Federal, State and Local regulatory agencies to receive and dispose of the material managed under this contract.
- C. The following regulations are cited for the information and guidance of the DESIGN-BUILDER. The list below is not all-inclusive; the DESIGN-BUILDER shall be responsible for a thorough knowledge and full implementation of all requirements for removal, transportation, and disposal of hazardous materials.
1. Massachusetts Hazardous Waste Regulations, 310 CMR 30.000.
 2. Massachusetts Contingency Plan (MCP) 310 CMR 40.0000.
 3. Massachusetts DEP Policy #COMM-97-001 – Reuse and Disposal of Contaminated Soil at Massachusetts Landfills.
 4. Solid Waste Management Facility Regulations, 310 CMR 19.00.
 5. Site Assignment Regulation for Solid Waste Facilities, 310 CMR 16.000.
 6. Universal Waste Management Standards, 310 CMR 30.1000 – MassDEP.

7. Rubbish Handling Regulations, 527 CMR 34.00 - Massachusetts Department of Fire Services (MADFS).
8. Transportation of Flammable and Combustible Liquids, 527 CMR 8.00 – MADFS.
9. “Hazardous Waste Operations and Emergency Response”, Federal Occupational Safety and Health Act (OSHA), Title 29 CFR, Part 1910.120.
10. “General Regulations for Hazardous Waste Management”, EPA, Title 40 CFR, Part 260.
11. “Regulations for Identifying Hazardous Waste, Hazardous Waste Generators and Hazardous Waste Transporters”, EPA, Title 40 CFR, Parts 261, 262 and 263.
12. Regulations for Owners and Operators of Permitted Hazardous Waste Facilities”, EPA, Title 40 CFR, Part 264.
13. “Interim Status Standards for Owners and Operators of Permitted Hazardous Waste Facilities”, EPA. Title 40 CFR, Part 265.
14. “Standards for Management of Specific Hazardous Wastes and Facilities”, EPA, Title 40 CFR, Part 266.
15. “Standards for Owners and Operators of Hazardous Waste Facilities under a Standardized Permit”, EPA, Title 40 CFR, Part 267.
16. Universal Waste Management Standards, Title 40 CFR, Part 273 – USEPA.
17. Polychlorinated Biphenyls (PCBs) Manufacturing, Processing, Distribution in Commerce, And Use Prohibition, Title 40 CFR, Part 761 – USEPA (TSCA).
18. Hazardous Materials Regulations Relating to Transportation, Title 49 CFR, Parts 171-180 – U.S. Department of Transportation (U.S. DOT).
19. Recycling and Emissions Reduction of Refrigerants, Title 40 CFR, Part 82 - Subpart F – USEPA.
20. Management of Used Oil Standards, Title 40 CFR, Part 279 – USEPA.
21. 29 CFR 1910, “Occupational Safety and Health Standards” (General Industry Standards)
22. 29 CFR 1910.20, “Access to Employee Exposure and Medical Records
23. 29 CFR 1910.134, “Respiratory Protection” 29 CFR 1910.146 “Permit Required Confined Space”
24. 29 CFR 1910.1025 “Lead”
25. 29 CFR 1910.1200, “Hazard Communication”
26. 29 CFR 1926, “Safety and Health Regulations for Construction” (Construction Industry Standards)
27. 29 CFR 1926.62, “Lead-Construction”

PART 2 – PRODUCTS

2.1 GENERAL

- A. The DESIGN-BUILDER shall provide all personnel with personal protective equipment (PPE), protective clothing, and monitoring equipment consistent with the levels of protection required for each type of work. The DESIGN-BUILDER is responsible for determining the required level of PPE for any work associated with this contract.
- B. The DESIGN-BUILDER shall maintain on the worksite a sufficient quantity of granular absorbent such as Speedy-Dri™ or approved equal, and any other emergency spill response equipment as may be necessary to complete the work outlined in this specification.
- C. The DESIGN-BUILDER shall provide all containers, overpack containers, storage containers, recovery cylinders, packing materials, gaskets and related products and materials required for collecting, storing, and transporting OHM in compliance with MassDEP, USEPA, and USDOT requirements. All containers shall be structurally and chemically compatible for the materials to be disposed and shall meet the requirements of USDOT 49 CFR 173 and UN rated performance specifications.

All reconditioned containers and drums must be pre-approved before use.

- D. The DESIGN-BUILDER shall provide all monitoring equipment, equipment, and containers necessary to collect, sample, drain, evacuate, flush, handle, secure, remove, transport, and dispose of all hazardous materials and refrigerant gases at the Site.
- E. The DESIGN-BUILDER shall provide all materials, products, and equipment necessary to bulk, shred, sort, flush, dilute, pre-treat or otherwise prepare hazardous materials for disposal at approved facilities.
- F. The DESIGN-BUILDER shall provide all materials for temporary containment areas including: berms; containment pads; impervious barriers; covers; and absorbent materials.

PART 3 – EXECUTION

3.1 GENERAL

- A. The AUTHORITY will be the generator and will sign all manifests, bills of lading, and other applicable documentation as required. The DESIGN-BUILDER shall prepare a summary of analytical data as part of the document package. The applicable documents will be prepared by the DESIGN-BUILDER and may be subject to applicable local, state and federal agency review and approval. The Engineer shall review all manifests, bills of lading, and other applicable documentation on behalf of the AUTHORITY.
- B. Utilization of a hazardous material manifest shall require the use of a licensed hazardous material transporter in conformance with the Massachusetts Hazardous Material Regulations as required by 310 CMR 30.000. A Licensed Site Professional Opinion (310 CMR 40.0000) is not required when using a hazardous material manifest when transporting contaminated materials.
- C. All Work shall be performed in a manner as to prevent any spills and leaks.
- D. In the event that work is being conducted in the vicinity of catch basins, drains or open pipes, berms or other barriers shall be constructed to prevent the release of hazardous materials to the subsurface at the Site.
- E. The DESIGN-BUILDER shall be fully aware of all such requirements; ensure that all required permits are obtained and in place including those required of any subcontractor, prepare all manifests and certifications, and deliver all copies of completed manifests and final certifications and certification of destruction to the Engineer in the form of one complete trucking document.

3.2 CHARACTERIZATION OF WASTES

- A. The DESIGN-BUILDER shall be responsible for all waste segregation, characterization, sampling and analysis.
- B. The DESIGN-BUILDER is responsible to ensure that materials are characterized to meet disposal facility requirements.
- C. The DESIGN-BUILDER shall be required to submit a copy of all analytical results to the Engineer within 5 business days of receipt and at least 5 business days prior to transportation off-site.
- D. If requested by the AUTHORITY or the Engineer, the DESIGN-BUILDER shall, at the time of sample collection, provide duplicate samples for analysis by the Engineer's laboratory.
- E. In the event that there are discrepancies between the DESIGN-BUILDER's and Engineer's lab, the DESIGN-BUILDER shall have their lab check and verify their results and provide all laboratory analytical backup.
- F. If the DESIGN-BUILDER and the Engineer cannot agree on the results, the DESIGN-BUILDER shall collect and resubmit samples to his lab for analyses at no additional cost to the AUTHORITY.
- G. Sampling of material shall be done by the DESIGN-BUILDER at sufficient and adequately distributed locations so that the concentrations of the chemical constituents are adequately characterized.

3.3 REFRIGERANT

- A. Unless contents are clearly labeled, the DESIGN-BUILDER shall perform analytical testing to identify the refrigerant.
- B. The DESIGN-BUILDER shall discharge gases into appropriate USDOT-approved containers, and label for transport and disposal. Decontaminate all systems by means of steam cleaning or triple rinsing or both with an approved cleaning fluid to remove all residual contamination. Collect all decontamination fluids into approved containers. Label containers for transport and disposal.
- C. All activities associated with the removal and reclamation of refrigerant gases shall be in accordance with the USEPA Clean Air Act and under the control and/or supervision of a certified Refrigerant Recovery Technician as specified in the applicable regulations.

3.4 MACHINERY FLUIDS

- A. The DESIGN-BUILDER shall drain and collect liquids from all equipment containing lubricating oils, hydraulic oils, or other types of fluids. This equipment includes, but is not limited to air compressors, fans, motors, and pumps.
- B. The DESIGN-BUILDER shall decontaminate all equipment and systems by means of steam cleaning or triple rinsing or both with an approved cleaning fluid to remove all residual contamination, and collect all decontamination fluids into approved labeled containers for transport and disposal.

3.5 PAINTS, OILS AND LUBRICANTS

- A. DESIGN-BUILDER's Environmental Consultant and the AUTHORITY are to be immediately notified of the presence of containerized liquid wastes encountered during the course of the work.
- B. Once liquid wastes are discovered, all ignition sources are to be removed from the immediate area.
- C. Containerized wastes that can be identified are to be removed from their origin without creating or exacerbating a release to the environment.

- D. After removal, DESIGN-BUILDER shall segregate the containerized liquids by placing into separate containers by preliminary type prior to final characterization of wastes. Combining waste liquids of different preliminary characteristics is strictly prohibited.
- E. Once fully characterized, DESIGN-BUILDER shall prepare waste manifests for the transportation of the waste liquids to an approved facility.

3.6 ELECTRICAL EQUIPMENT

- A. All lighting-related or oil-filled electrical equipment shall be removed using appropriate techniques and personal protection gear as detailed in the submittals.
- B. Removal shall be performed using approved methods and tools that will minimize damage to the equipment and ensure a quick, neat removal with the equipment intact and undamaged. Once removed, the equipment shall be placed in 55-gallon drums or other appropriately sized container suitable for transportation and disposal.
- C. Once filled, the container shall be closed and properly labeled for transport and disposal.

3.7 BATTERIES

- A. All batteries shall be removed using appropriate techniques and personal protection gear as detailed in the submittals.
- B. DESIGN-BUILDER shall remove all batteries intact, and reuse, recycle or dispose of all batteries in accordance with all applicable state and federal regulations.
- C. Removal shall be performed using approved methods and tools that will minimize damage to the batteries or other equipment of which it is a part and leave the batteries intact and undamaged.
- D. Once removed, the batteries shall be properly containerized.
- E. Once filled, the appropriate containers shall be closed and properly labeled for transport and disposal.

3.8 MERCURY

- A. DESIGN-BUILDER shall remove items containing mercury as hazardous waste. These include, but are not limited to fluorescent lamps, high-intensity discharge lamps, manometer thermostats and relay switches. The following shall be followed for disposal of all mercury items:
 - 1. Collection, characterization and proper disposal of all fluorescent lighting tubes and mercury items found throughout the facility.
 - 2. Care must be taken to not break these items, as that may cause mercury exposure to individuals handling them and may require additional clean-up and decontamination.
 - 3. Provide all waste shipment records and incorporate in the final report.

3.9 OTHER MISCELLANEOUS OHM

- A. The DESIGN-BUILDER shall properly identify and characterize any other miscellaneous OHM at the Site. This includes white goods, mechanical equipment, fire extinguishers, and cleaning/maintenance products.
- B. Other miscellaneous OHM shall be removed using appropriate techniques and personal protection gear as detailed in the submittals.

- C. Removal of other miscellaneous OHM shall be performed using approved methods and tools that will minimize damage to the fixture of which it is a part.
- D. Environmentally hazardous materials and system components shall be removed from white goods items and properly recycled or disposed prior to disposal or recycling of the white good carcasses. Environmentally hazardous materials requiring removal from white good items include, but are not limited to:
 - a. Capacitors
 - b. Refrigerants
 - c. Dry-type transformers.
- E. Once removed, the other miscellaneous OHM shall be properly containerized or secured, as necessary.
- F. Once filled, the appropriate containers (if applicable) shall be closed and properly labeled for transport and disposal.

3.10 STORAGE OF MATERIALS

- A. Once removed, DESIGN-BUILDER shall segregate and store hazardous materials on-site for no more than 30 calendar days.
- B. At the conclusion of each work day, drums or other containers of hazardous materials shall be labeled, and stored in a designated secure location under lock and key until they are removed for transport and disposal.
- C. If outdoors, hazardous materials shall be stored in areas that are impervious and contained. At a minimum, the area shall be within a locked fenced enclosure or secured covered structure, on a level surface of concrete or pavement and protected from weather.

3.11 WASTE PROFILES AND MANIFESTS/BILLS OF LADING

- A. The DESIGN-BUILDER shall comply with the RCRA Hazardous Waste Manifest regulations and shall be responsible for obtaining a temporary EPA Identification Number for each Site within this contract if applicable. The DESIGN-BUILDER shall also provide a landline telephone number in accordance with the RCRA regulations for each manifest generated. One EPA Identification Number per Site shall be used for all hazardous waste management associated within this contract if hazardous waste disposal is warranted for that Site.
- B. The DESIGN-BUILDER shall be responsible for preparing and submitting to the Engineer for review all waste profile applications and questionnaires, and coordination with disposal facilities and all Federal and State Environmental Agencies as applicable. The DESIGN-BUILDER shall provide the Engineer with completed copies of all waste profile applications and questionnaires prior to transportation off site. The DESIGN-BUILDER shall not transport any material off site until the submitted paperwork is authorized by the AUTHORITY.
- C. The DESIGN-BUILDER shall be responsible for preparing all hazardous material manifests, bills of lading and any other applicable paperwork with all applicable analytical backup, notification, and control forms. The DESIGN-BUILDER shall be responsible for coordination with the disposal facilities.
- D. The DESIGN-BUILDER shall also provide certified tare and gross weight slips or certified liquid volume measurements for each load received at the designated facility, which shall be attached to each completed manifest and/or bill of lading. The completed manifest and/or bill of lading, with supporting documentation, shall be submitted to the Engineer.

- E. The AUTHORITY will be designated as generator and will sign all manifests and waste profile applications or questionnaires.
- F. The DESIGN-BUILDER shall furnish all generator copies of the hazardous material manifest to the AUTHORITY. The DESIGN-BUILDER shall submit copies to the applicable local, state and federal authorities.
- G. The DESIGN-BUILDER shall submit to the AUTHORITY and the Engineer, prior to receiving progress payment, documentation certifying that all materials were transported to, accepted, and disposed of, at the selected disposal facility. The Engineer shall review all manifests, bills of lading, and other applicable documentation on behalf of the AUTHORITY. The documentation shall include, at a minimum, the following:
 - 1. Documentation shall be provided for each load from the site to the disposal facility, including all manifests and any other transfer documentation as applicable.
 - 2. Certified tare and gross weight slips and/or certified liquid quantity measurements for each load, as applicable.

3.12 TRANSPORT OF CONTAMINATED MATERIAL

- A. The DESIGN-BUILDER shall not be permitted to transport contaminated materials off-site until all disposal or recycling facility documentation has been received, reviewed, and accepted by the AUTHORITY.
- B. The DESIGN-BUILDER shall transport contaminated materials from the site to the disposal or recycling facility in accordance with all USDOT, USEPA, OSHA, MassDEP regulations and any other applicable regulations.
- C. The Hauler(s) shall be licensed in all states affected by transport.
- D. The DESIGN-BUILDER shall coordinate the schedule for truck arrivals and departures at the disposal site to meet the approved schedule.
- E. The DESIGN-BUILDER shall not deliver waste to any facility other than the disposal facilities listed on the shipping manifest, bills of lading, and/or other applicable documentation.
- F. The DESIGN-BUILDER shall be responsible for inspecting the access routes for road conditions, overhead clearance, and weight restrictions, and shall provide traffic control when needed.
- G. The DESIGN-BUILDER shall provide to the Engineer copies of all weight slips (both tare and gross) and certified liquid quantity measurements, for every load disposed of at the accepted disposal facility. The AUTHORITY shall only make progress payments upon receipt of these slips.
- H. The temporarily stored items must be removed from the site by the DESIGN-BUILDER in accordance with applicable regulatory deadlines and no later than the completion date of this contract.
- I. The DESIGN-BUILDER shall be responsible for any and all actions and costs necessary to remedy situations involving material spilled in transit or mud and dust tracked off-site. This cleanup and other ancillary activities shall be accomplished at the DESIGN-BUILDER's expense.
- J. The DESIGN-BUILDER is responsible for adhering to all loading and coverage restrictions and requirements. When loaded, materials shall be kept several inches below the top of the truck or container. The waste materials shall be loaded in a manner not to exceed over-the-road weight restrictions for the container and/or vehicle. All trucks and containers shall be covered during transport as required by applicable law.
- K. The DESIGN-BUILDER shall clean the truck tires and bodies before leaving the site by either hand or mechanical means. Should wash down water be utilized in the process, the DESIGN-

BUILDER is responsible to fully contain and characterize the water and for complying with all laws and regulations prior to discharge or disposal. In addition, the DESIGN-BUILDER shall conduct street sweeping of all public ways and/or private ways as necessary, and as determined by the AUTHORITY, and shall collect and dispose of all materials and soil which may have migrated off site in the truck transfer process.

3.13 OFF-SITE DISPOSAL

- A. The DESIGN-BUILDER shall be responsible for the disposal of contaminated materials and liquid wastes at licensed disposal/recycling facilities in accordance with all federal, state and local regulations, laws, codes, policies or requirements.
- B. The DESIGN-BUILDER shall identify within 15 business days of receiving the Notice to Proceed and prior to the transportation of any items off-site, the storage, disposal, and recovery facilities which they intend to use for this project.
- C. The DESIGN-BUILDER shall be responsible for acceptance of the specific material at an approved treatment, disposal, or recovery facility, for ensuring that the facility is properly permitted to accept the stated material, and that the facility provides the stated treatment and/or disposal services.
- D. All hazardous wastes, as defined, shall be disposed of at a RCRA or RCRA/TSCA-permitted facility as appropriate. Alternative hazardous waste disposal facilities including those outside the United States must be pre-approved by the Engineer.
- E. The AUTHORITY reserves the right to contact and visit the disposal facilities and regulatory agencies to verify their agreement to accept the stated material and to verify any other information provided. This does not in any way relieve the DESIGN-BUILDER of any responsibilities under this contract.
- F. In the event that the identified and approved facilities ceases to accept the stated materials or the facilities ceases operations, it is the DESIGN-BUILDER's responsibility to locate any alternate approved and permitted facilities for accepting materials. No additional compensation shall be provided to the DESIGN-BUILDER for having to utilize alternative facilities. The DESIGN-BUILDER is responsible for making the necessary arrangements to utilize alternative facilities, and the alternate facilities must be approved by the AUTHORITY in the same manner and with the same requirements as for the original facilities.
- G. All materials collected under this contract must be segregated and kept physically separate from any other items until the disposal facility is reached. The items must be so marked, so that they are readily identified to this contract throughout this period. In addition, the DESIGN-BUILDER must ensure that there is a clear audit trail for all items until final treatment/disposal is accomplished and the AUTHORITY has received all documents regarding final disposition including but not limited to signed manifests from the final Treatment, Storage and Disposal Facility.
- H. The DESIGN-BUILDER shall coordinate the disposal of work generated waste materials which may be contaminated. These waste materials include, but are not limited to, decontamination rinse water, disposable PPE, and miscellaneous disposable support equipment. Disposal of DESIGN-BUILDER generated waste shall be done at no additional cost to the AUTHORITY.

Mere acceptance of a waste at a properly permitted treatment, storage, or disposal facility (TSDF) does not meet the definition of final treatment/disposal under this contract. It is the DESIGN-BUILDER's responsibility to obtain all necessary documentation to prove that the final treatment/disposal of all items has been accomplished. This documentation shall be attached to the certificate of disposal and submitted with, or prior to, the payment requests.

- I. Treatment of waste on the AUTHORITY's premises is not permitted. Treatment is defined as any process that meets the definition of treatment as set forth in applicable federal (including Title 40 CFR, Part 260.10), state and local laws, codes, policies and regulations.

3.14 SPILL RESPONSIBILITY

- B. The DESIGN-BUILDER is solely responsible for any and all spills or leaks during the performance of work under this contract, which occur as a result of or are contributed to by the actions of its agents, employees or subcontractors. The DESIGN-BUILDER agrees to clean up such spills or leaks to the satisfaction of the AUTHORITY or its representative, and in a manner that complies with applicable federal, state and local laws, codes, policies and regulations. The spill cleanup shall be at no cost to the AUTHORITY or its representatives.
- C. As required, the DESIGN-BUILDER shall notify all applicable local, state and federal authorities immediately if the transport vehicle is involved in an accident and a reportable quantity of OHM is released or suspected to have been released.
- D. The DESIGN-BUILDER is responsible for conducting response actions to mitigate any hazardous material releases encountered or created by the work. The DESIGN-BUILDER shall not wait for the Environmental Consultant's or the AUTHORITY's direction if a delay of response actions will create a potential hazard to the public or the environment.
- E. The DESIGN-BUILDER shall report all such spills or leaks of oil or hazardous material, regardless of their quantity, to the AUTHORITY immediately upon discovery. A written follow-up report shall be submitted to the AUTHORITY as soon as possible, but not later than 24 hours after the initial telephone report. The written report shall be in narrative form and, at a minimum, include the following:
 - 1. Description of item spilled (including identity, quantity, manifest number, etc.).
 - 2. Exact time and location of spill, including a description of the area involved.
 - 3. Containment procedures initiated.
 - 4. Description of cleanup procedures employed or to be employed at the site, including location of disposal of spill residues, and corrective measures to prevent recurrences.
 - 5. Agency or Agencies contacted in response to spill containment if any made.

3.15 DECONTAMINATION PROCEDURES

- A. General: The DESIGN-BUILDER shall furnish labor, materials, tools, and equipment for decontamination of all personnel, equipment and supplies that enter the contaminated work area or are exposed to contaminated material. The DESIGN-BUILDER shall provide equipment and decontamination pads, etc. necessary for the decontamination of equipment and personnel.
- B. Methods: The decontamination procedure shall follow the requirements of Title 29 CFR, Parts 1926.65 & 1910.120 as described in the DESIGN-BUILDER's Health and Safety Plan.
- C. Personnel Decontamination: The DESIGN-BUILDER shall provide and maintain a decontamination area which is to be located in the contamination reduction zone. The DESIGN-BUILDER shall coordinate the location of the decontamination area with the Engineer. Decontamination of personnel and equipment is required after performance of activities in the exclusion zone. The personnel decontamination area may be in the form of a mobile trailer or field station.
 - 1. Routine Decontamination: Routine decontamination shall follow the guidelines of Title 29 CFR, Parts 1926.65 & 1910.120.
 - 2. Emergency Decontamination: Should a worker be splashed with contaminants, the worker shall be immediately escorted to the field decontamination station and decontaminated in accordance

with DESIGN-BUILDER's health and safety plan. Site eye wash and shower stations shall be made available and operable.

D. Equipment:

1. All equipment shall be provided to the work site free of contamination. The Engineer retains express AUTHORITY to prohibit from the site any equipment that in his/her opinion has not been thoroughly decontaminated prior to arriving at the project location. Any decontamination of the DESIGN-BUILDER's equipment prior to arrival at the site shall be at the expense of the DESIGN-BUILDER. The DESIGN-BUILDER is prohibited from decontaminating equipment on the project site which is not thoroughly decontaminated upon arrival.
2. All equipment involved in Exclusion Zone activities shall be decontaminated and the effectiveness of the decontamination shall be determined each time it is removed from the Exclusion Zone. Equipment decontamination shall be performed in conformance with the requirements of Title 29 CFR, Parts 1926.65 & 1910.120 as described in the DESIGN-BUILDER's Health and Safety Plan.
3. The DESIGN-BUILDER shall decontaminate all equipment that comes in contact with contaminated material, either directly or indirectly, after completion of work at one location and prior to beginning work at another location.

E. Rinse water used for decontamination which contains chemicals used during decontamination or which contains hazardous chemicals from the equipment which was decontaminated shall be collected, characterized, handled and disposed of by the DESIGN-BUILDER at no additional cost to the AUTHORITY.

F. Decontamination wastewater shall be classified as a "remedial wastewater".

G. Payment for the removal and disposal/discharge of decontamination wastewater shall be included under the DESIGN-BUILDER's base bid and shall not be paid for separately under any allowance item.

H. The DESIGN-BUILDER is responsible for any sampling and characterization as required by local, state, federal or facility requirements.

I. If appropriate, the DESIGN-BUILDER shall be responsible and coordinate with the Authority and/or Engineer all applications, licenses and permits required for discharges with the Massachusetts Water Resources Authority (MWRA), Boston Water and Sewer Commission (BWSC), and/or other local municipal water and sewer departments.

J. The DESIGN-BUILDER shall provide, maintain, and pay for any permits or monitoring necessary of the disposal/discharge of decontamination wastewaters.

K. If onsite treatment is proposed, the DESIGN-BUILDER shall provide a licensed Treatment Plant Operator as required by local, state, federal, or facility requirements.

L. The DESIGN-BUILDER shall be responsible for all costs, such as penalties and fines, related to materials transported and or disposed of in a manner not consistent with governing laws and regulations.

3.16 DISCOVERY OF HAZARDOUS MATERIALS

- A. If unknown hazardous materials, such as chemicals, other hazardous materials, or suspect containers are discovered during the course of the work, DESIGN-BUILDER shall cease work in affected area and immediately notify the ENGINEER and the AUTHORITY of such discovery. Work shall not proceed in such areas until instructions are issued by the ENGINEER.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02090

LEAD ABATEMENT

PART 1 - GENERAL

1.1 OVERVIEW

- A. The intent of this section is to:
1. Outline DESIGN-BUILDER responsibilities for worker protection and to prevent the contamination of the air, soil, and water around the project site from lead based paint.
 2. Specify the requirements for Lead Paint Abatement at the Bridges, buildings and other structures to be demolished for the Green Line Extension Project.
 3. Specify the minimum work practice requirements for the recovery and disposal of leaded coatings and associated waste generated as a result of abatement and demolition activities.
Lead coated paint may be encountered on painted structures and on buried building materials uncovered during the work.
- B. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all sections within DIVISION I-GENERAL REQUIREMENTS which are hereby made a part of this section.
- C. In addition to the requirements specified herein, refer to all Contract Documents for complete description of work required to be performed under this Section.
- D. Examine all Drawings and all other Sections of the Specifications for requirements of related Sections affecting the work of this Section.
- E. The work of this section shall be performed as stated herein. In performing the work of this section, the DESIGN-BUILDER shall refer to other Sections (i.e., Section 02081 – HAZARDOUS MATERIAL ABATEMENT) for additional procedures. The DESIGN-BUILDER is responsible for the coordination of the work of this Section with related work. No delays in completion of the work may be claimed for lack of coordination.
- F. DESIGN-BUILDER shall comply with all applicable local, state, and federal guidelines and regulations regarding all work involving the presence of lead-containing paint.

1.2 RELATED WORK

- A. Other specification sections that relate to the work include but are not limited to the following:
1. Section 01060 - PERMITS AND REGULATORY REQUIREMENTS
 2. Section 01560 – TEMPORARY CONTROLS
 3. Section 02080 – ASBESTOS REMOVAL
 4. Section 02081 – HAZARDOUS MATERIALS ABATEMENT
 5. Section 02091 – REMOVAL OF CONTAMINATED FIXTURES
 6. Section 02221 – DEMOLITION

1.3 DESCRIPTION OF WORK

- A. A. The procedures described herein apply to all abatement and excavation work where a worker may be occupationally exposed to lead or lead-contaminated debris. The DESIGN-BUILDER shall assume that any painted surface not tested under this specification contains lead paint and it shall be the DESIGN-BUILDER's responsibility to protect workers performing under this Contract.

This may require additional testing by XRF analysis by the DESIGN-BUILDER to verify lead content. The DESIGN-BUILDER must notify the AUTHORITY and obtain approval from the AUTHORITY prior to such testing. The DESIGN-BUILDER shall assume full responsibility for the compliance with all applicable Federal, State, and Local regulations pertaining to work practices, hauling and disposal of hazardous waste, protection of the workers, visitors to the Site, and persons occupying areas adjacent to the Site. The DESIGN-BUILDER shall hold the AUTHORITY harmless for failure to comply with any applicable work, hauling, disposal, safety, health, or any other type of regulation on the part of himself, his workers or his subcontractors.

- B. The DESIGN-BUILDER is required to ensure the protection of workers performing any work that will affect surfaces coated with lead containing paint as well as protecting the public and the environment from exposure to lead dust.
- C. DESIGN-BUILDER responsibilities established in this Section include the furnishing of all labor, materials, and equipment required to test, contain, recover, and dispose of lead coatings and associated waste as identified in these specifications.
 - 1. Removal of paint from structural steel, where cutting/grinding is necessary;
 - 2. Spot removal of paint from surfaces to facilitate demolition;
 - 3. Excavation, segregation, and disposal of lead painted debris uncovered during the work;
 - 4. Testing and disposal of all debris generated as a result of lead removal in accordance with requirements of this specification and federal and State regulations on hazardous and solid waste;
 - 5. Personal air sampling as required by OSHA for workers of the DESIGN-BUILDER or the MBTA that have the potential for exposure to airborne lead dusts as outlined in this specification.
- D. Codes and Standards
 - 1. All work shall conform to the standards set by applicable Federal, State and local laws, regulations, ordinances, and guidelines in such form in which they exist at the time of the work of the contract and as may be required by subsequent regulations.
 - 2. In addition to any detailed requirements of the Specification, the DESIGN-BUILDER shall at his own cost and expense comply with all laws, ordinances, rules, and regulations of Federal, State, Regional, and Local Authorities regarding handling and storing of lead waste material.
 - 3. The following references are cited as applicable standards and regulations as amended, and may not include all applicable standards and regulations:
 - a. Code of Federal Regulations (CFR) Publications:

29 CFR 1910	General Industry
29 CFR 1926.55	Gases, Vapors, Fumes, Dusts and
Mists 29 CFR 1926.57	Ventilation
29 CFR 1926.62	Lead in Construction
29 CFR 1926.200	Signs, Signals and Barricades
29 CFR 1926.354	Welding, Cutting and Heating in Way of Preservative Coatings
29 CFR Subpart T	Demolition

- 40 CFR 50 National Primary and Secondary Ambient Air Quality Standards for Lead
- 40 CFR 61 Subpart A General Provisions
- 40 CFR 61.152 Standard for Waste Manufacturing, Demolition, Renovation, Spraying, and Fabricating Operations.
- 40 CFR 241 Guidelines for the Land Disposal of Solid Wastes
- 40 CFR 257 Criteria for Classification of Solid Waste
- 40 CFR 261 - 263 Waste Disposal Facilities and Practices
- b. Massachusetts Regulations:
 - 310 CMR 30.000 Massachusetts Hazardous Waste Regulations
 - 310 CMR 40.0000 Massachusetts Contingency Plan
 - 454 CMR 22.00 Deleading
- c. American National Standards Institute (ANSI) Publications:
 - 29.2-79 Fundamentals Governing the Design and Operation of Local Exhaust Systems
 - 288.2-80 Practices for Respiratory Protection
- d. National Institute of Occupational Safety and Health (NIOSH) Publications:
 - Manual of Analytical Methods, 4th Edition
- e. Underwriters Laboratories, Inc. (UL) Fire Resistance Directory Publications:
 - 586-77 (R 1982) Test Performance of High Efficiency Particulate Air Filter Units
- 4. All regulations by the above and other governing agencies in their most current version are applicable throughout this project. Where there is a conflict between this Specification and the cited State, Federal, or Local regulations, the more restrictive or stringent requirements shall prevail.

E. THIS SECTION REFERS TO REQUIREMENTS FOUND IN THESE REFERENCES, BUT IN NO WAY IS IT INTENDED TO CITE OR REITERATE ALL PROVISIONS THEREIN OR ELSEWHERE. IT IS THE DESIGN-BUILDER'S RESPONSIBILITY TO KNOW, UNDERSTAND, AND ABIDE BY ALL SUCH REGULATIONS AND COMMON PRACTICES.

1.4 DEFINITIONS

- A. The following definitions apply to performance of the work of this project
 1. Action Level: An airborne concentration of lead above 30 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) as an 8-hour time-weighted average (TWA).
 2. Area Monitoring: Sampling of lead concentrations *within* the demolition work area and outside the work area which is representative of the airborne concentrations of lead.
 3. Clean Room: An uncontaminated change room directly adjacent to the work area having facilities for storage of employees' personal clothing and uncontaminated work clothes, materials and equipment provided when the airborne exposure to lead is above the Permissible Exposure Level (PEL).

4. Consultant: Authorized representatives who are under contract with the AUTHORITY or AUTHORITY's Engineer to provide lead paint consulting or monitoring services.
5. Decontamination Area: A contained area adjacent to or connected to the abatement work area and consisting of an equipment room, shower area, and clean room which is used for decontamination of workers, materials and equipment.
6. Demolition Subcontractor: The entity who is performing demolition involving lead containing paint under this Section.
7. HEPA Filter Equipment: High efficiency particulate air (HEPA) filtered vacuuming or exhaust ventilation equipment with a UL 586 filter system. Filters shall be of 99.97 percent efficiency for retaining 0.3 μ diameter particles as determined by Dispersed Oil Particulate (DOP) testing.
8. Lead Containing Paint or Coating: Paint, varnish, or stain which contains lead in excess of 0.1 milligrams per square centimeter (mg/cm^2 or 1.0 % lead by weight).
9. Lead Permissible Exposure Limit (PEL): 50 $\mu\text{g}/\text{m}^3$ of air, based upon an 8-hour TWA.
10. PM-10 Sampling: Sampling for suspended particulate matter particles with an aerodynamic diameter less than or equal to a nominal 10 micrometers.
11. Sample Location: Area or place where an air sample is collected.
12. Surface Preparation: Paint removal such that surfaces are free of visible paint chips, dirt, and rust where cutting, torching, welding, etc. may be required to facilitate demolition.
13. Time Weighted Average (TWA): The TWA is an 8-hour time weighted average for the test of the concentration of lead for worker exposure.
14. TSP Sampling for Lead: Sampling for airborne total suspended particulate with lead analysis.
15. Wet Cleaning: The Process of removing lead contamination from surfaces, equipment and other objects by using cloths, mops, or other cleaning tools which have been dampened with water, and by afterwards disposing of these cleaning tools as lead contaminated wastes.
16. Work Area: A controlled-access work area which has plastic sheeting or other containment barriers erected to separate the trades.

1.5 SUBMITTALS

A. Notifications

1. Provide in proper and timely fashion, all necessary notifications to relevant federal, state, and local authorities and obtain and comply with provisions of all permits or applications required by the work specified as well as make all required submittals required under those auspices. DESIGN-BUILDER shall indemnify AUTHORITY, Engineer and Consultant from, and pay for all claims resulting from failure to adhere to these provisions. Costs for all permits, applications, and the like are to be assumed by DESIGN-BUILDER.

B. Provide five (5) copies of the following Submittals to the Engineer for review:

1. Copies of all notifications, permits, applications, licenses and like documents required by Federal, State, or Local regulations and this specification obtained or submitted in proper fashion.
2. List of total number of supervisors and workers intended to be assigned to the project, including name and lead awareness qualifications.
3. Copies of written medical opinions for each employee who may be occupationally exposed to lead as required by Title 29 CFR, Part 1926.62 (j)(3)(v).

4. Record of successful respirator fit testing performed by a qualified individual within the previous 12 months for each employee to be used on this project with the employee's name and social security number with each record.
5. Employer's Lead Compliance Program as required by Title 29 CFR, Part 1926.62, including proposed respiratory protection program and medical monitoring for all employees throughout all phases of the job, including make, model, and NIOSH approval numbers of respirators to be used; worker orientation plan; written description of all proposed procedures, methods, or equipment to be utilized. In all instances, DESIGN-BUILDER must comply with all applicable federal, state and local regulations.
6. Material Safety Data Sheets on potentially hazardous materials to be used on the project.
7. Waste Disposal Plan which describes the waste stream and the disposal means (i.e., landfill, recycle, etc.) and includes the name, address, and ID number of the proposed hazardous waste hauler, waste transfer route, and proposed disposal reclamation or treatment facility.
8. Details of any proposed work platforms and or containment system design features including description and/or drawings of the following:
 - a. Locations, sizes, elevations, and numbers of individuals work platforms and/or enclosure systems.
 - b. Manner of construction, anticipated loads during operations, and load bearing capacities for each work area platform and/or enclosure system designed by a Registered Professional Engineer.
 - c. Proposed use and engineering of any proposed contamination control features such as HEPA- filtered negative pressure systems and decontamination facilities.
 - d. Special considerations used to protect the containment Integrity from effects of the local climate (e.g., wind, rain, snow, etc.).
 - e. Discussion of special permitting and construction code requirements applicable to installation of any work platform and containment system.
9. Name and Address of the proposed recycler who will accept painted metal component construction debris, including letter stating that it will accept such waste.
10. Construction schedule including sequence of critical work.
11. Submit the following to the AUTHORITY and Engineer as a Post-Construction submittal package:
 - a. Copies of waste manifests and receipts acknowledging disposal of all lead waste material from the project, showing delivery date, quantity, and appropriate signature of landfill's authorized representative;
 - b. Summary report with quantities of lead painted wastes recycled;
 - c. All personnel monitoring results; and
 - d. All TCLP testing results.

1.6 REPORT OF FINDINGS

- A. The DESIGN-BUILDER must be thoroughly familiar with the lead paint conditions. The responsibilities established in this Section include the furnishing of all labor, materials, and equipment required to remove, contain, recover, and dispose of lead paint and associated waste identified in these specifications, including the spot removal of paint from surfaces to facilitate demolition of metal structures.
- B. The DESIGN-BUILDER shall assume that all painted surfaces impacted by the Work contain lead.

Alternatively, the DESIGN-BUILDER at his expense may conduct testing utilizing other approved methods.

- C. All lead-containing painted surfaces associated with the work are included in the scope of work. It is the DESIGN-BUILDER's responsibility to familiarize himself with existing conditions and the extent of painted surfaces within the work zones that will need to be managed and disposed of as waste material.

1.7 GENERAL WORK PROCEDURES

- A. Work requiring lead paint abatement shall be carried out in sequential phases. Inspection and approval of each phase by the Consultant shall be sought and gained before proceeding to the next phase and in accordance with the schedule agreed upon by the AUTHORITY. This shall include demolition requirements for work area clearance and work area release prior to DESIGN-BUILDER work. As a Contract requirement, any reasonable delay caused by this requirement will not constitute a basis for claim against the AUTHORITY or Consultant. DESIGN-BUILDER must coordinate the work of this Section with the work of all other trades.
- B. At no time will AUTHORITY permit debris generated from abatement, excavation or demolition activities to be stored inside buildings, and any storage of materials will be subject to AUTHORITY's approval. Assure security of debris at all times.

1.8 SPECIAL CONSIDERATIONS

- A. Work Affected – In general, the following activities are minimum requirements of this section and affect the demolition performed on the painted components:
 - 1. No torch cutting, mechanical sanding, or stripping utilizing abrasive methods without the use of HEPA vacuum attachments and appropriate personal protection equipment for paint removal shall occur.
 - 2. No demolition activities may occur which increase the workers' exposure above the Action Level. DESIGN-BUILDER shall fully comply with the OSHA lead standard at Title 29 CFR, Part 1926.62.
 - 3. Workers shall be informed of the components to be demolished that have been identified as containing lead.
 - 4. Separation of Trades: Unprotected, untrained workers or trades shall not perform any related work within the same vicinity as demolition involving components identified with lead.

1.9 FEES, PERMITS AND LICENSES

- A. The DESIGN-BUILDER shall pay all licensing fees, royalties, and other costs necessary for the use of any copyrighted or patented product, design, invention, or process in the performance of the work specified in this Section. The DESIGN-BUILDER shall be solely responsible for costs, damages, or losses resulting from any infringement of these patent rights or copyrights. The DESIGN-BUILDER shall hold the AUTHORITY harmless from any costs, damages, and losses resulting from any infringement of these patent rights or copyrights. If the Contract Specification requests the use of any product, design, invention, or process that requires a licensing, patent or royalty fee for use in the performance of the job, the DESIGN-BUILDER shall be responsible for the fee or royalty fee and shall disclose the existence of such rights.
- B. DESIGN-BUILDER shall be responsible for costs for all applicable licensing requirements, notification requirements, and all other fees related to the DESIGN-BUILDER's ability to perform the work in this Section.

- C. DESIGN-BUILDER shall secure all necessary permits for work under this Section, including hauling, removal, and disposal, fire and materials usage, or any other permits required to perform this specified work.

1.10 CLEAN-UP

- A. Maintain the work Site in a neat and orderly manner at all times, so as not to interrupt or infringe upon the work of other trades.
- B. Comply with all requirements for release of work area as described in the project specification.
- C. It is the prerogative of the Engineer or his authorized representatives to inspect whenever deemed necessary. The DESIGN-BUILDER is responsible for meeting and correcting any deficiencies discovered which do not meet the current applicable regulations and the requirements of these specifications.

1.11 COORDINATION

- A. Extend full cooperation to AUTHORITY in all matters involving the use of AUTHORITY's facilities. At no time shall DESIGN-BUILDER cause or allow to be caused conditions which may cause risk or hazard to the general public or conditions that might impair safe use of the facility.
- B. Coordinate the work of this section with that of all other trades. Phasing and scheduling of this project will be subject to the approval of the AUTHORITY. The work of this Section shall be scheduled and performed so as not to impede the progress of the project as a whole. The DESIGN-BUILDER shall be available within 24 hours notice of additional work if after acceptance of the work it is determined that complete lead abatement was not achieved from the initial work effort as determined by the AUTHORITY or Consultant.
- C. Unless specifically authorized by the AUTHORITY, the work of this project shall be conducted according to the hours established in Division 1.
- D. Inspections by Consultant: The Consultant may perform visual inspections during the work of this Section, as described below. DESIGN-BUILDER shall not proceed with work until DESIGN-BUILDER has received Consultant's approval at the stages identified below:
 - 1. During: Prior to the commencement of a proposed alternative method other than specified.
 - 2. Post Inspection: At the completion of work and final clean-up, prior to clearance or removal of any critical barriers and decontamination unit from the work area.
 - 3. Waste Removal Inspection: Prior to removal of hazardous waste from the site, AUTHORITY and Consultant will inspect the quantity and type.

1.12 AUTHORITY TO STOP WORK

- A. The AUTHORITY has the authority to stop the demolition work, at any time the AUTHORITY determines either personally or through the services of the AUTHORITY's retained Consultant that conditions are not within the specification and applicable regulations. The stoppage of work shall continue until conditions have been corrected and corrective steps have been taken to the satisfaction of the Consultant. Standby time required to resolve violations shall be at the DESIGN-BUILDER's expense, and shall not be cause for extending the completion date.

1.13 EMERGENCY PRECAUTIONS

- A. The DESIGN-BUILDER shall establish and maintain emergency and fire exits from the work area.
- B. When an injury occurs, the DESIGN-BUILDER shall stop work until the injured person has been removed from the work area.

1.14 DISPOSAL OF WASTE MATERIAL

A. General

1. DESIGN-BUILDER will be required to comply with the Resource Conservation and Recovery Act (RCRA) and with all applicable state and local regulations.
2. Lead paint waste shall be separated from other building components where possible prior to disposal as lead waste.
3. Demolition DESIGN-BUILDER shall be responsible for disposing all waste determined by Toxicity Characteristics Leachate Procedure (TCLP) to be hazardous. If TCLP testing has not been performed, the Demolition DESIGN-BUILDER shall be responsible for testing the waste and the costs associated with the testing and analysis.
4. Demolition DESIGN-BUILDER shall comply with all EPA regulations.
5. Appropriate disposal of all lead paint waste of this project shall be according to Title 40 CFR, Part 241, -261, and 262.
6. Separate all unpainted metal components removed under this Contract for recycling. Submit proof of delivery to recycling facility.
7. The DESIGN-BUILDER is required to recycle/reuse any other recovered materials in lieu of disposal if the material is of acceptable physical quality and chemical quality, and the DESIGN-BUILDER can identify a facility willing and permitted to accept the material.

PART 2 – PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. The DESIGN-BUILDER shall deliver all materials and equipment to the site in the original containers bearing the name of the manufacturer, and details for proper storage and use.
- B. All materials or equipment delivered to the site shall be unloaded, and temporarily stored, and transferred to the work area in a manner which shall not interfere with other trades working in the area.
- C. Unloading and temporary storage sites, and transfer routes, must be approved in advance by the AUTHORITY.
- D. Damaged or deteriorated materials may not be used and must be promptly removed from the premises. Material which becomes contaminated shall be packaged and legally disposed in an approved, secure landfill.

2.2 MATERIALS

- A. All materials and equipment proposed to be used on this project shall be subject to the acceptance of the AUTHORITY and the Consultant. The list of required materials shall include, but not necessarily limited to the following:
 1. Fire retardant polyethylene sheeting, minimum thickness of six (6) mil.
 2. Plastic bags, minimum thickness of six (6) mil.
 3. High quality duct tape.
 4. Lead Warning Signs, as required by the MADOLS Regulations, and OSHA Hazard Communication requirements.

5. Spray adhesive (fire retardant).
6. Personal Protective Equipment, NIOSH approved respirators and filters.
7. Ventilation units with HEPA filtration and exhaust fans.
8. HEPA vacuums.
9. Trisodium-Phosphate (TSP) and product data.
10. Cloth tarpaulin.
11. Chemical strippers, where applicable, not containing methylene chloride and/or flammable materials.
12. Other materials, tools, and equipment necessary for the work.

PART 3 – EXECUTION

3.1 SCHEDULE OF ABATEMENT

- A. The DESIGN-BUILDER shall coordinate all abatement scheduling with the AUTHORITY. A schedule of work shall be submitted to the AUTHORITY, prior to contract performance.

3.2 UTILITIES

- A. Provide all necessary connections for temporary utilities in the work place during work. Shut down and disconnect all electrical power to the work area so that there is no possibility of reactivation and electrical shock during the work. The temporary electrical power shall be in accordance with all OSHA requirements.

3.3 IDENTIFICATION OF HAZARDS

- A. Prior to any work involving lead abatement or excavation of lead containing items, the DESIGN-BUILDER shall identify all work activities in which a worker may be occupationally exposed to lead.
- B. The DESIGN-BUILDER shall initially determine if any worker may be exposed to lead above the action level.

3.4 BARRIERS, ISOLATION AREAS, AND INSTALLATION OF DECONTAMINATION FACILITIES

- A. Containment controls, including critical barriers, protective coverings, HEPA-filtered ventilation and decontamination facilities, may be required for paint removal work. The degree of containment shall be appropriate for the anticipated levels of airborne lead dust. The lower the level of airborne lead, the lesser the requirements necessary to control lead emissions at the job site.
- B. Work Area Isolation During Abatement:
 1. The DESIGN-BUILDER shall isolate work areas for the duration of abatement work by completely sealing off all openings in the work area. Isolation sealing shall be accomplished by constructing critical barriers where necessary around the work area perimeter. The work area shall be sealed airtight to the greatest extent possible, subject to the approval of the Consultant.
 2. Provide temporary power and lighting (with ground fault circuit interrupt protection) to the work areas and ensure safe installation of temporary power sources and equipment per applicable electrical code requirements, and OSHA requirements for temporary lighting in the environment normal to lead-containing paint abatement work areas.

- C. Equipment and Services: The DESIGN-BUILDER shall provide portable lighting, staging and scaffolding, utility hook-ups, portable fire extinguishers, first aid equipment, and all other equipment or items for the safe and efficient performance of work.
- D. Decontamination Facility:
1. The DESIGN-BUILDER shall erect one or more Decontamination Facilities (if applicable) to serve each work area. The facility will consist of a series of two or more connected chambers including, at a minimum, a clean room and a shower/wash room, separated by an air lock. Unless otherwise specified, the shower/wash room shall be contiguous to the work area. Non-contiguous, remote, three-chamber decontamination facilities may be substituted with the Consultant's prior written approval. Three chamber decontamination facilities shall include an equipment room to be used for removal and temporary storage of contaminated work clothing, equipment, and other items leaving the work area, prior to decontamination in the shower/wash room of the decontamination facility.
 2. In all cases, non-emergency access between contaminated and uncontaminated rooms or areas shall only be through the Decontamination Facility/Wash room.
 3. Ensure that barriers and linings are effectively sealed and taped at all times, and that the Shower/Wash Room floor is completely water tight. Repair damaged barriers, and remedy defects immediately upon discovery. Visually inspect enclosures at the beginning of each work period.
- E. All abatement or excavation work areas impacting materials containing lead paints shall remain isolated from all other trades on the project and remain inaccessible to the public. DESIGN-BUILDER shall monitor the access to these work areas. The below listed items are required to control the generation of lead-containing dust during demolition activities. The DESIGN-BUILDER is ultimately responsible for cleaning all generated dust and paint debris and must maintain work areas free from lead dust generated from abatement or excavation activities.
1. Signs shall be posted at all approaches to the work areas warning that work involving lead is being conducted in the vicinity. Signs shall be in bold lettering not smaller than two inches tall.
 2. Barriers shall not be removed until the work areas are thoroughly cleaned and approved by the Consultant.

3.5 LEAD PAINT ABATEMENT

- A. Paint Removal: This shall include the removal of paint from all metal surfaces where torch cutting or welding is required to allow installation of new materials and/or modifications/demolition of existing as specified and/or where shown on the drawings. Paint removal shall follow the below listed requirements:
1. Paint removal shall occur to remove all visible paint down to the bare substrate. The paint shall be removed from an area of at least eight (8) inches where cut lines or welding is to occur at all surfaces of the member. DESIGN-BUILDER shall coordinate with the General DESIGN-BUILDER where the cut lines and welding are to occur.
 2. The following methods are prohibited for use in lead paint removal on this project:
 - a. torch or flame burning;
 - b. dry abrasive blasting using sand, grit or any other particulate;
 - c. on-site use of methylene chloride or solutions containing methylene chloride; and
 - d. machine sanding.

3. DESIGN-BUILDER shall seek AUTHORITY and Consultant approval for the use of chemical strippers/caustic paste on this project.
4. All paint chips, slurry, waste, and debris generated from paint removal shall be collected and removed upon generation during the work.
5. Paint removal shall occur only when proper barriers and protection are in place and approval has been given regarding barrier set-ups and methods of paint removal.

3.6 PERSONAL EXPOSURE AIR SAMPLING - DESIGN-BUILDER

- A. Perform personal exposure air sampling during all abatement work to determine worker exposure limits. Personal exposure sampling shall be conducted in accordance with the DESIGN-BUILDER's written Lead Compliance Program and OSHA requirements. The results of such sampling shall be posted, provided to individual workers, and submitted to the AUTHORITY and Consultant as described herein.
- B. Air sampling results shall be transmitted to the AUTHORITY and individual workers available at the job site in written form no more than forty-eight (48) hours after the completion of a sampling cycle. The reporting document shall list each samples result, sampling duration, sample yield, cassette size, and analysts name and company, and shall include an interpretation of the results. Air sample analysis results will be reported in micrograms/cubic meter ($\mu\text{g}/\text{m}^3$).
- C. The DESIGN-BUILDER's testing lab shall be American Industrial Hygiene Association (AIHA) accredited for analysis of metals. DESIGN-BUILDER shall submit for AUTHORITY's review and acceptance the name and address of the laboratory, certification(s) of AIHA accreditation for metal analysis, listing of relevant experience in air lead analysis, and presentation of a documented Quality Assurance and Quality Control program.
- D. Air monitoring frequency will be established in accordance with the requirements set forth in Title 29 CFR., Part 1926.62.

3.7 ENVIRONMENTAL IMPACT TESTING AND FINAL INSPECTIONS

- A. Ambient Air Monitoring:
 1. The DESIGN-BUILDER shall be responsible for performance of all ambient air monitoring required in accordance with Title 40 CFR, Part 50.12, "National Primary and Secondary Ambient Air Quality Standards for Lead." The DESIGN-BUILDER shall be responsible for retaining a qualified Industrial Hygiene firm for performance of the ambient air monitoring services in accordance with their Lead Compliance Program.
 2. The AUTHORITY may choose to conduct ambient air monitoring to verify that dust particulates containing lead do not exceed ambient air standards outside of the work area. DESIGN-BUILDER will be responsible for corrective measures as necessary.
- B. After a thorough clean-up, the Consultant will visually inspect the work area for the detection of visible debris or contamination. If the visual inspections do not reveal visible debris or contamination, the area shall be cleared. The AUTHORITY retains the right to take wipe samples to verify compliance with final cleaning requirements.

3.8 WORK PROCEDURES

- A. The DESIGN-BUILDER shall initiate and continue sufficient engineering and work practice control, as described in their DESIGN-BUILDERS Lead Compliance Program, the project Health and Safety Plan, and the Work Plan, to reduce and maintain worker exposures to lead at or below the Action Level.

- B. The following work practices are specifically required by these specifications:
 - 1. All persons except those directly involved in the work shall be excluded from the work area. Physical barriers shall be used, where necessary, to limit access to the work area for the duration of any abatement or demolition operations.
 - 2. Provide hand washing facilities and assure that all workers thoroughly wash their hands and face upon exiting the work area. Workers shall pay careful attention to cleanse the hands and face when decontaminating.
 - 3. Thoroughly wet the areas to be disturbed and mist the air to reduce the potential for creating airborne lead and dust.
 - 4. All equipment used by the workers inside the work area shall be either left in the work area or thoroughly decontaminated before being removed from the area. Extra work clothing (in addition to the disposable suits supplied by the DESIGN-BUILDER) shall be left in the clean area until the completion of work in that area. The clean area shall be cleaned of all visible debris and disposable materials daily.
 - 5. Under no circumstances shall workers or supervisory personnel eat, drink, smoke, chew gum, or chew tobacco or apply cosmetics in the work area; to do so shall be grounds for the Consultant to stop all demolition operations. Only in the case of life threatening emergency shall workers or supervisory personnel be allowed to remove their protective respirators while in the work area. In this situation, respirators are to be removed for as short a duration as possible.

3.9 STORAGE OF WASTE

- A. DESIGN-BUILDER shall establish staging areas for the management and containment of lead paint debris.
- B. Use of waste containers on site shall be controlled under the following requirements:
 - 1. Location of waste containers on site shall be coordinated with the DESIGN-BUILDER, subject to AUTHORITY's approval.
 - 2. For waste classified as hazardous based on TCLP testing, waste containers shall be lined with two layers of six-mil polyethylene sheeting, be solid, be enclosed containers, and be locked and sealed at all times.
 - 3. DESIGN-BUILDER shall comply with all federal, state, and local regulations and ordinances regarding lead waste storage.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02091

REMOVAL OF CONTAMINATED FIXTURES

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies the furnishing of all labor, materials, facilities, equipment, services, employee training, testing, permits and agreements necessary to perform the work required for the removal and disposal/recycling of light fixtures containing polychlorinated biphenyls (PCBs) and mercury-containing fluorescent lamps as part of demolition and rehabilitation included in the Green Line Extension Project.
- B. Work shall be in accordance with these specifications, the EPA, OSHA regulations, and any other applicable Federal, State and local government regulations. Whenever there is a conflict or overlap of the above references, the most stringent provisions shall apply.
- C. Equality of material, article, assembly, or system, other than those named or described in this Section, shall be determined in accordance with the provisions of the Contract and General Conditions.
- D. The DESIGN-BUILDER is responsible for any and all damage to the site caused by DESIGN-BUILDER's work, and shall repair all damage to a condition equal to or better than its original condition.
- E. The DESIGN-BUILDER shall coordinate the work outlined in this section with the work outlined throughout the specifications. Removal of fixtures containing hazardous materials shall be performed in preparation for renovations and/or demolition.
- F. All provisions of this contract relating to health and safety of the workers and the public, and protection of the environment, are minimum standards. The DESIGN-BUILDER is responsible for determining whether any additional and/or more stringent protective measures are legally required or necessary by prudent conservative practice. The DESIGN-BUILDER shall also be responsible for implementing such measures. Nothing in this document shall be deemed to relieve the DESIGN-BUILDER from any liability with respect to any such legal requirement or prudent conservative practice.
- G. In addition to the requirements specified herein, the DESIGN-BUILDER shall refer to all Contract Documents for a complete description of work required under this Section.
- H. Fixtures identified as containing PCBs, mercury, or lead shall be considered completely and thoroughly by bidders during pre-bid meetings and other viewing times made available by the AUTHORITY. Bids shall be based on conditions, quantities, and locations existing at the site. All areas shall be made accessible. The AUTHORITY is not responsible for a bidder's failure to completely and accurately document conditions, quantities, and locations of fixtures containing hazardous materials which are to be removed.

1.2 RELATED WORK

- A. Other specification sections that relate to the work include but are not limited to the following:
1. Section 01060 - PERMITS AND REGULATORY REQUIREMENTS
 2. Section 01560 – TEMPORARY CONTROLS
 3. Section 01800 – SUSTAINABILITY REQUIREMENTS
 4. Section 02081 – HAZARDOUS MATERIALS ABATEMENT
 5. Section 02092 – PCB BULK PRODUCT WASTE REMOVAL
 6. Section 02221 – DEMOLITION
 7. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 8. Section 02300 – EARTHWORK
 9. Section 02240 – DEWATERING

1.3 REGULATORY REQUIREMENTS

- A. The DESIGN-BUILDER shall comply with all federal, state, and local regulations pertaining to the Contract. These regulations include, but are not limited to, the following:
1. DOT: 49 CFR Part 171 - 180, Hazardous Materials Transportation Regulations
 2. 40 CFR 761, Polychlorinated Biphenyls Manufacturing, Processing, Distribution in Commerce and Use Prohibitions
 3. 29 CFR 1926.62 - Lead in Construction
 4. 15 U.S.C. 2605, Toxic Substances Control Act
 5. 310 CMR 30.0000, Massachusetts Hazardous Waste Regulations
 6. 40 CFR 273 and 310 CMR 30.1000 (Universal Waste Rule)
 7. 40 CFR 240-299, Resource Conservation and Recovery Act

The DESIGN-BUILDER shall also be responsible for complying with all other applicable OSHA construction and/or general industry standards, including, but not limited to, confined space entry, scaffolding, electrical, slips, trips and falls, lifting, respiratory standards, etc.

- B. The most recent edition of any relevant regulation, standard, document, or code shall be in effect. Where conflict among the requirements or with these Specifications exists, the DESIGN-BUILDER shall utilize the most stringent requirements.
- C. Copies of all applicable standards, regulations, codes, and other documents, including these Contract Documents and appropriate Drawings, shall be available for inspection in a clean area outside the work area, at the work site, at all times.
- D. The DESIGN-BUILDER shall be responsible for complying with all applicable labor regulations. The AUTHORITY shall not be held responsible, or liable, for labor and wage disputes between DESIGN-BUILDER and employees of the DESIGN-BUILDER.
- E. All disposals shall be undertaken in accordance with applicable federal, state, and local statutes, laws, and regulations.

1.4 REGULATORY NOTIFICATIONS

- A. The DESIGN-BUILDER is required to notify the following agencies, and any other agencies or entities which must be notified according to the applicable regulations, and to provide all information and pay all fees on forms acceptable to each agency or entity prior to each phase:

Environmental Protection Agency
One Congress Street, Suite 1100
Boston, MA 02114-2023 (to obtain RCRA generator ID, if needed)

1.5 NOTIFICATIONS TO WORKERS AND OTHER BUILDING OCCUPANTS

- A. Containers used to transport contaminated materials to disposal facilities shall be labeled in accordance with EPA, DOT, and OSHA requirements.
- B. DESIGN-BUILDER shall provide other signs, labels, warnings, and posted instructions that are necessary to protect, inform, and warn people of the hazard from PCB exposure. DESIGN-BUILDER shall post in a prominent place, convenient to the workers and visitors and other building occupants, if applicable, a copy of the latest applicable regulations from OSHA and EPA.

1.6 SUBMITTALS

- A. The DESIGN-BUILDER shall submit satisfactory proof to the AUTHORITY's representative that all required permits have been obtained and that all notifications pertaining to this project have been made.
- B. Name, address, and telephone number of transporter(s), and name, address, and telephone number of EPA-approved disposal/recycling site.
- C. The DESIGN-BUILDER shall submit a written project schedule, including the proposed work shift size and work hours for a minimum of the following activities:
1. Mobilization
 2. Preparation
 3. Removal of fixtures and packaging of PCB and fluorescent bulbs for disposal/recycling.
 4. Cleanup, inspection, and demobilization
- D. The DESIGN-BUILDER shall submit Material Safety Data Sheets (MSDS) for all materials and products to be used by the DESIGN-BUILDER on this project. Products containing methylene chloride or other components generally recognized as carcinogens shall not be allowed.
- E. The DESIGN-BUILDER shall submit the following documents no later than the pre-construction meeting:
1. A list of proposed electrical safeguards to be implemented, including but not limited to, location of transformers, ground-fault circuit intervention (GFCI) outlets, lighting, etc., necessary to safely perform the work, including a description of a plan for common safety practices concerning electrical hazards in the work area.
 2. A list of the chain of command at the work site, including supervisors, foremen, and competent persons and their names, resumes, certificates of training, and Department of Labor and Workforce Development (DLWD) licenses.

3. A written proposed emergency plan and route of egress from each work area in the event of fire or injury, including the name and telephone number of the nearest medical assistance center, fire department, and police department.
4. A list of the name(s), address(es), and identification number(s) of waste transporters and proposed disposal/recycling sites for PCBs and fluorescent bulbs.
5. Copies of completed waste manifests or recycling certificates.

PART 2 – PRODUCTS

2.1 TOOLS AND EQUIPMENT

- A. Other Tools and Equipment: DESIGN-BUILDER shall provide all other tools and equipment required for the removal and proper disposal of fixtures and lamps containing hazardous materials.

PART 3 – EXECUTION

3.1 WORK REQUIREMENTS

- A. The DESIGN-BUILDER shall take care not to break any electrical ballasts, capacitors, or other components containing PCBs or other hazardous materials during removal and packaging for disposal. If any of the ballasts are broken during removal or are observed to be leaking prior to removal, the disposal requirements under TSCA may be different and the DESIGN-BUILDER shall dispose of these broken/leaking ballasts accordingly.

3.2 WASTE PACKAGING AND DISPOSAL/RECYCLING REQUIREMENTS

- A. Waste containers shall include warning signs specific to the type of hazardous material contained within them and pre-printed labels indicating the name of the DESIGN-BUILDER, the name of the AUTHORITY, the site address, and the date of waste generation.
- B. Disposal or recycling must occur at facilities authorized to accept the materials and according to regulatory requirements of the EPA and applicable state and local guidelines and regulations.
- C. The appropriate shipping documentation shall be used to transport PCB and mercury-containing waste to the disposal/recycling facilities. The documentation shall include: (1) the name and address of the facility from which the waste is being removed; (2) the AUTHORITY's address; (3) the name(s), address(es), and telephone number(s) of the DESIGN-BUILDER and of the waste transporter(s); and (4) the name, address, and telephone number of the authorized disposal site. In addition, the document must include the type of waste materials generated, the number and type of waste containers used, and the quantity of each type of waste in pounds or tons.

3.3 TRANSPORTATION

- A. Workers shall load the containers that have been removed from the work area into an enclosed, lockable truck for transportation.
- B. When moving containers, workers shall utilize hand trucks, carts, and proper lifting techniques to avoid back injuries.

- C. The enclosed cargo area of the truck shall be free of debris and lined with 6-mil polyethylene sheeting to prevent containers that leak or spill from contaminating areas external to the cargo area. Floor sheeting shall be installed first and extended up the sidewalls. Wall sheeting shall then be overlapped and taped into place.
- D. Containers shall be placed, not thrown, on level surfaces in the cargo area or metal dumpster, and shall be packed tightly together to prevent shifting and tipping. Large structural components shall be secured to prevent shifting of containers placed on top. No worker shall throw any container into the cargo area of the truck.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02092

PCB BULK PRODUCT WASTE ABATEMENT

PART 1 – GENERAL

1.1 SUMMARY

- A. This Section establishes requirements for the removal, segregation, management, and disposal of assumed Polychlorinated Biphenyl (PCB) Bulk Product Waste and PCB Remediation Waste managed as a result of PCB Bulk Product Waste abatement, primarily in the form of PCB caulking/glazing/paint adhered to or released from building materials, including metal, glass, wood, masonry, asphalt and other building products.
- B. The removal and disposal of building materials with PCBs is regulated by the Toxic Substance Control Act (TSCA) pursuant to Federal regulation 40 CFR 761, and depends on whether the material is classified as a PCB Bulk Product Waste or PCB Remediation Waste. Waste derived from the demolition of man-made structures manufactured, coated, or serviced with PCBs at concentrations greater than or equal to 50 parts per million (ppm) are regulated as a PCB Bulk Product Waste (ref: 40 CFR 761.50(b)(4)). Non-manufactured materials (including substrates) that are “coated or serviced” with PCB Bulk Product Waste (from a greater than 50 ppm PCB source, such as caulk, paint, mastics, sealants) at the time of designation for disposal are also managed as PCB Bulk Product Waste. However, if the substrate is NOT “coated or serviced” (i.e., the PCB Bulk Product Waste, such as caulk or paint, has been removed from or fallen off of the substrate) at the time of designation for disposal, AND the substrate is contaminated with PCBs that have migrated from the Bulk Product Waste, the substrate would be considered a PCB Remediation Waste (ref: 40 CFR 761.50(b)(3)). (Ref: EPA Memorandum “PCB Bulk Product Waste Reinterpretation” dated October 24, 2012 and Federal Register Document Number 2012-4860, dated February 29, 2012).
- C. For the purposes of this project, caulking/glazing/paint materials at the site are known or assumed to contain PCBs in excess of 50 ppm. Therefore, all building materials currently in contact with the caulking/glazing/paint materials in contact with the caulking/glazing/paint materials confirmed through laboratory analysis to contain PCBs > 50 ppm will be treated as a PCB Bulk Product Waste or PCB Remediation Waste, as appropriate, and limited testing has been performed to confirm this assumption.
- D. This Section specifies requirements for the management of known or assumed PCB wastes classified as PCB Bulk Product Wastes and of the associated adhered substrate materials (wood, metals, glass, masonry, etc.) that may have been in contact with materials known or assumed to be classified as a PCB Bulk Product Waste. The substrate materials may be classified as either PCB Bulk Product Waste or as PCB Remediation Waste, as described in Section 1.1.B.
- E. The removal and disposal activities in this Section will be conducted as a “Performance Based” removal pursuant to applicable TSCA regulations (ref. 40 CFR 761.61(b) and 761.62(a)). Since limited sampling for PCBs has occurred, the TSCA regulations may not specifically apply to all portions of this project. Although this is the case, many of the performance requirements of TSCA have been included by reference in this Section as a basis for performing the work. These

performance requirements apply to the work irrespective of the results of any material testing which may take place in the future.

- F. Based on information received to date and correspondence with EPA, the proposed abatement/demolition summarized herein does not require notification or written approval from EPA, which is based on the assumptions presented herein.
- G. The DESIGN-BUILDER or affiliates of the DESIGN-BUILDER (subcontractors, subconsultants, etc.) shall not contact the EPA with respect to interpretations of the regulations or the performance of the work specified herein.
- H. For testing that may be deemed necessary during performance of the work of this Section or other related Sections (asbestos abatement), Engineer/AUTHORITY shall specifically review and approve in writing the proposed testing plan prior to samples being submitted for laboratory analysis.

1.2 RELATED WORK

- A. Other specification sections that relate to the work include but are not limited to the following:
 - 1. Section 01060 – PERMITS AND REGULATORY REQUIREMENTS
 - 2. Section 01560 – TEMPORARY CONTROLS
 - 3. Section 02080 – ASBESTOS REMOVAL
 - 4. Section 02081 – HAZARDOUS MATERIALS ABATEMENT
 - 5. Section 02091 – REMOVAL OF CONTAMINATED FIXTURES
 - 6. Section 02221 – DEMOLITION

1.3 WORK INCLUDED

- A. DESIGN-BUILDER is informed that building renovations and/or demolition activities, including the abatement of asbestos materials, may involve the disturbance materials that are known or assumed to contain PCBs. The intent of this section is to define performance requirements that the DESIGN-BUILDER shall comply with in order to perform the work. Health and safety concerns, disposal requirements, worker training and demolition procedures are described in this Section.
- B. In general, the following activities are minimum requirements of this Section and affect the work performed on building components known or assumed to contain PCBs:
 - 1. No torch cutting, mechanical sanding or stripping, or abrasive methods of removal shall be performed on known or assumed PCB impacted materials unless performed in a controlled setting as summarized herein.
 - 2. No demolition activities shall occur that can reasonably be expected to increase the worker's exposure above the Permissible Exposure Limits (PEL) for PCBs unless certain worker protection is implemented.
 - 3. Workers shall be informed of the known or assumed PCB building components to be removed.

4. At a minimum, worker protection shall comply with applicable OSHA standards. Worker Right to Know and Health and Safety Standards of 1926 shall also apply to the work of this Section.
5. Unprotected, untrained workers or trades shall not perform any related work within or adjacent to work areas that may involve assumed PCB impacted building components.

1.4 SUBMITTALS

- A. Prior to the start of the work, DESIGN-BUILDER shall prepare and submit the following items, and, not commence work activities until submittals are reviewed and acknowledged as being complete by the Engineer/AUTHORITY:
 1. Written demolition and abatement work plan that summarizes the DESIGN-BUILDER's means and methods related to the demolition, containment, cleanup, and management of known or assumed PCB impacted building materials, some of which may also contain lead paint, asbestos or other hazardous materials. The work plan must be compliant with 40 CFR 761.
 2. The names and operating permits of all proposed receiving facilities that may receive PCB wastes.
 3. Proposed sampling plans of any materials the DESIGN-BUILDER proposes to sample. Written approval MUST be obtained from the AUTHORITY prior to any samples being submitted for laboratory analysis.
 4. DESIGN-BUILDER's Performance-Based Work Plan for the removal and disposal of PCB Bulk Product Waste.
 5. DESIGN-BUILDER'S Plan for confirmation sampling of remaining substrates for verification of abatement completion.
 6. Draft waste profiles for all waste streams generated as part of this project for the AUTHORITY's representative to review prior to submitting to the facility.
- B. Review of DESIGN-BUILDER's work plan does not constitute approval of any specified means, methods and health and safety measures to be implemented. Review is for general compliance with this specification and the referenced TSCA regulations.
- C. DESIGN-BUILDER is to provide the following Contract Closeout Submittals (throughout project and prior to authorization of final payment)
 1. Records of the amounts of waste generated, by waste type, and address of origin.
 2. Fully executed and completed waste manifests.
 3. Copies of laboratory analysis of confirmatory substrate sampling.
 4. Drawings showing specific locations of substrate samples and distance from assumed PCB material, for each property and building where PCB waste was removed.
 5. Final PCB Abatement Report with tabulated data demonstrating that PCB bulk product, and PCB remediation wastes were removed in entirety.

1.5 REGULATORY REQUIREMENTS

- A. 40 CFR 761 as it relates to the generation, staging, labeling, removal and off-site management of the PCB wastes summarized herein. As stated, TSCA is being cited as a performance criterion to be achieved during the performance of this work, although TSCA may not specifically apply to work areas where PCB sampling has not been performed to confirm the presence of PCBs above regulatory threshold of 50 parts per million.
- B. Comply with all other applicable federal, state, and local environmental, safety and health requirements regarding the renovation/demolition of structures and other site features and recycling or disposal of demolition debris, as applicable.
- C. All workers involved with abatement of assumed PCB materials must be 40-hour OSHA HAZWOPER trained.

PART 2 -PRODUCTS

2.1 PRODUCTS

- A. HEPA-Filtered Exhausts -Abatement areas of assumed PCB materials (if applicable based on DESIGN-BUILDER's approach) shall be exhausted through a High Efficiency Particulate Air (HEPA) filter. The DESIGN-BUILDER's decision to exhaust work areas is specifically based on the DESIGN-BUILDER's ability to control dust from migrating beyond the immediate work limits.
- B. Commercially manufactured HEPA-filtered exhaust units, with specification plates intact, must be provided for each work area to attain, at a minimum, four air volume changes per hour and an inward flow of clean air into each work area at the Decontamination Facility of at least 100 feet per minute. The HEPA filter shall be preceded by replaceable pre-filters and the unit must be designed so that it cannot be operated unless all filters are in place. The purpose of the containment system is to capture fugitive particulate while removing assumed PCB items. If DESIGN-BUILDER can control visible fugitive dust by others means, HEPA-filtered exhaust units are not necessarily required.
- C. The contactor's specific containment approaches may also include the following products:
 - 1. Polyethylene Sheeting ("Poly") - polyethylene or equivalent with a thickness of at least 6 mil for all applications.
 - 2. Tape and Glue - Shall be capable of sealing plastic joints and attaching plastic to finished surfaces. The bonding strength and resulting seal integrity shall not be affected by mist or water, wetting or encapsulating agent, or any other materials to be used in the work area.
 - 3. Worker personal protective equipment.
 - 4. Drums and containers for management and transport of PCB wastes.
- D. Please note that HEPA-filtered containments of certain asbestos abatement areas may be required as it relates to asbestos abatement work being performed under Section 02080.
- E. Warning Signs and Labels -Work areas shall be properly demarcated in accordance with OSHA.

PART 3 –EXECUTION

3.1 DEMOLITION AND REMOVAL METHODS

- A. Demolition activities shall be conducted in a manner that prevents the potential release of dusts to areas outside each specific abatement work zone and containment.
- B. Any dust generated as part of the work shall be contained to within the PCB abatement work area and workers shall implement appropriate personal protection (respiratory, dermal, etc.).
- C. Non-PCB impacted demolition debris shall be segregated from known or assumed PCB impacted demolition debris.
- D. Feasible engineering controls (e.g., water misters and physical separation and containments) shall be implemented by the DESIGN-BUILDER to minimize the possibility of areas adjacent to work areas (both interior and exterior spaces) from becoming impacted by dusts/debris.

3.2 WORKER PROTECTION

- A. DESIGN-BUILDER shall inform personnel which building materials are assumed to contain PCBs.
- B. The DESIGN-BUILDER shall be responsible for ensuring OSHA compliance for all personnel working with assumed PCB items, including providing appropriate personal protective equipment and training to use such protective equipment.
- C. During selective demolition activities, DESIGN-BUILDER shall ensure that workers are not exposed to any listed contaminant in excess of the permissible exposure limits (PEL). If exposure cannot be reduced to or below the PEL through the use of engineering controls or revised work practices, the DESIGN-BUILDER shall provide personal protective equipment including, but not limited to, respiratory and dermal protection.
- D. DESIGN-BUILDER is permitted to perform personnel air sampling for PCBs as necessary to monitor health and safety.
- E. DESIGN-BUILDER is advised that certain assumed PCB building materials may also contain lead and asbestos. Assumed PCB materials that also contain asbestos shall also be removed in accordance with Section 02080.

3.3 BARRIERS AND ISOLATION AREAS

- A. The DESIGN-BUILDER shall construct and maintain suitable polyethylene barriers to isolate the work areas and to eliminate the potential contamination of other exterior and interior spaces. Barriers shall be of sufficient size and strength to prevent the migration of dust and debris from the work area.
- B. A centralized clean area adjacent to the work area(s) shall be constructed. This clean area shall be of sufficient size for workers to decontaminate personnel and equipment.
- C. Barriers shall not be removed until the work areas are thoroughly cleaned and approved by AUTHORITYs' representative/Engineer.

3.4 NEGATIVE PRESSURE EXHAUST

- A. Negative pressure enclosures will be required if the DESIGN-BUILDER is unable to control visible dusts from migrating beyond the work areas, particularly into interior building spaces.
- B. DESIGN-BUILDER shall consider work approaches that reduce the generation and/or migrations of dust associated with the work summarized herein, including tools operated adjacent to or equipped with high-volume vacuum attachments.

3.5 ABATEMENT OF ASSUMED PCB BULK PRODUCT WASTE AREAS

- A. Storage of PCBs waste shall comply with the labeling and storage requirements established in TSCA (761.40 to 761.50).
- B. Except as otherwise noted, the removal limits of building materials known or assumed to be classified as a PCB Bulk Product Waste or PCB Remediation Waste shall include the removal limits necessary to meet the TSCA regulatory requirements of less than 1 part per million of PCBs in remaining substrates or soil.
- C. Caulking and Glazing
 - 1. All caulking and glazing applications associated with the window/door systems shall be removed in their entirety.
 - 2. Methods of removal shall also be in accordance with Section 02080 if material is also asbestos containing.
 - 3. DESIGN-BUILDER may elect to remove entire window/door system with associated intact caulking and/or glazing.
 - 4. Separation of caulking/glazing from window/door systems is not required.
 - 5. Any residual/visible caulking/glazing in place on building materials designated to remain shall be removed to a minimum of 6 inches beyond the no-visible standard.
- D. Window Systems/Door Frames
 - 1. Window systems/Door Frames, including metal window lintels, wood frames, metal window frames, and wood or metal window trim shall be removed to the limits identified on the Contract drawings.
- E. Masonry, Mortar, Stone, Cast Stone
 - 1. No visible caulking materials shall remain on masonry not removed as specified above in Paragraph 3.5.
 - 2. During removal of masonry and the PCB caulking materials, any other associated materials in contact with caulking shall also be removed, including but not limited to backer filler and flashing materials.
 - 3. During masonry repair following initial abatement, the abatement DESIGN-BUILDER shall collect and dispose of any additional dust and debris that may be generated as part of the final masonry repair work.
 - 4. During the installation of new window/door systems, the abatement DESIGN-BUILDER shall collect and dispose of any incidental dust/debris that may be generated as part of the installation.
- F. Soil

1. DESIGN-BUILDER is required to protect exposed soil areas located beneath and adjacent to work areas.
2. If soil becomes visually impacted from masonry products or other PCB remediation waste materials as a result of the abatement work being performed, DESIGN-BUILDER shall remove and dispose of impacted soil to TSCA regulatory standard of 1 part per million.

3.6 VERIFICATION SAMPLING

- A. Verification sampling following abatement of assumed PCB building materials will be performed by the DESIGN-BUILDER's Environmental Consultant.
- B. A minimum of 3 samples shall be collected of each type of porous material remaining after abatement. The sampling frequency shall be 1 sample per 5 linear feet of PCB material abated. Samples will be submitted for laboratory analysis for PCBs using the Soxhlet extraction method.

3.7 CLEANING PROCEDURES

- A. Upon completion of the removal of known or assumed PCB building materials, cleaning will be performed by the DESIGN-BUILDER. In general, cleaning shall be performed at the end of each work day to prevent the migration of dusts or debris to areas beyond the defined abatement work limits.
- B. A thorough final cleaning shall be performed on all surfaces using wet methods and HEPA filter-equipped vacuums or other approved vacuum equipment. Any water used for final cleaning shall be containerized and managed as PCB-impacted by the DESIGN-BUILDER.
- C. Final cleaning includes removal of any assumed impacted material, equipment or debris (including polyethylene sheeting) from the work area and removal of all visible dusts located on surfaces. All collected polyethylene sheeting shall be packaged for disposal.
- D. Special attention shall be given to personal hygiene and cleaning of supplies and/or equipment.
- E. Non-porous surfaces (metal window frames, metal window lintels, etc.) that may remain in place and that may have been contact with assumed PCB Bulk Product Materials shall be swabbed/wiped using a non-chlorinated organic solvent. Verification sampling of non-porous material that remains in place is not required.

3.8 DECONTAMINATION OF TOOLS

- A. DESIGN-BUILDER shall decontaminate tools that may have been in contact with assumed PCB materials. Decontamination procedures shall be in accordance with 761.79(c)(2)(i), which includes swabbing non-porous tools with a non-chlorinated organic solvent. Swabbing materials shall be disposed as specified in Paragraph 3.9.

3.9 MANAGEMENT OF PCB WASTES

- A. The following materials are assumed to contain PCBs and shall be collected, packaged, sampled and labeled by the DESIGN-BUILDER according to this Section for off-site disposal:
- B. Assumed PCB Bulk Product Waste Management
 1. In accordance with the provisions of TSCA and recent EPA interpretations, the following waste stream(s) shall be assumed to be a PCB Bulk Product Waste:
 - a. Window glazing

- b. Caulking
 - c. Any building material in contact with assumed PCB containing window glazing or caulking that must be removed as part of the DESIGN-BUILDER's overall scope of work at the time of designation for disposal, including:
 - Glass window panes
 - Glass block (only the glass block directly in contact with caulking)
 - Wood window trim, door frames/trim sashes and/or window frames
 - Metal window frames or window lintels (if removed)
 - Electrical components and wire
 - Masonry products (brick, mortar, concrete)
 - Stone and cast stone
2. Portions of the above waste stream may also contain asbestos associated with caulking and glazing applications and therefore shall be noted in the appropriate waste profiles. Coordination with Section 02080 is required.
 3. In accordance with the Performance-Based disposal provisions of 761.61 and 761.62, the assumed PCB Bulk Product Waste and PCB Remediation Waste streams shall be managed in accordance with 761.61(b) or 761.62(a), which is generally a TSCA chemical waste landfill, or for PCB Bulk Product Waste only, 762(b), which is a solid waste landfill. The DESIGN-BUILDER must provide evidence of the selection of the less costly method to transport and disposal of the PCB Bulk Product Waste and PCB Remediation Waste in accordance with applicable regulations.
 4. If a 761.62(b) solid waste landfill is selected, the DESIGN-BUILDER shall receive verification in writing that the landfill is not prohibited from receiving PCB Bulk Product waste generated in Massachusetts. The proposed landfill disposal location must be approved by the AUTHORITY.
- C. Liquid PCB Remediation-Generated Waste Management
1. Any collected wash water or decontamination water shall be managed in accordance with the Performance-Based disposal provisions established in 761.61 (b)(1) and the decontamination standards and procedures established in 761.79. Unless work is specifically being completed in accordance with a Self-Implementation Plan under 761.61(a), management of this waste stream under 761.61(a) is NOT permitted.
 2. DESIGN-BUILDER must pass the water at a minimum through a 5-micron filter to remove total solids.
 3. After filtering, DESIGN-BUILDER must characterize PCB liquids prior to either discharge or transport off-site.
 4. DESIGN-BUILDER shall manage the water as follows:
 - a. Achieve by on-site treatment a PCB concentration of less than 0.5 µg/L for unrestricted use,

- b. Achieve by on-site treatment a PCB discharge concentration permitted by the local sewer authority. DESIGN-BUILDER is responsible for any permitting to a local sewer; or
 - c. Assuming the wastewater contains PCBs less than 50 ppm, transport the remediation wastewater to an appropriately permitted non-TSCA facility for treatment.
5. Coordination with Section 02080 related to asbestos abatement and decontamination may be necessary. To the extent, this liquid remediation-generated waste stream may also contain asbestos; the required 5-micron filtering will address the potential presence of asbestos in the wash water.
- D. Non-Liquid PCB Remediation-Generated Waste Management
- 1. The following materials are assumed to contain PCBs and therefore shall be managed for off-site disposal:
 - a. Debris and dusts generated and collected throughout work activities subject to this Specification.
 - b. HEPA vacuum bags of assumed PCB dusts/debris and potential asbestos debris.
 - c. Filter media from decontamination wash water filtering, including potential asbestos debris.
 - d. Respirator cartridges, scrapers, tarpaulins, suits, plastic and other materials used for PCB abatement, including ground covers and the potential presence of asbestos debris.
 - 2. Management of these materials shall be in accordance with Performance-Based disposal provisions established in 761.61(a) and 761.61(a)(5)(v), as appropriate, and shall include disposal at a non-TSCA landfill for non-liquid materials containing less than 50 ppm of total PCBs, whenever possible. Disposal by incineration at a TSCA-approved facility or in a TSCA-approved chemical waste landfill will be employed for non-liquid materials assumed to contain total PCBs greater than 50 ppm. Waste profiling of the above waste stream shall also include the potential presence of asbestos and lead (if applicable).
- E. Soil
- 1. If DESIGN-BUILDER is required to remove visually-impacted soils due to the DESIGN-BUILDER's inability to adequately protect the ground surface, these soils shall be managed in accordance with Paragraph 3.9 at no additional cost to the AUTHORITY.
- F. Sampling
- 1. Any sampling specified in this Section shall be performed by the DESIGN-BUILDER, including bearing all analytical costs.
 - 2. Written approval for all sampling MUST be received by the DESIGN-BUILDER prior to shipping samples for laboratory analysis.
 - 3. Failure to adhere to the specific sampling program within this Section could result in significant consequential costs/damages to the AUTHORITY. In this case, if DESIGN-BUILDER violates the required sampling program, AUTHORITY will be due from the DESIGN-BUILDER the actual value of the consequential costs.

G. Labeling, Manifests and Shipping Documentation

1. All wastes shall be appropriately containerized and labeled based on the individual waste profiles and classification.
 2. DESIGN-BUILDER shall provide draft waste profiles for all waste streams generated as part of this project for the AUTHORITY's representative to review prior to submitting to the disposal facility.
 3. AUTHORITY will sign as generator on all profiles and shipping documents.
 4. PCB Bulk Product Waste and PCB Remediation Waste (paragraph 3.9(B)) - transport on a non-hazardous manifest.
 - a. PCB wastes greater than 50 ppm that are generated in Massachusetts are classified as a Massachusetts hazardous waste. Since portions of the PCB Bulk Product Waste and PCB Remediation Waste streams are assumed to be greater than 50 ppm, typical transport over the road in Massachusetts for these wastes would require a hazardous materials manifest.
 - b. Once the proposed facility is provided to the AUTHORITY, the AUTHORITY will receive approval from the MassDEP to transport these assumed PCB materials on a non-hazardous materials manifest. This approval requires the materials to be disposed at an out-of-state facility permitted/licensed to receive PCB Bulk Product Waste or PCB Remediation Waste, per applicable sections of TSCA.
 - c. Liquid PCB Remediation-Generated Waste (paragraph 3.9C)) shall be transported under a generic Bill of Lading/material shipping record/non-hazardous waste manifest for less than 50 ppm PCB wastes.
- H. DESIGN-BUILDER shall provide evidence that the PCB waste has been received at legal disposal locations. The means for such proof shall be truck weight slips from an approved disposal facility and copies of applicable waste shipment records (waste profiles, manifests, and Bills-of-Lading). Transport of all materials off site shall be in accordance with applicable Department of Transportation Regulations.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02100
SITE PREPARATION
PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The Design-Builder shall design, layout and install all site preparations at all work sites.

The Design-Builder may elect to substitute different materials or methods other than those specified herein. In that instance, it shall be the Design-Builder's responsibility to demonstrate to the MBTA that the proposed design is equal to or greater than these specifications and will comply with all permit and regulatory requirements.

- B. Work Included: This Section specifies the following items.

1. Clearing, grubbing, and disposing of vegetation, including bushes, brush, trees, stumps, fallen timber, logs, roots, rubbish, refuse, trash, and debris within the indicated limits.
2. Protection from injury or defacement of vegetation (including urban wild) and objects indicated or designated by the Owner to be preserved.
3. Removal, salvage, or other disposition of basement walls, slabs and footings; existing pavement, curbs and gutters, sidewalks, headwalls, walls, and steps; utility service facilities; guardrail and posts, highway and street signs and fences; and other miscellaneous structures and site improvements which interfere with construction, as indicated, or as required by the Owner.
4. Placing of siltation fence and straw bales for erosion and sedimentation control.
5. Preparing site access roadways, storage areas, and temporary construction fencing.
6. Temporary Construction Easement Zones shall be restored or replaced as required by the Owner.

- C. Related Work:

1. Volume 2 Technical Provisions Exhibit 21 "Additional Project Requirements"
2. Section 02060 – EROSION AND SEDIMENTATION CONTROL
3. Section 02221 – DEMOLITION
4. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
5. Section 02300 – EARTHWORK.
6. Section 02650 – EXISTING SITE UTILITIES.
7. Section 02444 – CHAIN-LINK FENCE AND GATES.
8. Section 02359 – MODULAR PRECAST BLOCK RETAINING WALLS

9. Section 02509 – PAVEMENT BASE COURSES

1.2 SUBMITTALS

- A. Submit copies of requests for and certificates of severance of utility services to the MBTA at least ten days prior to start of site preparation work. Submit product information for temporary construction fencing to the MBTA at least ten days prior to fence installation. See Section 02060 – EROSION AND SEDIMENTATION CONTROL for submittal requirements for siltation fence and straw bales.

PART 2 - PRODUCTS

2.1 TEMPORARY CONSTRUCTION FENCING

- A. Construction fence material shall be rolled chain link fence, 6-feet high, conforming to ASTM A392-96 Standard Specifications for Zinc-Coated Chain Link Fence. All posts shall be galvanized steel composition line posts, end posts and corner posts shall be galvanized steel with a minimum OD of 2.375-inches. Gate posts shall have a minimum OD of 4.0-inches.

2.2 WARNING SIGNS

- A. Diamond shaped warning signs with message of “Construction Zone – Keep Out” shall be attached to the construction fencing.
- B. The signs shall have minimum dimensions of 24-inch by 24-inch with orange background and black letters.

2.3 EROSION AND SEDIMENTATION CONTROL PRODUCTS

- A. See Section 02060 - EROSION AND SEDIMENTATION CONTROL for materials and products required to implement the Project Wide Erosion and Sedimentation Control Program.

PART 3 - EXECUTION

3.1 PROTECTION

- A. Protect indicated or designated trees to prevent damage to the trunk, foliage and root system by construction equipment or procedures.
- B. Protect other plants, monuments, existing improvements, adjacent property, and facilities from damage.
- C. Maintain protected vegetation in a healthy growing condition during construction.

3.2 CLEARING AND GRUBBING

- A. Clear materials specified herein to the limits shown and remove from the site. Remove stumps and roots completely in excavation areas and under embankments where the original ground level is within

3.5 feet of the sub-grade or slope of embankments. In embankment areas where the original ground level is more than 3.5 feet below the sub-grade or slope of embankment, cut off trees, stumps, and brush to within six inches of the ground. Do not start earthwork operations in areas where clearing and grubbing is not complete, except that stumps and large roots may be removed concurrently with excavation.

- B. Where the work includes the removal of elm trees or the branches or stumps of elm trees, dispose of such material immediately after cutting or removal, by covering with earth to a depth of at least six inches in areas off the jobsite where such disposal has been arranged.
- C. Where the work under the Contract includes the provision of wood chip mulch, acceptable material from clearing and grubbing activities may be used to produce such mulch. Material obtained from elm trees will not be acceptable for such use.

3.3 TREE BRANCHES

- A. Remove tree branches overhanging trackways, roadways, and other designated areas of the site to within 20 feet of the finish grade. Cut off branches neatly close to the tree boles. Remove other branches as necessary to present a balanced appearance. Treat scars resulting from tree branch removal with a heavy coat of an approved asphaltic tree paint.

3.4 REMOVAL

- A. Remove entirely existing miscellaneous structures and site improvements that interfere with construction, as indicated, or as designated by the MBTA. Remove walls and masonry construction to a minimum depth of two feet below existing ground level in areas where such items do not interfere with construction.
- B. Remove organic or otherwise deleterious soils below proposed foundations.
- C. Abandoned Rail and Track Materials. Take possession of, remove, and dispose of offsite, materials between boundaries located two feet outside of the rails and including the space between double tracks.
- D. Slabs may be broken and left in place where the MBTA determines it is not detrimental to the structural integrity of the fill or structure to be placed above.
- E. All removal shall be done in accordance with applicable state and federal laws.

3.5 SALVAGE

- A. Salvage indicated material or material determined by the MBTA to be suitable for reuse, including: grates, frames, other metal castings and miscellaneous parts of inlets and manholes; hydrants, fire alarm posts and boxes; metal light poles; sound pipe and valves; metal fencing; guard rail; and highway and street signs and posts.
- B. Protect metallic coatings on salvaged items. Remove adhering concrete from salvaged items.
- C. Repair, or replace with new material, salvaged material damaged or destroyed due to the Design-Builder's negligence.

3.6 BACKFILL

- A. Backfill and compact trenches and excavations resulting from work under this Section in accordance with Section 02300 - EARTHWORK.

3.7 SILT FENCE AND HAY BALE INSTALLATION

- A. Refer to Section 02060 – EROSION AND SEDIMENTATION CONTROL.

3.8 TEMPORARY CONSTRUCTION FENCING

- A. The temporary fence shall be installed in accordance with the manufacturer’s instructions.
- B. All posts except those located on existing bituminous concrete pavement, shall be driven 2-ft deep into the ground, with gate posts and corner posts encased in concrete. The posts set on pavement shall be secured with concrete bases.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection with the work are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02150

UNDERPINNING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section presents the performance requirements for underpinning and support of existing structures adjacent to and above new construction, and the restoration of those structures to the conditions existing prior to the commencement of underpinning and support operations.
- B. Related Work: Other specification sections that relate to the work of this section include, but are not limited to, the following:
1. Volume 2 Technical Provisions – Exhibit 2I - Additional Project Requirements
 2. Section 02015 - GEOTECHNICAL INSTRUMENTATION
 3. Section 02240 - DEWATERING
 4. Section 02260 - EXCAVATION SUPPORT AND PROTECTION
 5. Section 02300 - EARTHWORK
 6. Section 02360 - DRIVEN PILES
 7. Section 02369 - DRILLED MINI-PILES
 8. Section 03300 - CAST-IN-PLACE CONCRETE
 9. Section 05126 - STRUCTURAL STEEL FOR RETAINING WALLS
- C. Definitions
1. Shoring: Props or posts of timber or other material in compression or bending, used for temporary support of excavations, formwork, or structures.
 2. Sheeting: A line of steel sections or timber planks, plain or tongue-and-grooved on sides, driven endwise into the ground to protect subgrade operations.
 3. Underpinning: Permanent construction which directly transmits existing structure foundation loads to a lower bearing elevation, and which preserves the structures being underpinned.
 4. Support: Structural elements required to prevent movement of existing structures until completion of the underpinning.
 5. Lagging: A temporary or permanent excavation support structure consisting of heavy timber boards, planking, or sheathing secured in place by H-piles.

6. Restoration: Reconstruction, by repair or replacement, of portions of structures removed or altered by underpinning and support operations.
7. Parcel: An area as indicated, including the structures thereon and any adjacent vaults and permanent closure walls connected thereto.

D. The Work of this section also includes the following:

1. The construction of drilled shafts shall not disturb existing structures or the completed work. Damage to such structures shall be repaired by the Design-Builder at no additional cost to the MBTA.
2. Adjacent structures shall be monitored and protected as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
3. Construction operations not to exceed specified noise limits in accordance with Volume 2 Technical Provisions, Exhibit 2I, Additional Project Requirements.

1.2 SUBMITTALS

- A. Working and Shop Drawings. Submit Working and Shop Drawings a minimum of 21 calendar days prior to the start of underpinning. Show method, staging, and necessary details for the construction of underpinning and support for each structure on which work is to be accomplished. Show details of shop assemblies when required for restoration of structures. Working and Shop Drawings, and calculations shall be prepared, sealed, and signed by a professional engineer hired by the Design-Builder currently registered in the Commonwealth of Massachusetts.
- B. Computations. Submit design computations in a design submission with the working and Shop Drawings a minimum of 14 calendar days prior to the start of underpinning. The design submission shall include the applicable code requirements and design references and shall include computations to support Shop Drawings to the MBTA.
- C. Procedures. Submit the following a minimum of 21 calendar days prior to the start of underpinning
 1. Submit procedure for detection of movement, as specified in Section 3.1.
 2. Submit procedure for preloading (jacking load) new foundations.
 3. Submit procedure for proof load testing and preloading (jacking load) of lateral support systems, such as strut and tieback assemblies.
- D. Jacking Gage Calibration. Submit data for the pressure gage and jack combination certified by an accepted testing laboratory not earlier than 14 days prior to start of use for underpinning.
- E. Support and Restoration. Submit procedures, methods, and materials lists for support and restoration a minimum of 21 calendar days prior to the start of underpinning.
- F. Qualifications of Design-Builder's Engineer a minimum of 21 calendar days prior to the start of underpinning.

1.3 QUALITY ASSURANCE

- A. Tolerances - Piles and Piers:

1. Offset of Top of Pile or Pier from Design Center: 1-1/2 inches maximum.
 2. Out of Plumb: Two % maximum.
- B. Job Conditions
1. Access. Notify the MBTA at least 30 days in advance of the date on which the Design-Builder requires occupancy of parcels to be underpinned, supported, and restored.
 2. Permits. The Design-Builder shall obtain and pay for permits for entry into structures and for the right to do underpinning, support, and restoration as required.
 3. Temporary Partitions
 - a. Build closed temporary partitions to isolate the work site from the portions of the structure not occupied by the Design-Builder.
 - b. Upon completion of the work, remove temporary partitions and restore the area to its condition prior to the start of underpinning.
 4. Maintenance of Services. Locate, protect, support, and maintain uninterrupted, utilities, equipment, and services within the limits of the underpinning work, or relocate same to the satisfaction of the Parcel owner.

PART 2 - PRODUCTS

2.1 REQUIREMENTS

- A. The Design-Builder shall furnish all materials, tools, equipment, facilities, and services as required for providing the necessary shoring and underpinning work and facilities.

2.2 CONCRETE AND REINFORCING STEEL

- A. Refer to Section 03300 - CAST-IN-PLACE CONCRETE.

2.3 STRUCTURAL STEEL

- A. Refer to Section 05126 - STRUCTURAL STEEL FOR RETAINING WALLS.

2.4 PILING

- A. Refer to Section 02360 - DRIVEN PILES.

2.5 DRILLED MINI-PILES

- A. Refer to Section 02369 – DRILLED MINI-PILES.

PART 3 - EXECUTION

3.1 DETECTION OF MOVEMENT

- A. Inscribe or firmly affix on each column, pile cap, or wall to be underpinned or supported, and at additional locations as directed by the MBTA, visual methods of determining movements. The method used is optional but shall be capable of being read to an accuracy of 0.005 foot.
- B. Take and record readings continually during excavation, jacking, and refounding operations under the existing structure.
- C. Stop work, notify the MBTA, and take immediate remedial action if movement of the existing structure occurs during progress of the work.
- D. Upon completion of underpinning of an existing structure, take daily readings of the measurement points for a minimum period of 30 days, or until movement stops, and report the results to the MBTA.
- E. Refer to Section 02015 – GEOTECHNICAL INSTRUMENTATION for additional requirements.

3.2 CONCRETE PIERS, WALLS, AND PILE CAPS

- A. Install concrete piers, walls, and pile caps with the top approximately three inches below the structure to be underpinned. Dry pack the space between the foundation and the concrete with 4,000 psi non-shrink grout within three days after concrete placement is completed.
- B. Where earth form is required, install a waterproof barrier between the earth and the concrete to prevent water loss from the fresh concrete.
- C. Do not remove support of the existing structure until concrete piers, walls, or pile caps have attained design strength.

3.3 PILES

- A. Install piles extending from the underside of existing footings to the elevations required to develop the design working load of the pile.
- B. Distribute jacking reactions over the existing structure in a manner that will not overstress or deflect the existing structure to cause damage. Provide computations of allowable stresses and deflections and show on the Shop Drawings.
- C. Provide watertight welds capable of developing the full strength of the pile. Align splices to ensure the straightness of the pile from top to tip. Use outside sleeves and backup rings as necessary.
- D. Load Testing. Load test each pile to demonstrate the load carrying capacity as required by the Shop Drawings and computations. Apply a minimum load of 150% of the design working load of the pile. Load-test piles in those sequences and groupings which will eliminate eccentric loadings and the associated structural damage to the existing structure and foundations.

- E. Securely fasten or wedge in place those piles which have satisfied the load-testing requirements. Weld and encase in concrete all wedges, plates, wedging struts, and piles, as indicated on the Shop Drawings
- F. Concreting Pits. Following completion of load transfer, fill the underpinning pits with concrete as indicated on the Shop Drawings. Without limitation, the Design-Builder shall furnish and install reinforcement, shear keys, dowels and waterstops as indicated on Shop Drawings. Place concrete to within three inches of the underside of the existing foundation. Dry pack the space between foundation and concrete with 4,000 psi non-shrink grout.

3.4 BACKFILL

- A. Backfill in accordance with Section 02300 - EARTHWORK, after acceptance of underpinning by the MBTA.

3.5 SUPPORT INSTALLATION

- A. Install supports where necessary to temporarily support structures to be underpinned and those which will be affected by underpinning and restoration work.

3.6 RESTORATION

- A. Restore existing structures and landscaping to conditions equivalent to those existing prior to the start of underpinning and support work, unless otherwise indicated. Any damage to affected buildings caused by the underpinning work shall be repaired by the Design-Builder at no additional cost to the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02195

GROUND IMPROVEMENT – AGGREGATE PIERS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work shall consist of designing, furnishing, and installing aggregate pier ground improvements as necessary to improve the strength and/or stiffness of the soil. Other methods of ground improvement may be proposed by the Design-Builder for review and approval by the MBTA. Ground improvement may be used for support of foundation loads, but may also be used for other situations where improved soil strength and/or stiffness is required.

1.2 WORK INCLUDED

- A. Without limitation, Design-Builder shall provide all equipment, material, labor, and supervision to design and install ground improvement including aggregate piers. The work of spoil removal, footing excavations, and subgrade preparation following aggregate pier installation is described in other specification sections.
- B. The aggregate pier design and installation shall adhere to all performance criteria and standards described in this Specification.
- C. The construction of ground improvements shall not disturb existing structures or the completed work. Damage to such structures shall be repaired by the Design-Builder at no additional cost to the MBTA.
- D. Adjacent structures shall be monitored and protected as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
- E. Vibration monitoring for ground improvement installation will be performed by the Design-Builder's Instrumentation Engineer as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
- F. Construction operations not to exceed specified noise limits in accordance with Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements".

1.3 APPROVED INSTALLERS

- A. The Aggregate Pier Installer (the Installer) shall be approved by the MBTA. Prior to approval, the Installer shall submit to the MBTA a qualification statement to demonstrate a minimum of 5 years of experience with the installation of aggregate pier systems and shall have completed at least 10 projects of a similar scope and nature. Without exception, no alternate installer will be accepted unless approved by the MBTA.

1.4 REFERENCE STANDARDS

- A. Modulus Testing
 - 1. ASTM D 1143 - Pile Load Test Procedures

2. ASTM D 1194 - Spread Footing Load Test
- B. Materials and Inspection
1. ASTM D 1241 - Aggregate Quality
 2. ASTM D 422 - Gradation of Soils

1.5 CERTIFICATIONS AND SUBMITTALS

PART 2 - PRODUCTS

2.1 AGGREGATE

- A. Aggregate used by the Aggregate Pier Installer for pier construction shall be pre-approved by the Designer and shall demonstrate suitable performance during modulus testing.
- B. Potable water or other suitable source shall be used to increase aggregate moisture content where required. The Design-Builder shall provide such water to the Aggregate Pier Installer.

PART 3 - EXECUTION

3.1 AGGREGATE PIER DESIGN

- A. The design of the aggregate pier system shall be based on the service load bearing pressure and the allowable total and differential settlement criteria of the structure foundations. The aggregate pier system shall be designed in accordance with generally-accepted engineering practice.
- B. The aggregate pier elements shall be designed using an aggregate pier stiffness modulus to be verified by the results of the modulus test described in Section 3.7 of these specifications.

3.2 DESIGN SUBMITTAL

- A. The Design-Builder shall submit detailed design calculations, construction drawings, and shop drawings (the Design Submittal), for approval at least six week(s) prior to the beginning of construction. A detailed explanation of the design parameters for settlement calculations shall be included in the Design Submittal. Additionally, the Design Submittal shall include a quality control test program for aggregate pier system, meeting these design requirements. All computer-generated calculations and drawings shall be prepared and sealed by a Professional Engineer, licensed in the Commonwealth of Massachusetts.
- B. The following shall be included in the design calculation submittal:
 1. A written summary report that describes the overall ground improvement design
 2. Applicable code requirements and design references.
 3. Ground improvement critical design cross-section(s) and geometry including soil/rock strata and location, magnitude and direction of external surcharge loads, and piezometric levels with critical slip surface shown along with a minimum calculated global stability factor of safety

4. Design criteria including, soil/rock shear strengths including friction angle and cohesion, unit weights, aggregate pier hole diameter, aggregate pier spacing, aggregate pier unit weight and friction angle, composite shear strength parameters, and any other design assumptions.
 5. Design calculation sheets with project number, wall location, designation, date of preparation, initials of designer and checker, and page number at the top of each page. An index page with the design calculations shall be provided.
 6. Design notes including an explanation of any symbols and computer programs used in the design.
 7. Detailed subgrade preparation notes and requirements.
- C. Working Drawings. Utility locations, right of way, and other applicable information is available on the plans. Without limitation, Working Drawings shall include:
1. A plan view of the ground improvement for identifying:
 - a. Right of way, permanent or temporary construction easement limits, location of all known active or abandoned existing utilities, adjacent structures, or other potential interferences. Any drainage structure or drainage pipe centerline behind, passing through, or passing under the structure.
 - b. Limits of the ground improvement and layout of the individual aggregate piers.
 2. Subsurface exploration locations shown on a plan view of the proposed structure alignment with appropriate reference base lines to fix the locations of the explorations relative to the structure.
 3. Elevation view showing aggregate pier locations, elevations and depth of improvement, location of drainage elements and expansion/contraction joints when applicable.

3.3 APPROVED INSTALLATION PROCEDURES

- A. Unless otherwise approved by the Designer, the installation method used for aggregate pier construction shall be that as used in the construction of the successful modulus test.

3.4 PLAN LOCATION AND ELEVATION OF AGGREGATE PIERS

- A. The as-built center and bottom elevation of each pier shall be within 6 inches of the locations indicated on the Working Drawings. Piers installed outside of the above tolerances and deemed not acceptable shall be rebuilt at no additional expense to the MBTA.

3.5 REJECTED AGGREGATE PIERS

- A. Aggregate Pier elements installed beyond the maximum allowable tolerances shall be abandoned and replaced with new piers, unless the Designer approves the condition or provides other remedial measures. All material and labor required to replace rejected piers shall be provided at no additional cost to the MBTA, unless the cause of rejection is due to an obstruction or mislocation.

3.6 CONTROL TECHNICIAN

- A. The Installer shall have a full-time, on-site Control Technician to verify and report all installation procedures. The Installer shall immediately report any unusual conditions encountered during installation to the Aggregate Pier Designer, the Design-Builder, and to the MBTA. The quality control procedures shall include the preparation of Aggregate Pier Progress Reports completed during each day of installation containing the following information:
1. Footing and aggregate pier location.
 2. Pre-auger diameter and soil conditions encountered during drilling (if required).
 3. aggregate pier length.
 4. Planned and actual aggregate pier elevations at the top and bottom of the aggregate pier.
 5. Average lift thickness of each aggregate pier.
 6. Volume of aggregate used in each aggregate pier.
 7. Documentation of any unusual conditions encountered.
 8. Type and size of densification equipment used.

3.7 AGGREGATE PIER MODULUS TEST

- A. A minimum of one (1) Modulus Test is required per structure or change in soil conditions, whichever is greater. When authorized, an Aggregate Pier Modulus Test(s) shall be performed at locations agreed upon by the Aggregate Pier Designer and the MBTA to verify or modify aggregate pier designs. Modulus Test Procedures shall utilize appropriate portions of ASTM D 1143 and ASTM D 1194, as outlined in the aggregate pier design submittal. aggregate piers shall be tested to 150% of the maximum design stress as shown in the aggregate pier design submittal. The aggregate pier used for each modulus tests shall be constructed using the same equipment and procedures and in similar soil conditions as production aggregate piers.
- B. A telltale shall be installed at the bottom of the test pier so that bottom-of-pier deflections may be determined. Acceptable performance is indicated when the bottom of the pier deflection is no more than 30% of the top of pier deflection at the design stress level.
- C. ASTM D-1143 general test procedures shall be used as a guide to establishing load increments, load increment duration, and load decrements. The loading increment shall be a minimum of 17% of the design load and shall be held for a maximum of 15 minutes. At least one load increment per test shall be held for 60 minutes to provide data to evaluate creep.
- D. All load increments shall be held for a minimum of 15 minutes. Loads are then maintained until the rate of deflection reduces to 0.01 inch per hour or for the maximum of 1 hour, whichever is occurs first.
- E. A minimum of one load increment that represents greater than 100% of the design maximum stress on the aggregate pier shall be held until the rate of deflection reduces to 0.01 inch per hour or for the maximum of 4 hours, whichever is occurs first.
- F. A seating load equal to 5% of the total load shall be applied to the loaded steel plate prior to application of load increments and prior to measurement of deflections to compensate for surficial disturbance.

3.8 BOTTOM STABILIZATION TESTING (BSTS) / CROWD STABILIZATION TESTING (CSTs)

- A. Bottom stabilization testing (BSTs) or Crowd stabilization testing (CSTs) shall be performed by the Control Technician during the installation of the modulus test pier. The installer shall perform a minimum of one test per Modulus Test. The tests are performed by applying downward vertical energy to the tamper, mandrel or probe following lift construction and monitoring the amount of additional deflection from the applied energy. Additional BST/CST testing as required by the Aggregate Pier Designer (a minimum of 10% of the production aggregate piers) shall be performed on selected production aggregate pier elements to compare results with the modulus test pier.

3.9 INDEPENDENT ENGINEERING TESTING AGENCY (MBTA'S QUALITY ASSURANCE)

- A. The Design-Builder is responsible for retaining an independent engineering testing agency to provide Quality Assurance services.

3.10 RESPONSIBILITIES OF INDEPENDENT ENGINEERING TESTING AGENCY

- A. The Testing Agency shall monitor the modulus test pier installation and testing. The Installer shall provide and install all dial indicators and other measuring devices.
- B. The Testing Agency shall monitor the installation of aggregate piers to verify that the production installation practices are similar to those used during the installation of the modulus test elements.
- C. The Testing Agency shall report any discrepancies to the Installer, Design-Builder, and MBTA immediately.
- D. The Testing Agency shall observe the excavation, fill placement and compaction, and preparation of subgrades for the construction of foundations supported by the aggregate piers.
- E. The Testing Agency shall observe subsurface soils are consistent with the design assumptions.

3.11 SITE PREPARATION AND PROTECTION

- A. The Design-Builder shall locate and protect underground and aboveground utilities and other structures from damage during installation of the aggregate piers.
- B. Design-Builder shall prepare site grades for aggregate pier installation to minimize aggregate pier installation depths. Ground elevations and bottom of footing elevations shall be determined in sufficient detail to estimate installation depth elevations to within 3 inches.
- C. The Design-Builder shall prepare and maintain a stable working surface required for the efficient installation of aggregate piers. Design-Builder to provide wet weather protection of the subgrade and to provide access for efficient operation of the aggregate pier installation.
- D. Prior to, during and following aggregate pier installation, the Design-Builder shall provide positive drainage to protect the site from wet weather and surface ponding of water.
- E. If spoils are generated by aggregate pier installation, Design-Builder shall remove spoils from the aggregate pier work area in a timely manner to prevent interruption of aggregate pier installation.

3.12 AGGREGATE PIER LAYOUT

- A. The Design-Builder shall layout individual aggregate pier elements in the field using survey stakes or similar means at locations shown on the drawings in accordance with Section 3.4 PLAN LOCATION AND ELEVATION OF AGGREGATE PIERS.

3.13 EXCAVATIONS FOR OBSTRUCTIONS

- A. The Design-Builder shall remove obstructions encountered during installation, or the pier shall be relocated or abandoned in accordance with a design change provided by the Designer. Obstructions include, but are not limited to, boulders, timbers, concrete, bricks, utility lines, which shall prevent placing the piers to the required location and depth.

3.14 UTILITY EXCAVATIONS

- A. The Design-Builder shall coordinate all excavations made subsequent to aggregate pier installations so that excavations do not encroach on the piers as shown in the aggregate pier construction drawings. Design-Builder shall protect completed aggregate piers. In the event that utility excavations are required in close proximity to the installed aggregate piers, the Design-Builder shall contact the Aggregate Pier Designer immediately to develop construction solutions to minimize impacts on the installed aggregate pier elements.

3.15 FOOTING BOTTOMS

- A. Excavation and surface compaction of all improved subgrades shall be the responsibility of the Design-Builder.
- B. Foundation excavations to expose the tops of aggregate piers shall be made to protect the subgrade and aggregate piers until concrete placement, with procedures and equipment best suited to: (1) avoid exposure to water; (2) prevent softening of the matrix soil between and around the aggregate piers before pouring structural concrete; and, (3) achieve direct and firm contact between the dense, undisturbed aggregate piers and the concrete footing.
- C. Subgrade Preparation: Following aggregate pier installation, the Design-Builder shall prepare the subgrade prior to the placement of structures to be supported.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02196

GEOTEXTILE MATERIALS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
1. Work of this Section consists of all labor, materials, equipment and incidentals required to furnish and install Geotextile Fabric for Stabilization (generally 2:1 or greater slopes) and for seeded drainage channels to minimize erosion of soils as shown on the contract documents and as directed by the MBTA.
- B. The Design-Builder shall design, layout and install all geotextile materials at all work sites necessary to stabilize soils and minimize soil erosion.

The Design-Builder may elect to substitute different materials or methods other than those specified herein. In that instance, it shall be the Design-Builder's responsibility to demonstrate to the MBTA that the proposed design is equal to or greater than these specifications and will comply with all permit and regulatory requirements.

- C. Related Work:
1. Section 02060 – EROSION AND SEDIMENTATION CONTROL
 2. Section 02100 – SITE PREPARATION
 3. Section 02270 – SLOPE PROTECTION
 4. Section 02300 – EARTHWORK
 5. Section 02357 – CAST IN PLACE CONCRETE RETAINING WALLS
 6. Section 02509 – PAVEMENT BASE COURSES

1.2 SUBMITTALS

- A. Design-Builder shall provide the following samples and submittals for approval. Do not order materials until MBTA's approval of samples, certifications and/or test results has been obtained. Delivered materials shall closely match the approved samples. Samples and approvals which are not obtained prior to the ordering of materials or the completion of work shall result in possible disapproval of obtained materials or completed work.
- B. Manufacturer's Literature: Submit manufacturer's literature indicating material descriptions, physical properties and installation instructions for the following:
1. Geotextile Fabric for Stabilization.
- C. Samples: Submit 2 foot x 2 foot samples of each of the following materials:
1. Geotextile Fabric for Stabilization.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Substitutions for alternative materials shall meet the equivalent specifications, and shall be requested in writing for approval by the MBTA.
- B. Testing for physical properties shall be completed at a Geosynthetic Accreditation Institute Program (GAI-LAP) accredited laboratory. Material property values shall be reflective of Minimum Average Roll Values (MARV). Letters of MARV values from a GAI-LAP accredited laboratory and signed by a manufacturer representative shall accompany all materials shipped to the job sites.

2.2 GEOTEXTILE FABRIC

- A. Fabric netting and fiber body shall be a composed of biodegradable materials approved by the MBTA.
- B. Limiting shear stress for soil loss shall be 4 pounds per square foot in vegetated state at 0.5 hours peak flow duration.
- C. Geotextile fabric shall be used in the ballast mat

2.3 ANCHORS

- A. Anchoring devices shall consist of U-shaped wire staples. Wire shall be a minimum of 8 gauge. All anchors should be 8-10 inches. Longer anchors may be necessary for loose soils.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

- A. Alternate construction methods, if required, shall be approved by the MBTA prior to construction. Specific written installation instructions of the manufacturer shall supplement the instructions in these Specifications and as shown on the Approved Drawings.
- B. Before placing erosion control fabric, the sub-grade shall be inspected by the Design-Builder and MBTA to ensure that it has been evenly graded, properly compacted, that it is smooth, without soft areas, voids, obstructions, stones or other foreign matter. All plantings shall have been installed with watering saucers or seeded as shown on the Approved Drawings prior to installation of fabric. Refer to Approved Drawings for specific details regarding installation of Geotextile Fabric for Stabilization. Work shall not be undertaken when it is raining or when rain is forecast for that workday. Weather forecast printout shall be given to the MBTA prior to commencing this work.
- C. Open bales of jute fabric according to manufacturer's printed instructions.
- D. At tops of slopes or channels, as shown on the Approved Drawings, cut a 6-inch deep trench at least two feet from the crown of the slope, where possible, and backfill and compact the fill. Insert wire staples one foot on center to secure the top edge. Unfold the fabric down the slope, ensuring that it lies smoothly but loosely on the surface without tension. Where plantings are present, make perpendicular cuts in the fabric to allow the fabric to work around the base of the plant, making

any additional cuts as required. Insert staples 6 inches on center to join the cut fabric and to secure around plant bases. Staple center area of fabric at 3 feet on center and 6 inches on center at edges after overlapping adjacent panels of fabric. At junction overlaps of fabric joints, fold under upper panel bottom edge 6 inches and insert lower panel 20 inches, shingle-like, under the upper panel. Inset staples 6 inches on center at junction overlaps. Terminate fabric 2 feet beyond toe of slope where possible. Adjacent longitudinal fabric panels should extend by 6 inches at side overlaps. Cover outside edges of fabric with existing topsoil with added Compost Topsoil and tamp in place. Ensure that fabric covers all areas shown on the Drawings which are to be protected from erosion. All surfaces shall be rolled with a 75-pound per linear foot roller to ensure complete contact with soil below. Any seeded areas that are disturbed by installation of fabric shall be overseeded. All completed areas of Geotextile Fabric for Stabilization shall be approved by the MBTA.

3.2 SLOPES

- A. Refer to General Installations preceding and modify as shown herein. Unless otherwise directed by the Approved Drawings, where cut or fill slopes extend into channels, channels shall be lined with fabric prior to placement of fabric on slopes.
- B. Where slopes extend into channels, trench for the top of the channel shall serve as the anchor for the slope material. Bury the ends of the fabric in the trench as specified below. Fabric shall be placed in such a way as to ensure continuous contact with soil without folds or wrinkles. Provide a minimum 6- inch seam overlap.

3.3 CHANNELS

- A. Refer to General Installations preceding and modify as shown herein. Dig anchor trenches minimum at the crest on either side of the channel. Where the side of the channel extends to become part of a cut or fill slope, cut the trench at or above the elevation of the trench at the corresponding point on the crest on the opposite side.
- B. Fabric for channels shall be laid out beginning at the bottom of the channel, at the drainage structure or low point, and rolled upstream parallel with the flow. Successive courses of mat shall be laid out with a minimum 20-inch overlap on the edges and a minimum of 12 inches overlap on the ends. At all overlaps, place the up-slope mat over the down-slope portion, to produce a shingled effect. Mat shall be placed in such a way as to ensure continuous contact with soil without folds or wrinkles. Bury ends of mat as specified below.
- C. Provide check slots in channel at intervals no greater than 30 feet.
- D. Place staples in evenly staggered rows to achieve at least 2.5 anchors per square yard. In addition, seams and overlaps shall be stapled at 12" on center.
- E. Reseed all backfill and disturbed areas around slopes and channels with specified seed as shown on the Approved Drawings and as directed by the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02202

MECHANICALLY STABILIZED EARTH RETAINING WALLS

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This work shall consist of the designing, furnishing, and construction of Mechanically Stabilized Earth Retaining Walls (MSE) in accordance with these specifications and in close conformity with the lines, grades, and dimensions shown on the Design Builders Approved Drawings or established by the MBTA. Final design details for these structures, such as concrete unit thickness, connection details, and loading appurtenances, shall be as designed by the manufacturer from design parameters contained herein. This specification is intended to cover all mechanically stabilized earth retaining wall systems, some of which may be proprietary.
- B. The mechanically stabilized earth retaining walls shall consist of precast concrete units, geosynthetic reinforcement, select fill, filter fabric, a cast-in-place leveling pad, and a precast or cast-in-place coping cap or curb. Steel reinforcement for soils shall not be used to avoid stray current issues. The precast concrete units shall be sized to have sufficient external stability resistance at each module course to satisfy the design criteria. The material, fabrication, and construction shall comply with this specification and the requirements specified by the supplier of the wall system.

1.2 RELATED SECTIONS

- A. Other specification sections that relate to the work include, but are not limited to, the following:
 - 1. Section 02100 – SITE PREPARATION
 - 2. Section 02196 – GEOTEXTILE MATERIALS
 - 3. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
 - 4. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 - 5. Section 02300 – EARTHWORK
 - 6. Section 02400 – DRAINAGE AND SEWER SYSTEMS
 - 7. Section 03300 – CAST-IN-PLACE CONCRETE
 - 8. Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE
 - 9. Section 03450 – ARCHITECTURAL PRECAST CONCRETE

1.3 REFERENCE STANDARDS AND DEFINITIONS

- A. Reference herein to any technical society, organization, group, or body is made in accordance with the following abbreviations. Unless otherwise noted or specified, all Work under this Section shall conform to the latest edition, as applicable.
 - 1. ASTM: American Society for Testing and Materials
 - 2. OSHA: Occupational Safety and Health Administration
 - 3. Building Code: Commonwealth of Massachusetts Building Code, Current Edition
 - 4. DEP: Massachusetts Department of Environmental Protection
 - 5. MCP: CMR 40.0000, Massachusetts Contingency Plan

6. Contractor: Entity responsible for completing the Work of this Section.
7. MBTA: Massachusetts Bay Transit MBTA
8. Earthwork: All excavation, handling, conditioning, and backfilling operations of all soil, rock, and other materials for new foundation, pavement, and all other construction and site development, including obstructions and utility relocation and construction, regardless of the nature of the material encountered, the water content thereof, and type of equipment required for excavation, removal, or placement.
9. Geosynthetic Reinforcement (grid reinforcement): A regular network of integrally connected polymer tensile elements with aperture geometry sufficient to permit significant mechanical interlock with surrounding fill material.

B. Precast Panels

1. Refer to specification Section 03450 – ARCHITECTURAL PRECAST CONCRETE, for related reference standards, definitions, and additional requirements.

C. Geosynthetic Reinforcement

1. ASTM D 1238 – Test Method for Melt Flow Rates of Thermoplastics by Extrusion Plastometer (PP&HDPE)
2. ASTM D 1248 – Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable
3. ASTM D 1505 – Test Method for Density of Plastics by the Density-Gradient Technique (HDPE only)
4. ASTM D 2455 – Test Method for Identification of Carboxylic Acids in Alkyd Resins (PET only)
5. ASTM D 4354 - Practice of Sampling Geosynthetics and Rolled Erosion Control Products (RECPs) for Testing
6. ASTM D 4595 - Test Method for Tensile Properties of Geotextiles by the Wide-Width Strip Method (modified for geogrids)
7. ASTM D 4603 – Test Method for Determining Inherent Viscosity of Poly (Ethylene Terephthalate) (PET) by Glass Capillary Viscometer (PET only)
8. ASTM D 4759 – Practice for Determining the Specification Conformance of Geosynthetics
9. ASTM D 5262 - Test Method for Evaluating the Unconfined Tension Creep and Creep Rupture Behavior of Geosynthetics
10. GRI GG-1: Single Rib Geogrid Tensile Strength (Quality Control only)
11. GRI GG-4(a): Determination of the Long-Term Design Strength of Stiff Geogrids
12. GRI GG-4(b): Determination of the Long-Term Design Strength of Flexible Geogrids
13. GRI GG-5: Geogrid Pullout
14. GRI GG-7: Determining Carboxyl End Groups in Polyethylene Terephthalate (PET) Geotextiles and Geogrids
15. GRI GG-8: Determining the Average Molecular Weight Based on a Relative Viscosity Value

D. Reinforced Backfill and Drainage Aggregate

1. ASTM D 1557 – Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort
2. ASTM D 422 – Test Method for Particle-Size Analysis of Soils
3. ASTM D 424 - Atterberg Limits of Soils
4. ASTM G 51 – Test Method for pH of Soil for Use in Corrosion Testing
5. ASTM D 448 - Classification for Sizes of Aggregate for Road and Bridge Construction
6. ASTM D 5321 – Test Method for Determining the Shear Strength of Soil-Geosynthetic and Geosynthetic-Geosynthetic Interfaces by Direct Shear
7. ASTM D 2974 – Test Methods for Moisture, Ash, and Organic Matter of Peat and Other Organic Soils

E. High Density Polyethylene (HDPE)

1. ASTM F 405 – Specification for Corrugated Polyethylene (PE) Pipe and Fittings

1.4 PROJECT CONDITIONS

- A. Subsurface investigation data are available for the project area. Prior to submitting his bid, the Contractor shall review and understand the information contained in the geotechnical report and all Contract Documents. The geotechnical report is made available to the Contractor for information on factual data only and shall not be interpreted as a warranty of subsurface conditions whether interpreted from written text, boring logs, or other data.
- B. The Contractor shall draw his own conclusions regarding site conditions based upon site history, Contractor site observations, and from available sources, for which the MBTA and its Consultants assume no responsibility. The Contractor shall assume that subsurface conditions between subsurface explorations could differ from conditions shown in the records of the explorations.

1.5 SUBMITTALS

- A. The Contractor shall submit the following to the MBTA for review:
1. The manufacturer’s product data for the MSE wall system including all materials, manufacture and erection specifications, all specialized erection equipment necessary, details of buried MSE wall elements, special details required of reinforcing layout, design properties, type of backfill, and details for connection between facing panels.
 2. A proposed narrative describing the means and methods for the proper construction of the wall, particularly including the following:
 - a. Sequence and schedule of all operations.
 - b. Method(s) of maintaining and monitoring horizontal and vertical position and orientation during installation of each course of facing elements.
 - c. Achieving and maintaining tension in the geosynthetic reinforcement during installation.

- d. Placement and compaction of backfill materials.
- e. Connection of the geosynthetic grid to the facing units.

The means and methods are subject to review by the MBTA's Representative prior to start of MSE wall construction.

- 3. A list of at least three reference projects performed within the past five years having similar wall heights and face areas with references, to demonstrate that the installer and its project personnel are experienced in constructing walls comparable to the proposed MSE wall. One additional reference project from the wall facing units' manufacturer shall be submitted having used the same facing units and type of geosynthetic reinforcement proposed for this project.
- 4. Geosynthetic Reinforcement: At least thirty (30) days prior to installation of the geogrid, the Contractor shall submit a certificate of compliance. The submittal shall include all applicable test data to support the minimum average roll value (MARV) based T_{ult} values and also the reduction factors used for the calculation of T_{al} . The test data shall be obtained in full accordance with the test methods and standards defined in the section of the AASHTO/ASTM Standard Specifications referenced herein. Each roll shall be clearly labeled so as to easily identify the product in the field. The label shall include as a minimum, the manufacturer's name, product name and number, and the contract item name and number. The Contractor shall submit the following information regarding the Geosynthetic Reinforcement proposed for use:
 - a. Manufacturer's name.
 - b. Full product name and manufacturers' literature and material specifications.
 - c. Geosynthetic Reinforcement structure and polymer type.
 - d. Samples: A representative square yard sample. The machine direction shall be clearly marked on each sample.
 - e. Laboratory Testing Results: ASTM-D4595 – At least 3 Geosynthetic Reinforcement samples shall be tested from the rolls to be delivered and used for the project. Wide width tests shall be performed at a strain rate of 10 ± 3 percent per minute as per ASTM D 4595. Actual data points shall be shown on graphs. Raw test data from any test or used test specimens shall be submitted to the MBTA upon request. All test results must meet the Geogrid requirements specified herein.
 - f. Laboratory Testing Results: ASTM-D5321 – At least 2 tests shall be completed using the proposed Granular Fill and Geosynthetic Reinforcement samples from rolls to be delivered and used for the project. For the specified soil to geosynthetic direct shear tests (ASTM D5321), a Standard Proctor compaction test shall be performed in accordance with AASHTO T99. The soil shall be compacted to 95 percent of the maximum Standard Proctor dry density with moisture content from 0 to 2 percent above optimum. The normal pressures for the direct shear tests shall be 250 psf, 500 psf, 1000 psf, and 2000 psf. Soil shall not be used for more than one data point. The soil and geosynthetic samples shall be inundated and soaked for 12 hr. (minimum) before testing. All test results must meet the Geosynthetic Reinforcement requirements specified herein.
- 5. Provide manufacturer's specifications and working drawings and calculations for the precast facing units.

- a. The precast facing units shall contain connection compatibility with the geosynthetic reinforcement type, spacing, and other installation details as referenced in this section.
 - b. The front face of the units shall receive form liner finish compatible with architectural finishes of other concrete elements specified elsewhere in these Contract Documents.
 - c. Refer to Section 03450 – ARCHITECTURAL PRECAST CONCRETE for additional requirements.
- B. Shop Drawing Submittals. Three weeks prior to the start of work on the wall, the Contractor shall submit to the MBTA for approval the following:
- 1. Details for the proposed MSE wall system including: drainage system; pipe penetrations; guardrail and/or fence post details; facing units; geosynthetic materials; backfill and fill materials; connections; cap blocks/copings; wall terminations; corner details. Contractor shall include details for pointing posts, or installing drive shoes to penetrate reinforcement and membrane materials, or include details for installing sleeves for posts as the wall system is constructed.
 - 2. Refer to specification Section 03450 – ARCHITECTURAL PRECAST CONCRETE for precast facing unit for additional drawing requirements.
- C. Submit Plan of Actions to be implemented in the event any Response Value for deformation, as specified in Table 02202-1, is reached.

**TABLE 02202-1
RESPONSE VALUES**

Monitoring Type	Value
<u>Lateral Deflection of Earth Support Wall</u>	
Top of wall	1%
Mid-Point of wall	0.5%
<u>Vertical Deflection of Earth Support Wall</u>	
Top of wall	1/2 inch
<u>Ground Surface Settlement</u>	
Top of Rail	1/4 inch

- D. The Plan of Actions shall be positive measures by the Contractor to limit further movement of the wall. The details of the mitigating measures shall include a schedule of implementation, location and/or availability of materials, and a detailed description of the method of implementation. The Contractor shall be prepared to work twenty four (24) hours per day to implement such measures

1.6 QUALITY ASSURANCE

- A. The MBTA's Geotechnical MBTA shall perform on-site observation and testing during various phases of the construction operations. The Geotechnical MBTA's presence does not constitute supervision or direction of the Contractor's work. Neither the presence of the Geotechnical MBTA, nor any observations and testing performed by him, nor any notice or failure to give notice shall excuse the Contractor from conformance with these Specifications or from defects discovered in its work or from the Contractor's responsibility for site safety including both persons and property.
- B. All costs and schedule delays related to testing or replacement of nonconforming materials shall be paid for by the Contractor at no additional cost to the MBTA. Testing in excess of two samples per material type shall be paid for by the Contractor at no additional cost to the MBTA.
- C. Approvals given by the MBTA, Geotechnical MBTA or MBTA shall not relieve the Contractor of his responsibility for performing the Work in accordance with the Contract Documents, nor shall they be construed to relieve the Contractor from full responsibility for the means and methods of construction and for safety on the construction site.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. The Contractor shall inspect the materials upon delivery to assure that proper type and grade of material has been received.
- B. The Contractor shall store and handle materials in accordance with the manufacturer's recommendations.
- C. The Contractor shall protect the materials from damage, deterioration, and contamination. Damaged or contaminated material shall not be incorporated into the MSE wall.

1.8 LINES, GRADES, AND TOLERANCES

- A. The Contractor shall be responsible for establishing all lines, grades, and other survey control to complete the Work. The Contractor shall be responsible for the maintenance and protection of the survey control reference points and location stakes. The Contractor shall employ a Registered Land Surveyor, licensed in Massachusetts, familiar with the required construction, which shall establish lines and levels. The Contractor shall be responsible for the correct location of the Work in this section, including locations and elevations and limits of excavations and fills.
- B. Construct finished grades to within 1/2-inch of the elevations indicated on the Design Builders Approved Drawings.
- C. Maintain the moisture content of the fill material during placement as required to achieve project specified compaction.

1.9 PERMITS, CODES, AND SAFETY REQUIREMENTS

- A. Comply with all local, state, and federal rules, regulations, laws, and ordinances having jurisdiction over the project site. All labor, materials, equipment, and services necessary to make the Work comply with such requirements shall be provided by the Contractor without additional cost to the MBTA.
- B. Comply with the provisions of the requirements of the Occupational Safety and Health Administration (OSHA), United States Department of Labor.
- C. The Contractor shall procure and pay for all permits and licenses required for the complete Work specified herein and shown on the Design Builders Approved Drawings.

PART 2 – PRODUCTS

2.1 GENERAL

- A. The Contractor shall make his own arrangements to purchase the materials covered by this section of the specifications, including all necessary incidentals. The Contractor, or the supplier as his agent, shall furnish the MBTA a Certificate of Compliance certifying that the applicable materials comply with this section of the specifications. Materials not conforming to this section of the specifications shall not be used without the written consent of the MBTA.

2.2 MATERIALS

- A. Refer to specification Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE for precast facing unit requirements.
- B. Geosynthetic reinforcement shall consist of geogrids manufactured for soil reinforcement applications, and shall be manufactured from high density polyethylene conforming to the requirements of ASTM D 1248. Geosynthetic reinforcement shall consist of manufactured geogrid materials, having a regular network of integrally connected polymer tensile elements with aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil. The geogrid structure shall be dimensionally stable and able to retain its geometry during manufacture, transport, installation, and use. All geosynthetic reinforcement shall be from the same manufacturer and of the same type, manufacturing process, and polymer. For all geogrid layers, Tensar UX1700MSE geogrid, or an equivalent approved by the MBTA, shall be used. The type, strength, placement, and location of the geosynthetic reinforcement shall be as shown on the Design Builders Approved Drawings and as stated herein. Do not use steel for soil reinforcement.
- C. Earth materials for use as fill and backfill shall be as described below. All soil materials proposed for importing to the site shall be clean, mineral soil materials from approved natural borrow sources, free of any contamination and recycled materials, as described above. Materials from construction sites or other non-commercial, natural borrow sources shall not be imported to the site. All materials imported

to the site shall contain no detectable amounts of oil and/or hazardous materials as defined by the MCP.

- D. All soil materials proposed to be used as fill shall be evaluated by the Geotechnical MBTA, based in part on information submitted by the Contractor. Materials shall be rejected for use based on the results of the evaluation. Materials shall not be brought to the site without prior approval of the Geotechnical MBTA. Off-site materials, which are rejected for use, if brought to the site, shall be immediately removed by the Contractor at its own expense.
- E. Stone Drainage Aggregate shall be used immediately behind the precast concrete panels and shall meet the requirements for processed 57 aggregate in accordance with AASHTO M 43-88. Drainage Aggregate shall consist of durable angular rock fragments, free from a detrimental quantity of thin, flat, elongated pieces or other objectionable pieces, or durable crushed stone obtained by artificial crushing of gravel, boulders or fieldstone with a minimum diameter before crushing of 8 in.
- F. Compacted Granular Fill shall conform to the requirements of Gravel Borrow, M1.03.0, Type b, of the Massachusetts Highway Department Standard Specifications for Highways and Bridges, current Edition. The material shall consist of clean, well-graded sand and gravel, free of organic material, snow, ice, recycled materials, debris, crushed or angular stones, or other objectionable materials. Compacted Granular Fill shall be compacted to at least 95 percent of the maximum dry density determined in accordance with ASTM D1557.
- G. Drainage pipe shall consist of 4-in. diameter Class I, perforated, corrugated, HDPE piping or approved equal in conformance with ASTM F405.

2.3 CERTIFICATION OF MATERIALS

- A. The Contractor shall submit a manufacturer's certification that the materials supplied meet the respective criteria in this Specification, measured in full accordance with all test methods and standards specified and as set forth in these Specifications. Refer to specification Section 03450 - ARCHITECTURAL PRECAST CONCRETE for additional precast facing unit requirements.
- B. The Contractor shall submit a manufacturer's certification that the geosynthetic materials supplied meet the respective criteria in this Specification, measured in full accordance with all test methods and standards specified and as set forth in these specifications. The manufacturer's certificate shall state that the furnished geosynthetic meets the requirements of the Specifications as evaluated by the manufacturer's quality control program. The certificates shall be attested to by a person having legal authority to bond the manufacturer. In case of dispute over validity of values, the Geotechnical MBTA can require the Contractor to supply test data from a laboratory accredited by the Geosynthetic Accreditation Institute (GAI) to support the certified values submitted. The quality control certificate shall include:
 - 1. Roll numbers and identification
 - 2. Sampling procedures
 - 3. Result of quality control tests, including a description of test methods used.

Manufacturer's certification shall include the manufacturer's tests and reports that substantiate the reduction factors for durability, creep and installation damage applicable to this project, including pull-out and connection strength values.

C. Geosynthetic Reinforcement

The geosynthetic reinforcement shall be manufactured with a high degree of quality control. The manufacturer is responsible for establishing and maintaining a quality control program to ensure compliance with the requirements of these Specifications.

Conformance testing shall be performed as part of the manufacturing process and shall vary for each type of product. As a minimum, the following index tests shall be considered as applicable for an acceptable QA/QC program.

Property	Test Procedure
Specific Gravity (HDPE only)	ASTM D 1505
Wide Width Tensile Strength	ASTM D 4595*; GRI GG1
Melt Flow (HDPE and PP only)	ASTM D 1238
Intrinsic Viscosity (PET only)	ASTM D 4603
Carboxyl End Group (PET only)	ASTM D 2455

* ASTM D 4595 or correlated to GRI GG-1.

2.4 SAMPLING, TESTING, AND ACCEPTANCE

A. Precast Panels:

Precast facing units shall be accepted for use in wall construction provided the concrete strength meets or exceeds the minimum compressive strength requirement, the soil reinforcement connection devices and the panel dimensions are within tolerances and any chipping, cracks, honeycomb or other defects are within acceptable standards for precast concrete as determined by the MBTA. The face side of the units shall receive the appropriate finish to match the architectural requirements for the project specified in Section 03450 - ARCHITECTURAL PRECAST CONCRETE.

It is recognized that certain cracks and surface defects are not detrimental to the structural integrity of the panel if properly repaired. The MBTA shall determine the need for and proper method of such repair. All repairs shall be approved by the MBTA prior to acceptance of the panel for use in wall construction.

The date of manufacture, the production lot number, and the piece-mark shall be clearly marked on the side of each panel.

Refer to specification Section 03450 - ARCHITECTURAL PRECAST CONCRETE for precast facing unit sampling, testing and acceptance requirements.

B. Geosynthetic Reinforcement:

Sampling and conformance testing shall be in accordance with ASTM D 4354. Geosynthetic product acceptance shall be based on ASTM D 4759. The Contractor shall submit testing results to the MBTA for review.

C. Reinforced Backfill and Drainage Aggregate:

Submit samples of reinforced backfill and drainage aggregate at a rate of 100 lbs. per 2,500 cu. yds. The Contractor shall provide sieve and compaction testing results performed in accordance with ASTM D442-63 and ASTM D1557-09 for each sample of submitted material for review by the MBTA. The MBTA shall perform in-place density tests of the materials during placement.

PART 3 – EXECUTION

3.1 GENERAL REQUIREMENTS

- A. A coordination meeting shall be held prior to initiating the geogrid installation and related work. The purpose of the meeting shall be to review all aspects of the MSE wall construction and to facilitate coordination among all involved parties. The coordination meeting shall not take place until the Contractor has submitted and received approval for the geogrid materials. Individuals attending the meeting shall include the MBTA, Geotechnical MBTA, the Contractor, the Geosynthetic Reinforcement Technical Representative, and all other personnel deemed appropriate by the previously mentioned personnel.
- B. The Contractor shall exercise necessary care while handling, storing and installing the Geosynthetic Reinforcement. Prior to installation, the Geosynthetic Reinforcement shall be protected from weather, damage, direct sunlight, other ultra-violet exposure, mud, cement or other elements which shall affect its performance. Geogrid shall be stored above -20° F. Geosynthetic Reinforcement which is torn, punctured or in the opinion of the Geotechnical MBTA is otherwise damaged, shall not be used.
- C. Prior to placement of the Geosynthetic Reinforcement and related backfill, the foundation soil shall be compacted to provide a firm and stable surface. Areas determined to be unsuitable by the Geotechnical MBTA shall be over-excavated and replaced with Granular Fill as defined herein or other materials as directed by the Geotechnical MBTA.
- D. The Contractor shall determine exact configurations, lengths, sizes and quantities of all facing units, connections, geosynthetic reinforcement materials, backfill and fill, drainage aggregate, drainage pipe material, and associated ancillary construction items required for the MSE wall. The Contractor shall be responsible for layout, elevation, length, quantity and quality of each work item required by this section, and request MBTA approval of underlying materials before proceeding with construction of succeeding MSE wall activities. The MBTA reserves the right to monitor the Contractor's MSE wall construction operations and installation of all geosynthetic materials, and modify the design as necessary.

3.2 FOUNDATION PREPARATION

Prior to beginning construction of the MSE wall, the MBTA shall observe the prepared subgrade to confirm that it is dry, firm, stable, level, and free from deleterious or loose materials or otherwise unsuitable soils and rock. If, according to the MBTA, any areas do not meet the above criteria, the Contractor shall dewater areas which are wet, excavate and replace soft areas with suitable compacted backfill, perform compaction, and raise or lower grades to reach the MSE wall subgrade. The MBTA shall require proof-rolling of the subgrade to demonstrate its suitability.

3.3 PRECAST FACING UNIT AND GEOSYNTHETIC REINFORCEMENT INSTALLATION

- A. All materials shall be installed at the proper location, elevation and orientation as shown in the wall details on the Design Builders Approved Drawings or as directed by the MBTA. The MSE wall panels and geosynthetic reinforcement shall be installed in general accordance with the manufacturer's recommendations, unless otherwise modified by these Specifications. The Design Builders Approved Drawings shall govern in any conflict between the two requirements.
- B. Direct overlap (geogrid on geogrid) of the geosynthetic reinforcement in the design strength direction shall not be permitted, except at wall corners or elsewhere as indicated on the Design Builders Approved Drawings. The design strength direction is that length of the geosynthetic reinforcement perpendicular to the wall face, and shall consist of one continuous piece of material. Adjacent sections of geosynthetic shall be placed in a manner to assure that the horizontal coverage shown on the Design Builders Approved Drawings is provided.
- C. Construction of the MSE wall shall be performed in a continuous and time efficient manner such that no layer of geosynthetic reinforcement shall be left exposed for a significant period of time during the day, leaving the material potentially subject to damage due to construction activities. Install only that amount of geosynthetic reinforcement that can be immediately backfilled. No layer of geosynthetic reinforcement, once installed, shall be left exposed overnight.
- D. Geosynthetic reinforcement shall be installed on level subgrades to lay flat and be pulled tight prior to backfilling. Means and methods of achieving and maintaining tension during installation until the subsequent soil layer can be placed shall be submitted. Under no circumstances shall a track-type vehicle be allowed on the geosynthetic reinforcement before at least 8 in. of soil has been placed and compacted.
- E. The geosynthetic reinforcement vertical spacing indicated on the Design Builders Approved Drawings is the maximum vertical spacing allowed.
- F. During construction, the surface of the reinforced zone shall be kept approximately horizontal. Geosynthetic reinforcement shall be placed directly on the compacted horizontal fill surface. Geosynthetic reinforcements are to be placed at the level of the connection with the MSE wall facing units and extend to the lengths as shown on the Design Builders Approved Drawings unless otherwise directed by the MBTA. Correct orientation of the geosynthetic reinforcement with the principal strength direction perpendicular to the wall face shall be verified by the Contractor.

- G. Install MSE wall facing units by placing, positioning, and aligning MSE wall facing units in conformance with the manufacturer’s recommended installation criteria, unless otherwise modified by the Contract Documents or the MBTA. MSE wall facing units shall be placed side by side for the full length of the wall while maintaining alignment. Install and verify that the facing units are installed and maintained within the following tolerances:

Vertical control	0.5 in. over a distance of 10 ft.
Horizontal location control	0.5 in. over a distance of 10 ft, and 1.0 in. overall.
Rotation from established plan wall batter	0.5 in. over 10 ft height

After placement, maintain each MSE wall facing unit in position. Correct all misalignments of installed MSE wall facing units that exceed specified tolerances allowed, by method acceptable to the MBTA. Control all operations and procedures to prevent misalignment of the MSE wall facing units. Install each succeeding MSE wall facing unit course after appropriate backfill levels are reached. Maintain alignment and verticality, adjusting as necessary to meet the above requirements.

- H. Construction equipment shall not be operated directly upon the Geosynthetic Reinforcement. A minimum fill thickness of 8 inches is required prior to the operation of construction vehicles over the Geosynthetic Reinforcement. Turning of construction vehicles shall be kept to a minimum to prevent tracks from displacing the fill and Geosynthetic Reinforcement. Sudden braking and sharp turning shall be avoided. Any Geosynthetic Reinforcement which has been damaged or disturbed during or after installation shall be corrected, or removed and replaced with an equivalent undamaged section of Geosynthetic Reinforcement at the Contractor’s expense.
- I. Broken, chipped, stained or otherwise damaged MSE wall facing units shall not be placed in the wall and any such units shall be replaced at no cost to the MBTA.

3.4 BACKFILL PLACEMENT

- A. Reinforced Backfill and Drainage Aggregate shall be placed in maximum 8 in. compacted lift thicknesses. Backfill placement shall closely follow placement of each course of MSE wall facing units. Backfill shall be placed, spread, and compacted in such a manner that eliminates development of wrinkles or movement of the geogrid and the MSE wall facing units. Any MSE wall facing units or geogrid that become damaged as deemed by the MBTA during backfill placement shall be removed and replaced at the Contractor’s expense. Any misalignment or distortion of the MSE wall facing units outside the limits set by these Specifications shall be corrected at the Contractor’s expense. At each level of geosynthetic reinforcement, the backfill in the reinforced zone shall be placed and compacted to the level of the connection to the MSE wall facing units. Backfill placement methods near the facing shall assure that no voids exist directly beneath the reinforcing elements.
- B. All soil material shall be placed and compacted to 95 percent of the maximum dry unit weight determined in accordance with ASTM D1557, and otherwise as required by the project specifications or indicated on the Design Builders Approved Drawings.

- C. Filling and backfilling shall be performed in accordance with Section 02300 - EARTHWORK. Backfill more than 3 ft laterally from wall facing units shall be compacted using hand-guided vibratory plate compactors or hand-guided vibratory rollers delivering a minimum dynamic force of 8,000 lbs. Within 3 ft behind the wall facing units, compactors imparting a dynamic force of 2,000 to 3,000 lbs shall be used.
- D. Drainage aggregate shall be placed immediately behind the MSE wall facing units, and extend 1-ft beyond back of panel. Drainage aggregate shall be placed in lifts as the lifts of reinforced backfill are placed. The drainage aggregate shall be compacted in lifts with each lift compacted with two passes using hand-guided plate compactors imparting a dynamic force of 2,000 to 3,000 lbs.
- E. Backfill and drainage fill shall be protected from freezing and other disturbances in accordance with Section 02300 – EARTHWORK.
- F. Tracked construction equipment shall not be operated directly on the geosynthetic reinforcement. A minimum backfill thickness of 8 in. is required prior to operation of tracked vehicles over the geosynthetic reinforcement. Turning of tracked vehicles shall be kept to a minimum to prevent displacing the fill and damaging or moving the geosynthetic reinforcement.
- G. Rubber-tired equipment shall not be allowed to traffic directly on exposed layers of the geosynthetic reinforcement. Rubber-tired equipment shall be allowed to pass over areas which have received geosynthetic reinforcement if a) a minimum 8-in. thick layer of backfill has been placed and compacted over the most recent layer of geosynthetic reinforcement, b) the equipment is sufficiently sized to limit depressions in the backfill to no more than 1 in., c) trafficking is performed in accordance with the equipment manufacturer’s recommendations, and d) field tests are performed to demonstrate the geosynthetic reinforcement shall not be damaged more than the geosynthetic manufacturer’s installation damage reduction factor would indicate under the equipment access conditions. If allowed, all equipment shall operate at speeds less than 8 miles per hour. Sudden braking and sharp turning are prohibited.
- H. At the end of each day’s operation, the Contractor shall slope the last lift of backfill away from the wall facing to direct storm water runoff away from the wall face. In addition, the Contractor shall not allow surface water runoff from adjacent areas to enter the MSE wall construction site.

3.5 PANEL COPING/CAP BLOCK PLACEMENT

If shown on the Design Builders Approved Drawings, the coping and/or top MSE wall facing unit shall be bonded to the facing units below using approved methods as described herein, and as described in Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02205

RETAINING WALL REHABILITATION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies retaining wall rehabilitation work including the following:
 - 1. Reface existing crib walls.
 - 2. Concrete repairs to the existing evergreen walls.
 - 3. Surface rehabilitation of existing cast-in-place retaining walls.
- B. Existing retaining walls within the project limits are listed in Technical Provision Article 8.1, Table 8.1-1 indicating the existing walls to remain, be rehabilitated or to be replaced as listed in the Table.
- C. Vegetation and organics shall be cleared from the face of the existing wall and between the existing cribs. Vegetation shall also be cleared at the top of the wall for distance of 2 feet behind the top of wall.
- D. Rehabilitation of existing walls may consist of soil nails and concrete or shotcrete re-facing, soil screws and concrete or shotcrete re-facing, modular precast block retaining walls or soldier pile retaining walls in front of existing retaining walls or any other means to protect the in-situ walls to remain.
- E. Rehabilitated walls shall maintain equivalent drainage characteristics of the original existing wall. Drainage details shall be submitted as part of the rehabilitation details which may include filter fabric with crushed stone, dimpled drainage board, weep holes or any other equivalent details designed to drain water from behind the wall and retain soil fines.
- F. The tops of the rehabilitated walls shall be finished with a cap of either cast-in-place or precast concrete. The design shall take into account surface runoff and not create a "dam-like" situation where surface water may back up behind the wall.
- G. Rehabilitated wall facing shall include architectural striations in accordance with Design Builders Approved drawings. Wall re-facing patterns shall not include horizontal striation patterns which may be used for climbing.
- H. Rehabilitated walls shall not incur additional loads greater than their current loading condition. If existing walls incur additional loading based on the Design Builders redesign, then the existing wall shall be redesigned for the new loads or replaced.
- I. Wall re-facing details, which include continuous concrete or shotcrete re-surfacing, shall include provisions for construction joints, expansion joints and stray current control.
- J. Cast-in-Place Concrete Wall repairs shall meet the requirements of Specification 03930 – CONCRETE REHABILITATION AND REPAIR.
- K. Existing walls designated as requiring rehabilitation may be replaced with a new wall by the Design Builder in lieu of rehabilitation at the Design Builders discretion and shall be submitted for approval.

1.1 RELATED SECTIONS

- A. Other specification sections that relate to the work include, but are not limited to, the following:
- 1.
 2. Section 02196 – GEOTEXTILE MATERIALS
 3. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
 4. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 5. Section 02300 – EARTHWORK
 6. Section 02356 – SOLDIER PILES AND LAGGING RETAINING WALLS
 7. Section 02357 - CAST-IN-PLACE CONCRETE RETAINING WALLS
 8. Section 02358 - SOIL NAIL RETAINING WALLS
 9. Section 02359 – MODULAR PRECAST BLOCK RETAINING WALLS
 10. Section 03300 – CAST-IN-PLACE CONCRETE
 11. Section 03371 - SHOTCRETE
 12. Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE
 13. Section 03930 – CONCRETE REHABILITATION AND REPAIR
 14. Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS

1.2 SUBMITTALS

- A. Working Drawings
1. Submit working drawings at least two (2) weeks before beginning excavation or installation of any excavation support system and bracing used for the rehabilitation of existing walls. Submit each existing wall location under separate cover and in the sequence of their installation.
- B. Additional Requirements for Working Drawings – Working drawings shall include the following:
1. Grades and strengths of all construction materials used.
 2. Full excavation depth.
 3. Depths below the main excavation to which the excavation support system shall be installed if necessary.
 4. Materials, details, arrangement, and method of construction of the proposed excavation support system, per Section 02260 – EXCAVATION SUPPORT AND PROTECTION, and sequence of construction (including bottom elevation of excavation at each stage).
 5. Method for wall rehabilitation.
 6. Loads on the excavation support system for various stages of excavation.
 7. Anticipated equipment, traffic (and other surcharge) loads on adjacent ground during construction.
- C. Existing utility facilities, including underground and overhead utilities. After checking locations of utilities by field investigations, determine which affect or potentially may affect the wall rehabilitation.

- D. Submit descriptive data and operating procedures for all equipment to be used. This shall include, at a minimum, machinery required to install wall and bracing, excavate soil, and remove obstructions. Submit all pertinent data including sizes, weights, capacities, torques and operating frequencies.

1.3 PROJECT CONDITIONS

- A. Visit the site to review all details of the work and working conditions affecting Work under this Section and to verify dimensions in the field including potential interference from adjacent structures and utilities. Notify the Engineer in writing of any discrepancy before performing any work. The Design Builder is hereby notified that the job site is located adjacent to the active railroad and existing low rise buildings. Refer to Section 00700 – GENERAL CONDITIONS.
- B. The Design Builder shall be responsible for implementing all necessary traffic control measures, which may include traffic cones, barriers, barrels, signage, flagmen, and police details.
- C. Consult official records of existing utilities, both surface and subsurface, and their connections to be fully informed on all existing conditions and limitations as they apply to this work and its relation to other construction work. Proceed with caution in areas of utility facilities. Expose them by hand excavation or by other methods acceptable to the utility owner. Protect existing utilities to remain within and adjacent to the work area in accordance with the requirements of authorities having jurisdiction over same. The Design Builder is responsible for any damage to utilities caused by the Design Builder's operations and shall restore them to equal or better operation at no additional cost to MBTA.

PART 2 - PRODUCTS

2.1 GENERAL

- A. The Design Builder shall make his own arrangements to purchase the materials covered by this section of the specifications, including all necessary incidentals. The Design Builder, or the supplier as his agent, shall furnish the MBTA a Certificate of Compliance certifying that the applicable materials comply with this section of the specifications. Materials not conforming to this section of the specifications shall not be used without the written consent of the MBTA.

2.2 MATERIALS

- A. Structural Steel for soldier piles shall conform to applicable requirements of Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- B. Reinforcement Steel for use within cast-in-place concrete shall conform to Section 03300 – CAST-IN-PLACE CONCRETE.
- C. Concrete for drilled shaft hole fill (below bottom of excavation as shown on Design Builder's Detailed Shop Drawings) shall conform to relevant articles of Section 03300 – CAST-IN-PLACE CONCRETE (4000 psi, 3/8").

- D. Concrete for cast-in-place shall conform to relevant articles of Section 03300 – CAST-IN-PLACE CONCRETE (4000 psi, 3/4”).
- E. Concrete for precast panels for retaining walls shall conform to relevant articles of Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE (5000 psi, 3/4”).
- F. Controlled Density Fill (CDF), Type 2E in accordance with specification Section 02300 - EARTHWORK.
- G. Headed welded studs shall conform to Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- H. Threaded welded studs shall conform to Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- I. All structural timber used as lagging shall be rough sawn and conform to MBTA Guide Specifications for Structural Design of Rapid Transit and Light Rail Structures Article 9.6 and AREMA.
- J. Filter fabric shall conform to Section 02196 - GEOTEXTILE MATERIALS.

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

- A. Rehabilitate the wall in accordance with the Design Builder’s Approved Drawings, and in such a manner as to prevent movement, settlement, loss of ground, removal of fines from the adjacent ground, and damage to or movement of the existing wall or adjacent structures and utilities. This could include the use of drilling slurry during installation of soldier piles in drilled shaft holes to maintain stable drill holes and limit the loss of ground outside the drill hole.
- B. Perform work from track side of the proposed wall unless temporary easements have been granted to minimize adjacent property impacts. Heavy equipment shall be placed on the track side of the proposed wall.
- C. Perform field welding by certified welders in accordance with American Welding Society Standards AWS D 1.1, "Structural Welding Code - Steel."
- D. Implement the Plan of Actions as submitted under Paragraph 1.3D, if Response Values as specified in Table 02356-1 are reached.
- E. Borings indicate below ground obstructions may be encountered. Such obstructions may include boulders and various other demolition and construction debris.

- F. Temporary casings if used for drilled shaft holes for soldier piles shall be installed where needed to the top of weathered bedrock, as a minimum, using rotary drilling techniques over their full depth to limit potential vibration damage to adjacent structures and facilities.
- G. Protection of Existing Properties
1. Design Builder shall protect existing properties in accordance with specification Section 01545 – PROTECTION OF WORK AND PROPERTY.
 2. Restore existing structures to conditions equivalent to those existing prior to the start of retaining wall rehabilitation and support work, unless otherwise indicated. Any damage to affected properties caused by the retaining wall rehabilitation shall be repaired by the Design Builder at no additional cost to the MBTA.
 3. If in the opinion of the MBTA the integrity of the adjacent railroad tracks, bridge, buildings, structures, or paved areas is jeopardized due to movement, the Design Builder shall immediately discontinue further excavation in the affected area and implement accepted Plan of Action to mitigate further movement. Mitigating measures shall remain in effect until such time that the MBTA evaluates the impact on the structure and may direct the Design Builder to perform any remedial work. The Design Builder shall submit proposed remedial measures to the Geotechnical MBTA for review and approval. Submittals shall include methods and names of subcontractors. The Design Builder shall proceed with remedial work upon acceptance by the MBTA. Mitigating measures shall be at no additional cost to the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02220

DEMOLITION FOR ROADWAY BRIDGES

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. This Section specifies work involving the following items:
1. The demolition and partial demolition of existing Roadway Bridges.
- B. Related Work:
1. Section 01560 – TEMPORARY CONTROLS.
 2. Section 02090 – LEAD ABATEMENT.
 3. Section 01800 – SUSTAINABILITY REQUIREMENTS.
 4. Section 02221 – DEMOLITION.
 5. Section 02223 – SEGREGATION OF DEMOLITION DEBRIS AND WASTE TRANSPORTATION AND DISPOSAL.
 6. Section 05420 – TEMPORARY STEEL UTILITY BRIDGES.
- C. Description of Demolition: The work to be done under this Section shall be performed in accordance with approved drawings from MassDOT, and shall consist of furnishing all labor, materials, and equipment necessary for the removal and satisfactory disposal the bridge structure.
- D. Description of Partial Demolition: The work to be done under this Section shall be performed in accordance approved drawings from MassDOT, and shall consist of furnishing all labor, materials, and equipment necessary for the modifications or partial removal and satisfactory disposal of the bridge structure.
- E. Bridge Structures: The following bridge structures are associated with the Green Line Extension Project:
1. Walnut Street Bridge, No. S-17-006 (AGV)
 2. School Street Bridge, No. S-17-008 (3G5)
 3. Medford Street Bridge, No. S-17-007 (3G4)
 4. Cedar Street Bridge, No. S-17-012 (AE7)
 5. Lowell Street Bridge, No. S-17-011 (AW2)
 6. Broadway Bridge, No. S-17-013 (3GA)
 7. College Avenue Bridge, No. M-12-012 (AN4)
- The Walnut Street Bridge, School Street Bridge, Medford Street Bridge, Cedar Street Bridge, Lowell Street Bridge and College Avenue Bridge involve only partial demolition. The Broadway Bridge is to be completely demolished.
- F. Prohibition on Blasting: No Blasting or use of explosives is permitted.

- G. **Jobsite Conditions:** The Contractor shall serve written notice to all Utility Companies and Municipal Departments and Agencies at least two weeks prior to the start of any work involved in the demolition of the bridges mentioned above, requesting discontinuance of service to or across the structures scheduled for demolition. The Contractor shall coordinate work with the utility relocation plans and the bridge staging plans.

- H. **Demolition Requirements:** The Contractor shall furnish all labor, materials and equipment necessary to remove and legally dispose of existing bridge elements, including but not limited to, reinforced concrete sidewalks, reinforced concrete bridge decks, bituminous pavement, earth fill, steel girders and bracing, reinforced concrete abutments and piers, bridge bearings, bridge railings, all pipelines and utility conduits, all pipe and utility supports and contents, and other incidental items associated with the existing bridge structures.

- I. **Limitations of Information Sources:** The Massachusetts Department of Transportation does not guarantee or represent that the bridge materials will actually coincide with any descriptions contained herein or represented on the drawings. The Contractor must visit the bridge site to become familiar with the scope of work and bridge conditions. No additional compensation shall be made if the site conditions, materials, or the scope of work provided, are different than that inferred or described herein or shown on the drawings. Drawings of the existing bridges are available on request from the office of the Director of Bridges and Structures, Massachusetts Department of Transportation, 10 Park Plaza, Boston, MA 02116.

- J. **Submittals:** The Contractor shall submit shop drawings that show the sequence of operations, measures to protect the public, and temporary supports. The sequence of operations must be planned so that at no time does an unsafe condition exist.

- K. **Applicability of the MassDOT Standard Specifications:** The Roadway Bridge Demolition requirements in this Specification are supplemented by MassDOT Standard Specifications (with Supplemental Specifications) Section 112.
 - 1. Replace all references to Measurement and Payment with the Section 4.1 below.
 - 2. For Roadway Bridge Demolition submittal requirements, including, but not limited to, shop drawings, working drawings, Requests For Information, Non Conformance and testing reports, refer to Section 01300 – SUBMITTALS of the Contract Specifications.
 - 3. Per Division 1 of the Contract Specifications, the Contractor is responsible for all sampling and testing as outlined in their approved Quality Management Plan and Testing Plan. The Contractor is also responsible for all costs related to the sampling, testing, and related work.

PART 2 – PRODUCTS

**2.1 TEMPORARY PROTECTIVE SHIELDING FOR BRIDGE DEMOLITION
DESCRIPTION OF WORK**

- A. The work to be done under this item shall provide for the safety beneath and adjacent to the bridges from falling debris during the removal of the existing bridge superstructure, substructure, sidewalks and any other miscellaneous materials that may fall during the course of demolition and reconstruction. This shall be accomplished by the utilization of adequate shielding placed beneath and adjacent to the existing structure prior to the work. Temporary Protective Shielding shall also be provided during the construction of the proposed superstructure.

The Contractor shall submit calculations and drawings stamped by a Professional Structural Engineer registered in the Commonwealth of Massachusetts, of the proposed shielding to the Engineer for his approval prior to the installation. The Design shall include a complete description of the equipment and construction methods proposed for the deck removal and also the maximum size of deck area being removed. The shielding shall be designed to withstand the maximum size of removed area should it fall during the removal. The drawings shall include details of all connections, brackets and fasteners and shall be submitted prior to the start of the demolition.

No portion of the bridge superstructure shall be removed or constructed until the Temporary Protective Shielding is completely in place and the Contractor has the approval from the Engineer to proceed. The protective shields shall remain in position for the duration of the work for each stage of construction. The shields shall be installed, relocated or removed only upon approval of the Engineer.

Shielding shall be designed to safely withstand all loads that it will be subjected to. The allowable design stresses shall be in accordance with AASHTO Standard Specifications for Highway Bridges.

The Contractor shall not be permitted to reduce the existing bridge clearances at any time.

Shielding shall extend a sufficient distance beyond the area to be removed and have all spaces along the perimeter and seams sealed to prevent dust and debris from escaping and falling below.

Shielding shall be installed or removed only upon approval of the Engineer.

All materials used in the shielding system shall become the property of the Contractor and shall be removed from the site upon completion of the project.

PART 3 – EXECUTION

3.1 GENERAL REQUIREMENTS FOR DEMOLITION AND WORK INVOLVING PAINTED STEEL

- A. To ensure worker and public safety, hazardous materials shall be removed in the immediate area of any intended cutting or burning. Removal of hazardous material is not required for mechanical disassembly, i.e. bolt and rivet removal unless heat is applied. Hazardous material removal is required to allow the demolition of structural steel, railings, drainage systems, utility supports, etc.
- B. Reference Standards: The Contractor shall comply with all applicable regulations even if the regulation is not specifically referenced herein. If a State or local regulation is more restrictive than the requirements of this Specification, follow the more restrictive requirements.
 - 1. State Regulations
 - a. 310 CMR 7.00 Air Pollution Control
 - b. 310 CMR 30.00 Hazardous Waste Regulations
 - c. 310 CMR 40.00 Massachusetts Contingency Plan
 - d. 310 CMR 19.00 Solid Waste Management Regulations
 - e. 314 CMR 1.00 – 30.00 Water Pollution Control Regulations
 - 2. Federal Regulations
 - a. 29 CFR 1910, Occupational Safety and Health Regulations for General Industry
 - b. 29 CFR 1926, Occupational Safety and Health Regulations for the Construction Industry 29 CFR 1926.62, Lead

- c. 40 CFR 50, National Primary and Secondary Ambient Air Quality Standards
 - d. 40 CFR 58, Ambient Air Quality Surveillance
 - e. 40 CFR 60, App. A, Method 22, Visual Determination of Fugitive Emissions from Material Sources and Smoke Emissions from Fires
 - f. 40 CFR 265, Subpart D, Contingency Plan and Emergency Procedures
3. The U.S. Environmental Protection Agency (EPA)
 - a. SW 846 Test Methods for Evaluating Solid Waste – Physical / Chemical Methods
 - b. Method 1311, Toxicity Characteristic Leaching Procedure (TCLP)
 4. Society for Protective Coatings (SSPC)
 - a. SP 1, Solvent Cleaning
 - b. SP 11, Power Tool Cleaning to Bare Metal
 - c. SP 10, Near White Blast Cleaning
 - d. Vis 1, Visual Standard for Abrasive Blast Cleaned Steel
 - e. Vis 3, Visual Standard for Power and Hand Tool Cleaned Steel
 - f. Guide 6, Guide for Containing Debris Generated During Paint Removal Operations
 5. American Society for Testing and Materials (ASTM)
 - a. D 4285, Detecting Oil or Water in Compressed Air

B. Cleaning / Removal

1. Cutting or Burning of Steel: All surfaces to be cut or burned shall be cleaned so as to remove all contaminants and/or hazardous materials, which could be discharged to the environment as a function of the subsequent operations.

Lead paint, if present, shall be removed in its entirety in an area prescribed by a one-foot minimum offset from the required work. Proper level of containment shall be used when performing this work. Full containment is not required during chemical stripping operation however; the Contractor shall install proper shielding and/or tarpaulins under the chemical stripping operations in order to catch all debris generated during this procedure. A cleaned area must be inspected and approved before the demolition operations are started.

During cleaning operations, the Contractor shall be required to furnish and erect temporary floodlights illuminating the steel surface at a minimum of 30 foot candles. This lighting shall be used in areas where there is insufficient lighting for proper cleaning operations and inspection. The Contractor shall supply electrical power.

The Contractor shall provide support for interim and final inspection of the bridge during cleaning operations. This support shall include the necessary traffic controls, safe access to the work and 9 volt lantern.

2. Mechanical Disassembly of Steel: All surfaces to be mechanically disassembled, i.e. bolt or rivet removal shall not require deleading. However, heating of the steel to facilitate mechanical disassembly shall require the removal of lead paint to a one foot off-set.

When removing bolts or rivets, the Contractor shall not use any method that will cause dust and/or particles to be emitted and/or dispersed into the environment to an extent that would expose the workers above the Action Levels of 30ug/cm.

Hazardous material shall be collected during the disassembly and shall be disposed of as outlined in Section 961.68 "Handling of Hazardous Waste and Reporting Release Programs" in the Supplemental Specifications dated June 2012, and all subsequent Interim Supplemental Specifications.

For purposes of limiting the lead (Pb) dust, the Contractor will be required to dampen the lead paint work areas.

The Contractor shall install a proper shielding and/or tarpaulins under all lead-paint-coated bolts or rivets ordered removed in order to catch any loose lead paint chips, dust or particles.

C. Worker Health & Safety Compliance Program

1. The Contractor shall develop a written program under the direction and approval of a Certified Industrial Hygienist (CIH) to establish and implement practices and procedures for protecting the health. Rely on respiratory protection only after feasible engineering and work practice controls have been first implemented to reduce airborne exposures.
2. The program shall identify the project competent person(s) by name, his or her qualifications, and indicate the frequency of inspections that will be undertaken. Daily inspections of the work area shall be made by the competent person and documented in the project logbook. All worker protection requirements shall apply to the Contractor, Subcontractors, and MassDOT and MBTA personnel on site.

D. Exposure Monitoring / Initial Assessment: Exposure monitoring shall be performed as required by 29 CFR 1926.62. All laboratory analysis must be performed by a State Certified Laboratory for each designated test. Protect workers during the initial monitoring to the anticipated exposure levels as dictated by 29 CFR 1926.62. The use of previous data as a substitute for initial exposure monitoring may be used when reviewed and approved by a CIH. The Contractor shall forward all data and the CIH's approval for review by the Engineer.

E. Action Level: The Action Level for lead is $30 \mu\text{g}/\text{m}^3$ as an eight (8) hour Time Weighted Average (TWA). In addition to the initial protection provided, invoke the following protective measures when the airborne exposure to lead exceeds the Action Level:

1. Exposure Monitoring
2. Housekeeping
3. Employee Medical Surveillance and Medical Removal Protection
4. Employee Information and Training
5. Signs and Regulated Areas
6. Recordkeeping

F. Permissible Exposure Limit (PEL): The PEL for airborne lead exposure is $50 \mu\text{g}/\text{m}^3$ as an 8 hour TWA. In the event that extended work shifts are allowed, use the following formula to adjust the PEL:

$$\text{PEL} = 8 \text{ hr. PEL} \times (8 \div \text{hours worked in a day})$$

In addition to complying with the requirements identified when exceeding the Action Level, invoke the following protective measures when the airborne exposure to lead exceeds the PEL:

1. Compliance Program, including engineering, administrative, and work practice controls
2. Respiratory Protection

3. Protective Clothing and Equipment
4. Hygiene Facilities and Practices

G. Protective Clothing and Equipment

1. Clothing: Provide protective clothing and equipment and ensure they are worn by all employees whose exposures exceed the PEL or TLV. Provide protective clothing and equipment and ensure all employees who enter regulated areas wear them. Provide all required protective clothing and equipment for use by three MassDOT representatives for the duration of the contract.

Clean or replace the protective clothing as required by the appropriate OSHA standard for lead that is present. Clean or replace the clothing weekly if the airborne exposure levels are less than $200 \mu\text{g}/\text{m}^3$ as an 8 hour TWA, or daily if the exposure levels are greater than or equal to $200 \mu\text{g}/\text{m}^3$.

Do not remove or clean the clothing by any means that reintroduces the lead into the ambient air such as brushing, shaking, or blowing. Use vacuums equipped with HEPA filters for cleaning. Store the used clothing in labeled sealed containers. If the clothing is to be laundered and it has been exposed to lead, label the containers with the following:

“CAUTION: CLOTHING CONTAMINATED WITH LEAD. DO NOT REMOVE DUST BY BLOWING OR SHAKING. DISPOSE OF LEAD CONTAMINATED WASH WATER IN ACCORDANCE WITH APPLICABLE LOCAL, STATE, OR FEDERAL REGULATIONS.”

If the clothing is disposable, label the containers as clothing contaminated with lead. Apply hazardous waste labels as appropriate after testing.

If the clothing is washed on site, provide containers for the collection and retention of the water after filtration. Provide ample filtration (e.g., through a multi-stage filtration system ending in 5 microns or better if needed) until the water can be disposed of as non-hazardous, or discharged into the sanitary sewer system if allowed by the Publicly Owned Treatment Works (POTW). Test the water in accordance with EPA Method 6010 for the parameters established by the POTW to confirm the acceptability of the filtration. The Contractor shall be required to obtain all necessary permits for disposal in accordance with applicable Federal, State, and local regulations.

2. Personal Hygiene facilities and Equipment: Provide clean lavatory and hand washing facilities in accordance with OSHA sanitation standard 29 CFR 1926.51. Locate the hand washing facilities in close proximity to the paint removal operation, in an area that is convenient for washing prior to eating or smoking.

Provide showers when exposures exceed the PEL or TLV. Confirm that all employees whose exposures exceed the PEL or TLV shower prior to leaving the project site. Allow MassDOT and MBTA representatives to use the lavatory and hand washing / shower facilities. Provide filtration and testing of the wastewater as described above under Protective Clothing and Equipment.

A decontamination / changing facility must be provided and used along with hot water washing and respirator cleaning facilities during lead (Pb) paint removal operations except for chemical stripping operations. A handwashing facility must be provided and used along with hot water washing and respirator cleaning facility during chemical stripping and mechanical disassembly

i.e. bolt and rivet removal.

Prohibit eating, drinking, smoking, chewing of food or tobacco products, or the application of cosmetics in any area where the exposure to lead exceeds the Action Level or within regulated areas, and confirm that workers thoroughly wash hands and face prior to undertaking any of these activities.

Provide clean lunch and break areas for use by all employees, and maintain airborne concentrations in these areas below the Action Levels.

Provide clean change area(s) for employees whose exposures exceed the PEL or TLV. Equip the change area(s) with separate storage facilities for street clothing that is adequately segregated to prevent cross-contamination from work clothing. Assure that employees do not leave the project site wearing any clothing that was worn while performing activities where exposures exceeded the PEL or TLV.

- H. Housekeeping: Clean accumulations of dust or debris containing lead daily, at a minimum. Clean more frequently if visible accumulations are observed that could be carried outside of the regulated area by wind, workers shoes, rainwater, or other means.

Conduct all cleaning with HEPA (High Efficiency Particulate Air)-filtered vacuums. Do not use compressed air for housekeeping purposes unless it is used in conjunction with a ventilation system capable of capturing the resulting airborne particulate. Containerize the debris for proper disposal.

- I. Establishment of Regulated Areas: Establish zones (regulated areas) around project locations or activities that might generate airborne emissions of lead in excess of the Action Level (e.g., paint removal and clean-up locations, dust collector staging areas, waste storage areas, etc).

Use ropes, ribbons, tape, or other visible means to define the areas. Prohibit entrance into the regulated areas by unprotected or untrained personnel to ensure that they are not exposed to lead from project activities. Establish the regulated area boundary a minimum of 15 feet away from any equipment or operations that might generate airborne emissions of lead.

Individuals who enter the regulated area shall have the proper training, blood analysis and medical examinations, and must wear the required protective clothing and equipment. Prohibit eating, drinking, smoking, and chewing of food or tobacco products in any area where the exposures exceed the Action Level. Maintain a log at the entrance of the regulated area and have all personnel sign in and out.

The adequacy of a regulated area shall be verified visually by the Engineer. Although it is recognized that airborne debris are not always visible, any observance of dust or debris passing outside the zone is cause for immediate shut down of the work and corrective action taken by the Contractor. The work activities and/or containment shall be modified to provide better control of emissions or the area will be reestablished as directed and approved by the Engineer.

- J. Cleaning Abutments: The horizontal surfaces of all abutments and pier caps as directed by the Engineer shall be swept clean of all debris, which may include but is not limited to, sand, gravel, bituminous material and bird droppings. This material shall be removed and disposed of as construction waste unless otherwise determined by the required testing as outlined in Section 961.68 "Handling of Hazardous Waste and Reporting Release Programs" in the Supplemental Specifications dated June 2012, and all subsequent Interim Supplemental Specifications. After the debris has been removed the Contractor shall wash down the horizontal surfaces of the abutments with fresh water under pressure.

3.2 CONSTRUCTION METHODS FOR TEMPORARY PROTECTIVE SHEILDING

- A. The installation of the protective shield including connections, fasteners, erection procedures and maintenance shall be undertaken in accordance with the following criteria:
1. The protective shield shall be designed to support all construction and dead loads safely, but not less than 100 pounds per square foot; to be stiff enough to limit deflection to 1/2 inch under maximum loads; and to be sealed tightly at all joints.
 2. The protective shield shall extend horizontally a minimum of three feet beyond the bridge parapet and shall extend vertically to a point one foot above the top of the bridge parapet or barrier wall.
 3. The protective shield shall be placed to protect the entire area of demolition.
 4. The protective shield shall be sufficiently tight to prevent leakage of slurry from cutting tools, dust, chips or other small debris to the surface below.
 5. The protective shield shall be tongue and groove or ship lap with 6 mil polyethylene unless otherwise specified or approved by the Engineer.

Alternate methods for protective shielding will be considered and reviewed by the Engineer.

Their use will be subject to the approval of the Engineer. If the Contractor proposes an alternate method, the Contractor shall submit shop drawings showing complete details of this method along with a detailed plan for traffic control. These drawings and details shall be designed and stamped by a Professional Structural Engineer registered in the Commonwealth of Massachusetts.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02221

DEMOLITION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items:
1. Demolition, selective demolition and removal of structures and buildings including and not limited to:
 - a. Existing Lechmere Station
 - b. Existing Bus Depot at existing Lechmere Station
 - c. Homan's Building at 350 Medford Street
 - d. Sako Auto Body Shop at 662 Boston Ave
 - e. Bowling Alley at 664 Boston Ave
 - f. Veterinary Office and Karate Studio at 675 Broadway
 - g. ACPA Building at 40-48 Third Ave
 - h. Walker Building at 20 Third Ave
 - i. Former Aerocycle Building at 642 Boston Avenue and Building at 646 Boston Avenue
 - j. Existing Viaduct structure
 2. Demolition, selective demolition and removal of site improvements
 3. The removal of all below-grade construction
 4. Disconnecting, capping or sealing and removing abandoned site utilities
 5. Salvaging items for reuse by the Authority
 6. All other works including support of excavation and dewatering as necessary to provide a safe adequate work site in accordance with applicable regulations
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
1. Section 01545 – PROTECTION OF WORK AND PROPERTY
 2. Section 01560 – TEMPORARY CONTROLS
 3. Section 01800 – SUSTAINABILITY REQUIREMENTS
 4. Section 02080 – ASBESTOS REMOVAL
 5. Section 02081 – HAZARDOUS MATERIALS ABATEMENT
 6. Section 02090 – LEAD ABATEMENT
 7. Section 02091 – REMOVAL OF CONTAMINATED FIXTURES
 8. Section 02092 – PCB BULK PRODUCT WASTE ABATEMENT
 9. Section 02100 – SITE PREPARATION
 10. Section 02222 – REMOVAL, STOCKPILING, AND PROTECTION OF SELECTED STONework
 11. Section 02223 – SEGREGATION OF DEMOLITION DEBRIS AND WASTE TRANSPORTATION AND DISPOSAL
 12. Section 02224 – REMOVAL, PRESERVATION, AND REUSE OF HISTORIC ELEMENTS
 13. Section 02282 – HANDLING, TRANSPORTATION AND DISPOSAL OF EXCAVATED MATERIALS
 14. Section 02300 – EARTHWORK
 15. Section 02369 – DRILLED MINI-PILES
 16. Section 02650 – EXISTING SITE UTILITIES

17. Section 02852 – TRACKWAY DEMOLITION AND SALVAGE
18. Section 16802 – EQUIPMENT REMOVAL FOR THE LIGHT RAIL SIGNAL SYSTEM
19. Section 16902 – SIGNAL EQUIPMENT REMOVAL FOR THE COMMUTER RAIL SIGNAL SYSTEM

1.2 DEFINITIONS

- A. Demolish: Completely remove and legally dispose of off-site.
- B. Salvage: Carefully detach from existing construction, in a manner to prevent damage, and deliver to the Authority ready for reuse. Include fasteners or brackets needed for reattachment elsewhere.
 1. Repurpose: Carefully document existing materials designated to be photo-documented in situ, tagged, cataloged, detached from existing construction, in a manner to prevent damage, delivered to an approved storage site, document each item for ease of identification, protect during storage, and prepare to deliver materials for reuse.
- C. Hazardous Material: Includes but is not limited to asbestos and materials regulated under TSCA, RCRA, Massachusetts Hazardous Waste Regulations (310 CMR 30.000) and the Massachusetts Contingency Plan (MCP) (310 CMR 40.000) and building construction material defined by OSHA. Consideration shall be given to MSDS in determining if a material could be potentially hazardous.

1.3 MATERIALS OWNERSHIP

- A. Unless otherwise indicated, demolition waste becomes the property of the Contractor.
- B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to the Authority that may be uncovered during demolition remain the property of the Authority.
 1. Carefully salvage in a manner to prevent damage, transport in a manner to prevent damage and promptly return to the Authority at a location designated by the Authority.

1.4 SUBMITTALS

- A. Proposed Protection Measures: Submit informational report in accordance with OSHA Part 1926 procedures, including drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, for dust control and for noise control. Indicate proposed locations and construction of barriers.
 1. Adjacent Buildings and Structures: Detail special measures proposed to protect adjacent buildings and structures to remain.
- B. Schedule of Building and Structure Demolition Activities: Indicate the following:
 1. Prepare and submit a list of Salvaged and materials designated for Repurposing.
 2. Detailed sequence of demolition work, with starting and ending dates for each activity.
 3. Temporary interruptions of utility services.
 4. Shutoff and capping or re-routing of utility services.
- C. Building and Structure Demolition Plans: Submit demolition drawings, Sealed and Signed by a Professional Engineer registered in the Commonwealth of Massachusetts (refer to 3.1D) and indicating the following:
 1. Locations of temporary protection and means of egress for adjacent occupied buildings.

- D. Inventory: Submit a list of items to be removed and salvaged and deliver to the Authority prior to start of demolition.
- E. Predemolition Photographs or Video: Show existing conditions of adjoining construction and site improvements, including Stone deigned for Repurposing, and finish surfaces that might be misconstrued as damage caused by building demolition operations. Documentation of existing damage shall include a close up with a readable scale in the photograph or video. Submit before the Work begins.
- F. Hazardous material remediation plan (HMRP). Include in the plan landfill recordkeeping. Submit landfill records indicating receipt and acceptance of hazardous wastes by a landfill facility licensed to accept hazardous wastes. Submit documentation of recycling of hazardous material per Section 01800 – SUSTAINABILITY REQUIREMENTS. Landfilling should be used only when recycling is technically or financially infeasible.
- G. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.
- H. Results of Professional Engineer’s survey required by Article 3.1D.
- I. Storage plan for Repurposed Stone Blocks.

1.5 QUALITY ASSURANCE

- A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning demolition. Comply with hauling and disposal regulations of authorities having jurisdiction. Comply with governing EPA and OSHA regulations during all phases of demolition.
- B. Standards: Comply with ANSI A10.6 and NFPA 241.
- C. Prepare a hazardous material remediation plan and submit to the Authority for approval.
- D. Predemolition Conference: Conduct conference at Project site to review the methods and procedures related to building and structure demolition including, but not limited to, the following:
 - 1. Review of hazardous material remediation plan.
 - 2. Inspect and discuss condition of construction to be demolished.
 - 3. Review structural load limitations of existing structures.
 - 4. Review and finalize building and structure demolition schedule and verify availability of demolition personnel, equipment, and facilities needed to make progress and avoid delays.
 - 5. Review and finalize protection requirements.
 - 6. Review procedures for noise control and dust control.
 - 7. Review procedures for protection of adjacent buildings.
 - 8. Review and list items to be salvaged and returned to the Authority.
 - 9. Review stone designated for Repurposing.

1.6 PROJECT CONDITIONS

- A. Buildings and structures to be demolished will be vacated and their use discontinued before the start of the Work.

- B. Buildings or other structures immediately adjacent to demolition areas may be occupied. Conduct demolition so operations of occupied buildings and structures will not be disrupted.
 - 1. Provide not less than 72 hours' notice of activities that will affect operations of adjacent occupied buildings.
 - 2. Maintain access to existing walkways, exits, and other facilities used by occupants of adjacent buildings.
 - a. Do not close or obstruct walkways, exits, or other facilities used by occupants of adjacent buildings without written permission from authorities having jurisdiction.
- C. The Authority assumes no responsibility for buildings and structures to be demolished.
 - 1. Conditions existing at time of inspection for bidding purpose will be maintained by the Authority as far as practical.
- D. Hazardous Materials: Hazardous materials may be present in buildings and structures to be demolished. Reports on the presence of hazardous materials are on file at the Authority for review and use. Examine the reports to become aware of locations where asbestos, lead paint or other hazardous materials are present. Do not disturb hazardous materials or items suspected of containing hazardous materials except under procedures specified or required by a licensed professional and/or agency having jurisdiction.
- E. On-site storage or sale of removed items or materials is not permitted.

1.7 COORDINATION

- A. Arrange demolition schedule so as not to interfere with the Authority's operations and operations of adjacent occupied buildings and structures.
- B. Accommodate site visits by representations of any regulatory agency having jurisdiction over the work.

PART 2 - PRODUCTS

2.1 FILL MATERIALS

- A. Comply with excavating, backfilling, and compacting procedures for soils used as backfill material to fill basements, voids, depressions or excavations resulting from demolition of structures.
 - 1. Un-contaminated soil excavated during removal of foundations may be re-used as fill material at the same location without sampling and analysis to verify it is un-contaminated. Excavated soil/fill material that is not re-used within the area of excavation must be characterized prior to re-use or disposal.
 - 2. Excavated material which exhibits chemical odors, staining and/or constituents which indicate the potential for contaminants to be present above MassDEP reporting thresholds, shall be pre-characterized prior to re-use.
 - 3. Re-used on-site soil and imported fill soil shall meet the requirements in Section 02300 – EARTHWORK and Section 02282 – HANDLING, TRANSPORTATION AND DISPOSAL OF EXCAVATED MATERIALS.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that utilities have been disconnected and capped before starting demolition operations.
- B. Review Project Record Documents of existing construction provided by the Authority. The Authority does not guarantee that existing conditions are the same as those indicated in Project Record Documents.
- C. Inventory and record the condition of items to be removed and salvaged. Provide photographs or video of conditions that might be misconstrued as damage caused by salvage operations.
- D. Engage a Professional Engineer registered in the Commonwealth of Massachusetts to perform an engineering survey of condition of building to determine whether removing any element might result in structural deficiency or unplanned collapse of any portion of structure or adjacent structures during building demolition operations.
- E. Verify that hazardous materials have been remediated before proceeding with building demolition operations.

3.2 PREPARATION

- A. Existing Utilities: Locate, identify, disconnect, and seal or cap off indicated utilities serving buildings and structures to be demolished.
 - 1. Arrange to shut off indicated utilities with utility companies.
 - 2. If removal, relocation, or abandonment of utility services will affect adjacent occupied buildings, then provide temporary utilities that bypass buildings and structures to be demolished and that maintain continuity of service to other buildings and structures.
 - 3. Cut off pipe or conduit a minimum of 24 inches below grade. Cap, valve, or plug and seal remaining portion of pipe or conduit after bypassing according to requirements of authorities having jurisdiction.
- B. Existing Utilities: Refer to Section 02650 – EXISTING SITE UTILITIES for shutting off, disconnecting, removing, and sealing or capping utilities. Do not start demolition work until utility disconnecting and sealing have been completed and verified in writing.
- C. Temporary Shoring: Provide and maintain interior and exterior shoring, bracing, or structural support to preserve stability and prevent unexpected movement or collapse of construction being demolished.
 - 1. Strengthen or add new supports when required during progress of demolition.
- D. Salvaged Items: Comply with the following:
 - 1. Clean salvaged items of dirt and demolition debris.
 - 2. Pack or crate items after cleaning. Identify contents of containers.
 - 3. Store items in a secure area until delivery to the Authority.
 - 4. Transport items to storage area designated by the Authority.
 - 5. Protect items from damage during transport and storage.
- E. Site Clearance: As required to complete demolition and provide a safe work site. Remove vegetation in those areas where removal is indicated on the drawings in conformance with Section 02100 - SITE

PREPARATION. Protect vegetation to remain in conformance with Section 01545 – PROTECTION OF WORK AND PROPERTY.

3.3 PROTECTION

- A. Existing Facilities: Protect adjacent walkways, loading docks, building entries, and other building facilities during demolition operations. Maintain exits from existing buildings.
- B. Existing Utilities: Maintain utility services to remain and protect from damage during demolition operations.
 - 1. Do not interrupt existing utilities serving adjacent occupied or operating facilities unless authorized in writing by the Authority and authorities having jurisdiction.
 - 2. Provide temporary services during interruptions to existing utilities, as acceptable to the Authority and authorities having jurisdiction.
 - a. Provide at least 72 hours' notice to occupants of affected buildings if shutdown of service is required during changeover.
- C. Temporary Protection: Erect temporary protection, such as walks, fences, railings, canopies, and covered passageways, where required by authorities having jurisdiction and as indicated. Comply with requirements in Division 1.
 - 1. Protect adjacent buildings and facilities from damage due to demolition activities.
 - 2. Protect existing site improvements, appurtenances, and landscaping to remain.
 - 3. Erect a plainly visible fence around drip line of individual trees or around perimeter drip line of groups of trees to remain.
 - 4. Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.
 - 5. Provide protection to ensure safe passage of people around building demolition area and to and from occupied portions of adjacent buildings and structures.
 - 6. Protect walls, windows, roofs, and other adjacent exterior construction that are to remain and that are exposed to building demolition operations.
 - 7. Erect and maintain dustproof partitions and temporary enclosures to limit dust, noise, and dirt migration to occupied portions of adjacent buildings.
- D. Remove temporary barriers and protections where hazards no longer exist. Where open excavations or other hazardous conditions remain, leave temporary barriers and protections in place.

3.4 DEMOLITION, GENERAL

- A. General: Demolish indicated existing buildings, structures and site improvements completely, unless otherwise indicated to be salvaged. Use methods required to complete the Work within limitations of governing regulations and as follows:
 - 1. Do not use cutting torches until work area is cleared of flammable materials. Maintain portable fire-suppression devices during flame-cutting operations.
 - 2. Maintain fire watch during and for at least four hours after flame cutting operations.
 - 3. Maintain adequate ventilation when using cutting torches.
 - 4. Locate building and structure demolition equipment and remove debris and materials so as not to impose excessive loads on supporting foundations, walls, floors, decks, or framing.
 - 5. In general, demolish buildings and structures top down.

- B. Engineering Surveys: During demolition, perform weekly surveys by a Professional Engineer registered in the Commonwealth of Massachusetts to detect hazards that may result from building demolition activities.
- C. Site Access and Temporary Controls: Conduct building and structure demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.
 - 1. Do not close or obstruct streets, walks, walkways, or other adjacent occupied or used facilities without permission from the Authority and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
 - 2. Use water mist and other suitable methods to limit spread of dust and dirt. Comply with governing environmental-protection regulations. Do not use water when it may damage adjacent construction or create hazardous or objectionable conditions, such as ice, flooding, and pollution.
- D. Explosives: Use of explosives is not permitted.

3.5 DEMOLITION BY MECHANICAL MEANS

- A. Proceed with demolition of structural framing members systematically, from higher to lower level. Complete building and structure demolition operations above each floor or tier before disturbing supporting members on the next lower level.
- B. Remove debris from elevated portions of the building or structure by chute, hoist, or other device that will convey debris to grade level in a controlled descent.
 - 1. Remove structural framing members and lower to ground by method suitable to minimize ground impact and dust generation. Where indicated to salvage structural framing members, disassemble connections via mechanical means and not via thermal cutting. Members to be salvaged shall be dismantled into the largest section possible for shipping and reuse.
- C. Salvage: Items to be salvaged include but are not limited to granite blocks with rock face finishes, existing Lechmere Viaduct structural steel Bents 570 & 571 along with the adjacent structural steel of existing spans 569, 570 and 571 and other items as indicated on Drawings.
- D. Below-Grade Construction: Demolish foundation walls and other below-grade construction that are within footprint of new construction and extending 5 feet outside footprint indicated for new construction. Abandon below-grade construction outside this area.
 - 1. Remove below-grade construction, including basements, foundation walls, footings and piles.
- E. Existing Utilities: Abandon existing utilities and below-grade utility structures. Cut utilities a minimum of 5'-0" below grade, unless indicated otherwise.
- F. Pipe or conduit greater than 15 inch in diameter shall be completely filled with Controlled Density Fill Type I or Type 1E in accordance with Commonwealth of Massachusetts, Massachusetts Department of Transportation (MassDOT) unless otherwise noted on the drawings: Standard Specifications for Highways and Bridges (Latest Edition).

3.6 SITE RESTORATION

- A. Below-Grade Areas: Rough grade below-grade areas ready for further excavation or new construction.

- B. Site Grading: Uniformly rough grade areas of demolished construction to a smooth surface, free from irregular surface changes. Provide a smooth transition between adjacent existing grades and new grades.

3.7 REPAIRS

- A. Promptly repair damage to adjacent buildings, utilities, fences, or other structures or features caused by demolition operations.

3.8 DISPOSAL OF DEMOLISHED MATERIALS

- A. Remove demolition waste materials from Project site and legally recycle or dispose of them in a landfill acceptable to authorities having jurisdiction.
 - 1. Do not allow demolished materials to accumulate on-site.
 - 2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
 - 3. Recycle building materials in accordance with applicable State and Federal Regulations.
- B. Do not burn demolished materials.

3.9 CLEANING

- A. Clean adjacent structures and improvements of dust, dirt, and debris caused by demolition operations. Return adjacent areas to condition existing before demolition operations began.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02223

SEGREGATION OF DEMOLITION DEBRIS AND WASTE TRANSPORTATION AND DISPOSAL

PART 1 - GENERAL

1.1 SUMMARY

- A. This section describes the requirements for the DESIGN-BUILDER and all subcontractors to minimize construction waste and debris and to reuse, salvage, and recycle to the greatest extent feasible.
- B. This Section includes administrative and procedural requirements for the segregation, management, recycling and disposal of demolition debris and project-generated, non-hazardous construction waste.

1.2 RELATED WORK

- A. Other specification sections that relate to the work include but are not limited to the following:
 - 1. Section 01060 - PERMITS AND REGULATORY REQUIREMENTS
 - 2. Section 01560 – TEMPORARY CONTROLS
 - 3. Section 01800 – SUSTAINABILITY REQUIREMENTS
 - 4. Section 02080 – ASBESTOS REMOVAL
 - 5. Section 02081 – HAZARDOUS MATERIALS ABATEMENT
 - 6. Section 02090 – LEAD ABATEMENT
 - 7. Section 02091 – REMOVAL OF CONTAMINATED FIXTURES
 - 8. Section 02092 – PCB BULK PRODUCT WASTE ABATEMENT
 - 9. Section 02221 – DEMOLITION

1.3 DEFINITIONS

- A. Asphalt Pavement, Brick, and Concrete (ABC) Rubble: Rubble that contains only weathered (cured) asphalt pavement, clay bricks and attached mortar normally used in construction, or concrete that may contain rebar, reinforcing steel and related accessories. The rubble shall not be mixed with, or contaminated by, another waste or building debris.
- B. Demolition Waste: Building and site improvement materials resulting from demolition or selective demolition operations.
- C. Disposal: Removal off-site of demolition waste and subsequent sale, recycling, reuse, or deposit in landfill or incinerator acceptable to authorities having jurisdiction.
- D. Fixed and Movable Assets: Items that can be removed intact during pre-demolition or demolition with the potential to be re-used or recycled. Examples of such items include, but are not limited to, windows and doors, casework, cabinetry, bathroom fixtures, and kitchen appliances and other items specified in this Section.

- E. Recycle: Recovery of demolition or construction waste for subsequent processing in preparation for reuse.
- F. Salvage: Recovery of demolition or construction waste and subsequent sale or reuse in another facility.
- G. Salvage and Reuse: Recovery of demolition or construction waste and subsequent incorporation into the Work.

1.4 PERFORMANCE REQUIREMENTS

- A. General: DESIGN-BUILDER to develop a waste management plan that results in End-of-Project rates for salvage/recycling of 90 percent by weight of total waste generated by the Work, excluding asbestos containing materials and hazardous materials.
- B. DESIGN-BUILDER shall sample demolition debris suspected to contain hazardous materials to verify prior to segregation as either a recyclable material or a waste.
- C. Salvage/Recycle Requirements: DESIGN-BUILDER shall salvage and recycle all non-hazardous demolition and construction waste including, but not limited to the following materials:
 - 1. Asphaltic concrete paving.
 - 2. Concrete, concrete block, concrete masonry units (CMU), slump stone (decorative concrete block), and rocks.
 - 3. Concrete reinforcing steel.
 - 4. Brick.
 - 5. Coated brick, concrete, and concrete masonry units. Coatings shall include, but not be limited to: paint, stucco applications, and plaster.
 - 6. Paper, including bond, newsprint, cardboard, mixed paper, packing materials, and packaging.
 - 7. Land clearing debris such as cut trees and shrubs.
 - 8. Carpet and Pad.
 - 9. Wood studs, wood joists, plywood, oriented strand board, paneling and trim.
 - 10. Structural steel, miscellaneous steel and rough hardware.
 - 11. Roofing.
 - 12. Doors, door frames, and door hardware.
 - 13. Windows, glass, plastic, and glazing.
 - 14. Metal (ferrous and non-ferrous) including, but not limited to, stud trim, ductwork, piping, reinforcing steel (rebar), roofing, other trim, steel, iron, galvanized sheet steel, stainless steel, aluminum, copper, zinc, lead, brass, and bronze.
 - 15. Equipment.
 - 16. Plumbing fixtures, piping, supports, hangers, valves, and sprinklers.
 - 17. Mechanical equipment and refrigerants.
 - 18. Electrical conduit, copper wiring, lighting fixtures, lamps, and ballasts.

- 19. Electrical devices, switchgear, panel boards, and transformers.
- D. In the event the DESIGN-BUILDER encounters previously unidentified material that is reasonably believed to be hazardous, asbestos containing, coated with lead-based paint, or oily debris, the DESIGN-BUILDER shall immediately stop work in the affected area and report the condition to the AUTHORITY.
- E. The DESIGN-BUILDER should be aware that the Commonwealth of Massachusetts has banned certain waste streams from solid waste management facilities, including incinerators and landfills (ref. 310 CMR 19.017). The list of banned materials has periodically expanded over time and currently includes the following materials:
 - 1. Lead-Acid Batteries
 - 2. Leaves and Yard Waste
 - 3. Whole Tires (banned from landfills only; shredded tires are acceptable)
 - 4. White Goods (large appliances)
 - 5. Cathode Ray Tubes (CRTs), including computer monitors
 - 6. Metal and Glass Containers
 - 7. Single Resin Narrow-Necked Plastics
 - 8. Recyclable Paper, Cardboard and Paperboard
 - 9. Asphalt Pavement, Brick and Concrete
 - 10. Ferrous and Non-Ferrous Metals
 - 11. Treated and Untreated Wood and Wood Waste (banned from landfills only)
 - 12. Clean Gypsum Wallboard
 - 13. Commercial Organic Material (effective October 1, 2014)

The DESIGN-BUILDER should refer to the current MassDEP regulations and guidance to ensure compliance with the waste bans.

1.5 SUBMITTALS

- A. Demolition Waste Management Plan (DWMP): Submit for approval within 21 calendar days of date established for the Notice to Proceed a DWMP as specified in section 1.7. Submit periodic updates to the DWMP whenever substantial changes to waste management procedures are implemented. The plan shall also include minimum worker training and communication plans.
- B. Locations of all designated temporary waste segregation and storage areas, with the naming conventions for waste types, and security measures to prevent unauthorized dumping.
- C. Results of characterization testing of potentially recyclable materials suspected to contain hazardous materials.
- D. Types and capacity of containers to be used for source separation or co-mingled collection.
- E. Distribution Channel: Submit qualifications of organization designated to reuse/recycle fixed and movable assets for AUTHORITY's approval. Include a list of recent projects where items have been

reused/recycled and locations where fixed and movable assets have been delivered. Include name of person assigned to this Project Facility Permitting Information:

1. For disposal and incinerator facilities provide a copy of the facility's current solid waste management facility permit in accordance with 310 CMR 19.000, prior to the start of construction.
 2. Facility Permitting Information: For off-site ABC rubble crushing and/or recycling facilities, provide a statement, prior to construction, from the facility that references its specific exemption from the solid waste regulations (per 310 CMR 16.05 (3) (e)) or provide a copy of the facility's current solid waste management facility permit in accordance with 310 CMR 19.000.
- F. Copies of logs of weekly inspections of each designated waste storage area. Provide written updates to waste management procedures after inspections to improve labeling, storage, dust control, prevention of improper disposal, and cross-mixing controls.
- G. Record Keeping for Recycling and Landfill and/or Incinerator Disposal: Documentation to be submitted by the DESIGN-BUILDER shall include the following:
1. Recycling and Processing Facility Records: Indicate receipt and acceptance of recyclable waste by recycling and processing facilities licensed to accept them. Include manifests, weight tickets, and/or receipts.
 2. Landfill and Incinerator Disposal Records: Indicate receipt and acceptance of waste by landfills and incinerator facilities licensed to accept them. Include manifests, weight tickets, and/or receipts.
 3. List of Fixed and Movable Assets to Be Reused/Recycled: Inventory site and provide preliminary list of materials that can be reused/recycled, including quantities and any costs or savings to the project budget. After consultation with ENGINEER, provide final list of fixed and movable assets to be reused/recycled. Provide tracking and reporting forms.
- H. Records of Donations: Indicate receipt and acceptance of salvageable waste donated to individuals and organizations. Indicate whether organization is tax exempt.
- I. Records of Sales: Indicate receipt and acceptance of salvageable waste sold to individuals and organizations. Indicate whether organization is tax exempt.
- J. At the Project Completion, submit a Final Report of the Management of Demolition Debris, to include at a minimum:
1. Material category.
 2. Generation point of waste.
 3. Total quantity of waste in tons.
 4. Quantity of waste salvaged, both estimated and actual in tons.
 5. Quantity of waste recycled, both estimated and actual in tons.
 6. Total quantity of waste recovered (salvaged plus recycled) in tons.
 7. Total quantity of waste recovered (salvaged plus recycled) as a percentage of total waste.
 8. Analytical testing results of recycled materials, if any.

1.6 QUALITY ASSURANCE

- A. Regulatory Requirements: Comply with hauling and disposal regulations of authorities having jurisdiction, including but not limited to, Massachusetts solid waste regulations contained in 310 CMR 16.00 and 310 CMR 19.000.

1.7 DEMOLITION WASTE MANAGEMENT PLAN

- A. General: The DESIGN-BUILDER is required to recover, store, and recycle/reuse all project waste, including demolition materials, in lieu of disposal if the material is of acceptable physical quality and chemical quality, and the DESIGN-BUILDER can identify a facility willing and permitted to accept the material.
- B. Develop and submit plan for approval, consisting of waste source identification, and waste reduction, storage, handling, testing, and transportation and recycling/disposal procedures. Include separate sections in plan for recycling and disposal of demolition waste. Indicate quantities by weight throughout waste management plan.
- C. Waste Identification: Indicate anticipated types and quantities of demolition and site-clearing waste generated by the Work. Include estimated quantities and assumptions for estimates.
- D. Waste Minimization and Diversion Plan: Describe the specific procedures for reducing waste generated by the project, including minimizing material packaging, recovering recyclable materials (paper, cardboard, metal, wood, etc.) and document plans for tracking the diversion of 90% of recyclable wastes from landfill disposal and compliance with MassDEP's solid waste bans (ref. 310 CMR 19.017).
- E. Waste Reduction Program: List each type of waste and whether it will be recycled, or disposed of in landfill or incinerator. Include points of waste generation, total quantity of each type of waste, quantity for each means of recovery any applicable sampling and analytical procedures, including TCLP if required, of materials to be recycled, and handling and transportation procedures.
 - 1. Recycled Materials: Include list of local receivers and processors and type of recycled materials each will accept, and any required testing of materials prior to acceptance. Include names, addresses, and telephone numbers.
 - 2. Disposed Materials: Indicate how and where materials will be disposed. Include name, address, and telephone number of each landfill and incinerator facility.
 - 3. Salvaged Materials for Sale: For materials that will be sold to individuals and organizations, include list of their names, addresses and telephone numbers.
- F. Handling and Transportation Procedures: Include methods that will be used for separating recyclable waste including sizes of containers, container labeling, and restrictions on waste mingling, and designated location on Project site where materials separation will be located.
- G. Waste Management Coordinator: Identify DESIGN-BUILDER employee who will be the Waste Management Coordinator for the project. The Waste Management Coordinator will be responsible for implementing, monitoring, and reporting status of waste management work plan.

PART 2- PRODUCTS

Not Used.

PART 3 – EXECUTION

3.1 DEMOLITION WASTE MANAGEMENT PLAN IMPLEMENTATION

- A. General: Implement approved Demolition Waste Management Plan (DWMP). Provide containers, storage, signage, transportation, and other items as required to implement DWMP for the entire duration of the Project.
- B. The DESIGN-BUILDER shall conduct a Demolition Waste Management Meeting at the Site. The DESIGN-BUILDER shall review methods and procedures related to waste management including, but not limited to, the following:
 - 1. Distribute approved DWMP to everyone concerned within three days of approved submittal return.
 - 2. Clearly identify the Waste Management Coordinator and explain the Coordinator's responsibilities.
 - 3. Review DWMP with each trade when they first begin work on-site. Review plan procedures and locations established for recycling and disposal.
 - 4. Review and finalize procedures for material separation and verify availability of containers and bins needed to maintain production.
 - 5. Review the weekly inspection procedures and chain of command for corrective measures to maintain compliance with the DWMP.
 - 6. Review procedures for periodic waste collection and transportation to recycling and disposal facilities.
 - 7. Provide recycling educational literature for all workers, subcontractors and suppliers engaged in on-site activities.
 - 8. Provide appropriate recycling signage for containers and workspaces.
- C. Site Access and Temporary Controls: DESIGN-BUILDER shall conduct waste management operations to ensure minimum interference with roads, streets, walkways, and other adjacent occupied and used facilities.
 - 1. Designate and label specific areas on project site necessary for separating materials that are to be salvaged, recycled, reused, donated, sold, and disposed.
 - 2. Comply with project requirements for controlling dust and dirt, pest management, environmental protection, and noise control.
 - 3. Conduct and document in logs the weekly inspections of waste management areas with recommendations for improvements.

3.2 SALVAGING DEMOLITION WASTE

- A. Salvaged Items for Sale and Donation: Sale activities are not permitted on project site.

3.3 RECYCLING WASTE FROM WORK-SITE

- A. General: These wastes include recycled paper, cardboard packaging, plastics, and beverage containers used by on-site workers.
- B. Procedures: DESIGN-BUILDER shall separate recyclable waste from other waste materials, trash, and debris, to the maximum extent practical. For waste which cannot be separated at project site, co-mingle only with waste which is to be separated later at a recycling facility. Contamination of recycling containers with trash or other contaminants or banned items will be addressed by the DESIGN-BUILDER and who will be solely responsible for payment of all fines and penalties.
 - 1. Provide appropriately labeled and marked containers or bins for controlling recyclable waste until they are removed from project site. Include list of acceptable and unacceptable materials at each container and bin. Inspect containers and bins at least weekly for contamination and remove contaminated materials if found.
 - 2. Stockpile processed recycled materials on-site without intermixing with other materials. Place, grade, and shape stockpiles to drain surface water. Cover with polyethylene sheeting to prevent windblown dust.
 - 3. Stockpile recycled materials away from construction area. Do not store any materials within 200 feet of residences, or within 30 feet of trees that are scheduled to remain.
 - 4. Store recycled equipment and components off the ground and protect from the weather.
 - 5. Remove recyclable waste that is generated from project site within 30 days of generation, and transport to recycling receiver or processor.

3.4 RECYCLING DEMOLITION WASTE

- A. On-site crushing of non-coated asphalt pavement, brick, and concrete (ABC) rubble as described in 310 CMR 16.05, is allowed, provided performed in accordance with 310 CMR 16.05. Coated ABC must be transported off-site to an asphalt batching plant or to an ABC crushing or recycling operation that is either conditionally exempt from 310 CMR 16.00 or has been sited and permitted in accordance with 310 CMR 16.00 and 310 CMR 19.000, respectively.
- B. Coated ABC must be tested for characterization prior to recycling, which may include laboratory analysis by Toxicity Characteristic Leaching Procedure (TCLP). The analysis and analytical documentation shall meet the MassDEP Compendium of Analytical Methods requirements. The DESIGN-BUILDER shall include the results of all materials testing in the Final Report of the Management of Demolition Debris in accordance with Section 1.5 Submittals.
- C. Asphaltic Concrete Paving: With the exception of paving debris to be crushed on-site, break up and transport paving to an asphalt-recycling facility.
- D. Concrete: With the exception of concrete debris to be crushed on-site, deposit all debris in designated container to be transported to an approved aggregate recycling facility to be crushed and screened for use as satisfactory soil for fill or sub-base.
- E. Masonry: With the exception of masonry debris to be crushed on-site for reuse, deposit all masonry debris in designated container to be transported to an approved aggregate recycling facility to be crushed and screened for use as satisfactory soil for general fill or satisfactory soil for fill or sub-base. Clean and stack undamaged whole masonry units on wood pallets for reuse.

- F. Wood Materials: Sort and stack salvageable members according to size, type, and length. Separate lumber/untreated wood debris and yard waste and deposit into appropriate container. Separate engineered wood products, panel products, and treated wood materials into designated containers.
- G. Metals: Separate metals by material type if practical. Stack salvageable structural steel members according to size, type of member, and length.
- H. Asphalt Shingle Roofing: Organic and glass-fiber asphalt shingles and felts shall be recycled at a facility permitted by Massachusetts Department of Environmental Protection (DEP) to process post-consumer (used) asphalt shingles. Recycle nails, staples acceptable, flashing trim and accessories as metals.
- I. Glass: Deposit glass debris into designated containers to be transported to an approved glass recycling facility.
- J. Plastics: Deposit plastic containers and debris into designated containers to be transported to an approved plastic recycling facility.
- K. Clean Gypsum WallBoard: Deposit scraps of clean gypsum wallboard into designated container protected from weather and transport to an appropriate gypsum recycling facility to be processed into soil amendment.
- L. Acoustical Ceiling Panels and Tile: Deposit pulp-able mineral fiber panels into designated container protected from weather and prepare for transport, as directed by manufacturer, to an appropriate recycling facility to be processed into new acoustic ceiling panels. Separate suspension system, trim, and other metals from panels and tile and sort with other metals.
- M. Equipment: Drain tanks, piping, and fixtures. Seal openings with caps or plugs. Protect equipment from exposure to weather.
- N. Plumbing Fixtures: Separate by type and size fixtures suitable for reuse. Deposit all other fixtures into designated containers by material type to be transported to an approved recycling facility.
- O. Piping: Separate piping materials by material composition. Deposit in designated containers. Separate supports, hangers, valves, sprinklers, and other components by material type and deposit in designated containers for transport to an approved recycling facility.
- P. Lighting Fixtures: Separate lamps by type and protect from breakage.
- Q. Electrical Devices: Separate switches, receptacles, switchgear, transformers, meters, panelboards, circuit breakers, and other devices by type.
- R. Conduit: Deposit conduit and fittings into designated container.
- S. Fixed and Removable Assets
 - 1. Unless specifically prohibited by the AUTHORITY, all fixed and removable assets specified below shall be removed intact and shall be distributed by sale or donation to parties who are capable of assuring their reuse.
 - 2. Materials: Fixed and movable assets to be removed for reuse may include but not limited to:
 - a. Windows (sash only)
 - b. Doors (including frames)
 - c. Wood millwork, paneling, wainscoting, and other similar interior finishing
 - d. Marble flooring
 - e. Wood flooring

- f. Bathroom plumbing fixtures (toilets and sinks)
 - g. Bathroom stall partitions
 - h. Mirrors
 - i. Kitchen cabinets and countertops
 - j. Kitchen sinks (in-counter and freestanding)
 - k. Kitchen food preparation tables
 - l. Kitchen appliances (ovens, free-standing and walk-in refrigerators, chillers, etc.)
3. Provide tools and manpower qualified to remove specified materials intact and in a condition that they may be reused.
 4. Remove specified materials intact and in condition suitable for reuse and set aside in a location and in such a manner that they will not be damaged by other site operations.
 5. Track and report the disposition of all fixed and movable assets, including organizations to which assets are distributed. Tracking and reporting may be by piece count or by weight, as appropriate to the materials and their distribution.

3.5 DISPOSAL OF WASTE

- A. General: Except for items or materials to be salvaged, recycled, or otherwise reused, DESIGN-BUILDER shall remove waste materials from project site and legally dispose in a landfill or incinerator acceptable to authorities having jurisdiction.
 1. Except as otherwise specified, do not allow waste materials that are to be disposed of accumulate on-site. Burning of wastes is prohibited.
 2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
 3. For solid waste disposal facilities located in the Commonwealth of Massachusetts, dispose of materials only in facilities which currently comply with applicable state regulations, including requirements of 310 CMR 16.00 {Site Assignment for Solid Waste Facilities} and 310 CMR 19.000 {Solid Waste Management}, and local bylaws.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02240

DEWATERING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. **Work Included:** This Section includes permitting, design, installation and operation of dewatering systems to facilitate subsurface construction.
- B. **Related Work:** Other specification sections that relate to the work of this section include, but are not limited to, the following:
 - 1. Volume 2 Technical Provisions Exhibit 2I – “Additional Project Requirements”
 - 2. Section 02015 – GEOTECHNICAL INSTRUMENTATION
 - 3. Section 02060 – EROSION AND SEDIMENTATION CONTROL
 - 4. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
 - 5. Section 02283 – HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER
 - 6. Section 02300 – EARTHWORK

1.2 PERFORMANCE REQUIREMENTS

- A. **Dewatering Performance:** Design, furnish, install, test, operate, monitor, and maintain dewatering system of sufficient scope, size, and capacity to control groundwater flow into excavations and permit construction to proceed on dry, stable sub-grades.
 - 1. Maintain dewatering operations to ensure erosion control, stability of excavations and constructed slopes, that excavation does not flood, and that damage to sub-grades and permanent structures is prevented.
 - 2. Prevent surface water from entering excavations by grading, dikes, or other means.
 - 3. Accomplish dewatering without damaging existing buildings adjacent to excavation.
 - 4. Remove dewatering system when no longer needed.
 - 5. Provide for legal and suitable disposal of groundwater including obtaining permits for discharge of water.
 - 6. Evaluate existing soil conditions and propose equipment and techniques to dewater both non-cohesive and cohesive soils.

1.3 SUBMITTALS

- A. **Shop Drawings:** For dewatering system show arrangement, locations, and details of monitoring wells and well points; pumps, locations of headers and discharge lines; and means of discharge and disposal of water.
 - 1. Dewatering plan and details stamped and signed by a Registered Professional Engineer of the Commonwealth of Massachusetts. This shall include a list of assumptions for design of

dewatering including groundwater levels, soil profile permeabilities, and duration of pumping and or recharge.

2. Include layouts of observation wells, piezometers and flow-measuring devices for monitoring performance of dewatering system and impacts to adjacent structures.
 3. Include a written report outlining control procedures to be adopted if dewatering problems arise, such as boils, loss of fines, or softening of the ground.
- B. Qualification Data: For Installer and professional engineer.
- C. Photographs or videotape of existing conditions of adjacent structures and site work that might be misconstrued as damage caused by dewatering operations. These photographs or videotape records are supplement to the Pre-Construction Survey documentation as specified in Section Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements"..
- D. Record drawings at Project closeout identifying and locating capped utilities and other subsurface structural, electrical, or mechanical conditions performed during dewatering.
1. Indicate locations and capping depth of wells and well points.
- E. Field Test Reports: Before starting excavation, submit test results and computations demonstrating that dewatering system is capable of meeting performance requirements.
- F. Adjacent Foundations Report and Analysis: Record subsurface foundation systems of adjacent structures and evaluate impacts of groundwater removal.
- G. The Design-Builder shall dewater for the length of time necessary to complete the specified sub-surface improvements. Any requirements to remove portions of the dewatering system will be noted on the Drawings.

1.4 QUALITY ASSURANCE

- A. Provide in accordance with Volume 1 DB Contract Terms and Conditions, Section 4, Quality Control and Quality Assurance, and Volume 2 Technical Provisions, Subsection 2.5, Quality Management..
- B. Regulatory Requirements: Comply with water disposal requirements of authorities having jurisdiction.
- C. Professional Engineer: Engage a professional engineer registered in the Commonwealth of Massachusetts to design and certify dewatering systems. Professional engineer shall have a minimum of 5 years experience with type of dewatering systems similar to those proposed for use.
- D. Retain the services of a field representative having a minimum of 5 years of experience in installation of well points, deep wells, recharge systems, or equal systems.

1.5 PROJECT CONDITIONS

- A. Existing Utilities: Do not interrupt utilities serving facilities occupied by MBTA or others unless permitted in writing by MBTA and then only after arranging to provide temporary utility services according to requirements indicated.

- B. Project-Site Information: Subsurface information collected at the project site is presented in the Geotechnical Data Reports, provided within Appendix 2E. MBTA will not be responsible for interpretations or conclusions drawn from this data.
1. The Design-Builder may elect to perform additional subsurface explorations and/or tests to confirm requirements for dewatering.
- C. Survey adjacent structures and improvements, employing a professional engineer or land surveyor, establishing elevations at fixed points to act as benchmarks. Identify benchmarks and record existing elevations.
1. During dewatering, regularly resurvey benchmarks, maintaining an accurate log of surveyed elevations for comparison with original elevations. Promptly notify MBTA if changes in elevations occur or if cracks, sags, or other damage is evident in adjacent structures.
 2. Notify the MBTA immediately if any settlement or movement is detected on structures. If the settlement or movement is deemed by the MBTA to be related to the dewatering, take actions to protect the adjacent structures and submit a modified dewatering plan to the MBTA within 24 hours. Implement the modified plan and repair any damage incurred to the adjacent structures.
 3. If subgrade soils are disturbed or become unstable due to dewatering operation or an inadequate dewatering system, notify the MBTA, stabilize the subgrade, and modify system to perform as specified.
 4. If oil and/or other hazardous materials are encountered after dewatering begins, immediately notify the MBTA. Handling of contaminated groundwater shall be in accordance with Section 02283 – HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER.

PART 2 - PRODUCTS

NOT USED.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Execution of earth excavation, installing earth retention systems, and dewatering shall not commence until the related submittals have been reviewed by the MBTA with all the MBTA's comments satisfactorily addressed and the geotechnical instrumentation has been installed.
- B. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by dewatering operations.
1. Prevent surface water and subsurface or groundwater from entering excavations, from ponding on prepared sub-grades, and from flooding site and surrounding area.
 2. Protect sub-grades and foundation soils from softening and damage by rain or water accumulation.

- C. Install dewatering system to ensure no interference with roads, streets, walks, and other adjacent occupied and used facilities.
 - 1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Authority and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.

3.2 INSTALLATION

- A. Install dewatering system utilizing wells, well points, or similar methods complete with pump equipment, standby power and pumps, filter material gradation, valves, appurtenances, water disposal, and surface-water controls.
- B. Before excavating below ground-water level, place system into operation to lower water to specified levels. Operate system continuously until drains, sewers, and structures have been constructed and fill materials have been placed, or until dewatering is no longer required. Dewatering operations shall be stopped based on a mutual decision between the Design-Builder and the MBTA.
- C. Provide an adequate system to lower and control groundwater to permit excavation, construction of structures, and placement of fill materials on dry sub-grades. Install sufficient dewatering equipment to drain water-bearing strata above and below bottom of foundations, drains, sewers, and other excavations.
 - 1. Do not perform open-sump pumping that leads to loss of fines, soil piping, sub-grade softening, and slope instability.
- D. Reduce hydrostatic head in water-bearing strata below sub-grade elevations of foundations, drains, sewers, and other excavations.
 - 1. Unless otherwise indicated maintain piezometric water level a minimum of 24 inches below bottom surface of excavation.
- E. Dispose of water removed by dewatering in compliance with applicable Local, State and Federal regulations in a manner that avoids negative impacts on abutters, endangering public health, property, and portions of work under construction or completed. Dispose of water in a manner that avoids inconvenience to others. Provide sumps, sedimentation tanks, and other flow-control devices as required by authorities having jurisdiction.
- F. Provide standby equipment and power source on-site, installed and available for immediate operation, to maintain dewatering on continuous basis if any part of system becomes inadequate or fails. If dewatering requirements are not satisfied due to inadequacy or failure of dewatering system, restore damaged structures and foundation soils at no additional expense to the MBTA.

Damages: Promptly repair damages to adjacent facilities caused by dewatering operations.

3.3 OBSERVATION WELLS

- A. Provide, take measurements, and maintain observation wells or piezometers indicated on the approved dewatering plan and additional observation wells as may be required by authorities having jurisdiction.
- B. Observe and record daily elevation of ground water and piezometric water levels in observation wells.

- C. Repair or replace, within 24 hours, observation wells that become inactive, damaged, or destroyed. Suspend construction activities in areas where observation wells are not functioning properly until reliable observations can be made. Add or remove water from observation-well risers to demonstrate that observation wells are functioning properly.

3.4 REMOVAL

- A. Do not remove dewatering system without written approval from the MBTA.
- B. Backfill and compact sumps or ditches with screened gravel or crushed stone wrapped with geotextile fabric in accordance with Section 02300 – EARTHWORK and Section 02196 – GEOTEXTILE MATERIALS.
- C. Dewatering wells shall be abandoned upon completion of the work, and completely backfilled with cement grout.
- D. Cut off and cap monitoring wells and piezometers a minimum of 48 inches below grade or overlying construction.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02250

STORM WATER POLLUTION PREVENTION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. The work specified in this Section includes the preparation, implementation, and termination of a Storm Water Pollution Prevention Plan (SWPPP) required by the U.S. Environmental Protection Agency (EPA) under the National Pollutant Discharge Elimination System (NPDES) *General Permit for Discharges from Construction Activities* (CGP).
- B. Pursuant to the Federal Clean Water Act, effective June 30, 2008, construction activities which disturb one acre or more are required to apply to EPA for coverage under the NPDES CGP. On February 16, 2012 (Federal Register/Vol. 77, No. 40/ pp. 12286 - 12293), EPA published the final NPDES *General Permit for Stormwater Discharges From Construction Activity*. The 2012 CGP will expire on February 16, 2017.
- C. Related work:
 - 1. Volume 2 Technical Provisions Exhibit 21 "Additional Project Requirements".
 - 2. Section 02060 EROSION AND SEDIMENTATION CONTROL
 - 3. Section 02100 SITE PREPARATION
 - 4. Section 02240 DEWATERING
 - 5. Section 02270 SLOPE PROTECTION
 - 6. Section 02283 HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER
 - 7. Section 02300 EARTHWORK

1.2 SUBMITTALS

- A. Design-Builder shall refer to Volume 2 Technical Provisions Subsection 2.7 "Design Submittal Review Management" and Subsection 2.8 "Construction Submittal Requirements". for submittal procedures.
- B. Submit the SWPPP in accordance with the requirements of Article 1.4 of this Section. Resubmit as appropriate during the progress of the Work to reflect proposed revisions and changed conditions, as well as after rainfall events exceeding one-inch. Appendices need not be included with these resubmittals. However, the Design-Builder is advised that submittal of selected items contained therein, or copies of same, are required to be submitted by other provisions of this Section or other Sections of these Contract Documents. At completion of the Work, and before final payment is made, Design-Builder shall submit one electronic copy of the final SWPPP, including all Appendices.

1.3 NPDES NOTICE OF INTENT

- A. The NPDES CGP requires the submission of a Notice of Intent (NOI) to the U.S. EPA prior to the

start of construction (defined as any activity which disturbs land, including clearing and grubbing). There is a fourteen (14) day review period commencing from the date on which EPA enters the Notice into their database. The Design-Builder is advised that, based on the review of the NOI, EPA may require additional information, including but not limited to, the submission of the SWPPP for review. Work may not commence on the project until final authorization has been granted by EPA. The scheduling requirements of the process should be anticipated by the Design-Builder. Any additional time required by EPA for review of submittals will not constitute a basis for claim of delay.

- B. The operator of the construction site, the Design-Builder, must submit the NOI. The Design-Builder is required to file a Notice of Intent form using EPA's electronic NOI (eNOI system) at: <https://www.epa.gov/npdes/electronic-notice-intent-enoi>.

1.4 STORM WATER POLLUTION PREVENTION PLAN

- A. The CGP also requires the preparation and implementation of a SWPPP in accordance with the aforementioned statutes and regulations. The SWPPP will include the CGP conditions and detailed descriptions of controls of erosion and sedimentation to be implemented during construction. It is the responsibility of the Design-Builder to prepare the SWPPP to meet the requirements of the most recently issued CGP, including but not limited to the requirements of the U.S. EPA's Developing Your Pollution Prevention Plan A Guide for Construction Sites (Office of Water/EPA 833-R-06-004/May 2007), and the requirements of this Section. The EPA's template for a Construction SWPPP is available at: <https://www.epa.gov/npdes/developing-stormwater-pollution-prevention-plan-swppp>.

The Design-Builder shall submit the SWPPP to the MBTA for approval at least four weeks prior to any site activities. It is the responsibility of the Design-Builder to be familiar with the CGP conditions and the conditions of all Massachusetts Wetlands Protection Act permits, the MassDEP Chapter 91 License, the U.S. Army Corps of Engineers Section 404 Permit, and other environmental permits applicable to this project, and to include in the SWPPP the methods and means necessary to comply with applicable conditions of said permits.

- B. It is the responsibility of the Design-Builder to complete the SWPPP in accordance with the EPA CGP, provide all information required, and obtain any and all certifications as required by the CGP. Any amendments to the SWPPP required by site conditions, schedule changes, revised work, construction methodologies, and the like are the responsibility of the Design-Builder. Amendments will require the approval of the MBTA prior to implementation.
- C. Included in the CGP conditions is the requirement for inspection of all erosion controls and site conditions on a weekly basis, or once every 14 calendar days and within 24-hours of the occurrence of a storm event exceeding 0.25 inches in twenty-four hours. The Design-Builder shall choose a qualified individual who will be on-site during construction to perform these inspections. The name and qualifications of the inspector shall be submitted to the MBTA for approval in accordance with Design-Builder approval requirements. In addition, if the MBTA determines at any time that the inspector's performance is inadequate, the Design-Builder shall provide an alternate inspector. Written weekly inspection forms, storm event inspection forms, and Monthly Summary Reports must be completed and provided to the MBTA. Monthly Summary Reports must include a summary of construction activities undertaken during the reporting period, general site conditions, erosion control maintenance and corrective actions taken, the anticipated schedule of construction activities for the next reporting period, any SWPPP amendments, and representative photographs. The inspector qualifications, inspection reports and monthly reports shall also conform to the requirements of the Wetlands Order of Conditions issued by any Conservation Commissions with jurisdiction over the

Work.

- D. The Design-Builder is responsible for preparation of the SWPPP, including all certifications, inspections, reports and any corrective actions necessary to comply with the provisions of the CGP. This Item addresses acceptable completion of the SWPPP, any revisions/amendments required during construction, inspection reports and preparation of monthly reports. In addition, any erosion controls beyond those specified in bid items elsewhere in this contract which are selected by the Design-Builder to facilitate and/or address the Design-Builder's schedule, methods and prosecution of the Work shall be considered incidental to this item.

1.5 NPDES NOTICE OF TERMINATION OF SWPPP

- A. The CGP requires the submission of a Notice of Termination (NOT) from all operators when final stabilization has been achieved. Approval of final stabilization by the MBTA and confirmation of submission of the NOT by the Design-Builder will be required prior to submission of the MBTA's Final Estimate.
- B. Upon submission of the NOT, Design-Builder to provide MBTA with all working documents and forms associated with the SWPPP as the MBTA will be deemed the "Operator" from that point forward.

1.6 PENALTIES

- A. Failure to comply with provisions of the NPDES permitting program and the SWPPP may result in penalties assessed by EPA, the costs of which would be borne by the Design-Builder.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION

3.1 IMPLEMENTATION OF THE STORM WATER POLLUTION PREVENTION PLAN

- A. The SWPPP, developed in accordance with Paragraph 1.4 of this Section, shall be implemented and adhered to during all phases of construction. The Design-Builder shall retain an up-to-date copy of his SWPPP and all Appendices at an on-site construction project office. The SWPPP, including all Appendices, shall be available for inspection during normal working hours by the MBTA, and all duly-authorized Federal, State, and local officials, from the date of initial SWPPP submittal until the final copy is submitted upon completion of the Work, in accordance with the requirements of Paragraph 1.2 B.
- B. The Design-Builder shall develop appropriate plans, figures, related sketches, etc. as necessary to illustrate the SWPPP. Such items shall be maintained in an Appendix to the SWPPP as they are developed by the Design-Builder. At a minimum, such drawings shall address the following three elements for the site: (1) Existing Site Conditions; (2) Site Plans (illustrating slopes after grading, areas of disturbance, drainage pattern, etc.); and (3) Site Controls (illustrating erosion and sediment control

measures, project construction waters management, oil and hazardous materials (OHM) management, etc.). Each element shall be separately addressed on its own drawing or series of drawings.

- C. The following inspection and maintenance practices shall be used to maintain erosion and sediment controls:
1. All control measures identified in the SWPPP shall be inspected by a Design-Builder-designated individual as specified in Section 1.4 C.
 2. All measures shall be maintained in good working order; if a repair is necessary, it shall be initiated within 48 hours of deficiency identification.
 3. An Inspection and Maintenance Report shall be completed for each inspection by the individual who performed the inspection. Completed Inspection and Maintenance Reports shall be maintained in an Appendix to the SWPPP. The Design-Builder-developed report form to be completed by the Design-Builder's inspector shall be submitted to the MBTA for approval, and shall address the control measures identified in the SWPPP. A sample Inspection and Maintenance Report form is presented in: *Office of Water/EPA 833-R-06-004/May 2007*. The Design-Builder shall further develop this form as necessary to list the specific control measures to be inspected and to provide additional detail based on his proposed work. Inspection activities performed by the Design-Builder shall in no way limit the MBTA from conducting their own inspections and identifying deficiencies to the Design-Builder for correction.
- D. The Design-Builder shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) to achieve compliance with the conditions of the NPDES CGP and with the requirements of the SWPPP.
- E. The Design-Builder shall maintain records of dates when major grading activities occur, dates of temporary or permanent cessation of construction, and dates of initiation of stabilization measures in an Appendix to the SWPPP.
- F. Oil and Hazardous Materials Management and Spill Control
1. For practices not more specifically addressed by federal, state, and local laws and implementing regulations or these Specifications, all oil and hazardous materials and all spills shall be managed in accordance with the OHM Management and Spill Control Program presented in the SWPPP.
 2. Spills
 - a. The NPDES CGP does not relieve the Design-Builder of the reporting requirements of the Massachusetts Contingency Plan, 40 CFR Part 117, or 40 CFR Part 302. Where a release containing a hazardous substance in an amount equal to or in excess of a reporting quantity established under the Massachusetts Contingency Plan, 40 CFR Part 117, or 40 CFR Part 302 occurs, the Design-Builder is required to comply with the requirements of the aforementioned regulations. Spills of oil or hazardous material by the Design-Builder shall be reported to the Massachusetts Department of Environmental Protection and/or the National Response Center as appropriate, if the reportable quantity is exceeded. All spills of OHM by the Design-Builder, in any quantity shall be reported to the MBTA within 24-hours.
 - b. A spill report shall be prepared by the Design-Builder following each occurrence. The spill report shall present a description of the release, including quantity and type of material, date of spill, circumstances leading to the release, location of spill, response actions and personnel,

documentation of notifications, and corrective measures implemented to prevent reoccurrence. Such reports shall be maintained in an Appendix to the SWPPP.

- c. The Design-Builder shall identify an appropriately trained site employee involved with day-to-day site operations to be the spill prevention and cleanup coordinator. The name(s) of responsible spill personnel shall be posted in the material storage area and in the office trailer on site. Each employee shall be instructed that all spills are to be reported to the spill prevention and cleanup coordinator.

- G. The Design-Builder shall be required to amend the SWPPP whenever there is a change in design, construction, operation, or maintenance, which has a significant effect on the potential for the discharge of pollutants to waters, including the addition of or change in location of storm water discharge points, or if the SWPPP proves to be ineffective in eliminating or significantly minimizing pollutants in storm water discharges or in otherwise achieving the general objectives of the SWPPP. Also, where warranted based on the results of an inspection by the Design-Builder or others, the site description, procedures, or other elements of the SWPPP shall be revised as appropriate; modifications called for by the inspection and resultant changes to the SWPPP shall be implemented within 7 calendar days following the inspection. In addition, the SWPPP shall be amended to identify any new subDesign-Builder that will implement a measure of the SWPPP. Finally, the SWPPP shall be amended to incorporate specific revisions if so directed by the MBTA, or any duly-authorized Federal, State, or local official at any time during the performance of the Work under this Contract.

- H. The Work specified in this Section for preparing, implementing, monitoring, and maintaining the SWPPP shall include development and implementation of activities and measures to properly handle OHM and to prevent storm water pollution; as such the Work shall also include installation, operation, maintenance, and removal of all facilities for the collection, containment, diversion, and disposal of surface and ground water as required for compliance with the SWPPP, including all supervision, labor, materials, and equipment not specifically included but necessary for proper completion of the Work.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection with the work are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02260

EXCAVATION SUPPORT AND PROTECTION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. **Work Included:** This Section specifies temporary soils excavation support and protection systems.
- B. **Related Work:** Other specification section that relate to work of this section include, but are not limited to, the following:
 - 1. Volume 2 Technical Provisions Exhibit 2I – “Additional Project Requirements”
 - 2. Section 02015 – GEOTECHNICAL INSTRUMENTATION
 - 3. Section 02240 – DEWATERING
 - 4. Section 02300 – EARTHWORK
 - 5. Section 03300 – CAST-IN-PLACE CONCRETE
 - 6. Section 03371 – SHOTCRETE
 - 7. The construction of excavation support systems shall not disturb existing structures or the completed work. Damage to such structures shall be repaired by the Design-Builder at no additional cost to the MBTA.
 - 8. Adjacent structures shall be monitored and protected as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
 - 9. Vibration monitoring for installation of excavation support systems will be performed by the Design-Builder’s Geotechnical Instrumentation Engineer as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
 - 10. Construction operations not to exceed specified noise limits in accordance with Volume 2 Technical Provisions Exhibit 2I, “Additional Project Requirements”.

1.1 PERFORMANCE REQUIREMENTS

- A. Design, furnish, install, monitor, and maintain excavation support and protection systems capable of supporting excavation sidewalls and of resisting soil and hydrostatic pressure and superimposed loads, and protect from damage existing and proposed improvements including, but not limited to, pipelines, utilities, structures, roadways, railroads and other facilities.
 - 1. Provide professional engineering services needed to assume engineering responsibility, including preparation of a design submittal, Shop Drawings and a comprehensive engineering analysis.
 - 2. Prevent surface water from entering excavations by grading, dikes, or other means.

3. Install excavation support and protection systems without damaging existing buildings, pavements, and other improvements or facilities adjacent to excavation.
 4. Provide vibration monitoring, and other geotechnical instrumentation, as needed, to prevent impacts on adjacent structures and utilities.
- B. Construction of the temporary excavation support systems shall not disturb the existing structures or the completed proposed structures. Damage to such structures shall be repaired by the Design-Builder at no additional cost to the MBTA.
- C. The Design-Builder shall bear the entire cost and responsibility of correcting any failure, damages, subsidence, upheaval, or cave-ins as a result of improper installation, maintenance, or design of the temporary excavation support systems. The Design-Builder shall pay for all claims, costs, and damages that arise as a result of the work performed at no additional cost to the MBTA.

1.2 SUBMITTALS

- A. Shop Drawings: Prepared by or under the supervision of a qualified professional engineer for excavation support and protection systems.
1. Include Shop Drawings signed and sealed by the qualified professional engineer responsible for their preparation.
 2. Show proposed temporary excavation support system(s), details, location, layout, depths, extent of different types of support relative to existing features and the permanent structures to be constructed, and methods and sequence of installation and removal.
 3. Provide a list of all design assumptions, including safety factors used for the temporary excavation support system(s) and all lateral pressures used for each system.
 4. If utilizing a tieback system, include tieback installation procedures and criteria for acceptance of tiebacks for performance and proof tests. Submit the tieback testing results to the MBTA for information only.
 5. Show requirements of dewatering during the construction.
 6. Show the minimum lateral distance from the edge of the excavation support system for use for vehicles, construction equipment, and stockpiled construction and excavated materials.
 7. Provide a list of equipment used for installing the excavation support systems.
 8. Provide a monitoring schedule, installation procedures, and location plans for vibration/noise monitoring, geotechnical instrumentation including deformation monitoring points, inclinometers, and observation wells/piezometers to monitor ground, excavation support system, adjacent structures, and groundwater fluctuation during the entire construction period.
- B. Qualification Data: For Installer and professional engineer currently registered in the Commonwealth of Massachusetts.
- C. Photographs or videotape, sufficiently detailed, of existing conditions of adjoining construction and site improvements that might be misconstrued as damage caused by the absence of, the installation of, or the performance of excavation support and protection systems. These photographs or videotape

records are supplemental to the Pre-Construction Survey documentation as specified in Volume 2 Technical Provisions Exhibit 2I, "Additional Project Requirements".

- D. Monitoring data from vibration and noise recording equipment, observation wells, deformation monitoring points, and offset lines in accordance with Section 02015 – GEOTECHNICAL INSTRUMENTATION. The data provided will be used by the MBTA only for the information of the MBTA and third parties. The Design-Builder shall remain responsible for the interpretation of the data as it relates to the protection of structures and the adequacy and safety of the means, methods, and sequencing of construction.
- E. For excavation support systems left in place, submit the following as-built information prior to backfilling and covering the excavation support systems:
 - 1. Survey locations of the temporary excavation support systems, including coordinates of the endpoints or change in direction.
 - 2. Type of the temporary excavation support system.
 - 3. Elevations of top and bottom of the excavation support systems left in place.

1.3 PROJECT CONDITIONS

- A. Existing Utilities: Do not interrupt utilities serving facilities occupied by MBTA or others unless permitted in writing by MBTA and then only after arranging to provide temporary utility services according to requirements indicated.
- B. Project-Site Information: A Geotechnical Data Report has been prepared for this Project and is available for information only. The report shall not be interpreted as a warranty of subsurface conditions whether interpreted from written text, boring logs, or other data. The Design-Builder shall assume that subsurface conditions between subsurface explorations could differ from conditions shown on the boring logs. MBTA will not be responsible for interpretations or conclusions drawn from this data.
 - 1. Make additional test borings and conduct other exploratory operations necessary for excavation support and protection.
- C. Survey adjacent structures and improvements, employing a qualified professional engineer or land surveyor; establish exact elevations at fixed points to act as benchmarks. Clearly identify benchmarks and record existing elevations.
 - 1. During installation of excavation support and protection systems, regularly resurvey benchmarks, maintaining an accurate log of surveyed elevations and positions for comparison with original elevations and positions. Promptly notify MBTA if changes in elevations or positions occur or if cracks, sags, or other damage is evident in adjacent construction.

1.4 QUALITY ASSURANCE

- A. Have a registered engineer approve and inspect all excavation support areas on a periodic basis.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. General: Provide materials that are either new or in serviceable condition.
- B. Structural Steel: ASTM A 36/A 36M, ASTM A 690/A 690M, or ASTM A 992/A 992M.
- C. Steel Sheet Piling: ASTM A 328/A 328M, ASTM A 572/A 572M, or ASTM A 690/A 690M; with continuous interlocks.
- D. Cast-in-Place Concrete: ACI 301, of compressive strength required for application.
- E. Reinforcing Bars: ASTM A 615/A 615M, Grade 60, deformed.
- F. Timber Piling: ASTM D 25, species listed in AWPA C3, pressure-treated in accordance with AWPA C3.
- G. Seven Wire Strand: ASTM A 416, Grade 250 or 270, uncoated seven-wire, low-relaxation strand.
- H. Grout: Suitable for application, minimum 4,000 psi.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards that could develop during excavation support and protection system operations.
 - 1. Shore, support, and protect utilities encountered.
- B. Install excavation support and protection systems to ensure minimum interference with roads, streets, walks, and other adjacent facilities.
 - 1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from MBTA and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
- C. Locate excavation support and protection systems clear of permanent construction.
- D. Monitor excavation support and protection systems daily during excavation progress and for as long as excavation remains open. Promptly correct bulges, breakage, or other evidence of movement to ensure that excavation support and protection systems remain stable.
- E. Promptly repair damages to adjacent facilities caused by installing excavation support and protection systems.

3.2 SOLDIER BEAMS AND LAGGING

- A. Install vertical steel soldier beams before starting excavation at element spacings and design depths indicated on the approved shop drawings. Space soldier beams at regular intervals not to exceed allowable flexural strength of lagging. Accurately align exposed faces of flanges to vary not more than 2 inches from a horizontal line and not more than 1:120 out of vertical alignment.
- B. Install wales horizontally at spacing indicated on the approved shop drawings and secure to soldier beams.

3.3 SHEET PILING

- A. Before starting excavation, install one-piece sheet piling lengths and tightly interlock to form a continuous barrier. Limit vertical offset of adjacent sheet piling to 60 inches. Accurately align exposed faces of sheet piling to vary not more than 2 inches from a horizontal line and not more than 1:120 out of vertical alignment. Cut tops of sheet piling to uniform elevation at top of excavation.

3.4 TIEBACKS

- A. Tiebacks: Drill for, install, grout, and tension tiebacks into position. Test load-carrying capacity of each tieback and replace and retest deficient tiebacks.
 - 1. Test loading as specified in the Shop Drawing submittal shall be observed by a qualified professional engineer responsible for design of excavation support and protection system.
 - 2. Maintain tiebacks in place until permanent construction is able to withstand lateral earth and hydrostatic pressures.
 - 3. Inspect tiebacks periodically to confirm anchors exhibit no movement.

3.5 BRACING

- A. Bracing: Locate bracing to clear columns, floor framing construction, and other permanent work. If necessary to move brace, install new bracing before removing original brace.
 - 1. Do not place bracing on permanent concrete work or where it will be cast into or included in permanent concrete work, unless otherwise approved by MBTA.
 - 2. Install internal bracing, if required, to prevent spreading or distortion of braced frames.
 - 3. Maintain bracing until structural elements are supported by other bracing or until permanent construction is able to withstand lateral earth and hydrostatic pressures.

3.6 REMOVAL AND REPAIRS

- A. Remove excavation support and protection systems when construction has progressed sufficiently to support excavation and bear soil and hydrostatic pressures. Remove in stages to avoid disturbing underlying soils or damaging structures, pavements, facilities, and utilities.

1. Remove excavation support and protection systems to a minimum depth of 48 inches below overlying construction and abandon remainder.
 2. Repair or replace, as approved by MBTA, adjacent work damaged or displaced by removing excavation support and protection systems.
- B. When tiebacks are used, release tension in tiebacks as the excavation is backfilled. Do not leave tensioned tieback in place at the completion of the work.

3.7 MONITORING TRACK MOVEMENT

- A. Before the start of excavation support work, establish elevations along Top of Rail of nearest track, each rail, spaced approximately every 20 feet in the vicinity of the work.
- B. Perform two baseline elevation surveys of the Top of Rail before the start of excavation support installation. Survey both vertical and lateral (into excavation) positions.
- C. Perform weekly survey of settlement monitoring points from the beginning of excavation support installation until the structure is completely in place and fully backfilled.

PART 4 - MEASUREMENT AND PAYMENT

4.2 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02270

SLOPE PROTECTION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following types of slope protection.
1. Type 1, Dumped Riprap: angular shaped stones dumped in place to form a well-graded mass with a minimum of voids.
 2. Type 2, Slope Paving: angular shaped stones, each having one flat face, carefully placed on slopes.
 3. Type 3, Special Slope Paving under Bridges:
 - a. Type 3A: Quarry stone, not grouted.
 - b. Type 3B: Quarry stone, grouted.
 - c. Type 3C: Precast concrete block.
 - d. Type 3D: Portland cement concrete.
 4. Type 4, Channel Paving: Nearly rectangular stones placed along the slopes around culvert inlets or outlets, around foundations, bridge berms and dikes.
 - a. Type 4A: not grouted.
 - b. Type 4B: grouted.
 5. Type 5, Stone Protected Slopes (Modified Rock Fill): to be used at detention basin on 2 to 1 side slope, at Lechmere Station Lot A Bus Access Road 1.5 to 1 side slope and the infiltration basin spillway as shown on the Drawings.
 6. Type 6, Gravel Slopes for Access Driveways: Red Bridge Pump Station
 7. Type 7, Grass Protected Slopes at detention basin
- B. Alternates: Not Applicable.
- C. Items to Be Installed Only: Not Applicable.
- D. Items to Be Furnished Only: Not Applicable.
- E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
1. Section 02060 – EROSION AND SEDIMENTATION CONTROL
 2. Section 02300 – EARTHWORK
 3. Section 03300 - CAST-IN-PLACE CONCRETE.
 4. Section 02920 - SEEDED LAWN

1.2 REFERENCES

- A. American Society for Testing and Materials, ASTM C-139, Standard Specification for Concrete Masonry Units for Construction of Catch Basins and Manholes
- B. American Society for Testing and Materials, ASTM C-140, Standard Test Methods for Sampling and Testing.

1.3 QUALITY ASSURANCE

- A. Control of gradation of stone for Type 1 slope protection shall be by visual inspection. Provide at the construction site and at the quarry a mass of rock of at least five tons meeting the specified gradation. The sample at the construction site may be a part of the finished riprap covering. These samples will be used as a reference for judging the gradation of riprap supplied.
- B. **JOB CONDITIONS**
 - 1. Do not grout slope or channel paving or place concrete slope paving on frozen ground nor when the temperature falls below 50 degree F. During cold weather, provide protective coverings for the work.
 - 2. Should any work be exposed to temperatures of 40 degrees F or below, within four days after grouting or concrete placement, cover the work with a one-foot thick layer of straw, hay or mulch; then cover with a weighted cover of canvas or plastic sheet.

PART 2 - PRODUCTS

2.1 TYPE 1, DUMPED RIPRAP

- A. Stone: hard, durable, angular in shape; resistant to weathering; free from overburden, spoil, shale and organic materials; neither breadth nor thickness of a stone shall be less than one third its length.
- B. Gradation

SIZE OF STONE SMALLER THAN	MAXIMUM PERCENT OF TOTAL WEIGHT
400 pounds	100
300 pounds	80
200 pounds	50
25 pounds	10

Maximum percent passing a two-inch sieve: 5 percent

- C. Filter Fabric (Geotextile) below riprap:
 - 1. Shall meet the physical requirements set forth in the MassDOT Standard Specifications M9.50.0 Type I geotextile fabrics.

2.2 TYPE 2, SLOPE PAVING

- A. Stone: sound, angular in shape, free from structural defects; each stone having one reasonably flat face, a thickness perpendicular to the face of not less than six inches and no dimension less than six inches.
- B. Gradation: approximately 60 percent, two to three cubic feet each in volume; the remainder, one to two cubic feet each in volume.
- C. Filter Fabric (Geotextile) below riprap:
 - 1. Shall meet the physical requirements set forth in the MassDOT Standard Specifications M9.50.0 Type I geotextile fabrics.

2.3 TYPE 3, SPECIAL SLOPE PAVING UNDER BRIDGES

- A. Quarry Stone: granite or other similar durable stone; rectangular exposed surface with split or quarry face finish; uniform in color; 12 to 28 inches long, 10 to 14 inches wide, 3 to 6 inches thick.
- B. Precast Concrete Block: ASTM C-139, 4 inches by 12 inches by 16 inches, sampled and tested in accordance with ASTM C-140.
- C. Grout: Portland cement, sand and water mixture with a minimum 28 day compressive strength of 3,000 psi.
- D. Concrete: Section 03310, Class 3000 - 1-1/2.

2.4 TYPE 4, CHANNEL PAVING

- A. Stone: sound, durable, angular blocks, as nearly rectangular as practicable; rounded stones or thin slabs will not be acceptable.
- B. Gradation: minimum 75 percent, at least 200 pounds; the remainder graded to produce a compact mass when placed with the larger stones.
- C. Grout: As specified in paragraph 2.03.C above.

2.5 TYPE 5, STONE PROTECTED SLOPES (MODIFIED ROCK FILL)

- A. Stone: sound, durable, angular shaped stones which are the product of primary crushing of a stone crusher; rounded stone, boulders, sandstone and similar soft stone or thin slabs will not be acceptable.
- B. Gradation: for rock fill slope, per MassDOT Standard Specifications M2.02.4, except that 95 to 100 percent passing stone size shall be 12-inch. At inlet and outlet structures in detention basin, minimum 50 percent passing stone size shall be 12-inch.

2.6 TYPE 6, GRAVEL SLOPES FOR ACCESS DRIVEWAYS

- A. Dense graded crushed stone shall meet the requirements per MassDOT Standard Specifications M2.01.7

2.7 TYPE 7, GRASS SLOPES

- A. Seed mixture, soil conditioning materials and fertilizers: shall meet the requirements set forth in MassDOT Standard Specifications M6.03.

2.8 GRAVEL BORROW OR CRUSHED STONE BASE: Section 02300 - EARTHWORK.

PART 3 - EXECUTION

3.1 TYPE 1, DUMPED RIPRAP

- A. Riprap shall be installed in accordance with construction methods for MassDOT Standard Specifications.
- B. A minimum 2-foot deep riprap key shall be installed to a depth below the final grade at the toe of the riprap. Filter fabric shall be wrapped around the riprap stone above at the toe of slope.

3.2 TYPE 2, SLOPE PAVING

- A. Slope paving shall be installed in accordance with construction methods for MassDOT Standard Specifications.
- B. A minimum 2-foot deep riprap key shall be installed to a depth below the final grade at the toe of the riprap. Filter fabric shall be wrapped around the riprap stone above at the toe of slope.

3.3 TYPE 3, SPECIAL SLOPE PAVING UNDER BRIDGES

- A. General: Place special slope paving under bridges on a six-inch gravel borrow or crushed stone base. Construct the paving to a continuous surface of uniform appearance, approximately parallel to and within three inches of the slope shown on the plans.
- B. Type 3A, Quarry Stone, not Grouted; Type 3B, Quarry Stone, Grouted and Type 3C, Precast Concrete Block: shall be installed in accordance with construction methods for MassDOT Standard Specifications.
- C. Type 3D, Portland Cement Concrete: Section 03300 CAST-IN-PLACE CONCRETE.

3.4 TYPE 4, CHANNELING PAVING

- A. Channeling shall be installed in accordance with construction methods for MassDOT Standard Specifications.

3.5 TYPE 5, STONE PROTECTED SLOPES (MODIFIED ROCK FILL)

- A. Stone shall be installed in accordance with construction methods for MassDOT Standard Specifications Section 983.
- B. A minimum 2-foot deep riprap key shall be installed to a depth below the final grade at the toe of the riprap.

3.6 TYPE 6, GRAVEL SLOPES FOR ACCESS DRIVEWAY

- A. Installation shall be in accordance with the MassDOT Standard Specification Section 401.
- B. Gravel course shall be installed to a depth of 8-inch.

3.7 TYPE 7, GRASS SLOPES

- A. Installation shall be in accordance with the MassDOT Standard Specification Section 765.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02282

HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the procedures used for field screening; soil sampling, stockpile management, reuse, transportation, and disposal of excavated materials.
- B. This section includes furnishing all labor, equipment, appliances and materials, and performing all operations in connection with the handling, segregating, testing, treating, stockpiling, transporting, and disposal and/or re-use of soil (defined hereinafter as including stone ballast, sediments and track bed for the purposes of this Section) and associated fill and waste material resulting from the construction operations as specified.
- C. Related Work: The following items are not included in this Section and will be performed under but may not be limited to the following designated Sections:
1. Section 01568 – CONSTRUCTION SAFETY
 2. Section 02300 – EARTHWORK
 3. Section 02221 – DEMOLITION
 4. Section 02060 – EROSION AND SEDIMENTATION CONTROL
 5. Section 02080 – ASBESTOS REMOVAL
 6. Section 02369 – DRILLED MINI-PILES
 7. Section 02400 – DRAINAGE AND SEWER SYSTEMS
 8. Section 02402 – STORMWATER TREATMENT AND DISPOSAL SYSTEMS
- D. For the purpose of this section the AUTHORITY will be the Generator and will sign all disposal facility waste profiles, Hazardous Waste Manifests (manifest), Material Shipping Records (MSR), and MCP Bills of Lading (BOL) as the Generator. The AUTHORITY's License Site Professional (LSP) will sign all BOL as the LSP and MSRs as the Environmental Professional. Except for soil that requires transport under a manifest, all soil shall be transported under BOL or MSR whichever is applicable, based on the results of the laboratory chemical analysis of soils. BOL shall be utilized for soils classified as containing chemical concentrations \geq Reportable Concentration (RCS-1) soils; MSR shall be utilized for all soils classified as containing chemical concentrations \leq RCS-1 soils.
- E. Furnish all labor, materials, equipment, and incidentals necessary to properly sample, classify, segregate, handle/manage, load, transport, and dispose of excavated materials located from within the Limit of Work. Work covered by this Section shall include furnishing, operating, and maintaining soil stockpile/staging areas and equipment decontamination stations for the duration of excavation activities and dismantling, disposing of decontamination stations, and stockpile/staging areas at project completion. Decontamination stations shall be capable of eliminating the dispersion of dust and mud caused by vehicles exiting the site.

1.2 RESPONSIBILITIES

- A. The DESIGN-BUILDER shall employ the services of an Environmental Consultant to assist in the activities listed below. DESIGN-BUILDER's Responsibilities:

1. The DESIGN-BUILDER shall employ the services of an Environmental Consultant to perform the soil screening, soil sampling, dust control measures, management coordination, and support compliance efforts associated with all references listed in this Section. The Environmental Consultant shall include at least one professional experienced in soil sampling and dust control measures and a Licensed Site Professional (LSP) registered with the Massachusetts LSP Board. Proof of current licensure and professional experience on projects of similar nature and complexity shall be provided to the Engineer with the Excavated Materials Management Plan (EMMP).
2. The DESIGN-BUILDER shall field-screen excavated material for the presence of volatile organic compounds (VOCs) with a photo ionization detector (PID) calibrated to a benzene standard. The DESIGN-BUILDER shall perform field screening of excavated material exhibiting olfactory and/or visual evidence of oil or hazardous materials at a frequency of no less than every 100 cubic yards of material or fraction thereof, or as directed by Engineer. Excavated materials not exhibiting such characteristics shall be screened upon initial excavation; additional screening shall be conducted if characteristics are inconsistent during subsequent excavation.
3. The DESIGN-BUILDER shall, as deemed appropriate by DESIGN-BUILDER'S LSP and AUTHORITY'S LSP, utilize x-ray fluorescence (XRF) for initial soil screening and segregation purposes. The DESIGN-BUILDER shall perform field screening of excavated material exhibiting olfactory and/or visual evidence of oil or hazardous materials at a frequency of no less than every 100 cubic yards of material or fraction thereof, or as directed by Engineer. Excavated materials not exhibiting such characteristics shall be screened upon initial excavation; additional screening shall be conducted if characteristics are inconsistent during subsequent excavation.
4. The DESIGN-BUILDER shall segregate excavated soils into stockpiles based upon the results of on-site screening.
5. The DESIGN-BUILDER shall be responsible for submitting to the Engineer the daily logs summarizing field screening and excavating activities. The logs shall include the soil screening classification, volume and a sketch showing the origin and on-site location of each excavated soil stockpile.
6. The DESIGN-BUILDER shall identify and propose locations for construction staging of both on or offsite temporary soil stockpiles and miscellaneous materials, soil/waste treatment technologies and treatment areas (on-site or offsite), disposal, recycling and treatment facilities, facilities for the beneficial re-use of excavated materials including but not limited to soil, debris, or other miscellaneous materials, temporary storage facilities, landfills, soil recycling and hazardous waste treatment, storage and disposal facilities for all excavated material.
7. The DESIGN-BUILDER shall be responsible for transporting excavated material to the approved construction storage location/stockpile area and disposal, recycling, treatment facilities and facilities for beneficial re-use.
8. The DESIGN-BUILDER shall furnish, operate and maintain equipment decontamination stations for the duration of excavation and soil disposal work.
9. The DESIGN-BUILDER shall develop and implement site-specific emergency response and health and safety protocols and procedures.

10. For each shipment of material transported to a disposal facility, the DESIGN-BUILDER shall demonstrate to the Engineer that the least costly means of disposal has been selected. This demonstration shall be made prior to shipment.
11. The DESIGN-BUILDER shall be responsible for submitting completed Bills of Lading, MSR, manifests and other shipping documents to the Engineer within two weeks of shipment to a storage or disposal/recycling facility. The DESIGN-BUILDER is responsible for up-loading these BOLs onto the MassDEP electronic filing system (eDEP). The AUTHORITY's LSP will sign and stamp BOLs. The receiving facility shall provide electronic attestation of receipt of soils within five days of receiving notification from the LSP of the availability of the BOL for that purpose on eDEP.
12. The DESIGN-BUILDER shall advise the Engineer at least three working days in advance of the schedule for off-site disposal of excavated material. No off-site shipments or on-site re-use will occur without the approval of the Engineer.
13. The DESIGN-BUILDER shall advise the Engineer at least three working days in advance of the collection of soil samples and any other environmental sampling. The DESIGN-BUILDER shall collect, analyze and characterize samples of excavated material prior to off-site recycling and/or disposal.
14. The DESIGN-BUILDER shall prepare the necessary documents to transport and dispose of excavated material for review and signing by the Authority's LSP. These documents include, but are not limited to waste profiles, BOLs, MSR and manifests, and any supporting documents required by the disposal facility.
15. The DESIGN-BUILDER shall submit the executed transportation and disposal documents to the appropriate local, state and federal agencies as well as the Engineer.
16. The DESIGN-BUILDER shall provide an environmental field technician to oversee the loading of excavated material into transport vehicles for off-site disposal/recycling.
17. The DESIGN-BUILDER shall develop an excavated soil tracking/management system and keep records, including daily logs and photographs, of all waste streams, stockpiles, and excavated materials for the purposes of tracking points of origin and final disposition. DESIGN-BUILDER's soil tracking/management system shall be compatible with ENGINEER's GIS-based soil management system.
18. The DESIGN-BUILDER shall develop and implement dust control measures.

B. AUTHORITY's Responsibilities:

1. The AUTHORITY will review and approve the proposed facilities selection of off-site recycling, reuse or disposal facilities.
2. The AUTHORITY will be the designated Generator for excavated material identified for off-site reuse, recycling and/or disposal.
3. The AUTHORITY's LSP will review and approve all paperwork, manifests, and Bills of Lading prior to soil disposal.
4. The AUTHORITY'S LSP will review and sign all shipping documentation as LSP-of-Record.

1.3 QUALITY ASSURANCE AND QUALITY CONTROL

- A. The DESIGN-BUILDER shall be responsible for the collection and analysis of soil samples from all areas of the site. Sampling frequency shall be conducted as to meet the requirements of the DESIGN-BUILDER's disposal facility. For the purpose of disposal, TPH data is acceptable. However, MCP notification will be based upon VPH and/or EPH MADEP Method 1.0 analysis. The analysis and analytical documentation shall meet the MassDEP Compendium of Analytical Methods requirements. The DESIGN-BUILDER shall include the result of all soil testing in the Excavated Materials Management Plan in accordance with Section 1.4 Submittals.

1.4 SUBMITTALS

- A. The DESIGN-BUILDER shall prepare an Excavated Materials Management Plan (EMMP) that describes the work to be performed under this Specification. The EMMP shall be submitted within fourteen days after the issuance of the Notice to Proceed. The EMMP shall be accepted before excavated soil is disposed of off-site or re-used. At a minimum the EMMP shall address the following:
 - 1. The Plan shall include the name and current licensure of the DESIGN-BUILDER's Environmental Consultant.
 - 2. The procedures that shall be used for field screening of the excavated soils.
 - 3. The procedures for the collection of soil samples for laboratory chemical analysis. The plan shall list the proposed laboratory analytical parameters.
 - 4. A plan (in accordance with Section 3.4 Temporary Stockpiling of Excavated Materials) for the on-site or off-site contaminated soil staging/stockpiling for each active construction area.
 - 5. A material management system plan to track the excavated materials from generation through final disposition. Plan shall be updated monthly and include at a minimum the following:
 - a. Provisions for the tracking of the excavated materials from the "point of excavation" to the location of the stockpile material in the storage/staging area to the final disposition of the stockpiled material including all proposed daily log sheets.
 - b. A description of the tracking methodology that shall be implemented to identify the source excavation area(s) and the final disposition of the excavated soil from each area of excavation.
 - c. Person(s) responsible for maintaining the tracking system, and the plan to provide the Authority with electronic access to the material management system and its updates.
 - 6. The means and methods for decontaminating all equipment and personnel, including provisions for installing equipment decontamination pad(s) within the work zone.
 - 7. The means and method for on-site treatment of soil requiring off-site disposal determined through TCLP analysis to be characteristically hazardous pursuant to RCRA (310 CMR 30.00 et. seq.).
 - 8. The DESIGN-BUILDER shall identify each waste stream and propose an appropriate disposal facility that will accept the excavated material as classified. The DESIGN-BUILDER shall submit approvals or letters of intent and facility information for each facility proposed. For each facility, the DESIGN-BUILDER shall submit the following information:
 - a. General Information

- 1) Facility Name
 - 2) Facility Address
 - 3) Name of Contract Person
 - 4) Title of Contact Person
 - 5) Telephone Number of Contact Person
 - 6) Permit Number
- b. The facility shall specify the volume of material that can be accepted from the site on a weekly and a total basis.
 - c. The facility shall provide written confirmation that they are permitted to accept and will accept the classified material of the general quality and quantity described by these Specifications.
 - d. The facility shall provide a listing of all current and valid permits, licenses, letters of approval, and other authorizations to operate that they hold, pertaining to the receipt and management of the soils or materials specified in this contract.
 - e. The DESIGN-BUILDER shall submit a complete list of the disposal facility's permitted allowable contaminant levels and physical characteristic requirements for excavated material, and list any required regulatory approvals for individual waste streams.
9. A plan for dust monitoring on-site during any earthwork activities.
 10. The plan shall be amended as necessary.
- B. Laboratory results for all samples collected and/or analyzed by the DESIGN-BUILDER shall be tabulated and compared to applicable MCP standards by the DESIGN-BUILDER's Environmental Consultant and subsequently submitted to the Engineer within two days of receipt. The results shall include all Chain-of-Custody forms and all documentation provided by the laboratory.
- C. All data shall be provided as Electronic data deliverables (EDDs) formatted for upload to EQUIS™ software. Tabulated analytical results shall be provided in Excel table format, compared to applicable regulatory standards. Final laboratory analytical reports shall be provided in PDF format.
- D. The DESIGN-BUILDER shall submit soil disposal documentation.
1. Pre-disposal documentation shall be prepared and submitted to the Engineer at least 5 business days prior to transportation and disposal. Each documentation submittal shall be assigned a unique identification referenced to the area of excavation, stockpile and sample name.
 - a. Completed MSR, BOL, or manifest signed by the AUTHORITY and AUTHORITY's LSP as required.
 - b. Completed and signed profiles as required by the receiving facility.
 - c. Analytical data report provided by the analytical laboratory.
 - d. Sketch plan showing sampling location.
 - e. Summary of soil source location; site history; sampling methods and data comparison to facility criteria and MCP reporting criteria.
 - f. Written approval from the disposal facility that the material has been accepted.
 - g. Receiving facility–required checklist of requirements.

2. Post disposal documentation shall be prepared and submitted following disposal and referenced to the pre-disposal documentation by name.
 - a. Load sheets completed and signed by the hauler and the receiving facility.
 - b. Certified weight slips from the receiving facility.
 - c. For BOLs only, the facility and AUTHORITY attestations of shipment and receipt.
 3. All soil disposal documentation shall be compiled and re-submitted at the completion of the disposal activities. The submittal shall consist of one or more PDF-Searchable electronic files contained on a CD. The final submittal shall be organized by the uniquely identified MSR, BOL, or manifest.
- E. All elements of the EMMP shall be submitted as a final close-out document within four weeks after the completion of all excavation and disposal activities. The final submittal shall consist of one or more PDF-searchable electronic files on a CD. Previous submittals of one or more of the elements described herein or previous eDEP filings shall not modify the requirements of the final submittal. The final submittal shall contain the supporting documentation identified in 1.4 (A) through (C).
- F. The DESIGN-BUILDER shall submit their work zone air quality monitoring program for review prior to commencement of site activities.

1.5 REFERENCES

- A. All regulations cited and those of other governing agencies in their most recent version are applicable. This Section refers to many requirements found in these references, but is in no way intended to cite or reiterate all provisions therein or elsewhere. It is the DESIGN-BUILDER's responsibility to know, understand, and abide by all such regulations and common practices. Other provisions contained in these references may from time to time during the execution of this Contract be enforced by the Engineer. In the event of a conflict, the most stringent regulations shall govern.

1.6 DEFINITIONS

- A. Area of Excavation: For the purpose of reusing soil/fill on site the limit of excavation is considered to be the approximate area in which the soil/fill was removed provided that area is consistent in soil strata, color, texture, geotechnical properties, and has substantially similar visual and olfactory characteristic as accepted by the AUTHORITY’s Engineer. Soil/fill returned to the limit of excavation shall be placed approximately in the same location from which it originated.
- B. Background: Any soil or fill material which meets the regulatory definition of “background” as defined in 310 CMR 40.0006 may be reused as common fill/ordinary borrow provided it also meets the physical requirements as specified herein and as specified in Section 02210 – Earth Excavation, Backfill, and Grading – or the environmental requirements as specified in Part 3.6. Excess soil that meets the definition of background shall be transported under a Material Shipping Record (MSR) or BOL.
- C. Contaminated Material/Soil: Any excavated material found to contain oil or hazardous material (OHM) at concentrations equal to or exceeding applicable MCP Method 1 standards (310 CMR 40.0300), reportable concentrations (310 CMR 40.1600), or regulated background levels (as defined in the MADEP Technical Update Background Levels of Polycyclic Aromatic Hydrocarbons and Metals in Soil and 310 CMR 40.00006) or other applicable State or Federal Regulations.
- D. Excavated Material: All soil, sediment, and/or debris excavated from within the Limit of Excavation.
- E. Generator: The AUTHORITY will be the generator, with the exception of materials contaminated by releases from the DESIGN-BUILDER’s vehicles, equipment, or supplies.
- F. Hazardous Material/Waste: A waste material or combination of waste material, that because of its quantity, concentration, physical, chemical, or infectious characteristics may cause or significantly contribute to an increase in a serious irreversible or incapacitating reversible illness, or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of or otherwise managed. This definition also includes but is not limited to materials regulated under TSCA, M.G.L., Chapter 21E, RCRA (40 CFR 239-282), Massachusetts Hazardous Waste regulations (310CMR 30.00), and the MCP (310 CMR 40.00), and any applicable Federal regulations. Where applicable, consideration shall be given to MSDS in determining if a material could be potentially hazardous.
- G. Historic Fill: Also referred to as “urban fill.” Generally acknowledged as fill material from non-specific sources. Historic fill typically are observed to contain mixtures of ash, coal, glass, brick, wood, and/or miscellaneous building debris. OHM attributable to a source or sources or to a specific

industrial process is excluded from this definition regardless of the physical soil constituents. Historic fill material typically contains elevated concentrations of polycyclic aromatic hydrocarbons, metals, and/or petroleum hydrocarbons. Historic fill shall not include boulders, ledge, consolidated rock, asphalt, concrete, railroad timbers, rail, cobblestones, or any other abandoned building materials, which would preclude the disposal of the material as daily cover at a landfill.

- H. Investigation-Derived Waste: Any potentially-contaminated material generated as a result of sampling potentially-contaminated media, such as soil, sediment, surface water or groundwater.
- I. Managed Fill Site: A site that can accept for re-use reclamation soils, <RCS-1 soils, or <RCS-2 soils, as applicable for that location.
- J. Natural soils: Unconsolidated sand gravel silt clay and organic materials which has become a part of the unconsolidated soil matrix.
- K. Reclamation Soil: Natural soil or soil containing only low levels of oil or hazardous material such that MassDEP would not require notification, further investigation or cleanup at the original location.
- L. Special Waste: Any solid waste that is determined not to be hazardous waste and that exist in such quantities or in such chemical or physical state or any combination thereof so that a particular management controls are required to prevent an adverse impact from the collection, transport, transfer storage processing, treatment or disposal of the solid waste. Asbestos and PCB contaminated soils/fill are examples of special waste.
- M. Soil: Any unconsolidated mineral and organic matter, including any fill, overlying bedrock that has been subjected to and influenced by geologic and other environmental factors.
- N. Stockpiled Materials: Any excavated soil/fill and/or debris (which include ABC material or other construction/demolition waste) which are stored prior to re-use, disposal, recycling, or treatment.

1.7 PERMIT REQUIREMENTS

- A. The DESIGN-BUILDER shall obtain all Federal, State, and local permits required for the transport and disposal of excavated material. The DESIGN-BUILDER shall adhere to all permit requirements.
- B. The DESIGN-BUILDER shall verify that the disposal facilities, recycling/treatment facilities proposed have all certifications and permits as required by Federal, State, and local regulatory agencies to receive and dispose of the excavated material.
- C. The DESIGN-BUILDER shall submit and/or amend all documentation of the permit requirements as stated in this subsection in accordance to the requirements of the EMMP (Section 1.4).

PART 2 - PRODUCTS

2.1 GENERAL

- A. All DESIGN-BUILDER personnel shall wear personal protective equipment and protective clothing consistent with the levels of protection for this Work as indicated in Section 01568 – CONSTRUCTION SAFETY.
- B. The containers must be approved by and labeled in accordance with the US Department of Transportation (DOT). The containers shall have a secure cover which will prevent a release of material during transportation.

2.2 STORAGE LABELS

- A. Signage must comply with Section 01580– PROJECT IDENTIFICATION AND SIGNS.
- B. Provide signage to label all stockpiles. Labels shall be of 6 in. by 12 in. weatherproof material, such as plastic, affixed to 1 in. x 3 in. wood straps, 3 ft long. The labels shall be clearly marked with indelible ink marker. Markings shall be as agreed upon between AUTHORITY and DESIGN-BUILDER.

2.3 STOCKPILE SHEETING

- A. Stockpile Sheeting: Provide nylon-reinforced polyethylene (NRPE) sheeting as follows:
 - 1. The membrane shall be manufactured of new, first quality product designed and manufactured specifically for the intended use.
 - 2. The material shall be 10 mil polyethylene reinforced with a non-woven grid of high-strength nylon cord.
 - 3. The material shall be ultra-violet resistant and cold crack resistant to -40°F.
 - 4. The materials shall be manufactured in a minimum 12 ft seamless width. Labels on the roll shall identify the thickness, length width and manufacturer’s mark number.

2.4 DUST MONITORING EQUIPMENT

- A. Air monitoring shall include total dust testing using MIE, INC. Miniram PDM-3 Dust Monitors or approved equal.

2.5 EQUIPMENT AND VEHICLE DECONTAMINATION PAD

- A. A decontamination pad shall be constructed of reinforced concrete or bituminous concrete. The decontamination pad shall be of minimum length to accommodate one eighteen-wheel dump truck, and a minimum area to accommodate the largest piece of equipment to be used in the excavation. The pad shall have a 6 in. containment berm and provisions for collection, storage, and disposal of decontamination water.
- B. If space restrictions exist, the DESIGN-BUILDER shall submit an alternative vehicle decontamination plan for Engineer’s approval.

PART 3 - EXECUTION

3.1 GENERAL

- A. The DESIGN-BUILDER shall handle and convey all materials to perform site work described in these Contract documents.
- B. The DESIGN-BUILDER shall perform all disposal characterization sampling and analytical testing of the excavated material as required by the DESIGN-BUILDER’S permitted disposal facility.
- C. Based upon all analytical results, DESIGN-BUILDER shall load, transport, and dispose of the excavated material as specified herein.
- D. The AUTHORITY shall have final approval over all disposal options.

- E. DESIGN-BUILDER shall immediately notify the Engineer of visible stains or unnatural odor of any excavated material, or if potentially contaminated and/or hazardous material including asbestos piping is encountered. Work shall not be allowed to continue in this area until approved by the Engineer.

3.2 FIELD SCREENING EXCAVATED MATERIAL

- A. The DESIGN-BUILDER shall screen excavated materials for the presence of oil and hazardous materials as excavation proceeds for preliminary waste profiling using visual, olfactory and field sample analysis.
- B. The DESIGN-BUILDER shall perform VOC field screening evaluation in accordance with Department of Environmental Protection Policy No. WSC-94-900, "Interim Remediation Waste Management Policy for Petroleum Contaminated Soils, Attachment II, Jar Headspace Analytical Screening Procedure."
- C. The DESIGN-BUILDER shall perform field screening of soils for metals by XRF as appropriate on a site-specific basis.
- D. Field screening equipment shall be provided by the DESIGN-BUILDER and maintained and calibrated according to the manufacturer's recommendations.
- E. The DESIGN-BUILDER shall use the following field screening classification system in order to segregate excavated material:

FIELD SCREENING & SEGREGATION - CLASSIFICATION SYSTEM

MEDIA	VISUAL/ODOR	JAR HEADSPACE ANALYSIS	SCREENING CLASSIFICATION
Material	Light or No Staining	<10 ppm	Presumed Reusable/ within project limit, temporarily store on-site
Material	Staining/Odor or Unnatural Colors	>10 ppm	Presumed not suitable for project re-use, stockpile for disposal testing

3.3 DISPOSAL CHARACTERIZATION SAMPLING

- A. The DESIGN-BUILDER shall be responsible for sampling and characterizing the excavated material to determine appropriate off-site disposal and/or re-use opportunities. The DESIGN-BUILDER is responsible for final waste characterization and shall determine if any additional waste characterization is required at no additional cost to the AUTHORITY.
- B. Stockpiled soils: Soil stockpiles shall be limited in size to a maximum of 500 cu yd. A minimum of one grab sample (for VOC analysis) and a composite sample (generated by collection of at least eight (8) random grab samples from across the stockpile) shall be collected from each stockpile. The sample will be collected at a minimum depth of 1 foot from the stockpile surface.
- C. For in-situ soils: Soil samples shall be collected at a frequency of a minimum of one five-point composite sample per 500 cubic yards of material and one grab sample for VOCs.
- D. Test pit sampling: Test pit samples shall be collected from the excavation pit or, if infeasible, from the excavator bucket. Samples shall be composited from the excavation bottom and the sidewalls so as to form a sample representative of the test pit soils. If samples are collected from the excavator bucket or from a stockpile generated from the test pit excavation, the collection method described in Section 3.3(B) shall apply.

- E. Should the Disposal Facility require additional samples the DESIGN-BUILDER shall collect a sufficient number of samples that will satisfy the requirements of the disposal facility. No separate payment will be made for sampling conducted by the DESIGN-BUILDER, the DESIGN-BUILDER's Environmental Consultant, or any agent/personnel acting on behalf of the DESIGN-BUILDER or the DESIGN-BUILDER's Environmental Consultant.
- F. Samples shall be collected in such a manner as not to result in cross-contamination. All sampling equipment shall be decontaminated between uses. Disposable sampling equipment shall not be used for collection of more than one sample.
- G. The collected samples shall be submitted, at a minimum, for the following chemical analyses: total petroleum hydrocarbons (TPH) using modified EPA Method 8100, acid/base/neutrals (A/B/Ns) using EPA Method 8270, volatile organic compounds (VOCs) using EPA Method 8260, polychlorinated biphenyls using EPA Method 8082, RCRA 8 metals (arsenic, barium, cadmium, mercury, selenium and silver) using Method 6010/7471, reactive cyanide and sulfide using EPA Method sw-846, Ignitability using modified EPA Method 1010, Corrosivity using EPA Method 9045, and Conductivity using EPA Method 120.1. Any sample found to contain contaminant concentrations equal to or greater than "20 times" their hazardous waste toxicity threshold (i.e., the twenty-times rule) shall be analyzed for toxicity characteristic leachate procedure (TCLP).
- H. All analyses shall be performed by a laboratory certified for such analyses by the Commonwealth of Massachusetts.

3.4 TEMPORARY STOCKPILING OF EXCAVATED MATERIALS

- A. Unless otherwise directed by the AUTHORITY, excavated material shall be reused on-site or transported for off-site re-use or disposal within forty-five days of excavation.
- B. When it is necessary to temporarily stockpile excavated material, it shall be stockpiled in a secure manner to prevent exposure to humans and the environment.
- C. The stockpiling or consolidating of excavated material near sensitive human health receptors such as public and private water supply wells or sensitive environmental receptors such as wetlands, surface water bodies, or marine environments shall be strictly prohibited.
- D. Excavated material to be stockpiled shall be placed entirely on intact pavement or on a polyethylene liner, shall be covered at the end of each day's work and at all times when earthwork is not taking place on site, with the same material or so as to minimize the infiltration of precipitation, volatilization of contaminants and erosion of the stockpile. Any cover material used shall be properly secured and replaced if damaged.
- E. Excavated material that has not been characterized and which exhibit odor staining and/or constituents which indicate the potential for OHM or which have been determined to be impacted by OHM at or above RCS-1 concentrations shall be completely covered with a minimum 10 mil thick layer of plastic tarp at the end of each working day and secured with ropes, ties, anchors or equivalent materials. The covered system shall be capable of resisting actual wind gust at the site, with a minimum wind capacity of 40 miles per hour.
- F. Excavated material not previously classified in accordance with the field screening classification, final characterization, or as otherwise directed by the Engineer shall be stockpiled separately based on type of suspected waste material. DESIGN-BUILDER shall maintain these materials separately and securely until classified by testing.
- G. Stockpiles are to be segregated based on a review of pre-characterization data, visual and olfactory conditions, and field screening results obtained during excavation. Stockpiles shall be no greater than

500 cu yds. Similar material may be stockpiled together; however, effort will be made to keep each stockpile separate. Each stockpile must be clearly marked from adjacent stockpiles.

- H. Stockpiles shall include berms around the edges to minimize infiltration of storm water or exfiltration of leachate.
- I. Any failure of materials or procedures used in employing the base layer or cover layer shall be immediately repaired, replaced or re-secured so as to minimize precipitation infiltration, volatilization and erosion/runoff of the excavated material.
- J. Movement and/or aeration of excavated material shall be limited to those activities that are necessary to manage such stockpiles. Land farming of excavated soils that are subject to MCP regulations is prohibited.
- K. Disposal of material that is contaminated as a result of careless handling, cross contamination or use of unauthorized procedures shall be at the DESIGN-BUILDER expense. Delays of Work resulting from temporary storage of excavated material, regardless of the classification, shall be at no additional cost to the AUTHORITY.
- L. The stockpiles shall be clearly labeled and securely barricaded from contact with workers and the general public.

3.5 DEBRIS MANAGEMENT

- A. The DESIGN-BUILDER shall be responsible for decontaminating debris. The decontamination means and methods shall be amended to the EMMP.
- B. The DESIGN-BUILDER is required to recycle/reuse any other recovered materials in lieu of disposal if the material is of acceptable physical quality and chemical quality, and the DESIGN-BUILDER can identify a facility willing and permitted to accept the material.

3.6 ON-SITE AND OFF-SITE SOIL REUSE AND DISPOSAL

- A. Excavated material found to be suitable for on-site or off-site reuse or disposal shall conform to the following:
 - 1. Soils shall comply with the geotechnical requirements and shall be suitable for the intended use as described in Section 02300 – Earthworks.
 - 2. Soils not exhibiting visual or olfactory evidence of OHM or elevated VOC or metal concentration as identified by PID or XRF screening may be reused within the area of excavation without first performing laboratory analysis. Soil/fill material that is not re-used within the area of excavation must be characterized prior to off-site re-use.
 - 3. Any soil which exhibits a petroleum odor or has a chemical odor or visual indications of OHM or VOCs identified by PID, or elevated metals as identified by XRF shall be handled as potentially contaminated soils. Soil exhibiting visual or olfactory evidence of OHM shall not be reused on-site without prior confirmation that the OHM concentration shall not pose a significant risk under current or future use scenarios.
 - 4. Excavated material which has been characterized may be re-used within the limits of work provided the proposed re-use area has been characterized and determined to meet MassDEP regulations and Similar Soils guidance. Soil reuse shall also comply with MassDEP Policy #WSC-00-425, “Construction of Buildings in Contaminated Areas.”

5. Excavated material that has been sampled and found to contain OHM concentrations less than MCP RCS-1 limits or regulated background (as defined in the Technical Update Background Levels of Polycyclic Aromatic Hydrocarbons and Metals in Soils) as applicable and subject to geotechnical requirements and is deemed suitable for use as described in Section 02300 – Earthworks – shall be considered suitable for on-site or off-site reuse.
6. If re-used off site, the DESIGN-BUILDER shall be responsible for conducting adequate testing and documenting that excavated material that is designated for off-site reuse shall contain OHM concentrations equal to or less than OHM concentrations at the designated reuse location (in accordance with the MCP’s “Similar Soils” policy) and in accordance with the facility permitted acceptance limits. The AUTHORITY shall have final approval over all proposed reuse locations.
7. Excavated material that has been sampled and determined to contain OHM in concentrations at or exceeding RCS-1 Reportable Concentrations or regulated background levels (as defined in the Technical Update Background Levels of Polycyclic Aromatic Hydrocarbons and Metals in Soils) whichever applicable, may be suitable for on-site re-use if a risk assessment determines that this soil does not pose a significant risk to human health and the environment at the proposed location(s) with associated current and anticipated future uses(s) and do not violate MassDEP policies or requirements.

3.7 MCP NOTIFICATION REQUIREMENTS

- A. Notification to the MassDEP shall be the sole responsibility of the AUTHORITY.
- B. The DESIGN-BUILDER shall be familiar with the MCP definitions of “two hour”, “72 hour” and “120 day” reportable conditions.
- C. The DESIGN-BUILDER shall immediately notify the Engineer of any 2 hour, 72 hour and 120-day reporting conditions.
- D. MCP notification for petroleum shall be based upon VPH/EPH MassDEP Method 1.0 analysis. Notification shall not be based upon Total Petroleum Hydrocarbon concentrations.
- E. Depending upon the nature of the reportable conditions, the MCP may require the cessation of work, implementing a Limited Removal Action (prior to notification), developing / implementing an “Immediate Response Action Plan” or a “Release Abatement Measure Plan” prior to continuing work or other actions which could delay certain aspects the site work.
- F. The AUTHORITY’s LSP shall prepare electronic eDEP MCP filings required during construction, including but not limited to Release Notification Forms (RNF), Release Abatement Measures (RAM), Utility-related Abatement Measures (URAM), and subsequent associated status reports or any other required MCP filings.
- G. DESIGN-BUILDER shall prepare all soil management documentation in support of those eDEP filings.

3.8 ENVIRONMENTAL FIELD MONITORING/DUST CONTROL

- A. During excavation and construction, the DESIGN-BUILDER shall monitor the air quality where construction activities involve soil handling such as excavation, relocation, staging, loading, or grading of soil/waste materials. All personnel shall be made aware of potential hazards and be informed of air monitoring information.

- B. The air monitoring program is to be designed to protect public health and the environment from the potential generation of dust and OHM contaminant releases during the Work.
- C. The DESIGN-BUILDER shall keep accurate documentation of all air monitoring which will be made available to the Engineer upon request.
- D. The DESIGN-BUILDER's Site Health and Safety Officer and Superintendent shall be responsible for ensuring that monitoring is conducted in an appropriate manner and that work practices, engineering controls and/or personal protective equipment are proper for the conditions.
- E. When there is a potential for visible dust being generated during periods of site activity, air monitoring shall include, at a minimum, daily monitoring and documentation of one upwind and two downwind conditions. Dust monitoring activities may be limited to visual assessment and documentation, subject to the approval of the AUTHORITY.
- F. The air monitoring information including air monitoring in the vicinity of the site activities shall also be utilized for establishing levels of personal protection measures in the DESIGN-BUILDER's Site Specific Health and Safety Plan.
- G. Air monitoring shall involve appropriate techniques capable of providing real-time indications of air contaminants to protect on-site personnel and the local population.
- H. If there are indications of OHM contamination, the frequency of air monitoring shall be determined by the DESIGN-BUILDER's Industrial Hygienist or competent health professional in consultation with the AUTHORITY's LSP.
- I. Dust shall be controlled during excavation of soil/fill material to limit potential spread of contaminants and potential exposure of contaminants to workers and the public.
- J. Nuisance dust levels shall be reduced by pre-wetting the surface soils and by establishing and maintaining clean access roads. The DESIGN-BUILDER's Dust, Vapor and Odor Control Plan shall describe the procedures and materials to minimize dust. At a minimum, the DESIGN-BUILDER shall provide clean water, free from salt, oil and other deleterious materials.
- K. Prior to excavation, areas of exposed earth shall be lightly sprayed with water before excavation if there is potential for nuisance dust generation. Additional water spray may be utilized only when any indication of excessive dust is observed. To the extent feasible, the DESIGN-BUILDER shall minimize the use of water within the limits of excavation.
- L. When feasible, access roads shall be sprayed with water on a regular basis to minimize the generation of dust.
- M. All containers and stockpiles shall be covered at all times except as necessary to place or remove materials from the containers or stockpiles. The DESIGN-BUILDER shall monitor the covers daily to ensure the covers are in place and effectively eliminating the generation of dust.

3.9 VAPOR AND ODOR CONTROL

- A. The DESIGN-BUILDER shall provide the materials and labor to control objectionable vapors and odor in accordance with the DESIGN-BUILDER's Dust, Vapor and Odor Control Plan. The DESIGN-BUILDER shall limit the exposure area and shall cover the exposure area with synthetic reusable covers, lime, foam suppressants or other methods to reduce off-site odors to acceptable levels. The DESIGN-BUILDER shall not use soil suitable for on-site re-use as a cover to control vapor and odors.

3.10 RE-USE/DISPOSAL FACILITY CLASSIFICATION/CATEGORIES

- A. The DESIGN-BUILDER shall transport excavated materials for off-site reuse, recycling, or disposal at a permitted facility based on the following categories:
1. **Managed Fill Site:** Compliant with the Similar Soils Provision Guidance (WSC#-13-500) and other DEP regulations and guidance. Accepts excavated materials that contain oil or hazardous materials at concentrations less than RCS-1 or RCS-2, as applicable to that facility, but less than applicable release notification thresholds established by 310 CMR 40.0300 and 40.1600.
 2. **In-State Unlined Landfill Facility:** Accepts excavated material that meets MassDEP criteria for reuse at in-state unlined landfills, to be used as daily cover, intermediate cover, and pre-cap contouring material. The material must not exceed the contaminant levels listed in DEP Policy #COMM-97-001. This category also includes excavated material and solid waste that meets Massachusetts DEP Solid Waste criteria and regulations and the facility's operating permit for reuse or disposal in the Massachusetts landfill per COMM 97-001. Sediments may not be reused at an in-state unlined landfill.
 3. **In-State Lined Landfill Facility:** Accepts excavated material that meets MassDEP criteria for reuse at in-state lined landfills, to be used as daily cover, intermediate cover, and pre-cap contouring material. The material must not exceed the contaminant levels listed in DEP Policy #COMM-97-001. This category also includes excavated material and solid waste that meets Massachusetts DEP Solid Waste criteria and regulations and the facility's operating permit for reuse or disposal in the Massachusetts landfill.
 4. **Asphalt Batch Recycling Facility:** Accepts excavated materials that meet the criteria set forth in MassDEP policy WSC-94-400 and the receiving facility's operating permit(s) for recycling at a licensed asphalt batch facility.
 5. **Regional Thermal Treatment Facility:** Accepts soil and fill that contains contaminants that exceed in-state lined and unlined landfill reuse criteria as well as in-state recycling acceptance criteria but meets the criteria for regional thermal treatment facilities or out-of-state recycling facilities and are not classified as a RCRA Hazardous Waste.
 6. **NON-RCRA Out-of-State Lined Landfill:** Accepts excavated material that contains concentrations of OHM that require removal to a regional disposal facility (ies), are not classified as a RCRA Hazardous Waste and meets the destination state's solid and hazardous waste regulations and the receiving facility's operating permit(s). This includes material designated as a "special waste.
 7. **Hazardous Waste:** Materials determined to contain TSCA PCB Remediation Waste or RCRA Listed or Characteristic Hazardous Waste at concentrations requiring management and disposal as a Hazardous Waste.
 8. **Other Legal Disposal and/or Recycling Facilities not mentioned above:** Accepts excavated materials in accordance with the valid state or federal operating permit(s).
- B. With the exception of Managed Fill and RCRA Landfill Materials, soil shall be transported using a Bill of Lading (BOL). If hazardous wastes are to be disposed of, the RCRA Landfill Material shall be transported under a Uniform Hazardous Waste Manifest (Manifest). Managed Fill soils shall be transported using a Material Shipping Record (MSR). Closed-out attested BOLs, Manifests and copies of MSRs will be appended to the electronic searchable PDF version of the EMMP.

- C. Treatment of Soil Prior to Disposal/Re-use: Materials determined through testing to be characteristically hazardous waste through TCLP analysis shall be treated on-site to render the material characteristically non-hazardous.
- D. Material shipped to any recycling/disposal facility must meet the selected facility's chemical and physical acceptance criteria. Selected facilities must be established, fully operational, appropriately insured, and be operating in compliance with all applicable local, state, and federal regulations.

3.11 WASTE PROFILES AND SHIPPING DOCUMENTS

- A. The DESIGN-BUILDER shall provide certified tare and gross weight slips for each load received at the accepted facility and these shall be attached to each returned shipping document.
- B. The DESIGN-BUILDER shall prepare and submit to the AUTHORITY for review all completed waste profile applications and questionnaires, and coordinate with disposal facilities and all Federal and State Environmental Agencies.
- C. The DESIGN-BUILDER shall prepare all draft Hazardous Waste Manifests, Bills of Lading, and material shipping records for review and use by AUTHORITY's LSP with all applicable analytical backup, notification, and control forms. Final copies of Bills of Lading shall be signed by the AUTHORITY as generator and by the AUTHORITY's LSP following approvals of draft Bills of Lading.
- D. The DESIGN-BUILDER shall furnish all generator copies of the Hazardous Waste Manifest to the AUTHORITY for submittal to the appropriate regulatory agencies and to retain for the AUTHORITY's records.

3.12 TRANSPORT OF EXCAVATED MATERIAL

- A. The DESIGN-BUILDER shall not be permitted to transport materials off-site until all storage, disposal, or recycling facility documentation has been received, reviewed, and approved by the AUTHORITY.
- B. The DESIGN-BUILDER shall transport materials from the site to the storage, disposal, reuse or recycling facility in accordance with all United State Department of Transportation (DOT), USEPA, MassDEP, and applicable state and local regulations.
- C. The Hauler(s) shall be licensed in all states affected by transport.
- D. The DESIGN-BUILDER shall be responsible for ensuring that free liquid is properly transported. "Wet soils" shall not be loaded for transport. The DESIGN-BUILDER shall dewater "wet soils", and properly dispose of free liquid in accordance with local, state, and federal regulations. The DESIGN-BUILDER shall dispose of any free liquids that may result during transportation at no additional cost to the AUTHORITY.
- E. All excavated material transported upon public roadways shall be covered to minimize fugitive dust, and where necessary truck tire and undercarriage decontamination shall be employed to minimize tracking of soils onto public roadways.

3.13 RE-USE/DISPOSAL

- A. DESIGN-BUILDER shall dispose of all excavated materials at a facility(ies) approved to accept them, in accordance with all federal, state and local regulations.

- B. The DESIGN-BUILDER shall perform analyses on the material as necessary to fulfill any disposal testing requirements of any approved Facility.
 - 1. The DESIGN-BUILDER shall bear all costs incurred in sampling and analyses for those tests required by any facility.
 - 2. The DESIGN-BUILDER shall submit a copy of all sampling analyses to the AUTHORITY within two days of receipt of the laboratory report.
- C. The DESIGN-BUILDER shall provide to the AUTHORITY copies of all weight slips; both tare and gross, for every load weighed and disposed of at the approved facility. The slips shall be tracked by the original shipping document number that was assigned by the DESIGN-BUILDER in accordance with its material management system.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02283

HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies requirements applicable to the handling and disposal of groundwater contaminated with oil or hazardous materials [as defined in 310 CMR 40.0000, the Massachusetts Contingency Plan (MCP)] encountered prior to or during the course of excavation in areas suspected or confirmed as containing contaminated soils or groundwater.
- B. The DESIGN-BUILDER shall coordinate the work outlined in this section with the work outlined throughout the specifications, and shall perform the work as specified in the project drawings.

1.2 RELATED WORK

- A. Other specification sections that relate to the work include but are not limited to the following:
 - 1. Section 01060 – PERMITS AND REGULATORY REQUIREMENTS
 - 2. Section 01560 – TEMPORARY CONTROLS
 - 3. Section 02221 – DEMOLITION
 - 4. Section 02240 – DEWATERING
 - 5. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 - 6. Section 02300 – EARTHWORK

1.3 RESPONSIBILITIES

- A. The DESIGN-BUILDER shall retain an Environmental Consultant which will include, at a minimum, a Licensed Site Professional (LSP) and a qualified Health and Safety Professional. The duties of the DESIGN-BUILDER's Environmental Consultant shall include preparation of a Groundwater Pre-characterization Sampling Plan and a Groundwater Management Plan.
- B. The DESIGN-BUILDER shall perform in-situ groundwater testing prior to the start of excavation in contaminated areas, and collect samples for laboratory analysis in accordance with the criteria contained herein and the Groundwater Pre-characterization Sampling Plan to be prepared by the DESIGN-BUILDER's Environmental Consultant.
- C. The DESIGN-BUILDER shall coordinate all work performed in contaminated areas with the AUTHORITY's LSP of Record.
- D. The DESIGN-BUILDER shall extract, handle, store, treat, and properly discharge or dispose of on or off-site, liquid waste and residual material according to the criteria contained herein and in the Groundwater Management Plan to be prepared by the DESIGN-BUILDER's Environmental Consultant. For each liquid waste stream and residual material, the DESIGN-BUILDER shall demonstrate to the Engineer that the least costly means of treatment and discharge, or disposal has been selected. This demonstration shall be made prior to treatment or shipment.
- E. The DESIGN-BUILDER shall provide compliance monitoring required by groundwater or surface water discharge permits including sampling, laboratory testing, and reporting. The DESIGN-BUILDER shall obtain all permits and approvals necessary for the discharge of groundwater generated from construction dewatering.

- F. The DESIGN-BUILDER shall select an appropriate destination facility, obtain approval for acceptance of the material, and contract directly with the facility for off-site reuse/disposal/treatment.
- G. The DESIGN-BUILDER shall obtain all discharge permits, be responsible for all fees, and adhere to permit conditions related to treatment, storage, and discharge of extracted groundwater.
- H. The DESIGN-BUILDER shall pump, handle, store, test, treat and dispose of dewatered groundwater from the excavation according to the procedures outlined herein and in the Groundwater Management Plan to be prepared by the DESIGN-BUILDER's Environmental Consultant.
- I. The DESIGN-BUILDER shall implement measures to prevent the flow of storm water runoff into open excavations.
- J. The DESIGN-BUILDER shall collect and dispose of non-aqueous phase liquids (NAPLs) and sediments encountered or generated from dewatering activities according to the procedures outlined herein and in the Groundwater Management Plan to be prepared by the DESIGN-BUILDER's Environmental Consultant.
- K. The DESIGN-BUILDER shall manage contaminated materials (sediments, oil, and liquid waste) generated by the work under this section in a manner that ensures the protection of health, safety, public welfare, and the environment. The DESIGN-BUILDER shall handle, store, transport, treat, recycle, reuse, dispose, or discharge contaminated materials in compliance with the provisions of 310 CMR 40.0000 and all other applicable federal, state, and local laws and regulations and bylaws.
- L. The DESIGN-BUILDER shall manage and treat dewatered groundwater in compliance with the applicable provisions of 310 CMR 30.00, 310 CMR 40.00, 314 CMR 7.00, 314 CMR 5.00, 314 CMR 40.00 and all other applicable federal, state, and local laws and regulations or bylaws.
- M. The DESIGN-BUILDER shall prepare and implement a DESIGN-BUILDER's Health and Safety Plan for all workers engaged in intrusive activity or other work where exposure to contaminated dewatering sediments or groundwater is possible during the performance of the work. The Plan shall include procedures for, without limitation, the following:
 - 1. Measures to protect human populations from exposure to oil or hazardous material from any source within the limits of work;
 - 2. The institution of air monitoring activities to protect the public from exposure to gases and airborne particulates;
 - 3. Measures that may be necessary to contain oil and/or hazardous material during the performance of the work, including:
 - a. Measures to decontaminate vehicles and equipment to minimize the spread of contaminated groundwater from the work area;
 - b. Discontinuance of work where necessary to protect public health and safety.

1.4 REFERENCES

- A. The DESIGN-BUILDER shall be responsible for adhering to regulations, specifications, and recognized standard practices related to contaminated groundwater treatment, management, and disposal during excavation activities. The AUTHORITY will not be responsible at any time for the DESIGN-BUILDER's violation of pertinent state or federal regulations or endangerment of laborers and others. Applicable regulations include, but are not limited to, the most recent versions of the following:
 - 1. MA Department of Environmental Protection (DEP) Policy WSC-94-400, Interim Remediation Waste Management Policy for Petroleum Contaminated Soils
 - 2. Massachusetts DEP, 310 CMR 40.0000, The Massachusetts Contingency Plan.

3. Massachusetts DEP, 310 CMR 30.0000, Hazardous Waste Regulations.
4. 314 CMR 3.00, "Massachusetts Surface Water Quality Permit Program."
5. 314 CMR 5.00, "Ground Water Discharge Permit Program."
6. U.S. Environmental Protection Agency, Requirements under the National Pollution Discharge Elimination System.
7. NIOSH/OSHA/USCG/EPA: "Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities," DHHS/NIOSH Pub. 85-115.

11. 105 CMR 670.000 and 441 CMR 21.00 (Right to Know).

1.5 SUBMITTALS PRIOR TO START OF WORK

- A. Within 21 days of the DESIGN-BUILDER receiving a Notice To Proceed, the DESIGN-BUILDER shall prepare and submit a Groundwater Pre-characterization Sampling Plan for the pre-testing of groundwater for contaminants. The groundwater investigations shall be required in areas of known or suspected groundwater contamination and/or within the limits of MCP Disposal Sites and where excavation dewatering is anticipated based on project design drawings and available information on depths to groundwater. DESIGN-BUILDER shall not begin dewatering until the submittal relevant to that dewatering location and permit has been accepted and required Permit(s) have been obtained.
- B. The DESIGN-BUILDER'S Groundwater Pre-characterization Sampling Plan is to be submitted for approval by the DESIGN-BUILDER's Environmental Consultant, and include at a minimum:
 1. Locations of existing and proposed groundwater monitoring wells to be sampled for the purpose of precharacterization sample collection. DESIGN-BUILDER shall install and sample an adequate number of wells at appropriate depths to adequately characterize groundwater in areas where dewatering will be required.
 2. Field screening and sample collection method(s) to be used, including a description of sample compositing techniques to obtain a vertical representation of the groundwater quality at each sample location.
 3. A scaled engineering drawing showing proposed sampling locations, known subsurface utilities, and other major site features.
 4. Number of samples to be collected from each location, sample preservation, and the laboratory methods for which the samples will be submitted for analysis.
- C. Within 21 days following the completion of groundwater testing, the DESIGN-BUILDER shall submit a Groundwater Management Plan for approval, prepared by the DESIGN-BUILDER's Environmental Consultant, based upon the results of pre-characterization testing and containing, at a minimum:
 1. Conceptual schematics of anticipated treatment methodologies based on available data. As detailed designs are developed for specific areas, DESIGN-BUILDER shall provide drafts of all applicable groundwater discharge Permits for review by AUTHORITY prior to submittal to

relevant agency. DESIGN-BUILDER shall allow a minimum of two weeks review period by the AUTHORITY.

2. Prior to start of dewatering at each location or separate treatment system location, DESIGN-BUILDER shall provide groundwater treatment design details, including but not limited to storage, treatment equipment and methods, sampling procedures, discharge or off-site disposal locations (including liquid waste, NAPL, and contaminated sediments), and treatment and dilution calculations.
 3. A scaled drawing of the work site(s) showing approximate limits of each area of contaminated groundwater identified in the Groundwater Management Plan, the related MassDEP release tracking numbers, and the locations where groundwater treatment systems are anticipated to be temporarily located during excavation in those areas. This portion of the Groundwater Management Plan shall be updated as applicable during construction.
 4. Anticipated locations of effluent discharge.
 5. A plan showing location of proposed temporary off-site storage areas, if needed.
 6. An Emergency Response Plan for addressing oil and/or hazardous materials released by the DESIGN-BUILDER or encountered during the work.
 7. Name and address of proposed Hauler licensed to transport Hazardous Waste material.
 8. Field screening and sample collection method(s) to be used, including a description of sample compositing techniques to obtain an adequate representation of the groundwater quality, in any areas where precharacterization testing is not performed.
 9. Sample preservation methods and the laboratory methods for which the samples will be submitted for analysis, in any areas where precharacterization testing is not performed.
 10. Evidence that the DESIGN-BUILDER's analytical laboratory is currently certified to perform these analyses in Massachusetts, if precharacterization testing is not performed.
 11. Tabulated results of all pre-characterization testing performed, compared with regulatory criteria in 310 CMR 40.0932 for the appropriate groundwater category. This data shall be provided as developed. All data shall be submitted as Electronic data deliverables (EDDs) formatted for upload to EQuIS™ software. Tabulated analytical results shall be provided in Excel table format, compared to applicable regulatory standards. Final laboratory analytical reports shall be provided in PDF format.
- D. Based upon the groundwater sampling results, the DESIGN-BUILDER shall prepare and submit a Health and Safety Plan (H&SP) prepared by a qualified Health and Safety Professional experienced in working in contaminated environments. The H&SP must be submitted prior to the health and safety coordination meeting. The DESIGN-BUILDER shall schedule the health and safety coordination meeting, to be held at least three (3) days prior to commencement of excavation work, to discuss issues relating to possible exposure to groundwater contamination and the provisions of the H&SP. The DESIGN-BUILDER shall provide written notice of this meeting to all interested parties, including the AUTHORITY, the AUTHORITY's LSP, and any subcontractors retained by the DESIGN-BUILDER. Health and safety training of DESIGN-BUILDER's workers and subcontractors shall be provided by the DESIGN-BUILDER.
- E. The DESIGN-BUILDER shall obtain and submit a copy of each discharge permit, and a map showing the approved groundwater extraction area and discharge location represented by each permit. Permit information shall be updated as applicable during construction.

1.6 ADDITIONAL SUBMITTALS

- A. The DESIGN-BUILDER shall submit the following to the AUTHORITY's LSP within one (1) week of receipt:
1. Approval letters from the receiving facility indicating their acceptance of the material and a complete list of their acceptance criteria.
 2. Copies of disposal or treatment facility weight slips and manifests, and certifications of disposal or recycling.
 3. Copies of field screening data and monitoring observations of the DESIGN-BUILDER's Environmental Consultant during work in contaminated areas.
 4. Copies of all permits obtained by the DESIGN-BUILDER for the work described herein, and all compliance and/or monitoring documents submitted, including completion reports, for these permits.
 5. Copies of laboratory reports showing a summary of analytical methods, analytical results, a QA/QC statement and Chain-of-Custody log. Tabulated results of all testing performed, compared with regulatory criteria in 310 CMR 40.0932 for the appropriate groundwater category.

1.7 ENVIRONMENTAL SITE CONDITIONS

- A. A complete assessment of the potential and existing sources of groundwater contamination in excavation areas has not been performed for this contract. The DESIGN-BUILDER shall conduct pre-characterization soil and/or groundwater sampling in the work areas and obtain representative data necessary to obtain approval from off-site disposal or treatment facilities or to design and operate on-site treatment facilities prior to extraction of groundwater, and obtain information on the potential health hazards to be encountered during the performance of the work.
- B. The nature of the materials which may be encountered in excavation areas may require use of special protective clothing, use of engineering controls, and the possible use of respiratory protective equipment which is intended to minimize worker exposure to known or suspected site hazards. During dewatering activities in areas of contaminated groundwater, DESIGN-BUILDER shall ensure that workers are not exposed to contaminants in excess of the permissible exposure limits (PEL). If exposure cannot be reduced to or below the PEL through the use of engineering controls or revised work practices, the DESIGN-BUILDER shall provide personal protective equipment including, but not limited to, respiratory and dermal protection.
- C. The DESIGN-BUILDER shall adequately characterize the groundwater for disposal based on the criteria established by the DESIGN-BUILDER's discharge permits or disposal facility.
- D. The DESIGN-BUILDER shall be responsible for determining the level of Personal Protection required based on the criteria outlined in the DESIGN-BUILDER's Health and Safety Plan. In the event that the DESIGN-BUILDER determines that a level of protection higher than Level D is required, and this condition has not been previously identified as potentially present, work shall be suspended in the contaminated area until the DESIGN-BUILDER is equipped to continue the work.

PART 2 – PRODUCTS

Not Used.

PART 3 – EXECUTION

3.1 CHARACTERIZATION REQUIREMENTS FOR EXTRACTED GROUNDWATER

- A. The DESIGN-BUILDER shall review existing soil and groundwater data and complete additional sampling as needed to determine the means and methods to treat, store, manage or discharge or dispose of contaminated groundwater extracted from the excavation areas.
- B. The DESIGN-BUILDER's Environmental Consultant shall conduct sampling in accordance with permit requirements and appropriate DEP policy, and submit all samples to a DEP-approved testing laboratory for analysis by EPA and DEP methods.
- C. The detection limits for all chemical tests shall be low enough to allow material classified according to the criteria specified herein with a statistical significance at a ninety percent confidence level and this detection shall be acceptable to the discharge permit issuer or the operator of the selected disposal facility to allow analysis within the parameters of the discharge permit or the facility's permit.
- D. The DESIGN-BUILDER shall determine the disposition of the material based on the laboratory test data and the estimated quantities for each disposition and arrange for the on-site treatment or transportation of the material to the appropriate facility. The AUTHORITY's LSP will review the laboratory test data and DESIGN-BUILDERS estimated quantity for each disposition prior to transport.
- E. The AUTHORITY's LSP will review and obtain the signature of an authorized representative of the AUTHORITY on the Hazardous Waste Manifests on behalf of the AUTHORITY, which will be designated as the Generator, for all liquids transported off-site.

3.2 GENERAL REQUIREMENTS FOR EXCAVATION IN CONTAMINATED AREAS

- A. The DESIGN-BUILDER shall design and implement support of excavation or other methods to minimize inflow of groundwater into excavations where contaminated groundwater is present.
- B. The DESIGN-BUILDER shall limit excavation activities and related dewatering in contaminated areas to only those actions that are necessary for completion of the construction.
- C. The DESIGN-BUILDER shall excavate material using methods which will permit observation of exposed subsurface soils to identify and segregate any contaminated soils/wastes and to reduce the potential for contaminating groundwater beyond the contaminated areas.
- D. The DESIGN-BUILDER shall not exacerbate contamination at the site as a result of performing the work or as a result of placing structures within the contaminated area.
- E. The DESIGN-BUILDER shall protect construction workers, surrounding human populations and environmental receptors from exposure to oil or hazardous material during construction activities.
- F. The DESIGN-BUILDER shall manage contaminated groundwater, and other Remediation Wastes removed from the construction area in compliance with the provisions of 310 CMR 40.0040 and all applicable Federal, State, and local laws. The DESIGN-BUILDER shall obtain a NPDES Remediation General Permit for dewatering in areas of known or suspected groundwater contamination in a timely manner so as to not impact the construction schedule.
- G. While conducting the work, if conditions are encountered which, in accordance with 310 CMR 40.0311 through 40.0314, requires DEP notification within 2 hours or 72 hours, as applicable, the DESIGN-BUILDER shall suspend construction in the affected area and coordinate with the AUTHORITY's LSP and DEP to implement an Immediate Response Action (IRA) in accordance with 310 CMR 40.0410.

3.3 GROUNDWATER CLASSIFICATION CRITERIA

- A. The DESIGN-BUILDER shall become familiar with the areas where contaminated soil and/or groundwater has been identified, and plan for and manage the groundwater extraction, treatment, and discharge requirements for each work zone based on the results of soil and groundwater testing.
- B. Excavated soils within contaminated areas shall be monitored by the DESIGN-BUILDER's Environmental Consultant. The DESIGN-BUILDER's Environmental Consultant will confirm by visual and olfactory observation whether precharacterization soil and/or groundwater testing adequately represents localized groundwater conditions and the types of contaminants present.
- C. If the presence of localized releases of oil and/or hazardous materials affecting groundwater are identified in areas not previously suspected or known to be contaminated, DESIGN-BUILDER shall stop work and immediately notify Engineer and AUTHORITY'S LSP. Work will not continue until new conditions are evaluated by the AUTHORITY'S LSP.

3.4 GROUNDWATER TREATMENT UNIT STORAGE

- A. The DESIGN-BUILDER shall operate and manage groundwater treatment systems outside of any active public way, and/or transport the material to a temporary off-site treatment and storage areas owned or operated by the DESIGN-BUILDER, or to the approved disposal facility.
- B. The DESIGN-BUILDER shall operate and manage contaminated groundwater treatment systems and the sediments generated in a manner that is protective of health, safety, public welfare and the environment.
- C. The DESIGN-BUILDER's Environmental Consultant shall collect and submit all analytical samples necessary for proper off-site reuse, disposal or treatment of the material. The DESIGN-BUILDER shall obtain preapproval for off-site reuse, disposal or treatment and discharge of extracted groundwater prior to dewatering in designated areas.

3.5 REQUIREMENTS FOR DISPOSITION OF TREATED GROUNDWATER

- A. The DESIGN-BUILDER shall perform testing of treated groundwater to confirm it meets the discharge permit requirements. The number of samples which must be collected and the analytical methods required are permit-specific.
- B. Non-aqueous waste liquids that are generated as a result of treatment of groundwater, such as oil, grease, or sediments shall be containerized for transportation and disposal as Special Waste Liquids.
- C. All data shall be submitted as Electronic data deliverables (EDDs) formatted for upload to EQUIS™ software. Tabulated analytical results shall be provided in Excel table format, compared to applicable regulatory standards. Final laboratory analytical reports shall be provided in PDF format.

3.6 TRANSPORTATION AND DISPOSAL OF CONTAMINATED MATERIAL

- A. The DESIGN-BUILDER shall be responsible for extracting, storing, treating, managing, and disposing of treated groundwater.
- B. Contaminated materials transported by the DESIGN-BUILDER shall be loaded into properly licensed and permitted vehicles and transported directly to the destination facility in watertight containers.
- C. Transportation of Special Waste Liquid material shall be conducted by the DESIGN-BUILDER's licensed hazardous-waste hauler. The hauler shall be licensed in all states necessary for proper disposal of Special Waste Liquid materials.

3.7 DEWATERING/SEDIMENTATION CONTROL

- A. All contaminated water collected during dewatering under this Specification will require, at a minimum, sedimentation removal and oil/water separation, and temporary storage.
- B. The DESIGN-BUILDER shall obtain all required local, state, and federal permits necessary for discharge of pumped groundwater. The DESIGN-BUILDER is responsible for compliance with the permit conditions and is responsible for any fines levied for permit violations.
- C. The DESIGN-BUILDER shall design and furnish the sedimentation control system to reduce the concentration of sediments to less than 100 ppm Total Suspended Solids (TSS) or in accordance with the criteria given in the DESIGN-BUILDER's discharge permit and install and operate the system according to the approved shop drawings.
- D. The DESIGN-BUILDER shall perform laboratory testing of the discharge water in accordance with the permit requirements and report the results to the permitting agency and the AUTHORITY's LSP. The DESIGN-BUILDER shall not discharge treated water without verifying compliance with permit limits by laboratory testing.
- E. The DESIGN-BUILDER shall remove NAPL and sediments from pumped water using an oil/water separator, sedimentation devices and/or oil absorbent materials. The DESIGN-BUILDER shall be responsible for proper handling, characterization and disposal of collected oil, oily water and sediments as Special Waste Liquids.

3.8 CONTINGENCIES

- A. The DESIGN-BUILDER is required to notify their workers of the history of the site area and contaminants that may be present, and to be alert for the potential discovery or evidence of contaminated materials.
- B. Should any sudden, continuous or intermittent release of oil or hazardous material occur during the course of the work, the DESIGN-BUILDER shall notify the AUTHORITY's LSP immediately and shall immediately begin actions to contain or abate the release. If such release of oil or hazardous material is the responsibility of the DESIGN-BUILDER, then the cost of complying with this provision shall be borne by the DESIGN-BUILDER.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02296

TRAFFIC DECKING

PART 1 - GENERAL

1.1 GENERAL

- A. Temporary traffic decking over excavated areas shall consist of steel plates which span the incomplete work.
- B. Traffic controls are specified in Volume 2 Technical Provisions Exhibit 21 “Additional Project Requirements”.
- C. All steel plates must be identified with the name of the Design-Builder and a 24-hour phone number on both sides.
- D. The Design-Builder is required to comply with all requirements of 520 CMR 14.00: *Excavation and Trench Safety*, which has established standards to prevent unauthorized access to the unattended trenches.
- E. The Design-Builder shall contact local DPW prior to potential snow storms to coordinate the use of steel plates in roadways.
- F. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 02052 - MAINTENANCE OF TRAFFIC THROUGH WORK AREAS
 - 2. Section 02298 - TEMPORARY PEDESTRIAN FACILITIES
 - 3. Section 02360 - DRIVEN PILES
 - 4. Section 02400 - DRAINAGE AND SEWER SYSTEMS

1.2 SUBMITTALS

- A. Submit shop drawings to show methods and sequence of installation and construction of decking and supporting members, including details of girders, beams, piles other than those forming a part of the excavation support system, accessories, surface materials, openings, ramps, guard rails, curbs, signs, and access hatches. Roadways shall conform to existing roadway elevations and grades where possible.
- B. Include engineering calculations supporting the design and selection of materials and methods stamped by a registered engineer in the Commonwealth of Massachusetts.
- C. Show methods and proposed sequence of removing decking and restoring the roadway.

1.3 QUALITY ASSURANCE

- A. Design Criteria: The Design-Builder shall be responsible for the design of decking. Comply with Contract Drawings and the following criteria.
 - 1. Design for AASHTO HS20-44 Wheel loading, indicated earth pressures, utility loads, and other applicable live and dead loads, including construction equipment.
 - 2. Design structural steel in accordance with industry standards.
 - 3. Design decking to include the following:
 - a. Wheel guards, railings, barricades, and safety construction.
 - b. Access hatches for utilities and for fire hydrants and valves.
 - c. Clearance for existing and relocated utilities.
 - 4. Select timber and lumber species and grade in accordance with ASTM D2555 to meet the design unit stresses.
 - 5. Select anti-skid material of a type which, after installation, has a skid number at 30 mph or not less than 35 when tested in accordance with ASTM E274.
 - 6. Maximum grade for vehicular ramps: five percent.
 - 7. Maximum grade for pedestrian ramps: seven and half percent and design with appropriate allowances for construction tolerances.
 - 8. Provide minimum 12-inch high wheel guards of an accepted type securely installed around perimeter of openings in the decking.

1.4 PROJECT CONDITIONS

- A. Ventilation. Provide ventilation as required to prevent the accumulation of gases below decking.
- B. Illumination and Access. Provide illumination, galleries, walkways, and access facilities as necessary to enable inspection of the supporting system, lagging, bracing, and utilities maintained in place. Provide these facilities for the full length of decking where excavation is deeper than 20 feet. Provide suitable openings and flush covers for access to utility services located below the decking and for fire fighting access.

PART 2 - PRODUCTS

2.1 STEEL PLATES

- A. Steel plates spanning across excavations shall be designed and constructed to HS20-44 Wheel Loading.
- B. Steel shall be ASTM A36 with a minimum yield stress of 36 KSI. The steel plates shall have sufficient thickness for supporting the intended traffic load with a maximum allowable deflection of (3/4") three-quarter inch.
- C. Decking materials may be either new or used. Used materials shall be sound and free of damage or defects, which would impair their suitability. Prior to installation of decking material the MBTA will inspect used material and may require that certain items of decking material be removed from the work.

PART 3 - EXECUTION

3.1 INSTALLATION OF STEEL PLATES

- A. Install decking in accordance with the approved Shop Drawings and conform the decking system to existing roadway elevations and grades. Securely fasten surface members to prevent movement under traffic conditions. Bed transition members, plates, and ramps to existing pavement to prevent movement and noise under traffic conditions.
- B. The plates shall be set with a maximum vertical lip of ¼-inch, which may be accomplished by recessing the plate or providing for the transition area. Plates shall be pinned or welded together to prevent lateral movement, noise, or vibration.
- C. Apply anti-skid material at ramps, vehicular traffic intersections, and on traffic lanes approaching traffic intersections and pedestrian crossings for a distance of 150 feet, in accordance with the manufacturer's instructions.
- D. Install decking within plus or minus one inch of the elevations indicated on the approved Shop Drawings; except, install and maintain surface elevations at abutting elements within 1/2 inch of each other.

3.2 INSPECTION OF STEEL PLATES

- A. It is the responsibility of the Design-Builder to inspect and monitor the condition of active steel plates and to make the necessary adjustments to protect the public safety.

3.3 MAINTENANCE

- A. Immediately replace or repair broken or chipped pieces, bent or loose plates and deck members and protruding fasteners. Patch adjacent paving as potholes develop using bituminous concrete. Immediately adjust, re-secure, and bed loose transition members, plates, and ramps to the existing pavement.
- B. Replace anti-skid materials when the MBTA determines the material is no longer effective. Maintain the surfaces of the decking, transitions, and ramps in vehicular and pedestrian traffic lanes and intersections free of dirt, snow, and ice and other deleterious materials.
- C. Maintain the decking in an acceptable condition at all times.

3.4 REMOVAL

- A. Coordinate with other work of the project to accomplish a smooth transition from temporary facilities to permanent facilities.
- B. When no longer required, remove the decking and all temporary supporting members and dispose of them off the project site.

- C. Cut off interior support members at the elevation shown on the approved Shop Drawings.
- D. Remove exterior support members either to a level ten feet below finish ground level or to the top of the adjacent MBTA subway structures, whichever elevation is higher.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02298

TEMPORARY PEDESTRIAN FACILITIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. This section specifies requirements for furnishing, installing, operating and maintaining temporary pedestrian facilities. Temporary pedestrian facilities shall be provided for all construction work zones.
- B. Except for the materials shown on the Drawings to be left in place, all materials provided by the Contract under this section shall be removed by the Design-Builder when no longer required.
- C. Related Work:
 - 1. Volume 2 Technical Provisions Exhibit 21 "Additional Project Requirements".
 - 2. Section 02052 – MAINTENANCE OF TRAFFIC THROUGH WORK AREAS
 - 3. Section 02296 - TRAFFIC DECKING

1.2 SUBMITTALS

- A. Submit shop drawings of temporary pedestrian facilities for each phase of construction at least 30 days prior to implementation of that portion of the Work.
 - 1. Indicate construction zones, laydown areas, storage areas, and location of construction field offices. Indicate access locations for each zone.
 - 2. Indicate pedestrian routes and detours through and around each construction zone.
 - 3. Indicate all existing and temporary crosswalks.
 - 4. Indicate the extent and type of all proposed temporary pedestrian facilities.
 - 5. Indicate all directional signage and directional arrows.
 - 6. Indicate the proposed surface improvements in the areas of temporary pedestrian facilities.
 - 7. Indicate a sequence of construction and a sequence of removal such that at no time is there any unsafe condition.

1.3 QUALITY ASSURANCE

- A. Structural loads shall be calculated according to the Massachusetts Building Code.
- B. Electrical components shall conform to the Massachusetts Electrical Code.
- C. Temporary pedestrian facilities shall conform with:
 - 1. Americans With Disabilities Act, Accessibility Guidelines for Buildings and Facilities

2. Rules and Regulations of the Massachusetts Architectural Access Board
3. Massachusetts Building Code
4. Manual on Uniform Traffic Control Devices
5. Occupational Health and Safety, Code 1926
6. Local municipality Traffic Department Guidelines

1.4 PROJECT CONDITIONS

- A. Coordination will be required with the work requirements to install permanent paved walks, and curbs.

PART 2 - PRODUCTS

2.1 CONCRETE

- A. Precast concrete barriers meeting the Massachusetts Highway Department Standard Specification 629. Precast barriers are the only acceptable barrier where pedestrians are being protected from vehicular traffic.

2.2 METALS

- A. Chain-link fence meeting the Specification 02444 – CHAIN-LINK FENCE AND GATES.
- B. Hot galvanized pipe, ASTM A53 Type E, Grade B coated with zinc inside and outside. Brackets, plates, anchoring elements, and miscellaneous components shall be hot-dip galvanized.
- C. Welding shall conform with AWS D1.1 Structural Welding Code-Steel and AWS D1.3 Structural Welding Code-Sheet Metal.

2.3 WOOD

- A. Wood and Timber Members: Suitable for service, sized to limit deflection under full construction loading.
- B. Plywood flooring shall be Sturdifloor Exposure-1, exterior adhesive type, ¾ inch thick with non-skid epoxy resin and aggregate coat on exposed surfaces.
- C. Plywood shall be ¾ inch, exterior Medium Density Overlay

2.4 ELECTRICAL

- A. Fluorescent light fixtures shall be vandal resistance, UL listed, and suitable for wet and outdoor installations. Light housing shall be 20 gauge steel seamless with white corrosion resistant finish of baked enamel, epoxy or porcelain. Lamp shall be rapid start and energy saving type. Ballast shall be 120 V, Class P, thermally protected, high power factor.

- B. Electrical components shall be grounded. Metal frames shall be bonded to the electrical system grounding conductor as well as to a locally driven rod. Final installation of grounding system shall ensure that no point in the metal framing shall have a resistance measurement to, local earth ground exceeding 25 ohms.
- C. Conduit shall be UL listed with corrosion resistant coating for all electrical system wiring, with all fittings meeting the Massachusetts Electrical Code for outdoor installations.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. For each work area where temporary pedestrian facilities are used, perform on-site assembly expeditiously to minimize interference with the walking public and vehicular traffic. Complete and place in service all required temporary pedestrian facilities prior to the start of the construction work in the area.
- B. Prepare substrate surfaces to support barriers and fences with slopes not to exceed 5% in the direction of the traveling path, and does not exceed 2% across the traveling path.
- C. Firmly secure temporary pedestrian facilities to substrates as required to resist all wind, snow, dead, and live loads.

3.2 MAINTENANCE

- A. The Design-Builder is responsible to repair all temporary pedestrian facilities until they can be removed following construction
- B. The Design-Builder shall remove snow and ice, apply salt, broom clean, and make all necessary repairs. Snow, ice, sweepings, and other material generated by maintenance activities will be disposed of off the project site.
- C. The Design-Builder shall inspect all temporary facilities daily and make all necessary repairs to maintain the structural integrity of the system and allow safe passage by the walking public and vehicular traffic.
- D. Maintain the decking in an acceptable condition at all times.

3.3 REMOVAL

- A. Coordinate with other work of the project to accomplish a smooth transition from temporary facilities to permanent facilities.
- B. Perform removed work so that at no time is there any unsafe construction.
- C. When no longer required, remove all temporary facilities and dispose of them off the project site.
- D. Obtain permission from the Owner to leave any materials in place.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02300

EARTHWORK

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A Work Included: This Section specifies the following items.

1. Preparing subgrades for structures and landscaping.
2. Excavating, backfilling and compacting for structures and track bed.
3. Drainage course for slabs-on-grade.
4. Subbase course for bituminous and cement concrete pavements.
5. Subsurface drainage backfill for walls and trenches.
6. Excavating, backfilling and compacting for utility trenches.
7. Excavating, backfilling and compacting for test pits.
8. Placement and compaction of structural backfill.
9. Placement of Ordinary Borrow for fill and embankment areas.
10. Placement of Gravel for base courses.
11. Crushed stone shall be installed only in areas directed by the Owner.

B Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 02100 - SITE PREPARATION
2. Section 02221 - DEMOLITION
3. Section 02240 - DEWATERING
4. Section 02260 - EXCAVATION SUPPORT AND PROTECTION
5. Section 02282 - HANDLING, TRANSPORTATION AND DISPOSAL OF EXCAVATED MATERIALS
6. Section 02357 – CAST IN PLACE CONCRETE RETAINING WALLS
7. Section 02358 – SOIL NAIL RETAINING WALLS
8. Section 02359 – MODULAR PRECAST BLOCK RETAINING WALLS
9. Section 02370 – DRILLED SHAFTS
10. Section 02400 – DRAINAGE AND SEWER SYSTEMS
11. Section 02402 – STORMWATER TREATMENT AND DISPOSAL SYSTEMS
12. Section 02450 – SECONDARY CONTAINMENT SYSTEM WITH GEOSYNTHETIC BARRIERS
13. Section 02470 – SITE IMPROVEMENTS
14. Section 02509 – PAVEMENT BASE COURSES
15. Section 02513 – BITUMINOUS CONCRETE PAVEMENT
16. Section 02524 – CURBS, GUTTERS, AND WALKS
17. Section 02650 – EXISTING SITE UTILITIES
18. Section 02713 – EXTERIOR WATER DISTRIBUTION SYSTEMS
19. Section 02800 – EXTERIOR CONDUIT SYSTEMS
20. Section 02920 – SEEDED LAWNS
21. Section 03300 - CAST-IN-PLACE CONCRETE
22. Division 2 Sections for installing underground mechanical and electrical utilities and buried mechanical and electrical structures.

- C Geotechnical reports have been prepared for the retaining walls and bridges associated with this project and are provided for information only. The opinions expressed in these reports are those of the geotechnical engineers and represent interpretations of subsoil conditions, tests, and results of analyses conducted by geotechnical engineers. Authority will not be responsible for interpretations or conclusions drawn from this data.
- D Design-Builder shall perform a minimum of 8 additional test borings and conduct other exploratory operations as deemed necessary to verify subsurface conditions for earthwork and for design of support of excavation and dewatering systems. The location and depth of explorations shall be determined by the Design-Builder.

1.2 DEFINITIONS

- A Backfill: Soil and/or fill material and/or controlled low-strength material used to fill an excavation.
 - 1. Initial Backfill: Backfill placed beside the pipe from the springline to the crown of the pipe or utility and 12-in over pipe or utility in a trench unless otherwise noted, including haunches to support sides of pipe.
 - 2. Final Backfill: Backfill placed over initial backfill to the gravel sub-base layer to fill a trench.
- B Bedding Course: Granular material placed under structures or utilities to a depth of 12-in unless otherwise noted and to the springline of the pipe or utility or to the base of the structure.
- C Borrow: Geotechnically and analytically satisfactory soil imported from off-site for use as fill or backfill.
- D Drainage Course: Course supporting the slab-on-grade that also minimizes upward capillary flow of pore water.
- E Excavation: Removal of material encountered above subgrade elevations and to lines and dimensions indicated.
 - 1. Authorized Additional Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions as directed by the Owner for the removal of unsuitable material or for other reasons.
 - 2. Bulk Excavation: Excavation more than 10 feet in width and more than 30 feet in length.
 - 3. Unauthorized Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions without direction by Owner. Unauthorized excavation, as well as remedial work directed by Owner, shall be without additional compensation.
- F Fill: Soil materials used to raise existing grades.
- G Fill (Urban Fill): In-situ material known as Fill, also known as urban fill or miscellaneous fill, is defined as a mixture of soil and other materials which have been located in the area through man-made processes primarily for the purpose of grading, backfilling or filling in low areas. Material commonly associated with urban fill includes, but are not limited to; glass, brick, ash, wood fragments and other similar granular materials. Urban fill as defined herein shall not include boulders, ledge, consolidated rock, asphalt, concrete, railroad timbers, rail, cobblestones or any other abandoned building materials which would preclude the disposal of the urban fill as daily cover at a landfill. Material containing less than 10%, by volume, solid waste/debris, as determined by the Owner, shall be classified as urban fill. Material that contains 10% or more solid waste/debris by volume, as determined by the Owner, shall be classified as solid waste.

- H Soil (Natural Soils): Soil, otherwise known as natural soil, is defined for the purposes of the Contract as unconsolidated sand, gravel, silt and clay, and the organic material which has become part of the unconsolidated soil matrix.
- I Rock: Rock material in beds, ledges, unstratified masses, conglomerate deposits, and boulders of rock material that exceed 1 cu. yd. for bulk excavation or 3/4 cu. yd. for trench, and pit excavation that cannot be removed by rock excavating equipment equivalent to the following: (Bulk Excavation - Rock material that cannot be excavated with a heavy duty track-type tractor, rated at not less than 300 hp flywheel power and equipped with a single shank hydraulic ripper, capable of exerting not less than 50,000 lbs breakout force (Caterpillar D8R or equivalent); Trench Excavation – Rock material that cannot be excavated with a track-type hydraulic excavator, equipped with a 36-inch wide short-tip radius rock bucket, rated at not less than 138 hp flywheel power with bucket-curling force of not less than 29,000 lbs and stick-crowd force of not less than 26,000 lbs (Caterpillar 320DL or equivalent)).
- J Structures: Buildings, footings, foundations, retaining walls, slabs, rail tracks, tanks, curbs, mechanical and electrical appurtenances, manholes, catch basins or other man-made stationary features constructed above or below the ground surface.
- K Subbase Course: Course placed between the final backfill and the bituminous or cement concrete pavement.
- L Subgrade: Surface or elevation remaining after completing excavation, or top surface of a fill or backfill immediately below subbase, drainage fill, or topsoil materials.
- M Utilities: On-site underground pipes, conduits, ducts, and cables, as well as underground services within buildings.
- N Fine Grading and Compaction: Grading, shaping, and compacting those portions of excavations, backfills, embankments, and original ground, upon which pavement, structures, surfacing, ballast, subballast, base, or subbases are to be placed.
- O Unsuitable Material: Unsuitable material shall be material determined by the Owner to be unsuitable in its natural location and condition as a foundation material, as a sub-base, or as a part of the finished site work. Unsuitable material may include, but is not limited to, clays, silts, very wet material, very plastic material, peat, muck, logs, stumps, roots, grass, sod, highly organic material, refuse, ashes, and other types of unsuitable material.

1.3 QUALITY ASSURANCE

- A The Authority reserves the right to perform inspections and testing at any time during the execution of work.
- B When rework or replacement of soils are required to achieve compaction, the Authority may conduct confirmatory testing.
- C The Owner may require Design-Builder to perform additional tests to determine compliance with these specifications.

1.4 QUALITY CONTROL

- A The Design-Builder shall assume full responsibility for quality control inspection and testing and give sufficient notice to the Owner to permit the witnessing of the inspections or tests.
- B The Design-Builder shall engage a qualified, independent testing agency to perform quality control testing and inspections.
- C Source of supply. No earthwork materials will be accepted on the jobsite without written approval from the Owner. The Design-Builder shall perform sufficient tests and inspections necessary to determine the acceptability of the source of supply. A Certified Testing and Inspection Agency may be used to perform such test and inspections. The qualifications of the person or agency performing these tests and inspections shall be forwarded to the Owner for approval. Subsequent to this approval, test results showing the acceptability of the source of supply, shall be forwarded to the Owner for approval.
- D The Owner reserves the right to perform inspections and tests at any time during the execution of the work.
- E Notification Point: The Design-Builder shall give the Owner 2 days notice in advance of quality control tests and inspections.

1.5 SUBMITTALS

- A Product Data: For the following:
 - 1. Geotextile
 - 2. Controlled low-strength material, including design mixture.
- B Material Test Reports: From a qualified testing agency indicating and interpreting test results for compliance of the following with requirements indicated:
 - 1. Classification according to ASTM D 2487 and moisture content according to ASTM D 2216 of each on-site and borrow soil and/or fill material proposed for fill and backfill.
 - 2. Laboratory compaction curve according to ASTM D 1557 for each onsite and borrow soil and/or fill material proposed for fill and backfill.
 - 3. During Construction, submit written confirmation of fill lift thickness, in-place soil moisture content, and percentage of compaction to the Owner before placing the next lift or constructing foundations or structures.
- C Qualifications for Approving Source: Prior to earthwork operations, submit the qualifications of the persons or Agency approving the source of supply of materials and quality control testing and inspection.
- D Hold Point-Earthwork Operations: Submit, prior to commencing earthwork activities, a plan describing the earthwork operations including the frequency and locations of tests and inspections. No work shall be performed until this plan has been approved by the Owner.
- E Hold Point-Supply and Quality Control Inspection Results: Submit the results of all sources of supply and quality control inspections and tests. Submittals reviewed beyond the second rejection (or required submittal) shall be provided at no cost to the Authority and shall be reviewed by the Owner

at the Design-Builder's expense. No work shall be performed until the Owner has approved the source of supply.

- F Hold Point-Material Handling: At least two weeks prior to the start of any excavation activity submit, in writing, the following for review and Design-Builder shall not start excavation activity until the entire submittal is acceptable to the Owner.
1. Description of the method of dewatering excavated material and control of effluent water quality.
 2. Identification of a licensed hauler and disposal facility for possible vacuum collection, trucking and disposal of contaminated aqueous liquids.
 3. Locations and methods of excavating, handling, and stockpiling (if applicable) excavated material, including drainage, as specified in this Section. Describe methods to keep materials from various sources separated during stockpiling operations (if applicable).
- G Pre-excavation Photographs and Videotape: Refer to Section 01545.
- H Backfill Materials: Submit a 20 lb. sample, grain size analysis, moisture content determination, and moisture density curve performed in accordance with ASTM D422, ASTM D2216 and compaction test results (ASTM D1557 Procedure C) for each proposed source of backfill, imported material and on-site material to be reused, for review by the Owner at least, one (1) week prior to use of the material. The grain size analysis shall indicate that the backfill material conforms to the gradation requirements specified. Provide Atterberg Limits test results in accordance with ASTM D4318 for samples with greater than 5 percent fines.
- I In addition, a certification statement and analytical results shall accompany each physical sample of earth materials to be imported onto the site, including but not limited to crushed stone, loam, bedding sand, gravel sub-base, common fill and structural backfill. At a minimum the certification shall state the point of origin and that the material is free of contaminants. The certification shall include representative sample analysis from each point of origin of backfill to be used on the site. The sample(s) shall be analyzed by a certified laboratory for total metals (MCP 14 metals), volatile organic compounds (EPA Method 8260), semi-volatile organic compounds (EPA Method 8270), petroleum hydrocarbons (EPA Method 8100), and Total PCBs and pesticides (EPA Method 8081 and 8082). On-site soils defined as suitable for reuse in this Section and in Section 02282 – HANDLING, TRANSPORTATION AND DISPOSAL OF EXCAVATED MATERIAL can be used as backfill without providing the certification required above.
- J All sampling of soils for chemical testing shall be performed by a person experienced in sample collection and shall be either: 1) a Licensed Site Professional registered in the Commonwealth of Massachusetts or 2) an authorized representative of the Licensed Site Professional. Samples of each material shall be submitted to a chemical analytical laboratory, certified by the Massachusetts Department of Environmental Protection.
- K Submit additional samples and geotechnical and analytical test data and certifications for every 1000 cubic yards (every 200 cubic yards for moisture density curves) of material imported or anytime consistency of material changes in the opinion of the Owner. Submit associated chemical laboratory data on the imported materials throughout the course of the Work, if requested by the Owner, to evaluate the consistency of the source or process, at no additional cost to the Owner.

1.6 PROJECT CONDITIONS

- A Existing Utilities: Do not interrupt utilities serving facilities occupied by the Authority or others unless permitted in writing by Owner and then only after arranging to provide temporary utility services according to requirements indicated.
 - 1. Notify the Owner not less than two days in advance of proposed utility interruptions.
 - 2. Do not proceed with utility interruptions without the Owner's written permission.
 - 3. Contact utility-locator service for area where Project is located before excavating.
- B Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies to shut off services if lines are active.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS

- A Soil, Fill and Borrow Materials:
 - 1. Ordinary Borrow: Shall be in accordance with the Massachusetts Department of Transportation (MassDOT) Standard Specifications section M1.01.0 which uses soil groups A-1, A-2-4, and A-3 gradation limits under AASHTO M145 to define Ordinary Borrow.
 - 2. Gravel Borrow: Shall be used below retaining wall foundations and as backfill behind retaining walls and shall consist of inert material that is hard, durable stone and coarse sand, free from loam and clay, surface coatings, and deleterious material with the following gradation requirement.

<u>Sieve Size</u>	<u>Percent Passing by Weight</u>
3-inch (76.2 mm)	100
1/2 inch (12.5 mm)	50-85
No. 4	40-75
No. 50	8-28
No. 200	0-5

- 3. Processed Gravel for Subbase: Shall be in accordance with MassDOT Standard Specifications section M1.03.1.
- 4. Sand Borrow: Sand borrow shall be used as pipe bedding for all pipe, unless shown or directed otherwise, with the exception of Reinforced Concrete Pipe and Ductile Iron Pipe, placed between 6 inches below pipe invert to 6 inches above pipe crown and shall be in accordance with MassDOT Standard Specifications section M1.04.0.
- 5. Sand Borrow for Subdrains: Shall be in accordance with MassDOT Standard Specifications section M1.04.1.
- 6. Controlled Density Fill (CDF) Type 2E: CDF Type 2E shall consist of a cementitious hard excavatable mixture of aggregate, Portland Cement, air entraining admixtures and water. The material shall be of the type specified in MassDOT 1995 Standard Specifications for Highway and Bridges and 2012 Supplemental Specifications, Type 2E. Controlled density fill shall be used as trench backfill material around structures (not including manholes and catch basins) as

directed by the Owner. Controlled density fill shall also be used around the excavation support systems as directed by the Owner.

7. Controlled Density Fill (CDF) Type 1: CDF Type 1 shall be used to fill abandoned utilities, as specified in Section 02221 – DEMOLITION.
8. Controlled Density Fill Type 2: CDF Type 2 shall consist of a cementitious hard non-excavatable mixture of aggregate, Portland Cement, air entraining admixtures and water. The material shall be of the type specified as Type 2 in MassDOT 1995 Standard Specifications for Highway and Bridges and 2012 Supplemental Specifications. CDF Type 2 shall be used in areas where size and distance do not require the very flowable characteristic and is intended for permanent installations.

B Aggregates and Related Materials:

1. Crushed Stone: Shall be in accordance with MassDOT Standard Specifications section M2.01.4 for ¾-inch crushed stone. Crushed stone shall be used as Ductile Iron Pipe and Reinforced Concrete Pipe bedding between 12 inches below pipe invert to 6 inches above pipe crown and as a working mat or as a filter around perforated drain pipe. Crushed stone shall be wrapped in filter fabric, placed in maximum 6-inch thick layers, loose measure, and compacted with a minimum of four passes of a vibratory plate or roller compactor. The crushed stone shall be uniformly blended.
2. Dense-Graded Crushed Stone: Aggregate base course for concrete pavement over structural slabs shall conform to the requirements of MassDOT, Highway Division, M2.07.1, except that the maximum particle size shall be ¾”.

C Satisfactory Soils: ASTM D 2487 Soil Classification Groups GW, GP, GM, SW, SP, and SM or a combination of these groups; free of rock or gravel larger than 4 inches in any dimension, debris, waste, frozen materials, vegetation, and other deleterious matter.

D Unsatisfactory Soils: Soil Classification Groups GC, SC, CL, ML, OL, CH, MH, OH, and PT according to ASTM D 2487, or a combination of these groups.

1. Unsatisfactory soils also include satisfactory soils not maintained within 2 percent of optimum moisture content at time of compaction.

E Subbase Material: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; with at least 90 percent passing a 1-1/2-inch sieve and not more than 12 percent passing a No. 200 sieve.

F Engineered Fill: Naturally or artificially well graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; with at least 90 percent passing a 1-1/2-inch sieve and not more than 12 percent passing a No. 200 sieve.

G Drainage Course: Narrowly graded mixture of washed crushed stone, or crushed or uncrushed gravel; ASTM D 448; coarse-aggregate grading Size 57; with 100 percent passing a 1-1/2-inch sieve and 0 to 5 percent passing a No. 8 sieve.

H Filter Material: Narrowly graded mixture of natural or crushed gravel, or crushed stone and natural sand; ASTM D 448; coarse-aggregate grading Size 67; with 100 percent passing a 1-inch sieve and 0 to 5 percent passing a No. 8 sieve.

I Sand: ASTM C 33; fine aggregate, natural, or manufactured sand.

- J Impervious Fill: Clayey gravel and sand mixture capable of compacting to a dense state.
- K Ballast Berm: The inner core material shall be a low permeability soil meeting the requirements of item M1.08.1, Impervious Soil Borrow, containing no peats and other organic soils, as per MassDOT Highway Division Standard Specifications for Highways and Bridges.

2.2 GEOTEXTILES

- A Geotextiles shall be of type and properties required for specific application as determined by the Owner.
 - 1. Geotextiles for erosion and sedimentation control are specified in Section 02060 – EROSION AND SEDIMENTATION CONTROL.
 - 2. Geotextile used for marker barrier to separate the clean fill and contaminated soil (site urban fill) shall be constructed of a non-woven high visibility geotextile, TenCate Mirafi Orange Delineation or approved equal. The materials chosen must be of a professional grade, but “landfill quality” products are not needed.

2.3 ACCEPTANCE SAMPLING AND DOCUMENTATION REQUIREMENTS FOR MASSDOT ROADWAY BRIDGES

- A The following samples and documents must be submitted to the Program Manager per MassDOT Research and Materials assurance requirements:
 - 1. For Gravel Borrow: Sampling frequency shall be a minimum of one per 5000 CY or fraction thereof from each source.
 - 2. For Crushed Stone: Sampling frequency shall be a minimum of one test per lot per each source.

PART 3 - EXECUTION

3.1 PREPARATION

- A Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.
- B Preparation of subgrade for earthwork operations including removal of vegetation, topsoil, debris, obstructions, and deleterious materials from ground surface is specified in Section 02100 - SITE PREPARATION.
- C Protect and maintain erosion and sedimentation controls, which are specified in Section 02100 - SITE PREPARATION, during earthwork operations.
- D Provide protective insulating materials to protect subgrades and foundation soils against freezing temperatures or frost.

3.2 DEWATERING

- A Comply with requirements of Section 02240 - DEWATERING.

3.3 EXPLOSIVES

- A Explosives: Do not use explosives. Use of explosives is subject to consideration by the Authority only on a case-by-case basis.

3.4 EXCAVATION, GENERAL

- A Unclassified Excavation: Excavate to subgrade elevations regardless of the character of surface and subsurface conditions encountered. Unclassified excavated materials may include bituminous and cement concrete sidewalks and roadways, bricks and cobbles, soil materials, and obstructions. No changes in the Contract Sum or the Contract Time will be authorized for removal of obstructions.

All excavations required by the Contract Documents, except Contaminated Soils, over-excavation of unsuitable materials, and Rock Excavation will be considered to be "Unclassified Excavation." This item does not include excavation for the convenience of the Design-Builder and does not include excavation identified as incidental to the work of other Sections. Excavation for the convenience of the Design-Builder shall conform to the limits acceptable to the Owner and shall be at no additional expense to the Authority.

1. If excavated materials intended for fill and backfill include unsatisfactory soil materials and rock, replace with satisfactory soil materials.
2. Remove rock to lines and grades indicated to permit installation of permanent construction without exceeding the following dimensions:
 - a. 24 inches outside of concrete forms other than at footings.
 - b. 12 inches outside of concrete forms at footings.
 - c. 6 inches outside of minimum required dimensions of concrete cast against grade.
 - d. Outside dimensions of concrete walls indicated to be cast against rock without forms or exterior waterproofing treatments.
 - e. 12 inches beneath bottom of concrete slabs on grade.
 - f. 18 inches beneath pipe in trenches, and the greater of 24 inches wider than pipe or 42 inches wide.
3. Follow a construction procedure that permits visual identification of firm stable ground. In the event that groundwater is encountered, the Owner may require that the size of the open excavation be limited to that which can be handled by the Design-Builder's chosen method of dewatering and allow visual observation of the bottom and backfill in the dry.
4. Exercise extreme caution while excavating so as not to damage existing signal cable and duct lines or disturb other appurtenances and structures and buildings not designated for removal. To avoid adverse impacts on existing buildings on footings, excavation should not intrude the "zone of influence" beneath existing building footings. The Zone of Influence is defined as the section below the footing extending outward and downward at a slope of 1H:1V from 1 foot beyond the outside edges of the existing footings. Any damage caused by the Design-Builder's

operations shall be immediately repaired with materials and methods approved by the Owner at no cost to the Authority.

5. If unsuitable bearing materials are encountered at required subgrade elevations consult Owner for direction. The extent of over-excavation of unsuitable bearing materials and the type of material used to backfill over-excavations will be determined by the Owner.
6. Protect track ballast from fouling by excavated material, transport of backfill, dust, concrete operations, and other construction work.

3.5 EXCAVATION OF GRANITE BLOCK ABUTMENTS AND WINGWALLS

- A. Granite blocks demolished as part of the work shall be removed from the MBTA property and become the property of the Design Builder.

3.6 CONCRETE EXCAVATION

- A. Removal of existing concrete retaining walls and foundations and removal of portions of existing concrete abutments and wingwalls as indicated on the plans. The work to be done under this item shall consist of the removal and disposal of all reinforced and unreinforced concrete portions of the retaining walls, the abutments, wingwalls and foundations as specified on the plans.
 1. The Design-Builder shall not allow debris, tools or incidental equipment of any kind to swing over areas where vehicular or pedestrian traffic exists. Any material that accidentally falls into such areas shall be removed immediately at the Design-Builder's expense.

3.7 EXCAVATION FOR STRUCTURES

- A. Excavate to indicated elevations (i.e. the bottom elevation of proposed footing if no gravel borrow is required under the footing or 2 feet below the bottom elevation of proposed footing if 2 feet minimum gravel borrow is required under the footing) and dimensions within a tolerance of plus or minus 1 inch. Extend excavations a sufficient distance from structures for placing and removing concrete formwork, for installing services and other construction, and for inspections. Notify the Owner when excavations have reached subgrade to perform subgrade inspection per Section 3.9.
 1. Excavations for Footings and Foundations: Do not disturb bottom of excavation. Excavate by hand to final grade just before placing concrete reinforcement. Trim bottoms to required lines and grades to leave solid base to receive other work. If material remaining at bottom of trench is disturbed, recompaction shall be required.
 2. Excavation for Underground Tanks, Basins, and Mechanical or Electrical Utility Structures: Excavate to elevations and dimensions indicated within a tolerance of plus or minus 1 inch. Do not disturb bottom of excavations intended as bearing surfaces. If material remaining at bottom of trench is disturbed, recompaction shall be required.

3.8 EXCAVATION FOR WALKS AND PAVEMENTS

- A. Excavate surfaces under walks and pavements to indicated lines, cross sections, elevations, and subgrades.

B Bituminous Concrete Excavation by Cold Plane

1. This work shall consist of removing bituminous concrete by Cold Planer in designated areas. The Cold Planer must be equipped with an elevating device capable of loading planed material directly into dump trucks while operative. It shall have all necessary safety devices such as reflectors, headlights, taillights, flashing lights, and back up signals so as to operate safely in traffic both day and/or night.
2. The Cold Planer shall be designed and built for planing flexible pavements and possess the ability to plate cement concrete patches when encountered in bituminous pavement. It shall be self-propelled and have the means for planing without tearing or gouging the underlying surface. Variable lacing patterns shall be provided to permit a rough grooved or smooth surface as directed.
3. A three inch cut to predetermine grade or any specified lesser depth may be required in one pass. The minimum width of pavement planed in each pass shall be six feet, except in areas to be trimmed and edged. The machine shall be adjustable as to crown and depth and meet the standards set by the Air Quality Act of noise and air pollution. The milled or planed surface shall conform generally to the grade and cross slope required. The surface shall not be torn, gouged, shoved, broken or excessively grooved. It shall be free of imperfections in workmanship that prevent resurfacing after this operation. Surface texture shall be as specified by the Owner and excess material shall be removed so that the surface is acceptable to traffic if required.

3.9 EXCAVATION FOR UTILITY TRENCHES

A Excavate trenches to indicated gradients, lines, depths, and elevations.

1. Excavate trenches to allow installation of top of pipe below frost line unless otherwise noted. Frost line is defined as 4 feet below the lowest adjacent grade.

B Excavate trenches to uniform widths to provide the following clearance on each side of pipe or conduit. Excavate trench walls vertically from trench bottom to 12 inches higher than top of pipe or conduit, unless otherwise indicated.

1. Clearance: 12 inches each side of pipe or conduit.

C Trench Bottoms: Excavate and shape trench bottoms to provide uniform bearing and support of pipes and conduit. Shape subgrade to provide continuous support for bells, joints, and barrels of pipes and for joints, fittings, and bodies of conduits. Remove projecting stones and sharp objects along trench subgrade.

1. For pipes and conduit less than 6 inches in nominal diameter and flat-bottomed, multiple-duct conduit units, hand-excavate trench bottoms and support pipe and conduit on an undisturbed subgrade. If material remaining at bottom of trench is disturbed, recompaction shall be required.
2. For pipes and conduit 6 inches or larger in nominal diameter, shape bottom of trench to support bottom 90 degrees of pipe circumference. Fill depressions with tamped sand backfill.
3. Excavate trenches 6 inches deeper than elevation required in rock or other unyielding bearing material to allow for bedding course.

4. Soft unsuitable material existing below the required subgrade shall be removed and replaced with thoroughly compacted gravel, or crushed stone.
5. If cross pipes, drains, or other unforeseen obstacles are encountered during the excavation, the proposed line and grade of the conduit trench or foundation may be altered only with prior approval of the Owner.
6. Temporary Sheet piling and Shoring of Trenches:
 - a. When conduit and foundations are being installed in a trench or hole, the Design-Builder shall furnish, place, and maintain such sheet piling and shoring as may be required to support the sides of such excavations and adjacent structures.
 - b. Should the Design-Builder be permitted to slope the sides of such excavations so that sheet piling, shoring, or bracing is not necessary to prevent cave-ins or slides along the excavation, such additional excavation and backfill required because of flattening of slopes shall be done at no additional cost to the Authority.
7. Marker barrier shall be placed on sides and bottom of all utility trenches within the NorthPoint Development before bedded and backfilled.

3.10 SUBGRADE INSPECTION

- A Notification Point - Notify Owner when excavations have reached required subgrade.
- B If Owner determines that unsatisfactory soil is present, continue excavation and replace with backfill of type approved by the Owner.
- C Proof-roll subgrade below wall foundations, slabs, and pavements with heavy pneumatic-tired equipment to identify soft pockets and areas of excess yielding. Do not proof-roll wet or saturated subgrades.
 1. Completely proof-roll subgrade in one direction, repeating proof-rolling in direction perpendicular to first direction. Limit vehicle speed to 3 mph.
 2. Proof-roll with a loaded 10-wheel, tandem-axle dump truck weighing not less than 15 tons.
 3. Excavate soft spots, unsatisfactory soils, and areas of excessive pumping or rutting, as determined by Owner, and replace with backfill of type approved by the Owner.
- D Reconstruct subgrades damaged by freezing temperatures, frost, rain, accumulated water, or construction activities, as directed by Owner, without additional compensation.

3.11 REPLACEMENT OF ADDITIONAL AUTHORIZED EXCAVATION OR UNAUTHORIZED EXCAVATION

- A Fill over-excavation that the Owner authorized and any over-excavation that takes place by accident under foundations or wall footings. Lean concrete fill, with 28-day compressive strength of 2500 psi may be used when approved by Owner.
 1. Fill over-excavation that the Owner authorized and any over-excavation that take place by accident under other construction or utility pipe with backfill of type directed by Owner.

3.12 STORAGE OF SOIL MATERIALS

- A Stockpile borrow soil materials and excavated satisfactory soil materials without intermixing unless as directed by the Owner. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.
 - 1. Stockpile soil materials away from edge of excavations. Do not store within drip line of remaining trees.

3.13 BACKFILL

- A Place and compact backfill in excavations promptly, but not before completing the following:
 - 1. Construction below finish grade including, where applicable, subdrainage, dampproofing, waterproofing, and perimeter insulation.
 - 2. Surveying locations of underground utilities for Record Documents.
 - 3. Testing and inspecting underground utilities.
 - 4. Removing concrete formwork.
 - 5. Removing trash and debris.
 - 6. Removing temporary shoring and bracing, and sheeting.
 - 7. Installing permanent or temporary horizontal bracing on horizontally supported walls.
- B Place backfill on subgrades free of mud, frost, snow, or ice.

3.14 UTILITY TRENCH BACKFILL

- A Place backfill on subgrades free of water, mud, frost, snow, or ice.
- B Place and compact bedding course on trench bottoms and where indicated. Shape bedding course to provide continuous support for bells, joints, and barrels of pipes and for joints, fittings, and bodies of conduits. Sand borrow bedding shall be placed by hand shovels, in layers not more than 4-inches thick in loose depth, and each layer shall be thoroughly and evenly compacted by tamping on each side of the pipe to provide uniform support around the pipe, free from voids. Crushed stone bedding material shall be placed in layers not more than 6-inches thick in loose measure, and compacted with at least 4 passes using a vibratory plate or roller compactor.
- C Backfill trenches excavated under footings and within 18 inches of bottom of footings with gravel borrow; backfill remaining depth with concrete to elevation of bottom of footings. Concrete is specified in Section 03300 - CAST-IN-PLACE CONCRETE.
- D Provide 4-inch thick, concrete-base slab support for piping or conduit less than 30 inches below surface of roadways. After installing and testing, completely encase piping or conduit in a minimum of 4 inches of concrete before backfilling or placing roadway subbase. If required by utility owners when their minimum cover requirements cannot be met, install steel plates over ductbanks per their standard procedures.
- E Place and compact initial backfill of material free of particles larger than 1 inch in any dimension, to a height of 12 inches over the utility pipe or conduit.

1. Carefully compact initial backfill under pipe haunches and compact evenly up on both sides and along the full length of utility piping or conduit to avoid damage or displacement of piping or conduit. Coordinate backfilling with utilities testing.
- F Backfill voids with satisfactory soil while installing and removing shoring and bracing.
- G Place and compact final backfill of satisfactory soil to final subgrade elevation in uncompacted layers not to exceed 9 inches.
- H The Design-Builder shall not place backfill against or on structures until they have attained sufficient strength to support the loads (including construction loads) to which they will be subjected, without distortion, cracking or other damage. As soon as practicable after the structures are structurally adequate and other necessary work has been satisfactorily completed, the Design-Builder, as required by the Owner, shall make special leakage tests of the structures. After the satisfactory completion of leakage tests and the satisfactory completion of any other required work in connection with the structures, the backfilling around the structures shall proceed using Controlled Density Fill (CDF) material. Symmetrical backfill loading shall be maintained. Special care shall be taken to prevent any wedging action or eccentric loading upon or against the structures.
- I Install warning tape directly above utilities, no less than 12 inches above the crown of the pipe or utility and no more than 16 inches above the crown of the pipe or utility.

3.15 EMBANKMENT FILL

- A Bench sloped surfaces steeper than 1 vertical to 4 horizontal so fill material will bond with existing material.
- B Place and compact fill material in layers to required elevations as follows:
1. Under grass and planted areas, use satisfactory soil material.
 2. Under walks and pavements, use engineered fill.
 3. Under steps and ramps, use engineered fill.
 4. Under slabs, use engineered fill.
 5. Under footings and foundations, use Gravel Borrow.
 6. Behind retaining walls, use Gravel Borrow.
- C Place fill on subgrades free of mud, frost, snow, or ice.

3.16 SOIL MOISTURE CONTROL

- A Uniformly moisten or aerate subgrade and each subsequent fill or backfill soil layer before compaction to within 2 percent of optimum moisture content.
1. Do not place backfill or fill soil material on surfaces that are muddy, frozen, or contain frost or ice.
 2. Remove and replace, or scarify and air dry otherwise satisfactory soil material that exceeds optimum moisture content by 2 percent and is too wet to compact to specified dry unit weight.

3.17 COMPACTION OF SOIL BACKFILLS AND FILLS

- A Place backfill and fill soil materials in layers not more than 12 inches in loose depth for material compacted by heavy compaction equipment, and not more than 6 inches in loose depth for material compacted by hand-operated tampers.
- B Place backfill and fill soil materials evenly on all sides of structures to required elevations, and uniformly along the full length of each structure.
- C Compact soil materials to not less than the following percentages of maximum dry unit weight according to ASTM D 1557:
 - 1. Under structures, rail ways, slabs, steps, and pavements, compact each layer of backfill or fill soil material at 95 percent minimum at a moisture content within 2% of optimum; and areas behind retaining walls and within 10 feet of structures, building slabs, steps, and pavements at 95 percent minimum.
 - 2. Care should be given to compaction effort used near building walls to not exceed the pressures the wall is designed to resist.
 - 3. Under walkways, compact each layer of backfill or fill soil material at 95 percent minimum.
 - 4. Under lawns, compact each layer of backfill or fill soil material at 90 percent minimum.
 - 5. Under unpaved areas, compact each layer of backfill or fill soil material at 92 percent minimum.
 - 6. For utility trenches, compact each layer of initial and final backfill soil material at 95 percent minimum.
 - 7. For embankments, compact each layer at minimum 92 percent minimum.

3.18 GRADING

- A General: Uniformly grade areas to a smooth surface, free of irregular surface changes. Comply with compaction requirements and grade to cross sections, lines, and elevations indicated.
 - 1. Provide a smooth transition between adjacent existing grades and new grades.
 - 2. Cut out soft spots, fill low spots, and trim high spots to comply with required surface tolerances.
- B Site Grading: Slope grades to direct water away from buildings and to prevent ponding. Finish subgrades to required elevations within the following tolerances:
 - 1. Lawn or Unpaved Areas: Plus or minus 1 inch.
 - 2. Walks: Plus or minus 1 inch.
 - 3. Pavements: Plus or minus 1/2 inch.

3.19 SUBSURFACE DRAINAGE

- A Subdrainage Pipe: Specified in Section 02400 - DRAINAGE AND SEWER SYSTEMS.
- B Subsurface Drain: Place subsurface drainage geotextile around perimeter of subdrainage trench. Place a 6-inch course of filter material on subsurface drainage geotextile to support subdrainage pipe.

Encase subdrainage pipe in a minimum of 12 inches of filter material, placed in compacted layers 6 inches thick, and wrap in subsurface drainage geotextile, overlapping sides and ends at least 6 inches.

1. Compact each filter material layer to 90 percent of maximum dry unit weight according to ASTM D 1557.

C Drainage Backfill: Place and compact filter material over subsurface drain, in width indicated, to within 12 inches of final subgrade, in compacted layers 6 inches thick. Overlay drainage backfill with 1 layer of subsurface drainage geotextile, overlapping sides and ends at least 6 inches.

1. Compact each filter material layer to 90 percent of maximum dry unit weight according to ASTM D 1557.
2. Place and compact impervious fill over drainage backfill in 6-inch-thick compacted layers to final subgrade.

3.20 SUBBASE COURSE

A Place subbase course on subgrades free of water, mud, frost, snow, or ice.

B On prepared subgrade, place subbase course under pavements and walks as follows:

1. Shape subbase course to required crown elevations and cross-slope grades.
2. Place subbase 6 inches or less in compacted thickness in a single layer.
3. Place subbase that exceeds 6 inches in compacted thickness in layers of equal thickness, with no compacted layer more than 6 inches thick or less than 3 inches thick.
4. Compact subbase course at optimum moisture content to required grades, lines, cross sections, and thickness to not less than 95 percent of maximum dry unit weight according to ASTM D 1557.

C Pavement Shoulders: Place shoulders along edges of subbase and base course to prevent lateral movement. Construct shoulders, at least 12 inches wide, of satisfactory soil materials and compact simultaneously with each subbase and base layer to not less than 95 percent of maximum dry unit weight according to ASTM D 1557.

3.21 DRAINAGE COURSE

A Place drainage course on subgrades free of water, mud, frost, snow or ice.

B On prepared subgrade, place and compact drainage course under cast-in-place concrete slabs-on-grade as follows:

1. Install subdrainage geotextile on prepared subgrade according to manufacturer's written instructions, overlapping sides and ends.
2. Compact each layer of drainage course to required cross sections and thicknesses to not less than 90 percent of maximum dry unit weight according to ASTM D 1557.

3.22 FIELD QUALITY CONTROL

- A Testing Agency: The Design-Builder shall engage a qualified independent testing agency to perform field quality-control testing.
- B Allow testing agency to inspect and test subgrades and each fill or backfill layer. Proceed with subsequent earthwork only after test results for previously completed work comply with requirements.
- C Footing Subgrade: If in the opinion of the Design-Builder's independent testing agency unsuitable bearing materials are encountered at required subgrade elevations consult Owner for direction. The extent of over-excavation of unsuitable bearing materials and the type of material used to backfill over-excavations will be determined by the Owner.
- D The Design-Builder's qualified independent testing agency will test compaction of soils in place according to ASTM D 1556, ASTM D 2167, ASTM D 2922, and ASTM D 2937, as applicable. Tests will be performed at the following locations and frequencies:
 - 1. Paved and Slab Areas: At each compacted fill and backfill layer, at least 1 test for every 2000 sq. feet or less of paved area or slab, but in no case fewer than 3 tests.
 - 2. Foundation and Wall Backfill: At each compacted backfill layer, at least 1 test for each 30 feet or less of wall length, but no fewer than 2 tests.
 - 3. Trench Backfill: At each compacted initial and final backfill layer, at least 1 test for each 100 feet or less of trench length per lift, but no fewer than 2 tests.
- E When testing agency reports that subgrades, fills, or backfills have not achieved degree of compaction specified, scarify and moisten or aerate, or remove and replace soil to depth required; recompact and retest until specified compaction is obtained. Authority may conduct confirmatory testing.

3.23 PROTECTION

- A Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.
- B Repair and reestablish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions.
 - 1. Scarify or remove and replace soil material to depth as directed by Owner; reshape and recompact.
- C Where settling occurs before Project correction period elapses, remove finished surfacing, backfill with additional soil material, compact, and reconstruct surfacing.
 - 1. Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.24 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A Disposal as specified in Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS.

3.25 MONITORING OF EXCAVATION

- A If in the opinion of the Owner the integrity of the adjacent railroad tracks, buildings, structures, or paved areas are jeopardized due to movement, the Design-Builder shall immediately discontinue further excavation in the affected area and implement a Plan of Action to mitigate further movement. Mitigating measures shall remain in effect until such time that the Owner evaluates the impact on the structure and may direct the Design-Builder to perform any remedial work. The Design-Builder shall submit proposed remedial measures to the Geotechnical Engineer for review and approval. Submittals shall include methods and names of subDesign-Builders. The Design-Builder shall proceed with remedial work upon acceptance by the Owner. Mitigating measures shall be at no additional cost to the MBTA.
- B Possible effects of the excavation on the lateral support system:
1. Deflection of the wall into the excavation due to soil, groundwater, and surcharge loads.
 2. Settlement adjacent to the lateral support wall due to inward deflection of the wall.
 3. Settlement adjacent to the lateral support wall due to ground loss into the excavation through gaps and voids in the wall.
- C Monitoring Deflection of Wall
1. Once the wall is installed to final elevation but before excavation begins, establish deformation-monitoring points on the top of the wall, spaced approximately every 20 feet along the wall (every other soldier pile). The monitoring points shall consist of painted marks on the steel member.
 2. Perform a baseline survey of each deformation monitoring point before excavation begins. Survey both vertical and lateral (into proposed excavation) position.
 3. Perform daily survey of each top-of-wall deformation monitoring point from when excavation begins until full excavation depth is reached adjacent to the wall. Thereafter, perform weekly survey of monitoring points until the wall is backfilled.
- D Monitoring Track Movement
1. Before the start of excavation, wall installation or any work near or adjacent to existing railroad tracks, install surface settlement points in the railroad ties along the tracks spaced approximately every 15½ feet along the proposed work zones and to 100 feet beyond either end of the proposed work zones.
 2. Perform two baseline elevation surveys of the surface settlement points before the start of excavation/wall installation. Survey both vertical and lateral (into excavation) position.
 3. Perform daily survey of settlement monitoring points from the beginning of excavation work until the track support structure is completed.
 4. Perform weekly survey following completion of the track support structure until all work for the access structure is completed including all concrete work, backfill and compaction. Landscaping work shall not be considered an outstanding work item.
 5. Any existing structures supporting tracks or embankments adjacent to tracks in the vicinity of work, such as bridges, abutments, retaining walls, or other structures where settlement, deflection, or failure could affect the tracks shall be included in any monitoring program.

- E Make adjustments to survey schedule and monitoring point locations (including the addition of monitoring points) as requested by the Owner if additional monitoring of wall performance is desired. Extra monitoring points and increases in survey frequency shall be considered incidental to the costs.
- F All monitoring data shall be reported to the Owner within twenty four (24) hours of measurement in tabular and graphical format, allowing comparison of current data to previous data, including baseline data.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02310

FINE GRADING

PART 1 - GENERAL

1.1 GENERAL

- A. The Work shall be performed in accordance with the following documents as issued by the Massachusetts Bay Transportation Authority:
 - 1. The Contract Specifications, which include Volume 1 DB Contract Terms and Conditions; Volume 2 Technical Provisions; and applicable Sections of Divisions 2 through 16.

1.2 SUMMARY

- A. This Section contains the following:
 - 1. Fine Grading.
- B. Related Sections include the following:
 - 1. Section 02300 – EARTHWORK
 - 2. Section 02920 – SEEDING
 - 3. Section 02930 – PLANTING
 - 4. Section 02932 – PLANTING SOILS
 - 5. Section 02970 – LANDSCAPE MAINTENANCE

1.3 REFERENCES

- A. Comply with applicable requirements of:
 - 1. Commonwealth of Massachusetts, Standard Specifications for Highways and Bridges, Department of Public Works, latest edition.
 - 2. United States Department of Justice, ADA Standards for Accessible Design.
 - 3. Massachusetts Architectural Access Board (MAAB) 521 CMR.

1.4 SUBMITTALS

- A. Submittals: in accordance with Volume 2 Technical Provisions, Subsection 2.7, “Design Submittal Review Management” and Subsection 2.8, “Construction Submittal Requirements” and the source approval, sample provision and material testing requirements of Specification SECTION 02300 – EARTHWORK, Subsection 1.5, “Submittals”.
- B. Qualification Data: submit written project list and references for other Fine Grading project work.

1.5 EXAMINATION OF SITE AND DOCUMENTS

- A. Design-Builder responsible for judging extent of work requirements involved. By submitting bid, Design-Builder affirms he has carefully examined the site and conditions affecting work.

1.6 PERMITS AND CODES

- A. Work shall conform to Contract Documents and comply with applicable codes and regulations.
- B. Comply with rules, regulations, laws and ordinances of the local community, of the Commonwealth of Massachusetts and other authorities having jurisdiction.
- C. Arrange for and obtain permits and licenses required to complete Work. Fees not waived shall be paid by Design-Builder.
- D. Do not close or obstruct streets, sidewalks, alleys or passageways without prior notification and permission. Conduct operations to minimize interference with use of roads, driveways, alleys, sidewalks, or other facilities near enough to Work to be affected.

1.7 QUALITY ASSURANCE

- A. Qualifications: Design-Builder shall have minimum five years experience in fine grading.
- B. Pre-Installation Conference: Design-Builder shall convene a meeting with the MBTA present prior to start of fine grading.

1.8 PROJECT/SITE CONDITIONS

- A. Environmental Requirements: Do not deliver, handle or place soils when dry, wet, or frozen.
 - 1. Field Test: Compact Test per SECTION 02300 – EARTHWORK, paragraph 3.16.

1.9 SEQUENCING AND SCHEDULING

- A. Fine Grading
 - 1. Finish grade after soil preparation is accepted and prior to planting.

PART 2 - MATERIALS

2.1 SOILS

- A. See SECTION 02932 – PLANTING SOILS

2.2 EQUIPMENT

- A. Fine Grading: Grading Tractor or other approved equipment.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verification of Conditions: in the event field conditions are not in conformance with the Contract Documents, notify the MBTA in writing.
 - 1. Spot and Invert Elevations: verify that field elevations of existing site conditions, such as drainage and utility fixtures, pavements, curbs and subsurface piping conform to Existing Site Conditions Plan.

3.2 PREPARATION

- A. Protection:
 - 1. Prior to fine grading operations, field locate and protect from damage site improvements such as drainage and utility fixtures, pavements, site furnishings and curbs.
 - 2. Dust Control: upon acceptance of soil preparation provide dust control.
 - 3. Agricultural Chemicals: protect site improvements from contact with agricultural chemicals, soil amendments, and fertilizers.
 - 4. Protect benchmarks.

3.3 FINISH GRADING

- A. Subgrade: top of subgrade to be parallel to finish grade and of uniform depth with the finish grade.
- B. Positive Drainage: provide free and uninterrupted flow of surface waters without erosion.
- C. Gradients: finish grade between spot elevations and between contours shall be constant. Eliminate mounds and depressions.
- D. Slope: finish grade shall be smooth with gradual transitions between top and bottom of slopes.
- E. Grade Tolerances: +.01% to -.01%.
- F. Maintain levels, profiles, and contours of rough grades.
- G. Removal: clear stones, roots, weeds, and debris while grading landscape soil materials. Rake surface clean of stones 1" or larger and debris.

3.4 FIELD QUALITY CONTROL

- A. Notify the MBTA upon completion of fine grading. The MBTA shall review the work for conformance to Contract Documents and if the work is approved, subsequent lawn and planting work shall proceed.

- B. Soil compaction at moisture content near field capacity based on measurements with a CL 700 pocket penetrometer shall not exceed 2.5 tons per square foot.

3.5 ADJUSTING

- A. Repair and re-establish grades in settled, eroded, and damaged areas.
- B. The Design-Builder is responsible for the protection of the area from construction operations and anticipating weather conditions. Where completed areas are disturbed by construction operations or adverse weather, the Design-Builder shall regrade as required.

3.6 CLEANING

- A. Clean up debris generated under work of this section.
- B. Site Improvements
 - 1. Wash and sweep clean site improvements such as drainage and utility fixtures, pavements, existing plantings, and site furnishings.

3.7 PROTECTION

- A. Protect work of this section until Final Acceptance.
- B. Protect prepared soils from compaction by construction traffic and from contamination by construction materials.

PART 4 – MEASUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in Volume 1 DB Contract Terms and Conditions, Section 14, "Payment".

END OF SECTION

SECTION 02356

SOLDIER PILE AND LAGGING RETAINING WALLS

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing Soldier Pile and Lagging Retaining Walls (SPL) along portions of the railroad trackway as shown on the Design Builder's Detailed Shop Drawings.
- B. Soldier piles may be installed in augured holes at the size and locations shown on the Design Builder's Detailed Shop Drawings. Soldier piles may be driven or vibrated into place if there is sufficient control on placement and angularity as detailed herein. The Design Builder shall stay within approved noise and vibration limits as well.
- C. Soldier piles shall be installed through all material encountered to the depth shown on the Design Builder's Detailed Shop Drawings. Installation equipment shall be capable of drilling through boulders, and any other obstructions, encountered during installation at no additional cost to MBTA.
- D. For this project soldier pile and lagging walls are designed and detailed to be free draining and shall be constructed to conform to this intent.
- E. The supports for the soldier pile and lagging walls may consist of a pre-augured drilled shaft with an embedded galvanized steel soldier pile. Timber lagging shall be placed starting from the top and progressing to the bottom of the wall. A filter fabric shall be attached to the lagging. Precast concrete panels shall be installed and crushed stone shall be used to fill the void between the panel and the lagging. A cast-in-place concrete cap shall be placed on top of the wall. In some cases, the soldier pile and lagging walls shall support a noise wall. These soldier pile and lagging walls shall be furnished complete in place in accordance with the lines, grades, dimensions and all appurtenances shown on the Design Builder's Detailed Shop Drawings, as directed herein, or as directed by the Engineer.
- F. All protruding items such as anchor bolts or embedded items such as steel plates shall be embedded in the concrete of the cap and not drilled and grouted or cut in afterward. Such items must be coordinated with the striation patterns, if any, in the cap.
- G. Full length temporary casing drilled to the elevation shown on the Design Builder's Detailed Shop Drawings may be required for all drilled shaft holes for soldier piles
- H. Soldier pile and lagging walls shall be bonded for continuity by extending a continuous uncoated bar to connect the tops of all the soldier piles.
- I. Stray current criteria apply to this wall type in accordance with the Design Builder's Detailed Shop Drawings.

1.2 RELATED SECTIONS

- A. Other specification sections that relate to the work include, but are not limited to, the following:
 - 1. Section 02015 – GEOTECHNICAL INSTRUMENTATION
 - 2. Section 02196 – GEOTEXTILE MATERIALS
 - 3. Section 02240 – DEWATERING
 - 4. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
 - 5. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 - 6. Section 02300 – EARTHWORK
 - 7. Section 03300 – CAST-IN-PLACE CONCRETE
 - 8. Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE
 - 9. Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS
 - 10. Section 05500 – MISCELLANEOUS METALS
 - 11. Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION

1.3 SUBMITTALS

- A. Working Drawings
 - 1. Submit working drawings at least two (2) weeks before beginning excavation or installation of excavation support system and bracing. Submit each Soldier Pile and Lagging Wall under separate cover and in the sequence of their installation.
- B. Additional Requirements for Working Drawings – Working drawings shall include the following:
 - 1. Grades and strengths of all construction materials used.
 - 2. Full excavation depth.
 - 3. Depths below the main excavation to which the excavation support system shall be installed if necessary.
 - 4. Materials, details, arrangement, and method of construction of the proposed excavation support system, per Section 02260 – EXCAVATION SUPPORT AND PROTECTION, and sequence of construction (including bottom elevation of excavation at each stage).
 - 5. Method for installing wall.
 - 6. Method for attaching lagging.
 - 7. Method for attaching concrete cap beam.
 - 8. Loads on the excavation support system for various stages of excavation.
 - 9. Anticipated equipment, traffic (and other surcharge) loads on adjacent ground during construction.
 - 10. Existing utility facilities, including underground and overhead utilities. After checking locations of utilities by field investigations, determine which affect or potentially may affect the wall.

- C. Submit Plan of Actions to be implemented in the event any Response Value for deformation, as specified in Table 02356-1, is reached.

**TABLE 02356-1
RESPONSE VALUES**

Monitoring Type	Value
<u>Lateral Deflection of Earth Support Wall</u>	
Top of pile	1.5%
Mid-Point of exposed pile	0.75%
<u>Ground Surface Settlement</u>	
Top of Rail	1/4 inch

- D. The Plan of Actions shall be positive measures by the Design Builder to limit further movement of the wall. The details of the mitigating measures shall include a schedule of implementation, location and/or availability of materials, and a detailed description of the method of implementation. The Design Builder shall be prepared to work twenty four (24) hours per day to implement such measures.
- E. Submit Welder Qualifications and Welding Procedures in accordance with AWS D1.1.
- F. Submit descriptive data and operating procedures for all equipment to be used. This shall include, at a minimum, machinery required to install wall and bracing, excavate soil, and remove obstructions. Submit all pertinent data including sizes, weights, capacities, torques and operating frequencies.
- G. Review of the wall system by the Engineer shall not relieve the Design Builder from the responsibility for the adequacy of the design and construction of temporary excavation support system, per Section 02260 - EXCAVATION SUPPORT AND PROTECTION, to achieve the required results.
- H. Means and methods to advance through obstructions. Review and approval of submittal by Engineer or MBTA does not relieve the Design Builder in any way from the responsibility to complete the construction.
- I. Submittals reviewed beyond the second rejection (or required re-submittal) shall be printed at no cost to the MBTA and shall be reviewed by the Engineer at the Design Builder's expense.

1.4 TOLERANCES

- A. Variation of center of any drilled shaft holes from the required plan location: Maximum 3 inches, measured at the existing ground surface in any horizontal direction.
- B. Horizontal deviation of the steel soldier pile during concrete placement in the drilled shaft, plus or minus 1 inch.

- C. Vertical tolerance of the steel soldier pile during concrete placement is plus or minus 1 inch.
- D. Angular deviation of the steel soldier pile in any direction during concrete placement is 1/2 percent.
- E. Bottom diameter: Minus 0, plus 3 inches measured in any direction. No additional payment will be made beyond the bid price for increased diameter.
- F. Wall elevation tolerance of the completed wall including the cap is minus 0 inches, plus 1/2 inch.
- G. Refer to attached Table 02356-1 for response values.
- H. Excavation equipment and methods shall be designed so that the completed drilled shaft holes shall have a planar bottom. The cutting edges of excavation equipment shall be normal to the vertical axis of the equipment within a tolerance of $\pm 3/8$ inch per foot of diameter.
- I. Any soldier pile wall or its components not in conformance with the above tolerances shall be rejected. The Design Builder shall notify the Engineer in writing and submit a plan of action to bring the wall or its components into conformity. Any rework required to bring the wall into conformity shall be at no additional cost to MBTA. Walls that are installed such that they cannot be brought into conformity shall need to be replaced in kind at no additional cost to MBTA.

1.5 PROJECT CONDITIONS

- A. Visit the site to review all details of the work and working conditions affecting Work under this Section and to verify dimensions in the field including potential interference from adjacent structures and utilities. Notify the Engineer in writing of any discrepancy before performing any work. The Design Builder is hereby notified that the job site is located adjacent to the active railroad and existing low rise buildings. Refer to Section 00700 – GENERAL CONDITIONS.
- B. The Design Builder shall be responsible for implementing all necessary traffic control measures, which may include but not be limited to traffic cones, barriers, barrels, signs, flagmen, and police details.
- C. Provisions for Contingencies
 - 1. Monitor the performance of components of the wall, for horizontal movement, at intervals specified herein. Take initial readings of the wall upon completion of the wall cap.
 - 2. Implement contingency plans if Response Values specified in Table 02356-1 are reached.
 - 3. Have materials and equipment available to implement the accepted Plan of Action.
- D. Consult official records of existing utilities, both surface and subsurface, and their connections to be fully informed on all existing conditions and limitations as they apply to this work and its relation to other construction work. Proceed with caution in areas of utility facilities. Expose them by hand excavation or by other methods acceptable to the utility owner. Protect existing utilities to remain within and adjacent to the work area in accordance with the requirements of authorities having

jurisdiction over same. The Design Builder is responsible for any damage to utilities caused by the Design Builder's operations and shall restore them to equal or better operation at no additional cost to MBTA.

1.6 SUBSURFACE DATA

- A. Logs of subsurface explorations performed at the site are shown in the Contract Documents. Approximate locations of these subsurface explorations are shown on the Contract Plans.
- B. The aforementioned data is for general information and is accurate only at the particular locations and times the subsurface explorations were made. It is the Design Builder's responsibility to make interpretations and draw conclusions based on the character of materials to be encountered and the impact on his work based on his expert knowledge of the area and of earthwork techniques. The Design Builder shall review test pit and boring logs and locations and other pertinent data for the site. The Design Builder, at his own expense, may conduct additional subsurface explorations for his own information after obtaining the MBTA's permission.

1.7 QUALITY ASSURANCE

- A. The Design Builder shall provide written certification indicating that the equipment used for monitoring of deformation monitoring points (DMP) (as specified in Paragraph 3.2 herein) has been calibrated and maintained in accordance with the test equipment manufacturer's calibration requirements. The accuracy/precision of horizontal and vertical survey monitoring shall be to the nearest 0.01 feet.

1.8 QUALIFICATIONS OF DESIGN BUILDER'S INSTRUMENTATION PERSONNEL

- A. The Design Builder shall have on his staff, or on the staff of a specialist instrumentation subcontractor, instrumentation/survey personnel who are responsible for furnishing, installing, and maintaining instrumentation/survey equipment, as well as obtaining and interpreting data from the instrumentation/survey equipment.
- B. The Design Builder's instrumentation/survey personnel shall have the following qualifications:
 - 1. A minimum of a Bachelor of Science Degree in Civil Engineering or related discipline.
 - 2. A minimum of 2 years' experience in the installation, monitoring, and interpretation of data from the types of monitoring equipment used to monitor deformation-monitoring points (as specified in Paragraph 3.2 herein).
- C. The Design Builder's instrumentation personnel shall:
 - 1. Be on site and supervise or perform installation of each monitoring point.
 - 2. Perform deformation monitoring in accordance with the Project Specifications.
 - 3. Interpret deformation-monitoring data.
 - 4. Ensure that deformation-monitoring data is tabulated accurately and in a format consistent with the Project Specifications.

5. Forward monitoring data to the designated review parties in a timely manner.

PART 2 – PRODUCTS

2.1 GENERAL

- A. The Design Builder shall make his own arrangements to purchase the materials covered by this section of the specifications, including all necessary incidentals. The Design Builder, or the supplier as his agent, shall furnish the Engineer a Certificate of Compliance certifying that the applicable materials comply with this section of the specifications. Materials not conforming to this section of the specifications shall not be used without the written consent of the Engineer.

2.2 MATERIALS

- A. Structural Steel for soldier piles shall conform to applicable requirements of Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- B. Reinforcement Steel for use within cast-in-place concrete cap shall conform to Section 03300 – CAST-IN-PLACE CONCRETE.
- C. Concrete for drilled shaft hole fill (below bottom of excavation as shown on Design Builder’s Detailed Shop Drawings) shall conform to relevant articles of Section 03300 – CAST-IN-PLACE CONCRETE (4000 psi, 3/8”).
- D. Concrete for cast-in-place cap shall conform to relevant articles of Section 03300 – CAST-IN-PLACE CONCRETE (4000 psi, 3/4”).
- E. Concrete for precast panels for retaining walls shall conform to relevant articles of Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE (5000 psi, 3/4”).
- F. Controlled Density Fill (CDF), Type 2E in accordance with specification Section 02300 - EARTHWORK.
- G. Headed welded studs shall conform to Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- H. Threaded welded studs shall conform to Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- I. All structural timber used as lagging shall be rough sawn and conform to MBTA Guide Specifications for Structural Design of Rapid Transit and Light Rail Structures Article 9.6 and AREMA.
- J. Filter fabric shall conform to Section 02196 - GEOTEXTILE MATERIALS.
- K. Structural timber lagging supporting train loads whether temporary or permanent shall conform to MBTA Guide Specifications for Structural Design of Rapid Transit and Light Rail Structures Article

9.6 and AREMA. Structural timber lagging supporting earth and/or roadway loads whether temporary or permanent shall conform to AASHTO Standard Specifications for Highway Bridges, 17th Edition, 2002 with latest interims and shall meet requirements shown on the Design Builder's Detailed Shop Plans. Design Builder to supply chosen species, grade of wood, conditions of use, and submit for approval. Where timber lagging is used special care must be exercised in torch cutting or welding of steel components to eliminate the risk of fire. Appropriate fire extinguishing measures shall be ready for immediate implementation.

- L. Crushed stone used to fill the void space behind the precast panel shall be in accordance with specification Section 02300 - EARTHWORK if the void is greater than 4". If the void space is smaller than 4", crushed stone used to fill the void space behind the precast panel shall not be greater than 3/4" or smaller than 3/8".
- M. Corrosion control and stray current shall conform to Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION.

PART 3 – EXECUTION

3.1 GENERAL REQUIREMENTS

- A. Install the wall in accordance with the accepted working drawings, and in such a manner as to prevent movement, settlement, loss of ground, removal of fines from the adjacent ground, and damage to or movement of adjacent structures and utilities. This could include the use of drilling slurry during installation of soldier piles in drilled shaft holes to maintain stable drill holes and limit the loss of ground outside the drill hole.
- B. Perform work from track side of the proposed wall unless temporary easements have been granted to minimize adjacent property impacts. Heavy equipment shall be placed on the track side of the proposed wall.
- C. Perform field welding by certified welders in accordance with American Welding Society Standards AWS D 1.1, "Structural Welding Code - Steel."
- D. Implement the Plan of Actions as submitted under Paragraph 1.3D, if Response Values as specified in Table 02356-1 are reached.
- E. Borings indicate below ground obstructions may be encountered. Such obstructions may include, but are not necessarily limited to, boulders and various other demolition and construction debris.
- F. Temporary casings used for drilled shaft holes for soldier piles shall be installed where needed to the top of weathered bedrock, as a minimum, using rotary drilling techniques over their full depth to limit potential vibration damage to adjacent structures and facilities.
- G. Protection of Existing Properties

1. Design Builder shall protect existing properties in accordance with specification Section 01545 – PROTECTION OF WORK AND PROPERTY.
2. Restore existing structures to conditions equivalent to those existing prior to the start of retaining wall construction and support work, unless otherwise indicated. Any damage to affected properties caused by the retaining wall construction shall be repaired by the Design Builder at no additional cost to the MBTA.
3. If in the opinion of the Engineer the integrity of the adjacent railroad tracks, bridge, buildings, structures, or paved areas are jeopardized due to movement, the Design Builder shall immediately discontinue further excavation in the affected area and implement accepted Plan of Action to mitigate further movement. Mitigating measures shall remain in effect until such time that the Engineer evaluates the impact on the structure and may direct the Design Builder to perform any remedial work. The Design Builder shall submit proposed remedial measures to the Geotechnical Engineer for review and approval. Submittals shall include methods and names of subcontractors. The Design Builder shall proceed with remedial work upon acceptance by the Engineer. Mitigating measures shall be at no additional cost to the MBTA.

3.2 MONITORING OF EXCAVATION

- A. The Design Builder shall monitor the performance of components of the excavation support system, both for vertical and horizontal movement, at intervals specified. If the Response Values as specified in Table 02356-1 in Article 1.3C are reached at any time during the work, the Design Builder shall immediately stop work and implement approved contingency plans.
- B. Visual effects of the excavation on the lateral support system shall be recorded and submitted to the Engineer along with monitoring deflection data.
 1. Deflection of the wall into the excavation due to soil, groundwater, and surcharge loads.
 2. Settlement adjacent to the lateral support wall due to inward deflection of the wall.
 3. Settlement adjacent to the lateral support wall due to ground loss into the excavation through gaps and voids in the wall.
- C. Monitoring Deflection of Wall (Section 02015 - GEOTECHNICAL INSTRUMENTATION)
 1. Once the soldier pile is installed to final elevation but before excavation begins, establish deformation-monitoring points on the top of the pile, spaced approximately every 24 feet along the wall. The monitoring points shall consist of painted marks or targets on the steel pile.
 2. Perform a baseline survey of each deformation monitoring point before excavation begins. Survey lateral positions.
 3. Perform daily survey of each top-of-pile deformation monitoring point from when excavation begins until full excavation depth is reached adjacent to the wall. Thereafter, perform weekly survey of monitoring points until the wall is complete to the bottom of the cap or as directed by the Engineer.

4. Monitoring shall continue until the backfill behind the wall shall be completed to its finished grade (not including loam and seeding) or to the bottom of the cap.
 5. For monitoring of temporary support walls see specification Section 02260 – EXCAVATION SUPPORT AND PROTECTION.
- D. Monitoring Track Movement
1. Before the start of excavation and wall installation, establish elevations along Top of Rail of nearest track, each rail, spaced approximately every 20 feet along the walls.
 2. Perform two baseline elevation surveys of the Top of Rail before the start of excavation/wall installation. Survey both vertical and lateral (into excavation) positions.
 3. Perform weekly survey of settlement monitoring points from the beginning of excavation until the structure is completely in place and fully backfilled.
- E. Make adjustments to survey schedule and monitoring point locations (including the addition of monitoring points) as requested by the Engineer if additional monitoring of wall performance is desired. Extra monitoring points and increases in survey frequency shall be considered incidental to the costs associated with this Section.
- F. Survey instruments used for vertical deformation monitoring shall have a minimum accuracy of ± 0.05 in and a minimum setting accuracy of ± 1.0 arc seconds. Leveling staffs shall be non-telescopic in design (i.e. 'Chicago' style leveling staff). A bull's eye bubble shall be used to plumb the leveling rod.
- G. Survey instruments used for horizontal deformation monitoring shall have a minimum accuracy of ± 3.0 arc seconds and a minimum display reading less than or equal to the accuracy. Distances less than 30 feet shall be measured with a standardized steel tape used in conjunction with a tension handle. Distances greater than 30 feet shall be measured with an Electro-Optical Distance Measuring Instrument (EDM). Distances between 30 and 100 feet shall be verified with a standardized steel tape in conjunction with a tension handle. Electronic pointing shall be used to minimize error due to possible misalignment of the EDM axis and telescope. Centering shall be accomplished using high precision optical plummets or mechanical centering devices.
- H. EDM equipment used for lateral deformation monitoring shall, after calibration, have a minimum accuracy of ± 0.02 in plus 5 parts per million.
- I. The Design Builder shall submit the results of the settlement point readings to the Engineer in draft form at the end of each working day. All monitoring data shall be reported to the MBTA and Engineer within twenty-four (24) hours of measurement in tabular format, allowing comparison of current data to previous data, including baseline, and showing a complete history of movement versus time.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02357

CAST IN PLACE CONCRETE RETAINING WALLS

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies constructing Cast-In-Place (CIP) Concrete Retaining Walls along portions of the railroad trackway as shown on the Contract Drawings. These cast-in-place concrete retaining walls shall be backfilled and furnished complete in place in accordance with the lines, grades, dimensions, and all appurtenances shown on the Contract Drawings, as directed herein, or as directed by the Engineer.
- B. Install temporary excavation support elements and excavate to one foot below the bottom of wall elevations shown on the Contract Drawings.
- C. When obstructions are encountered during excavation, the Design Builder shall remove or clear the obstructions. The Design Builder is responsible for the cost of this work.
- D. Place one foot of gravel borrow beneath the footing that shall extend one foot beyond in all directions.
- E. Cast-in-place concrete retaining walls shall be constructed to the dimensions and locations shown on the Contract Drawings. Membrane waterproofing shall be attached to the cast-in-place concrete retaining wall. One cubic yard of crushed stone wrapped in filter fabric shall be provided at each end of each 4” diameter weep hole at locations indicated on the Contract Drawings.
- F. For the GLX project, cast-in-place concrete retaining walls are designed to be free draining and shall be constructed to conform to this intent.
- G. The construction of cast-in-place concrete retaining walls shall not disturb existing structures or the completed work. Damage to such structures shall be repaired by the Design Builder at no additional cost to the MBTA.
- H. Construction operations not to exceed specified noise limits in accordance with Section 01560 - TEMPORARY CONTROLS.
- I. The Design Builder shall bear the entire cost and responsibility of correcting any failure, damages, subsidence, upheaval, or cave-ins as a result of installation of the cast-in-place concrete retaining walls. The Design Builder shall pay for all claims, costs, and damages that arise as a result of the work performed at no additional cost to the MBTA.

1.2 RELATED SECTIONS

A. Other specification sections that relate to the work include, but are not limited to, the following:

1. Section 01560 – TEMPORARY CONTROLS
2. Section 02196 – GEOTEXTILE MATERIALS
3. Section 02240 – DEWATERING
4. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
5. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
6. Section 02300 – EARTHWORK
7. Section 03300 – CAST-IN-PLACE CONCRETE
8. Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS

1.3 SUBMITTALS

A. Working Drawings

1. Submit working drawings at least two (2) weeks before beginning excavation or installation of excavation support system and bracing.
2. Concrete mix designs, form work designs, rebar layout, etc. shall be submitted under Section 03300 – CAST-IN-PLACE CONCRETE.

B. Additional Requirements for Working Drawings – Working drawings shall include the following:

1. Grades and strengths of all construction materials used.
2. Full excavation depth.
3. Depths below the main excavation to which the excavation support system shall be installed.
4. Materials, details, arrangement, and method of construction of the proposed excavation support system and sequence of construction (including bottom elevation of excavation at each stage).
5. Method for installing wall.
6. Loads on the excavation support system for various stages of excavation.
7. Anticipated equipment, traffic (and other surcharge) loads on adjacent ground during construction.
8. Existing utility facilities, including underground and overhead utilities. After checking locations of utilities by field investigations, determine which utilities affect or potentially may affect the wall.

C. Submit Welder Qualifications and Welding Procedures in accordance with AWS D1.4.

D. Submit descriptive data and operating procedures for all equipment to be used. This shall include, at a minimum, machinery required to install wall and bracing, excavate soil, and remove obstructions. Submit all pertinent data including sizes, weights, capacities, torques and operating frequencies.

E. Review of the temporary support of excavation for wall system installation by the Engineer shall not relieve the Design Builder from the responsibility for the adequacy of the design and construction of temporary excavation support systems to achieve the required results.

- F. Submittals reviewed beyond the second rejection (or required re-submittal) shall be printed at no cost to the MBTA and shall be reviewed by the Engineer at the Design Builders expense.

1.4 TOLERANCES

- A. Concrete tolerances shall conform to Section 03300 – CAST-IN-PLACE CONCRETE.

1.5 PROJECT CONDITIONS

- A. The Design Builder shall visit the site to review all details of the work and working conditions affecting work under this Section and to verify dimensions in the field including potential interference from adjacent structures. Notify the Engineer in writing of any discrepancy before performing any work. The Design Builder is hereby notified that the job site is located adjacent to the active railroad and existing structures.
- B. The Design Builder shall be responsible for implementing all necessary traffic control measures, which may include but not be limited to traffic cones, barriers, barrels, signs, flagmen, and police details.
- C. Consult official records of existing utilities, both surface and subsurface, and their connections to be fully informed on all existing conditions and limitations as they apply to this work and its relation to other construction work. Proceed with caution in areas of utility facilities. Expose them by hand excavation or by other methods acceptable to the utility owner. Protect existing utilities to remain within and adjacent to the work area in accordance with the requirements of authorities having jurisdiction over same. The Design Builder is responsible for any damage to utilities caused by the Design Builder's operations and shall restore them to equal or better operation at no additional cost to the MBTA.

1.6 SUBSURFACE DATA

- A. Logs of subsurface explorations performed at the site are shown in the Contract Documents. Approximate locations of these subsurface explorations are shown on the Contract Plans.
- B. The aforementioned data is for general information and is accurate only at the particular locations and times the subsurface explorations were made. It is the Design Builder's responsibility to make interpretations and draw conclusions based on the character of materials to be encountered and the impact on his work based on his knowledge of the area and of earthwork techniques. The Design Builder shall review test pit and boring logs and locations and other pertinent data for the site. The Design Builder, at his own expense, may conduct additional subsurface explorations for his own information after obtaining the MBTA's permission.

1.7 QUALITY ASSURANCE

- A. The Design Builder shall provide written certification indicating that the equipment used for the monitoring of deformation monitoring points (DMP) (as specified in Paragraph 3.2 herein) has been calibrated and maintained in accordance with the test equipment manufacturer's calibration

requirements. The accuracy/precision of horizontal and vertical survey monitoring shall be to the nearest 0.01 feet.

- B. Temporary excavation support elements whose depth is equal to or less than the distance away from the closest rail shall be left in place and cut off below the sub-ballast so as not to impede track drainage. If sheeting must be pulled for any reason the Design Builder shall notify the Engineer for approval prior to implementing any work. The Design Builder shall be responsible for backfilling any void space with flowable fill. Any work associated with removal of any temporary excavation support walls shall require approval of train operations. A track monitoring plan shall be required and any ballasting required shall be done at the expense of the Design Builder.

1.8 QUALIFICATIONS OF DESIGN BUILDER'S INSTRUMENTATION PERSONNEL

- A. The Design Builder shall have on his staff, or on the staff of a specialist instrumentation subcontractor, instrumentation/survey personnel who are responsible for furnishing, installing, and maintaining instrumentation/survey equipment, as well as obtaining and interpreting data from the instrumentation/survey equipment.
- B. The Design Builder's instrumentation/survey personnel shall have the following qualifications:
 - 1. A minimum of a Bachelor of Science Degree in Civil Engineering or related discipline.
 - 2. A minimum of 2 years' experience in the installation, monitoring, and interpreting data from the types of monitoring equipment used to monitor deformation-monitoring points (as specified in Paragraph 3.2 herein).
- C. The Design Builder's instrumentation personnel shall:
 - 1. Be on site and supervise or perform installation of each monitoring point.
 - 2. Perform deformation monitoring in accordance with the Project Specifications.
 - 3. Interpret deformation-monitoring data.
 - 4. Ensure that deformation-monitoring data is tabulated accurately and in a format consistent with the Project Specifications.
 - 5. Forward monitoring data to the designated review parties in a timely manner.

PART 2 – PRODUCTS

2.1 GENERAL

- A. The Design Builder shall make his own arrangements to purchase the materials covered by this section of the specifications, including all necessary incidentals. The Design Builder, or the supplier as his agent, shall furnish the Engineer a Certificate of Compliance certifying that the applicable materials comply with this section of the specifications. Materials not conforming to this section of the specifications shall not be used without the written consent of the Engineer.

2.2 MATERIALS

- A. Concrete for cast-in-place walls shall conform to relevant articles of Section 03300 – CAST-IN-PLACE CONCRETE (4000 psi, 3/4”).
- B. Reinforcement Steel for use within cast-in-place concrete walls shall be uncoated and conform to Section 03300 – CAST-IN-PLACE CONCRETE.
- C. Structural Steel shall conform to applicable requirements of Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- D. Headed welded studs for embedded items shall conform to Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- E. Membrane waterproofing shall conform to the requirements of Protective Seal Coat Emulsion, M3.03.3, of the Massachusetts Highway Department Standard Specifications for Highways and Bridges, current Edition.
- F. Filter fabric shall conform to Section 02196 - GEOTEXTILE MATERIALS.
- G. Crushed stone used at each end of weep holes shall be 1 1/2”.
- H. Gravel borrow for cast-in-place concrete retaining walls shall consist of inert material that is hard, durable stone and coarse sand, free from loam and clay, surface coatings, and deleterious materials. Gradation requirements for gravel shall be determined by AASHTO-T11 and T27 and shall conform to the following:

<u>Sieve Designation</u>	<u>Percent Passing</u>
1/2 in.	50-85
No. 4	40-75
No. 50	8-28
No. 200	0- 5

Maximum size of stone in gravel shall be 3 inches (Type B).

PART 3 – EXECUTION

3.1 GENERAL REQUIREMENTS

- A. Construct the walls in accordance with the accepted working drawings, and in such a manner as to prevent movement, settlement, loss of ground, removal of fines from the adjacent ground, and damage to or movement of adjacent structures and utilities.
- B. Perform work from track side of the proposed wall unless temporary easements have been granted to minimize adjacent property impacts. Heavy equipment shall be placed on the track side of the proposed wall.
- C. Perform field welding by certified welders in accordance with American Welding Society Standards AWS D 1.4, "Structural Welding Code - Steel."

- D. Borings indicate below ground obstructions may be encountered. Such obstructions may include, but are not necessarily limited to, boulders and various other demolition and construction debris.
- E. Protection of Existing Adjacent Structures
 - 1. The Design Builder shall repair all damage to adjacent properties and restore the surfaces and finishes to the original state.
 - 2. If in the opinion of the Engineer the integrity of any adjacent railroad tracks, bridges, buildings, structures, or paved areas are jeopardized due to movement, the Design Builder shall immediately discontinue further excavation in the affected area and implement accepted Plan of Action to mitigate further movement. Mitigating measures shall remain in effect until such time that the Engineer evaluates the impact on the structure and may direct the Design Builder to perform any remedial work. The Design Builder shall submit proposed remedial measures to the Geotechnical Engineer for review and approval. Submittals shall include methods and names of subcontractors. The Design Builder shall proceed with remedial work upon acceptance by the Engineer. Mitigating measures shall be at no additional cost to the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02358

SOIL NAIL RETAINING WALL

PART 1 – GENERAL

1.1 DESCRIPTION

- A. The Work shall consist of constructing a soil nail retaining wall with or without concrete facing as specified herein and as shown on the plans. The Design Builder shall furnish all labor, tools, materials, and Equipment to complete the Work.
- B. The Design Builder is responsible for the construction means and methods and the process of the Work. This includes the construction sequence, the safety of the workers, temporary handrails, excavation access, barriers, lifting of materials and construction Equipment into and out of the excavation, temporary bracing of form work, and the stability of all temporary cut slopes.
- C. The soil nail retaining wall is an earth retention system designed to support the excavated slope once the components of the soil nails and facing system are completely installed for all lifts up to and including the current excavation lift. The stability of interim temporary face cuts that exist prior to installation of the wall facing is the sole responsibility of the Design Builder.
- D. The Work shall consist of installing soil nails to the specified minimum length, diameter, and orientation as specified herein. Work also required includes excavating in accordance with the staged lifts as required, installing the wall drainage elements and shotcrete facing, performing soil nail pullout testing, and installing the concrete facing if shown on the plans.

1.2 RELATED SECTIONS

- A. Other specification sections that relate to the work include, but are not limited to, the following:
 - 1. Section 02240 – DEWATERING
 - 2. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
 - 3. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 - 4. Section 02300 – EARTHWORK
 - 5. Section 03300 – CAST-IN-PLACE CONCRETE
 - 6. Section 03371 – SHOTCRETE
 - 7. Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS
 - 8. Section 05500 – MISCELLANEOUS METALS

1.3 SUBMITTALS

- A. Provide a brief description of at least 3 projects of similar size and scope, including the Owner's name, address, and current phone number; location of project; project contract value; and scheduled completion date and actual completion date for the project. The Design Builder shall demonstrate that they have successfully completed at least 3 permanent soil nail retaining wall projects in the last 5 years totaling at least 10,000 square feet of face area and at least 500 soil nails.

- B. For Soil nail walls construction used as temporary support of excavation, the Design Builder shall submit design calculations. All design calculations shall be performed stamped and sealed by a Professional Engineer registered in the Commonwealth of Massachusetts.
- C. The Design Builder is responsible for providing the necessary survey and alignment control during the excavation for each lift, locating drill holes and verifying limits of wall installation. At least 14 days before starting soil nail work, submit a Construction Plan to the Engineer that includes the following:
 - 1. The start date and proposed detailed wall construction sequence.
 - 2. Drilling and grouting methods and Equipment including drill rig type, use of cased or open-hole methods, proposed drill hole diameter, and method of cuttings removal to achieve the specified pullout resistance.
 - 3. Nail grout and shotcrete mix designs, including compressive strength test results (per AASHTO T1 06/ASTM C 109) supplied by a qualified independent testing lab verifying the specified minimum 3-day and 4,000 psi 28-day grout compressive strengths. Previous test results for the same grout mix completed within one year of the start of grouting may be submitted for verification of the required compressive strengths.
 - 4. Nail grout placement procedures, Equipment used for placement, and method of mixing.
 - 5. Shotcrete materials and methods of mixing and placement including methods of controlling the location of the finish face and determining shotcrete thickness.
 - 6. Soil nail testing methods and Equipment setup: Include details of the jacking frame and appurtenant bracing, methods of isolating test nails during shotcrete application, and methods of grouting the unbonded length of test nails after testing. The Design Builder shall submit test results and detailed daily field reports; as a minimum, the field reports shall indicate nail type, diameter, length, inclination, grout takes, and if the nail has been installed in accordance with plans and specs for each nail installed.
 - 7. Identification numbers and certified calibration records for each test jack and pressure gauge and load cell to be used. Jack and pressure gauge shall be calibrated as a unit. Calibration records shall include the date tested, the device identification number, and the calibration test results and shall be certified for an accuracy of at least 2 percent of the applied certification loads by a qualified independent testing laboratory within 90 days prior to submittal.
 - 8. Material certifications for soil nail reinforcement bars, couplers, facing reinforcement, Portland cement, centralizers, bearing plates, and epoxy coating or encapsulation if used.
- D. Soil nail test results and daily field reports documenting compliance with the plans and specification.
- E. Manufacture's data relative to drainage material.
- F. Grout mix designs.
- G. Bonding agent manufacturer's data.

1.4 PRECONSTRUCTION MEETING

- A. A preconstruction meeting shall be held prior to the start of the Work and shall be attended by the Owner's representatives, the Engineer, the general Design Builder, the excavation subcontractor, shotcreting subcontractor, the soil nail specialty subcontractor, and the wall facing contractor. Wall

construction requires excavation in soil and rock material, excavation in staged lifts and excavation in the vicinity of the wall face requires special care and effort compared to general earthwork excavation. The preconstruction meeting shall be conducted to clarify the requirements for the Work, to coordinate the construction activities, and to identify contractual relationships and responsibilities.

1.5 SUBSURFACE DATA

- A. Logs of subsurface explorations performed at the site are shown on the Contract Drawings. Approximate locations of these subsurface explorations are shown on the Contract Drawings.
- B. The aforementioned data is for general information and is accurate only at the particular locations and times the subsurface explorations were made. It is the Design Builder's responsibility to make interpretations and draw conclusions based on the character of materials to be encountered and the impact on his work based on his expert knowledge of the area and of earthwork techniques. The Design Builder shall review test pit and boring logs and locations and other pertinent data for the site. The Design Builder, at his own expense, may conduct additional subsurface explorations for his own information after obtaining the MBTA's permission.

1.6 QUALITY ASSURANCE

- A. Comply with local rules, and in conjunction with all city, state, and federal guidelines and regulations, laws and ordinances and all other authorities having jurisdiction. All labor, materials, Equipment and services necessary to make the Work comply with such requirements shall be provided without additional cost to the Owner.
- B. The Work defined in this Specifications Section is specialty construction requiring a specialty contractor who is highly knowledgeable and experienced in the fabrication and installation of soil nail walls. The Design Builder performing the Work in this Specifications Section shall submit proof of three projects on which the Design Builder has successfully installed soil nail walls (permanent and as temporary SOE) of similar capacities required for this project within the last 5 years. Provide an experienced supervisor with at least 3 years of experience in the construction of soil nail walls. The Design Builder's supervisor shall be present at all times during execution of this portion of the Work and shall be thoroughly experienced with materials being installed, referenced standards, and requirements of this work. Drilling operators, nozzle men, and foremen shall have a minimum of 2 years' experience installing soil nail walls with the Design Builder's organization.
- C. Certification of the quality of the soil nail wall assemblies to be used in the Work shall be furnished, in a form acceptable to the Engineer, at the time of delivery of materials to the site. As a minimum, the certification of the quality of the soil nail walls assemblies shall include all submittals required as specified herein.
- D. Install and conduct all pre-production verification tests at the locations indicated on the Drawings prior to the installation of soil nail walls. In addition, performance tests shall be required on each drill hole size; bond length; bar size and cement grout mix design combination.
- E. Monitor and record data associated with nail grouting, performance, lift off and proof tests and provide the Engineer with a typewritten record of the data for each soil nail within 2 days after testing.
- F. All grout shall be tested for conformance with this Specifications Section by an independent certified testing agency at no additional cost to the Owner.

- G. All concrete and reinforcement used for construction of the wall shall be tested for conformance with this Specification Section by an independent certified testing agency at no additional cost to the Owner.

1.7 EXISTING SITE CONDITIONS, UTILITIES, AND UNDERGROUND OBSTRUCTIONS

- A. The Design Builder shall visit the Site prior to any construction activities for the purpose of observing and documenting the preconstruction condition of all structures, infrastructure, sidewalks, roadways, and all other facilities adjacent to the Site. During construction the Design Builder shall observe the conditions above the soil nail wall on a daily basis for signs of ground or building movements. The Design Builder shall immediately notify the Owner's representative and the Engineer if a sign of movement such as slope deformation, new cracks, and increased size of old cracks or separation of joints in structures, foundations, streets or paved and unpaved surfaces are observed. The Design Builder shall provide the Engineer written documentation of the observed conditions within 24 hours of initial observation.
- B. The Design Builder must verify all existing dimensions and Site conditions. The Design Builder is responsible for placing a one-call notification with dig safe Massachusetts prior to the start of Work. The Design Builder shall also determine the location of all existing utilities or underground obstructions not shown on the Plans, that may impact or conflict with the soil nail wall.
- C. Based on the as-built locations of sewers, water service and gas or power service lines, the Design Builder shall seek approval of the Engineer to shift nail locations to avoid conflicts with these utilities.

1.8 SPECIAL INSPECTION

- A. If required by the local building code, special inspection shall be provided by the Engineer for all soil nail installation and testing and for all shotcrete work. Such Inspection shall include observation and testing of test panel, observation of nail installation and testing performed by the Design Builder, placement of reinforcing steel, drainage board, and placement of shotcrete.
- B. The Engineer providing the special inspection shall be a qualified geotechnical Engineer or his representative with experience monitoring soil nail wall construction. Accurate records documenting the soil nail wall construction shall be maintained by the Engineer. The Design Builder shall assist the Engineer as necessary to obtain the as-built nail locations, top of wall elevations, and all other information as required by the Owner and Engineer. The Design Builder shall provide access to the Work and allow the special inspector to observe the Work in an unimpeded manner. The Design Builder shall inform the Owner at least 24 hours in advance of construction activities commencing so that inspection activities can be coordinated. Special inspection of the Work by the Engineer shall not relieve the Design Builder from completing the Work in accordance with the Plans and Specifications.
- C. All shotcrete and soil nail grout shall be tested, and soil nail design adhesions verified, in accordance with these Specifications.

1.9 CONSTRUCTION REQUIREMENTS

- A. The Design Builder is responsible for providing construction Site drainage, both behind and in front of the soil nail wall that is independent of the wall drainage system.

- B. At least 15 days prior to initiating the Work, the Design Builder shall submit to the Engineer for review and approval a detailed construction Site drainage plan addressing all elements necessary to divert, control, and dispose of surface water. Among other means, control of surface water from behind the wall may be accomplished by grading away from the wall, trenches and sumps, or a shotcreted gutter system. In addition, the excavation should be graded so as to direct surface water away from the toe of the soil nail wall and to prevent the ponding of water.
- C. The Design Builder is responsible for the condition and maintenance of any pipe or conduit used to control surface water during construction. Upon substantial completion of the Work, surface water control pipes or conduits shall be removed from the Site. Alternatively, pipes or conduits that are left in place with the approval of the Owner's representative shall be fully grouted (abandoned) or left in a manner that protects the structure and all adjacent facilities from ground loss associated with migration of fines through the pipe or conduit.

PART 2 – PRODUCTS

2.1 GENERAL

- A. Materials for construction of soil nail walls shall be furnished new and without defects. Defective materials rejected by the Owner's representative shall be removed by the Design Builder with no additional cost to the Owner. The materials shall consist of the following:

2.2 SOIL NAILS

- A. All nail bars shall be carefully handled and shall be stored on supports to keep the steel from contact with the ground. Steel bars shall be picked up in such a way as to prevent overstressing. Damage to the nail steel as a result of overstressing, abrasion, cuts, nicks, welds, and weld splatter shall be cause for rejection Engineer. Grounding of welding leads to the nail steel is prohibited. Nail steel shall be protected from and sufficiently free of dirt, rust, and other deleterious substances prior to installation. Heavy corrosion or pitting of nails shall be cause for rejection by the Engineer. Light rust that has not resulted in pitting is acceptable.
- B. Nail Solid Bar: AASHTO M31/ASTM A615, Grade 75. Deformed bar, continuous without splices or welds, new, straight, undamaged, epoxy-coated, or encapsulated for corrosion protection as shown on the Plans. Bar shall be threaded a minimum of 12 inches on the wall anchorage end, to allow proper attachment of bearing plate and nut as well as embedment into facing attachment plate. Threading may be continuous spiral deformed ribbing provided by the bar deformations (continuous thread bars) or may be cut into a reinforcing bar. If threads are cut into a reinforcing bar, provide the next-larger bar number designation that is shown on the Plans, at no additional cost to the Owner.
- C. Bar couplers shall develop the full ultimate tensile strength of the bar as certified by the Manufacturer.
- D. Fusion Bonded Epoxy Coating: ASTM A 775 or AASHTO No. M284 Minimum 0.3-mm (0.016-in.) thickness electrostatically applied. Bend test requirements are waived. Coating at the wall anchorage end of epoxy-coated bars may be omitted over the length provided for threading the nut against the bearing plate.
- E. Encapsulation. Minimum 1-mm (0.04-in.) thick, corrugated, HDPE tube conforming to ASTM 01248 and AASHTO M252 or corrugated PVC tube conforming to ASTM DI784, Class 13464-B.

- F. Centralizers shall be constructed of schedule 40 PVC, shall be securely attached to the nail bar, sized to position the nail bar within 1 inch of the center of the drill hole, sized to allow tremie pipe insertion to the bottom of the drill hole, and sized to allow grout to flow freely up the drill hole.

2.3 SOIL NAIL GROUT

- A. Fine Aggregate. AASHTO M6/ASTM C33.
- B. Portland cement: AASHTO M85/ASTM C150, Type I or Type II.
- C. Admixtures: AASHTO M194/ASTM C494. Admixtures that control bleed, improve flowability, reduce water content, and retard set may be used in the grout subject to review and acceptance by the Engineer. Accelerators are not permitted. Expansive admixtures may only be used in grout used for filling sealed encapsulations. Admixtures shall be compatible with the grout and mixed in accordance with the Manufacturer's recommendations.
- D. Nail grout shall be a neat cement or sand-cement mixture with a minimum 3-day comprehensive strength of 2000 psi and a minimum 28-day compressive strength of 4000 psi per ASTM C I 09/AASHTO T 106.
- E. Cement shall be adequately stored to prevent moisture degradation and partial hydration. Cement that has become caked or lumpy shall not be used.
- F. Film Protection: Polyethylene film per AASHTO M 171.

2.4 SOIL NAIL APPURTENANCES

- A. Bearing Plates, Nuts, and Welded Stud Shear Connectors.
 - 1. Bearing Plates: ASTM A36, Grade 36. Steel plate dimensions shall be within 0.25 inches of that shown on the Plans.
 - 2. Nuts and Washers: AASHTO M291, Grade B, hexagonal, fitted with beveled washer or spherical seat to provide uniform bearing.
 - 3. Shear Connectors: ASTM AI08. Shear connector locations shall be within 0.25 inches of that shown on the Plans.
- B. Welded Wire Fabric. AASHTO M55/ASTM A 185 or A497.
- C. Reinforcing Steel. AASHTO M3 1/ASTM A6 I 5, Grade 60, deformed.
- D. Geocomposite Sheet Drain: Manufactured with a drainage core (e.g., geonet) and a drainage geotextile attached to or encapsulating the core. Drainage core to be manufactured from long chain synthetic polymers composed of at least 85 percent by mass of polypropylenes, polyester, polyamine, polyvinyl chloride, polyoleofin, or polystyrene and having a minimum compressive strength of 275 kPa (40 psi) when tested in accordance with ASTM D 1621 Procedure A. The drainage core with the geotextile fully encapsulating the core shall have a minimum flow rate of 1 liter per second per meter of width tested in accordance with ASTM D 4716. The test conditions shall be under an applied load of 69 kPa (10 psi) at a gradient of 1.0 after a 100-hour seating period. Sheet drains shall be at least 12 inches wide, and overlaps shall be at least 12 inches long.

E. Underdrain and Perforated Pipe

1. Pipe: ASTM 1785 Schedule 40 PVC solid and perforated wall; cell classification 12454-B or 12354-C, wall thickness SDR 35, with solvent weld or elastomeric joints.
2. Fittings: ASTM D3034, Cell classification 12454-B or C, wall thickness SDR 35, with solvent or elastomeric joints.

2.5 SHOTCRETE

A. General:

1. All shotcrete shall comply with the requirements of ACI 506.2-95 except as specified otherwise herein. The Engineer shall contract an independent testing laboratory to core and test shotcrete panels and inspect all shotcrete and steel reinforcement placement in accordance with ACI 506.4R-94.
2. All workers, including foreman, nozzle men, finishers and delivery Equipment operators, shall be fully qualified to perform the Work. Qualification of the nozzle men shall be based on the results of test panels as required herein, unless approved otherwise by the Engineer.

B. Shotcrete Materials:

1. All materials for shotcrete shall conform to the following requirements:
 - a. Cement shall conform to ASTM C150 / AASHTO M85, Type I or Type II.
 - b. Fine aggregate shall conform to ASTM C33/ AASHTO M6.
 - c. Coarse aggregate shall conform to AASHTO M-80, Class B.
 - d. Water shall be potable, clean, and free from substances deleterious to concrete and steel or that would cause staining.
 - e. Accelerator shall be the fluid type, applied at nozzle, and meet the requirements herein.
 - f. Water-reducer and super-plasticizer shall conform to ASTM C494 / AASHTO M194; Type A, D, F, and G.
 - g. Air-entraining agent shall conform to ASTM C260 / AASHTO M154.
 - h. Fly ash shall conform to ASTM C618 / AASHTO M245, Type F or G, cement replacement up to 35% by weight of cement.
 - i. Silica fume shall conform to ASTM C1240, 90% minimum silicon dioxide solids content, not to exceed 12% by weight of cement.
 - j. Welded wire fabric shall conform to ASTM A185 / AASHTO M55.
 - k. All reinforcing steel shall conform to ASTM A615 / AASHTO M31, Grade 60. All reinforcing steel details shall conform to ACI 315.
 - l. Curing compounds shall conform to AASHTO M148, Type ID or Type 2.
 - m. Film protection for curing shall conform to AASHTO M171 or polyethylene film.

2. Shotcrete admixtures shall not be used unless approved by the Engineer. Admixtures used to entrain air, to reduce water-cement ratio, to retard or accelerate setting time, or to accelerate the development of strength, shall be thoroughly mixed into the shotcrete at the rate specified by the Manufacturer unless specified otherwise. Accelerating additives shall be compatible with the cement used, be non-corrosive to steel and shall not promote other detrimental effects such as cracking or excessive shrinkage. The maximum allowable chloride ion content of all ingredients shall not exceed 0.10 percent when tested per AASHTO T260.
3. Materials shall be delivered, stored and handled to prevent contamination, segregation, corrosion or damage. Liquid admixtures shall be shipped, stored, and handled to prevent evaporation and freezing.
4. Aggregates for shotcrete shall meet the strength and durability requirement of AASHTO M80.
5. Cement content shall be at least 600 pounds per cubic yard. The water/cement ratio shall not be greater than 0.45. For wet-mix shotcrete exposed to freezing and thawing, the air content at the truck shall be between 7 to 10 percent when tested in accordance with ASTM C231 /AASHTO T1 52.
6. Shotcrete shall be proportioned to attain a compressive strength of 2000 PSI in 3 days and 4000 PSI in 28 days. The average compressive strength of each set of three cores extracted from test panels or wall face must be equal to or exceed 85%, with no individual core less than 75% of the specified compressive strength in accordance with ACI 506.2.
7. Aggregate and cement may be batched by weight or by volume in accordance with the requirements of ASTM C94 / AASHTO M157. Mixing Equipment shall be capable of thoroughly mixing the materials in sufficient quantity to maintain placing continuity. Ready-mix shotcrete shall be delivered and placed within 1-1/2 hours of the batch time unless approved otherwise by the Engineer.

PART 3 – EXECUTION

3.1 GENERAL

- A. The construction sequence shall be as shown on the Plans, or in accordance with the approved submittal, unless approved otherwise by the Engineer. No excavations steeper or higher than those specified herein or on the Plans shall be made above or below the soil nail wall without written approval of the Engineer.
- B. Construction methods, sequence or closure times that are either indicated on the Plans or approved otherwise by the Engineer do not relieve the Design Builder of all responsibility for stability of the temporary cut face until it is closed and stabilized with hardened shotcrete and the nail head connection is completely installed.
- C. Where the Design Builder's construction sequencing results in a discontinuous lift along any nail row, the ends of the lift shall extend beyond the ends of the next lower lift by at least 10 feet. A soil berm shall be constructed immediately beneath these stepped lifts to prevent sloughing or failure that would result in loss of ground at the face.

3.2 EXCAVATION

- A. At least 15 days prior to initiating the Work, the Design Builder shall submit to the Engineer for review and approval excavation Equipment types, methods of excavating to nail benches, methods used to control the limits of excavation and overbreak, to the staged lifts indicated on the Plans.

- B. Mass excavation for site development at distances from the shotcrete wall face greater than the current shotcrete wall height or 10 feet, whichever is more, may occur at any time, but slopes shall be compliant with OSHA regulations or other applicable standards.
- C. Mass excavation of the drill bench for the next row of soil nails may occur at any time of the day after shotcreting the preceding lift, provided such excavation occurs no closer than 5 feet from the face of the shotcrete.
- D. Mass excavation beneath a preceding shotcrete lift, closer than 5 feet from the shotcrete wall face, shall not occur until: (1) nail grout and shotcrete on the preceding lift shall have reached 50% of their specified 28-day compressive strengths; and (2) installation of connection hardware and nail testing for the preceding lift are complete and acceptable to the Owner's representative. Mass excavation closer than 5 feet to the shotcrete face must be in accordance with the drill berm requirements described below and shown on the plans, unless approved otherwise by the Engineer.
- E. During mass excavation of the drill bench for the next row of soil nails, the Design Builder shall maintain a bench of material to serve as a platform for the drilling Equipment and as a stabilizing berm for the wall excavation face (neat line). In accordance with the Plans or as approved by the Engineer, the stabilizing berm may be either: (1) a native berm, (2) a fill berm, or (3) neat cut. In all three cases, the drill bench shall be established not more than 1 foot below the row of nails to be installed and shall extend out from the wall face a minimum distance necessary to provide a safe working bench for the drill Equipment and workers,
- F. Excavation to the neat line shall be done using procedures that prevent over excavation or loosening, minimize degradation of the soil bearing support below the overlying portions of the soil nail wall and below the soil nails currently being installed, minimize loss of soil moisture and prevent ground freezing. The Design Builder is responsible for all costs associated with the shotcrete facing necessary to address excavation and overbreak beyond the neat line.
- G. The duration of time between final excavation to the neat line and the application of shotcrete is referred to as the closure time. The closure time for all wall excavation faces shall be less than a single work shift, unless shown otherwise on the Plans or approved otherwise by the Engineer.
- H. Extension of the closure time shall be submitted to the Engineer for review and approval. No extension of closure time shall be approved until a test cut is constructed and the Design Builder demonstrates for each material type that the cut face shall be stable over the proposed closure time. Extensions to the closure time may be revoked by the Engineer at any time depending on the performance of the cut face.
- I. Methods of removal of face protrusions (e.g. cobbles, boulders, rubble, or other objects) to accomplish the construction shall be determined by the Design Builder. The Design Builder shall notify the Engineer of the proposed method for mitigation of face protrusions prior to initiation of the Work. Should the removal of face protrusions result in voids beyond the neat line, the Design Builder shall determine the appropriate method of backfilling and shall submit to the Engineer such methods prior to initiating the Work.

3.3 NAIL INSTALLATION

- A. For each different method of nail installation, two successful verification tests shall be performed in soil units comprised of soil/ weathered rock, and sound rock prior to starting installation of production nails in the various soil units. Final verification test locations shall be determined by the Design Builder and approved by the Owner's representative.

- B. Nails shall be installed at the locations and to the lengths indicated on the Plans. The Engineer may add, eliminate, or relocate nails to accommodate actual field conditions.
- C. The Design Builder shall select the drilling Equipment and methods suitable for the ground conditions described in the geotechnical report. The drill hole diameter shall be as shown on the Plans and provide the minimum specified grout cover over the nail bar and to develop the specified pullout resistance. Water, drilling muds, or other fluids used to assist in cutting removal shall not be allowed for uncased drill holes. Uncased drill holes shall be observed for cleanliness prior to insertion of the nail bar. In caving ground, the Design Builder shall use cased or augercast drilling methods to support the sides of the drill hole.
- D. The Design Builder shall immediately suspend drilling operations if ground subsidence is observed, if the soil nail wall is adversely affected, or if adjacent structures are damaged as a result of the drilling operation. The adverse conditions shall be stabilized immediately and the Engineer shall be notified of such conditions within 24 hours.
- E. Nail bars shall be inserted into the drill hole to the required length without difficulty and in such a manner as to prevent damage to the drill hole. Nail bars that cannot be fully inserted to the design depth shall be removed from the drill hole and the drill hole wall be cleaned sufficiently to allow unobstructed installation of the bar.
- F. If the nail bar is installed using cased or augercast methods, centralizers are not required provided the installation method ensures that the bar shall remain in the central portion of the grout. In such situations, grout slump shall not exceed 8 inches.

3.4 NAIL GROUTING

- A. Grout Equipment shall produce a uniformly mixed grout free of lumpy and undispersed cement. A positive displacement grout pump shall be used. The pump shall be equipped with a pressure gauge that can measure at least twice but no more than three times the intended grout pressure. The grouting Equipment shall be sized to enable the entire nail to be grouted in one continuous operation. The mixer shall be capable of continuously agitating the grout during usage.
- B. Uncased drill holes shall be grouted after installation of the nail bar. Grouting prior to insertion of the nail bar may be allowed provided neat cement grout is used and the nail bar is immediately inserted through the grout to the specified length without difficulty. No portion of the nail hole shall be left open for more than 1 hour prior to grouting unless approved otherwise by the Engineer. The grout shall be injected at the lowest point of each drill hole through a tremie pipe, hollow-stem auger, or drill rods with the drill hole filled in one continuous operation. Cold joints in the grout placement are allowed for construction of test nails. The conduit delivering the grout shall be kept below the surface of the grout as the conduit is withdrawn. The grouting conduit shall be withdrawn as the nail hole is filled in a manner which prevents the creation of voids. The quantity of grout and the grouting pressures shall be recorded for each soil nail. Grout pressures shall be controlled to prevent excessive ground heave or fracturing.
- C. During casing removal for drill holes advanced by either cased or augercast methods, the grout surface within the casing shall be continually monitored for maintenance of "head" sufficient to offset the external groundwater/soil pressure.
- D. Nail grout shall have a minimum compressive strength of 2,000 psi in 3 days and 4,000 psi in 28 days. Nail grout shall be tested by a testing agency under contract with the Owner in accordance with ASTM

CI 09 / AASHTO T 106 at a frequency of no less than one test for every 50 cubic yards of grout placed or once per day, whichever is first.

- E. Temporary unbonded lengths shall be provided for each test nail. The test nail bar shall be isolated from the wall facing and the reaction frame during testing. Satisfactory test nails may be incorporated in the Work provided the temporary test unbonded length is fully grouted subsequent to testing.

3.5 NAIL TOLERANCES

- A. The soil nails shall not extend beyond the right-of-way or easement limits shown on the plans, unless approved otherwise, bars shall be centered within 1 inch of the center of the drill hole. Individual nails shall be positioned plus or minus 1 foot from the design locations shown in the Plans. Location tolerances shall be considered applicable to only one nail and not cumulative over large wall areas. The nail inclination shall be plus or minus 3 degrees of that shown in the Plans. Nail splay angle shall be plus or minus 3 degrees. Nails that encounter unanticipated obstructions during drilling shall be relocated by the Design Builder with the approval of the Engineer.

3.6 NAIL TESTING

- A. General:

1. Verification tests shall be performed at the locations shown on the Plans. Alternate locations selected by the Design Builder are subject to approval by the Engineer. Proof tests shall be performed at the locations selected by the Engineer. All test data shall be recorded by the Engineer and the Design Builder. Pullout testing of nails shall not be performed until the nail grout and wall facing have attained at least 50 percent of their specified 28-day compressive strengths.
2. Where temporary casing of the unbonded length of test nail is provided, the casing shall be installed to prevent any reaction between the casing and the grouted bond length of the nail and/or the stressing apparatus.
3. Testing Equipment shall include two dial gauges, a dial gauge support, jack and pressure gauge, a pump, and a reaction frame.
4. A minimum of two dial gauges capable of measuring to 0.001-inch shall be available at the Site to measure the nail movement. The dial gauges shall be aligned within 5 degrees of the axis of the nail and shall be supported independent of the jacking setup and the wall. A hydraulic jack, pressure gauge, and pump shall be used to apply and measure the test load.
5. The jack and pressure gauge wall shall be calibrated by an independent testing laboratory as a unit. The pressure gauge shall be graduated in 100 psi increments or less and shall have a range not exceeding twice the anticipated maximum pressure during testing unless approved otherwise by the Engineer. The ram travel of the jack shall be sufficient to enable the test to be performed without resetting the jack.
6. The jack shall be independently supported and centered over the nail so that the nail does not carry the height of the jack. The stressing Equipment shall be placed over the nail in such a manner that the jack, bearing plates, and stressing anchorage are in alignment. The jack shall be positioned at the beginning of the test such that unloading and repositioning of the jack during the test shall not be required.

7. The test reaction frame shall be sufficiently rigid and of adequate dimension such that excessive deformation of the test apparatus requiring repositioning of any components does not occur during testing. Where the reaction frame bears directly on the wall, the reaction frame shall be designed to prevent damage or cracking of the wall facing.

B. Pre-Production Verification Testing of Sacrificial Nails:

1. Pre-production verification testing in each soil unit shall be performed in that unit to verify the Design Builder's installation methods, nail pullout capacity, and design assumptions. A minimum of 4 tests shall be performed. The nails used for the verification tests may not be incorporated as production nails. Payment for additional verification test nails required due to differing Site conditions, as determined by the Engineer, shall be per nail tested.
2. Test nails shall be constructed using the same Equipment, methods, and hole diameter as planned for the production nails. Changes in the drilling or installation method may require additional nail testing as determined by the Engineer.
3. The unbonded length of test nails shall be at least 3 feet unless approved otherwise by the Engineer. The bond length of test nails shall be determined by the Design Builder such that the allowable bar load is not exceeded but shall not be less than 3 feet. The bar load during testing shall not exceed 90% of the steel yield strength for grade Grade 75 bars.
4. The Design Test Load (DTL) during testing shall be determined by multiplying the bond length of the nail times the design pullout resistance. Verification test nails shall be incrementally loaded in 0.25 DTL increments to a maximum load of 1.50 DTL in accordance with the following schedule. Verification test nails shall be incrementally loaded and unloaded in accordance with the following schedule:

Load	Hold Time
AL	1 minute
0.25 DTL	10 minutes
0.50 DTL	10 minutes
0.75 DTL	10 minutes
1.00 DTL	10 minutes
1.25 DTL	10 minutes
1.50 DTL	60 minutes
1.75 DTL	10 minutes
2.00 DTL	10 minutes

5. The Alignment Load (AL) should be the minimum load required to align the testing apparatus and should not exceed 0.05 DTL. Dial gauges should be zeroed after the alignment load is applied.
6. Each load increment shall be held for at least 10 minutes. The verification test nail shall be monitored for creep for 60 minutes at the 1.50 DTL load increment. Nail movements during the creep portion of the test shall be measured and recorded At 1, 2, 3, 5, 6, 10, 20,30, 50, and 60 minutes.

C. Proof Testing of Production Nails:

1. Proof testing shall be performed on approximately 5 percent of the production nails or as determined by the Owner's Engineer. If nail installation methods are substandard on any particular nail or series of nails, additional tests may be required.
2. The unbonded length of test nails shall be at least 3 feet unless approved otherwise by the Engineer. The bond length of test nails shall be determined by the Owner's representative such that the allowable bar load is not exceeded but shall not be less than 7 feet. The bar load during testing shall not exceed 90% of the steel yield strength for grade 60 and Grade 75 bars.
3. Proof test nails shall be incrementally loaded in 0.25 DTL increments to a maximum load of 1.50 DTL in accordance with the following schedule:

AL	1.00 DTL
0.25 DTL	1.25 DTL
0.50 DTL	1.50 DTL
0.75 DTL	

4. The Alignment Load (AL) should be the minimum load required to align the testing apparatus and should not exceed 0.05DTL. Dial gauges should be zeroed after the alignment load is applied.
5. Depending on performance, either a 10 minute or 60 minute creep test shall be performed at 1.50DTL. Nail movement shall be measured and recorded at 1,2,3,5,6, and 10 minutes. Where the nail movement between 1 minute and 10 minutes exceeds 0.04 inches, the maximum test load shall be maintained an additional 50 minutes and movements shall be recorded at 20,30,50, and 60 minutes.

D. Test Nail Acceptance:

1. A test nail shall be considered acceptable when:
 - a. For verification tests, a creep rate less than 0.08 inches per log cycle of time between the 6 and 60 minute readings is observed during creep testing, and the rate is linear or decreasing throughout the creep test load hold period.
 - b. For proof tests, a creep rate less than 0.04 inches per log cycle of time between the 1 and 10 minute readings is observed or a creep rate less than 0.08 inches per log cycle of time between the 6 and 60 minute readings, and the creep rate is linear or decreasing throughout the creep test load hold period.
 - c. The total movement at the maximum test load exceeds 80% of the theoretical elastic elongation of the unbonded length.
 - d. A pullout failure does not occur during testing. Pullout failure is defined as the load at which attempts to increase the test load simply result in continued pullout movement of the test nail.

2. At the Design Builder's option, successful proof test nails meeting the above test acceptance criteria may be incorporated as production nails provided that (1) the unbonded test length of the nail hole has not collapsed during testing, (2) the minimum required hole diameter has been maintained, and (3) the test nail length and bar size are equal to or greater than the scheduled production nail length and bar size. Test nails meeting these requirements shall be completed by satisfactorily grouting the unbonded test length. Maintaining the temporary unbonded test length for subsequent grouting is the Design Builder's responsibility.
3. The Engineer shall evaluate the results of each verification test. Nail installation methods that do not satisfy the nail testing requirements shall be considered inadequate. The Design Builder shall propose alternative methods and install replacement verification test nails.
4. The Engineer may require that the Design Builder replace some or all of the production nails represented by inadequate proof tests with no additional cost to the Owner.

3.7 EXECUTION OF PRODUCTION SHOTCRETE WORK

A. Alignment Control:

1. Alignment wires and/or thickness control pins shall be provided as necessary to establish and maintain the minimum shotcrete thickness shown on the Plans. The maximum distance between the wires and/or thickness control pins on any surface shall be equal to the vertical nail spacing. The Design Builder shall ensure that alignment wires are tight, true to line, and placed to allow further tightening.

B. Surface Preparation:

1. Prior to shotcreting the ungrouted zone above the nail grout at the excavation cut face (bird's beak), the Design Builder shall remove all loose materials from the surface of the grout.
2. The Design Builder shall remove all loose materials and loose dried shotcrete from previous placement operations and from all receiving surfaces by methods acceptable to the Engineer. The removal shall be accomplished in such a manner as not to loosen, crack, or shatter the surfaces to receive the shotcrete. Any surface material that, in the opinion of the Engineer, is so loosened or damaged shall be removed to sufficient depth to provide a base that is suitable to receive the shotcrete. Material that loosens as the shotcrete is applied shall be removed. Shotcrete shall not be placed on frozen surfaces.

C. Delivery and Application:

1. A clean, dry, oil-free supply of compressed air sufficient for maintaining adequate nozzle velocity for all parts of the Work and for simultaneous operation of a blow pipe for cleaning away rebound shall be maintained at all times. The Equipment shall be capable of delivering the premixed material accurately, uniformly, and continuously through the delivery hose.
2. The shotcrete shall be applied from the lower part of the work area upwards to prevent accumulation of rebound on uncovered surfaces. Thickness, methods of support, air pressure, and rate of placement of shotcrete shall be controlled to prevent sagging or sloughing of freshly applied shotcrete. Where shotcrete is used to fill the bird's beak, the nozzle shall be positioned

into the mouth of the drill hole to completely fill the void. Rebound shall not be worked back into the placement nor shall the rebound be salvaged. Rebound that does not fall clear of the working area shall be removed. The nozzle shall be held at a distance and at an angle approximately perpendicular to the working face so that rebound shall be minimal and compaction shall be maximized. The nozzle should be rotated steadily in a small circular pattern.

3. Shotcrete placement shall be by the bench gunning method when the thickness of the shotcrete layer is 6 inches or greater. The gunning method shall consist of building up a thick layer of shotcrete from the bottom of the lift and maintaining the top surface at approximately a 45-degree slope.

D. Visual Observation:

1. A clearly defined pattern of continuous horizontal or vertical ridges or depressions at the reinforcing elements after they are covered shall be considered indication of insufficient cover of reinforcement or poor application and probable void. In this case, the Work shall be immediately suspended and the Work carefully inspected by the Owner's representative. The Design Builder shall implement and complete corrective measures prior to resuming the shotcrete operations.
2. The shotcreting procedure may be corrected by adjusting the nozzle distance and orientation perpendicular to the surface, adjusting the water content of the shotcrete mix, or other means acceptable to the Engineer. All overspray and rebound shall be removed from the surface.
3. Surface defects shall be repaired as soon as possible after initial placement of shotcrete. All shotcrete that lacks uniformity, exhibits segregation, sagging, honeycombing, or lamination, or contains any voids or sand pockets shall be removed and replaced with fresh shotcrete by the Design Builder to the satisfaction of the Engineer.

E. Attachment of the Nail Head Connection Hardware:

1. For bearing plate connections, the plate shall be wet-set while the shotcrete is plastic to assure full shotcrete bearing behind the plate. However, the retention nut shall only be hand tightened such that full bearing is achieved without excessively squeezing fresh shotcrete out from under the plate.
2. For embedded plate connections (typically with headed studs), the embedment's wall shall be located within the wall such that the proper shotcrete cover is provided as shown on the Plans. In addition, the plate, washer, and nut shall BE installed so that they have sufficient contact with each other as shown on the Plans.

F. Construction Joints:

1. Construction joints shall be watertight and uniformly tapered toward the excavation face over a minimum distance equal to the thickness of the shotcrete layer. The surface of the joints shall be rough, clean, sound and damp. The hardened surface shall be cleaned of all laitance, foreign substances, washed with clean water, and wetted thoroughly immediately prior to placement of fresh shotcrete.

G. Finishing and Curing Requirements:

1. Shotcrete finish shall be as applied.
2. The shotcrete shall be protected from loss of moisture for at least 7 days after placement. When shotcrete is being protected from low temperatures, curing shall be terminated no sooner than one day after the removal of low temperature protection. Curing of shotcrete shall be by methods that shall keep shotcrete surfaces adequately wet and protected during the specified period. Curing shall commence within one hour of shotcrete application. When the ambient temperature exceeds 80 degrees Fahrenheit, the Design Builder shall plan the Work such that curing can commence immediately after finishing, the curing shall be completed using water, membrane, or film curing methods in accordance with the following requirements.
3. For water curing, the rate of water application shall be regulated to provide complete surface coverage with a minimum of runoff.
4. For membrane curing, curing compounds shall not be used on any surfaces against which additional shotcrete or other finishing materials are to be bonded unless the surface is sandblasted in a manner acceptable to the Owner's representative. Membrane curing compounds shall be spray applied as quickly as practical after initial shotcrete set at coverage of not less than 40 square feet per gallon.
5. For film curing, polyethylene sheeting may be used to supplement water curing on shotcrete that shall be covered later with additional shotcrete or concrete. The sheeting shall completely cover all surfaces, and have edges overlapped for proper sealing and anchorages.

H. Test Panels:

1. In general, preconstruction and production shotcrete test panels shall be required. However, depending on the amount of shotcrete wall reinforcement, the Engineer may waive the requirements for a reinforced preconstruction test panel. Preconstruction and production test panels shall not be disturbed or moved within the first 24 hours after shooting. Test panels shall be field cured under conditions similar to those anticipated for the Work. Shotcreting and coring of test panels shall be performed by qualified personnel in the presence of the Engineer. The Design Builder shall notify the Engineer not less than 2 days prior to the shooting of the preconstruction test panels.
2. Each nozzle man shall furnish at least two preconstruction test panels for each proposed mixture being considered and for each shooting position encountered on the job. Preconstruction test panels shall be made by each application crew using the Equipment, materials, mixture proportions, and procedures proposed for the job prior to the commencement of the Work.
3. Preconstruction test panels shall be 30 inches by 30 inches (minimum), in accordance with ACI 506.2-95 and the following:
 - a. One test panel shall be the maximum shotcrete thickness shown on the plans and shall include the maximum anticipated reinforcing congestion. Cores extracted from the reinforced test panel shall demonstrate encapsulation of the reinforcement in accordance with ACI 506.2 equal to core grade 2 or better.

- b. One test panel shall be un-reinforced, at least 8 inches thick, and used for compressive strength testing.
- c. The sides of the test panels shall be chamfered outward at 45 degrees over the full thickness of the panel.
4. The Design Builder shall furnish at least one production test panel or, in lieu of production test panels, six 3-inch diameter cores from the shotcrete face during the first application of shotcrete and henceforth for every fifth application of shotcrete, or every 5000 square feet, or 50 cubic yards of shotcrete placed, whichever is less. The production test panels shall be constructed simultaneously with the shotcrete facing installation at times designated by the Engineer. The production test panels shall have minimum dimensions of 18 inches by 18 inches by 8 inches.
5. Shotcrete shall be accepted based on the 28-day strength of cores taken from the production test panels. The frequency specified for the production test panels is approximate. A greater number of panels may be required by the Engineer.
6. At least six cores shall be cut from each preconstruction and production test panel for compressive strength testing. Cores shall be soaked in water for at least 40 hours in accordance with AASHTO T24 or ACI 506.2. Cores shall be at least 3 inches in diameter and shall have a minimum length to diameter ratio of one. When the length of a core is less than twice the diameter, apply the correction factors given in ASTM C42 to obtain the compressive strength of individual cores. Three cores shall be tested at 3-days, and three cores shall be tested at 28-days for compressive strength. Core holes in the wall shall be filled with patching mortar after cleaning and thorough dampening.

I. Weather Limitations:

1. Shotcrete shall not be placed in cold weather unless adequately protected when the ambient temperature is below 40° F and falling and/or when the shotcrete is likely to be subjected to freezing temperatures before reaching a minimum strength of 750 psi. Cold weather protection shall be maintained until the strength of the shotcrete is greater than 750 psi. Cold weather protection shall include heating under tents, blankets or other means acceptable to the Engineer. The temperature of the shotcrete, when deposited, shall be not less than 50° F or more than 80° F. The air in contact with shotcrete surfaces shall be maintained at temperatures above 32° F for a minimum of 7 days.
2. Shotcrete application shall also be suspended during high winds and heavy rains when in the opinion of the Engineer the quality of the application is not acceptable. Newly-placed shotcrete exposed to rain that washes out cement or otherwise makes the shotcrete unacceptable to the Owner's representative shall be removed and replaced. The Design Builder shall provide adequately secured polyethylene sheeting or equivalent when adverse exposure to weather is anticipated.

J. Tolerances:

1. The tolerances for shotcrete facings shall be as follows:
 - a. The vertical location of a horizontal shotcrete joint shall be within 0.5 feet of the elevation shown on the Plans
 - b. The shotcrete wall thickness shall be no less than that shown on the Plans minus 0.5 inches.

- c. The horizontal and vertical locations of reinforcing bars shall be within 1 inch of the locations shown on the Plans.
- d. Reinforcing bar lap lengths shall be no less than that shown on the Plans minus 1 inch.
- e. Reinforcing bar spacing's shall not exceed that shown on the Plans plus 1 inch.
- f. The deviation in planeness of the finished wall surface shall not exceed 0.5 inches in 10 feet.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02359

MODULAR PRECAST BLOCK RETAINING WALLS

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This work shall consist of the designing, furnishing, and construction of Modular Precast Block Retaining Walls (MPB) in accordance with these specifications and in close conformity with the lines, grades, and dimensions shown on the Design Builder's Approved Drawings or established by the Engineer. Final design details for these structures such as, concrete unit thickness, connection details, and loading appurtenances shall be as designed by the manufacturer from design parameters contained herein. This specification is intended to cover all modular precast block retaining wall systems, some of which may be proprietary.
- B. The Walls shall consist of precast concrete units, select fill, filter fabric, drainage piping and a leveling pad. The precast concrete units shall be sized to have sufficient external stability resistance at each module course to satisfy the design requirements. The material, fabrication, and construction shall comply with this specification and the requirements specified by the supplier of the wall system.

1.2 RELATED SECTIONS

- A. Other specification sections that relate to the work include, but are not limited to, the following:
 - 1. Section 02100 – SITE PREPARATION
 - 2. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
 - 3. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
 - 4. Section 02300 – EARTHWORK
 - 5. Section 02400 – DRAINAGE AND SEWER SYSTEMS
 - 6. Section 02470 – SITE IMPROVEMENTS
 - 7. Section 03300 – CAST-IN-PLACE CONCRETE
 - 8. Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE

1.3 REFERENCE DOCUMENTS

- A. American Society for Testing and Materials (ASTM)
 - 1. ASTM C140 Rev A Sampling and Testing Concrete Masonry Units and Related Units
 - 2. ASTM C666 Test Method for Resistance of Concrete to Rapid Freezing and Thawing
 - 3. ASTM C1262 Evaluating the Freeze-Thaw Durability of Dry-Cast Segmental Retaining Wall Units and Related Concrete Units
 - 3. ASTM C1372 Dry-Cast Segmental Retaining Wall Units
 - 4. ASTM D422 Particle Size Analysis of Soils
 - 5. ASTM D698 Laboratory Compaction Characteristics of Soil Using Standard Effort
 - 6. ASTM D4318 Liquid Limit, Plastic Limit, and Plasticity Index of Soils
 - 7. ASTM D3034 Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings
 - 8. ASTM F2619 High-Density Polyethylene (HDPE) Line Pipe

- B. AASHTO LRFD Bridge Design Specifications - American Association of State Highway and Transportation Officials (AASHTO).
- C. Standard Specifications for Transportation Materials and Methods of Sampling and Testing, American Association of State Highway and Transportation Officials (AASHTO).
- D. American Railway Engineering and Maintenance-of-Way Association - AREMA

1.4 SUBMITTALS

- A. Final design computations demonstrating compliance with the design requirements specified herein and shown on the Design Builder's Approved Drawings, prepared, signed and stamped by a registered Professional Engineer registered in the Commonwealth of Massachusetts with structural/geotechnical engineering expertise. The drawings and design calculations shall include:
 1. Statement of all assumptions made and copies of all references used in the calculations.
 2. Design Builder shall submit construction drawings and design calculations for the modular precast block retaining wall system prepared and stamped by a structural/geotechnical Professional Engineer registered in the Commonwealth of Massachusetts.
 3. Analyses demonstrating compliance with all applicable earth, water, surcharges, seismic, or other loads, as specified herein and required by AREMA and AASHTO.
 4. Analyses or studies demonstrating durability and corrosion resistance of modular precast block retaining wall systems for the proposed location and environment. The designers shall provide all corrosion protection devices necessary for the modular precast block retaining wall to have a minimum service life of 75 years in the proposed location and environment.
 5. Existing ground elevations that have been verified by the Design Builder for each location involving construction wholly or partially in original ground.
 6. Layout of retaining walls that shall effectively retain the earth but not less in height or length than that shown for the wall system in the Design Builder's Approved Drawings.
 7. Complete design calculations substantiating that the proposed design for each alternative proprietary or nonproprietary earth retaining system as permitted or specified satisfies the design parameters and minimum requirements shown in the Design Builder's Approved Drawings.
 8. Complete details of all elements required for the proper construction of the system, including complete material specifications and connection details.
 9. Earthwork requirements including specifications for material and compaction of backfill.
 10. Details of revisions or additions to drainage systems or other facilities required to accommodate the system.

The Design Builder shall not start work on any earth retaining system for which shop drawings and installation drawings are required until such drawings have been approved by the Engineer. Approval of the Design Builder's Approved Drawings shall not relieve the Design Builder of any of his responsibility under the contract for the successful completion of the work

- B. A detailed resume of the wall designer listing similar projects and demonstrating necessary experience to perform the modular precast block retaining wall design, including a brief description of each

project that is similar in scope. A reference shall be included for each project listed. As a minimum, the reference shall include an individual's name, address and current phone number.

- C. A detailed listing of modular precast block retaining walls that the Design Builder has constructed including a brief description of each project and a listing of personnel who shall construct the walls demonstrating their experience in construction of modular precast block retaining walls. A reference shall be included for each project listed. As a minimum, the reference shall include an individual's name, address and current phone number.
- D. Manufacturer's product data for the modular precast block retaining wall system, including material, manufacturer and erection specifications, all specified erection equipment necessary, details of buried modular precast block retaining wall elements, special details required of reinforcing layout around drainage structures and sign foundations as applicable, structures design properties, type of backfill and details for connections between facing panels.
- E. Concrete mix design in accordance with Section 03300 – CAST-IN-PLACE CONCRETE and 03410 – PLANT PRECAST STRUCTURAL CONCRETE.
- F. Work/shop drawings showing the configuration and all details, dimensions, quantities and cross-sections necessary to construct the modular precast block retaining wall, including but not limited to the following:
 - 1. A plan view of the wall which shall include Contract limits, stations and offsets, and the face of wall line shown on the Design Builder's Approved Drawings.
 - 2. An elevation view of the wall which shall include the elevation at the top of the wall at all horizontal and vertical break points and at least every 30 feet along the face of the wall, all steps in the leveling pads, the designation as to the type of retaining wall system(s), and an indication of the final ground line and maximum calculated bearing pressures. The face of wall shown on the Design Builder's Approved Drawings shall be indicated.
 - 3. A typical cross section or cross sections for each different wall configuration showing the elevation relationship between existing ground conditions and proposed grades, and the proposed wall configuration, including details for the proposed methods for connecting to existing conditions. The sections shall also indicate the location of the face of wall, surcharge fill, and outline of concrete barriers and base slabs, as shown on the Design Builder's Approved Drawings.
 - 4. General notes pertaining to design criteria and wall construction.
 - 5. A listing of the summary of material quantities for each wall.
 - 6. Details of sleeves and pipes and other embedded items to be installed through the walls.
 - 7. Clearly indicated details for construction of walls or reinforcing elements around drainage, foundations, utilities, culverts, or any other potential obstructions.
 - 8. Details of the architectural treatment of facing panels.
 - 9. Drainage design detail and design scheme.
 - 10. Location of utilities.
 - 11. Sequence and schedule of construction, including overall construction schedule.
 - 12. Methods of excavation and backfill.

13. Method of maintaining stability of excavated trenches.
 14. Method of monitoring plumbness and deviation of wall.
 15. Excavation support system, if any.
 16. Any acceptance testing and frequency.
 17. Details and location of all necessary construction and expansion joints. Due to the concerns of differential settlement, vertical slip joints shall be designed and constructed at a spacing of no greater than 30 feet apart.
 18. Connection details at the interface of the wall and any adjacent proposed cast in place retaining wall or abutment structure.
 19. Details of impermeable membrane connection to facing panels and to runoff collection system.
- G. Submit Plan of Actions to be implemented in the event any Response Value for deformation, as specified in Table 02359-1, is reached.

**TABLE 02359-1
RESPONSE VALUES**

Monitoring Type	Value
<u>Lateral Deflection of Earth Support Wall</u>	
Top of wall	1%
Mid-Point of wall	0.5%
<u>Vertical Deflection of Earth Support Wall</u>	
Top of wall	0.5 inches per 10 feet of wall
<u>Ground Surface Settlement</u>	
Top of Rail	¼ inch

- H. The Plan of Actions shall be positive measures by the Design Builder to limit further movement of the wall.
The details of the mitigating measures shall include a schedule of implementation, location and/or availability of materials, and a detailed description of the method of implementation. The Design Builder shall be prepared to work twenty four (24) hours per day to implement such measures.
- I. Samples:
1. Modular Precast Block Units shall be submitted in accordance with the provisions of Section 03410 –PLANT-PRECAST STRUCTURAL CONCRETE.
- J. Design Builder shall submit a Manufacturer's certification, 30 days prior to start of work, that the retaining wall system components meet the requirements of this specification and the structure design.

K. Design Builder shall submit a test report documenting strength of specific modular concrete.

1.5 DESIGN REQUIREMENTS

- A. The Modular Precast Block Retaining Walls shall be designed to provide the grade separation shown on the Design Builder's Approved Drawings with a service life of not less than 75 years.
- B. The Modular Precast Block Retaining Wall System shall be designed in accordance with the manufacturer's requirements, as specified herein, with the minimum requirements shown on the Design Builder's Approved Drawings, in accordance with AREMA (American Railway Engineering and Maintenance of Way Association), Manual for Railway Engineering, and in accordance with the AASHTO LRFD Standard Specifications for Highway Bridges. Design the wall system to support all applicable loads including, earth pressures, unrelieved hydrostatic pressures, Railroad loads (E-80), HS20-44 traffic loads, and any adjacent structure surcharge loads, utility loads, equipment loads, and construction loads. HS20-44 load shall be as set forth by the latest edition of AASHTO Standard Specification for Highway Bridges. The Design Builder shall verify that the latest editions of AREMA Manual and AASHTO manuals are being used for design. Where conflicting requirements occur, the more stringent shall govern. The design shall consider the internal and external stability of the wall mass.
- C. The structures shall be designed such that the following minimum factors of safety are achieved:
- | | |
|---------------------------|-----|
| 1. Sliding | 1.5 |
| 2. Overturning | 2.0 |
| 3. Bearing Capacity | 2.5 |
| 4. Global Slope Stability | 1.5 |
- D. The minimum wall embedment shall be to the local frost depth or at least 4 feet from the bottom of the leveling pad to the final exterior grade. The bottom of crushed stone leveling pads is inclusive of the 4 foot minimum.
- E. The modular precast block retaining wall design shall follow the dimensions of the wall envelope shown on the Design Builder's Approved Drawings. Base of leveling pad elevation shall be as shown on the Design Builder's Approved Drawings. All wall elements shall be within the right-of-way limits shown on the Design Builder's Approved Drawings. The facing panels shall be placed so as not to interfere with drainage or other utilities, or other potential obstructions.
- F. Facing panels shall have tongue and groove, ship lap, or similar approved connections along all joints, both vertical and horizontal. The top of wall panels shall be sloped to match the profile or as shown on the Design Builder's Approved Drawings.
- G. Modular precast block facing panels shall be installed on 6 inch cast-in-place concrete or 12 inch crushed stone leveling pads.
- H. All appurtenances behind, in front of, under, mounted upon, or passing through the wall such as drainage structures, utilities, fences, light poles, or other appurtenances shown on the Contract Drawings shall be accounted for in the final design of the wall.
- I. Walls or wall sections which intersect at an angle of one hundred thirty (130) degrees or less shall include a special corner element to cover the joint formed by the abutting walls or wall sections and to permit relative movement. Corner elements shall not consist of connected standard facing panels.
- J. Vertical slip joints shall be designed and installed at a spacing of no greater than 30 feet apart.

1.6 QUALITY ASSURANCE

- A. Modular Precast Blocks units shall be manufactured in a concrete products plant with approved facilities. Before proceeding with production, precast sample units shall be provided for the Engineer's acceptance. These samples shall be kept at the plant to be used for comparison purposes during production. The Inspector shall be allowed access to the plant for a prescheduled inspection.
- B. Verify that all calculations and working/shop drawings are signed and stamped by a Professional Engineer registered in the Commonwealth of Massachusetts and specializing in structural/geotechnical construction.
- C. Requirements for the precast units for this project may be different from the standard units from the approved systems. Appropriate, alternative details shall be prepared by the Design Builder and submitted for approval by the Engineer.
- D. All MPB walls shall be built in accordance with the Design Builder's Approved Drawings and accepted Shop Drawings for the proposed wall systems.
- E. A qualified representative from the wall manufacturer shall be present during construction of the MPB walls.
 - 1. One or more qualified civil engineer(s) representing the Manufacturer of the MPB wall shall be on site at the start of construction of each MPB wall to assist and advise the Design Builder in methods of construction and to advise the Engineer, in methods of ensuring that the walls are constructed in accordance with the Manufacturer's recommendations. The Engineer shall be notified as to which day the representative shall be present at the site. Additionally, the representative shall be available on an as-needed basis, as requested by the Engineer at any time during construction of the walls. In no case shall changes in the Design Builder's Approved Drawings or specifications recommended by the Manufacturer's Representative be made unless submitted in writing and approved by the Engineer.
- F. The Design Builder shall submit to the Engineer for approval a daily report of the wall Manufacturer's Representative activities. The report shall be prepared by the wall Manufacturer's Representative and shall describe all items investigated, inspected, and discussed with MBTA inspectors and personnel on the job site for that day.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. The Design Builder shall submit for approval, prior to fabrication, all materials to assure that the proper type, grade, color, and certification have been received.
- B. The Design Builder shall check all materials upon delivery to assure that the proper type, grade, color, and certification have been received.
- C. The Design Builder shall protect all materials from damage due to jobsite conditions and in accordance with manufacturer's recommendations. Damaged materials shall not be incorporated into the work.

PART 2 - PRODUCTS

2.1 GENERAL

- A. The Design Builder shall make his own arrangements to purchase the materials covered by this section of the specifications, including all necessary incidentals. The Design Builder, or the supplier as his agent, shall furnish the Engineer a Certificate of Compliance certifying that the applicable materials comply with this section of the specifications. Materials not conforming to this section of the specifications shall not be used without the written consent of the Engineer.

2.2 MATERIALS

A. Modular Precast Block Units

1. The precast units shall be manufactured of 5000 psi, 3/4 in, air-entrained cement concrete in accordance with the provisions of Section 03410 – PLANT-PRECAST STRUCTURAL CONCRETE and the following:
 - a. The panels shall be cast using custom architectural form liners that conform to the finish as shown on the Design Builder's Approved Drawings.
 1. All modular precast blocks to be manufactured to maintain a flush face upon completion of installation.
 2. Double sided panels shall be used when a panel or any portion of a panel is exposed above final grade. This applies to all end units as well.
 3. The top panel shall be designed such that the majority of the top surface is below finish grade.
 - b. Tolerances - All units shall be manufactured within the following tolerances:
 1. Panel Dimensions - Position panel connection devices within 1 inch, except for all other dimensions within 3/16 inch.
 2. Panel Squareness - Squareness as determined by the difference between the two diagonals shall not exceed 1/2 inch.

B. Attachment Devices

1. All attachment devices shall be carefully inspected to insure they are true to size and free from defects that may impair their strength and durability.
2. Coil Embeds/Loop Embeds - shall be fabricated of cold drawn steel wire conforming to ASTM A510M, UNS G 10350 or AASHTO M32/M (ASTM A82). Loop imbeds shall be welded in accordance with AASHTO M55/M (ASTM A185). Both shall be galvanized in accordance with ASTM B633.
3. Coil Embed Grease - The cavity of each coil embed shall be completely filled with no-oxide type grease.
4. Coil Bolt - The coil bolts shall have 2 inches of thread. They shall be cast of 80-55-06 ductile iron conforming to ASTM A536. Galvanization shall conform to ASTM B633.
5. Fasteners - Fasteners shall consist of hexagonal cap screw bolts and nuts, which are galvanized and conform to the requirements of AASHTO M164/M (ASTM A325M) or equivalent.
6. Connector Bars and Pins - Connector pins and mat bars shall be fabricated from cold drawn steel wire confirming to the requirements of AASHTO M32/M (ASTM A82) and

welded to the soil reinforcement mat. Galvanization shall conform to AASHTO M111/M (ASTM A123M).

C. Joint Materials

1. Installed to the dimensions and thickness in accordance with the Design Builder’s Approved Drawings or approved shop drawings.
2. Provide either preformed ethylene propylene diene monomer (EPDM) rubber pads conforming to ASTM D2000 for Type AA, 812 rubber or neoprene elastomeric bearing pads having a Durometer Hardness of 55 ±5.
3. Cover all joints between panels on the back side of the wall with a geotextile fabric. The geotextile fabric shall conform to the requirements of AASHTO M288. Slit film and multifilament woven and resin bonded non-woven geotextile fabrics are not allowed for this application. The minimum width of the fabric shall be at least 18 inches. Lap fabric at least 6 inches where splices are required.

D. Wall Base

1. The wall base shall consist of a minimum of 12” dense graded crushed aggregate. A minimum of 75% of coarse material shall have 2 or more fractured faces. Wall base material shall meet the following gradation:

<u>US Standard Sieve Size</u>	<u>Percent Passing</u>
1-1/2”	80-100
3/4”	50-90
#4	0-40
#200	0-5

2. The Design Builder may substitute the granular base material for concrete with a minimum 28-day compressive strength of 3,000 psi, in accordance with Section 03300 – CAST-IN-PLACE CONCRETE. Concrete leveling pad shall have minimum dimensions of 6 inch thickness, a width that extends beyond the inner and outer concrete face by a minimum of 6”, and be placed at the design elevation shown on the Design Builder’s Approved Drawings within a 1/8 inch tolerance. Crushed stone leveling pads shall have minimum dimensions of 12 inch thickness, a width that extends beyond the inner and outer concrete face by a minimum of 12 inches, and be placed at the design elevation shown on the Design Builder’s Approved Drawings within ¼ inch tolerance.

E. Unit Fill and Select Zone Behind MPB Blocks

1. Unit fill and select zone behind the MPB blocks shall meet the requirements of Section 02300 – EARTHWORK, and consist of clean 1” minus crushed stone or crushed gravel meeting the following gradation tested in accordance with ASTM D422:

<u>Sieve Size</u>	<u>Percent Passing</u>
1 inch	100
3/4 inch	75-100
No. 4	0 - 10
No. 50	0 – 5

2. One cubic foot, minimum, of drainage fill shall be used for each square foot of wall face.

Drainage fill shall be placed within cores of, between, and behind units to meet this requirement.

F. Backfill Material

1. All other backfill behind and in front of the wall shall consist of suitable on-site soil or imported borrow and shall be approved by the Geotechnical Engineer. Backfill shall generally consist of sands, silts, or lean clays with a liquid limit less than 45 and a plasticity index less than 20. Fat clay soils, cobbles, and large rock should generally be avoided unless approved by the Geotechnical Engineer based on local practices. Frozen soils, excessively wet or dry soils, debris, and deleterious materials shall not be used.
2. For areas adjacent to the tracks, see AREMA 2010 Section 1.2.3 – Fills.

G. Drainage Pipe

1. If required, the Drainage pipe shall be perforated or slotted PVC pipe manufactured in accordance with ASTM D3034 or corrugated HDPE pipe manufactured in accordance with ASTM F2619.

H. Geocomposite Strip

1. Prefabricated Drainage Mat/Geocomposite strip: Miradrain 6000, Amerdrain 500, or approved equivalent material.

2.3 ACCEPTANCE OF MATERIALS

- A. The Design Builder shall furnish to the Engineer a Certificate of Compliance certifying that the above materials comply with the applicable contract specifications. A copy of all test results performed by the Design Builder necessary to assure contract compliance shall also be furnished to the Engineer. Acceptance shall be based on the Certificate of Compliance, accompanying test reports, and visual inspection by the Engineer.

PART 3 - EXECUTION

3.1 EXCAVATION

- A. Design Builder shall excavate to the lines and grades shown on the Design Builder's Approved Drawings. The manufacturer's representative and the Engineer shall inspect the excavation and approve prior to placement of leveling material or fill soils. Proof roll foundation area as directed to determine if remedial work is required.
- B. Remove all unsuitable subgrade material and replace with new granular structural fill (borrow) per specification 02300 – EARTHWORK, which shall be performed below the base of leveling pad and within the entire modular precast block footprint, as shown on the Design Builder's Approved Drawings. A layer of high strength/density woven geotextile, such as Mirafi HP570 or equivalent, shall be placed at the base of undercut zone prior to new structural fill placement.
- C. Earth excavations shall be performed in accordance with the applicable requirements of Section 02300 – EARTHWORK, and in close conformity to the limits and construction stages shown on the Design Builder's Approved Drawings.

3.2 FOUNDATION SOIL PREPARATION

- A. The foundation soils for the structure shall be graded level as recommended by the manufacturers design. Prior to wall construction, undercut and replacement of the foundation soils shall be performed and the base of the undercut shall be compacted with a hand compactor. Any foundation soils found to be unsuitable shall be further removed and replaced in accordance with the requirements of Section 02300 – EARTHWORK. The foundation for the structure shall be approved by the Engineer before erection is started.
- B. The maximum backfill lift thickness for foundation preparation after compaction shall not exceed 8 inches.

3.3 BASE LEVELING PAD

- A. Leveling pad base material shall be placed to the lines and grades shown on the Design Builder's Approved Drawings, to a minimum thickness of 12 inches and extend laterally a minimum of 12 inches in front and behind the modular precast block retaining wall unit.
- B. Leveling pad shall be prepared to insure full contact to the base surface of the concrete units.
Allowable elevation tolerances are 1/8 inch from the design elevation for concrete leveling pads and 1/4 inch from design elevation for crushed stone leveling pads.

3.4 WALL ERECTION

- A. Precast concrete units shall be placed so that their final position is vertical as shown on the Design Builder's Approved Drawings. For erection, units are handled by means of lifting devices as designed by the wall unit manufacturer. Wall Units should be placed in successive horizontal lifts in the sequence shown on the approved Shop Drawings as backfill placement proceeds. As backfill material is placed behind the units, the units shall be maintained in position by means of temporary wedges or bracing according to the wall supplier's recommendations. Concrete facing vertical tolerances and horizontal alignment tolerances shall not exceed 1/2 inches when measured with a 10 foot long straight edge. During construction, the maximum allowable offset in any panel joint shall be 3/4 inch. The overall vertical tolerance of the wall (top to bottom) shall not exceed 1/2 inch per 10 feet of wall height.

3.5 BACKFILL PLACEMENT

- A. Backfill placement shall closely follow erection of each course of wall units. Backfill shall be placed in such a manner as to avoid any damage or disturbance of the wall materials or misalignment of the wall units. Any wall materials which become damaged during backfill placement shall be removed and replaced at the Design Builder's expense. Any misalignment or distortion of the wall units due to placement of backfill outside the limits of this specification shall be corrected at the Design Builder's expense. At each wall unit level, the backfill shall be placed to the level of the connection. Backfill placement methods near the facing shall assure that no voids exist.
- B. Backfill shall be compacted to 95 percent of the maximum density as determined by AASHTO T-99, Method C or D (with oversize corrections as outlined in Note 7 of that test). For backfills

containing more than 30 percent retained on the 3/4 inch sieve, a method of compaction consisting of a hand compactor behind the walls shall be used.

- C. The moisture content of the backfill material prior to and during compaction shall be uniformly distributed throughout each layer. Backfill materials shall have a placement moisture content less than or equal to the optimum moisture content. Backfill material with a placement moisture content in excess of the optimum moisture content shall be removed and reworked until the moisture content is uniformly acceptable throughout the entire lift.
- D. The maximum lift thickness for backfill materials after compaction shall not exceed 10 inches. The Design Builder shall decrease this lift thickness, if necessary, to obtain the specified density.
- E. Compaction within 3 ft of the back face of the wall shall be achieved by a hand compactor.
- F. At the end of each day's operation, the Design Builder shall slope the last lift of the backfill away from the wall facing to rapidly direct runoff away from the wall face. In addition, the Design Builder shall not allow surface runoff from other areas to enter the wall construction site.

3.6 ROADWAY RUNOFF COLLECTION SYSTEM

- A. The Design Builder shall place an impervious membrane and drainage layer at the locations directed by the Engineer after consultation with the modular precast block retaining wall manufacturer's representative. The impervious membrane shall be placed just below the drainage layer. If angular fill material is to be placed above or below the impervious membrane, a suitable thickness of sand shall be used to protect the membrane from puncture. The membrane shall be continuous throughout the length of the wall with watertight seams at any splices. Repair any holes created during installation according to the membrane manufacturer's recommendation before covering.

3.7 AS-BUILT CONSTRUCTION TOLERANCES

- A. Vertical alignment: $\pm 1/2$ " over any 10' distance.
- B. Wall Batter: within 1 percent of design batter.
- C. Horizontal alignment: $\pm 1/2$ " over any 10' distance.
- D. Corners, bends, curves ± 1 feet to theoretical location.
- E. Maximum horizontal gap between erected units shall be 1/2 inch.

3.8 FIELD QUALITY CONTROL

- A. The Design Builder shall engage inspection and testing services, including independent laboratories, to provide quality assurance and testing services during construction. This does not relieve the Design Builder from securing the necessary construction control testing during construction.
- B. Testing and inspections services shall only be performed by qualified and experienced technicians and engineers.

- C. As a minimum, quality assurance testing should include foundation soil inspection, soil and backfill testing, verification of final design parameters, and observation of construction for general compliance with Design Builder's Approved Drawings and specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02360

DRIVEN PILES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the furnishing of all labor, materials, tools, and equipment, and performance of all operations necessary for the design, installation, and testing of driven piles for structures.
- B. The work of this Section also includes, but is not limited to, the following:
 - 1. Evaluate need for verification borings in the vicinity of driven pile locations. Perform verification borings, as needed, to allow for design of driven piles.
 - 2. The Design-Builder's design shall meet the requirements of all applicable Codes and Specifications. The design shall be prepared, signed, sealed, and dated by a Professional Engineer registered in the Commonwealth of Massachusetts.
 - 3. Perform dynamic and/or static load testing of driven piles, as required by the relevant code applicable to the driven pile supported structure.
 - 4. Revise installation procedures and driven pile length as required based on load test data and/or as directed by the MBTA.
- C. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements".
 - 2. Section 02015 – GEOTECHNICAL INSTRUMENTATION
 - 3. Section 03300 - CAST-IN-PLACE CONCRETE.

1.2 DEFINITIONS

- A. Test Pile: An individual pile, which is observed to determine its behavior during driving and under static axial compression load.
- B. Reaction Pile: An individual pile which provides the reaction load required to perform the load test on a test pile. During this process the reaction pile can be subjected to either an axial compression load or an axial tension load.

1.3 SUBMITTALS

- A. General: Submit items B through F for acceptance by the MBTA not less than thirty (30) calendar days prior to the start of the respective work:

- B. The Design-Builder shall prepare and submit to the Engineer for review and approval, working drawings and design submission, signed, sealed, and dated by a Professional Engineer registered in the Commonwealth of Massachusetts, describing the driven pile system or systems intended for use. The design submittal shall include the applicable code requirements and design references. The working drawings and design submission shall be submitted 30 calendar days prior to the commencement of the driven work. The working drawing and design submission shall include a drawing showing the location and orientation of each driven pile, splice details, pile tips, installation procedures for driven-piles including equipment technical specifications and all calculations showing axial and lateral resistance capacities and estimated deformations. The working drawing and design submission shall include a monitoring schedule, installation procedures and location plans for vibration/noise monitoring as specified in Volume 2 Technical Provisions, Exhibit 2I, “Additional Project Requirements”, and Section 02015 – GEOTECHNICAL INSTRUMENTATION.
- C. Submit boring logs for verification borings to the MBTA.
- D. Pile Schedule and Installation Plan
 - 1. Steel H-Pile: Show typical details of size, weight, splices, tip construction, and welding design of section connection.
 - 2. Steel Pipe: Show typical details of sizes, configuration, tip construction, and welding design of section connection, and class of concrete fill.
 - 3. Prestressed Concrete Piles (Pretensioned): Show typical details of size, weight, splices, tip construction, and class of concrete.
 - 4. Piles intended for use as reaction test piles: Show tension steel reinforcing and connections for uplift loads.
- E. Pile Driving Sequential Layout
 - 1. Submit layout drawings showing the proposed sequence of driving the piles.
 - 2. Indicate if preaugering is required prior to driving piles.
 - 3. On the sequential layout show each pile identified as indicated on the working drawings, its driving sequence number, type, size, and load bearing capacity.
- F. Equipment Review and Working Drawings
 - 1. Submit complete list of the equipment proposed for use, including a description of the characteristics of each piece of driving equipment.
 - 2. Submit working drawings of driving accessories showing compatibility with the size, configuration, handling, and driving requirements of each type of pile indicated on the Contract Drawings.
 - 3. Submit working drawings showing the methods and equipment proposed for loading test piles.
- G. Pile Driving Record. Maintain a pile driving record during pile driving and submit it to the MBTA upon completion of pile driving. On the record indicate, for each pile driven, the information specified, and the following: type and rating of driving equipment, blow count, number of blows per inch penetration for the last 12 inches, and any unusual conditions encountered during driving.

1.4 QUALITY ASSURANCE

- A. Installation Tolerances
 - 1. Drive piles as close as practicable to the plan location. A maximum lateral deviation from the correct location at cutoff elevation equal to 3 inches will be permitted. A maximum vertical

- deviation from design cutoff elevation equal to 1 inch will be permitted. Pulling piles into position will not be permitted.
2. Provide to the MBTA an accurate survey when otherwise acceptably installed piles exceed the specified tolerances and are subject to eccentric loading. The Design-Builder will then analytically determine the total loads on individual piles based on this survey data, and provide the analyses to the MBTA. If the load on any pile exceeds 110% of the specified load capacity, appropriate corrections shall be made subject to approval by the MBTA.
- B. The MBTA may review the proposed driving equipment, accessories, and methods for adequacy for the conditions expected to be encountered. The adequacy of the equipment and accessories shall remain the responsibility of the Design-Builder. Should the equipment used by the Design-Builder prove inadequate to drive the scheduled types of piles in the locations shown, or should the use rate of accessories show damage to the piles, the MBTA shall require replacement, or use different types of expendable accessories, or additional equipment.
- C. Piles delivered to the site shall be visually inspected by the Design-Builder prior to installation. Piles which are cracked, bowed, chipped, undersize, or which break under driving stresses shall be rejected; remove such piles from the site and replace with sound piles.
- D. Reference Codes and Specifications:
1. American Society for Testing and Materials (ASTM):
 - a. A252, Welded and Seamless Pipe Piles,
 - b. A615, Reinforcing Bars,
 - c. A722 Thread Bars,
 - d. C33, Standard Specification for Concrete Aggregates,
 - e. C109, Compressive Strength of Hydraulic Cement Mortars (using two inch or 50 mm cube specimens),
 - f. C150, Portland Cement,
 - g. D1143, Standard Test Method for Piles under Static Axial Compressive Load,
 - h. D1586, Standard Test Method for Penetration Test and Split Barrel Sampling of Soils,
 - i. D2113, Standard Practice for Diamond Core Drilling for Site Investigation,
 - j. A36, Specification for Structural Steel,
 - k. C136, Sieve Analysis of Fine and Coarse Aggregates,
 - l. C939, Flow of Grout for Preplaced - Aggregate Concrete.
 2. American Concrete Institute (ACI)
 - a. ACI 304, Recommended Practice for Measuring, Mixing, Transporting, and Placing Concrete.
 - b. ACI 305, Hot Weather Concreting
 - c. ACI 306, Cold Weather Concreting
 3. American Welding Society (AWS):
 - a. AWS D1.1, Structural Welding Code
 4. Commonwealth of Massachusetts, State Building Code.
 5. AREMA 2016
 6. AASHTO LRFD Bridge Design Specifications.

PART 2 - PRODUCTS

2.1 STEEL H-PILES

- A. ASTM A36 and the AISC Manual of Steel Construction.

2.2 STEEL PIPE PILES

- A. Shell: Steel pipe conforming to ASTM A252, Seamless, diameter and weight as indicated on the working drawings.

2.3 PRECAST, PRESTRESSED CONCRETE PILES

- A. Materials:

1. Portland Cement: ASTM C 150, "Standard Specification for Portland Cement."
2. Aggregates: ASTM C 33, "Standard Specification for Concrete Aggregates."
3. Water: Clean, potable and free from injurious amounts of oils, acids, alkalis, organic materials, or other substances that may be deleterious to concrete or steel.
4. Admixtures: ASTM C 494, "Standard Specification for Chemical Admixtures for Concrete."
5. Mild Steel Reinforcement: ASTM A 615, "Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement," Grade 60.
6. Wire Spiral Ties: ASTM A 82 "Standard Specification for Steel Wire, Plain, for Concrete Reinforcement," smooth or deformed.
7. Prestressing Strand: ASTM A 416, "Standard Specification for Steel Strand, Uncoated Seven-Wire, for Prestressed Concrete."

- 8. Concrete Mixtures:

- a. Mix designs shall be developed by the pile Manufacturer using the materials as specified herein. The designs shall comply with the requirements of ACI 318 and shall have been prepared in accordance with ACI 211.1, for the concrete strengths shown on the working drawings. The mix designs shall be based on materials previously evaluated by the pile Manufacturer using established methods of statistical quality control that conform to ACI 214.

- B. Formwork:

1. Provide exterior forms of steel on concrete founded casting beds. Side forms for square piles may have minimum draft adequate for stripping. Interior forms shall be of steel and either the fixed-collapsible or moving-mandrel type capable of maintaining specified dimensional tolerances. Forms shall be cleaned and oiled prior to placement of reinforcing.

- C. Placement of Reinforcing:

1. Place prestressing strands symmetrically in the piles and jack simultaneously to specified force. Space spiral wire to specified pitch and tie adequately to maintain position during placement of concrete.
- D. Placement of Concrete:
1. Place concrete continuously and consolidate with high frequency vibration. Strike-off unformed surfaces and apply good float finish.
- E. Curing:
1. Cover forms with moisture-retaining cover and apply heat in uniform manner. Embed thermocouples in piles and connect through central computer to electrically heated test cylinders for constant monitoring of curing temperatures and to insure that test cylinders and piles are heated equally.
- F. Stripping and Handling:
1. When a test cylinder made from the concrete pour for the piles involved reaches the minimum release strength specified, detension strands gradually and simultaneously so as to maintain internal stresses uniform across the pile cross sections. Burn strands flush with ends of piles. Handle and transport piles as described above. Do not drive piles until they have reached their required 28 day strength and have been cured a for a minimum of 10 days.
- G. Finishes:
1. Piles with minor imperfections which do not impair the structural integrity of the pile, such as small surface holes caused by air bubbles, color variations, form joint marks, and minor chips and spalls will be accepted as is. Piles with defects such as honeycomb which could reduce the structural capacity of the pile will be accepted only if repaired to the Engineer's satisfaction.
- H. Patching of Lift Loops:
1. Prior to driving piles in a marine or fresh water location, cut off and patch embedded lifting loops at elevations higher than 10 feet below the mudline using materials and methods as recommended by the Manufacturer.
- I. Manufacturing Tolerances:
1. Length: +6 in., -2 in.
 2. Width or diameter: $\pm 3/8$ in.
 3. Sweep (variation from straight line parallel to centerline of pile) (considered to be a form tolerance): $\pm 1/8$ in. per 10 ft.
 4. Position of tendons: $\pm 1/4$ in.
 5. Wall thickness: $-1/4$ in., $+1/2$ in.
 6. Position of handling devices: +6 in.
 7. Position of steel driving tips: $\pm 1/2$ in.
 8. Variation from specified end squareness or skew: $\pm 1/4$ in. per 12 in., $\pm 1/2$ in. max.
 9. Local straightness any surface: $\pm 1/4$ in. per 10 ft.
 10. Longitudinal spacing of spiral reinforcement: $\pm 3/4$ in.

PART 3 - EXECUTION

3.1 GENERAL

- A. The Design Submittal will specify piling type. End-bearing piles shall be driven to the required bearing value. The bearing value for each pile shall be determined by the Design-Builder. Friction piles shall be driven to the required penetration, as determined by the Design-Builder.
- B. The Design-Builder shall order and drive the test piling. The safe bearing capacities of the test piling will be determined by the Design-Builder using methods described below. From the test pile data and behavior and his subsurface exploration data, the Design-Builder will determine the penetration required. The Design-Builder may also determine the required penetration based upon settlement criteria or any other factors which in the opinion of the Design-Builder are applicable to the work.
- C. Bearing Value and Penetration: The determination of the safe bearing value will be obtained from observing and recording the behavior of the test pile(s) from the time first placed in the leads until it attains practical refusal or reaches the required depth and/or required axial capacity presented in the Design Submittal.

3.2 PILE LOAD TESTS FOR PILES UNDER AXIAL COMPRESSION LOAD

- A. Install test piles and reaction piles, of the same type and kind as permanent piles, in the locations required by design.
 - 1. Reinforce reaction piles for the full length to resist uplift loads.
 - 2. Install test piles vertically.
- B. Test piles which pass the load test in an undamaged condition may be utilized as permanent piles in the work. Reaction piles are not to be used as permanent piles. Either withdraw reaction piles and damaged test piles and remove from the site, or cut them off three feet below any structure to be installed above.
- C. A minimum of one test per structure. Use ASTM D1143 at a minimum, other test procedures may be submitted for review and acceptance by MBTA.
- D. When the safe bearing capacity of the pile is less than 90% of the required bearing capacity the MBTA may require additional load tests.
- E. The MBTA may require the Design-Builder to make additional load tests in the event that the behavior of the test pile or any other pile shows any peculiarity, erratic actions, or otherwise causes suspicion as to the reliability of the safe bearing capacity determined by the formulae given herein.
- F. Immediately following completion of load testing, submit two copies of a test report to the MBTA. Include in the test report the data required by ASTM D1143.

3.3 DYNAMIC PILE DRIVING TESTING

- A. Dynamic measurements shall be performed in accordance with ASTM D-4945. The Design-Builder shall employ a qualified specialty Consultant, which has successfully completed no less than ten

dynamic pile driving tests, to perform the testing and report preparation for all Dynamic Pile Driving Analysis (PDA) Tests to be performed. The specialty Consultant shall provide pile driving recommendations, including hammer recommendations, pile driving criteria (blows per inch), and criteria for practical refusal.

- B. At least thirty days prior to driving the test piles the Design-Builder shall submit to the MBTA for review and approval the qualified specialty consultant, as well as the complete installation, and testing procedures. The submittal shall include all necessary pile driving equipment and support facilities to drive the piles to capacities and depths shown on the plans within allowable stress limits. As part of the submittal the Design-Builder's Consultant shall perform wave equation analyses, and a summary report confirming that the pile driving system proposed by the Design-Builder can meet the capacity, driving resistance and allowable stress limits.
- C. The pile test equipment shall conform to the requirements of ASTM D-4945, Standard Test Method for High Strain Dynamic Testing of Piles, and be capable of testing the pile to one and one-half times the ultimate pile capacity. An experienced engineer, who has successfully completed no less than ten dynamic pile driving tests, shall operate the Pile Driving Analyzer in the field.
- D. Prior to lifting the pile to be dynamically tested, the Design-Builder shall provide as a minimum 3 feet of clear access to 180 degrees opposite face of the pile for pile preparation. The Consultant shall then drill and prepare holes in the pile for gage attachment.
- E. The Consultant shall attach the gages to the pile before driving the piles. Pile driving shall be performed using routine pile installation procedures. When the level of the gages is within one foot of the ground surface, or obstruction, driving shall be halted to remove the gages from the pile. If additional driving is required, the pile shall be spliced and gages shall be reattached to the head of the next pile segment.
- F. With the dynamic testing equipment attached, the Design-Builder shall drive the pile to the design penetration depth or to a depth specified in their design. The Design-Builder will use the ultimate pile capacity estimates at the time of driving and/or restriking from dynamic test methods to determine the required pile penetration depth for the ultimate pile capacity. The stresses in the piles shall be monitored during driving with the dynamic test equipment to ensure that the actual driving stresses do not exceed the maximum allowed values. If necessary, the Design-Builder shall reduce the driving energy transmitted to the pile by using additional cushions or reducing the energy output of the hammer in order to maintain driving stresses below the maximum values. If non-axial driving is indicated by dynamic test equipment measurements, the Design-Builder shall immediately realign the driving system.
- G. After the initial drive of the pile, the Design-Builder shall wait a minimum of 24 hours and restrike the dynamic monitoring test pile with the dynamic testing instruments attached. A cold hammer shall not be used for the restrike. The hammer shall be warmed up before restrike begins by applying at least 20 blows to another pile. The maximum amount of penetration allowed during restrike shall be 6 inches, or 50 hammer blows, whichever occurs first.
- H. The Design Builder shall provide preliminary estimates of pile capacity of the test pile to the MBTA within 24 hours of the restrike of each tested pile. The Design Builder shall also prepare and submit a written report within 5 calendar days of the completion of the testing. This report shall contain a discussion of the pile capacity obtained from the dynamic testing. CAPWAP analyses of the dynamic testing data shall be performed on data obtained at the end of initial driving and the beginning of restrike. The MBTA may request additional analyses at selected pile penetration depths. The report shall also discuss hammer and driving system performance, driving stress levels, and pile integrity. The report is to be prepared, signed, sealed and dated by a Professional Engineer licensed in the

Commonwealth of Massachusetts. No production piles can be driven until the report has been submitted and approved by the MBTA.

- I. Test piles shall be driven to a driving resistance established by the Design-Builder at the estimated pile toe elevation. The Design-Builder shall excavate the ground at each test pile to the elevation of the bottom of the footing before the pile is driven. All test piles shall be driven with impact hammers unless specifically otherwise required by design. In general, the specified length of test piles shall be greater than the estimated length of production piles in order to provide for variation in soil conditions. The driving equipment used for driving test piles shall be identical to the equipment proposed for driving the production piling.
- J. Test piles that do not attain the specified driving resistance at a depth of 6 inches above the estimated pile tip elevation, or are specified as a dynamic monitoring pile, shall be redriven after being allowed to set up. The minimum time period before restrrike shall be 24 hours, or as required by design. A cold hammer shall not be used for the restrrike. The hammer used shall be warmed up by applying at least 20 blows to another pile. The maximum amount of penetration allowed during restrrike shall be 6 inches, or 50 hammer blows, whichever occurs first.
- K. The Design-Builder shall not order piling to be used in the permanent structure until test pile data has been reviewed by the MBTA.

3.4 INSTALLATION OF PILES

- A. General. Provide piling of the type required by design and of the length and configuration necessary to:
 - 1. Achieve the required penetration as required by the design;
 - 2. Extend into the pile cap or structure footing to the location as required by design; and
 - 3. Attain the indicated bearing capacity.
- B. Install piling to the required penetration, or to the required bearing, as indicated in the design. Water jetting to obtain the required penetration will not be permitted.
- C. The construction of driven piles shall not disturb existing structures or the completed work. Damage to such structures shall be repaired by the Design-Builder.
- D. Adjacent structures shall be monitored and protected as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
- E. Vibration monitoring for driven pile installation will be performed by the Design-Builder’s Instrumentation Engineer as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
- F. Construction operations not to exceed specified noise limits in accordance with Volume 2 Technical Provisions, Exhibit 2I, “Additional Project Requirements”.
- G. Predrilled Holes
 - 1. Predrilling through existing embankments and fill material or natural soils with the potential for containing obstructions shall be performed in accordance with the design requirements. After driving the pile, fill any annular space around the pile with dry sand or pea gravel.
- H. Drive Piles
 - 1. Do not drive piles within 20 feet of concrete less than seven days old.

2. Drive piles at interior of bases of footings before driving perimeter piles.
3. If necessary, provide adequate lateral support for installed individual piles, to prevent excessive temporary flexural stresses or movement of the pile top out of tolerance.
4. Maintain the hammer coaxial with the pile during the driving operation by using a combination of driving cap and leads. Equipment used to drive production piles shall be identical to the equipment used to drive acceptable test piles.
5. Investigate any sudden decrease in driving resistance for possible breakage of the pile. If sudden decrease in driving resistance cannot be correlated to boring data or some incident in the driving, and if the pile cannot be removed for inspection, such decrease in driving resistance shall be cause for rejection of the pile.
6. Redrive any pile which is raised during driving of adjacent piles, to at least the original tip elevation.
7. Splice piles only by methods and at places accepted by the Engineer.
8. Cut off piles at top elevation as required by design. Replace or repair, to the satisfaction of the MBTA, piles which are damaged when cut off.

I. Steel H-Piles

1. Design the driving cap with grooves in the base that loosely conform to the shape of the pile. The bearing surface of the grooves shall be true, without roughness. The driving cap shall extend down the side of the pile at least four inches and be loosely attached to the hammer so that it will at all times rest squarely over the entire surface of the pile.
2. Make splices as detailed on the Working Drawings by electric-arc field welding in accordance with AWS D1.1. Cut-off damaged portion of pile top before splicing. Take care to align the sections connected so that the axis of the pile will be straight.

J. Steel Pipe Piles

1. Shells shall be inspected for collapse, tears, splits or reduced diameter throughout their length after pipes have been driven and before reinforcing steel and concrete are placed therein.
2. For acceptance, the pile shell shall be:
 - a. Free of collapsed sections and tears;
 - b. Free of water, except that a minor amount of water may be allowed if it can be absorbed by placing a suitable amount of dry sand-cement mixture in the tip of the pile; and
 - c. Visible to the bottom of the casing.
3. Remove rejected pipe piles and replace with new pipe piles. When rejected pipes cannot be removed, furnish and install replacements. Cut off abandoned pipes three feet below the structure and fill the abandoned pipes with concrete. Backfill and compact holes.
4. Assemble reinforcing steel, if any, as a complete unit and install in pile before starting to place concrete.

5. Place concrete through a short funnel hopper on the top of the pipe. Vibration of the concrete will not be required except in the top 15 feet of the pipe. Discharge concrete into the hopper at a continuous and rapid rate.

K. Precast, Prestressed Concrete Piles

1. Piles with approved mechanical splices shall be permitted only when shown in the Working Drawings.
2. Suitable techniques shall be used to prevent the spalling or weakening of concrete below the cut-off elevation. For example, during easy driving conditions the stroke shall be reduced to minimize tensile stresses.
3. Cutting Off: Cut off tops of driven piles square with pile axis and at elevations indicated.

L. Remove piles not meeting the requirements of the design and replace with acceptable piles. The Design-Builder may accept piles which do not meet these tolerances, subject to acceptable redesign of the pile group and pile cap.

M. Repair or replace piles which are split, broken, or otherwise damaged. Perform such repair at the discretion of the MBTA, subject to acceptance upon completion.

3.5 MONITORING TRACK MOVEMENT

- A. Before the start of driven pile installation, establish elevations along Top of Rail of nearest track, each rail, spaced approximately every 20 feet in the vicinity of the driven pile work.
- B. Perform two baseline elevation surveys of the Top of Rail before the start of driven pile installation. Survey both vertical and lateral (into excavation) positions.
- C. Perform weekly survey of settlement monitoring points from the beginning of driven pile installation until the structure is completely in placed and fully backfilled.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02362

STEEL SHEET PILE RETAINING WALLS

PART 1 – GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installing Permanent Steel Sheet Pile Retaining Walls (SSP) along portions of the railroad trackway as shown on the Contract Drawings. The steel sheet pile retaining walls shall form a water-tight barrier to cutoff groundwater/seepage and serve as a flood protection system. The walls include, but are not limited to, driven or vibrated steel sheet piles with a reinforced cast-in-place concrete cap. Additionally they may include welded studs and reinforcing with a cast-in-place concrete or shotcrete facing. Concrete striation details shall be in accordance with the Contract Drawings.
- B. The Contractor shall either pre-trench or use a guide frame to maintain the lines and grades and offset distances to the nearest existing/proposed track. Steel sheeting installed out of tolerance shall be removed and reinstalled at no additional cost to Authority. The Contractor shall prepare a level surface and verify location and orientation of each sheet prior to initiating installation.
- C. The steel sheet pile retaining walls shall be driven to the elevations shown on the Contract Drawings.
- D. The construction of steel sheet pile retaining walls shall not disturb existing structures or the completed work. Damage to such structures shall be repaired by the Contractor at no additional cost to Authority.
- E. Adjacent structures include but are not limited to the following: existing building to the west of the existing abandoned Red Bridge abutment. Monitor and protect adjacent structures as specified and indicated.
- F. Vibration monitoring for steel sheet pile retaining wall installation shall be performed by Contractor's vibration consultant and monitoring firm as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
- G. Construction operations not to exceed specified noise limits in accordance with Section 01560 - TEMPORARY CONTROLS.
- H. The Contractor shall bear the entire cost and responsibility of correcting any failure, damages, subsidence, upheaval, or cave-ins as a result of installation of the steel sheet pile retaining walls. The Contractor shall pay for all claims, costs, and damages that arise as a result of the work performed at no additional cost to Authority.
- I. The Contractor shall use polyurethane chemical grout to seal leaks at steel sheet pile joints.
- J. Steel sheet piles shall be installed through all material encountered to the depths shown on the Contract Drawings. Installation equipment shall be capable of driving through boulders, and any other obstructions, encountered during installation. If obstruction cannot be driven through, equipment shall be on hand to remove or drill through such obstructions. Sheet piles shall be removed and re-driven if necessary. No additional cost to Authority shall be incurred for this work.

- K. Stray current criteria apply to this wall type in accordance with the Contract Documents.

1.2 RELATED SECTIONS

- A. Other specification sections that relate to the work include, but are not limited to, the following:

1. Section 01560 – TEMPORARY CONTROLS
2. Section 02015 – GEOTECHNICAL INSTRUMENTATION
3. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
4. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS
5. Section 02300 – EARTHWORK
6. Section 03300 – CAST-IN-PLACE CONCRETE
7. Section 03371 – SHOTCRETE
8. Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS
9. Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION

1.3 SUBMITTALS

- A. Submit the following in accordance with Section 01300 - SUBMITTALS:

1. Submit the following qualifications four (4) weeks prior to construction:
 - a. Qualifications of Contractor's steel sheet pile retaining wall installer as specified in Paragraph 1.8D.
 - b. Qualifications of Contractor's steel sheet pile retaining wall installation supervisor as specified in Paragraph 1.8E.
 - c. Qualifications of the Contractor's Professional Land Surveyor.

- B. Submit a steel sheet pile retaining wall installation plan at least two (2) weeks prior to start of the construction. The review shall be only for the information of the Owner and third parties for an overall understanding of the project relating to access, maintenance of existing facilities and proper utilization of the site. The Contractor shall remain responsible for the adequacy and safety of the means, methods and sequencing of construction. The plan shall include the following items as a minimum:

1. Proposed steel sheet pile details, location, layout, depths, and methods and sequence of installation and removal.
2. List of equipment used for installing the steel sheet pile retaining wall system.
3. Monitoring schedule, installation procedures and location plans for vibration/noise monitoring as specified in Section 01560 - TEMPORARY CONTROLS and Section 02015 - GEOTECHNICAL INSTRUMENTATION.

- C. Submit the as-built location and top and bottom elevations of the steel sheet pile retaining wall prior to installation of concrete facing and cap. This work is to be performed by a Professional Land Surveyor.

- D. Working Drawings

1. Submit working drawings at least two (2) weeks before beginning excavation or installation of excavation support system and bracing. Submit each sheet pile wall under separate cover and in the sequence of their installation. Submittals in excess of 40 sheets shall require a 60 day review period.
- E. Additional Requirements for Working Drawings – Working drawings shall include the following:
1. Grades and strengths of all construction materials used.
 2. Full excavation depth.
 3. Tip elevation.
 4. Materials, details, arrangement, and method of construction of the permanent steel sheet pile wall system and sequence of construction. For temporary sheet pile walls used as excavation support system see Section 02260 – Excavation Support and Protection.
 5. Method for attaching facing components and concrete cap beam.
 6. Loads on the excavation support system for various stages of excavation.
 7. Anticipated equipment, traffic (and other surcharge) loads on adjacent ground during construction.
 8. Existing utility facilities, including underground and overhead utilities. After checking locations of utilities by field investigations, determine which affect or potentially may affect the wall.
- F. Submit Plan of Actions to be implemented in the event any Response Value for deformation, as specified in Table 02362-1, is reached.

TABLE 02362-1 RESPONSE VALUES

Monitoring Type	Value
<u>Lateral Deflection of Earth Support Wall</u>	
Top of steel sheet	1.5%
Mid-Point of steel sheet	0.75%
<u>Ground Surface Settlement</u>	
Top of Rail	1/4 inch

- G. The Plan of Actions shall be positive measures by the Contractor to limit further movement of the wall. The details of the mitigating measures shall include a schedule of implementation, location and/or availability of materials, and a detailed description of the method of implementation. The Contractor shall be prepared to work twenty four (24) hours per day to implement such measures.
- H. Submit Welder Qualifications and Welding Procedures in accordance with AWS D1.1.
- I. Submit descriptive data and operating procedures for all equipment to be used. This shall include, at a minimum, machinery required to install wall and bracing, excavate soil, and remove obstructions. Submit all pertinent data including sizes, weights, capacities, torques and operating frequencies.

- J. Review of the wall system by the Engineer shall not relieve the Contractor from the responsibility for the adequacy of the installation and construction of excavation support system.
- K. Means and methods to advance through obstructions. Review and approval of submittal by Engineer or Authority does not relieve the Contractor in any way from the responsibility to complete the construction.
- L. Submittals reviewed beyond the second rejection (or required re-submittal) shall be reviewed by the Engineer at the Contractors expense.

1.4 TOLERANCES

- A. Variation of center of any steel sheet pile from the required plan location: Maximum 3 inches, measured at the existing ground surface in any horizontal direction.
- B. Vertical tolerance of the steel sheet pile shall be ± 1 " from Contract Drawing elevations.
- C. Angular deviation of the steel sheet pile shall be less than 1% of the height measured from the top of the sheet to the bottom of the excavation.
- D. Wall elevation tolerance of the completed cap is minus 0 inches, plus 1/2 inches.
- E. Refer to attached Table 02362-1 for response values.
- F. Any steel sheet pile wall or its components not in conformance with the above tolerances shall be rejected. The Contractor shall notify the Engineer in writing and submit a Plan of Action to bring the wall or its components into conformity. Any rework required to bring the wall into conformity shall be at no additional cost to Authority. Walls that are installed such that they cannot be brought into conformity may need to be replaced in kind at no additional cost to Authority. This shall be at the sole discretion of the Engineer.

1.5 PROJECT CONDITIONS

- A. Visit the site to review all details of the work and working conditions affecting Work under this Section and to verify dimensions in the field including potential interference from adjacent structures and utilities. Notify the Engineer in writing of any discrepancy before performing any work. The Contractor is hereby notified that the job site is located adjacent to the active railroad and existing buildings. Refer to Section 00700 – GENERAL CONDITIONS.
- B. The Contractor shall be responsible for implementing all necessary traffic control measures, which may include but not be limited to traffic cones, barriers, barrels, signs, flagmen and police details.
- C. Provisions for Contingencies
 - 1. Monitor the performance of components of the wall, for horizontal movement, at intervals specified herein.
 - 2. Implement contingency plans if Response Values specified in Table 02362-1 are reached.
 - 3. Have materials and equipment available to implement the accepted Plan of Action.
- D. Consult official records of existing utilities, both surface and subsurface, and their connections to be fully informed on all existing conditions and limitations as they apply to this work and its relation to

other construction work. Proceed with caution in areas of utility facilities. Expose them by hand excavation or by other methods acceptable to the utility owner. Protect existing utilities to remain within and adjacent to the work area in accordance with the requirements of authorities having jurisdiction over same. The Contractor is responsible for any damage to utilities caused by the Contractor's operations and shall restore them to equal or better operation at no additional cost to the Authority.

1.6 SUBSURFACE DATA

- A. Logs of subsurface explorations performed at the site are shown in the Contract Documents. Approximate locations of these subsurface explorations are shown on the Contract Drawings.
- B. The aforementioned data is for general information and is accurate only at the particular locations and times the subsurface explorations were made. It is the Contractor's responsibility to make interpretations and draw conclusions based on the character of materials to be encountered and the impact on his work based on his expert knowledge of the area and of earthwork techniques. The Contractor shall review test pit and boring logs and locations and other pertinent data for the site. The Contractor, at his own expense, may conduct additional subsurface explorations for his own information after obtaining the MBTA's permission.

1.7 QUALITY ASSURANCE

- A. The Contractor shall provide written certification indicating that the equipment used for monitoring of deformation monitoring points (DMP) (as specified in Paragraph 3.2 herein) has been calibrated and maintained in accordance with the test equipment manufacturer's calibration requirements. The accuracy/precision of horizontal survey monitoring shall be to the nearest 0.01 feet.
- B. If sheeting must be pulled for any reason the Contractor shall notify the Engineer for approval prior to implementing any work. The Contractor shall be responsible for backfilling any void space with Controlled Density Fill (CDF) Type 2E in accordance with Section 02300 - EARTHWORK. Any work associated with removal of any sheet pile in the zone of influence of the rail shall require approval of train operations. A track monitoring plan shall be required and any ballasting required will be done at no additional cost to the Authority.

1.8 QUALIFICATIONS OF CONTRACTOR'S INSTRUMENTATION PERSONNEL

- A. The Contractor shall have on his staff, or on the staff of a specialist instrumentation subcontractor, instrumentation/survey personnel who are responsible for furnishing, installing, and maintaining instrumentation/survey equipment, as well as obtaining and interpreting data from the instrumentation/survey equipment.
- B. The Contractor's instrumentation/survey personnel shall have the following qualifications:
 - 1. A minimum of a Bachelor of Science Degree in Civil Engineering or related discipline.
 - 2. A minimum of 2 years' experience in the installation, monitoring, and interpretation of data from the types of monitoring equipment used to monitor deformation-monitoring points (as specified in Paragraph 3.2 herein).
- C. The Contractor's instrumentation personnel shall:

1. Be on site and supervise or perform installation of each monitoring point.
 2. Perform deformation monitoring in accordance with the Project Specifications.
 3. Interpret deformation-monitoring data.
 4. Ensure that deformation-monitoring data is tabulated accurately and in a format consistent with the Project Specifications.
 5. Forward monitoring data to the designated review parties in a timely manner.
- D. The Contractor's sheet pile retaining wall Installer's personnel shall:
1. A minimum of three (3) years experience in the installation of similar types and equal complexity as the proposed system
 2. Have completed not less than three (3) successful excavation support systems of similar type and equal complexity as the proposed system
- E. Install the sheet pile retaining wall system under the supervision of a supervisor having the following qualifications:
1. Not less than five (5) years experience in installation of systems of similar type and equal complexity as the proposed system.
 2. Completed at least five (5) successful excavation support systems of similar type and equal complexity as the proposed system.

PART 2 – PRODUCTS

2.1 GENERAL

- A. The Contractor shall make his own arrangements to purchase the materials covered by this section of the specifications, including all necessary incidentals. The Contractor, or the supplier as his agent, shall furnish the Engineer a Certificate of Compliance certifying that the applicable materials comply with this section of the specifications. Materials not conforming to this section of the specifications shall not be used without the written consent of the Engineer.

2.2 MATERIALS

- A. Structural Steel for sheet piles shall conform to applicable requirements of Section 05126 - STRUCTURAL STEEL FOR RETAINING WALLS.
- B. Reinforcement Steel for use within cast-in-place concrete caps and facing shall conform to Section 03300 – CAST-IN-PLACE CONCRETE.
- C. Concrete for cast-in-place caps and facing shall conform to relevant articles of Section 03300 – CAST- IN-PLACE CONCRETE, 4000 psi, 3/4”.
- D. Shotcrete shall conform to relevant articles of Section 03371 – SHOTCRETE.
- E. Controlled Density Fill (CDF), Type 2E in accordance with specification Section 02300 - EARTHWORK.

- F. Headed welded studs shall conform to Section 05126 – STRUCTURAL STEEL FOR RETAINING WALLS.
- G. Polyurethane Chemical Grout
- H. Corrosion control and stray current shall conform to Section 16451 – CORROSION CONTROL AND STRAY CURRENT MITIGATION.

2.3 EQUIPMENT

- A. A vibratory hammer shall be utilized for driving the sheet piling providing that such operations do not exceed vibration/noise requirements of the specifications. Impact hammer shall be utilized when vibratory hammer is unable to drive temporary sheet piling to required depth and/or unable to meet vibration requirements. Impact hammer shall also meet noise requirement.

PART 3 – EXECUTION

3.1 GENERAL REQUIREMENTS

- A. Install the wall in accordance with the accepted working drawings, and in such a manner as to prevent movement, settlement, loss of ground, removal of fines from the adjacent ground, and damage to or movement of adjacent structures and utilities.
- B. Perform work from track side of the proposed wall unless temporary easements have been granted to minimize adjacent property impacts. Heavy equipment shall be placed on the track side of the proposed wall.
- C. Perform field welding by certified welders in accordance with American Welding Society Standards AWS D 1.1, "Structural Welding Code - Steel."
- D. Implement the Plan of Actions as submitted under Paragraph 1.3G, if Response Values as specified in Table 02362-1 are reached.
- E. Borings indicate below ground obstructions may be encountered. Such obstructions may include, but are not necessarily limited to, boulders and various other demolition and construction debris.
- F. Protection of Existing Properties
 - 1. Contractor shall protect existing properties in accordance with Section 01545 – PROTECTION OF WORK AND PROPERTY.
 - 2. Restore existing structures to conditions equivalent to those existing prior to the start of retaining wall construction and support work, unless otherwise indicated. Any damage to affected properties caused by the retaining wall construction shall be repaired by the Contractor at no additional cost to the Authority.
 - 3. If in the opinion of the Engineer the integrity of the adjacent railroad tracks, bridge, buildings, structures, or paved areas are jeopardized due to movement, the Contractor shall immediately discontinue further excavation in the affected area and implement accepted Plan of Action to mitigate further movement. Mitigating measures shall remain in effect until such

time that the Engineer evaluates the impact on the structure and may direct the Contractor to perform any remedial work. The Contractor shall submit proposed remedial measures to the Engineer for review and approval. Submittals shall include methods and names of subcontractors. The Contractor shall proceed with remedial work upon acceptance by the Engineer. Mitigating measures shall be at no additional cost to the MBTA.

3.2 MONITORING OF EXCAVATION

- A. The Contractor shall monitor the performance of components of the excavation support system, for horizontal movement, at intervals specified below. If the Response Values as specified in Table 02362-1 attached are reached at any time during the work, the Contractor shall immediately stop work and implement approved contingency plans.
- B. Visual effects of the excavation on the lateral support system shall be recorded and submitted to the Engineer along with monitoring deflection data.
 - 1. Deflection of the wall into the excavation due to soil, groundwater, and surcharge loads.
 - 2. Settlement adjacent to the lateral support wall due to inward deflection of the wall.
 - 3. Settlement adjacent to the lateral support wall due to ground loss into the excavation through gaps and voids in the wall.
- C. Monitoring Deflection of Wall (Section 02015 - GEOTECHNICAL INSTRUMENTATION.)
 - 1. Once the sheet piles are installed to final elevation but before excavation begins, establish deformation-monitoring points on the top of the sheet piles, spaced approximately every 24 feet along the wall. The monitoring points shall consist of painted marks on the steel member.
 - 2. Perform a baseline survey of each deformation monitoring point before excavation begins. Survey lateral positions.
 - 3. Perform daily survey of each top-of-pile deformation monitoring point from when excavation begins until full excavation depth is reached adjacent to the wall. Thereafter, perform weekly survey of monitoring points until the wall is complete to the bottom of the cap or as directed by the Engineer.
 - 4. Monitoring shall continue until the backfill behind the wall shall be completed to its finished grade (not including loam and seeding) or to the bottom of the cap.
 - 5. Contractor may perform External Device Monitoring (EDM) as an approved alternate survey method.
 - 6. For monitoring of temporary support walls see specification Section 02260 – EXCAVATION SUPPORT AND PROTECTION.
- D. Monitoring Track Movement
 - 1. Before the start of excavation and wall installation, establish elevations along Top of Rail of nearest track, each rail, spaced approximately every 20 feet along the walls.
 - 2. Perform two baseline elevation surveys of the Top of Rail before the start of excavation/wall installation. Survey both vertical and lateral (into excavation) positions.
 - 3. Perform weekly survey of settlement monitoring points from the beginning of excavation until the structure is completely in place and fully backfilled.
- E. Make adjustments to survey schedule and monitoring point locations (including the addition of monitoring points) as requested by the Engineer if additional monitoring of wall performance is

desired. Extra monitoring points and increases in survey frequency shall be considered incidental to the costs associated with this Section.

- F. Survey instruments used for horizontal deformation monitoring shall have a minimum accuracy of ± 3.0 arc seconds and a minimum display reading less than or equal to the accuracy. Distances less than 30 feet shall be measured with a standardized steel tape used in conjunction with a tension handle. Distances greater than 30 feet shall be measured with an Electro-Optical Distance Measuring Instrument (EDM). Distances between 30 and 100 feet shall be verified with a standardized steel tape in conjunction with a tension handle. Electronic pointing shall be used to minimize error due to possible misalignment of the EDM axis and telescope. Centering shall be accomplished using high precision optical plummets or mechanical centering devices.
- G. EDM equipment used for lateral deformation monitoring shall, after calibration, have a minimum accuracy of ± 0.02 in plus 5 parts per million.
- H. The Contractor shall submit the results of the settlement point readings to the Engineer in draft form at the end of each working day. All monitoring data shall be reported to the Authority and Engineer within twenty-four (24) hours of measurement in tabular format, allowing comparison of current data to previous data, including baseline, and showing a complete history of movement versus time.

3.3 EXECUTION

- A. Installation of steel sheet pile retaining wall systems shall not commence until the related earth excavation and dewatering submittals have been reviewed by the Engineer with all of the Engineer's comments satisfactorily addressed.
- B. Install the steel sheet pile retaining wall systems in accordance with the installation plan and as specified.
- C. Install and read geotechnical instrumentation in accordance with the steel sheet pile retaining wall installation plan. Notify the Engineer immediately if any geotechnical instrumentation is damaged. Repair or replace damaged geotechnical instrumentation at the sole option of the Engineer and at no additional cost to the Authority.
- D. Notify utility companies or municipalities if existing utilities interfere with the wall system. Modify the existing utility with the utility company's or municipality's permission or have the utility company or municipality make the modifications at no additional cost to the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02369

DRILLED MINI-PILES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the furnishing of all labor, material, tools, and equipment and performance of all operations necessary for the design and installation of Drilled Mini-Piles.
- B. The work of this Section also includes, but is not limited to, the following:
1. Evaluate need for verification borings in the vicinity of mini-pile locations. Perform verification borings, as needed, to complete design of drilled mini-piles. Additional borings required by the Design-Builder for the design of the drilled mini-piles will be at his expense.
 2. Excavated soils and soil/grout mixtures shall be managed and disposed of in accordance with applicable federal, state, and local laws, regulations, and ordinances and as directed by the Licensed Site Professional for this Project and in accordance with specification Section 02282- HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS.
 3. The Design Builder's design shall meet the requirements of all applicable Codes and Specifications including satisfying allowable stress requirements at welded joints. The design shall be prepared, signed, sealed, and dated by a Professional Engineer registered in the Commonwealth of Massachusetts.
 4. Perform load testing of mini-piles, as required by the relevant code applicable to the mini-pile supported structure, a minimum of one load test on mini-piles per structure.
 5. Monitor settlement of the test mini-pile by surveying methods and dial gages during the performance of load tests.
 6. Revise installation procedures and mini-pile length as required based on load test data and/or as directed by the MBTA.
 7. Control all wash water used in the installation of drilled mini-piles.
 8. Remove all equipment, including testing equipment, tools, and materials including unused materials, and any spoils generated during mini-pile installation, and perform final cleanup of the site for all work pertaining to drilled mini-piles.
 9. The construction of drilled shafts shall not disturb existing structures or the completed work. Damage to such structures shall be repaired by the Design-Builder at no additional cost to the MBTA.
 10. Adjacent structures shall be monitored and protected as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.

11. Construction operations not to exceed specified noise limits in accordance with Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements".

C. Related Work: Other specification sections that relate to the work of this section include, but are not limited to, the following:

1. Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements"
2. Section 02015 – GEOTECHNICAL INSTRUMENTATION
3. Section 02060 – EROSION AND SEDIMENTATION CONTROL
4. Section 02240 – DEWATERING
5. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
6. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL EXCAVATED MATERIAL
7. Section 02300 – EARTHWORK
8. Section 02650 – EXISTING SITE UTILITIES
9. Section 03300 – CAST-IN-PLACE CONCRETE

1.2 SUBMITTALS

A. The Design-Builder shall prepare and submit to the MBTA for review and approval, working drawings and corresponding design submission, signed, sealed, and dated by a Professional Engineer registered in the Commonwealth of Massachusetts, describing the mini-pile system or systems intended for use. The design submittal shall include the applicable code requirements and design references. The design submission shall be submitted 30 calendar days prior to the commencement of the mini-pile work. The working drawing and design submission shall include a drawing showing the location and orientation of each mini-pile, details of casing, splice details for steel pipe, grouting sequence, installation procedures for drilled mini-piles including mini-pile equipment technical specifications, calculations for axial static capacity and a schedule giving:

- a. Mini-pile number;
- b. Mini-pile design load; and
- c. Type and size of mini-pile.

B. The MBTA shall approve or reject the Design-Builder's drawings and design submission within 20 working days after receipt of the submission.

C. Submit boring logs for verification borings to the MBTA.

D. Prior to the start of work, the Design-Builder shall furnish a load test plan for each structure to be supported by mini-piles. The load test plan shall include a description of the load test procedure, planned equipment, method of loading the test mini-piles with planned loading range (e.g. twice the design load). The Design-Builder shall furnish a calibration curve for the jack and gage to be used for the load tests. The curve shall be certified by a recognized testing laboratory. Each load test shall include the use of a recently calibrated load cell and a ball joint to assure concentric loading of the mini-pile top.

E. Furnish load test reports using data recorded during the test. Submit survey and other data necessary to complete these reports within 2 days after the completion of tests.

F. Prior to placement, submit the grout mix design(s) to the MBTA for approval along with supportive certification from an independent testing laboratory listing seven and 28-day compression strength testing results, and identification of constituent materials. Submit flow cone data for each design mix in accordance with ASTM C939 except a 3/4-inch opening shall be used for sand/cement grout mixes

in the flow cone rather than the 1/2 -inch opening specified. Submit specific gravity data for each design mix of neat cement grout. Duplicate grout cube testing, including 3, 7, 10, 14, and 28 day strengths, shall be provided for each design mix.

- G. Mini-pile installation record. Furnish a complete and accurate record of all mini-piles, including:
 - 1. The date of installation.
 - 2. The mini-pile number or identification, final location, size, length, elevation of tip and top of mini-pile and reinforcement, elevation of top and bottom of the pipe, elevation of top and bottom of the socket.
 - 3. Rate of drilling for each foot of penetration throughout the entire length of each mini-pile.
 - 4. Grout pressure applied and any change in grout pressure with depth.
 - 5. Any unusual occurrence during installation of the mini-pile.
 - 6. Quantity of grout used excluding wastage, measured to the nearest 1/10 cubic foot.
 - 7. Compressive test results of grout cube samples to be submitted within 1 day after completion of tests.
- H. Submit test report or certifications for materials when the materials are delivered to the site.
- I. Report mini-pile deviation beyond mini-pile installation tolerances to the MBTA. Stop work until corrective measures are established.
- J. Submit the qualifications of the proposed Independent Testing Agency for approval by the MBTA.
- K. Submit monitoring schedule, installation procedures, and location plans for noise monitoring as specified in Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements", and Section 02015 – GEOTECHNICAL INSTRUMENTATION.

1.3 QUALITY CONTROL

- A. Qualifications:
 - 1. The Design-Builder's subcontractor(s) performing this work shall be a reputable firm regularly engaged in installation of these types of mini-piles or similar work. The subcontractor shall have had experience in this type of construction for a period of at least five years, with a proven record of successfully completing a minimum of 10 projects similar in scope. Installation of mini-piles shall be continuously supervised by a foreman having supervised at least 10 comparable projects.
 - 2. The Design-Builder Independent Testing Agency performing the mini-pile load testing shall be a reputable firm regularly engaged in the testing of mini-piles or similar work. The subcontractor shall have had experience in this type of testing for a period of at least five years, with a minimum of 10 projects similar in scope. Load testing of mini-piles shall be performed by an Engineer having performed at least 5 comparable projects. The Engineer performing the load testing shall be responsible for collecting, interpreting, plotting, and reporting data to the Engineer. The Design-Builder's Independent Testing Agency Field Engineer shall have, at a minimum:
 - a. Bachelor of Science degree in Civil Engineering.
 - b. Four years of direct field experience in performing the type of load testing specified herein.

B. Reference Codes and Specifications:

1. American Society for Testing and Materials (ASTM):
 - a. A252, Welded and Seamless Pipe Piles,
 - b. A615, Reinforcing Bars,
 - c. A722 Thread Bars,
 - d. C33, Standard Specification for Concrete Aggregates,
 - e. C109, Compressive Strength of Hydraulic Cement Mortars (using two inch or 50 mm cube specimens),
 - f. C150, Portland Cement,
 - g. D1143, Standard Test Method for Piles under Static Axial Compressive Load,
 - h. D1586, Standard Test Method for Penetration Test and Split Barrel Sampling of Soils,
 - i. D2113, Standard Practice for Diamond Core Drilling for Site Investigation,
 - j. A36, Specification for Structural Steel,
 - k. C136, Sieve Analysis of Fine and Coarse Aggregates,
 - l. C939, Flow of Grout for Preplaced - Aggregate Concrete.
2. American Concrete Institute (ACI)
 - a. ACI 304, Recommended Practice for Measuring, Mixing, Transporting, and Placing Concrete.
 - b. ACI 305, Hot Weather Concreting
 - c. ACI 306, Cold Weather Concreting
3. American Welding Society (AWS):
 - a. AWS D1.1, Structural Welding Code
4. Commonwealth of Massachusetts, State Building Code.
5. AREMA 2016
6. AASHTO LRFD Bridge Design Specifications.

- C. The Design-Builder shall take a minimum of one set of 2" x 2" x 2" cubes of grout for each day during which mini-piles are grouted. A set of cubes shall consist of six cubes with one cube tested at three, seven and ten days and three cubes tested at twenty-eight days. Test cubes shall be made and tested in accordance with ASTM C109. Install and load test mini-piles in accordance with ASTM D1143. Provide complete testing materials and equipment as required.
- D. Store materials in accordance with the recommendations of "Recommended Practice for Measuring, Mixing, Transporting, and Placing Concrete", ACI 304.
- E. The Design-Builder shall engage an independent testing agency to collect samples in the field, perform laboratory tests, maintain and distribute test results, provide calibrated test equipment, and perform other duties associated with quality control.

1.4 JOB CONDITIONS

- A. The Design-Builder shall inspect the site to evaluate the conditions affecting the work.

- B. Details of the subsurface explorations performed for this project are included in the Geotechnical Data Report. Refer to the Geotechnical Data Report for additional details and boring logs. The Design-Builder shall assume that subsurface conditions between subsurface explorations could differ from conditions shown on the boring logs. The Design-Builder shall perform additional borings, as they deem necessary, to complete their design.
- C. The mini-piles shall be designed, detailed, and constructed to avoid impact to existing or proposed utilities. The Design-Builder shall protect utilities in accordance with Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements".

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Cement shall conform to "Standard Specification for Portland Cement (ASTM C150)".
- B. Mixing water for cement grout shall be clean and potable, free from oil, acids, alkali, salts, organic material, or other deleterious substances.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Preparation shall include, but not be limited to, the following:
 1. Layout of mini-pile locations. All mini-pile locations shall be clearly marked on the ground surface. Design-Builder shall confirm the location of all utilities through field observations. Utilities interfering with mini-pile installation shall be moved, temporarily rerouted, or relocated to permit mini-pile installation.
 2. Protect structures, underground utilities, and other construction from damage caused by installation operations.
 3. Protection of work areas: surrounding areas shall be protected from damage. Refer to Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements.
 4. Areas shall be returned to their "pre-work" condition upon completion of the work. Any and all damage arising from the Design-Builder's actions shall be replaced or repaired to the satisfaction of the MBTA. Damage is further defined to include items requiring additional clean-up as a result of the Design-Builder's failure to provide adequate protection.
 5. Obtain any and all necessary permits, licenses, and notifications related to the work.

3.2 INSTALLATION

- A. Mini-Pile Drilling:
 1. The equipment and procedures used by the Design-Builder shall provide a stable bottom within the casing during drilling and be capable of advancing and seating the casing at the tip elevation

and without causing damage to the surrounding areas. The equipment shall be of sufficient capacity to install the pipe to the depths required by the design or as revised by the load test results whichever is greater.

B. Bond Zone for Drilled Mini-Piles:

1. The length of the bond zone for production mini-piles shall be determined based on the results of the mini-pile load tests. The bond zone shall be measured from the bottom of the pipe.

3.3 GROUT PLACEMENT

- A. Special precautions shall be exercised as deemed necessary by the Design-Builder to avoid grout intrusion into existing utilities and spaces not intended to be grouted.
- B. The grouting sequence shall be submitted to the MBTA for approval.
- C. Grout shall be mixed in batches of 10 cubic feet or less, unless the Design-Builder demonstrates to the satisfaction of the MBTA that larger batches can be used without premature hydration and specific approval for a larger batch size is obtained from the MBTA.
- D. The Design-Builder shall test each truck load of grout using the flow cone test (ASTM C939) with 3/4" opening. Maintain grout within acceptable tolerances determined by the mix design.
- E. Protect grout from physical damage or reduced strength which could be caused by frost, freezing actions or low temperatures, in compliance with ACI 306.
- F. Place grout in accordance with ACI 305 when hot weather conditions exist that would seriously impair the grout's quality and strength.
- G. The Design-Builder shall prepare and submit daily to the MBTA, a record showing the quantity of holes drilled, pipe drilled and grout pumped per hole.
- H. The Design-Builder be responsible for maintaining all areas in a neat and orderly condition, both during and upon completion of the work. All waste material and Construction debris shall become the property of the Design-Builder and shall be removed from the site and disposed of in a legal manner.

3.4 TOLERANCES

- A. Horizontal: Location of mini-piles shall be installed within two inches from the theoretical location as required by design. The locations shall be determined by a Professional Land Surveyor registered in the Commonwealth of Massachusetts who shall prepare an As-Built Plan. The As-Built Plan shall be updated by the Professional Land Surveyor as necessary.
- B. Vertical: Plumbness of mini-piles shall be installed with no more than 1% deviation from the plumb position.

3.5 MINI-PILES OUT OF TOLERANCE

- A. Mini-Piles installed more than two inches from the design locations may not be acceptable for full design loading. Remedial measures, if required, shall be implemented by the Design-Builder.
- B. Any mini-pile out of tolerance for either location or plumbness by more than the amounts stated above may be rejected. If rejected, it shall be replaced by another mini-pile or mini-piles, at locations approved by the MBTA.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02370

DRILLED SHAFTS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies requirements for foundations constructed by drilling or otherwise excavating a shaft, and filling it with steel reinforcement and concrete.
- B. The Work of this Section also includes:
1. Excavation, backfilling, and disposal of existing obstructions encountered within the limits of the drilled shaft foundation construction. Transportation and disposal of excavation materials from the drilled shaft foundations. Soils shall be managed and disposed of in accordance with applicable Federal, State, and Local laws, regulations, and ordinances and as directed by the Licensed Site Professional (LSP) for this Project and in accordance with specification Section 02282- HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIALS.
 2. Supply, circulation, maintenance, and disposal of mineral slurry or other drilling fluid in accordance with all applicable federal, state, and local laws, regulations, and ordinances.
 3. Verification borings and reports; Design-Builder shall perform verification borings at the centerline of all drilled shaft locations and provide final boring logs to MBTA for review.
 4. Crosshole Sonic Logging (CSL) will be performed on all drilled shafts to verify proper concrete consolidation, placement, and integrity of the concrete in the drilled shaft foundations, and to determine the extent and location of defects in the shafts (internal voids, shaft perimeter integrity, transverse cracks, soil intrusions, and weak concrete or grout). CSL measurements shall be performed by an approved testing agency hired by the Design-Builder at all completed drilled shafts. CSL shall be performed between 1 and 7 days after concrete placement.
 5. Removal of concrete overpour or other irregularities which interfere with other structural elements, utilities, or other planned construction.
 6. The Design-Builder shall examine the site prior to mobilization to determine existing surface conditions.
 7. The Design-Builder shall be responsible for all coordination with the MBTA and utility companies.
 8. The Design-Builder shall obtain required permits from all authorities having jurisdiction.
 9. The construction of drilled shafts shall not disturb existing structures or the completed work. Damage to such structures shall be repaired by the Design-Builder at no additional cost to the MBTA.
 10. Adjacent structures shall be monitored and protected as specified in Section 02015 – GEOTECHNICAL INSTRUMENTATION.
 11. Construction operations not to exceed specified noise limits in accordance with Section 01560 – TEMPORARY CONTROLS.
- C. Related Work: Other specification sections that relate to the work of this section include:
1. Volume 2 Technical Provisions, Exhibit 2I, “Additional Project Requirements”.
 2. Volume 1 DB Contract Terms and Conditions, Subsection 9.4, Railroad Coordination and Requirements.

3. Section 02015 – GEOTECHNICAL INSTRUMENTATION
4. Section 02060 – EROSION AND SEDIMENTATION CONTROL
5. Section 02081 – HAZARDOUS MATERIALS ABATEMENT
6. Section 02240 – DEWATERING
7. Section 02260 – EXCAVATION SUPPORT AND PROTECTION
8. Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIAL
9. Section 02283 – HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER
10. Section 02300 – EARTHWORK
11. Section 03300 – CAST-IN-PLACE CONCRETE

1.2 WORK RESTRICTIONS

- A. The Design-Builder shall refer to MBTA General Specifications related to work on or adjacent to MBTA Railroad Property. These specifications are published by MBTA under the title “Railroad Operations Directorate”. It is the responsibility of the Design-Builder to obtain the latest version of all the necessary specifications including Volume 1 DB Contract Terms and Conditions, Subsection 9.4, Railroad Coordination and Requirements and strictly follow the guidelines specified during the execution of this work.

1.3 SUBMITTALS

- A. Unless otherwise specified, the Design-Builder shall submit the information specified herein to the MBTA not less than 30 days before the start of the Work of this Section.

- B. Core Borings and Report

Beyond the mandatory minimum requirements indicated herein, requirements for drilled shaft design and construction shall be determined by the Design-Builder based on subsurface information collected at the project site. The MBTA’s field representative will be onsite during drilling of drilled shafts to confirm the subsurface conditions assumed in the Design-Builder’s design. The results of subsurface explorations and/or tests including test core borings, rock core samples and Rock Quality Designations (RQD) for each core sample, shall be submitted to the MBTA prior to construction of any drilled shafts.

- C. The Design-Builder shall prepare and submit to the MBTA for review and approval, working drawings and design submission describing the drilled shaft design. The design submittal shall include the applicable code requirements and design references. The working drawings and design submission shall be submitted 30 calendar days prior to the commencement of the drilled shaft work. The working drawing and design submission shall include a drawing showing the location of each drilled shaft, details of casing, reinforcement, concrete design and placement details, installation procedures for drilled shafts including equipment technical specifications, and a schedule giving:

1. Drilled shaft number;
2. Drilled shaft design load; and
3. Diameter or drilled shaft and rock socket, if applicable.

- D. Submit shop drawings in accordance with these specifications.

1. Submit details of proposed equipment, methods, and sequence of operations to be used to excavate both soil and rock and maintain an open shaft, remove and dispose of obstructions within the limits of the shaft excavation, clean the shaft walls and bottom, produce, maintain, mix, and reclaim slurry, place reinforcing steel, and place concrete and backfill.
2. Submit test reports and drilled shaft installation logs as specified herein and in Article 1.6 of this Section. Submit proposed drilled shaft installation log forms for acceptance.
3. Submit description of equipment and method of providing and checking the cleanliness of shaft bottoms and identifying type of bearing material for consistency with design assumptions prior to placing concrete.
4. Submit the type of proposed access tubes and associated materials to prepare drilled shaft foundations for CSL, see Article 2.4 for limitations on material types. Submit shop drawings detailing installation of materials.
5. When drilling slurry is used, submit data from the supplier giving the recommended physical and chemical properties of the slurry. During construction, furnish the results of quality control tests performed on the slurry promptly after the tests are completed. Submit record copies each week.
6. Submit method of monitoring and continuously maintaining slurry level in drilled shafts in two principal perpendicular planes.
7. Submit method of monitoring verticality of the shaft excavation during excavation and details of proposed corrective measures to be implemented as necessary. For personnel who will perform verticality monitoring, submit documentation of training by the manufacturer in the use of the device to monitor verticality.
8. Submit method of maintaining stability of drilled shafts in the event of sudden slurry loss or loss of slurry stabilization properties.
9. Submit proposed building materials such as concrete mix design, reinforcing steel, and casing steel.
10. Submit method of securing and maintaining position of steel reinforcing.
11. Submit method of placing concrete, including number, location, and details of tremie pipes.
12. Submit monitoring schedule, installation procedures, and location plans for noise monitoring as specified in Volume 2 Technical Provisions, Exhibit 2I, "Additional Project Requirements", and Section 02015 – GEOTECHNICAL INSTRUMENTATION.

1.4 INSPECTION AND TESTING

- A. Concrete test cylinders for acceptance testing shall be made as specified in Section 03300 - CAST-IN-PLACE CONCRETE.
- B. Welding Inspection - all welds shall be visually inspected. All complete joint penetration welds shall be 100% ultrasonic examined.
- C. Hold Point - After completion of excavation and prior to placement of reinforcing steel and concrete, the condition of the excavation will be inspected by the MBTA.
- D. Remove any debris or other loose material from the shaft prior to placing reinforcing steel and concrete. An accumulation of muck in the bottom of the excavation will not be allowed.

1.5 TOLERANCES

- A. Variation of center of any drilled shaft foundation from the required plan location: Maximum 3 inches, measured at the ground surface in any horizontal direction, unless noted otherwise.

- B. Bottom diameter: Minus 0, plus 6 inches measured in any direction.
- C. Maximum variation from vertical: 1:100 measured continuously along the length of the shaft.
- D. Elevation of the top of shaft: Within 1 inch of cut-off elevation as required by design.
- E. After all the concrete is placed, the top of the reinforcing steel cage shall be no more than 1” above and no more than 3” below the position required by design.
- F. Excavation equipment and methods shall be designed so that the completed shaft excavation will have a horizontal planar bottom.

1.6 RECORD INFORMATION

- A. For each drilled shaft foundation installed, record on drilled shaft installation logs the location, alignment, dimensions, elevations of top and bottom, depth of bearing stratum penetration, description of materials encountered at all elevations, elevation of water table during excavation, condition of bottom of excavation, concrete data, verticality and deviation from plan location, and other data called for on the report form or pertinent to the drilled shaft. Record the theoretical volume of excavation, volume of concrete placed vs. depth, and total volume of concrete placed. Report irregularities to the MBTA within 24 hours of discovery.
- B. Submit draft record information for each completed shaft weekly to the MBTA. Submit final record drawings of each drilled shaft installed no more than 3 weeks after completion.
- C. Maintain daily job records of mineral or polymer slurry testing performed under Article 3.6 “Control Testing of Slurry”. Submit records to the MBTA on a weekly basis, and more frequently if variations occur.

PART 2 - PRODUCTS

2.1 CONCRETE AND REINFORCING STEEL

- A. Provide concrete and reinforcing steel in accordance with the requirements of Specification Section 03300 - CAST-IN-PLACE CONCRETE.

2.2 TEMPORARY CASING STEEL

- A. The thickness of temporary steel casing shall be as required to support soil and water pressure and withstand handling stress.

2.3 SLURRY

- A. Slurry shall be a stable suspension of either mineral or polymer in potable water. The Design-Builder shall anticipate encountering brackish groundwater, ash and cinder fill, leakage from storm and sanitary sewers, and other agents that may be deleterious to the slurry. The Design-Builder is responsible for and shall modify the slurry mix as required so as to maintain a stable suspension at all times.
- B. Density shall be such that adequate excavation support is provided, and that the slurry will be readily displaced by the tremie concrete.
- C. Additives shall be used in the slurry if needed to maintain the necessary properties, as approved by the MBTA.
- D. Fluid loss in the open excavation shall be limited to a drop in the slurry level of no greater than one inch per hour per 20 feet of excavation depth, and no more than 2 feet total in a 24-hour period.
- E. Mineral slurry shall be premixed thoroughly with clean fresh water and adequate time (as prescribed by the mineral manufacturer) shall be allotted for hydration prior to introduction into the shaft excavation. Slurry tanks of adequate capacity will be required for slurry circulation, storage, and treatment.

No excavated slurry pits will be allowed in lieu of slurry tanks without the written permission of the MBTA. Desanding equipment shall be provided by the Design-Builder, as necessary, to control slurry sand content to less than 4 percent by volume at any point in the borehole at the time the slurry is introduced, including situations in which temporary casing will be used.

The Design-Builder shall take all steps necessary to prevent the slurry from “setting up” in the shaft. Such methods include: agitation, circulation, and/or adjusting the properties of the slurry. Disposal of all slurry shall be done off site by the Design-Builder in accordance with applicable federal, state, and local laws, regulations and ordinances.

- F. Control tests using suitable apparatus shall be carried out on the mineral slurry by the Design-Builder to determine density, viscosity, and pH. An acceptable range of values for those physical properties is shown in the following table:

MINERAL SLURRY			
Acceptable Range of Values			
Property (Units)	At Time of Slurry Introduction	In Hole at Time of Concreting	Test Method
Density (pcf)	64.3* - 69.1*	64.3* - 75.0*	Density Balance
Viscosity (sec./qt**)	28 - 45	28 - 45	Marsh Cone
pH	8 - 11	8 - 11	pH paper, pH meter

* Increase the Acceptable Range by 2 pcf in salt water.

** Note that standard measurements are in seconds per quart, not seconds per liter.

- H. Tests shall be performed when the slurry temperature is above 40 degrees Fahrenheit. If de-sanding is required, sand content shall not exceed 4 percent by volume at any point in the borehole as determined by the American Petroleum Institute sand content test when the slurry is introduced.
- I. Tests to determine density, viscosity, and pH value shall be performed during the shaft excavation to establish a consistent working pattern. A minimum of four sets of tests shall be made during the first 8 hours of slurry use. When the results show consistent behavior, the testing frequency may be decreased to one set every four hours of slurry use.
- J. Polymer slurry, either natural or synthetic, may be used if approved by the MBTA. Slurry properties at the time of mixing and at the time of concreting shall be in conformance with the written recommendations of the manufacturer. The sand content at the base of the drilled shaft excavation shall not exceed 1 percent when measured by Method API (American Petroleum Institute) 13B-1, Section 5, immediately prior to concreting.
- K. The Design-Builder shall maintain the level of mineral slurry at not less than 4 feet above the highest expected piezometric pressure head. For polymer slurry maintain at a level not less than 6 feet above the highest expected piezometric head.

2.4 CROSSHOLE SONIC LOGGING ACCESS TUBES

- A. Access tubes for Crosshole Sonic Logging (CSL) shall be schedule 40 steel pipe conforming to ASTM A53, Grade A or B Type E, F, or S. The access tubes shall be placed in all drilled shafts, have a round, regular internal diameter free of defects and obstructions in the tube and at joints, in order to permit free, unobstructed passage of the source and receiver probes. The tubes shall be watertight and free from corrosion, with clean internal and external surfaces to ensure a good bond between the concrete and tubes. The tubes shall be fitted with threaded caps at the top and bottom ends. Submit proposed alternatives for the top caps for acceptance by the MBTA. In the event the tube is obstructed, the Design-Builder shall remove the obstruction and repair the tube at his/her own expense.

2.5 DRILLING MONITORING UNIT

- A. Provide a Drilling Monitoring Unit and a qualified technician for monitoring the dimensions and plumb of drilled shaft excavations.

PART 3 - EXECUTION

3.1 EXCAVATION

A. General

1. It is the obligation of the Design-Builder to become completely familiar with the conditions existing at the site. The Design-Builder may carry out whatever additional explorations are deemed necessary at no additional cost to the MBTA. It is the Design-Builder's sole responsibility to make interpretations and draw conclusions about the character of the material to be encountered and their impact upon the work based upon knowledge of the area and of shaft installation techniques. The MBTA assumes no responsibility for the accuracy of the data other than the location and the time the subsurface exploration was made.
2. Design-Builder shall perform conformational borings at the centerline of all proposed drilled shafts, prior to finalizing design and installation. Design-Builder shall develop final boring logs for each conformational boring and submit them to the MBTA for review.
3. The Design-Builder shall consult official records of existing utilities at the site to determine any conflicts with the work and shall advise the MBTA of any discrepancy before performing any work. Existing utilities found on the project site which are to remain shall not be disturbed or damaged. Provisions for protection of the utilities shall be made in accordance with the requirements of the authorities having jurisdiction.
4. Excavate drilled shafts by drilling, augering, or other effective methods to advance the excavation through overburden materials and bedrock to the required bottom design elevation. Use whatever means necessary to maintain a stable shaft without loss of ground.
5. Protect the excavation walls with steel cylinder casing, or accepted sheeting as necessary to prevent instability or displacement of the surrounding earth, excessive water intrusion, or damage from construction operations.
6. Monitoring and evaluation of the shafts at each stage will be performed by the MBTA. Do not place concrete in the shaft until the shaft excavation has been accepted by the MBTA.
7. Design-Builder shall remove obstructions encountered during shaft excavation. Obstructions are defined as man-made or man-placed objects, man-made or man-placed materials, man-made or man-placed structures, such as granite blocks, concrete, timber, logs, piles, or other man-placed materials, and naturally occurring boulders encountered at or below ground surface which unavoidably and completely stop the progress of the shaft excavation or subsurface drilling work for more than one (1) hour, despite the Design-Builder's diligent efforts, as determined by the MBTA. In drilled shaft operations, abandoned utilities and utility structures indicated on the existing reference documents or found by the Design-Builder, shall not be considered. Bedrock shall not be treated as an obstruction during any drilled shaft operations. The Design-Builder shall probe to locate the extent of the obstruction and propose a method of passing or removing it.
8. Potential obstructions include:
 - a. Abandoned or active deep foundations consisting of timber piles, concrete piles, and steel piles.
 - b. Active or demolished structures including: miscellaneous granite blocks, granite block foundations; walls, granite pavements and slabs; concrete foundations, walls, pavements, slabs and pile caps; brick pavements; brick foundations; miscellaneous construction debris and rubble from demolished structures including steel members, concrete, steel,

brick and timber structures; abandoned steel transit rails; timber cribbing and bulkheads; timber sheeting; timber ties.

- c. Abandoned and active utilities and utility structures not indicated on the existing reference documents or found by the Design-Builder.
 - d. Riprap, naturally occurring boulders, or stone fill.
 - e. Drilling tools, which are lost in the excavation, shall not be considered obstructions and shall be promptly removed by the Design-Builder without compensation. All costs due to lost tool removal shall be borne by the Design-Builder including but not limited to, costs associated with hole degradation due to removal operations or the time the hole remains open.
9. Do not excavate new shafts closer than 20 feet from newly concreted shafts until the shaft concrete has been in place a minimum of 24 hours.
 10. Design-Builder shall be responsible for the characterization of the drilling spoils. If the spoils are characterized as oil and hazardous materials (OHM), Design-Builder shall handle and transport the spoils in accordance with specification Section 02081 – HAZARDOUS MATERIALS ABATEMENT and specification Section 02282 – HANDLING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED MATERIAL.

B. Groundwater Control

1. Should groundwater be encountered during excavation operations, pumping shall be performed in accordance with Section 02240 - DEWATERING, and provided that no soil movement, caving of the excavation walls, bottom heaving, or ground settlement occurs. Dewatering discharge shall be in accordance with the requirements of Section 02240 - DEWATERING and Section 02283 – HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER.
2. If groundwater intrusion endangers the security of the excavation or adjacent property or structures, mitigative measures shall be implemented in accordance with the requirements of Volume 2 Technical Provisions, Exhibit 2, “Additional Project Requirements”.

C. Inspection

1. Details of shaft construction shall be recorded on the drilled shaft installation logs.
2. Core borings shall be drilled by the Design-Builder at each shaft location, the bottom elevation of the drilled shaft will be adjusted to obtain the required design capacity based on the elevation and quality of the bearing material encountered during installation of drilled shaft.
3. Sound, measure, and record the final bottom of shaft excavation depth and elevation in the presence of the MBTA at the following times, to verify that soil from the sides of the shaft has not fallen into the shaft and sediment has not collected on the shaft bottom:
 - a. Immediately after excavation has been performed to the final depth.
 - b. Immediately after the excavation has been cleaned of all loose material.
 - c. Immediately prior to and after placing reinforcing steel in the shaft.
 - d. Immediately prior to concrete placement.
4. Before the placement of reinforcing steel and concrete, ensure that loose material from the bottom and sides of the excavation has been removed and that the shaft is within the specified tolerances. Remove all loose material at the bottom of the shaft to permit the development of end bearing as per the Design-Builder’s design using a combination of clean-out buckets and airlifts. Document drilled shaft excavation dimensions versus depth and verticality using the approved Drilling Monitoring Unit to verify that the shaft is within the specified tolerance.

- D. The Design-Builder shall be responsible for correcting drilled shafts not constructed within the specified tolerances. Remedial measures, including engineering analysis and redesign, to correct for out-of-tolerance drilled shaft foundations, shall be performed at no additional cost to the MBTA.

3.2 INSTALLATION OF CASING

- A. Provide steel casing as needed to construct a stable shaft excavation. Excavations using permanent casing shall be made in a manner such that the outside of the casing is in direct contact with undisturbed natural soils.
- B. Permanent casing joints shall be continuously welded.

3.3 INSTALLATION OF REINFORCING STEEL

- A. Prior to installation, inspect and clean reinforcing steel of materials that prevent effective bonding.
- B. The reinforcing steel cage, consisting of longitudinal bars, ties, cage stiffeners, spacers, centralizers, and other necessary appurtenances, shall be completely assembled and placed as a unit immediately after the shaft excavation is inspected and accepted, and prior to concrete placement. Internal stiffeners shall be removed as the cage is placed in the borehole so as not to interfere with the placement of concrete.
- C. The reinforcing steel in the shaft shall be tied and supported so that the reinforcing steel will remain within allowable tolerances given in Article 1.5 "Tolerances" of this specification. Concrete spacers or other approved non-corrosive spacing devices shall be used at sufficient intervals (near the bottom and at intervals not exceeding 5 feet up the shaft) to ensure concentric spacing for the entire cage length. Spacers shall be constructed of a material equal in quality and durability to the concrete specified for the shaft. The spacers shall be of adequate dimension to insure a minimum 3" annular space between the outside of the reinforcing cage and the side of the excavation hole. Approved cylindrical concrete feet (bottom supports) shall be provided to ensure that the bottom of the cage is maintained at the proper distance above the base.
- D. Dropping or forcing the reinforcing steel into the shaft shall not be permitted. If the reinforcing cage does not properly or smoothly enter the excavation, it shall be retrieved and the excavation adjusted and properly cleaned as specified until the reinforcing fits smoothly. Repair or replace any damaged reinforcing.
- E. After the installation of reinforcing steel and immediately prior to concrete placement, the bottom of the excavation shall be measured to determine if sediment has accumulated on the shaft bottom. If sediment is found to have accumulated on the shaft bottom, clean the bottom of the excavation with an air-lift or other equipment which is capable of removing the sediment.

3.4 PLACING CONCRETE

- A. Place concrete immediately after inspection by the MBTA of the completed excavation, and the placement of reinforcement. Shaft concrete shall be placed within 24 hours of completion of shaft excavation.
- B. Place concrete in one continuous operation. Concrete shall be placed through a tremie or concrete pump.

- C. When the casing is to be removed, withdraw the casing while concrete is still fluid, before initial set.
 - 1. Withdraw the temporary steel casing used to support the excavation walls as the concrete is being placed unless otherwise indicated, or unless the casing is to be left in place. Concrete shall be a minimum of 5 feet above the bottom of casing at all times while the casing is being withdrawn. The tremie pipe shall be raised to the minimum 5-foot embedment depth following the delivery of concrete from each truckload of concrete. Withdraw the casing when the concrete pressure at the casing seal exceeds water and soil pressure at that level. Remove the steel casing in a manner that prevents water and earth from entering the casing at the bottom. Do not damage or displace the reinforcing cage when withdrawing the casing. Ensure the fluid trapped behind the casing is displaced upward without contaminating shaft concrete.
 - 2. Check concrete level before, during, and after withdrawing casing to confirm that separation of shaft concrete has not occurred.
 - 3. Do not vibrate concrete internally before casing is withdrawn.
- D. Vibrate the top 5 feet of concrete after the casing has been withdrawn, and in locations where the casing is permanent.
- E. Fill the void space between permanent casing and shaft excavation with concrete or fluid grout.
- F. Cure and finish the top of the shaft to comply with the construction methods of Specification Section 03300 CAST-IN-PLACE CONCRETE.

3.5 SLURRY

- A. Use equipment that produces a stable suspension and provides mechanical agitation. Transport slurry by means of a temporary pipeline or other safe methods.
- B. Use equipment that removes detrimental quantities of excavated material from the slurry.

3.6 CONTROL TESTING OF SLURRY

- A. Perform control testing of mineral slurry in accordance with API Standard RP 13B, “Standard Procedure for Testing Drilling Fluids” and as specified herein. If polymer slurry is used, modify the parameters in accordance with the slurry manufacturer’s recommendations. The Design-Builder or his representative shall have demonstrated experience in testing on at least 5 projects.
- B. Test the slurry to determine the following:
 - 1. Freshly Mixed Slurry. Measure density, pH, and Marsh Cone viscosity of freshly mixed slurry. Perform an API fluid loss test on freshly mixed mineral slurry.
 - a. Calibrate density measuring devices monthly, or more often if there is evidence of needed calibration, to an accuracy of ± 0.05 PCF.
 - b. Perform an API fluid loss test in accordance with American Petroleum Institute Standard 13A. Fluid loss shall not exceed 25cc in 30 minutes.
 - 2. Slurry Inside Excavation. Perform tests specified below to verify that properties of slurry inside excavations are within the specified limits.

- a. Obtain samples from the top and bottom of the shaft, and perform the following tests once every 2 hours.
 1. Density, by mud density balance.
 2. Viscosity, by Marsh Cone Method.
 3. pH.
 4. Sand content.
 - b. Perform fluid loss measurements in the shaft at the beginning or end of every shift as directed by the MBTA.
 - c. Perform an API fluid loss test for polymer slurry once every 3 days at times directed by the MBTA. Fluid loss shall not exceed 25cc in 30 minutes.
3. Prior to concreting, obtain samples from the top and bottom of the shaft and at intervals not exceeding 10 feet up the slurry column in shaft until 2 consecutive samples produce the acceptable values for density, viscosity, and pH.

3.7 INSTALLATION REQUIREMENTS FOR CROSSHOLE SONIC LOGGING

- A. Preparation of Crosshole Sonic Logging (CSL) Access Tubes. The access tubes shall be placed in all drilled shafts. The access tubes shall be installed as shown on the approved shop drawings. The tubes shall be securely fastened at 3-foot intervals to the interior of the reinforcement cage in a parallel manner. Care shall be taken during reinforcement installation operations not to damage the tubes or break the fasteners of the tubes. Immediately prior to concrete placement of the drilled shaft, the tubes shall be filled with clean water and capped. All CSL test results shall be submitted to the MBTA.

3.8 ACCEPTANCE OR REJECTION OF DRILLED SHAFT

- A. In addition to other Contract acceptance criteria, drilled shafts shall be accepted when the CSL test reports are reviewed and accepted by the MBTA. Rejection of a drilled shaft, based on the results of the CSL, will require conclusive evidence that a defect exists in the drilled shaft that will result in inadequate or unsafe performance under service loads. If the record is complex or inconclusive, coreholes shall be drilled in the drilled shaft of questionable quality. When a defect is confirmed by coring of the concrete, the Design-Builder shall repair the defect and perform additional CSL testing to confirm that the repair was successful. Repaired drilled shafts shall be accepted when the CSL test reports are reviewed and accepted by the MBTA. The MBTA will be the sole judge of drilled shaft acceptance.
- B. In the case that a drilled shaft is determined to be unacceptable, the Design-Builder shall submit a plan for remedial action to the MBTA. Calculations and working drawings for the remedial action shall be stamped by a Registered Professional Engineer in the Commonwealth of Massachusetts. The Design-Builder shall carry out the remediation work without cost to the MBTA and without an extension of the contract time.
- C. Following final acceptance of each drilled shaft by the MBTA, the Design-Builder shall completely fill all CSL access tubes with minimum 5,000 psi tremied concrete grout.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions, Section 14, Payment.

END OF SECTION

SECTION 02400

DRAINAGE AND SEWER SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies construction of drainage facilities and sanitary sewer facilities.
- B. Related Work: The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 02060 – EROSION AND SEDIMENTATION CONTROL
 - 2. Section 02081 – HAZARDOUS MATERIALS ABATEMENT
 - 3. Section 02221 – DEMOLITION
 - 4. Section 02240 – DEWATERING
 - 5. Section 02282 – HANDLING, TRANSPORTATION AND DISPOSAL OF EXCAVATED MATERIALS
 - 6. Section 02283 – HANDLING AND DISPOSAL OF CONTAMINATED GROUNDWATER
 - 7. Section 02296 – TRAFFIC DECKING
 - 8. Section 02300 – EARTHWORK
 - 9. Section 02359 – MODULAR PRECAST BLOCK RETAINING WALLS
 - 10. Section 02402 – STORMWATER TREATMENT AND DISPOSAL SYSTEMS
 - 11. Section 02450 – SECONDARY CONTAINMENT SYSTEMS - GEOSYNTHETIC BARRIERS
 - 12. Section 02509 – PAVEMENT BASE COURSES
 - 13. Section 02615 – DUCTILE IRON PIPE AND FITTINGS FOR STORMWATER PUMP STATIONS
 - 14. Section 02632 – STORMWATER BYPASS PUMPING SYSTEMS
 - 15. Section 02633 – WASTEWATER BYPASS PUMPING SYSTEMS
 - 16. Section 02650 – EXISTING SITE UTILITIES
 - 17. Section 03300 - CAST-IN-PLACE CONCRETE
 - 18. Section 05500 – MISCELLANEOUS METALS
- C. The Design-Builder is required to comply with all requirements of the MBTA Railroad Operations Directorate Specifications Part IV, Pipeline Occupancy Specifications, and shall comply with the MBTA Commuter Rail Design Standards Manual.

1.2 SUBMITTALS

- A. Shop Drawings. Include details of sewers and drains, including relationship to other systems; true position and details of interfaces, connections, inlets, cleanouts, manholes, safety gates, alignment, grade, changes of direction, offsets, bedding, protection, materials and other pertinent data.

- B. Product Data: Submit copies of manufactures' printed product data, specifications, standard details, installation instructions, use limitations and recommendations for each material used. Provide certifications that materials and systems comply with specified requirements.
- C. Product data for all materials shall be submitted for approval. Product data shall be submitted for any installed materials, including but not limited to the following materials:
1. PVC pipe and fittings
 2. PVDF pipe and fittings
 3. Reinforced concrete pipe and box culvert
 4. Ductile iron pipe
 5. High density polyethylene (HDPE) pipe
 6. Fiberglass reinforced pipe (FRP)
 7. Precast concrete manhole sections
 8. Precast concrete catch basins
 9. Pipe and structure joint gaskets and seals
 10. Manhole steps, joint sealer, brick and mortar and frames and grates/covers.
 11. Fiberglass manhole tee bases, risers and cones.
 12. Filter fabric
 13. Underdrain filter
 14. Perforated pipe
 15. Polyethylene encasement for ductile iron pipe
 16. Steel casing pipe, casing spacers and end seals
 17. Galvanized steel grating
 18. Stop logs and appurtenances
 19. Controlled density fill
 20. Inline check valve
 21. Area Drains
 22. Concrete admixtures
 23. Splash Pads
 24. Galvanized steel pipe

1.3 PERMITS AND LICENSES

- A. The Design-Builder is required to submit permit applications and pay the associated fees to the Cities of Boston, Cambridge, Medford and Somerville to obtain permits for the construction of the sanitary sewer and storm water drainage improvements.

- B. The Design-Builder is required to apply for and obtain Drainlayers Licenses from the Cities of Boston, Cambridge, Medford and Somerville. The Design-Builder shall submit a General Service Application to the Boston Water and Sewer Commission (BWSC).
- C. For drainage installations within the City of Boston, the Design-Builder shall coordinate installation schedules with BWSC inspectors.
- D. The Design-Builder is required to comply with all requirements of 520 CMR 14.00: *Excavation and Trench Safety*, which has established standards to prevent unauthorized access to unattended trenches.

1.4 PRESSURE AND LEAKAGE TESTING AND TOLERANCES

- A. Gravity Lines: Maximum allowable leakage for any section or sections, or for the total lengths of pipelines: 200 gallons per inch of diameter per mile per 24 hours.
- B. Polyvinyl Chloride PVC and Polyvinylidene Fluoride PVDF:
 1. Testing of Pipe: After completing installation and backfill of pipe, the Design-Builder shall, at his expense, conduct a line acceptance test using low pressure air. Equipment used shall meet the following minimum requirements: Pneumatic plugs shall have a sealing length equal to or greater than the diameter of the pipe to be inspected; Pneumatic plugs shall resist internal test pressures without requiring external bracing or blocking; All air used shall pass through a single control panel. Three individual hoses shall be used for the following connections: From control panel to pneumatic plugs for inflation; from control panel to sealed line for introducing the low pressure air; from sealed line to control panel for continually monitoring the air pressure rise in the sealed line.
 2. All pneumatic plugs shall be seal tested before being used in the actual test installation. One length of pipe shall be laid on the ground and sealed at both ends with the pneumatic plugs to be checked. Air shall be introduced into the plugs to 25 psig (172.3689 Kpa). The sealed pipe shall be pressurized to 5 psig (34.47378 Kpa). The plugs shall hold against this pressure without bracing and without movement of the plugs out of the pipe.
 3. After a manhole to manhole reach of pipe has been backfilled and cleaned, and the pneumatic plugs are checked by the above procedure, the plugs shall be placed in the line at each manhole and inflated to 25 psig (172.4 Kpa). Low pressure air shall be introduced into this sealed line until the internal air pressure reaches 4 psig (27.579 Kpa) greater than the average back pressure of any groundwater that may be over the pipe. At least two minutes shall be allowed for the air pressure to stabilize.
 4. After the stabilization period (3.5 psig (24.1317 Kpa) minimum pressure in the pipe), the air hose from the control panel to the air supply shall be disconnected. The portion of line being tested shall be termed "Acceptable" if the time required in minutes for the pressure to decrease from 3.5 to 2.5 psig (24.1317 to 17.2369 Kpa) (greater than the average back pressure of any groundwater that may be over the pipe) is not less than the time shown for the given diameter in the following table.

Pipe Diameter	Specification Time for Length Shown (min: sec)			
	<u>Inches</u>	<u>100 ft.</u>	<u>200 ft.</u>	<u>300 ft.</u>
6	5:40	5:40	5:40	5:42
8	7:34	7:34	7:36	10:08
10	9:26	9:26	11:52	15:49
12	11:20	11:24	17:05	22:47
15	14:10	17:48	26:42	35:36
18	17:00	25:38	38:27	51:16
21	19:50	34:54	52:21	69:48
24	22:47	45:34	68:22	91:10

5. In areas where groundwater is known to exist, the Design-Builder shall install a 1/2 inch (1.27cm) diameter capped pipe nipple, approximately 10 inches long, through the manhole wall adjacent to one of the sewer lines entering the manhole. This shall be done at the time the line is installed. Immediately prior to the performance of the Line Acceptance Test, the groundwater shall be determined by removing the pipe cap, blowing air through the pipe nipple into the ground so as to clear it, and then connecting a clear plastic tube to the nipple. The hose shall be held vertically and a measurement of the height in feet of water over the invert of the pipe shall be taken after the water has stopped rising in this plastic tube. The height in feet shall be divided by 2.3 to establish the pounds of pressure that will be added to all readings. (For example, if the height of water is 11 1/2 feet, then the added pressure will be 5 psig. This increases the 3.5 psig to 8.5 psig, and the 2.5 psig to 7.5 psig. The allowable drop of one pound and the timing remain the same). In no case shall the starting pressure exceed 9.0 psig.
6. If the Design-Builder is unable to pass a pressure test because lines are “live”, the Design-Builder shall perform closed circuit television inspections of the lines at no additional cost to the MBTA. The MBTA must be able to witness the tests and must be provided with a video recording of each test for further inspection.
7. Test Failure: If the section of pipe fails to pass the leakage and pressure test, or if there is any visible leakage, the Design-Builder shall locate, uncover and repair or replace the defective pipe fitting or joint and retest all at his own expense. Pipe will be considered passing only when the leakage does not exceed the above standard. Passing the test does not absolve the Design-Builder from his responsibility if leaks develop later within the period of warranty.

C. RCP and Box Culverts:

1. Leakage Tests: Leakage tests will be required by the Authority for all pipe and manhole installations. Tests shall meet all requirements of this paragraph. Leakage into or from the piping and structures, except storage tanks, will be determined respectively by infiltration tests or by exfiltration tests, as specified herein and as directed. The maximum allowable amount of infiltration into the piping or exfiltration from the piping as determined respectively by the infiltration tests or by the exfiltration tests, including manholes, shall be at a rate of not greater

than 150 gallons (567.8 l) per inch of pipe diameter per mile of pipe per 24 hours, and there shall be no gushing or spurting streams of water into or from the piping or manholes. The phrase, "per mile of pipe" shall refer to the total length of pipe measured through manholes. Where the groundwater level can be maintained at a height of not less than one foot (304.8 mm) above the top of the pipe for the full length of the section of pipe being tested for leakage, the leakage into the piping and manholes shall be determined as specified under "Infiltration Tests." Where the groundwater cannot be maintained at a level of not less than one foot (304.8 mm) above the top of the pipe for the full length of the section of pipe being tested, the leakage from the piping and manholes shall be determined as specified under "Exfiltration Tests". Perform all work, provide all necessary weirs or such other measuring devices as required, do all pumping and furnish all equipment necessary for the proper performance of leakage tests at no additional cost to the MBTA. Leakage testing of piping shall be satisfactorily performed in sections as the work progresses, and as directed.

2. Infiltration Tests: The tests shall be conducted at such times as the groundwater level is at a height of not less than one foot (304.8 mm) above the top of the pipe for the full length of the section of the pipe being tested. The groundwater leakage into the pipe will be measured by the Authority at such point or points as he may direct. Construct such weirs or other means of measurement as required and pump as necessary for the tests to be properly made.
3. Exfiltration Tests: Where exfiltration tests are required, the section of pipe to be tested shall be subjected to an internal pressure. The lower end of the section of pipe to be tested shall be closed and the entire section of the pipe, including manholes, shall be filled with clean water so as to obtain a minimum head of 2 feet (0.6096 m) above the top of the pipes; the length of the section of pipeline being tested shall be such that with the head of water 2 feet (0.6096 m) above the top of pipe at the upper end of the section of the pipeline being tested will not exceed 8 feet (2.4384 m). The rate of leakage from each section of the pipe being tested will be determined by the MBTA by measuring the amount of water required to maintain the minimum head of 2 feet (0.6096 m) above the top of the pipe for the full length of each section of the pipes being tested.
4. Should the infiltration or exfiltration test on any section of the pipelines, including manholes, show a rate of leakage into or from the pipeline exceeding the maximum allowable rate of infiltration or exfiltration specified herein, locate, repair, or replace defective joints and work in a manner satisfactory to the MBTA and retest at no additional cost to the MBTA until the rate of infiltration into or exfiltration from each section of the pipeline being tested does not exceed the rate specified herein for infiltration or exfiltration.
5. The completed pipe and joints shall be visually inspected by the MBTA. If the Design-Builder is unable to pass a pressure test because lines are "live", the Design-Builder shall perform closed circuit television inspections of the lines at no additional cost to the MBTA. The MBTA must be able to witness the tests and must be provided with a video recording of each test for further inspection.

D. Ductile Iron Force Mains:

1. Pressure Testing: All pipe and appurtenances installed shall be hydrostatically tested in accordance with ANSI/AWWA C600, latest version unless stated otherwise herein. Test pressure, expressed in terms of feet of water, applied at any point in pipe equals arithmetic difference between specified test pressure plane elevation and elevation of horizontal center line of pipe at selected location. Multiply value by 0.433 to obtain pounds per square inch. Ensure pressure gauges are accurately calibrated. Do not attempt pressure testing until all air has been vented from the mains. All new force mains that shall become the property of the MBTA shall be pressure tested at a minimum of 150 psi for a continuous period of two hours.

2. Leakage Testing: Conduct leakage testing in conjunction with pressure tests. Ensure that joints in piping are watertight and free from visible leaks during leakage test.
 3. Leakage Test Pressure: Maintain specified normal operating line pressure for pressure testing of reach during leakage test. Maintain hydrostatic pressure within plus or minus 5 percent during entire time of leakage measurements.
 4. Leakage Measurement: Do not attempt measurement of leakage until trapped air has been vented and constant test pressure has been established. Measure leakage by means of an approved water meter installed in the pressure piping on discharge of the pump. Ensure that water meter is accurately calibrated.
 5. Allowable Leakage: Ensure that pipe reach does not exceed the allowable leakage rate. Calculate allowable leakage with following formula:
 - a. $Q = 0.0075 \text{ DLN}$ where
 - b. Q = allowable leakage in gallons per hour
 - c. D = nominal diameter of pipe in inches
 - d. L = length of section tested in thousand feet (1,000-foot maximum)
 - e. N = square root of avg test pressure in psi (12.25)
 6. Calculate allowable leakage separately for each diameter and add resulting allowable leakage rates to obtain total allowable leakage for entire reach.
- E. Drainage and Sanitary Structures and Catch Basins, Leakage Tests:
1. The manholes shall be made as nearly watertight as practicable.
 2. The Design-Builder shall perform leakage tests on each manhole installed using an approved low air pressure testing system. This type of test shall be used only immediately after assembly of the manhole and only prior to backfilling. The manhole to pipe connection should only be a flexible connector. All lift holes shall be plugged with a non-shrinking mortar. For this test, each manhole shall be tested under 10-inch Hg vacuum. The test shall pass if the vacuum remains at 10-inch Hg or drops no lower than 9-inch Hg after 60 seconds for 4 or 5 foot manholes from 0 to 10 feet deep, 75 seconds for 4 or 5 foot manholes from 10 to 15 feet deep, or 90 seconds for 4 or 5 foot manholes from 15 to 25 feet deep. A volume equivalent shall be calculated for larger diameter manholes to determine the testing length based on these parameters.
- F. Fiberglass Reinforced Pipe
1. Low Pressure Air Test: Each joint / coupling is to be air tested with air pressure (max 5 psi). The joint passes the test if there is no pressure drop through the pipe or pipe joints for 4 minutes.
 2. The Design-Builder shall furnish manufacturer's test data that substantiates pipe joints will not leak (into the pipe) with a 25-foot head of water above the top of pipe.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Materials used to manufacture storm drainage products (pipe, structures and their appurtenances) are specified in the following paragraphs of this Part. For portions of the storm drainage system to be

installed that are tributary to and downstream of the Washington Street Pump Station (WSPS) the following additional requirements specified in this Paragraph apply. The storm drainage facilities in these areas require protection from chlorinated volatile organic compounds (CVOC) that have been reported in the groundwater. These additional requirements shall pertain to all drainage facilities within the railroad corridor as determined by the designated Project LSP and generally between the Washington Street Pump Station (WSPS) and just north of Cross Street (NH-T1 Sta. 103+50), the Washington Street underpass roadway drainage collection and conveyance system, the WSPS discharge force main piping from the pump station to force main piping Station 68+00 and the end seals of the casing pipe for the force mains which begins at approximately force main piping Station 68+00. The previous design measures are provided herein and listed below as a general reference only. Subsequent findings and final recommendation of the designated Project LSP shall govern.

1. Joint sealing material and gaskets for all piping and drainage structures shall be the fluorocarbon type, and at a minimum, be constructed of Viton. This shall also include all flexible pipe connector devices used to connect piping to drainage structures and the WSPS. Gasket material shall be in accordance with ASTM D2000.
 2. Cement concrete used to manufacture precast reinforced concrete pipe (RCP) and drainage structures shall include an additive to provide a waterproofing system. Concrete waterproofing system shall be of the integral crystalline type, defined by the ACI 212.3R – 10 Report on Chemical Admixtures for Concrete as a “PRAH” type hydrophilic admixture. It shall react such that it chemically controls and permanently fixes a non-soluble crystalline structure throughout the capillary voids of the concrete. The system shall cause the concrete to become sealed against the penetration of liquids from any direction, and shall protect the concrete from deterioration due to harsh environmental conditions. Admixture shall be a product produced by Kryton International Inc., Xypex Chemical Corporation or an approved equal. Design-Builder shall submit product literature and mix designs demonstrating compliance with the intent of these specifications and indication of precaster acceptance of use of the additive.
 3. Plastic drain and underdrain shall be polyvinylidene fluoride (PVDF) piping, as shown on the Plans.
- B. Products used at interface with utility companies shall conform to the requirements of connected utility companies.

2.2 PIPE AND FITTINGS

- A. Clay Pipe and Fittings:
1. Pipe: ASTM C 700, except crushing strength shall be in accordance with National Clay Pipe Institute Specification ER4, salt or ceramic glazed, bell and spigot except where plain ends are indicated.
 2. Joints and Gaskets: ASTM C 425.
- B. Plain Concrete Pipe:
1. Unperforated: ASTM C14, class as indicated, bell and spigot.
 2. Perforated: ASTM C 444, type as indicated, and all applicable requirements of ASTM C 14, class as indicated.
- C. Reinforced Concrete Pipe (RCP) and Box Culverts (preferred for all gravity flow drainage systems):

1. Circular Section: ASTM C 76; ends, class, and wall as indicated. All RCP on MBTA property shall utilize Class 5 with a Wall C. RCP that is to be jacked shall be minimum Class 5.
 2. Elliptical Section: ASTM C 507; ends and class as indicated.
 3. Box Culvert Section: ASTM C 1433; ends, class, and wall as indicated.
- D. Joints and Gaskets for Circular Concrete Pipe: ASTM C 443.
- E. Steel Casing Pipe for Jacking or Open-Cut Installations: Casing pipe shall be designed for the earth and/or pressure present, and for railroad live load. The dead load of earth shall be considered 120 pounds per cubic foot. Railroad live load shall be Cooper E-80 with 50% added for impact. The minimum yield strength for steel pipe shall be 35,000 psi.
- F. Ductile Iron Pipe for Gravity and Force Mains:
1. Refer to Section 02615 for Ductile Iron Pipe and Fittings for Stormwater Pump Stations.
 2. Ductile iron pipe shall be that of a United States manufacturer who can demonstrate at least 5 years of successful experience in manufacturing ductile iron pipe. The pipe shall be equipped with push on type, restrained joint, or mechanical joints, as required.
 3. All ductile iron pipe shall conform to ANSI/AWWA C 151/A21.51 and ASTM A 746.
 4. The ductile iron pipe shall be, at a minimum, Class 52 or as determined considering the trench load and internal pressure separately in accordance with ANSI/AWWA C150/A21.50. Ductile iron pipe shall be H2 Sewer Safe Pipe (Sewer Coat lined).
 5. The ductile iron pipe shall be asphalt coated on the outside and inside with a minimum of 1 mil bituminous paint according to ANSI/AWWA C151/A21.51 Section 51-8.1. Prior to the lining, the inside and outside of the spigot end shall be coated with a minimum of 8 mil of epoxy. The inside of the bell end including the gasket cavity shall also be coated with 8 mil of epoxy.
 6. The ductile iron pipe lining shall be as manufactured by Lafarge Calcium Aluminates or approved equal. The coating shall be a calcium aluminate mortar consisting of calcium aluminate cement and fused calcium aluminate aggregates. A seal coat shall be applied to the lining. The thickness of the lining shall be 0.125-inch for 6-inch through 12-inch pipe and 0.1875-inch for 14-inch through 24-inch pipe.
 7. Ductile iron pipe shall be encased in polyethylene film, conforming to the requirements of AWWA C105.
 8. Gasket Materials: Push-on and mechanical joint gaskets shall be Nitrile (NBR) (Acrylonitrile Butadiene) or equal gasket acceptable for use in an environment which will handle fats, oils and greases unless otherwise noted or approved.
 9. Fittings: Fittings shall be compact ductile iron Class 350 Mechanical Joint, conforming to ANSI Specification A21.53 (AWWA C 153), latest edition, for pipe sizes 16 inches and smaller, and Class 350 standard Mechanical Joint fittings conforming to AWWA C110/ANSI A21.10, latest edition except as specified, for pipe sizes 16 through 24 inches, unless specifically stated otherwise in the specifications or on the drawings. Fittings shall be suitable for use with restraints as specified hereinafter. Fittings shall be manufactured in the United States. Fittings shall be of the same material and have the same lining and coating as the pipe specified above. All fittings shall be marked with the weight and shall have distinctly cast upon them the pressure rating, the manufacturer's identification, nominal diameter of openings and the number of degrees or fraction of the circle on all bends.

- a. Caps and plugs installed in all new work as indicated on the drawings shall be provided with a threaded corporation or bleeder valve so that air and water pressure can be relieved prior to future connection.
- b. Solid sleeve couplings shall be ductile iron with 350 psi rating. Sleeves shall conform to ANSI/AWWA C 219.

G. Polyvinyl Chloride Pipe (PVC):

1. All PVC pipe shall be continuously and permanently marked with the manufacturer's name, pipe size, and pressure rating or stiffness in psi (kpa).
2. The Design-Builder shall also require the manufacturer to mark the date of extrusion on the pipe. This dating shall be done in conjunction with records to be held by the manufacturer for 2 years, covering quality control tests, raw material batch number, and other information deemed necessary by the manufacturer.
3. Pipe:
 - a. All PVC pipe shall be joined by compression joints unless otherwise shown or specified, and shall conform to the following requirements:
 - b. Non Perforated Polyvinyl chloride pipe (PVC) shall conform to the requirements of ASTM D 3034, Class SDR 35. Material for PVC pipe shall conform to the requirements of ASTM D 1784 for Class 12454-B or 12454-C as defined therein. All diameters shall be as specified on the Contract Drawings.
 - c. Perforated PVC pipe shall conform to the requirements of ASTM D 3034, Class SDR 35. Material for perforated PVC pipe shall conform to the requirements of ASTM D 1784 for Class 12454-B or 12454-C as defined therein. The pipe shall have 3/8-inch perforations, 6 inch on center and 4 holes per row. The pipe shall be 6 inch diameter unless otherwise specified on the Contract Drawings.
 - d. Elastomeric seals for compression type joints for PVC pipe and fittings shall conform to the requirements of ASTM D 3212.
 - e. Service pipes for storm services shall be minimum of 8-inch and shall match diameter of existing services for reconnections. Service pipes for sanitary services shall be minimum of 6-inch and shall match diameter of existing, services for reconnections.
4. Fittings:
 - a. All fittings shall conform to the requirements of ASTM D 3034 or ASTM F 679. The ring groove and gasket ring shall be compatible with PVC pipe ends. The flanged fittings shall be compatible with cast-iron or ductile iron pipe fittings.
 - b. The strength class of the fittings shall be not less than the strength class of any adjoining pipe.
 - c. PVC pipe fittings shall be full-bodied, either injection molded or factory fabricated.
5. Connections:
 - a. Sanitary services shall be connected to new, parallel or replacement sanitary sewer lines with full bodied tees or wye fittings.

- b. Storm services shall be connected to new, parallel, or replacement storm sewer lines with full bodied tees or wye fittings for all pipes up to 18-inch in diameter. Connections to pipes larger than 18-inch in diameter or odd sizes shall be made with saddle tap connections, as approved by Owner.
 - c. Connections of storm and sanitary service lines to existing storm and sanitary main lines shall be made with full bodied tees or wye fittings wherever possible for existing lines less than 18-inch in diameter and with tapping saddles as approved by Owner for existing lines greater than 18-inch in diameter and in odd sizes.
6. Gaskets: Flexible elastomeric rings conforming with ASTM F 477.

H. Perforated High Density Polyethylene (HDPE) Pipe:

- 1. Perforated high density polyethylene pipe and fittings for use as underdrain pipe shall be corrugated profile-wall pipe with a smooth interior wall. HDPE underdrain pipe shall meet the requirements of AASHTO M294 and ASTM F2306. Virgin material for pipe and fitting production shall be high-density polyethylene conforming with the minimum requirements of ASTM D3350, except that carbon black content should not exceed 4%.
- 2. Pipe joints shall comply with the requirements of AASHTO M294 and ASTM F2306. Pipe joints shall be watertight meeting the requirements of ASTM D3212. The joint gaskets shall comply with ASTM F477.
- 3. Perforations shall be Class 2 type slots.

I. Solid Wall High Density Polyethylene (HDPE) Pipe:

- 1. The HDPE pipe shall be manufactured from a high density, high molecular weight polyethylene resin, which conforms to ASTM D-1248 and meets the requirements for Type III, Class B, Grade P34, Category 5, and has a PPI rating of PE 3408, when compounded. The pipe produced from this resin shall have a minimum cell classification of 345434C or D under ASTM D 3350.
- 2. The wall thickness of the HDPE pipe shall be as determined by the Design-Builder for the minimum thickness required to meet the structural requirements listed under Design Criteria below, and shall meet the following:
- 3. Minimum Wall Thickness: 0-12 feet depth, minimum wall thickness SDR 26; over 12 feet depth, SDR 21 minimum wall thickness.
- 4. All pipes shall be made of virgin material. No re-work, except that obtained from the manufacturer's own production of the same formulation shall be used.
- 5. The pipe shall be homogenous throughout and shall be free of visible cracks, holes, foreign material, blisters, or other deleterious faults.
- 6. The interior surface of the HDPE pipe shall not be dark or non-reflective in nature that could inhibit proper television inspection.
- 7. The finished HDPE pipe shall be continuous over the entire length of an insertion run between the insertion pit and reception pit. The HDPE pipe shall be impervious and free of any leakage from the rehabilitated host pipe to surrounding ground, or from the surrounding ground to the inside of the pipe.
- 8. The manufacturer of the pipe shall supply the AUTHORITY with certificates of compliance indicating conformance for all material and testing requirements furnished under these Specifications.

9. Each standard pipe unit shall be clearly and permanently marked with the date of manufacture, class, production code, and manufacturer's trademark.
10. The Design-Builder and manufacturer shall exercise extreme care during transportation, handling, storing, and installation of the HDPE pipe to ensure that the pipe is not gouged or otherwise damaged in any way. The Design-Builder shall store the pipe with a cover to block ultraviolet light in accordance with the manufacturer's recommendations. If the HDPE pipe becomes gouged or otherwise damaged, before or during installation, it shall be replaced or repaired by the Design-Builder at no additional cost to the Authority.

J. Fiberglass Reinforced Pipe (FRP):

1. General: Workmanship and methods shall be in accordance with the best practices of modern shops for this type of work and shall be the product of a manufacturing firm having at least five years of experience in the manufacture of this type of pipe. Pipe shall have a smooth and even interior surface free from roughness or irregularities. Prior to fabrication of pipe, submit shop drawings showing lengths of pipe, pipe joint details, construction details and tolerances as required by the Authority. Each pipe shall be marked with the date of manufacture, mark or trademark of the manufacturer, and the class, wall thickness of the pipe, and serial number. No slurry mix shall be used on interior of pipe.
2. Resin Systems: The manufacturer shall use only polyester resin systems with a proven history of performance in this particular application. The historical data shall have been acquired from a composite material of similar construction and composition as the proposed product.
3. Glass Reinforcements: The reinforcing glass fibers used to manufacture the components shall be of highest quality commercial grade E-glass filaments with binder and sizing compatible with impregnating resins.
4. Silica Sand: Sand shall be minimum 98% silica with a maximum moisture content of 0.2%.
5. Additives: Resin additives, such as curing agents, pigments, dyes, fillers, thixotropic agents, etc., when used, shall not detrimentally effect the performance of the product.
6. Elastomeric Gaskets: Gaskets shall be supplied by qualified gasket manufacturers and be suitable for the service intended.
7. Pipes, Joints, and Fittings:
 - a. Pipe shall be manufactured by a casting process that results in a dense, nonporous, corrosion-resistant, consistent composite structure. Pipe shall comply with ASTM D3262.
 - b. Actual outside diameter (18-inch to 48-inch) of the pipes shall be in accordance with ASTM D 3262. For other diameters, OD's shall be per manufacturer's literature.
 - c. The minimum pipe stiffness class shall be 72 psi unless otherwise noted or manufacturer demonstrates another class is adequate. Minimum wall thickness shall be the stated design thickness.
 - d. Pipe ends shall be square to the pipe axis with a maximum tolerance of 1/8-inch.
8. Unless otherwise specified, the pipe shall be field connected with fiberglass sleeve couplings or bell-spigot joints, "flush" or "non-flush", that utilize elastomeric sealing gaskets as the sole means to maintain joint watertightness. The joints must meet the performance requirements of ASTM D 4161. Joints at tie-ins, when needed, may utilize fiberglass, gaskets-sealed closure couplings.
9. Flanges, elbows, reducers, tees, wyes, laterals, and other fittings shall be capable of withstanding all operating conditions when installed. They may be contact molded or manufactured from

mitered sections of pipe joined by glass-fiber-reinforced overlays. Properly protected standard ductile iron, fusion-bonded epoxy-coated steel and stainless steel fittings may also be used.

- K. Polyvinylidene Fluoride Pipe (PVDF) (as may be recommended by the Project LSP in areas of existing or suspected areas of soil/groundwater contamination):
1. All PVDF pipe shall be continuously and permanently marked with the manufacturer's name, pipe size, and pressure rating or stiffness in psi (kpa).
 2. The Design-Builder shall also require the manufacturer to mark the date of extrusion on the pipe. This dating shall be done in conjunction with records to be held by the manufacturer for 2 years, covering quality control tests, raw material batch number, and other information deemed necessary by the manufacturer.
 3. Pipe:
 - a. All PVDF pipe shall be joined by compression joints unless otherwise shown or specified.
 - b. Polyvinylidene fluoride shall conform to the requirements of ASTM F1673, SDR 21. Pipe diameters shall be as shown on the Contract Drawings.
- L. Galvanized Steel Pipe (must meet all Stray Current and Corrosion Control requirements as described in the Technical Provisions subsection 8 Right of Way Structures and Specification Section 16451 Corrosion Control and Stray Current Mitigation):
1. Steel Pipe: ASTM A53 / A53M, Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless, standard weight (Schedule 40), unless another weight is indicated.
 2. Pipe fittings shall be minimum standard weight (Schedule 40).
 3. Joints: grooved-ends conforming to ANSI / AWWA C606.
 4. Mechanical coupling method for joining pipe. Manufactured in two segments of cast ductile iron, conforming to ASTM A-536, Grade 65-45-12. Gaskets shall be pressure responsive synthetic rubber, grade compatible with railroad track bed stormwater runoff, conforming to ASTM D2000.
 5. All hardware and fasteners shall be hot-dip galvanized.

2.3 STRUCTURAL STEEL FOR SITE ERECTION

- A. Corrugated: AASHTO M 167.
- B. Flat: AASHTO M 218.

2.4 UNDERDRAIN FILTER

- A. Filter Material: Narrowly graded mixture of natural or crushed gravel, or crushed stone and natural sand; ASTM D 448; coarse-aggregate grading Size 67; with 100 percent passing a 1-inch sieve and 0 to 5 percent passing a No. 4 sieve.

2.5 DRAINAGE AND SANITARY STRUCTURES

- A. Precast Concrete Structures shall be manufactured in accordance with ASTM C478 (circular structures) and ASTM C913 (rectangular structures) and all applicable associated ASTM standards. Design loading for all structures installed within MBTA Railroad Property influenced by the track live load shall be

Cooper E-80, unless noted or approved otherwise. Design loading for other areas shall conform to AASHTO-HS20.

- B. Precast Sections (for non-load bearing drainage structures other than manholes): ASTM C 139 for Concrete Masonry Units for Catch Basins and Manholes.
- C. Pipe openings in the structure shall be the minimum size required to receive the pipe, with either a flexible connector or mortared in place, and shall be accurately set to conform to the required line and grade.
- D. Drain pipe shall be joined to the wall of the concrete manholes or catch basins with flexible manhole connectors complying with ASTM C923.
- E. Precast manhole and catch basin structures shall have eccentric cone sections. Where depth to inlet/outlet piping is limited, a flat top type of structure may be used.
- F. Manhole bases shall be either precast or cast-in-place. When cast-in-place, the base shall be shaped by means of an accurate bell-ring to conform to the barrel sections.
- G. The exterior surfaces of all sanitary manholes shall be coated with two (2) coats of Super Service Black by Koppers or an equivalent product by Mobil, Tnemec, or equal. The final thickness shall be 20-24 mils dry.
- H. Preformed flexible joint sealant, conforming to ASTM Designation C990 shall be used to seal joints between precast sections.
- I. Manhole steps shall be fabricated of a minimum 1/2-inch Grade 60 circular steel reinforcement core, with a bonded outer shell of Copolymer Polypropylene plastic, and shall be cast into the manhole sections(s). Steps shall comply with the applicable provisions of ASTM A615, C478 and D4101.

2.6 DRAINAGE AND SANITARY STRUCTURES REMODELED

- A. The work to be done under this item shall conform to the relevant provisions of Section 220 of the MassDOT Standard Specifications, Construction Standards. The work shall include the removal and resetting of the casting to the proposed line and grade and the removal and replacement, in kind, of the masonry which, in the judgment of the MBTA, shows signs of deterioration.

2.7 BRICK

- A. ASTM C32, Grade SS, 2-1/4 inches by 3-3/4 inches by 8 inches.

2.8 CONCRETE

- A. Concrete, General: Section 03300 - CAST-IN-PLACE CONCRETE.
- B. Cradles and Cradle-Arches: Class 4,000-3/4.
- C. Manholes and Other Load-Bearing Drainage Structures: Class 4000-3/4.

2.9 CEMENT MORTAR

- A. One part Portland cement, two parts sand by volume with sufficient water to form a workable mixture, mortar minimum strength of 3,000 psi.

2.10 FRAMES AND COVERS

- A. Drain Manhole Frames shall meet the requirements set forth by MassDOT.
- B. Drain Manhole Covers shall meet the requirements set forth by MassDOT.
- C. Iron castings shall be true to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blow-holes and other defects affecting the strength and value for the service intended. The finished coating shall be tough and tenacious when cold and not brittle or with any tendency to scale off under reasonable temperature changes.
- D. Frames and Covers shall be Cast Iron, minimum Class 25 conforming to ASTM A 48, and as follows: Castings to be free from scale, lumps, blisters and sandholes. Machine contact surfaces to prevent rocking. Thoroughly clean and hammer inspect.
- E. Frames and covers shall meet the requirements set forth by MassDOT. Frames and covers shall be capable of withstanding AASHTO H-20 loading unless otherwise indicated or specified.
- F. The Design-Builder shall furnish all manhole frames and covers conforming to the details shown on the drawings, or as herein specified. Frames and covers shall be of cast iron with diamond cover surface design. Manhole covers shall be machined to fit securely and evenly on the frame.
- G. Covers for all structures shall have the word "DRAIN", "SEWER" or other appropriate designation cast upon them.
- H. Track underdrain cleanout ring and cover shall meet the requirements set forth by MassDOT.
- I. Combination inlet castings shall be an integral curb inlet with double grates, shall meet the requirements set forth by MassDOT.

2.11 FRAMES

- A. Single Catch Basin Frames shall meet the requirements set forth by MassDOT.

2.12 GRATES

- A. Single Catch Basin Grates shall meet the requirements set forth by MassDOT.

2.13 LOCKING FRAMES AND COVERS

- A. Locking Frames and Covers shall meet the requirements set forth by MassDOT.

2.14 HOODS

- A. Catch Basin Hoods shall meet the requirements set forth by MassDOT.

2.15 NO DUMP CURB MARKERS

- A. No-dump markers shall be installed on all existing-to-remain or proposed catch basins and inlets within the project area. Curb markers shall be 4-inch diameter, 0.090 mil. thick, PVC laminate, with urethane dome. The Design-Builder shall obtain and utilize the most current maker requirements from the respective municipality at the time of the installation.

2.16 FLEXIBLE MANHOLE SEALS

- A. Flexible manhole seals shall meet the requirements set forth by MassDOT. Field applied seals shall meet the requirements set forth by MassDOT. Manhole sleeves, gaskets and sealants shall be furnished complete with lubricants, stainless steel stops, inserts, clamps, etc.

2.17 FILTER FABRIC

- A. Filter fabric for lining PVC drain and underdrain trenches shall meet the requirements set forth by MassDOT. Refer to other paragraphs in this Section and in Earthwork, Section 02300, for other applications of filter fabric for piping.

2.18 PIPE BEDDING

- A. Bedding Course for Ductile Iron Pipe: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; except with 100 percent passing a 1-inch sieve and not more than 8 percent passing a No. 200 sieve.
- B. Sand Borrow: Sand borrow shall be used as pipe bedding for all pipe with the exception of Reinforced Concrete Pipe and Ductile Iron Pipe, placed between 6 inches below pipe invert to 6 inches above pipe crown.
- C. Crushed Stone: Crushed stone meeting the requirements of ASTM D2490 shall be used as Ductile Iron, Reinforced Concrete, Fiberglass Reinforced and PVC Pipe bedding between 12 inches below pipe invert to 6 inches above pipe crown and initial 12 inches of backfill under structures, as a working mat or as a filter around perforated drain pipe. Crushed stone shall be wrapped in filter fabric, placed in maximum 6-inch thick layers, loose measure, and compacted with a minimum of four passes of a vibratory plate or roller compactor. The crushed stone shall be uniformly blended.
- D. Controlled Density Fill: For use as flowable fill for pipe bedding material at locations noted, shown or as specified. This controlled density fill shall be the excavatable type, complying with the material requirements of the Massachusetts DOT Highway Division Standard Specifications, Section M4.08.00, Type 2E, flowable (excavatable).

2.19 POLYETHYLENE ENCASEMENT

- A. The polyethylene film used for encasing ductile iron pipe shall be manufactured in accordance with the formulation, physical tests, thickness and dimensional requirements specified in AWWA/ANSI Standard C105/A21.5 (*Standard for Polyethylene Encasement of Ductile Iron Pipe Systems*) and ASTM A674.

2.20 STOP LOGS

- A. Stop logs for all drainage structures for all locations within the project shall be constructed of the same material and furnished by the same manufacturer. Stop logs shall be either aluminum or fiberglass reinforced plastic.
- B. Stop logs constructed of extruded aluminum shapes shall have a minimum thickness of 5/16-inch.
 - 1. Maximum bending stress shall not exceed 7600 psi at the maximum operating head.
 - 2. Adequate drainage shall be provided for each stop log. Logs shall be self-draining and shall not retain water.
 - 3. Two slots shall be provided in the top of each stop log for removal and installation via the stop log lifter.
 - 4. A mill finish on aluminum surfaces shall be required. All aluminum in contact with concrete shall be shop coated with a heavy coat of bitumastic paint. Welds on aluminum shall be cleaned to provide a uniform finish.
- C. Stop logs constructed of fiberglass reinforced plastic shapes shall have a minimum thickness of 1/4-inch on the front and back facings and 3/4-inch on the remaining perimeter.
 - 1. Maximum fiber stress shall not exceed 2.5 times the working stress at the maximum operating head.
 - 2. Stop log shall be fabricated by a steel internal matrix being fully encased by thermoset plastic, no less than 1/4-inch thick on all sides, so as to totally encapsulate the internal frame. Steel shall be sandblasted and coated with vinyl ester resin immediately prior to vacuum infusion in order to ensure complete bonding with external barrier.
 - 3. Surface resin shall be at a depth between 0.010 and 0.020 inches and reinforced with C-glass or polymeric fiber surfacing material. Resin shall also include an added ultraviolet stabilizing pigment to provide long term protection.
 - 4. Per ASTM D2563-0 allowable surface defect tolerances are as follows: No cracks, blisters, chips, pits, dry spots, fish eyes, burned areas, pinholes, foreign matter or exposed glass or exposed cut edges shall be acceptable. Scratches shall be acceptable up to 0.002-inch in depth. Winkles shall be acceptable up to 1/8-inch. If any stop log exceeds these requirements it shall not be installed.
 - 5. Adequate drainage shall be provided for each stop log. Logs shall be self-draining and shall not retain water.
 - 6. Two slots shall be provided in the top of each stop log for removal and installation via the stop log lifter.
- D. Each stop log shall be outfitted with a continuous resilient lip seal along the bottom and both sides to restrict leakage in accordance with the requirements listed in this specification.
 - 1. The continuous lip seal shall be constructed of urethane or neoprene rubber and shall be mechanically attached to the log.
 - 2. Seal shall be activated by a combination of the weight of the stop log and the differential water pressure, which will push the seal against the inside of the lip groove assembly.
 - 3. Stop logs that utilize rubber “J” seals or “P” seals are not acceptable.

- E. One stop log lifter shall be provided for each different guide frame width.
 - 1. The lifter shall be constructed of aluminum and shall be outfitted with Ultra High Molecular Weight Polyethylene (UHMW) guide bars and stainless steel fasteners.
 - 2. The lifter shall be provided with lifting hooks designed to automatically engage in the slots in the top of the stop logs and stay engaged until manually released. Lifter shall be fitted with eye bolts for the attachment of lifting cables.
 - 3. The lifter shall be capable of installing and removing all stop logs of the same width whether they are installed or at the operating floor level.

- F. Storage racks shall be provided to house stop logs while they are not in use.
 - 1. Storage racks shall be constructed of aluminum and shall be mounted on the interior wall of the valve chamber rooms at the Red Bridge Pump Station and the Washington Street Pump Station..
 - 2. A latch or locking mechanism shall be required on rack to hold logs in place while being stored.

- G. Anchor bolts shall be provided by the stop log manufacturer for mounting the guide frames and storage racks (if applicable).
 - 1. Quantity and location shall be determined by the stop log manufacturer.
 - 2. If epoxy type anchor bolts are provided, the stop log manufacturer shall provide the studs and nuts.
 - 3. Anchor bolts shall have a minimum diameter of ½-inch.

2.21 INLINE CHECK VALVE

- A. Inline check valve shall be installed at the end of the 12-inch discharge pipe from the proposed viaduct infiltration system into the outlet control structure for the detention basin at Red Bridge.
 - 1. No mechanical parts
 - 2. Operates on differential pressure
 - 3. Low headloss
 - 4. Self-draining
 - 5. Silent, non-slamming
 - 6. Less than 1” of head pressure opens the valve, eliminating standing water
 - 7. 100% elastomer durable construction
 - 8. Simple installation
 - 9. Maintenance free except for periodic inspection

- B. Inline check valve shall be Tideflex CheckMate or approved equal.

2.22 AREA DRAINS

- A. Area drain catch basins shall be nine inch (9”) square structural-foam polyolefin structures with ultraviolet (UV) light inhibitors.

- B. Square tapered polypropylene drain risers with UV inhibitors shall be used where necessary and cut to height to achieve the correct rim and invert elevations. Design-Builder shall not stack more than five (5) risers between the catch basin and grate per structure.
- C. Drain grate shall be square cast iron grate with powdered coating. Grate shall meet ADA spacing requirements of openings no greater than one-half inch (1/2") wide in one direction and be able to meet AASHTO H-20 loading requirement.

2.23 SPLASH PADS

- A. Splash pads for protection of site surfaces at downspout outlet discharges and other locations, as directed by the Owner, shall be precast concrete items manufactured of Class 4,000 psi concrete and 5% to 9% air entrained. The splash pad shall be configured to form a trough, with trough minimum inside dimensions of 18" wide and 48" long, unless site constraints restrict dimensions. The trough bottom shall be sloped slightly and its minimum depth shall be 4". All corners shall be rounded over, 3/16" radius, and all edges rounded over, 1/16" radius.

PART 3 - EXECUTION

3.1 GENERAL

- A. Excavation. Excavate trenches as specified in Section 02300 - EARTHWORK.
- B. Bedding. Classes of bedding are defined in ASTM C12. Use class of bedding indicated; prepare trench and bedding as specified in ASTM C12. Place concrete for encasement against undisturbed soil. Where noted, shown or as specified bedding material shall be a controlled density fill.
 - 1. Bedding for Drainage Pipes
 - a. Place and compact bedding course on trench bottoms and where indicated. Shape bedding course to provide continuous support for bells, joints, and barrels of pipes and for joints, fittings, and bodies of conduits. Sand borrow bedding shall be placed by hand shovels, in layers not more than 4-inch thick in loose depth, and each layer shall be thoroughly and evenly compacted by tamping on each side of the pipe to provide uniform support and around the pipe, free from voids. Crushed stone bedding material shall be placed in layers not more than 6-inch thick in loose measure, and compacted with at least 4 passes using a vibratory plate or roller compactor.
 - 2. Bedding for Underdrains
 - a. Place subsurface drainage geotextile around perimeter of subdrainage trench. Place a 6-inch course of filter material on subsurface drainage geotextile to support subdrainage pipe. Encase subdrainage pipe in a minimum of 12 inches of filter material, placed in compacted layers 6 inches thick, and wrap in subsurface drainage geotextile, overlapping sides and ends at least 6 inches.
 - 1. Compact each filter material layer to 90 percent of maximum dry unit weigh according to ASTM D 1557.
- C. Pipe Laying. Lay all pipe in accordance with the manufacturer's written instructions. Additional requirements for specific types of pipe are included in subsequent articles herein.

- D. Structures. Construct manholes, junction chambers, inlets, wingwalls, and other related drainage structures in connection with the installation of pipe. Install or cut pipe flush with the inside face of structure walls.
- E. Protection
 - 1. Protect joint materials from the air and sun to prevent drying and other deterioration.
 - 2. Take precautions to prevent flooding of trench prior to backfilling.
 - 3. Do not allow free water to come in contact with pipelines until Portland cement joint and sealing materials have set for at least 24 hours.
- F. Backfill. Backfill trenches as specified in Section 02300 - EARTHWORK.
- G. Interfacing with existing pipeline
 - 1. Existing pipeline shall be cleaned at the locations as directed by the Owner.
 - 2. The Design-Builder is required to comply with all requirements of MassDOT Interim Supplemental Specifications, Section 227 DRAINAGE SYSTEM SEDIMENT.
 - 3. Design-Builder shall propose means and methods to the Owner for review and approval.
 - 4. Design-Builder shall be responsible for the characterization of the sediment in the pipe. If the sedimentation is characterized as oil and hazardous materials (OHM), Design-Builder shall handle and transport the sediments in accordance with the specification Section 02081 – HAZARDOUS MATERIALS ABATEMENT.

3.2 CRADLES

- A. Where gravel, crushed stone, or concrete cradles are indicated, provide bell holes in subgrade to permit uniform cradle depth beneath entire pipe length.

3.3 JACKING PIPE

- A. At locations where the Design-Builder proposes to jack reinforced concrete pipe, steel casing pipe or fiberglass reinforced pipe into place, jacking operations shall be performed on a continuous basis, 24 hours per day, 7 days per week. All MBTA requirements shall be strictly adhered to. Railroad operations shall be maintained at all times.
- B. Strength, reinforcement, and gauge of pipe designated to be jacked will be determined for vertical loads only. Provide additional reinforcement or higher strength or heavier gauge pipe as necessary to withstand jacking pressure, at no additional expense to the Authority.
- C. Excavate for jacking pipe not more than 0.1 foot wider than outside limits of pipe. When material tends to cave beyond that limit, use a shield ahead of the first section of pipe. Backfill caving and excavation beyond that limit with sand or grout to fill voids.
- D. Sluicing and jetting will not be permitted.
- E. Design-Builder shall submit proposed jacking plan for Owner's review and approval. The plan must be specific as to:

1. Size and material of casing pipe, casing spacers and end seals
 2. Size and material of carrier pipe
 3. Location and dimensions of jacking pits shall be shown with details of their sheeting and shoring.
 4. Temporary track support structures
- F. Casing pipe shall be installed in accordance with the most current edition of the American Railway Ownering Association specifications, "Jacking Culvert Pipe Through Fills". Design-Builder shall install signage at the ends of all casing pipes in accordance with the requirements of the MBTA Railroad Operations Specifications. The Design-Builder shall seal casing ends, including provisions for drainage if leakage occurs within the casing pipe, also in accordance with these Specifications. At locations identified on the Plans, end seals shall be constructed to be chemically resistant to the potential contaminants identified to be present in the groundwater.
- G. Design-Builder shall execute jacking and conduct geotech and surface monitoring conforming to the Authority's requirements for pipe jacking operations as specified in the MBTA Railroad Operations Specifications. Design-Builder shall conduct ground stabilization also in accordance with these Specifications.

3.4 INSTALLATION OF REINFORCED CONCRETE PIPE AND BOX CULVERTS

- A. Placement: Lay pipe upgrade with bell or groove end uphill. Place circular pipe having elliptical reinforcement with minor axis of the reinforcement in vertical position.
- B. Backfilling: Except where an exfiltration/infiltration test is to be performed, backfill of culvert-pipe and siphon-pipe trenches may be completed while joint mortar is still plastic. Should joint mortar become set before placing backfill, do not commence backfilling within 16 hours of joining pipe sections.

3.5 INSTALLATION OF DUCTILE IRON PIPE

- A. Handling Pipe: The Design-Builder shall take care not to damage pipe by impact, bending, compression, or abrasion during handling, and installation. Joint ends of pipe especially shall be kept clean. Pipe shall be stored above ground at a height no greater than 5 feet, and with even support for the pipe barrel. Only nylon protected slings shall be used for handling the pipe. No hooks or bare cables will be permitted. Gaskets shall be shipped in cartons and stored in a clean area, away from grease, oil, heat, direct sunlight and ozone producing electric motors.
- B. Alignment and Placement of Pipe: Jointing of ductile iron pipe and fittings shall be done in accordance with the printed recommendations of the manufacturer and as specified. The last 8 inches of the outside of the spigot end of pipe and the inside of the bell end of pipe shall be thoroughly cleaned. The joint surfaces and the gasket shall be painted with a lubricant just prior to making up the joint. The spigot end shall then be gently pushed home into the bell. The position of the gasket shall be checked to insure that the joint has been properly made and is watertight. Care shall be taken not to exceed the manufacturer's recommended maximum deflection allowed for each joint.
- C. Installation and jointing of push-on ductile iron pipe shall be in accordance with AWWA C 600 Sections 9b and 9c, latest revision, as applicable. Mechanical joints shall be installed with Mega-Lug, Uni-Flange or MJR restraints. Restraints shall be installed in full accordance with the manufacturers' instructions. All bolt heads on Mega-Lugs or Uni-flanged shall be tightened sufficiently so that they shear off to provide indication that proper tightening torque was achieved. MJR systems shall be installed with ductile iron locking ring, tapered MJ gland and a symmetrical locking ring. Restrained push on joints

shall be installed with specified gasket joint restraints. Restraints shall be installed in full accordance with the manufacturers' instructions.

- D. Piping Support: Furnish and install supports to hold piping at lines and grades indicated or specified. Support pipe and appurtenances connected to equipment to prevent any strain imposed on equipment.
- E. Pipe and Fittings: Remove and replace defective pieces. Clear of all debris and dirt before installing and keep clean until accepted. Lay accurately to lines and grades indicated or required. Provide accurate alignment, both horizontally and vertically. Provide firm bearing along entire length of buried pipelines.
- F. Appurtenances: Set valves, fittings and appurtenances as indicated.
- G. Push-on Joints: Insert gasket into groove bell. Apply thin film of nontoxic gasket lubricant over inner surface of gasket in contact with spigot end. Insert chamfered end into gasket. Force pipe past it until it seats against socket bottom. Where required install restraint and secure in accordance with manufacturer's instructions.
- H. Mechanical Joints: Wire brush surfaces in contact with gasket and clean gasket. Lubricate gasket, bell, and spigot with soapy water. Slip gland and gasket over spigot, and insert spigot into bell until seated. Seat gasket and press gland firmly against gasket. After bolts inserted and nuts made finger-tight, tighten diametrically opposite nuts progressively and uniformly around joint by torque wrench. Torque bolts to values specified above.
- I. Testing: Clean of all dirt, dust, oil, grease and other foreign material, before conducting pressure and leakage tests.

3.6 INSTALLATION OF PVC AND PVDF PIPE

- A. Piping shall be installed per the requirements of ASTM D2321. Each pipe unit shall be inspected before being installed. No single piece of pipe shall be laid unless it is generally straight. The centerline of the pipe shall not deviate from a straight line drawn between the centers of the openings at the ends of the pipe by more than 1/16-inch per foot of length. If a piece of pipe fails to meet this requirement for straightness, it shall be rejected and removed from the site. Any pipe unit or fitting discovered to be defective, either before or after installation, shall be removed and replaced with a sound unit.
- B. No pipe or fitting shall be permanently supported on saddles, blocking, or stones. Crushed stone shall be as specified in Section 02300 - EARTHWORK.
- C. Suitable bell holes shall be provided, so that after placement, only the barrel of the pipe receives bearing pressure from the supporting material. Special care shall be taken to hold the trench width at the crown of the pipe to the maximum indicated on the Trench Detail included in the Details Section of these specifications.
- D. All pipe and fittings shall be cleared of all debris, dirt, etc., before being installed and shall be kept clean until accepted in the completed work.
- E. Pipe and fittings shall be installed to the lines and grades indicated on the Drawings. Care shall be taken to ensure true alignments and gradients.
- F. Before any joint is made, the previously installed unit shall be checked to assure that a close joint with the adjoining unit has been maintained and that the inverts are matched and conform to the required

grade. The pipe shall not be driven down to the required grade by striking it with a shovel handle, timber or other unyielding object.

- G. All joint surfaces shall be cleaned. Immediately before jointing the pipe, the bell or groove shall be checked to see that the rubber ring is properly seated. Apply lubricant to the spigot end only, paying particular attention to the bevel, in accordance with the manufacturer's recommendation. Each pipe unit shall then be carefully pushed into place without damage to pipe or gasket. Suitable devices shall be used to force the pipe units together so that they will fit with minimum open recess inside and outside and have tightly sealed joints. Care shall be taken not to use such force as to wedge apart and split the bell or groove ends. Joints shall not be "pulled" or "cramped" unless permitted by the Owner.
- H. Where any two pipe units do not fit each other closely enough to enable them to be properly jointed, they shall be removed and replaced with suitable units and new gaskets.
- I. Details of gasket installation and joint assembly shall follow the directions of the manufacturers of the joint materials and of the pipe, all subject to review by the MBTA. The resulting joints shall be watertight and flexible.
- J. All premolded gasket joint polyvinyl chloride or polyvinylidene fluoride pipe of a particular manufacturer may be rejected if there are more than five unsatisfactory joint assembly operations or "bell breaks" in 100 consecutive joints, even though the pipe and joint conform to the appropriate ASTM Specifications as hereinbefore specified. If the pipe is unsatisfactory, as determined above, the Design-Builder shall, if required, remove all pipe of that manufacturer of the same shipment from the work and shall furnish pipe from another manufacturer which will conform to all of the requirements of these specifications.
- K. Open ends of pipe and branches shall be closed with polyvinyl chloride or polyvinylidene fluoride stoppers, as applicable, secured in place in an acceptable manner.
- L. After each pipe has been properly bedded, enough crushed stone shall be placed between the pipe and the sides of the trench, and thoroughly compacted, to hold the pipe in correct alignment. Bell holes, provided for jointing, shall be filled with crushed stone and compacted, and then crushed stone shall be placed and compacted to complete the pipe bedding.
- M. The Design-Builder shall take all necessary precautions to prevent flotation of the pipe in the trench. At all times pipe installation is not in progress, the open ends of the pipe shall be closed with temporary watertight plugs, or by other acceptable means.
- N. If water is in the trench when work is to be resumed, the plug shall not be removed until suitable provisions have been made to prevent water, earth, or other substances from entering the pipe. Pipelines shall not be used as conductors for trench drainage during construction. Install PVC pipe and fittings in accordance with manufacturer's printed instructions.
- O. Allowable Pipe Deflection: Pipe provided under this Specification shall be so installed as to not exceed a maximum deflection of 5.0 percent. Such deflection shall be computed by multiplying the amount of deflection (nominal diameter less minimum diameter when measured) by 100 and dividing by the nominal diameter of the pipe. Upon completion of a section of pipe, including placement and compaction of backfill, the Design-Builder shall measure the amount of deflection by pulling a specially designed gage assembly through the completed section. The gage assembly shall be in accordance with the recommendations of the pipe manufacturer, and be reviewed by the Owner. The section of pipe must be placed and backfilled for a minimum of 90 days before the deflection can be measured. Should

the installed pipe fail to meet this requirement, the Design-Builder shall do all work to correct the problem without additional compensation.

- P. Cleaning: Care shall be taken to prevent earth, water and other materials from entering the pipeline. As soon as possible after the pipe and manholes are completed, the Design-Builder shall clean out the pipeline and manholes being careful to prevent soil, water and debris from entering any existing pipe.

3.7 INSTALLATION OF HIGH DENSITY POLYETHYLENE (HDPE) PIPE

- A. All requirements specified for the installation of PVC pipe shall also pertain to the installation of HDPE pipe.
- B. The Design-Builder shall take all necessary precautions to prevent flotation of the pipe in the trench.
- C. Installation shall be in strict compliance with ASTM D2321 and with the manufacturer's installation guidelines. HDPE pipe bedding and initial backfill materials shall be a Class I type material as defined by ASTM D2321.
- D. The minimum depth of cover over the pipe, or minimum distance between bottom of railroad cross-tie and the top of pipe, shall be 2 feet.

3.8 INSTALLATION OF FIBERGLASS REINFORCED PIPE (FRP)

- A. General: Installation of pipe shall comply with the applicable provisions of ASTM D2321 and ASTM F1668. Installation of pipe and fittings shall be in accordance with the project plans and specifications and the manufacturer's requirements. In addition, installation of piping shall be in accordance with governing authorities having jurisdiction, except where more stringent requirements are indicated.
- B. Handling Pipe: Textile slings, other suitable materials or a forklift shall be used in the handling of pipes. Use of chains or cables is not recommended. Each pipe unit shall be handled into its position in the trench only in such manner and by such means, as the Owner accepts as satisfactory. The Design-Builder will be required to furnish suitable devices to permit satisfactory support of all parts of the pipe unit when it is lifted.
- C. Laying Pipe: Except where a concrete cradle or envelope is required, all pipe shall be laid in crushed stone. In trenches, no blocking or supporting of the piping by concrete, stones, bricks, wooden wedges, or method other than bedding the pipe on crushed stone will be permitted. Each length of pipe shall be shoved home against the pipe previously laid and held securely in position. Joints shall not be "pulled" or "cramped" without approval of the Owner. The Design-Builder shall take all necessary precautions to prevent flotation of the pipe in the trench.
- D. Jointing Pipe: After the pipe are aligned in the trench and are ready to be jointed, the following shall be performed: Ends of pipe and coupling components shall be cleaned. Joint lubricant shall be applied to pipe ends or bell interior surfaces and the elastomeric seals. Only lubricants approved by the pipe manufacturer shall be used. Suitable equipment and end protection to push or pull the pipes together shall be used. Recommended forces by the manufacturer for joining or pushing pipe shall not be exceeded. Pipes shall be joined in straight alignment and then deflected to required angle. Deflection angle shall not exceed the deflection permitted by the manufacturer.
- E. Alignment and Placement: All pipe shall be laid with extreme care as to grade and alignment. Each pipe shall be so laid as to form a close joint with the next adjoining pipe and bring the inverts continuously to the required grade.

- F. Cleaning: Care shall be taken to prevent earth, water and other materials from entering the pipeline. As soon as possible after the pipe and manholes are completed, the Design-Builder shall clean out the pipeline and manholes being careful to prevent soil, water and debris from entering any existing Drain. Place plugs in end of uncompleted conduit at end of day or whenever work stops. Flush lines between manholes if required to remove collected debris.
- G. The manufacturer shall supply a qualified field representative to be present periodically during the installation of the pipe.

3.9 INSTALLATION OF GALVANIZED STEEL PIPE

- A. As shown and detailed on the Plans, install galvanized steel stormwater drainage piping on bridge and viaduct structures and their respective piers and columns.
- B. Pipe ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove for proper gasket sealing.
- C. Install the piping system in accordance with the manufacturer's latest recommended practices and installation instructions.

3.10 CONCRETE ENCASEMENT

- A. If pipe is to be entirely or partly embedded in concrete or controlled density fill or if pipe is within 10' and above existing or proposed water piping,, support and brace pipe in a manner that will prevent movement or displacement of pipe during placement, consolidation and curing of the concrete and fill mixes, and during testing.
- B. Place concrete as specified in Section 03300 - CAST-IN-PLACE CONCRETE, being careful to tamp concrete under and around pipe without displacing pipe.
- C. Do not use earth form.

3.11 INLINE CHECK VALVE

- A. Install inline check valve at the locations indicated or as may be required as part of the Design-Builder's proposed design.
- B. Install in accordance to the manufacture's recommendations.

3.12 BACKFILL

- A. Partial Backfill Before Testing
 - 1. Deposit and compact backfill in four inch layers around bottom half of pipe and for full width of trench, leaving top half of pipe exposed.
 - 2. Deposit and compact additional backfill between joints, to a depth of 12 inches above top of pipe, leaving joints exposed.
- B. Final Backfill After Testing
 - 1. Backfill and compact as specified in Section 02300 - EARTHWORK, flush with finished grade. If permitted by the Owner, surface of backfill may be slightly convex.

2. Restore surface to its original condition or as required.

3.13 LEAKAGE TOLERANCES

- A. Gravity Lines. Maximum allowable leakage for any section or sections, or for the total lengths of pipe lines: 200 gallons per inch of diameter per mile per 24 hours.
- B. Force Mains: Zero leakage in 30 minutes at 150 percent of the maximum pressure that pump or ejector is capable of developing.

3.14 ABANDONED FACILITIES

- A. When abandoned facilities are to be left in place, plug, or cap or bulkhead the ends of conduits and pipes, as indicated. Pipe or conduit greater than 15-inch diameter shall be completely filled with Controlled Density Fill per Section 02221 - DEMOLITION. Remove abandoned utility manholes, junction boxes, and similar structures to a minimum depth of two feet below finish grade and fill the remaining void with sand or select fill, as specified in Section 02300 – EARTHWORK, after the plugging, or capping, or bulkheading of conduits and pipes has been completed. Puncture or break the bottom slabs of manholes and similar structures to provide drainage. Backfill and compact excavations resulting from removal of utility facilities, as required.
- B. Bulkheads for pipes greater than 15-inch diameter shall be constructed of solid concrete masonry bricks or solid concrete masonry blocks with full mortar joints. The bulkhead shall be watertight. Recess the bulkhead ½-inch and seal with non-shrink grout.
- C. Refer to Section 02650 – EXISTING SITE UTILITIES for abandonment of existing storm drain.

3.15 AREA DRAINS

- A. Install area drain catch basins in accordance with manufacturer’s instructions at locations indicated and/or required by the Design-Builders proposed design.. Each structure shall be inspected before being installed.
- B. Area drain catch basins and grates shall be installed level and to proper elevation per the plan set. Risers shall be installed between catch basin and grate to achieve the correct elevation. Grate shall be recessed 1/8 inch below finish grade listed on plan set.
- C. Area drain catch basins shall be installed on top of compacted gravel or crushed stone and encased with a 4-inch collar of concrete as indicated on the drawings. Crushed stone shall be as specified in Section 02300 - EARTHWORK.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02401

STORMWATER PUMP STATION CONTROLS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Provide complete pump control panel and appurtenances including operator interface, enclosures, level control devices and transmitters, and auxiliary items, as indicated and as specified, to provide a complete pump control system at each stormwater pump station. The stormwater pump stations are identified as: Red Bridge Pump Station (RPS); Washington Street Pump Station (WPS) and the Gilman Square Pump Station (GPS). The RPS and WPS stormwater pump stations are equipped with three 100-Hp high flow pumps that operate with variable frequency drives and two 20-Hp low flow pumps that operate at constant speed. The Gilman Square Pump Station (GPS) is equipped with two 10-Hp constant speed pumps.
- B. Construction of the Red Bridge and Washington Street pump stations (RPS and WSP, respectively) was initiated under IGMP-03, a previous GLX construction contract. That work was advanced to near completion of the basic structure. The pumps, variable frequency motor controllers, communication programmable logic controllers, and pump station controls were not (or may not have been) completed, however certain items of that equipment were procured by the Owner and will be provided to the Design-Builder. The Design-Builder shall complete the construction of these two pump stations in full compliance with the specifications. The Design-Builder shall complete all work within this Section and all related work, to provide complete operable pump station facilities.
- C. The specifications relative to the WPS and RPS pump stations, including all operating parameters, control logic and other parameters, shall not be modified in any way.
- D. The Design-Builder may elect to adapt these specifications, if appropriate, to any pump station it may propose at Gilman Square.
- E. Certain work under this Section was, or may have been, completed by the previous GLX contractor. The Design-Builder shall be responsible for making its own assessments and evaluations as to the exact scope and limits of the completed and the uncompleted work. The Design-Builder shall complete any and all work associated with this Section and all Related Sections, including any and all uncompleted and/or partially completed work. The Design-Builder shall coordinate all related work, to provide complete and operable stormwater pumping facilities.
- F. The terms and meaning of “Manufacturer’s Services Engineer”, “Startup/Testing Engineer”, “Factory Trained Service Engineer” and “Service Engineer” (collectively, “Startup, Testing and Service Engineers”) as used in this Section shall all remain unchanged and any remaining work required of these Startup, Testing and Service Engineers shall be the responsibility of the Design-Builder. Likewise, the services of a Structural Engineer as required herein shall be the responsibility of the Design-Builder unless that work was completed by the previous Contractor.
- G. The use of the word “Contractor” has been retained in this Section; however, it shall be interpreted to mean the Design-Builder for any and all work remaining to be completed. Likewise, the word “Engineer” has been retained; however, it shall be interpreted to mean the Owner for any and all work remaining to be completed.

- H. Pump control panels can be supplied by the Contractor or by the pump manufacturer at the Contractor's option. The pump control system must be an integrated package to provide a complete operating system.
- I. Pump control panels and devices shall be manufacturer's current standard technology and in production for a minimum of 5 years.
- J. Installation and integration of the control panel and devices shall be the responsibility of the Contractor. All electrical work shall be performed by a licensed electrician in accordance with UL 508A and Article 409 of the National Electrical Code (NEC).
- K. **Related Work:** The following items are not included in this Section and will be performed under the designated Sections:
 - 1. Section 11306 – SUBMERSIBLE SOLIDS HANDLING PUMPS AND APPURTENANCES
 - 2. Section 16260 - VARIABLE FREQUENCY MOTOR CONTROLLERS FOR STORMWATER PUMP STATIONS (Note: Gillman Square PS does not incorporate a VFD, only a soft start.)
 - 3. Section 16790 - COMMUNICATION PROGRAMMABLE LOGIC CONTROLLERS

1.2 SUBMITTALS

- A. Shop drawings, brochures and samples shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 - SUBMITTALS.
- B. The Contractor shall coordinate the submittals for this section with the Related Work to confirm coordinated and integrated controls and operation review.
- C. Submittals required with the section, but are not limited to the following:
 - 1. Shop Drawings, including all equipment and components shall be provided in a concise organized three-ring binder for review including:
 - a. Manufacturer's brochures and/or catalogue cuts for all equipment and appurtenances.
 - b. Complete master wiring diagrams and elementary or control schematics, including required coordination with other electrical control devices operating in conjunction with the pumping equipment. Due to the complexity of the control functions, it is imperative the above drawings be clear and carefully prepared to facilitate interconnections with other equipment. Standard preprinted sheets or drawings simply marked to indicate applicability to this contract will not be acceptable.
 - c. Panel layout and front view drawings.
 - d. Enclosure drawings and details showing all dimensions and construction details for all installed devices.
 - e. Other submittals specified herein.
 - 2. Performance Test Reports shall be submitted to the Engineer upon completion of installed system and include all shop and field tests performed to prove compliance with specified performance criteria.

3. Operation and Maintenance (O&M) Manuals shall be submitted to the Engineer for approval within 30 days of equipment approval. The O&M manual shall include a table of contents for all components of the integrated pumping system, control panel and related devices, and provide a clear explanation of the operation and maintenance of the equipment with a cross-referenced index. The manual shall include, but not necessarily be limited to the following information:
 - a. Contact and order information for all components.
 - b. Recommended spare parts for one year's operation.
 - c. Preventive maintenance schedule and instructions.
 - d. Operating instructions including reprogramming level and alarm settings.
 - e. Troubleshooting and fault isolating procedures for on-site repair.
 - f. Complete copy of O&M on compact disk with updated as-built working drawings.

1.3 PRODUCT HANDLING

- A. All materials and equipment shall be shipped, stored, handled, and installed in such a manner as not to degrade quality, serviceability, or appearance. The equipment shall be stored in a clean, dry location free from construction dust, precipitation, and excess moisture. If stored for more than two weeks, the equipment shall receive all maintenance considerations required by the manufacturer for proper storage of the equipment.

1.4 DESIGN CRITERIA

- A. The materials and equipment covered by this specification are intended to be standard materials and equipment of proven ability as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the best practice of the industry and shall be installed in accordance with the manufacturer's recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment. All work shall conform to the requirements of Section 01600 – MATERIALS AND EQUIPMENT.

1.5 QUALITY ASSURANCE

- A. Provide in accordance with Section 01400 - QUALITY ASSURANCE and as specified.
- B. Ensure that conduit size and wire quantity, size and type are suitable for the equipment supplied. Coordinate all design information with the Electrical Contractor. Review the proper installation with the equipment supplier prior to installation.
 1. Services of Service Engineer, specifically trained on type of equipment specified. Person-day requirements listed exclusive of travel time and are for each pump station location.
 - a. Assist in location of devices, methods of mounting, field erection, etc.
 - b. 1 person-day

1.6 WARRANTY AND SERVICE

- A. Guarantee components, parts and assemblies supplied against defects in materials and workmanship for a period of 24 months after acceptance, and in this time period include onsite, parts and labor warranty. All labor to be performed by trained service technicians.

PART 2 - PRODUCTS

2.1 CONTROL PANEL

- A. For each stormwater pump station, the pump manufacturer shall provide a completely self-contained NEMA 12 motor control panel. A 460 V three phase power supply and 120 VAC control power supply shall be provided to the panel.
 - 1. The RBP and WPS control panel will interface to three 100-Hp motor/VFDs (high flow pumps) and include a PLC based level control system, operator interface, two circuit breakers and two 20-Hp SSRV starters (low flow pumps) and all required control for integrated pumping control system. Operation of the high flow pumps (RPS-1, RPS-2, RPS-3 and WPS-1, WPS-2, WPS-3) shall be independent of the low flow pumps (RPS-4, RPS-5 and WPS-4, WPS-5) as described herein.
 - 2. The GPS control panel will interface to two (2) 10-Hp motors and include a PLC based level control system, operator interface, two circuit breakers and two 10-Hp SSRV starters and all required control for integrated pumping control system
- B. Pump motor protection shall be provided for all pumps including a moisture sensing circuit to detect water leakage into the cavity of each pump. The circuit shall latch through a contact, de-energize the motor, and energize a pilot light indicating a seal failure. A pushbutton shall be provided to reset the circuit after the seal failure has been corrected. A motor over-temperature sensor shall also be provided to detect abnormal and detrimental motor temperature, de-energize the motor, and energize a pilot light indicating over temperature alarm. A pushbutton shall be provided to reset circuit after the over-temperature condition has been corrected.
- C. The control panels shall conform to National Electrical Manufacturer's Association (NEMA), Joint Industry Council (JIC), and National Electrical Code (NEC) specifications, and shall be Underwriters' Laboratories (UL) listed and labeled. The panel shall be factory wired and tested.
- D. Alternator
 - 1. An alternator shall be provided to alternate the lead pump duty between the three 100 Hp high flow pumps on successive pump cycles. The alternator shall be integral to the pump controller.
 - 2. A separate alternator shall be provided to alternate pump duty between the two 20 Hp low flow pumps on successive pump cycles. The alternator shall be integral to the pump controller.
 - 3. The Gilman Square PS alternator shall be provided to alternate the lead pump duty between the two 10 Hp pumps on successive pump cycles. The alternator shall be integral to the pump controller.
- E. Selector Switches

1. A hand-off-automatic selector switch shall be provided for each pump at the Main Control Panel. Selector switches shall be of oil-tight construction. Toggle switch types shall not be considered equal. Selector switch contacts shall be heavy duty, double-break, and silver.

F. Relays

1. Heavy duty relays shall be 600 volt industrial control type. Intrinsically safe relays shall be furnished for interconnection of each wet well float switch with the control panel.

G. Terminal Blocks

1. Terminal blocks shall be provided for all external connections to the control panel and for all connections between the component mounting plate and enclosure mounted components to allow for easy removal of the component mounting plate if required for service. Terminal blocks shall consist of individual snap together contact sections mounted on a common mounting channel. Terminal block sections shall have tubular screw contacts mounted in a nylon housing to resist breakage; phenolic or other rigid, brittle materials shall not be considered equal. Plain screw contacts requiring lugs to be installed on wires shall not be considered equal.

H. Control Circuit

1. The control circuit of the motor control panel shall operate at 120 VAC and be fuse protected.

I. Elapsed Time Meters

1. Provide a non-reset meter for each pump to indicate elapsed time of operation from 0 to 99,999.9 hours.

J. Indicating Lights

1. In addition to the aforementioned indicating lights, a green "pump running" light and red "pump off" light shall be provided for each pump. All indicating lights shall be transformer type, oil-tight, press-to-test with colored lens and legend plate.

K. Alarm System

1. The control panel shall be furnished with an alarm system consisting of separate red indicating lights for each alarm condition, alarm lock-in relays, alarm acknowledge/silence pushbutton and alarm reset button. Each individual alarm shall energize two auxiliary contacts. One of these auxiliary contacts shall illuminate the respective alarm light; the second shall be a spare. The alarm light shall remain "steady" illuminated until the alarm condition is corrected and the reset pushbutton depressed.
2. The RPS and WPS alarm system shall be energized by up to 48 alarm points, including, but not limited to the following alarm conditions that shall be provided to the Alarm Dialer:
 - a. High Wet well level (HWL)
 - b. Low Wet Well Level (LWL)
 - c. Primary Level Device Failure
 - d. Pump Running (each)
 - e. Pump Failure (each)

- f. VFD fault (each)
 - g. Power Failure
 - h. Generator Run
 - i. Generator Failure
 - j. Control Building Intrusion
 - k. Wet Well Intrusion (each)
 - l. High Level at Red Bridge Detention Basin
 - m. High Level at Storage Chamber Outlet Control
3. The GPS alarm system shall be energized by up to 24 alarm points, including, but not limited to the following alarm conditions that shall be provided to the Alarm Dialer:
 - a. High Wet well level (HWL)
 - b. Low Wet Well Level (LWL)
 - c. Primary Level Device Failure
 - d. Pump Running (each)
 - e. Pump Failure (each)
 - f. Soft start fault (each)
 - g. Power Failure
 - h. Pump Station Intrusion
 4. Each of the above alarm conditions shall be monitored and transmitted by the alarm dialer for remote indication of pump station trouble at the 45 High Street Control Center operated by the MBTA.
 5. The RPS and WPS dialer shall continuously monitor the presence of AC power and the status of up to 48 contact closure inputs. The GPS dialer shall continuously monitor the presence of AC power and the status of up to 24 contact closure inputs. AC power failure shall cause the unit to go into alarm status and begin dial-outs. Alarms are acknowledged by either pressing a touch tone “9” as the call is received, or by calling the dialer back after receiving an alarm call.
 6. The dialer shall be the Verbatim as manufactured by RACO Manufacturing or equal as approved by the Engineer.

2.2 PUMP OPERATION

A. Red Bridge and Washington Street Pump Station Control Description

1. The pump controls shall be located in the Pump Control Panel and shall operate the pumps to maintain the liquid level between adjustable operating limits. The stormwater pump stations are each designed to meet two pumping conditions.

- a. For short duration and/or low intensity stormwater flows into the station, the 20 Hp low flow pumps (RPS-4, RPS-5 and WPS-4, WPS-5) are intended to alternate operation (lead/back-up) on constant speed, based on programmed set points/wet well level settings as specified herein.
 - b. The 100 Hp high flow pumps (RPS-1, RPS-2, RPS-3 and WPS-1, WPS-2, WPS-3) shall operate when the low flow pump capacity is exceeded and the wet well level continues to rise to the established elevation settings for the high flow pumps. The three high flow pumps are intended to operate (lead/lag/back-up) with VFD control within certain operating levels as specified herein.
2. Starting and stopping of each stormwater pump shall be accomplished by a level sensor for primary start and stop levels. Float type mercury switches serve as backup level set-points for alarm notification and shall be capable of pump start/stop control in the event of the main controller fault.
 3. Refer to Table 02401-1 at the end of this section for a listing of Elevation IDs and the corresponding wet well elevations and pump operation settings for each of the stormwater pump stations. The following narrative references the Elevation ID as measured by the primary level sensor (primary device) and transmitted to the Pump Control Panel.
 - a. Low Flow Pumps - RPS-4 and RPS-5 or WPS-4 or WPS-5
 1. As the influent stormwater fills the wet well and reaches Elevation K the lead pump will start and operate at full speed after a soft-start. If the wet well level drops to Elevation L, the lead pump will shut down. If the pump fails to shut down and the wet well level reaches Elevation M, the low level float will initiate a LWL alarm and shut down the pump. This alarm will indicate that the primary level device failed to signal for the pump to shut down and that a Low Wet Well Level condition exists in the wet well.
 2. If the lead pump fails to start an alarm will indicate lead pump failure. If the wet well level continues to rise and reaches Elevation I, the standby pump will start and operate at full speed after a soft-start. If the wet well level drops to Elevation L, the pump will shut down. If the pump fails to shut down and the wet well level reaches Elevation M, the low level float will initiate a LWL alarm and shut down the pump. This alarm will indicate that the primary level device failed to signal for the pump to shut down and that a Low Wet Well Level exists in the wet well.
 3. The "lead" and "standby" pump shall alternate with each pump cycle. The automatic alternator shall alternate the pump sequence after each pump cycle. The lead pump selector switch shall be used for manually bypassing the alternator and setting any of the pumps in automatic mode as the lead pump. In the "Hand" mode, the pump selected shall immediately operate, bypassing all automatic controls.
 - b. High Flow Pumps - RPS-1, RPS-2 and RPS-3 or WPS-1, WPS-2 and WPS-3
 1. If the wet well level continues to rise and reaches Elevation D, the lead high flow pump will start until it reaches full speed (100%) using a 0 to 120 second timer. At the same Elevation D, the low flow pump(s) will shut down with a 0 to 60 second time delay. As the wet well level drops to Elevation E, Elevation F, Elevation G, and Elevation H, the high flow pump shall decrease in speed as specified herein. When the wet well level reaches Elevation I, the lead low flow pump will start and operate at full speed after a soft-start and the high flow pump shall shut down with a 0 to 120 second timer. If the high flow pump(s) fail to shut down and the wet well continues to fall to Elevation J, the

back-up float will initiate an alarm and shut down the pump(s) with a 0 to 120 second timer. This alarm will indicate that the primary level device failed to signal for the pump(s) to shut down. If the low flow pump(s) fail to shut down and the wet well level reaches Elevation M, the low level float will initiate a LWL alarm and shut down the pump(s).

2. If the wet well continues to rise and reaches Elevation C, the lag high flow pump will start until it reaches full speed (100%) using a 0 to 120 second timer. The alarm condition will indicate that the lag high flow pump is operating. As the wet well level drops to Elevation E, Elevation F, Elevation G, and Elevation H, the high flow pumps shall decrease in speed as specified herein. When the wet well level reaches Elevation I, the low flow pump will start and operate at full speed after a soft-start and the high flow pump(s) shall shut down with a 0 to 120 second timer. If the pump(s) fail to shut down and the wet well level reaches Elevation L, the low level float will initiate a LWL alarm and shut down the pump(s). This alarm will indicate that the primary level device failed to signal for the pump(s) to shut down and that a Low Wet Well Level condition exists in the wet well.
 3. If the wet well continues to rise and reaches Elevation B, the primary level sensor will initiate a High Water Level Alarm condition. The alarm condition will indicate pump failure and/or that the storm event exceeds the capacity of the pumps operating.
 4. If the wet well continues to rise and reaches Elevation A, the back-up float shall initiate a High High Water Level. The alarm condition will indicate that the primary level device failed or that the storm event exceeds the capacity of the pumps operating.
 5. The "lead", "lag", and "standby" pumps shall alternate with each pump cycle. The automatic alternator shall alternate the pump sequence after each pump cycle. The lead/lag/standby pump selector switch shall be used for manually bypassing the alternator and setting any of the pumps in automatic mode as the lead pump. In the "Hand" mode, the pump selected shall immediately operate, bypassing all automatic controls.
- c. At the Red Bridge Pump Station, the pump control panel shall include a contact and alarm indication for Detention Pond High Level (float) in the Outlet Structure (Sheets 000-C-2068 and 000-C-8022). Upon activation, an alarm shall be initiated and the low flow pumps shall shut down and that high flow pumps shall shut down using a 0 to 120 second timer.
 - d. At the Red Bridge Pump Station, the pump control panel shall include a contact and alarm indication for indication of High Water Level (float) at the twin storage pipe Storage Chamber outlet control structure (Sheets 000-C-2007 and 000-C-8024). Upon activation, an alarm shall be initiated for the need of maintenance at the Storage Chamber outlet control structure.

B. Gilman Square Pump Station Control Description

1. The pump controls shall be located in the Pump Station Control Panel and shall operate the pumps to maintain the liquid level between adjustable operating limits. The pump station is designed to meet pumping conditions.
 - a. The pump Station shall operate when the operator selects the pump to run during dry weather conditions within the limits set by the high and low level set points.

2. Starting and stopping of each pump shall be accomplished by a manual hand-off-automatic (H-O-A) selector switch. Float type mercury switches serve as backup level set-points for alarm notification and shall be capable of pump start/stop control in the event of the main controller fault.
3. Refer to Table 02401-2 at the end of this section for a listing of Elevation IDs and the corresponding wet well elevations and pump operation settings for the pump station. The following narrative references the Elevation ID as measured by the primary level sensor (primary device) and transmitted to the Pump Control Panel.

a. GPS Pumps

1. When the pump operator switches the H-O-A switch to Automatic the lead pump will start and operate at full speed after a soft-start. If the wet well level drops to Elevation B, the lead pump will shut down. If the pump fails to shut down and the wet well level reaches Elevation C, the low level float will initiate a LWL alarm and shut down the pump. This alarm will indicate that the primary level device failed to signal for the pump to shut down and that a Low Wet Well Level condition exists in the wet well.
2. If the lead pump fails to start an alarm will indicate lead pump failure and the “standby” pump will start.
3. The "lead" and “standby” pump shall alternate with each pump cycle. The automatic alternator shall alternate the pump sequence after each pump cycle. The lead pump selector switch shall be used for manually bypassing the alternator and setting any of the pumps in automatic mode as the lead pump. In the "Hand" mode, the pump selected shall immediately operate, bypassing all automatic controls.

C. Wet Well Level Sensors

1. Ultrasonic Level Transmitter (LE, LIT)

- a. Level transmitter shall be a Milltronics Mini Ranger Plus non-contacting ultrasonic meter or approved equal.
- b. Unit shall include two (2) form ‘C’ SPDT relays, 110VAC, 5amp non-inductive contacts assignable as alarms.
- c. Transmitter output to be milliamp current loop into 750 Ohms +/-0.1% resolution, 4-20 mA. Transmitter shall be wall-mounted.
- d. Transducer shall have built- in temperature sensor, including a minimum 125 feet of cable or as indicated on the drawings. Transducer shall be suitable for this application.
- e. Power supply to transmitter to be 120V, 60Hz. Transmitter to come complete with digital display to show level (feet, inches), loss of echo, shorted or open cable, or transducer incorrectly wired.
- f. Transmitter enclosure to be polycarbonate CSA type 4 NEMA, IP65 rated enclosure.
- g. Mounting hardware shall be furnished by the probe manufacturer and all metal components shall be made of stainless steel.

2. Float type switches, each encapsulated within a solid polyurethane float ball shall be provided as back-up to the level sensor and to signal alarm conditions. Float switches shall be provided with individual weights. A mounting bracket shall be provided near the access opening to allow

adjustment of the control/alarm levels as shown on the drawings. Each float switch shall be furnished with cable lengths to suit the installation without splices (control panel is remotely mounted). A properly rated electrical cable shall connect the float switches to the control panel with no splices or terminations within the electrical junction box in the wetwell.

D. Operator Interface Device

1. Provide a color touchscreen as manufactured by Red Lion or approved equal including the following:
 - a. 10.4-INCH TFT 32K VGA 640x480 Pixel LCD (G310CI/A2)
 - b. Configuration and Firmware shall be Stored in 8MB of Non-volatile FLASH Memory
 - c. Resistive Analog Touchscreen
 - d. Dedicated MENU Key
 - e. Up to 5 RS-232/422/485 Serial Ports
 - f. UL Listed NEMA 4X I IP66 Front Panel
2. At a minimum, the Operator Interface Device shall include operator screens for station status, station pump set points, speed control, and alarms. Screen shots to be provided for review and approval with control system submittal.
3. Control system operation shall be coordinated with the variable frequency motor controllers and motor starters in accordance with the pumping operation as specified in Table 02401-01 – Wet Well Elevation ID Schedule for Pump Controls.
4. Provide PLC system for all pump control and alarm functioning.
 - a. A microprocessor-based automatic pump and alarm control system shall be provided for each pumping station incorporating an industrial-grade, 32-bit CMOS microcomputer and associated elements suitable for achieving performance as hereinafter described. The PLC will incorporate the following:
 - 1) Internal diagnostics
 - 2) Real time clock calendar
 - 3) Floating-point data file
 - 4) Battery back up
 - 5) Non-proprietary RTU communication
 - 6) PID loops
 - 7) 6K memory
 - 8) Expansion 110 options (up to 6 modules discrete/analog)
 - 9) Data file download protection
 - 10) 20kHz high-speed counter
 - 11) Advanced communication options (SCADA/RTU networks, DH-485, DeviceNet, and EtherNet/IP)

- 12) Capability of a DF1-Full Duplex device
 - b. The system shall incorporate U.L. 508 Industrial Control Panel approved elements as required of all components of these project panels and be furnished with all necessary hardware and software to accomplish level-responsive pump and alarm operation with software specifically suited to this project.
 - c. All of the discrete 110 circuitry of the computer-based system shall be built to the IEEE 472 (1974) Surge Withstand Capability Standards. The automatic pump and alarm control system computer shall be the standard product of the control system manufacturer and specifically suited for this type of industrial control panel service. All job connections shall be a UL recognized clamp type barriered screw terminals accepting up to two AWG 14 conductors per terminal.
 - d. The drive equipment shall be programmed to respond to variations in the wet well in a manner wherein the hydraulic requirement will be accommodated in the pumping program using simple menu-related operator interface routines.
 - e. The controller must use Microsoft Windows latest compatible software. The software shall utilize a ladder logic language for programming and shall be open architecture.
 - f. The PLC shall be manufactured by Allen Bradley, Series 1400 MicroLogix or approved equal to be coordinated with the MBTA operations.

2.3 REMOTE MONITORING TERMINAL POINTS AND CONNECTIONS

- A. The Red Bridge and Washington Street PS contractor shall furnish and install remote I/O terminals for monitoring pump control alarms from the pump controller located at each stormwater pump station. Dry contacts closures shall be labeled on the terminals for up to 16 points including the following Red Bridge and Washington Street PS general alarms:
 1. Main Power Fail
 2. Generator Running
 3. Generator Fail
 4. Pump Running
 5. Pump Fail
 6. High Wet Well Level
 7. Low Wet Well Level
 8. Control Building Intrusion
 9. Wet Well Intrusion
 10. High Level at Red Bridge (from RPS only)
 11. High Level at Stormwater Storage Outlet Structure (from RPS only)
- B. The Gilman Square PS contractor shall furnish and install remote I/O terminals for monitoring pump control alarms from the pump controller located at the pump station. Dry contacts closures shall be labeled on the terminals for up to 16 points including the following Gilman Square PS general alarms:
 1. Main Power Fail
 2. Pump Running

3. Pump Fail
 4. High Wet Well Level
 5. Low Wet Well Level
 6. Wet Well Intrusion
 7. Control Panel Intrusion
- C. The I/O terminals shall be integrated to the future station Communications Programmable Logic Controllers (CPLC). See Section 16790 - COMMUNICATION PROGRAMMABLE LOGIC CONTROLLERS for remote system monitoring at the 45 High Street Control Center Operated by the MBTA.

2.4 SPARE PARTS

- A. All spare parts indicated are for each stormwater pumping station.
- B. Spare parts for each Control Panel:
 1. One control interface
 2. Two (2) spare timing relays of each type
 3. One panel board of each type
 4. One box of fuses of each size used (each box shall have a minimum of 6 fuses)
 5. Two boxes of pilot lights (each box shall have a minimum of 6 bulbs)
 6. Two PLC power supplies
 7. Ten percent (minimum of one each) of each type I/O Module
- C. Provide one (1) spare ultrasonic level transducer with cable length as specified.
- D. Provide two (2) spare float switches with cable length as specified.
- E. Spare parts shall be identical to and interchangeable with parts installed.

PART 3 - EXECUTION

3.1 VERIFICATION OF CONDITIONS

- A. Before the start of the work of this Section, verify that the project is ready for this work.
- B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.
- C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations at no additional cost to the owner.
- D. Notify subcontractors involved or affected by this work and coordinate the work with them.

3.2 GENERAL REQUIREMENTS

- A. All materials and equipment shall be installed in a neat, workmanlike manner.
- B. All wiring of the equipment shall be as specified under DIVISION 16 - ELECTRICAL of these specifications.

3.3 MANUFACTURER'S FIELD SERVICES

- A. At each of pump station location, a minimum of two days shall be provided for services during installation and startup.

3.6 MANUFACTURER'S TRAINING

- A. At each pump station location, a minimum of two days shall be provided for manufacturer's training on the pump station control and operation performed.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02402

STORMWATER TREATMENT AND DISPOSAL SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies construction of stormwater treatment and disposal facilities. Design-Builder shall furnish all labor, equipment and materials necessary to install the stormwater treatment and disposal systems, complete and operable as designed and as specified herein, in accordance with the requirements of all contract documents. The Design-Builder shall provide and install all pre-manufactured stormwater treatment and disposal systems that it proposes to use, in conformance with all manufacture's requirements.
- B. The project has been designated as a Redevelopment Project by MADEP under their Stormwater Management Standards and Policy. Accordingly, only certain Stormwater Management Standards are required to be met on the Project and those, to the maximum extent practical. The Design-Builder shall make all reasonable attempts to comply with the full Standards. The Owner shall be made aware of any instance where an applicable Standard cannot reasonably be fully met, including site-specific information of what prevents compliance. It is recognized that site conditions may make it difficult to install some systems, for example, high groundwater and/or unfavorable soil conditions may preclude the use of infiltration type stormwater disposal systems at some locations.
- C. The Design-Builder may propose for consideration, alternative stormwater treatment and disposal systems that otherwise meet the design intent of these specifications, including compliance with all regulatory requirements and permits as specified herein and/or elsewhere in related specifications. Such systems, if proposed by the Design-Builder, shall meet all performance requirements required herein and/or by regulatory requirements. If alternative designs are accepted by the Owner, the Design-Builder shall be responsible demonstrating compliance with these specifications and for completing any and all additional permitting requirements.
- D. Stormwater treatment systems shall generally consist of flow-through underground water quality devices to remove fine-grained sediment, nutrients and oils to achieve a higher water quality.
- E. Two types of stormwater treatment systems are generally to be constructed as part of the work. Systems with their discharge in the City of Cambridge, Massachusetts shall be a filtration type system, preceded by a pre-treatment device. All systems in Cambridge must meet their phosphorous standard. At the Vehicle Maintenance and Storage Facility (VMSF) site and in all other areas of the Project the systems shall generally be the hydrodynamic separation type, referred to as water quality structures (WQS).
- F. Stormwater disposal systems for the detention and recharge of stormwater shall generally be a standard design modular chamber system installed in a horizontal field of crushed stone.
- G. All stormwater treatment and disposal systems, including any proposed alternative designs, shall be of a type that have been installed and in use successfully for a minimum of five (5) or more years.
- H. The sizing of all treatment and disposal systems shall be based on the Design-Builder's hydraulic calculations including flow rates and volumes, as approved by the Owner, for each location. The requirements of MADEP Stormwater Management Standards and related design manuals/guidelines, along with any municipal requirements and/or permit requirements which may be more stringent, shall

apply. The manufacturer shall establish the actual size, configuration, model and particular installation requirements for each treatment system to be installed. Sizing of stormwater disposal systems shall consider soil investigations, findings and data conducted earlier and/or that may be conducted by the Design-Builder.

1.2 RELATED WORK IN OTHER SECTIONS:

1. Section 02240 - DEWATERING
2. Section 02260 - EXCAVATION SUPPORT AND PROTECTION
3. Section 02282 - HANDLING, TRANSPORT AND DISPOSAL OF EXCAVATED MATERIALS
4. Section 02300 - EARTHWORK
5. Section 02400 - DRAINAGE AND SEWER SYSTEMS
6. Section 02632 - WASTEWATER BYPASS PUMPING SYSTEMS
7. Section 03300 - CAST-IN-PLACE CONCRETE

1.3 SUBMITTALS

- A. Shop Drawings. Include details of stormwater treatment and disposal facilities, including relationship to other systems; true position and details of interfaces, connections, inlets, cleanouts, manholes, alignment, grade, changes of direction, offsets, bedding, protection, materials and other pertinent data.
- B. Product data: Submit copies of manufactures' printed product data, specifications, standard details, installation instructions, use limitations and recommendations for each material used. Provide certifications that materials and systems comply with specified requirements.
- C. Manufacturer's Performance Certificate. The manufacturer shall submit to the Owner a "Manufacturer's Performance Certification" certifying that each device is capable of achieving the specified removal efficiencies listed in these specifications. The certification shall be supported by independent third-party research
- D. Warranty: The manufacturer shall guarantee the stormwater treatment and disposal systems components against all manufacturer originated defects in materials or workmanship for a period of twelve (12) months from the date the installed components are accepted by the Owner. The Design-Builder and manufacturer shall, upon determination of a defect, repair, correct or replace any manufacturer originated defects advised in writing to the Design-Builder/manufacturer within the referenced warranty period.
- E. Operation and Maintenance Manual: Furnish two full-size paper hard-copies bound in a three-ring binder and one electronic copy in PDF format.

1.4 PERMITS AND LICENSES

- A. The Design-Builder is required to submit permit applications required and pay the associated fees to the Cities of Cambridge, Medford and Somerville to obtain permits for the construction of the facilities.

- B. The Design-Builder is required to apply for and obtain Licenses from the Cities of Cambridge, Medford and Somerville.
- C. The Design-Builder is required to comply with all requirements of 520 CMR 14.00: Excavation and Trench Safety, which has established standards to prevent unauthorized access to the unattended trenches.

1.5 QUALITY CONTROL INSPECTION

- A. The quality of materials, the process of manufacture, and the finished systems shall be subject to inspection by the Owner. Such inspection may be made at the place of manufacture, or on the work site after delivery, or at both places. The systems shall be subject to rejection at any time if material conditions fail to meet any of the specification requirements, even though sample sections may have been accepted as satisfactory at the place of manufacture. Sections rejected after delivery to the site shall be marked for identification and shall be removed from the site at once. All sections, which have been damaged beyond repair during delivery, will be rejected and, if already installed, shall be repaired to the Owner’s acceptance level, if permitted, or removed and replaced, entirely at the Design-Builder's expense.

PART 2 - PRODUCTS

2.1 STORMWATER TREATMENT AND DISPOSAL SYSTEMS

- A. Stormwater Treatment System, Filtration Type
 1. The filtration type stormwater treatment system shall consist of a pre-treatment device to pre-treat the incoming stormwater, followed by a stormwater filter system. The pre-treatment device shall be a hydrodynamic separation (WQS) device as specified herein, unless the pre-treatment device is manufactured integral to the filtration device.
 2. All system internal components including piping, filter media, flow spreader, energy dissipater and pre-treatment devices shall be provided by the manufacturer of the stormwater filter.
 3. Removal Efficiencies: The systems shall be capable of removing up to 80% total suspended solids, 95% total petroleum hydrocarbons and 80% phosphorus on a net annual basis.
 4. System Capacities: The stormwater filtration system shall be capable of capturing and storing petroleum hydrocarbons and sediment in the volumes as determined by the manufacturer for each treatment system to be installed. The system shall be able to convey a peak hydraulic flow rate and a water quality filtration rate as determined by the Design-Builders hydraulic calculations, as approved by the Owner, for each treatment system to be installed.
 5. Alternative designs which otherwise meet these specifications, including the performance criteria for removal efficiencies and system capacities, may be submitted for consideration.
 6. The treatment structure shall be designed and manufactured to withstand all loads, including lateral soil loads and AASHTO HS-20 vehicle loadings. All structures shall be designed to resist flotation assuming the structure is empty and the groundwater elevation is at finished grade.

- B. Stormwater Treatment System, Hydrodynamic Separation Type (Water Quality Structure)

1. The hydrodynamic separation type stormwater treatment system shall consist of single treatment device. The treatment system structure shall be capable of accommodating multiple inlet pipes and be able to be used at an angle point in the storm drain system alignment.
2. The separator should be equipped with an internal high flow bypass that regulates the flow rate into the treatment chamber and conveys high flows directly to the outlet so the scour and/or re-suspension of material previously collected in the separator does not occur. External bypasses are not acceptable. The bypass area must be physically separated from the separation area to prevent mixing with the separator circular and constructed from either fiberglass or precast concrete risers.
3. Removal Efficiencies: The separator shall remove oil and sediment from storm water during frequent wet weather events. It shall treat a minimum of 75 to 90 percent of the annual runoff volume and be capable of removing 50 to 80 percent of the total suspended sediment load as well as more than 90 percent of floatable free oil. The separator shall be capable of trapping silt and clay size particles, in addition to large particles
4. System Capacities: The hydrodynamic separation treatment system shall be capable of capturing and storing petroleum hydrocarbons and sediment for the volumes as determined by the manufacturer for each treatment system to be installed. The system shall be able to convey a peak hydraulic flow rate and a water quality filtration rate based on the Design-Builders hydraulic calculations, as approved by the Owner, for each treatment system to be installed.
5. The treatment structure shall be precast concrete, designed and manufactured in accordance with ASTM C-478. The concrete gasketed joints shall be oil resistant, water tight and meet the design criteria according to ASTM C-443. A fiberglass insert, bolted and sealed watertight to the inside of the bypass chamber, shall divert low to normal stormwater flows into the treatment chamber. A minimum of 12 inches of oil storage shall be lined with fiberglass to provide secondary containment of any hydrocarbon materials.
6. Alternative designs which otherwise meet these specifications, including the performance criteria for removal efficiencies and system capacities, may be submitted for consideration.
7. For stormwater treatment structures proposed to be constructed in the vicinity of the Washington Street Pump Station refer to Section 02400, Paragraph 2.1 A. for additional requirements that shall pertain to the manufacture of these structures.
8. The treatment structure shall be designed and manufactured to withstand all loads, including lateral soil loads and AASHTO HS-20 vehicle loadings. All structures shall be designed to resist flotation assuming the structure is empty and the groundwater elevation is at finished grade.

C. Stormwater Disposal System, Detention and Recharge Fields

1. The Detention and Recharge Fields shall meet municipality and MassDEP standards.
2. Each chamber shall be provided with discharge holes in the sidewall to promote lateral conveyance of water into the surrounding stone media. Holes shall not be drilled or bored in the modules by the Design-Builder unless specifically allowed by the system manufacturer and the Owner.
3. Underground stormwater disposal systems, including all chambers and appurtenances shall be designed and manufactured to withstand all soil loads and AASHTO HS-20 vehicle loadings at the proposed depth of bury. All components of the system, including chambers, headers, cleanouts, interconnecting pipe, special fittings and flush mounted frames and covers, shall be of a type suitable for use in paved areas

4. Alternative designs which otherwise meet these specifications may be submitted for consideration.

2.2 DESIGN-BUILDER PROVIDED COMPONENTS

All Design-Builder provided components shall meet the requirements of this section, related other specifications and contract documents. In the case of conflict, the more stringent specification shall apply.

- A. Crushed rock base material shall be six-inch minimum thick layer of ¾-inch minus rock. Compact undisturbed sub-grade materials to 95% of maximum density at +/-2% of optimum moisture content. Unsuitable material below sub-grade shall be replaced to Owner's approval.
- B. Concrete shall have an unconfined compressive strength at 28 days of at least 4,000 psi, with ¾-inch round rock, a 4-inch slump maximum, and shall be placed within 90 minutes of initial mixing.
- C. Silicone Sealant shall be pure RTV silicone conforming to Federal Specification Number TT S001543A or TT S00230C or Owner approved.
- D. Grout shall be non-shrink grout meeting the requirements of Corps of Engineers CRD-C588. Specimens molded, cured and tested in accordance with ASTM C-109 shall have minimum compressive strength of 6,200 psi. Grout shall not exhibit visible bleeding.
- E. Backfill material shall be ¾-inch minus crushed rock, or approved equal.
- F. Crushed stone used in the detention / recharge disposal fields shall be 1-2 inch double-washed clean stone.
- G. Filter fabric to encapsulate the crushed stone detention and recharge fields and separate them from surrounding in-situ soil as well as backfill material shall be a product recommended by the chamber manufacturer. Filter fabric shall be used along the leveled subgrade below the field, along the sidewalls and along the top of the leveled crushed stone placed over the chamber system.
- H. Polyliner to protect the field at inlet pipe locations, manifolds and feed connectors which may be part of the chamber system, shall be a product recommended by the chamber manufacturer.

PART 3 - EXECUTION

3.1 GENERAL

- A. Stormwater Treatment Systems, including filtration type and hydrodynamic separation types: The Manufacturer shall be responsible for delivering the Stormwater Treatment Systems to the site. The system includes the pretreatment unit with all internal components and service access riser to surface, the filtration chamber with all internal components, service access risers to surface, filter media, pipe coupling between the pretreatment unit and filter chamber, and manhole frames and covers.
- B. Stormwater Disposal Systems, including detention and recharge chambers and appurtenances: The Manufacturer shall be responsible for delivering the Stormwater Disposal Systems to the site. The system may include pre-formed HDPE chambers, all internal and external manufactured components,

service access riser to surface, pipe coupling, and manhole frames and covers that are part of the completed system.

- C. The Design-Builder shall install all Stormwater Treatment and Disposal Systems in accordance with the Contract Documents and all manufacturers recommended installation instructions.
- D. Stormwater Treatment Systems: The Design-Builder shall be responsible for preparing the site for the treatment system installation including, but not limited to, temporary shoring, excavation, cutting and removing pipe, new pipe, bedding, and compaction. The Design-Builder shall be responsible for furnishing the means to lift the system components off the delivery trucks. The Design-Builder shall be responsible for providing any concrete anti-floatation/anti-creep restraints, anchors, collars, etc. with any straps or connection devices required. The Design-Builder shall be responsible for field cutting/adjusting, if necessary, service access risers to grade. The Design-Builder shall be responsible for sealing the pipe connections to the Stormwater Treatment System, backfilling and furnishing all labor, tools, and materials needed.
- E. Stormwater Disposal System: The Design-Builder shall be responsible for preparing the site for the chamber system, including a prepared level subgrade, installing filter fabric materials to line the bottom of the field and encapsulate the crushed stone surrounding the chambers. The Design-Builder shall install crushed stone and the component parts of the chamber system in accordance with the manufacturer's recommendations. After the modular system has been installed and accepted by the Owner and the site prepared, crushed stone shall be placed between, around and above the chamber system to the elevations and dimensions consistent with the Design-Builders approved final design. Design-Builder shall level the top layer of crushed stone field, place filter fabric above it and place and compact backfill above the crushed stone field. Final surface treatment shall be as described elsewhere in the Contract Documents.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection with the work are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02444

CHAIN-LINK FENCE AND GATES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the furnishing and installation of chain-link fence and gates, of the following types:
1. Type I: Galvanized Steel
 2. Type II: Aluminum-Coated Steel Fabric with Galvanized Steel Posts, Hardware, and Fittings
 3. Type III: (not used)
 4. Type IV: Colored PVC-Coated Steel Fabric with Galvanized and PVC-Coated Steel Posts, Hardware, and Fittings
- B. Related Work:
1. Section 02100 – SITE PREPARATION
 2. Section 03300 - CAST-IN-PLACE CONCRETE
 3. Section 05500 - MISCELLANEOUS METALS
 4. Section 09900 – PAINTING
 5. Section 16060 – GROUNDING AND BONDING
 6. Section 16702 – ELECTRONIC ACCESS CONTROL SYSTEMS (for panic bar and alarm on emergency egress gates)

1.2 SUBMITTALS

- A. Shop Drawings:
1. Include cross sectional dimensions of posts, braces, rails, fence fabric, fittings, accessories and gate frames and details of all gate hardware.
 2. Include a layout drawing showing the spacing of posts and location of all gates; abrupt changes in grade; and all corner, gate, anchor, end, and pull posts.
- B. Certificates: Submit certified test reports giving results of tests specified herein for zinc and vinyl coatings.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. General: Comply with AASHTO M181, with the additions and modifications specified herein.
1. Aluminum alloy line, end, and corner posts, and top rail, may be substituted for galvanized steel at the Design-Builder's option.

2. Aluminum Alloy: ASTM B221 for shapes, and B429 for pipe, Alloy 6061-T6. Pipe dimensions specified are the nominal pipe sizes per ASTM B429 Schedule 40. Coat portions of posts to be embedded in concrete with two coats of an accepted coal-tar mastic, allowing 24 hours drying time between coats.
3. Steel pipe dimensions and weights: ASTM A120, Schedule 40. Dimensions specified are the nominal pipe sizes.
4. Dimensions and weights specified herein are subject to a tolerance of plus or minus five percent.
5. Zinc Coating: Minimum 2.0 ounces per square foot except where specified otherwise.
6. Provide posts with accepted tops of same material as posts, so designed as to fit securely over post and carry top rail or cable; the base of top fitting shall carry an apron around outside of post.

B. Line Posts

1. Steel, Five Feet and Shorter: 1-1/2 inch pipe; or 1.625 by 1.875 inch H column weighing 2.70 pounds per foot; or 1.625 by 1.875 inch C column weighing 2.20 pounds per foot.
2. Aluminum, Five Feet and Shorter: 1.625 by 1.875 inch H column weighing 1.03 pounds per foot.
3. Steel, Over Five Feet: 2 inch pipe; or 1.95 by 2.25 inch H column weighing 4.10 pounds per foot; for 1.70 by 2.25 inch C column with a weight of 2.66 pounds per foot.
4. Aluminum, Over Five Feet: 2 by 2.25 inch H column weighing 1.24 pounds per foot.

C. Gate Posts: Steel, minimum 3-1/2 inch pipe, except as otherwise specified in the Contract Documents .

D. End and Corner Posts

1. Steel, Five Feet and Shorter: 2 inch pipe, or 3.5 inch square C column weighing 5.163 pounds per foot.
2. Aluminum, Five Feet and Shorter: 2 inch pipe.
3. Steel, Over Five Feet: 2.5 inch pipe, or 3.5 inch square C column weighing 5.163 pounds per foot.
4. Aluminum, Over Five Feet: 2.5 inch pipe.

E. Top Rail, Cables, and Spring Tension Wire

1. Top Rail
 - a. Steel: 1-1/4 inch pipe, or 1.25 x 1.625 inch C section weighing 1.262 pounds per foot.
 - b. Aluminum: 1.25 inch pipe.
 - c. Couplings and Expansion Sleeves: Outside sleeve type, minimum six inches long.
2. Cable: ASTM A475, 3/8 inch, seven-strand, common grade, Class A galvanizing.
3. Cable attachments
 - a. Shoulder Eye Bolts: 5/8 inch diameter, of sufficient length to fasten to the post used.

- b. Turnbuckles: Shackle end type, 1/2 inch diameter, with six-inch standard take-up and 3/8 inch diameter pins.
 - c. Thimbles: lightweight wire rope for use with 3/8 inch diameter cable.
 - d. Wire Rope Clips: U-bolt diameter of 7/16 inch for use with 3/8 inch diameter cable.
 - e. Anchor Shackles: 3/8 inch diameter, 11/16 minimum distance between eyes, 7/16 inch in diameter.
 - f. Seizing: 0.0181 inch diameter galvanized annealed iron wire.
4. Spring Tension Wire: Coil spring steel, 0.1770 inch diameter; base metal having a minimum tensile strength of 80,000 psi, galvanized with 1.6 ounces per square foot; or aluminum coated with 0.4 ounces per square foot.
- F. Braces and Tension Rods
- 1. Compression Braces: Same type and size as top rail.
 - 2. Tension Rods: 3/8 inch round rods with drop-forged turnbuckles or other approved type of adjustment.
- G. Fence Fabric
- 1. Type I, Galvanized Steel: ASTM A392, Size 9, Class 2 coating.
 - 2. Type II, Aluminum-Coated Steel: ASTM A491, Size 9.
 - 3. Type IV, PVC-Coated Steel: ASTM A392, Size 9, except with PVC coating in lieu of galvanizing.
 - 4. Selvages, all Types
 - a. Fabric 60 inches high and under: knuckled at both selvages.
 - b. Fabric over 60 inches high: knuckled at one selvage and twisted and barbed at the other.
- H. Fabric Band and Stretcher Bars
- 1. Fabric Band: Minimum 1/8 by 3/4 inch section.
 - 2. Stretcher Bars: Minimum 1/4 by 3/4 inch section.
 - 3. Aluminum Alloy Items: ASTM B221, 6061-T6.
- I. Tie Wire and Miscellaneous Items
- 1. Tie Wire: Galvanized or aluminum-coated 0.148 inch steel wire, or aluminum alloy conforming to ASTM B211, 1100-H14.
 - 2. Hog Rings: Galvanized or aluminum-coated 0.120 inch steel wire, or aluminum conforming to ASTM B221, 6061-T6. Aluminum coating: minimum 0.24 ounces per square foot.
 - 3. Post Clips: Galvanized or aluminum-coated 0.192 inch steel wire, or aluminum alloy conforming to ASTM B211, 1100-H14. Aluminum coating: minimum 0.30 ounces per square foot.
- J. Barbed Wire and Extension Arms
- 1. Barbed Wire: ASTM A121, 12-1/2 gauge, 4-point round barbs, Class 3 coating.

2. Extension Arms: Projecting at an angle of approximately 45 degrees, fitted with clips or other means of attaching three strands of barbed wire, the top outside wire approximately 12 inches from the fence line and the other wires spaced uniformly between the top outside wire and the fence fabric.

K. Gates

1. General: Swing Gates: per ASTM F900 Sliding Gates: per ASTM F1184 type.
2. Furnish gates complete with necessary hinges, latches, rollers and roller track, and drop bar locking devices; corners shall be welded or fastened and reinforced with suitable fittings.
3. Gates Frames, Six Feet and Under: 1-1/4 inch steel pipe or aluminum tubing.
4. Gate Frames, Over Six Feet: 1-1/2 inch steel pipe or aluminum tubing.
5. Cross-Trussing: 3/8 inch galvanized iron adjustable rods.
6. All gates shall be equipped with a positive type latching device with a means for padlocking. Latches shall be arranged for padlocking so that padlock will be accessible from both sides of the gate regardless of the latching arrangement. The double gate shall be equipped with a center plunger, rods, catch and semi-automatic outer catches to secure the leaves in open position. Hinges shall be heavy duty and designed to permit easy and trouble free operation.

L. Concrete: Section 03300 - CAST-IN-PLACE CONCRETE

M. Vinyl Coating

1. Vinyl color shall be black. All fabric, posts and fittings shall comply with the Munsell Color System as indicated: Black N.1.1.7/0.
2. The vinyl coating shall be continuously bonded (not sprayed or dipped) over the galvanized steel by the Extrusion Bonding process under pressure of 5,000 psi to insure a dense and impervious covering free of voids, having a smooth and lustrous surface appearance. The coating thickness over the galvanized steel shall be in accordance with U.S. Gov't Spec. RR-F-191/1A, Type V. The wire mesh shall be vinyl-clad before weaving and shall be free and flexible at all joints.
3. Plasticized Polyvinyl Chloride (PVC) with low temperature (-20 degrees C) plasticizer, no filler, extenders or extraneous matter, other than the necessary stabilizers and pigments shall be used. Colors will be stabilized and have a light fastness that shall withstand a minimum WEATHER-O-METER exposure of 1,5000 hours without any deterioration (Test Equipment Operating Light and Water Exposure Apparatus Carbon - Arc Type ASTM D1499.E42 Type E). The vinyl covering shall, in addition, resist attack from prolonged exposure to dilute solutions of most common mineral acids, sea water and dilute solutions of most salts and alkali.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Fence, post and gate installation including all manufactured parts shall adhere to municipal and agency standard requirements.

B. Gates:

1. Install gates plumb, level, and secure for full opening without interference.
2. Install ground set items in concrete for anchorage.
3. Adjust hardware for smooth operation and lubricate where necessary.
4. Install gates according to manufacturer's instructions, plumb, level, and secure.
5. Where panic bars and alarms are required they shall be installed per Section-16702 ELECTRONIC ACCESS CONTROL SYSTEMS.

C. Grounding: Refer to Section 16060 - GROUNDING AND BONDING.

3.2 TOUCH-UP AND REPAIR WORK

- A. Remove and replace fencing which is improperly located, damaged or is not true to line, grade and plumb within tolerances as indicated.
- B. Repair damaged vinyl-coated components as recommended by the manufacturer.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection with the work are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02451

GUARD RAIL

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies furnishing and installing steel beam type highway guardrail with steel posts and steel guard rail with posts as locations shown on the Contract Documents.

1.2 SUBMITTALS

- A. Product Data: Provide manufacturers' literature complete describing products.
- B. Shop Drawings:
 - 1. Include cross sectional dimensions of posts, rail elements, and terminal sections.
 - 2. Include layout drawing showing spacing of posts; abrupt changes in grade; and all rail and terminal sections.
- C. Certificates: Provide certificate certifying compliance of materials with standards designated.

1.3 QUALITY ASSURANCE

- A. Erect guardrail true to line and grade and to dimensions conforming to Contract Documents and manufacturers' instructions and recommendations.

PART 2 - PRODUCTS

2.1 STEEL POSTS

- A. Fabricated from ASTM A36 steel "H" sections and channels as indicated; hot-dip galvanized per ASTM A123, and stamped with the ASTM number and the weight of the zinc coating in ounces per square foot.

2.2 RAIL ELEMENT AND TERMINAL SECTIONS

- A. Steel Rail: AASHTO M180, Class A, Type 2. Fit each end of the rail, for each stretch of guard, with a terminal section as indicated, using the same splice detail as for the rail. Provide shapes and profiles indicated on the Drawings.

2.3 BOLTS, NUTS, WASHERS

- A. ASTM A307, galvanized per ASTM A153.

2.4 TOUCH-UP PAINT

- A. Provide touch-up paint meeting requirements of paint as specified in Section 09900 - PAINTING.

2.5 FABRICATION

- A. Fabricate all metal work in the shop. Do not punch, cut, or weld in the field. Where holes are required to be made in the field, drill such holes.
- B. Galvanize components of bolted assemblies separately before assembly. When necessary to straighten sections after galvanizing, perform such work without damage to the zinc coating.

PART 3 - EXECUTION

3.1 ERECTION

- A. Posts:
 - 1. Post installation shall meet MassDOT standard requirements.
- B. Rail:
 - 1. Rail installation shall meet MassDOT standard requirements.
- C. Touch-Up of Damaged Surfaces: Touch-up damaged galvanized surfaces in accordance with requirements of Section 09900 - PAINTING.

PART 4 – MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection with the work are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 “Payment”.

END OF SECTION

SECTION 02470

SITE IMPROVEMENTS

PART 1 - GENERAL

1.1 DESCRIPTION

- A. This Section specifies furnishing and installation of miscellaneous site improvements including the following:
1. Benches (Community Path & Skilton Avenue)
 2. Trash Receptacles (Community Path)
 3. Signs and Sign Support Structures: Wayfinding, Warning, and Regulatory (Community Path)
 4. Solar-Powered Emergency Call Boxes (Community Path)
 5. Steel Bollards - Fixed (Community Path)
 6. Steel Bollards – Removable (Community Path)
 7. Cobblestone (Community Path)
 8. Inlaid Preformed Thermoplastic Asphalt Pavement Marking System
 9. Low Mow Seed Mix
 10. Parking Bumper Curbs
 11. Low Retaining Walls (Maintenance Facility site)
 12. Shelter (Skilton Avenue)
 13. Barrier Free Fountain (Skilton Avenue)
 14. Dog Waste Station (Skilton Avenue)
 15. Pet Shower (Skilton Avenue)
 16. Tree Guard (Skilton Avenue)
 17. Lighted Bollard (Skilton Avenue)
- B. Concrete, concrete reinforcement, miscellaneous metals, and incidentals thereto shall conform to the applicable requirements of Section 03300 - CAST-IN-PLACE CONCRETE and Section 05500 - MISCELLANEOUS METALS.
- C. Related Work specified elsewhere:
1. Section 02300 – EARTHWORK
 2. Section 02359 – MODULAR PRECAST BLOCK RETAINING WALLS
 3. Section 02513 – BITUMINOUS CONCRETE PAVEMENT
 4. Section 02525 – GRANITE CURBS
 5. Section 02526 – DETECTABLE WARNING STRIPS

6. Section 02577 – PAVEMENT MARKING
7. Section 02784 – SITE FURNISHINGS; for benches, trash receptacles, bollards at stations.
8. Section 02920 – SEEDED LAWN
9. Section 02930 - PLANTING
10. Section 02932 – PLANTING SOILS
11. Section 02970 – LANDSCAPE MAINTENANCE
12. Section 03300 - CAST-IN-PLACE CONCRETE; for concrete, reinforcement, and incidentals pertaining thereto.
13. Section 05500 – MISCELLANEOUS METALS
14. Section 09900 – PAINTING
15. Section 16050 – BASIC MATERIALS AND METHODS FOR ELECTRICAL WORK
16. Section 16145 – LIGHTING CONTROL DEVICES
17. Section 16521 – EXTERIOR LIGHTING

1.2 REFERENCES

A. Comply with applicable requirements of:

1. Commonwealth of Massachusetts, Standard Specifications for Highways and Bridges, MassDOT, latest edition, Boston, Massachusetts.
2. ASTM: American Society for Testing and Materials.
3. AASHTO: American Association of State Highway and Transportation Officials.

1.3 SUBMITTALS

- A. Submit product data, shop drawings, samples, certificates, and other submittals in accordance with requirements of General Conditions, Supplementary Conditions, and Section 01300 - SUBMITTALS
1. Product Data: Submit manufacturer's specifications, installation, and maintenance instructions for:
 - a. Benches
 - b. Trash Receptacles
 - c. Emergency Call Boxes
 - d. Steel Bollards, fixed and removable
 - e. Inlaid Preformed Thermoplastic Asphalt Pavement Marking System
 - f. Cobblestone Pavers
 - g. Shelter
 - h. Barrier-Free Fountain
 - i. Dog Waste Station
 - j. Pet Shower
 - k. Tree Guard
 - l. Lighted Bollard
 2. Certificates: Submit material certificates signed by material producer and Design-Builder. Provide certifications stating materials comply with requirements.
 3. Shop Drawings: Submit shop drawings for the following components showing attachment methods, fabrication, casting, and hardware:
 - a. Benches
 - b. Trash Receptacles
 - c. Signs (Include span lengths, post heights, and vertical and horizontal clearances)
 - d. Sign Posts
 - e. Chain Link Fence Sign Support Frame for Overhead Sign Mount
 - f. Emergency Call Boxes
 - g. Steel Bollards, fixed and removable
 - h. Lighted Bollard
 - i. Parking Bumper Curbs
 - j. Shelter
 - k. Barrier-Free Fountain
 - l. Dog Waste Station
 - m. Pet Shower
 - n. Tree Guard

4. Samples: Full Size Sample: Provide full size sample of one unit of the following for the Owner's approval prior to fabrication of remaining units:
 - a. Benches (Community Path)
 - b. Trash Receptacles
 - c. Steel Bollards, fixed and removable
 - d. Cobblestone Paver

5. Submit manufacturer's samples of materials, finishes, and colors for the following:
 - a. Benches (Skilton Avenue)
 - b. Shelter
 - c. Barrier-Free Fountain
 - d. Dog Waste Station
 - e. Pet Shower
 - f. Tree Guard
 - g. Lighted Bollard

6. Shelter:
 - a. Design Requirements: The building shall meet the following design requirements and as specified by the manufacturer:
 1. Building Code: IBC 2009.
 2. Ground Snow Load (Pg):50.
 3. Basic Wind Speed (V): 110.
 4. Design: See drawings.

 - b. Calculations and Submittal drawings shall include, at a minimum:
 1. Calculations:
 - a. References to building codes and design manuals used for calculations.
 - b. Identification of lateral force resisting system.
 - c. Formulas used for determining snow, wind, and seismic loads to specific project location.
 - d. Three dimensional modeling input, model geometry, and analysis results.
 - e. Member design results and controlling load combinations.
 - f. Connection design for structural bolts, welds, plate thicknesses, and anchorage to the foundation.
 - g. Foundation designs shall include the required combinations of gravity and lateral loads.

 2. Submittal Drawings:

- a. Anchor bolt layout.
 - b. Foundation design.
 - c. Three dimensional views of frame.
 - d. Member sizes and locations.
 - e. Structural connection details, including bolt sizes and plate thicknesses.
 - f. Roof trim and connection details for installation clarity.
- c. Foundation Design:
- 1. The shelter shall be set on foundations designed by manufacturer.
 - 2. Foundation materials shall be provided by the Design-Builder.
 - 3. Owner shall provide manufacturer with complete information about the site including soil bearing capacity and lateral load capacity.
 - 4. If soil data is not available in this area, foundations shall be designed to the minimum values
- d. Anchor Bolts:
- 1. Anchor bolts shall be provided by the manufacturer.
7. Emergency Call Boxes: Shop drawings for Emergency Call Boxes on viaduct shall include pole mounting attachment detail to parapet and special side mounting detail of call box attachment to pole. Provide dimension height of call box from deck surface or finished grade. In addition, shop drawings for both at-grade call boxes and those on the viaduct shall adequately detail the mounting location and orientation of the solar panel on the pole to ensure that there are no conflicts with adjacent fence or other surrounding elements.
8. Inlaid Preformed Thermoplastic Asphalt Pavement Marking System: Shop drawings for crosswalks shall include detailed plans of the pattern specific for each of the crossings, showing overall dimensions of the crosswalk length and width as well as dimensioning of the pattern changes. Template layout drawings shall be submitted to illustrate proper template placement to create the specified pattern.
9. No Mow/Low Grow Seed Mix: At least 30 days prior to ordering, the Design-Builder shall submit to the Owner seed packing certificates with source and date. No material shall be ordered until submittals have been approved by the Owner. Delivered materials shall match approved materials.
10. Maintenance Recommendations: Provide maintenance recommendations from the equipment manufacturers for the records of the Owner and the City of Somerville.

1.4 QUALITY ASSURANCE

- A. Source: For each type of material required for the work of this section, provide primary materials which are the products of one manufacturer. Provide secondary materials which are acceptable to the manufacturers of the primary materials.

- B. Accessibility: The ADAAG and the MAAB regulations are pertinent to the design and installation of items covered under the work of this Section. When guidelines conflict, the guidelines giving greater access shall be applicable.
- C. The approved manufacturer shall have experience in the type of work required, shall have a reputation for doing satisfactory work on time and shall have recently successfully completed similar work.
- D. The Design-Builder is responsible for the proper engineering of all items. The internal structure, dimensions and specifications for all items shall be indicated in the Design-Builder's shop drawings. Sign Design-Builder to engineer signs to proper level to withstand abuses of their environment.
- E. Coordination: The work of this Section shall be completely coordinated with the work of other Sections. Verify dimensions and work of other trades that adjoin materials of this Section before the installation of items herein specified. Cooperate with such trades to assure the steady progress of all work under this Contract.
- F. Inlaid Preformed Thermoplastic Asphalt Pavement Marking System
 - 1. The manufacturer must be ISO 9001:2008 certified for design, development and manufacturing of preformed thermoplastic, and provide proof of current certification.

G. SHELTER

- 1. Manufacturer's Qualifications:
 - a. Minimum of (10) years in the shelter construction industry.
 - b. Full time on-staff Licensed Engineer.
 - c. Full time on-staff AWS Certified Associate Welding Inspector.
 - d. Full time on-staff Quality Assurance Manager.
 - e. All welders AWS Certified.
 - f. Manufacturer owned and controlled finishing system to include shot blast, pretreatment, primer, and top coat.
 - g. Published Quality Management System.
 - h. Annual audit of Quality System and Plant Processes by Third Party Agency.
 - i. Annual audit of powder coat finish system by Third Party Agency (PCI).
- 2. Manufacturer's Certifications:
 - a. PCI 4000 S Certified, Certification thru Powder Coating Institute for original equipment manufacturers (OEMs) to evaluate process on entire finish system to add powder coat over steel.
- 3. Manufacturer's Warranty
 - a. Shelter must have a (10) ten year limited warranty on steel frame members.
 - b. Shelter must have a (10) ten year limited warranty on paint system.
 - c. Pass through warranty of Metal Roof manufacturer shall be provided upon request.

H. Inlaid Preformed Thermoplastic Asphalt Pavement Marking System

1. The manufacturer must be ISO 9001:2008 certified for design, development and manufacturing of preformed thermoplastic, and provide proof of current certification.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials under this Section shall be delivered, stored, and handled so as to prevent damage and deterioration. Products stored on site shall be stored above the ground.
- B. Preformed Thermoplastic Material: Shall be vacuum sealed in protective plastic film with cardboard stiffeners to prevent damage in transit. The cartons in which standard preformed thermoplastic patterned sheets are packed shall be non-returnable and shall not exceed 25 in. in length and 25 in. in width. The cartons shall be labeled for ease of identification. The weight of an individual carton must not exceed fifty (50) pounds. The carton must be wrapped with a protective film to protect the material from rain or premature aging.
- C. Shelter: Protect building products after arrival at destination from weather, sunlight, and damage. Installer shall store product elevated to allow air circulation and to not introduce mold, fungi decay or insects to the product. Product must be handled with protective straps or padded forks if lifting with mechanical equipment. Use of chain or cable to lift product into place will not be accepted and may void manufacturer's warranty.

PART 2 - PRODUCTS

2.1 BENCHES (COMMUNITY PATH)

- A. Park Bench with back, 6'-0" Ribbon Bench, Model No. CFPB-018, as manufactured by Custom Fabrication, Inc., C/O Marturano Recreation Company, PO Box 106, Spring Lake, NJ 07762. Contact: Brian Killmeier. Phone: (732) 320-5254, email: BKillmeier@MRCREC.com, or approved equal.
 1. Bench shall be six (6) feet in length; seat height shall be 17 inches; overall depth shall be 25 ¾"; overall height shall be 31 ½".
 2. Arms: Cast Iron Ends with integrated armrests.
 3. Seat Surface Shape: contoured or dished. Frame shall be fabricated of (2) 2" schedule 40 (2-3/8" OD) steel pipes and 1 ½" x ¼" steel bars. (1) ¾" schedule 40 (1.05" OD) steel pipe connecting integrated armrest/legs.
 4. All steel parts shall be phosphate washed, primed with zinc rich primer, and painted with exterior grade polyester powder coat, color shall be black. Final coating shall be a minimum of 4 mils thick on all surfaces.
 5. All assembly hardware shall be stainless steel.
 6. Bench shall be surface mounted on concrete pad. For flush surface anchoring, use flat head coated stainless steel bolt 8" long minimum, anchored to concrete pad.

- B. Park Bench (Backless), 6'-0" Ribbon Bench, Model No. CFPB-033, as manufactured by Custom Fabrication, Inc., C/O Marturano Recreation Company, PO Box 106, Spring Lake, NJ 07762. Contact Brian Killmeier. Phone: (732) 320-5254, email: BKillmeier@MRCREC.com, or approved equal.
1. Bench shall be six (6) feet in length and shall be installed on the viaduct as per the contract documents and approved shop drawings.
 2. Seat Surface Shape: contoured or dished. Frame shall be fabricated of (2) 2" schedule 40 (2-3/8" OD) steel pipes and 1 1/2" x 1/4" steel bars. (1) 3/4" schedule 40 (1.05" OD) steel pipe connecting integrated armrest/legs.
 3. All steel parts shall be phosphate washed, primed with zinc rich primer, and painted with exterior grade polyester powder coat, color shall be black. Final coating shall be a minimum of 4 mils thick on all surfaces.
 4. All assembly hardware shall be stainless steel.
 5. Bench shall be surface mounted on concrete deck of viaduct. For flush surface anchoring, use flat head coated stainless steel bolt 8" long minimum, anchored to concrete pad.
- C. Bench concrete pad shall be 6 inches of 4,000 psi concrete with 12 inches of compacted gravel base. Concrete pad shall be reinforced with 6 x 6 – W4 x W4 Welded Wire Mesh.
- D. Concrete for bench concrete pad specified under Section 03300 – CAST-IN-PLACE CONCRETE.
- E. Stone Base for bench concrete pad specified under Section 02300 – EARTHWORK.

2.2 BENCHES (SKILTON AVENUE)

- A. "Plainwell" Bench, 73-1/4 inches with back, no center arm, surface mount, as manufactured by Landscape Forms, Inc., 431 Lawndale Ave., Kalamazoo, MI 49048 (contact Nadene Worth. Phone 800-430-6206 x 1325. Email: nadenew@landscapeforms.com), or approved equal.
- B. Style:
1. Backed
 - a. Depth: 24 inches
 - b. Overall Height: 33 inches
 - c. Arm height: 27-3/8 inches
 - d. Length: 73-1/4 inches
 2. Mounting:
 - a. Surface mount
- C. Materials:
1. Seat and Back Panels:

- a. Aluminum: ASTM B221 extruded aluminum boards have end caps. Aluminum boards and end caps are clear anodized (202-R1) and powder coated to match the frame color.
2. Frame:
- a. End supports with integral armrests are sand-cast aluminum. Seat straps and back straps are sand-cast aluminum. Leg section is 1-1/2" x 2" oval shape. End supports are connected by two A36 steel channels 1-1/2" x 9/16" x 3/16" fasted with black Magni-coated steel cap screws.
3. Bench shall be surface mounted on concrete pad with corrosion resistant anchor bolts.
- D. Finishes:
- 1. Primer: Rust inhibitor on ferrous supports.
 - 2. Topcoat: Thermosetting TGIC polyester powder coat. UV, chip, and flake resistant.
 - 3. Test Results: "Pangard II".
 - a. Gloss consistency, Gardner 60 Degrees, ASTM D 523: Plus or minus 5 percent from standard.
 - b. UV Resistance, Color and Gloss, ASTM G 155, Cycle 7: Delta E less than 2 at 2.0 mils and less than 20 percent loss.
 - c. Cross-hatch Adhesion, ASTM D 3359, Method B: 100 percent pass.
 - d. Flexibility Test, Mandrel, ASTM D 522: 3 mm at 2 mils.
 - e. Erichsen Cupping, ISO 1520: 8 mm.
 - f. Impression Hardness, Buchholz, ISO 2815: 95.
 - g. Impact Test, ASTM D 2794: 60 inch-pounds at 2.5 mils.
 - h. Pencil Hardness, ASTM D 3363: 2H minimum.
 - i. Corrosion Resistance, 1500-Hour Test, ASTM B 117: Max undercutting 1 mm.
 - j. Humidity Resistance, 1500-Hour Test, ASTM D 2247: Max. Blisters 1 mm.
 - 4. Color: Mercury
- E. Bench concrete pad shall be 6 inches of 4000 psi concrete with 12 inches of compacted gravel base. Concrete pad shall be reinforced with 6 x 6 – W4 x W4 Welded Wire Mesh.
- F. Concrete for bench concrete pad specified under Section 03300 - CAST-IN-PLACE CONCRETE.
- G. Stone Base for bench concrete pad specified under Section 02300 – EARTHWORK.

2.3 TRASH RECEPTACLES (COMMUNITY PATH)

- A. Trash Receptacle, Part No. CFTR-003, as manufactured by Custom Fabrications, Inc., C/O Marturano Recreation Company, PO Box 106, Spring Lake, NJ 07762. Contact: Brian Killmeier, Phone (732) 320-5254, email: BKillmeier@MRCREC.com, or approved equal.

1. Trash receptacle shall have Hinged Lockable Side Door, welded down Bonnet Style lid, and 32-gallon Rubbermaid liner.
 2. All steel parts shall be phosphate washed, primed with zinc rich primer, and painted with exterior grade polyester powder coat, color shall be black. Final coating shall be a minimum of 4 mils thick on all surfaces.
 3. Mounting: Provide stainless steel vandal proof Anchor Bolts (2) minimum.
 4. Lids and Tops: Bonnet Style Steel Lid permanently secured.
 5. Receptacle Height: 36"
 6. Overall Width: 23 ¼"
 7. Inner Container: 32-gallon Rubbermaid Container, capacity not less than 32 gallon.
 8. Service Access: Side access with inner container.
- B. Trash Receptacle concrete pad shall be 6 inches of 4,000 psi concrete with 12 inches of compacted gravel base. Concrete pad shall be reinforced with 6 x 6 – W4 x W4 Welded Wire Mesh.
- C. Concrete for trash receptacle concrete pad specified under Section 03300 – CAST-IN-PLACE CONCRETE.
- D. Stone Base for trash receptacle concrete pad specified under Section 02300 – EARTHWORK,

2.4 SIGNS (COMMUNITY PATH)

- A. Signs:
1. All signs on the community path shall be constructed and erected in accordance with the latest edition of the “Manual on Uniform Traffic Control Devices for Streets and Highways” (MUTCD) with all revisions.
- B. Sign Posts for free-standing signs
1. Sign Posts shall be 2-inch tubular steel for all free-standing signs along the Community Path and shall have a black powder-coat finish.
 2. Sign Posts for signs on the roadway at path intersections shall be Type P5.
- C. Sign Supports for overhead signs
1. Signs on the viaduct shall be mounted on overhead supports and centered over the path as shown on the drawings.
 2. Frames for the sign supports shall match, and attach to, the security fence mounted on the sides of the viaduct structure. Color shall be black to match fence.

2.5 SOLAR-POWERED EMERGENCY CALL BOXES (COMMUNITY PATH)

A. General

1. Emergency Call Boxes shall be located at locations shown on the drawings. The City of Somerville's standard Signal Communications Solar Powered Radio Fire Alarm Box shall be used at all locations, both at-grade and on viaduct. On the viaduct section of the community path, the mounting poles shall be mounted on top of the parapet. The height of the mounting poles on the viaduct shall be shorter to accommodate the height of the parapet and the security fence.
2. Emergency Call Boxes shall be Signal Communications Solar Powered Radio Fire Alarm Box DTS L1R1 – P104 (DTX Solar Powered Radio Box) as supplied by L.W. Bills Company, 7-9 Park Street, PO Box 7, Georgetown, MA 01833-0007, Phone: (800) 892-0275, Email: lwbills@comcast.net, or approved equal. This is the City of Somerville's standard emergency call box.
 - a. Three Button Box: FIRE/POLICE/MEDICAL
 - b. Stickers: EMERGENCY
3. Call Boxes shall meet all ADA requirements.

B. Emergency Call Boxes At-Grade

1. Mounting Pole: 11 ½ foot long aluminum pole mounted on 18 inch diameter x 4 foot deep concrete base. Standard City of Somerville emergency call box assembly.
2. Concrete foundation for call boxes shall be designed to meet MassDOT requirements. Concrete shall be as specified under Section 03300 – CAST-IN-PLACE CONCRETE.

C. Emergency Call Boxes on Viaduct

1. Mounting Pole: 6 ½ foot long aluminum pole mounted to the top of the 30 inch parapet wall for a total height of 9 feet above deck.
2. Call Box shall be side mounted on mounting pole. Call box shall not extend into the path. There shall be breaks in the railing where the call boxes are to be located. Coordinate with railing installation.

2.6 STEEL BOLLARDS (COMMUNITY PATH)

A. Steel Bollards specified under this section are for bollards located within or adjacent to the community path as shown on the community path plans.

B. Steel Bollards - Fixed

1. Bollard shall be 5 ¾ inch diameter, schedule 40, galvanized steel pipe. Length of pipe shall be 6 feet and it shall extend 39 inches above finished grade. Steel shall conform to ASTM A36 and shall be galvanized in accordance with relevant sections of ASTM A123 or ASTM A386 to assure proper bonding of paint to steel surface exposed to the weather.

2. A six inch diameter cast iron cap shall be welded to the top of the bollard. All welds shall be ground smooth.
3. Two white reflectors, square in shape, shall be bolted to each side of the bollard. Submit shop drawings detailing method of connection to the pipe bollard.

C. Steel Bollard – Removable

1. Bollard shall be 5 ¾” diameter, schedule 40, galvanized steel pipe. Length of pipe shall be 6 feet and it shall extend 39” above finished grade. Steel shall conform to ASTM A36 and shall be galvanized in accordance with relevant sections of ASTM A123 or ASTM A386 to assure proper bonding of paint to steel surface exposed to the weather.
2. A six inch diameter cast iron cap shall be welded to the top of the bollard. All welds shall be ground smooth.
3. Two white reflectors, square in shape, shall be bolted to each side of the bollard. Submit shop drawings detailing method of connection to the pipe bollard.

D. Finish and welding of bollards shall be as specified in Section 05500 – MISCELLANEOUS METALS.

E. Finish: Bollards shall be phosphate washed, primed with zinc rich primer, and painted with exterior grade polyester powder coat; color shall be yellow, RAL #1016. Final coating shall be a minimum of 4 mils thick on all surfaces.

F. Concrete for footing foundation as specified under Section 03300 – CAST-IN-PLACE CONCRETE.

G. Crushed Stone and Gravel Borrow base for footing specified under Section 02300 – EARTHWORK.

2.7 COBBLESTONE (COMMUNITY PATH)

A. Characteristics and Quality

1. Cobblestone units shall be sound stock, and free from defects impairing strength, durability or appearance, such as cracks, seams, starts, holes, flaws or imperfections which have been patched or filled.
2. Units shall be uniformly consistent in color, value, graining texture, and other features to the extent inherent in each stone type.
3. Units shall be clean, used, split-faced cobbles, 4” deep, and with 4”x8” face sizes.
4. Stone shall be cut to sizes, shapes, dimensions, and details shown on the drawings or as per approved shop drawings and as directed by the Owner.
5. Exposed surfaces and edges of stone units shall be free from cracks, broken corners, chipped edges, scratches, or defects affecting appearances. No patching or hiding of defects will be permitted
6. Shop Cutting, Drilling and Fitting: Include all cutting, drilling, and fitting of stone required to accommodate the work of other trades and to fit conditions on-site. In cutting and fitting,

carefully cut and grind edges to a neat, tight fit. Cutting shall be in such a manner so as not to impair strength or appearance.

B. Mortar

1. All mortar mixes shall be in accordance with ASTM C270. Portland Cement, Type I ASTM C150, White Portland Cement. Cement shall be in accordance with ASTM C91, not more than 0.30 percent water-soluble alkali. Hydrated Type S Lime for Masonry Purposes, ASTM C207. Do not use air entrained lime. Aggregate shall be well graded sharp bagged mason's mortar sand in accordance with ASTM C144. Water shall be clean and free from deleterious materials. Only potable water shall be used. Mortar pigment color shall be approved by the Owner. Design-Builder shall submit samples. Do not exceed pigment to cement ratio by weight of 1 to 7. Proportion specification for mortar materials shall be:

Type S Mortar

Portland Cement	1 Part by volume
Hydrated Lime	½ Parts by volume
Sand	4 Parts by volume (as measured damp)

2.8 INLAID PREFORMED THERMOPLASTIC ASPHALT PAVEMENT MARKING SYSTEM

A. Inlaid Prefomed Thermoplastic Asphalt Pavement Marking System

1. Purpose: This is a durable preformed thermoplastic asphalt pavement marking system that is inlaid just below the asphalt pavement surface to create colorized patterns within the asphalt for streetscape and traffic calming purposes on public roads.
2. The preformed thermoplastic is inlaid into asphalt pavement using infrared heating equipment designed specifically to elevate the temperature of the asphalt without it being adversely affected. A specialized template is imprinted into the heated asphalt pavement to create depressions to match the desired pattern. The preformed thermoplastic, precut by the material manufacturer to match the imprinted pattern, is laid to fit within the depressions and melted into place using the infrared heater.
3. The top of the inlaid preformed thermoplastic lies slightly below the surface level of the surrounding asphalt pavement allowing the pavement to absorb the physical effects of the traffic. When applied in accordance with the manufacturer's application guidelines by an applicator certified by the manufacturer, the inlaid preformed thermoplastic will wear at a similar rate as the surrounding asphalt pavement. Therefore, the life of the inlaid preformed thermoplastic is dependent upon using a long lasting, durable and stable asphalt pavement to prevent premature wear.
4. The pattern and color of the inlaid preformed thermoplastic at all designated community path crosswalks shall be as shown on the drawings and approved shop drawings. The primary pattern shall be created using precut preformed thermoplastic sheets that are 24 inches x 24 inches. The precut patterned border pieces shall measure either 8 inches or 12 inches wide x 24 inches long. These sizes ensure the specified patterns are created with a minimal number of seams between the preformed thermoplastic sheets. The use of individual preformed thermoplastic strips inlaid into standard imprinted patterns to create the design shall not be allowed.

5. The inlaid preformed thermoplastic is manufactured without glass beads. The inlaid preformed thermoplastic material must be a resilient preformed thermoplastic product, which contains intermixed anti-skid/anti-slip elements with a minimum hardness of 6 (Mohs scale), and where the top surface contains factory applied anti-skid/anti-slip elements with a minimum hardness of 8 (Mohs scale).
6. **Preformed Thermoplastic Material:** Must be composed of an ester-modified rosin impervious to degradation by motor fuels, lubricants, etc. in conjunction with aggregates, pigments, binders, and anti-skid/anti-slip elements. Pigments and anti-skid/anti-slip elements must be uniformly distributed throughout the material. The thermoplastic material shall conform to AASHTO designation M249, with the exception of the relevant differences due to the material being supplied in a preformed state, being non-reflective, and potentially being of a color from white or yellow.
 - a. **Pigments:**
 1. **White:** The material shall be manufactured with sufficient titanium dioxide pigment to meet FHWA Docket No. FHWA-99-6190 Table 5 and 6 as revised and corrected.
 2. **Other Colors:** The pigment system must not contain heavy metals, nor any carcinogen as defined in 29 CFR 1910.1200 in amounts exceeding permissible limits as specified in relevant Federal Regulations.
 - b. **Skid Resistance:** The surface of the preformed thermoplastic material shall contain factory applied anti-skid material with a minimum hardness of 8 (Mohs scale). Upon application the material shall provide a minimum skid resistance value of 60 BPN when tested according to ASTM E 303.
 - c. **Slip Resistance:** The surface of the preformed thermoplastic material shall contain factory applied anti-skid material with a minimum hardness of 8 (Mohs scale). Upon application the material shall provide a minimum static friction of coefficient of 0.6 when tested according to ASTM C 1028 (wet and dry), and a minimum static coefficient of friction of 0.6 when tested according to ASTM D 2047.
 - d. **Thickness:** The material must be supplied at a minimum thickness of 90 mil (2.3 mm).
 - e. **Environmental Resistance:** The material must be resistant to deterioration due to exposure to sunlight, water, salt or adverse weather conditions and impervious to oil and gasoline.
 - f. **Storage Life:** The material may be stored for 12 months, if stored indoors and protected from the elements.
 - g. **Transverse Lines for Inlaid Preformed Thermoplastic Crosswalk Application:** Supplied as white, retroreflective preformed thermoplastic linear striping material in 90 mil (2.3 mm) or 125 mil (3.2 mm) thickness, material is available in 6 in., 8 in., or 12 in. widths. This material may be supplied and applied by the certified applicator in conjunction with the inlaid preformed thermoplastic system and is available from the inlaid preformed thermoplastic manufacturer. (Consult the manufacturer's published application instructions for the preformed thermoplastic linear striping material selected for proper application methods.)

7. Specialized Application Equipment

- a. Stamping Templates: Designed and constructed for imprinting the specified pattern into the asphalt pavement, templates are supplied by the inlaid preformed thermoplastic manufacturer in 150 mil (3.81 mm) thickness. Standard patterned templates are designed to create crosswalks ranging from 6 feet to 20 feet wide, in 2 feet increments. Template layout drawings shall be supplied by the inlaid preformed thermoplastic manufacturer to illustrate proper template placement to create the specified pattern. Certain templates may be field assembled as needed using the manufacturer supplied template assembly kit.
- b. Heating Equipment: The inlaid preformed thermoplastic manufacturer shall distribute reciprocating infrared heating equipment designed specifically to elevate the temperature of the asphalt pavement without adversely affecting it, as well as the inlaid preformed thermoplastic material. The primary asphalt heating unit must employ a bank of propane-fired infrared heaters, mounted on a track device that allows the heater bank to reciprocate back and forth over a designated area, thereby allowing the operator to monitor the temperature of the asphalt pavement and the inlaid preformed thermoplastic at all times during the pavement heating process.
 1. A smaller, mobile infrared heater distributed by the inlaid preformed thermoplastic manufacturer is designed specifically to heat areas such as borders and narrow areas that are inaccessible to the primary heater. This secondary heater also allows the operator to monitor the temperature of the asphalt pavement and the inlaid preformed thermoplastic at all times during the heating process.
 2. An approved hand-held propane heat torch distributed by the inlaid preformed thermoplastic manufacturer shall be used to heat isolated areas of the asphalt pavement or inlaid preformed thermoplastic.
- c. Hand Held Finishing Tool: Enables the applicator to complete the imprinting of the asphalt pavement in areas around permanent structures, such as curbs and manhole covers, which may be inaccessible to the stamping template. The hand held finishing tools are distributed by the inlaid preformed thermoplastic manufacturer.
- d. Vibratory Plate Compactor (700-900 lb./318-408 kg.): Shall be used for pressing the stamping template into the heated asphalt to create the specified pattern. The inlaid preformed thermoplastic manufacturer does not supply vibratory plate compactors.

B. Granite Curb flush with pavement as per Section 02525, Granite Curbs.

C. Asphalt Roadway Surface as per Section 02513, Bituminous Concrete Pavement.

2.9 LOW-MOW SEED MIX

- A. Low-Mow Seed Mix shall conform to the relevant provisions of Section 02920 – SEEDING and the following:
- B. The intent of this specification is to establish a healthy stand of a Low-Mow species. Low mow species are slow growing and require more attention during establishment than typical lawn mixes. The steps specified herein are strongly recommended for best establishment and shall be followed unless otherwise recommended by the supplier.

- C. Seed Mix: Seed mix shall be Pure Live Seed and shall be comprised of a No Mow or Low Mow mix from one of the following suppliers or an equal approved by the Owner:
 - 1. No mow Lawn Mix, Prairie Nursery, Inc., Westfield, WI (800) 476-9453.
 - 2. Sun-Shade Ultra Low Maintenance Mix, Pearls Premium, Wayland, MA (508) 521-9940.
 - 3. Lo-Mo Mix, North Country Organics, Bradford, VT (802) 222-4277.
- D. Hay Mulch: Hay Mulch shall consist of mowed and properly cured grass, clover or other acceptable plants. No salt hay shall be used.

2.10 PARKING BUMPER CURBS

- A. Parking bumper curbs shall be of the dimensions and configuration as shown on the Plans. They shall be precast concrete items manufactured of Class 4,000 psi concrete and 5% to 9% air entrained. Steel for concrete reinforcement and anchor / tie-down rods shall be ASTM A615, 60 KSI. Longitudinal reinforcement shall include at least two #3 bars. Anchor rods shall be minimum 18-inch long #6 bars each, embedded flush with the top of the bumper curb.

2.11 LOW RETAINING WALLS (MAINTENANCE FACILITY SITE)

- A. Low retaining walls shall comply with the requirements of Section 02359, MODULAR PRECAST BLOCK RETAINING WALLS.

2.12 SHELTER (SKILTON AVENUE)

- A. Description
 - 1. Multi-Rib Metal Roof “R” Panel, size and shape as shown on the plans, or approved equal.
 - 2. Roof Slope: 5/12
 - 3. Minimum Clearance Height (MCH): 7.5 ft. Minimum clearance height under the structure indicates the lowest height of a member from finish grade for clearance under the structure. This is generally the clearance under roof eave or frame, whichever is lower.
- B. Shelter System and Materials
 - 1. Manufacturer:
 - a. The product shall be designed, produced, and finished at a facility operated and directly supervised by the supplier who has a minimum of (10) years in the business of making pre-manufactured shelters.
 - 2. Product Requirements and Materials:
 - a. General: The pre-engineered package shall be pre-cut unless otherwise noted and pre-fabricated which will include all parts necessary to field construct the shelter. The shelter shall be shipped knocked down to minimize shipping expenses. Field labor will be kept to a minimum by pre-manufactured parts. Onsite welding is not necessary.

- b. Reinforced Concrete:
 - 1. Concrete shall have minimum 28-day compressive strength of 3,000 psi and slump of 4" (+/- 1"), unless otherwise noted on the drawings.
 - 2. Reinforcing shall be ASTM A615, grade 60.
- c. Steel Columns
 - 1. Hollow structural steel tube minimum ASTM A500 grade B with a minimum wall thickness of 3/16" or approved equal.
 - 2. Unless columns are direct buried, columns shall be anchored directly to concrete foundation with a minimum of four anchor rods to meet OSHA requirement 1926.755(a)(1).
- d. Structural Framing:
 - 1. Hollow Structural Steel tube minimum ASTM500 grade B. "I" beams, tapered columns, or open channels shall not be accepted for primary beams. Frame will have a STANDARD POLI-5000 finish.
- e. Compression Members:
 - 1. Compression rings of structural channel or welded plate minimum ASTM A36 or compression tubes or structural steel tube minimum ASTM A500 grade B shall only be used.
- f. Connection Requirements:
 - 1. Anchor bolts shall be ASTM F1554 (Grade 36) unless otherwise noted.
 - 2. Structural fasteners shall be zinc plated ASTM A325 high strength bolts and A563 high strength nuts.
 - 3. Structural fasteners shall be hidden within framing members wherever possible.
 - 4. No field welding shall be required to construct the shelter.
 - 5. All welds shall be free of burrs and inconsistencies.
 - 6. Exposed fasteners shall be powder coated by manufacturer prior to shipment to match frame or roof colors as applicable.
 - 7. Manufacturer shall provide extra structural and roofing fasteners.
- g. Roofing Materials:
 - 1. Primary Roof Deck of "R" Panel Metal Roofing (MR):
 - a. Roofing shall be 24 gauge ribbed galvalume steel sheets, with ribs 1 3/16" high and 12" on center.
 - b. Roof surface shall be painted with per manufacturer's specifications to the City's standard color.
 - c. Ceiling surface shall be a "wash coat" primer.

- d. Roof panels shall be factory pre-cut to size and angled to provide ease of one-step installation.
 - e. Metal roofing trim shall match the color of the roof and shall be factory made of 26 gauge painted steel.
 - f. Trim shall include panel ridge caps, hip caps, eave trim, splice channels, rake trim, roof peak cap, and corner trim as applicable for model selected. Trim may need to be cut to length and notched. Installation drawings shall have detailed information on how to cut and affix roof trim.
 - g. Ridge, hip, and valley caps shall be pre-formed with a single central bend to match the roof pitch and shall be hemmed on the sides.
 - h. Roof peak cap shall be pre-manufactured.
 - i. Manufacturer shall supply painted screws and butyl tape.
- h. Finishes:
- 1. Coat Base Coat Finish:
 - a. Entire building under durable polyester TGIC powder coat shall have a base coat.
 - b. Steel shall be shot blasted in-house to SSPC-SP10 near-white blast cleaning prior to adding base coat. SSPC-SP2 hand tool cleaning will not be an acceptable alternative.
 - c. Top powder coat system durable TGIC powder coat which includes epoxy primer shall be applied.

2.13 BARRIER FREE FOUNTAIN (SKILTON AVENUE)

- A. Drinking fountain shall be Murdock model M-43A-PFS. Unit shall be furnished with one fountain bowl mounted on an arm and one fountain pet bowl mounted on the pedestal. Pedestal and arm shall be heavy duty iron castings and base of pedestal shall have four mounting holes. Pedestal and arm shall be furnished with a heavy grade of oil based enamel. Access cover shall be secured with vandal-resistant stainless steel screws. Murdock Manufacturing, P.O. Box 3527, City of Industry, CA 91744-0527. 800-591-9880, www.murdockmfg.com.
- B. Pet Bowl shall be round, case aluminum alloy with matte finish and two 3/8" holes for draining.
- C. Valves shall be self-closing, pushbutton operated, incorporating a replaceable cartridge and requiring less than 5 pounds of force to operate. Valves shall include an adjustable stream regulator controlling the water.
- D. Bubblers shall be stainless steel and operate on a water pressure range of 30 - 105 psig.
- E. Spigot shall be constructed of cast brass with a rough chrome plated finish and pushbutton operated. Supply line shall be lead free brass piping with 1/2" NPT connection.
- F. All solid brass castings shall conform to ASTM standards B61 and B62. Unit shall conform to ANSI A117.1, 2010 ADA Standards for Accessible Design, ANSI/NSF 61-9, and Public Law 111-380.

Spigot valve conform to lead-free requirements of NSF61, Section 9, 1997 and Federal Public B61 and B62. Law 111-380.

G. Pedestal Color:

1. Black

2.14 DOG WASTE STATION (SKILTON AVENUE)

A. Pet Waste Station as detailed on the plans and shall include the following:

1. 7 ft. U-Channel Post
2. Bag Dispenser
3. 10-Gallon Non-Locking Can
4. Sign and Sign Brackets. Heavy-gauge, rust-proof aluminum
5. Commercial-Grade Post, 2 lb./ft. steel. Powder coated.

B. Color:

1. Powder coated: Black

2.15 PET SHOWER (SKILTON AVENUE)

A. Pet Shower as detailed on the plans and shall include the following:

1. Pet Shower to be rectangular and have Push Button Activation. Unit shall be pre-piped and hydrostatically tested.

B. Materials:

1. Valves shall have internally mounted metering valve, pushbutton operated and requiring less than 5 pounds of force to activate. Timing shall be adjusted from 5 to 60 seconds.
2. Shower heads shall be chrome plated brass with 2.5 gpm flow restrictor and include an adjustable spray pattern from a coarse stream to a fine mist.
3. Unit shall be constructed of heavy duty 14 gauge type 304 stainless steel polished to a corrosion and scratch resistant stain finish with vandal resistant fasteners and shall include a ¼” thick stainless steel bottom plate, providing secure mounting for shower.

C. Color:

1. Powder coated Black

2.16 TREE GUARD (SKILTON AVENUE)

A. Materials:

1. Cast components will be of 100% recycled aluminum: ASTM B261

2. Castings will be squared and flat, free of burrs, slag, air pockets, blow holes, flashing, and grinding or welding on exposed surfaces. Excessive warping or shrinkage is not acceptable.
3. Fabricated components will be mild carbon steel, ASTM A36
4. Fabrication will be true to square, or diameter and sized within 1/8"

B. Finishes:

1. All visible welds to be ground smooth on outside edges.
2. Finish to be powder coat, Black, and applied per UA specifications.

2.17 LIGHTED BOLLARD (SKILTON AVENUE)

A. Materials:

1. Flat Top Cap: One-piece sand-cast, secured to louvers by concealed allen screws in keyhole slots. For relamping access, allen screws shall not require complete removal.
2. Louvers: Aluminum die-cast.
3. Shaft: One-piece extruded aluminum, .with a heavy cast aluminum twist-lock anchor base concealed within the shaft. Concealed set screws shall lock shaft onto the cast anchor base.
4. Electronic Module: All electrical components are either UL or ETL recognized, mounted on a single plate and factory prewired with quick disconnect plugs. Driver is rated for -40°F starting and has a 0-10V dimming interface for multi-level illumination options.
5. Optical Module: Each LED equipped with a directional optic for maximum beam angle projecting through louver stack spacing. LED boards to be mounted to an anodized interlocking heat sink extrusion. (Type I) two 5-LED boards for a total of 10-LED. (Type III) three 5-LED boards for a total of 15-LED. (Type V) four 5-LED boards for a total of 20-LED. Available in 580nm Amber, 3000K, 4200K and 5100K color temperatures.
6. Anchor Bolts: Four C" x 10" + 2" zinc plated L-hooks, each with two nuts, washers and a rigid pressed board template.

B. Finishes

1. Fade and abrasion resistant, polyester powdercoat finish.

C. Color

1. Dark Bronze

PART 3 - EXECUTION

3.1 BENCHES (COMMUNITY PATH)

- A. Community Path Benches shall be installed in accordance with the contract drawings, as per manufacturer's instructions and approved shop drawings.
- B. The concrete pad for benches shall slope at a ½ percent slope or crown from the center to the edges to eliminate any wet spots. The pad shall have a brushed finish.
- C. Benches shall be surface mounted to the concrete pad with anchor bolts as per manufacturer's recommendations and approved shop drawings.

3.2 BENCHES (SKILTON AVENUE)

- A. Examination:
 - 1. Examine areas to receive benches.
 - a. Verify that substrates are stable and capable of supporting the weight of items covered under this section.
 - b. Verify that substrates have been adequately prepared to securely anchor those items that will be surface mounted.
 - c. Notify Owner of conditions that would adversely affect installation or subsequent use.
 - d. Do not begin installation until unacceptable conditions are corrected.
- B. Installation:
 - 1. Install benches in accordance with manufacturer's instructions at locations indicated on the Drawings.
 - 2. Install benches level.
 - 3. The concrete pad for benches shall slope at a ½ percent slope or crown from the center to the edges to eliminate any wet spots. The pad shall have a brushed finish.
 - 4. Benches shall be surface mounted to the concrete pad with anchor bolts as per manufacturer's recommendations and approved shop drawings.
- C. Adjusting:
 - 1. Finish Damage: Repair minor damages to finish in accordance with manufacturer's instructions and as approved by the Owner.
 - 2. Component Damage: Remove and replace damaged components that cannot be successfully repaired as determined by the Owner.
- D. Cleaning:
 - 1. Clean benches promptly after installation in accordance with manufacturer's instructions.
 - 2. Do not use harsh cleaning materials or methods that could damage finish.

- E. Protection:
 - 1. Protect installed benches to ensure that, except for normal weathering, benches will be without damage or deterioration at time of Substantial Completion.

3.3 TRASH RECEPTACLES (COMMUNITY PATH)

- A. Community Path Trash Receptacles shall be installed in accordance with the contract drawings, as per manufacturer's instructions and approved shop drawings.
- B. The concrete pad for trash receptacles shall slope at a ½ percent slope or crown from the center to the edges to eliminate any wet spots. The pad shall have a brushed finish.
- C. Trash Receptacles shall be surface mounted to the concrete pad with anchor bolts as per manufacturer's recommendations and approved shop drawings.

3.4 SIGNS (COMMUNITY PATH)

- A. Before fabricating the sign support structures, the Design-Builder shall submit erection plans and shop drawings for approval. Span lengths, post heights, vertical and horizontal clearances, material specifications, anchor bolt layout, and all pertinent information shall be included in the shop drawings.
- B. Locate signs and accessories where indicated, using mounting methods of types described and in compliance with manufacturer's written instructions and approved shop drawings.
 - 1. Install signs level, plumb, and at heights indicated, with sign surfaces free from distortion and other defects in appearance.
 - 2. Strictly comply with approved shop drawings and manufacturer's instructions and recommendations, except where more restrictive requirements are specified in this Section.
 - 3. Signs on the viaduct shall be mounted on chain link fence frame supports over the path as indicated on the drawings. Mounting frame shall be attached to the security fence.

3.5 SOLAR-POWERED EMERGENCY CALL BOXES (COMMUNITY PATH)

- A. Emergency Call Boxes At-Grade
 - 1. At-grade Emergency Call Boxes shall be installed at the locations shown on the drawings in accordance with manufacturer's instructions and approved shop drawings.
 - 2. Call Box Terminal Foundation shall be installed as per Signal Communications Corp. Drawing No. 1000-0436-4 Typical Foundation Installation.
 - 3. Solar Panel shall be mounted to the top of the mounting pole at the appropriate orientation to the sun to receive sufficient sun exposure for maximum charging of the call box. Submit shop drawings detailing solar panel attachment to pole for approval.
 - 4. Antennae shall be mounted on top of the mounting pole as per manufacturer's instructions and approved shop drawings.

5. Concrete foundation for call boxes shall be designed to meet MassDOT requirements, the foundation shall slope at a ½ percent slope or crown from the center to the edges to eliminate any wet spots. Depth of concrete footing shall be 4'-0" minimum.
6. Height and installation of call boxes shall meet all ADA requirements.

B. Emergency Call Boxes on Viaduct

1. Emergency Call Boxes on the viaduct shall be installed at the locations shown on the drawings in accordance with manufacturer's instructions and approved shop drawings. Boxes shall be side mounted to the mounting pole as per approved shop drawings.
2. Call Box Terminal Foundation shall be installed as per Signal Communications Corp. Drawing No. 1000-0436-4 Typical Foundation Installation except that the foundation shall be the 12 inch wide parapet wall. Coordinate installation of call boxes on viaduct with other trades as required.
3. Solar Panel shall be mounted to the top of the mounting pole at the appropriate orientation to the sun to receive sufficient sun exposure for maximum charging of the call box. Submit shop drawings detailing solar panel attachment to pole for approval.
4. Antennae shall be mounted on top of the mounting pole as per manufacturer's instructions and approved shop drawings.
5. Height and installation of call boxes shall meet all ADA requirements.

- C. Testing and Coordination with the City of Somerville: Test the individual call boxes in a coordinated program with the City of Somerville and the Owner. Make adjustments until the installation is satisfactory to all parties.

3.6 STEEL BOLLARDS (COMMUNITY PATH)

- A. Bollards shall be set vertically plumb and securely anchored in cement concrete footings as shown on the drawings and as per approved shop drawings. Align bollards to the lines and grades indicated on the Plans. Install bollards in a vertical position, maintaining a consistent height of 39 inches above grade. The Design-Builder will be required to coordinate the sequence of operation in planning footings and installation of surrounding pavement so bollards are not damaged or impacted from grading or paving operations.
- B. Fixed bollards shall be fixed and embedded into a concrete footing as per drawings and approved shop drawings.
- C. Removable bollards shall be inserted into a steel tube sleeve 3'-0" long embedded into concrete footing and shall be equipped with a hinged locking device as indicated on the drawings. Locking device shall be embedded into concrete and shall be hinged so that when the bollard is removed, the locking device will be flush with the pavement. Install removable bollards as per details and approved shop drawings.
- D. All welds shall be ground smooth.
- E. Painting

1. Bollards shall be phosphate washed, primed with zinc rich primer, and painted with exterior grade polyester powder coat prior to being delivered to the site.
 2. After installation of bollards, provide touch-up painting, if necessary, as approved by the Owner.
 3. Follow the provisions of Section 09900 – PAINTING.
- F. Protect bollards from paint spatter, concrete splashes and other construction damage by wrapping in plastic sheeting or heavy craft paper and taping in place. Do not remove until adjacent work is completed. Repair any damage to painted finish.

3.7 COBBLESTONE (COMMUNITY PATH)

- A. Preparation of Subgrade: The Design-Builder shall trim and roll the subgrade to smooth, uniform lines to the satisfaction of the Owner, prior to placing the pavement.
- B. Concrete Base: Shall be installed as shown in the details and shall be as described in Section 901 CEMENT CONCRETE MASONRY of the MassDOT Standard Specifications.
- C. Expansion Joints: Shall be thirty (30) feet O.C. typical.
- D. Mortar Bed: Spread mortar over concrete base to the thickness indicated on the drawings.
- E. Setting Cobbles: All cobbles shall be clean when placed. The cobbles shall be carefully laid according to the patterns shown on the drawings or as directed by the Owner. Joints between cobbles shall be a maximum of one half inch (1/2”) and a minimum of one-quarter inch (1/4”) in width. Cutting of cobbles to meet pattern requirements will be permitted, subject to the approval of the Owner. Cobbles shall be laid so that there are no depressions exceeding one-quarter inch (1/4”). Correct any depressions exceeding one-quarter inch (1/4”) by lifting cobbles to bring to proper grade. All stones disturbed in making replacements or correcting depressions shall be settled into place by carefully ramming or tamping to grade by the use of a hand tamper applied upon a two inch (2”) board. Each section of pavement must be acceptable to the Owner before the joints in that section are filled.
- F. Filling Joints: Joints shall be completely filled with a cement grout mixture of one part Portland cement and two parts sand. The grout shall be firmly packed in the joints between cobbles. Immediately after the joints are filled, the pavement shall be cleaned. The finished surface shall be free of all cement stain and excess grout and shall be acceptable to the Owner.

3.8 INLAID PREFORMED THERMOPLASTIC ASPHALT PAVEMENT MARKING SYSTEM

- A. Application of Inlaid Preformed Thermoplastic Asphalt Pavement Marking System
 1. Manufacturer Certified Applicator Requirement: The material shall be supplied and applied only by an applicator certified by the manufacturer. The applicator shall provide proof of current certification before commencing work. The Certified Applicator shall follow the manufacturer’s current published application guidelines.
 2. Substrate Condition: The material must only be applied to a stable, high quality asphalt pavement substrate over a stable base that is free of defects, as per the manufacturer’s published

substrate guide. The asphalt pavement surface shall be dry and free from all foreign matter, including but not limited to, dirt, dust, de-icing materials, and chemical residue.

3. Procedure: The asphalt pavement surface is heated with the primary reciprocating infrared heater to the appropriate temperature range to allow for surface imprinting. The stamping template in the specified pattern is imprinted into the heated asphalt pavement using the 700-900 lb. vibratory plate compactor. The preformed thermoplastic sheets, precut at the factory by the material manufacturer to match the template pattern, are laid into the pattern created by the stamping template, and heated until thoroughly molten with the primary reciprocating infrared heater. The mobile infrared heater or approved propane heat torch may be used in areas inaccessible to the primary reciprocating infrared heater. The material is then allowed to cool thoroughly before being opened to vehicle or pedestrian traffic. (Consult the manufacturer's published application procedures for complete information.)
4. The inlaid preformed thermoplastic asphalt pavement marking system shall not be applied to Portland Cement Concrete.

3.9 LOW- MOW SEED MIX

- A. Seeding Period: Optimum time for seeding is between August 20th and October 20th. To reduce weed competition and improve chances of establishment, it is recommended that, if possible given contract limitations, seeding be done at this time. Otherwise, seeding shall be between March 15th and May 15th. Seeding outside of this period shall be as approved by the Owner. Seeding outside of the specified time without prior approval shall not be compensated.
- B. Unless otherwise directed by the supplier, installation shall be as follows:
 1. Site Preparation: Area shall be seeded immediately following placement and preparation of loam so as to reduce the chance of weed seeds establishing. Seeding shall take place within 3 days of soil preparation, depending on weather conditions. Seeding 7 days or more after site preparation or if weeds are already established shall require the Design-Builder to submit a plan of action to ensure removal of weeds prior to seeding. Owner shall approve site conditions prior to seeding.
 2. Seeding: Unless otherwise specified by the supplier, seeding shall be at the rate of 5 lbs. per 1,000 square feet and shall be as follows:
 - Seed shall be brought to the site in unopened bags for approval by the Owner. Owner shall collect certification from bag prior to opening bag and prior to any seeding activity. Seeding without approval of the Owner shall be considered unacceptable for payment. Certification list shall match species and percentages of submittal.
 - Apply seed with broadcast spreader or drop seeder.
 - Cover the seed with 1/8 to 1/4 inch of soil.
 - Firm the seed into the soil by rolling with a roller, cultipacker, or similar implement.
 - Mulch with approximately one inch of weed free straw such as winter wheat or marsh hay.
 3. Watering: Watering is essential for establishment, increasing germination rates and seedling survival. Seeds shall be watered every other morning for 15 to 30 minutes during the first four to six weeks after planting, except during rainy days. Once established, seed should be watered

only during dry periods. Design-Builder shall notify Owner prior to or after watering so that the site may be inspected if necessary.

4. Overseeding: Bare patches shall be overseeded in the fall (best by end of September). Rake seed into top ½ inch of soil with steel rake where this does not disturb existing lawn. Seed at a rate of ½ pound per 100 square feet, Mulch lightly with hay.
 5. Compost: If seed fails to germinate or coverage is poor due to poor soil conditions, ½ inch of finish compost shall be spread over lawn prior to re-seeding.
 6. Mowing: It is recommended that Low Mow/No Mow turf be mowed to a height no lower than 3 inches from the ground.
- C. Inspection: Seeding shall be inspected 45 days after completion of seeding to assess establishment of the seeded species. Acceptance shall be based on adequate coverage of the seeded species (no bare spots greater than approximately 6 inches in diameter) and adequate weed control. Weed species shall not comprise more than 10% of the seeded area.

3.10 PARKING BUMPER CURBS

- A. Parking Bumper Curbs shall be installed as per manufacturer's recommendations and as detailed on the drawings and approved shop drawings.

3.11 LOW RETAINING WALLS (MAINTENANCE FACILITY SITE)

- A. As shown and detailed on the Plans, complying with the requirements of Section 02359, MODULAR PRECAST BLOCK RETAINING WALLS, and as directed by the Resident Engineer, install low height retaining walls on the site.

3.12 SHELTER (SKILTON AVENUE)

- A. Erection
1. Installation:
 - a. Install all foundations and anchor bolts according to manufacturer's installation instructions and these specifications.
 2. General Contractor:
 - a. Design-Builder shall coordinate the construction of the shelter with all other building trades impacted.
 3. Tolerances:
 - a. Tolerances on steel structural members are set according to AISC construction practices, abided in the factory, and cannot be increased. No field slotting or opening of holes will be allowed. It is therefore essential that Design-Builders conform to the tolerances specified on the installation drawings for anchor bolt or column layout details.
 4. OSHA Compliance:
 - a. OSHA Compliance to Steel Erection Standard 29CFR 1926 Subpart R-Steel Erection.
- B. Repair
1. Do not attempt any field changes without first contacting manufacturer.

C. Field or Site Quality Control

1. Field or Site Tests and Inspections as required by the Owner or by the local building inspector.

3.13 BARRIER-FREE FOUNTAIN (SKILTON AVENUE)

- A. Barrier-Free Fountain shall be installed in accordance with the contract drawings, as per manufacturer's recommendations and approved shop drawings.

3.14 DOG WASTE STATION (SKILTON AVENUE)

- A. Dog Waste Station shall be installed in accordance with the contract drawings, as per manufacturer's recommendations and approved shop drawings.

3.15 PET SHOWER (SKILTON AVENUE)

- A. Pet Shower shall be installed in accordance with the contract drawings, as per manufacturer's recommendations and approved shop drawings.

3.16 TREE GUARD (SKILTON AVENUE)

- A. Tree Guard shall be installed in accordance with the contract drawings, as per manufacturer's recommendations and approved shop drawings.

3.17 LIGHTED BOLLARD (SKILTON AVENUE)

- A. Lighted Bollard shall be installed in accordance with the contract drawings, as per manufacturer's recommendations and approved shop drawings; Design-Builder shall coordinate work with electrical contractor.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02509

PAVEMENT BASE COURSES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the construction of base courses for bituminous pavements on prepared subgrades to the lines, grades, compacted thickness, and cross sections indicated.
- B. Related Work:
 - 1. Section 02100 - SITE PREPARATION
 - 2. Section 02196 – GEOTEXTILE MATERIALS
 - 3. Section 02400 – DRAINAGE AND SEWER SYSTEMS
 - 4. Section 02300 – EARTHWORK
 - 5. Section 02513 - BITUMINOUS CONCRETE PAVEMENT
 - 6. Section 02524 – CURBS, GUTTERS AND WALKS

1.2 REFERENCE STANDARDS

- A. American Society for Testing and Materials (ASTM)
- B. Commonwealth of Massachusetts, Massachusetts Department of Transportation (MassDOT) Standard Specifications for Highways and Bridges (Latest Edition).

1.3 SUBMITTALS

- A. Submit the following under provisions of Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
 - 1. See 2.1.C below.

1.4 QUALITY ASSURANCE

- A. General: Design-Builder shall establish and maintain quality control for operations under this section to assure compliance with contract requirements and maintain records of his quality control for all materials, equipment, and construction operations.
- B. The services of qualified inspection and testing agencies shall be used for this work.
- C. Testing: Design-Builder shall arrange for services of a commercial laboratory for material and compaction testing. Design-Builder shall coordinate and cooperate with testing lab to insure timely completion of required tests.

- D. Laboratory Maximum Density: Tests shall be made in accordance with ASTM D 1557 for each type of material to be used on Project to determine optimum moisture content and laboratory maximum density values.
- E. Materials Analysis: Aggregate base material shall be tested per ASTM D 422.
- F. The MBTA reserves the right to perform inspections and testing at the plant and in the field at any time during the execution of work.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Base courses shall conform to the requirements of Section M2.01 of the MassDOT Standard Specifications for Highways and Bridges (Latest Edition). Each stone size shall meet its respective gradation as tabulated below:

**GRADATION REQUIREMENTS FOR COARSE AGGREGATE
(PERCENT BY WEIGHT)**

Nominal Size of Stone Sieve Size	Stone Sizes					
	2 in.	1-1 /2 in.	1-1 /4 in.	3 /4 in.	1 /2 in.	3 /8 in.
2-1/2"		100				
2"	90-100	100				
1-1/2"		95-100	100			
1-1/4"	25-50		85-100			
1"		35-70		100		
3/4"	0-15	0-25	10-40	90-100		
5/8"					100	
1/2"	0-5		0-8	10-50	85-100	100
3/8"				0-20	15-45	85-100
No. 4				0-5	0-15	20-50
No. 8					0-5	0-15
No.16						0-5

- B. Filter fabric: Provide filter fabric where indicated on Contract Documents.
- C. Prior to constructing the base course, Design-Builder shall submit the proposed plants, equipment, and material sources for approval.

PART 3 - EXECUTION

3.1 SUBGRADE

- A. The preparation of the subgrade shall be in accordance with specifications section 02300 - EARTHWORK, and the relevant provisions of Section 400 of the MassDOT Standard Specifications.

3.2 TRANSPORTATION OF MATERIALS

- A. Handle and transport mixed base materials in a manner that minimizes segregation and loss of moisture. Cover all loads in accordance with State laws unless hauling is off road and is approved. Unless approved, do not dump material into piles, haul over the completed base course, or stockpile the material on the job site.

3.3 INSTALLATION

- A. General Requirements: aggregate base shall be constructed to lines and grades indicated on Drawings. When constructed in more than one layer, first layer shall be cleaned of loose and foreign matter by sweeping with power sweepers or power brooms, except that hand Brooms may be used in areas where power cleaning is not practicable. Adequate drainage shall be provided during entire period of construction to prevent water from collecting or standing on the area to receive aggregate base. Line and grade stakes shall be provided as necessary for control. Grade stakes shall be in lines parallel to centerline of area under construction and suitably spaced for string lining.
- B. High Early Strength Cement Concrete shall be used in areas of roadway widening of six (6) feet or less in width. The cement concrete shall be set to a depth as shown on the plans or established by the MBTA. The top of the cement shall be set to allow for placement of pavement to match the adjacent roadway.
- C. Limit excavation for widening to an area that can be backfilled the same working day using graded aggregate base. Maintain the temporary graded aggregate base wedge with a 4:1 or flatter fill slope. Compact the material as directed. Leave the graded aggregate base wedge in place until placement of the hot mix asphalt base.
- D. Weather limitations: Base shall not be constructed when atmospheric temperature is less than 35°F. Base shall not be constructed on frozen subgrades or subgrade containing frost. If temperature falls below 35° F, completed areas shall be protected against any detrimental effects of freezing.
- E. Compaction: Compact graded aggregate base, bank run gravel base, and sand aggregate base to at least 97 percent of the maximum dry density. Compact graded stabilized aggregate base to at least 95 percent of the maximum dry density. Measure in place density per MSMT 350 or 352. Begin compaction operations, except on superelevated curves, at the sides of the course. Overlap the shoulder or berm at least 1 ft and progress toward the center parallel to the center line of the roadway. On superelevated curves, begin compaction at the low side and progress toward the high side. Continue compaction operations until all compaction marks are removed.
- F. Moisture and Dust Control Agents. When specified, add calcium or magnesium chloride at the plant or apply it to the surface of the material at the project site. Apply calcium chloride at the rate of 1

lb/yd². Apply magnesium chloride at the rate of 1 lb/yd² or as a solution at the rate of 1/2 gal/yd². Finishing: Surface of top layer shall be finished to grade and cross section shown. Finished surface shall be of uniform texture. Light blading during compaction may be necessary for finished surface to conform to lines, grades, and cross sections. If surface for any reason become rough, corrugated, uneven in texture, or traffic marked prior to completion, such unsatisfactory portion shall be scarified, reworked, recompacted, or replaced as directed.

3.4 FIELD TESTING AND PROTECTION

- A. In-Place Density: Field in-place density shall be determined in accordance with ASTM D 1556. Areas not meeting specified compaction requirements shall be reworked as recommended by testing lab and retested until specified compaction is obtained.
 - 1. Tests shall be performed as follows: Aggregate Base - Two (2) tests per lift
- B. Samples: Samples of all materials imported to site for use on Project shall be submitted to or taken by testing lab for testing as specified herein. Copies of all test reports shall be approved by Engineer prior to importing any materials to site.
- C. Defects: Settlement is considered to be among defects to be corrected. Design-Builder shall repair all defects and replace any permanent construction items disturbed by corrective measures at no additional cost to Owner.
- D. Smoothness: Surface of each layer shall show no deviations in excess of 3/8 inch when tested with 10-foot straightedge. Deviations exceeding this amount shall be corrected by removing material and replacing with new material, or by reworking existing material and compacting, as directed.
- E. Thickness: Compacted thickness of the aggregate base course shall be within 1/2 inch of the thickness indicated. Where measured thickness is more than 1/2 inch deficient, such areas shall be corrected by scarifying, adding new material of proper gradation, reblading, and recompacting as directed. Where thickness measures more than 1/2 inch thicker than indicated, course shall be considered as conforming to specified thickness requirements. Average job thickness shall be average of all thickness measurements taken for the job, but shall be within 1/4 inch of thickness indicated.
- F. Traffic: Completed portions of base course area may be opened to traffic provided there is no marring or distorting of the surface. Heavy equipment shall not be permitted except when necessary to construction, and then area shall be protected against marring or damage to completed work.
- G. Protection: Aggregate base course shall be maintained in satisfactory condition until accepted. Maintenance shall include immediate repairs to any defects and shall be repeated as often as necessary to keep area intact.

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection therewith are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

END OF SECTION

SECTION 02513

BITUMINOUS CONCRETE PAVEMENT

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

- A. Work Included: This Section specifies the following items.
1. Construction of bituminous concrete pavement on prepared subgrade or aggregate subbase or base course, and on existing pavement, and for the base course for unit pavers; to the lines, grades, compacted thickness, and cross sections indicated.
 2. Construction of SUPERPAVE Hot Mix Asphalt (HMA) Pavement on prepared subgrade or aggregate subbase or base course to the lines, grades, compacted thickness, and cross sections indicated at locations shown on the plans. Work under SUPERPAVE Items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) SUPERPAVE REQUIREMENTS contained herein and the following:
 - a. The Equivalent Single Axle Loads (ESALs) for Shared Use Paths, Sidewalks, Driveways, and Small Parking Lots over a 20-year period, is <0.3 Million 18-kip (80-kn) ESALs.
 - b. The Equivalent Single Axle Loads (ESALs) for Large Parking Lots and Local Roads, over a 20-year period, are estimated to be between 0.30 and <3.0 Million 18-kip (80-kn) ESALs. (examples include: Horace Street, Tufts Street)
 - c. The Equivalent Single Axle Loads (ESALs) for the design travel lane of Local Roads over a 20-year period are estimated to be between 3.0 and <10 Million 18-kip (80-kn) ESALs. (examples include: Water Street, East Street, and West Boulevard)
 - d. The Equivalent Single Axle Loads (ESALs) for the design travel lane of Arterials and Collectors over a 20-year period are estimated to be between 10 and <30 Million 18-kip (80-kn) ESALs. (examples include: Washington Street and Medford Street)
 - e. Any pavement section anticipated to receive bus or truck traffic shall be a minimum of a traffic level 3 design (3.0 to <10 Million 18-kip (80-kn) ESALs.
 - f. If the traffic volume or functional classification is unknown or in disagreement, the ESALs shall be determined by the MBTA.

Functional Classifications, as described above, shall be obtained from the MassDOT road inventory map, as applicable: <http://services.massdot.state.ma.us/maptemplate/roadinventory/>

The PGAB Grade selected for this Contract is *PG 64-28*.

3. Constructing a Microsurfacing Surface Treatment Course to the lines, grades, compacted thickness, and cross sections indicated at locations shown on the plans.

4. Milling of existing bituminous concrete pavement surface to various depths and cross slope to produce a uniform surface for the application of the pavement overlay, as shown on the Approved Plans and as directed by the MBTA, and the legal disposal of the removed material off the site.
5. Micromilling of existing bituminous concrete pavement surface to various depths and cross slope as shown on the Approved Plans and as directed by the MBTA, and the legal disposal of the removed material off the site.
6. Construction of Bituminous Concrete Berm.

B. Related Work:

1. Section 02300 - EARTHWORK; excavation and compacted subgrade.
2. Section 02509 - PAVEMENT BASE COURSES
3. Section 02524 - CURBS, GUTTERS AND WALKS
4. Section 03300 - CAST-IN-PLACE CONCRETE

1.2 QUALITY ASSURANCE

- A. The MBTA reserves the right to perform inspections and testing at the plant and in the field at any time during the execution of work.
- B. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

1.3 QUALITY CONTROL

- A. The Design-Builder shall engage the services of a qualified independent testing agency approved by the Authority to perform quality-control testing in the field.
- B. Job Mix Formulae – SUPERPAVE HMA Pavement
 1. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.
- C. Job Mix Formulae – Bituminous Concrete Pavement (not SUPERPAVE)
 1. The composition limits specified in Table 02513-C at the end of this Section are master ranges of tolerances of materials in general. In order to obtain standard texture, density, and stability, furnish to the MBTA for approval a specific job mix formula for the particular uniform combination of materials and sources of supply to be used on each project. Establish the job mix formula in accordance with the requirements of the Massachusetts Department of Transportation (MassDOT) Standard Specifications Section M3.
 2. Should a change of sources of materials be made, furnish a new job mix formula for approval before using the new material.
 3. Two or more job mix formulae may be approved for a particular plant; however, only material conforming to one job mix formula will be permitted to be used on any given day. If the

Design-Builder elects to furnish bituminous concrete from more than one plant, the job mix formulae shall be adhered to by all plants.

4. When unsatisfactory results or other conditions make it necessary, the MBTA may establish new job mix formulae.

D. Job Mix Formulae – Microsurfacing

1. The job mix formula shall provide a minimum Marshall stability of 1,800 pounds and a flow of 6 to 16 units when tested according to the ASTM 1559 or AASHTO 245 procedure as modified. All component material used in the mix design shall be representative of the material proposed by the Design-Builder for use on the project.

E. Methods of Sampling and Testing – SUPERPAVE HMA Pavement

1. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

F. Methods of Sampling and Testing – Bituminous Concrete Pavement (not SUPERPAVE)

1. Performance Graded Asphalt Binder

- a. Viscosity: ASTM D4402.
- b. Dynamic Shear: AASHTO TP5.
- c. Flash Point: AASHTO T48.
- d. Rolling Thin Film Over Test: AASHTO T240.
- e. Mass Change %: AASHTO T240.
- f. PAV Aging: AASHTO PP1.
- g. Specific Gravity: ASTM D 3142.
- h. Creep Stiffness and M-Value: AASHTO TP1.

2. Cutback Asphalt

- a. Viscosity: ASTM D 2170.
- b. Flash Point: ASTM D 3143.
- c. Distillation: ASTM D 402.
- d. Water in Asphalt: AASHTO T55.
- e. Specific Gravity: AASHTO T228.

3. Emulsified Asphalt: ASTM D 977.

4. Mineral Aggregates and Filler

- a. Sieve Analysis, Aggregates: ASTM C 136.
- b. Sieve Analysis, Mineral Filler: ASTM D 242.
- c. Unit Weight of Aggregate: ASTM C 29.
- d. Material Passing No. 200 Sieve: ASTM C 117.
- e. Abrasion of Coarse Aggregate: ASTM C 131.
- f. Soundness of Aggregates: ASTM C 88.
- g. Specific Gravity, Coarse Aggregate: ASTM C 127.
- h. Specific Gravity, Fine Aggregate: ASTM C 128.
- i. Specific Gravity, Mineral Filler: AASHTO T100 to T133

5. Bituminous Concrete Mixtures
 - a. Density: AASHTO T166.
 - b. Compaction: ASTM D 2950.

- G. Methods of Sampling and Testing – Microsurfacing Surface Treatment
 1. Materials
 - a. The Design-Builder will permit the MBTA to take samples of the aggregate and asphalt emulsion to be used in the project at the MBTA’s discretion. Gradation and sand equivalent tests may be run on the aggregate and residual asphalt content test on the emulsion. Test results will be compared to specifications. Tests will be run by a qualified laboratory at the expense of the buyer. The buyer must notify the Design-Builder immediately if any test fails to meet the specifications.
 2. Micro-Surfacing Mixture
 - a. Samples of the mixture should be taken daily and may be taken directly from the mixing unit(s). Consistency and residual asphalt content tests may be made on the samples and compared to the specifications. Tests will be run by a qualified laboratory at the expense of the buyer. The buyer must notify the Design-Builder immediately if any test fails to meet specifications.
 3. Non-Compliance
 - a. If any two successive tests fail on the stockpile material, the job shall be stopped. It is the responsibility of the Design-Builder, at his own expense, to prove to the MBTA that the conditions have been corrected. If any two successive tests on the mix from the same machine fail, the use of the machine shall be suspended. It will be the responsibility of the Design-Builder, at his own expense, to prove to the MBTA that the problems have been corrected and that the machine is working properly.

- H. Composition and Compaction Acceptance Tests– SUPERPAVE HMA Pavement
 1. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

- I. Composition and Compaction Acceptance Tests – Bituminous Concrete Pavement (not SUPERPAVE)
 1. Where plant inspection is maintained, bituminous concrete will be acceptable for use if the specified tests from samples obtained at the production plant indicate conformance to the approved job mix formula.
 2. For determination of pavement density, perform in-place density testing by the Nuclear Density Method, ASTM D 2950. The number of tests shall be determined by the MBTA QA lab.
 3. The MBTA may also require bituminous cores to determine in-place density.
 4. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

1.4 SUBMITTALS

- A. Submit the following under provisions of Volume 2 Technical Provisions Subsection 2.7 “Design Submittal Review Management” and Subsection 2.8 “Construction Submittal Requirements”.
 - 1. Product Data: For each material and manufactured product specified.
 - a. Submit manufacturer’s product data, installation instructions, use limitations and recommendations for each material used.
 - b. Provide certifications stating materials comply with requirements.
 - c. All work under SUPERPAVE HMA Pavement items shall also conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.
 - d. For Microsurfacing Surface Treatment the Design-Builder shall submit a signed mix design covering the specific material to be used on the project. This design shall be performed by a qualified laboratory. Once the materials are approved, no substitution will be permitted unless first tested and approved by the laboratory preparing the mix design

1.5 MAAB AND ADA COMPLIANCE

- A. Special attention is to be given to compliance with the American with Disabilities Act (ADA) and the requirements of the Massachusetts Architectural Access Board (MAAB).
 - 1. Slopes: All Walkways as defined by Section 22.1 of 521 CMR shall be graded to a maximum 4.5%. The cross pitch (perpendicular to travel) for all walkways and paths shall be constructed at 1.5% and the slope of all ramps shall be constructed at 7.5% with a construction tolerance of $\pm 0.5\%$. Ramps as defined in Section 24.1 of 521 CMR shall be constructed to a maximum slope of 8.33%.
 - 2. The Design-Builder is to assume that all sidewalk grades shall be verified/checked with a 2-foot long electronic ‘smart’ level.
 - 3. A 5-foot-0-inch minimum level (1.5% pitch maximum) area shall be provided at all entrances to buildings. Puddling of water at the entrances will not be allowed.
- B. The above requirements shall supersede the grades shown on the Approved Plans. If these requirements cannot be met with the grades shown on the plans, the designer shall be notified immediately for direction.

1.6 TEMPORARY PAVEMENT

- A. The Design-Builder shall place temporary bituminous concrete pavement in all trenches, construction access pits, and damaged pavement sections on a weekly basis for erosion and sediment control. Roadway patching shall be performed before any pavement milling. Additional roadway patching may be required to correct pavement defects made visible by the pavement milling.
- B. Temporary bituminous concrete pavement shall be used to provide temporary access and egress for vehicles and pedestrians to sidewalks and to those properties abutting the work area only as determined by the MBTA. The subsequent removal of this material, if directed by the MBTA, shall also be included in this item.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Performance Graded Asphalt Binder: AASHTO M320, grade as indicated, except that the requirements listed under Table 02513-A shall apply.
- B. Cutback Asphalts
 - 1. Medium-Curing: AASHTO M82, grade as indicated.
- C. Bituminous Emulsions
 - 1. Asphaltic Emulsions: AASHTO M140, grade as indicated. Use grade RS-1 for prime coat or tack coat.
 - 2. Cationic Emulsified Asphalt: AASHTO M208, grade as indicated.
 - 3. Clay-Type Asphalt Emulsion: A mineral colloid type of asphalt emulsion containing no chemical emulsifiers and meeting the following requirements:
 - a. Percent water, per AASHTO T59: 40 to 55
 - b. Percent residue by evaporation, per AASHTO T59: 45 to 60
 - c. Percent ash in residue, per ASTM D1010: 5 to 15
 - d. Curing time, per Massachusetts DPW standard test procedures: firm set in 48 hours maximum
 - e. Resistance to water, per Massachusetts DPW standard test procedures: no re-emulsification.
 - 4. Protective Seal Coat Emulsion: a homogeneous emulsion consisting of coat tar pitch dispersed in water by means of a mineral colloid, containing no asphaltic materials or chemical emulsifiers; capable of overcoming any separation or coagulation of its components by moderate stirring; meeting the following requirements:
 - a. Percent Water, per AASHTO T59: 50 maximum
 - b. Percent non-volatile matter, per ASTM D1010: 48 minimum
 - c. Percent ash in non-volatile matter, per ASTM D1010: 20 to 45
 - d. Percent solubility on non-volatile matter in carbon disulfide: 40 minimum
 - e. Resistance to water, per ASTM D466: no blistering, loss of adhesion, or re-emulsification
 - f. Resistance to petroleum solvents, per ASTM D466 with solvents substituted for water: no penetration nor loss of adhesion.
- D. Asphalt Anti-Stripping Additive
 - 1. General: An additive to asphalt to assist in the coating of wet aggregate and to increase the resistance of the bituminous coating to stripping in the presence of water; shall be chemically inert to asphalt (heat stable) and when blended with asphalt shall withstand storage at a temperature of 400 degrees F for extended periods without loss of effectiveness.
 - 2. Composition: An organic chemical compound free from inorganic mineral salts or inorganic mineral soaps, containing no ingredient harmful to the bituminous material or to the operator, and not appreciably altering the specified characteristics of the bituminous material; chemically inert to asphalt.

3. Heat Stability: The compound shall retain its effectiveness after heating in asphalt according to the prescribed method for 24 hours at 350 degrees F.
4. Resistance to Stripping. Treated Bitumen shall coat wet aggregate and shall retain at least 90 percent of the coating after 24 hours of static immersion. There shall be no loss of the retained coating after the immersion has been extended to one week.

E. Coarse Aggregate

1. General: Clean, crushed rock consisting of the angular fragments obtained by breaking and crushing shattered natural rock, free from a detrimental quantity of thin or elongated pieces, and free from dirt or other objectionable materials; having a percentage of wear of not more than 30; surface dry and having a moisture content of not more than 0.5 percent after drying. The use of crushed gravel stone will not be permitted.
2. Gradation: Blended from the stone sizes listed in Table 02513-B. Each stone size shall meet its respective gradation as tabulated in Table 02513-B. Sizes other than primary stone sizes may be used providing they are separately introduced on the cold feed belt and can be shown to be an improvement to the mix. Such usage shall require the prior written approval of the MBTA.

F. Fine Aggregate

1. General: Natural or stone sand or a blend thereof; or a blend of natural sand and stone screenings, or a blend of stone, sand and stone screenings;
 - a. Natural Sand: Clean, inert, hard durable grains of quartz or other hard durable rock, free of loam, clay, surface coatings or other deleterious substances.
 - b. Stone Sand: Process from the stone screenings, of either a primary or secondary crusher to produce a product that when used alone or blended in any combination with natural sand shall meet the specified gradation requirements. Wash plant or other equipment used for processing stone sand shall be as accepted by the MBTA.

G. Mineral Filler: Portland cement, limestone dust, hydrated lime, stone float, or stone dust, 100 percent passing a No. 50 sieve and not less than 65 percent passing a No. 200 sieve. Stone dust shall be produced from crushed ledge stone and shall be the product of a secondary crusher so processed as to deliver a product of uniform grading.

H. Reclaimed Asphalt Pavement (RAP): Reclaimed Asphalt Pavement (RAP) shall consist of the material obtained from the highways or streets by crushing, milling, or planing existing hot mix asphalt pavements. This material shall be transported to the hot mix asphalt production facility yard and processed through an appropriate crusher so that the resulting material will contain no particles larger than the maximum aggregate size of the hot mix asphalt mixture in which it will be used. The material shall be stockpiled on a free draining base and kept separate from virgin aggregates. The material contained in the RAP stockpiles shall have a reasonably uniform gradation from fine to coarse and shall be protected from accumulation of excessive moisture and shall not be contaminated by foreign materials. The use of RAP will be permitted provided that the end product is in conformance with the approved job-mix formula. The proportion of RAP to virgin aggregate for base course mixtures and intermediate course mixtures shall be limited to a maximum of 40% for drum mix plants and 20% for modified batch plants. The maximum amount of RAP for surface course mixtures shall be 15%. The PG binder grade for mixes combining RAP shall be PG 64-28 if recycled binder content is 25% or less. If recycled binder content exceeds 25%, the PG binder grade shall be 52-34.

I. Bituminous setting-bed materials for unit pavers

1. Primer for Base: ASTM D 2028, cutback asphalt, grade as recommended by unit paver manufacturer.
2. Fine Aggregate for Setting Bed: ASTM D 1073, No. 2 or No. 3.
3. Asphalt Cement: ASTM D 3381, Viscosity Grade AC-10 or Grade AC-20.
4. Neoprene-Modified Asphalt Adhesive: Paving manufacturer's standard adhesive consisting of oxidized asphalt combined with 2 percent neoprene and 10 percent long-fibered mineral fibers containing no asbestos.
5. Sand for Joints: Fine, sharp, washed, natural sand or crushed stone with 100 percent passing No. 16 sieve and no more than 10 percent passing No. 200 sieve.
 - a. Provide sand of color needed to produce required joint color.

J. Bituminous setting-bed mix for unit pavers

1. Mix bituminous setting-bed materials at an asphalt plant in approximate proportion, by weight, of 7 percent asphalt cement to 93 percent fine aggregate, unless otherwise indicated. Heat mixture to 300 degrees Fahrenheit.

K. Bituminous Berm

1. Work under this item shall conform to the relevant provisions of MassDOT Standard Specification Section 470.

2.2 CLASS I BITUMINOUS CONCRETE MIXES - BITUMINOUS CONCRETE PAVEMENT (NOT SUPERPAVE)

- A. Provide Class I bituminous concrete mixtures composed of mineral aggregate, mineral filler if required bituminous material, and anti-stripping additive if required, proportioned as specified herein to conform to the composition by weight tabulated in Table 02513-C and in the approved job mix formulae.
- B. Use sufficient mineral filler to correct any deficiencies in grading of fine aggregate.
- C. Anti-stripping additive, if required, shall be incorporated and thoroughly dispersed in the bituminous material in an amount equal to the percent by weight established by the MBTA's Materials Testing Laboratory. This percent will be based on the efficiency of the additive as determined by laboratory tests. No modification of the established additive concentration will be permitted because of the use of hydrophobic aggregate. The MBTA reserves the right to establish as minimum the percentage of additive required. Blend additive in the refinery with the asphalt in the presence of the Inspector.
- D. The percentages stated herein and in Table 02513-C are stated as proportional percentages of integral total aggregate for the mix.
- E. Furnish Intermediate Course, with anti-stripping additive, for use as protective (bottom) course of pavements on bridges, and elsewhere as indicated.
- F. Furnish Patching Mix with one percent hydrated lime.

2.3 SUPERPAVE HMA PAVEMENT MIXES

SUPERPAVE HMA Pavement mixes shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein. And the following:

- A. Construction of SUPERPAVE Hot Mix Asphalt (HMA) Pavement on prepared subgrade or aggregate subbase or base course to the lines, grades, compacted thickness, and cross sections indicated at locations shown on the Approved Plans. Work under SUPERPAVE Items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) SUPERPAVE REQUIREMENTS contained herein and the following:
1. The Equivalent Single Axle Loads (ESALs) for Shared Use Paths, Sidewalks, Driveways, and Small Parking Lots over a 20-year period, is <0.3 Million 18-kip (80-kn) ESALs.
 2. The Equivalent Single Axle Loads (ESALs) for Large Parking Lots and Local Roads, over a 20-year period, are estimated to be between 0.30 and <3.0 Million 18-kip (80-kn) ESALs. (examples include: Horace Street, Tufts Street)
 3. The Equivalent Single Axle Loads (ESALs) for the design travel lane of Local Roads over a 20-year period are estimated to be between 3.0 and <10 Million 18-kip (80-kn) ESALs. (examples include: Water Street, East Street, and West Boulevard)
 4. The Equivalent Single Axle Loads (ESALs) for the design travel lane of Arterials and Collectors over a 20-year period are estimated to be between 10 and <30 Million 18-kip (80-kn) ESALs. (examples include: Washington Street and Medford Street)
 5. Any pavement section anticipated to receive consistent bus or truck traffic shall be a minimum of a traffic level 3 design (3.0 to <10 Million 18-kip (80-kn) ESALs.
 6. If the traffic volume or functional classification is unknown or in disagreement, the ESALs shall be determined by the MBTA.

Functional Classifications, as described above, shall be obtained from the MassDOT road inventory map, as applicable: <http://services.massdot.state.ma.us/maptemplate/roadinventory/>

The PGAB Grade selected for this Contract is PG 64-28.

B. Warm-Mix Asphalt Pavement

1. All SUPERPAVE Hot Mix Asphalt Mixture shall be modified using a WMA additive capable of lowering plant production temperatures to below 260° F. Warm Mix Asphalt additives reduce compaction effort and permit lower production temperatures than conventional hot mix asphalt. The WMA additive shall be a product listed on the Northeast Asphalt User Producer Group (NEAUPG) website (<http://www.superpave.psu.edu/NEAUPG.html>), except that no WMA foaming technology will be permitted which requires the mechanical injection of steam or water into the liquid asphalt.
2. The WMA additive must be compatible with polyphosphoric acid modified binders, polymer modified binders, and the HMA producer's HMA anti-stripping agents. The WMA additive shall be introduced in accordance with the Manufacturer's dosing rates and approved blending methods. The WMA additive Manufacturer shall have an on-site representative at the beginning of paving operations. The Manufacturer's representative shall be available for additional consultation during the remaining Warm Mix production.
3. All work done under this Item shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) SUPERPAVE REQUIREMENTS contained herein and the relevant provisions of Sections 450 and 455 of the MassDOT specifications. The WMA

mixture design shall incorporate the requirements of NCHRP Report 691: Mix Design Practices for Warm Mix Asphalt “*Draft Appendix to AASHTO R35, Special Mixture Design Considerations and Methods for Warm Mix Asphalt (WMA)*”. In addition to the provisions of Sections 450 and 455, laboratory prepared samples that have been manufactured at specified temperatures with and without the WMA additive shall be submitted to MassDOT at least 45 days prior to placement for testing. These samples shall be subject to Hamburg Wheel testing for moisture damage and rutting for verification that the WMA is at least equal in performance to the HMA. Preparation of these samples shall be coordinated with the MassDOT.

C. Latex Modification of HMA

1. Latex-modify the Superpave Surface Courses for Roadways and Bridges only.
2. The latex polymer modifier type and amount shall be included as part of the job mix formula. The Superpave Hot Mix Asphalt mixtures shall be produced with asphalt binder modification as follows:
3. Latex Polymer Modified Asphalt Binder:
 - a. The polymer additive shall consist of unvulcanized Styrene Butadiene Rubber (SBR) in liquid latex form, with a minimum quantity of rubber solids of 3% by weight of the performance grade asphalt binder (PGAB) content of the mix. The PG 64-28 shall be modified to produce a PGAB grade of 70-28.
 - b. Quantity: 3% rubber solids by weight of the bitumen content of the mix. (Example: If the latex polymer is 70% solids, weight per gallon is 7.69 lbs. = 5.38 lbs. solids per gallon. If mix calls for 6% bitumen, 3% = 3.6 lbs. of latex solids per ton mix or 0.70 gallons of latex per ton of mix.)
 - c. The latex polymer modified asphalt binder shall be injected into the mix at the time of manufacture. In a drum plant, the liquid latex polymer shall be pumped into the asphalt binder through a spud welded to the asphalt binder line just prior to where it enters the drum. The constant rate at which the latex polymer is pumped shall be determined by the mix speed of the drum. In a batch plant, the polymer is pumped directly into the mix five (5) seconds after the asphalt binder starts to dump into the pug mill. Mix time per batch after polymer is pumped in is 45 to 60 seconds.
 - d. The plant shall be equipped with an in-line blender and a sample cock for Quality Control and Acceptance purposes.
 - e. A metering system shall be attached to a printer which prints a time and date stamp, latex flow rate and cumulative polymer usage during the HMA production, allowing the MBTA to reference the injection rate and latex used against the plant’s projection rate. The printout shall be set for a five minute interval. The latex polymer manufacturer will have a professional representative available at the HMA plant during the first day of mix production and placement, and as required thereafter by the MBTA.
 - f. The manufacturer of the SBR latex shall provide certified test results for Styrene Butadiene ratio, total rubber solids percentage by weight, pH, ash content, and viscosity to the MBTA prior to mix production.
 - g. Mix conforming to the requirements of these Special Provisions shall be placed when the ambient temperature is 50°F and rising when measured in the shade away from artificial heat.
 - h. Mixing temperature shall be 290°F to 325°F unless otherwise specified by the MBTA. Mix shall be placed at between 275°F and 310°F.

2.4 MICROSURFACING MIXES

A. Emulsified Asphalt

1. The emulsified asphalt shall be a quick-set latex modified cationic type CSS-1H emulsion and shall conform to the requirements specified in AASHTO M208 and ASTM 2397. It shall pass all applicable storage and settlement tests. The latex shall be milled into the emulsion. The cement mixing test shall be waived for this emulsion.
 - a. Special Residue Properties:

Distillation of residue will be at a temperature of 350 degrees F for 20 minutes. Softening point of the residue shall be 140 degrees F minimum. Viscosity, absolute at 140 degrees F, shall be 8,000 poise minimum.

B. Aggregate

1. The mineral aggregate used shall be of the type and grade specified for micro-surfacing. The aggregate shall be manufactured crushed stone such as granite, slag, limestone, chat, or other high quality aggregate or combination thereof.
 - a. Aggregate Physical Requirements
 1. Grading. The aggregate including natural fines when tested by AASHTO methods T11 or T27 or ASTM C117 or C136, should meet the referenced gradation requirements.
 2. Deleterious Substances. To limit the permissible amount of clay like fines in an aggregate, a sand equivalent value of 65 or higher is required when tested by ASTM 2419.
 3. Soundness. The aggregate shall have a weighted loss of not more than 15% when the sodium sulfate test is used or 20% when the magnesium sulfate test is used.
 4. Hardness. The aggregate wear, from resistance to abrasion, shall be a maximum of 35% when using AASHTO T96 or ASTM C131 test methods.

C. Water

1. The water shall be potable and shall be free of harmful soluble salts.

D. Modifier

1. Special quick-setting emulsifier agents shall be milled into the asphalt emulsion. The emulsified asphalt shall be so formulated that when the paving mixture is applied at thickness of one inch with the relative humidity at not more than 50% and the ambient air temperature of at least 75 degrees F. the material will cure sufficiently so that rolling traffic can be allowed in one hour with no damage to the surface, as verified by the MBTA.

E. Additives

1. A mineral additive shall be introduced to the mineral aggregate and may be any recognized brand of non-air entrained portland cement or hydrated lime that is free of lumps, or other approved mineral additive. It may be accepted upon visual inspection. The amount of mineral additive needed shall be determined by the laboratory mix design and will be considered as part of the material gradation requirement. A liquid field control additive is introduced and blended

with water to provide effective control of the required quick-set properties. This additive shall be made available by the chemical supplier or emulsion manufacturer and certifiable as being compatible with the mixture.

F. Mix Design

1. The qualified laboratory shall develop the job mix design and present certified test results for MBTA approval. The MBTA shall approve the design mix and all micro-surfacing materials and methods prior to use. The component materials shall be within the following limits:

- a. Residual Asphalt 5% to 9% by dry weight of aggregate
- b. Mineral Additive 0.5% to 3% by dry weight of aggregate
- c. Latex Modifier As required to provide specified properties
- d. Field Control Additive As required to provide specified properties
- e. Water As required to produce consistency
- f. Aggregate - Recommended Gradations:

Screen Size	Type II % Passing	Type III % Passing
3/8"	100	100
#4	90-100	70-90
#8	65-90	45-65
#16	40-65	30-50
#30	25-45	19-34
#50	15-30	12-25
#100	10-21	7-18
#200	5-13	4-12

PART 3 - EXECUTION

3.1 PLANT REQUIREMENTS

A. General: The plant used in the production of bituminous concrete shall comply with AASHTO M156, subject to the following additional requirements.

B. Plant Scales

- 1. Scales for measuring materials into the mixtures shall be springless dial type and shall be of standard make and design. Scale graduations and markings shall be plainly visible and dials shall be so located as to be easily readable from the operator's normal work station by direct sight or through repeating dials. Parallax effects shall be reduced to the practical minimum with clearance between indicator index and scale graduations not exceeding 0.06 inch. Dials shall be equipped with a full complement of adjustable index pointers for marking the required weight of each material to be weighed into the batch.
- 2. Digital scales will be either electric/mechanical (load cell and lever system) or fully electronic (all load cell). Digital indicators shall be of standard make and design. Scale graduations and capacity shall be plainly visible on the faceplate of the indicator, if panel mounted. If the unit is of desktop or wall-mount variety, a data sticker shall be located on the side of the unit. Indicators must be located as to be easily readable from the operator's normal workstation by sight.

3. Bitumen scales shall be accurate to 0.05 percent, have minimum graduations not greater than 0.025 percent, and shall be readable and sensitive to 0.0125 percent or less. Scales for any weigh box or hopper shall be accurate to 0.5 percent, have minimum graduations not greater than 0.5 percent and shall be readable and sensitive to 0.25 percent or less. The preceding percentages for both bitumen and aggregate scales are based on the maximum total batch weight of the mixtures.

C. Testing of Scales

1. All plant scales, including truck scales, shall be tested at the expense of the Design-Builder by a competent scale technician as follows:
 - a. Annually prior to use in MBTA work.
 - b. At intervals of not more than 90 calendar days.
 - c. At any time ordered by the MBTA.
2. A cradle or platform approved by the MBTA for each scale and at least ten standard fifty-pound test weights shall be provided for testing scales whenever directed by the MBTA. The use of a set of test weights for two or more plants will be permitted only when they can be made readily available with no more than an hour's notice.

D. Automated Batching

1. Automatic proportioning. Batch type mixing plants shall be equipped with approved automatic proportioning devices. Such devices shall include equipment for accurately proportioning batches containing the various components of the mixture by weight in the proper sequence and for controlling the sequence and timing of mixing operations. Interlocks shall be provided which will hold or delay the automatic batch cycling whenever the batched quantity of any component is not within the specified weight tolerance, when any aggregate bin becomes empty or when there is a malfunction in any portion of the control system. The weight setting and time controls shall be so equipped that they may be locked when directed by the MBTA.
2. Automatic Recordation. Recordation equipment shall be provided. Each recorder shall include an automatic printer system. The printer shall be so positioned that the scale dial and the printer can be readily observed at one location by the plant inspector. Use of repeating dials or an additional printer to achieve this condition will be permitted. The printer shall print, in digital form, on a delivery ticket the following data:
 - a. Date mixed.
 - b. Time of batching.
 - c. Tare weight of aggregate weigh box.
 - d. Tare weight of bitumen weigh bucket.
 - e. Accumulative weights as batched for each bin. (Total of last bin will be aggregate total).
 - f. Weight of bitumen.
 - g. Total weight of mix in truck (Pay weight). This printed ticket shall be used in lieu of truck scale weights.
3. Equipment Failure. If at any time the automatic proportioning of recording system becomes inoperative, the plant will be allowed to batch materials manually for a period not in excess of two working days. Manual batching for longer periods will require written permission of the MBTA.
4. Batching Controls

- a. The batching controls shall meet the following delivery tolerances with respect to the various components weighed in each batch:
 1. Tare Weight of Aggregate Weigh Box: + 0.5 percent of total batch weight.
 2. Tare Weight of Bitumen Weigh Bucket: + 0.1 percent of total batch weight.
 3. Individual Aggregate Components: + 1.0 percent of total batch weight.
 4. Combined Aggregate Components: + 1.5 percent of total batch weight.
 5. Mineral Filler: + 0.5 percent of total batch weight.
 6. Asphalt: + 0.1 percent of total batch weight.
- b. The total weight of the batch shall not vary more than plus or minus 2 percent from the theoretical design weight.
- c. If directed by the Owner, provisions shall be made for locking controls against tampering.

E. Plant Laboratory

1. A building shall be furnished at the site of the producing plant suitable for the housing and use of equipment necessary to carry on the various tests required and for recording and processing test results. This building shall be for the exclusive use of the Owner or his representatives for testing and recording purposes.
2. The building shall have a minimum floor area of 100 square feet; the least dimension to be 6 feet. Windows and doors shall be adequately screened; satisfactory lighting, heating and water shall be supplied. A table, chairs, desk and work bench shall be provided. Provision shall be made for the safe performance of extraction test determinations by providing an adequate exhaust fan and suitable means of disposing of used solvent and other waste.
3. If the Owner permits, the plant laboratory may be part of another building in which case it shall be entirely partitioned off from the remainder of such building.
4. Testing equipment shall be furnished as follows and installed in the building for use in testing the materials and mixtures supplied by the Plant for the work:
 - a. One Approved Rotary Extractor.
 - b. One Coarse Aggregate Sieve Shaker, power driven with a minimum clear sieve area of 324 square inches. The shaker shall be attached to a firm anchorage.
 - c. One each of the following square opening screens for coarse aggregate shaker: 2 inch, 1-1/2 inch, 1 inch, 3/4 inch, 1/2 inch, 1/8 inch, No. 4 and No. 8.
 - d. One Fine Aggregate Sieve Shaker, power driven and independent of the coarse aggregate shaker, for eight inch minimum diameter sieves.
 - e. One each of the following standard eight inch minimum diameter square opening sieves: 3/4 inch, 1/2 inch, 3/8 inch, No. 4, No. 8, No. 16, No. 30, No. 50, No. 100, and No. 200, with pan and cover.
 - f. One Sample Splitter with a minimum capacity of one cubic foot. It shall be the clam shell type and the chute width shall be adjustable from a minimum of 1/2 inch up to 2 inches.
 - g. One Solution Balance, 20 kilogram capacity, weighing directly to 1 gram, with two weighing beams and a taring beam; tare capacity to be 2 kilograms; weighing beams to read 1000 grams by 100 gram divisions and 100 grams by 1 gram division. Additional matching weights (one 1 kg., two 2 kg., one 5 kg., and one 10 kg.) shall be provided to fulfill the capacity of 20 kilograms. The platform to be 11 inches in diameter.
 - h. One Approved Scale with a minimum capacity of 2000 grams and with a sensitivity of 0.50 grams
 - i. Two Approved Dial Type Thermometers, range 50 degrees F. to 500 degrees F.
 - j. One Approved Hot Plate

5. Approval of a plant will be contingent upon approval of the aforementioned requirements for Plant Laboratory, including the building and appurtenances, furnishings, facilities including heat, light, power and water, the testing equipment, and any other incidentals.
- F. Sampling facilities. Adequate and convenient sampling facilities shall be provided to allow the Inspector to obtain representative samples from the full width and depth of the discharge area of each aggregate bin. The sampling tray shall be structurally supported during the sampling operation. Access to the sampling facilities shall be provided requiring no more difficulty than that to climb a ladder leading to a secure platform with railings.
- G. Inspection. The Engineer or his authorized representative shall have access at any time to all parts of the plant for:
 1. Inspections of the conditions and operations of the plant.
 2. Confirmation of the adequacy of the equipment in use.
 3. Verification of the character and proportions of the mixture.
 4. Determination of temperatures being maintained in the preparation of the mixtures.
 5. Inspection of incidental related procedures.
- H. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

3.2 PREPARATION OF MIXTURES

- A. Preparation of Asphalt Cement. Place bituminous materials in the mixer at a temperature between 275 and 375 degrees F., as directed.
- B. Preparation of Mineral Aggregate. Thoroughly dry and heat aggregates before placing them in the mixer. Control the temperature of the aggregates so that the temperature of the complete mixture shall be within the range specified in paragraph C. below.
- C. Preparation of Bituminous Concrete Mixtures (Not SUPERPAVE). Combine the heated and dried aggregates and mineral filler and convey them into the mixer in the proportionate amounts of each size required to meet the job mix formula. After these materials have been mixed for the specified dry-mixing time, add the asphalt cement and mix for the specified wet-mixing time. Measure asphalt cement by weight or by an approved metering device. The temperature of the mixture when discharged shall be between 275 and 325 degrees F.
- D. Preparation of SUPERPAVE HMA Pavement. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

3.3 TRANSPORTATION AND DELIVERY OF MIXTURES.

- A. Vehicles for transportation of mixtures from the plant to the jobsite shall be clean of all foreign materials, tight, and evenly and lightly coated with a suitable thin oil or approved soap solution. No excess of lubricant shall be allowed to accumulate in low spots in the body. When necessary, vehicles shall be insulated so that the mixture is delivered for placement at the proper temperature.

- B. Arrange dispatching of trucks from the plant so that all material which is delivered to the jobsite during any day shall be placed and shall have received final compaction before nightfall of the same day, unless satisfactory artificial light is provided.
- C. Do not transport mixtures such a distance that segregation of the ingredients takes place or that any crust is formed on the top, bottom, or sides of the mixture which will not crumble or flatten out when the mixture is dumped or which might otherwise be deleterious to the mixture in place on the work.
- D. During transportation of the mixture from the plant to the spreader at the jobsite, keep the mixture fully covered at all times with canvas or other suitable material of sufficient size and thickness to furnish complete protection.
- E. Deliver the mixture to the jobsite at a temperature governed by the air temperature in the shade and away from artificial heat, as follows with a tolerance of plus or minus 20 degrees F.:

1. Normal Layered Construction:

Air Temperature	Delivered Mix Temperature
35 degrees F.	300 degrees F.
40 degrees F.	290 degrees F.
65 degrees F.	280 degrees F.
90 degrees F. and Over	275 degrees F.

2. Deep Lift Paving (3 inches and over), Base and Binder Courses only:

Air Temperature	Delivered Mix Temperature
35 degrees F.	280 degrees F.
40 degrees F.	270 degrees F.
65 degrees F. and over	260 degrees F.

3.4 TRANSPORTATION AND DELIVERY OF SUPERPAVE MIXTURES

- A. Transportation of SUPERPAVE HMA Pavement shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

3.5 TRANSPORTATION AND DELIVERY OF MICROSURCAING MIXTURES

- A. Stockpiling: Precautions shall be taken to insure that stockpiles do not become contaminated. The mineral aggregate shall be screened prior to being weighed for job site delivery. This weight shall be done by means of a scale approved by the MBTA.

3.6 PRIME COAT (OR TACK COAT)

- A. Where an existing hardened surface is used as a base for new pavement, or elsewhere where the surface to receive bituminous pavement is, in the MBTA's judgment, unsatisfactory to receive the pavement, give the surface a prime coat of bituminous material of the kind and grade indicated or directed. Where unsatisfactory conditions, requiring application of prime coat, are due to the fault of the Design-Builder, provide the prime coat at no additional expense to the MBTA.
- B. Clean the existing surface of all foreign matter and loose material before applying prime coat. Apply the prime coat by mechanical means at the rate indicated or directed.

3.7 SPREADING AND FINISHING - BITUMINOUS CONCRETE PAVEMENT (NOT SUPERPAVE)

A. General

- 1. Place bituminous concrete in courses as indicated.
- 2. When an existing surface or new base, upon which the bottom course is to be laid, contains unsatisfactory irregularities, in the MBTA's judgment, eliminate such irregularities by placing and compaction of mixture, so as to furnish a surface with true contour and grade before placing any specified bottom course.
- 3. Paint thoroughly the contact surfaces of bridge curbing, manholes, catch basins, and other appurtenant structures in pavement, with a thin coating of bitumen immediately prior to placing any mixture against them.
- 4. Give special attention to proper testing of the surface of each course with a straightedge. Finished surfaces shall be even and uniform throughout.
- 5. Remove and replace with new mixture any mixture which becomes loose or broken, mixed with dirt, or defective in any way. Finish and compact the repaired area to conform to the surrounding area. Remove and replace areas of one square foot or more showing an excess of bitumen.
- 6. No mixture shall be placed unless the breakdown and intermediate rolling can be completed by the time the material has cooled at 175 degrees F., and provided that the density of the pavement attains at least 95 percent of the laboratory compacted density.

B. Spreading and Finishing Equipment

- 1. The equipment for spreading and finishing shall be mechanical, self-powered pavers, capable of spreading and finishing the mixture to line, grade, width, and crown by means of fully automated controls for both longitudinal and transverse slope.
- 2. The pavers shall be equipped with hoppers and distributing screws of the reversing type to place the mixture evenly in front of adjustable screeds. They shall be equipped with a quick and efficient steering device and shall have reverse as well as forward traveling speeds.
- 3. The pavers shall employ mechanical devices such as equalizing runners, straight edge runners, evener arms or other compensating devices to adjust the grade and confine the edges of the

mixture to true lines. They shall be capable of spreading the mixture without segregation in layers to the depths and widths required. They shall be equipped with blending or joint leveling devices for smoothing and adjusting all longitudinal joints between adjacent strips or courses of the same thickness.

4. The screed shall be adjustable for profile and shall have an indicating level attached.
5. An approved device will be required for heating the screed to the temperature required for the laying of the mixtures without pulling or marring.
6. The term "screed" includes any "strike-off" device operated by cutting, crowding, or other practicable action, which is effective on the mixtures at permissible workable temperatures without tearing, shoving, or gouging and which produces a finished surface of the evenness and texture required.
7. The pavers employed on projects requiring in excess of 15,000 tons shall operate by the use of a sensing grid for operation to a stringline and matching shoe for joints.
8. The paver shall be provided with a "ski" which may be employed for paving on the previously laid bituminous concrete base, or binder as directed or permitted by the Owner.
9. The paver employed on deep lift construction shall be capable of satisfactorily feeding the mix without intermittent stopping during the discharge of the mix from the trucks into the paving machine.
10. If during construction, it is found that the spreading and finishing equipment in use leaves tracks or indented areas, or produces other permanent blemishes in the pavement which are not satisfactorily corrected by the scheduled operations, the use of such equipment shall be discontinued and other satisfactory spreading and finishing equipment shall be provided.
11. Complete all compaction rolling before the bituminous concrete temperature drops below 185 degrees Fahrenheit.

C. Machine Spreading

1. Deposit mixtures in the approved mechanical spreader, spread immediately, and strike off in a uniform layer to the full width required and to such depth that each course, when compacted, shall have the required thickness and shall conform to the indicated grade and cross section contour.
2. Deposit mixture in the center of the hoppers, exercising care to avoid overloading and spilling. Operate the pavers, while the mixture is being spread, at a speed which will produce a uniform surface texture.
3. Immediately after each course is screeded and before roller compaction is started, check the surface, adjust any irregularities, remove accumulation from the screed by rake or lute, and remove and replace any unsatisfactory spots in the course. Correct irregularities in line and grade along outside edges by addition or removal of material before the edge is rolled. Indiscriminate casting of mix on the new screeded surface, where irregularities are not evident, will not be permitted.
4. All edges shall be true and uniform.

D. Hand Spreading

1. Spreading by hand methods will be permitted only for particular locations in the work which because of irregularity, inaccessibility or other unavoidable obstacles do not allow mechanical spreading and finishing.
2. When hand spreading is permitted, place the mixture by dumping on approved steel dump sheets outside the area upon which it is to be spread; or by other approved methods. Immediately thereafter, distribute the mixture into place by means of hot shovels, and spread it with hot rakes or lutes in a loose layer of uniform density and correct depth. Tines of the rakes shall be not less than 1/2 inch longer than the loose depth of mixture, and spaces between tines shall be not less than 1 inch.
3. Do not dump loads faster than they can be properly handled by the shovelers, and do not distribute the dumped load faster than it can be properly handled by the rakers. Rake carefully and skillfully to avoid segregation and so that, after the first passage of the roller over the raked mixture, no back patching will be necessary.

3.8 SPREADING AND FINISHING - SUPERPAVE HMA PAVEMENT MIXES

- A. SUPERPAVE HMA Pavement mixes shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

3.9 SPREADING AND FINISHING – MICROSURFACING

A. General

1. If directed by the MBTA the Design-Builder shall pretreat the cracks in the pavement surface with fiber reinforced crack filler by Fiber Reinforced Method prior to the application of microsurfacing.

B. Equipment

1. General

- a. All equipment, tools, and machines used in the performance of this work shall be maintained in satisfactory working condition at all times to ensure a high quality product.

2. Tack Coat

- a. The Design-Builder shall apply a tack coat consisting of one part emulsified asphalt and three parts water with a distributor at .10-.15 gallons per square yard. This emulsified asphalt should be the CSS1H emulsion grade. It is recommended that a tack coat always be applied to a concrete or brick surface.

3. Mixing Equipment

- a. The material shall be mixed by a self-propelled micro-surfacing mixing machine which shall be a continuous flow mixing unit able to accurately deliver and proportion the aggregate, emulsified asphalt, mineral and field control additives, and water to a revolving multi-blade twin shafted mixer and discharge the mixed product on a

continuous flow basis. The machine shall have sufficient storage capacity for aggregate, emulsified asphalt, mineral and field control additives, and water to maintain an adequate supply to the proportioning controls. The machine may be equipped with self-loading devices which provide for the loading of materials while continuing to lay micro-surfacing, thereby minimizing construction joints.

4. Proportioning Devices

- a. Individual volume or weight controls for proportioning each material to be added to the mix, i.e., aggregate, emulsified asphalt, mineral and field control additives, and water shall be provided and properly marked. These proportioning devices are usually revolution counters or similar devices and are used in material calibration and determining the materials output at any time.

5. Emulsion Pump

- a. The emulsion pump shall be a heated positive displacement type.

6. Spreading Equipment

- a. The surfacing mixture shall be spread uniformly by means of a mechanical type spreader box attached to the mixer, equipped with paddles to agitate and spread the materials throughout the box. A front seal shall be provided to insure no loss of the mixture at the road contact point. The rear seal shall act as final strike off and shall be adjustable. The mixture shall be spread to fill cracks and minor surface irregularities and leave a uniform skid resistant application of material on the surface. The spreader box and rear strike off shall be so designed and operated that a uniform consistency is achieved to produce a free flow of material to the rear strike off. The longitudinal joint where two passes join shall be neat appearing, uniform and lapped. All excess material shall be removed from the job site prior to opening the road. The spreader box shall have suitable means provided to side shift the box to compensate for variations in pavement width and longitudinal alignment. A Rut Box shall be available to prefill wheel ruts when necessary prior to overlay to eliminate puddles or runoff interruption. The box shall be readily adjustable from 4' - 6' width with hydraulically adjusted strike off screeds to attain maximum grade and profile.

7. Auxiliary Equipment

- a. Suitable surface cleaning equipment, traffic control equipment, hand tools and any support equipment shall be provided as necessary to perform the work.

C. Machine calibration

1. Each mixing unit to be used in performance of the work shall be calibrated in the presence of the MBTA prior to construction, or previous calibration documentation covering the exact materials to be used may be acceptable provided they were made during that calendar year. The documentation shall include the individual calibration of each material at various settings, which can be related to the machine metering devices.

D. Application

1. General

- a. The surface should be pre-wetted by fogging ahead of the spreader box when required by local conditions. The rate of application of the fog spray shall be adjusted during the day to suit temperatures, surface texture, humidity, and dryness of the pavement surface.
 - b. The micro-surfacing mixture shall be of the desired consistency upon leaving the mixer and no additional materials should be added. A sufficient amount of material shall be carried in all parts of the spreader at all times so that a complete coverage is obtained. Overloading of the spreader shall be avoided. No lumping, balling, or unmixed aggregate shall be permitted.
 - c. No streaks, such as those caused by oversized aggregate, will be left in the finished surface. If excessive oversize develops, the job will be stopped until the Design-Builder proves to the MBTA that the situation has been corrected.
2. Joints
- a. No excessive buildup, uncovered areas or unsightly appearances shall be permitted on longitudinal or transverse joints. The Design-Builder shall provide suitable width spreading equipment to produce a minimum number of longitudinal joints throughout the project. When possible, longitudinal joints shall be placed on lane lines. Half passes and odd widths passes will be used only in minimum amounts. If half passes are used, they shall not be the last pass of any paved areas.
3. Mix Stability
- a. The micro-surfacing mixture shall possess sufficient stability so that premature breaking of the material in the spreader box does not occur. The mixture shall be homogeneous during and following mixing and spreading. It shall be free of excess water or emulsion and free of segregation of the emulsion and aggregate fines from the coarser aggregate.
4. Hand Spreading
- a. Areas which cannot be reached with the mixing machine shall be surfaced using hand squeegees to provide complete and uniform coverage. The area to be handworked shall be lightly dampened prior to mix placement. Care shall be exercised to leave no unsightly appearance from handwork.
 - b. The same type finish as applied by the spreader box shall be required. Handwork shall be completed at the time of the machine applying process.
5. Lines
- a. Care shall be taken to insure straight lines along curbs and shoulders. No runoff on these areas will be permitted. Lines at intersections will be kept straight to provide a good appearance.
6. Rolling
- a. If required by the plans, specified areas shall be rolled by a self-propelled 10 ton pneumatic roller with a tire pressure of 50 PSI and equipped with a water spray system.

E. Weather limitations

1. The material shall be spread only when the road surface and atmospheric temperatures are at least 45 degrees F and rising and the weather is not rainy and there is no forecast of temperatures below 32 degrees F within 48 hours from the time of placement of the mixture.

3.10 COMPACTION - BITUMINOUS CONCRETE PAVEMENT (NOT SUPERPAVE)

A. Compaction Equipment

1. After the paving mixture has been properly spread, initial compaction shall be obtained by the use of power rollers of approved design and weight per inch width of roller. The rollers shall be steel-wheeled supplemented with pneumatic-tired rollers where required, or where permitted, vibratory rollers.
2. Steel wheel rollers for initial and intermediate rolling shall have a weight of not less than 240 pounds per inch width of tread; for top course, minimum weight shall be 285 pounds per inch width of tread.
3. Pneumatic-tired rollers, when conditions warrant, shall be provided with devices capable of varying tire pressures. When the mixture being spread by each paver requires more than the minimum number of steel wheel rollers, at least one of the additional rollers for each paver shall be a pneumatic-tired roller, except where the use of a vibratory roller is permitted. When using a pneumatic-tired roller, care shall be taken that initial rolling by the steel wheel roller be restricted to one pass where upon the pneumatic-tired roller shall immediately follow the initial steel wheel rolling.
4. Vibratory steel drum rollers shall not be used on top course mix or structures. The machine shall have a device registering the number of vibrations per minute and a tachometer shall be provided to the Owner in order to check the operation of the roller.
5. The V.P.M. on base and binder course material shall be a minimum of 1400 V.P.M. and a maximum of 1500 V.P.M., or in accordance with the recommendations of the manufacturer, when approved by the MBTA.
6. The vibratory roller shall be operated with the vibrating drum in the direction of the paver and the vibrating action of the roller shall be completely shut off during change of direction and care exercised to start this action only when the roller is in motion. In order to prevent creeping and aggregate crushing during rolling of layered pavement, care shall be taken not to exceed one pass in the direction of the paver with vibrator in action and one return in a static condition and for deep lift pavements these passes shall not exceed two operations in each direction, except that the number of vibratory passes in either direction may be varied in order to obtain the required density.
7. An oscillatory roller, 10 ton minimum, shall be used for compaction of hot mix asphalt on bridge decks and in locations where heavy vibration is prohibited or undesirable.
8. A smoothing roller of either the pneumatic-tired, oscillatory, or steel wheeled type shall be used immediately behind the last pass of the vibrating roller. The use of a vibratory roller may be suspended by the MBTA if, in his opinion, unsatisfactory results are being obtained and no

further mix shall be spread until a sufficient number of approved rollers are on the project to satisfy the compaction requirements.

9. A plate shall be attached to each roller which shall show the ballasted and unballasted weight per inch width of tread.
10. The number of rollers and passes required shall be governed by the compaction results; however, at least one steel roller shall be provided for each paver employed on the paving operation. This is independent of the requirements of the pneumatic-tired roller.

B. Compaction Procedures

1. Roll the mixture longitudinally, diagonally, and transversely as may be necessary to produce the required contour for surface. Start longitudinal rolling at the side and proceed toward the center of the pavement, except on superelevated curves start at the low side and progress to the high side, overlapping on successive trips by at least 12 inches.
2. Continue the rolling so that all roller marks, ridges, porous spots, and impressions are eliminated and the surface has the required contour and grade. Maintain the motion of the rollers at all times slow enough to avoid any displacement of the hot mixture. Correct any displacement or marring of the surface resulting from reversing the direction of the roller or from any other cause.
3. To prevent adhesion with the mixture, keep the wheels of steel rollers lightly moistened with water. Excess water or oil for this purpose will not be permitted.
4. To prevent "rolloff" of the pavement edges and longitudinal joints on deep lift paving, leave the outer eight inches of the deep lift mixture unrolled until the temperature of the mix ranges between 150 and 180 degrees F., whereupon compact it with a steel roller.
5. Along curbs, structures, and all places not accessible with a roller, compact the surface thoroughly with mechanical tamping devices, smooth and true to established line, grade, and contour.
6. The in place density of each pavement course tested shall be $95\% \pm 2.5\%$ of the maximum theoretical density as determined by AASHTO T 209. The Authority shall conduct confirmatory testing.

3.11 COMPACTION - SUPERPAVE HMA PAVEMENT MIXES

- A. SUPERPAVE HMA Pavement mixes shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

3.12 JOINTS

- A. Place mixture as nearly continuously as possible. Pass the roller over the unprotected end of newly placed mixture only when the placing of the course is to be discontinued for such length of time as will permit the mixture to attain initial stability. In all such cases, including the formation of joints as herein specified, provide for proper bond with the new surface for the full specified depths of the courses.

- B. Maximum length of longitudinal joint shall be such that the temperature of the mixture at the joint shall not be less than 150 degrees F. when the abutting mixture is placed. Joints which fall below 200 degrees F. shall receive an application of hot poured rubberized asphalt prior to the adjacent pass.
- C. Make longitudinal and transverse joints in a careful manner, well bonded and sealed, true to line and grade. Where directed, cut back longitudinal and transverse joints to expose the full depth of the course and, when laying of the course is resumed, paint the exposed edge of the joint with a thin coat of bitumen. Carefully rake the new mixture against the joint, then thoroughly tamp and roll.
- D. In making joints along any adjoining edge such as curb, gutter, or an adjoining pavement, and after the mixture is spread by the paver, place by hand just enough of the hot material to fill any space left open. Set up these joints with the back of a rake at the proper height and level to receive the proper compaction.
- E. Stagger transverse and longitudinal joints in successive courses so that there is a minimum of one foot overlap between longitudinal joints in adjacent courses.
- F. Overlap the rolling of successive widths of courses so as to leave smooth, uniform joints and cross sections.
- G. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements).

3.13 PAVEMENT ON BRIDGES

- A. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) and the Standard Bridge Deck Pavements memorandum dated November 12, 2009.
- B. Engineer, the Design-Builder shall provide temporary markings at no additional cost to the MBTA.

3.14 FIELD QUALITY CONTROL

- A. Test the plane of the finished surfaces of base, binder, and surface courses with a 16-foot straightedge, except use a 10-foot straightedge on vertical courses and on the top course of resurfaced streets which contain manhole covers, valve boxes, and the like.
- B. Carefully apply the straightedge immediately after the first compaction by rolling, and from then on as may be necessary until and after the final compaction of the material in place. Hold the straightedge in successive positions parallel to the road centerline and in contact with the road surface; check the entire area from one side of the pavement to the other.
- C. Correct irregularities which vary 3/8 inch from a true finished surface in base and binder courses, and 1/4 inch in top courses.
- D. Irregularities which may develop before the completion of rolling and while the material is still workable, may be remedied by loosening the surface mixture and removing or adding material as necessary. Should any unsatisfactory irregularities or defects remain after final compaction, correct the defective work by removing and replacing with new material to form a true and even surface.

- E. Micromilled Surface shall meet the requirements of the MassDOT Standard Specification section 415.62.
- F. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements) contained herein.

3.15 PAVEMENT MILLING

- A. The planed surface shall conform to the grades and cross slope required for the required minimum thickness overlay and to revise existing cross slope transitions.
- B. The Design-Builder shall obtain accurate elevations of the existing pavements and compare them with the proposed elevations shown on the drawings to determine the extent and depth of milling required to provide for the minimum 1 ¾ inch overlay and the extent and depth of leveling course required within the proposed pavement overlay areas.
- C. Equipment
 - 1. The machine shall be capable of being operated at speeds from 10 to 40 feet per minute and designed so that the operator can at all times observe the milling operation without leaving his control area. Pneumatic rubber-tire mounted equipment shall be used only for trimming and edging operations.
 - 2. The milling equipment shall have a cutting mandrel with carbide tipped cutting teeth and shall be designed specifically for planing bituminous concrete surfaces to close tolerances. The equipment shall accurately establish cross slope and profile grade controls. A vacuum equipped street sweeper, capable of removing all loose material from the roadway without causing dust to escape into the air, shall follow immediately behind the milling machine.
 - 3. The equipment furnished by the Design-Builder shall be maintained in good repair at all times.
- D. Protection of Utilities
 - 1. Throughout the milling operation, protection shall be provided around existing catch basin inlets, manholes, utility valve boxes, and any similar structures. Any damage to such structures as a result of the milling operation is the Design-Builder's responsibility and shall be repaired at the Design-Builder's expense. To prevent the infiltration of milled material into the storm sewer system the Design-Builder shall take special care to prevent the milled material from falling into the inlet openings or inlet grates. Any milled material that falls into inlet openings or inlet grates shall be removed at the Design-Builder's expense.
 - 2. Pavement areas abutting utility structures and other areas, which cannot be planed by the principal milling machine, shall be excavated with smaller mechanical milling equipment designed for this purpose or by manual methods.
- E. After the milling has been completed, all depressions, potholes and other irregularities shall be filled and any existing manholes or other structures shall be wedged using hot mix asphalt for miscellaneous work.
- F. The pavement shall be swept to remove cuttings at the end of each work period. No pavement cuttings shall remain on the project at the end of each work day, except as approved by the MBTA.

3.16 PAVEMENT MICROMILLING

A. Equipment

1. The milling equipment shall be self-propelled with sufficient power, traction, and stability to remove the existing HMA pavement to the specified depth and cross-slope. The milling machine shall be capable of operating at a minimum speed of 10 feet (3 meters) per minute, designed so that the operator can at all times observe the milling operation without leaving the control area of the machine, and equipped with the following:
 - a. A built in automatic grade control system that can control the longitudinal profile and the transverse cross-slope to produce the specified results.
 - b. Longitudinal controls capable of operating from any longitudinal grade reference, including string line, 30 foot (10 meter) ski minimum, 30 foot (10 meter) mobile string line minimum, or a matching shoe.
 - c. The transverse controls shall have an automatic system for controlling cross-slope at a given rate.
 - d. Cutting heads able to provide a minimum 6 foot (2 meter) cutting width and a 0 to 4 inch (0 to 100 mm) deep cut in one pass. The teeth on the evolving cutting drum must be continually maintained and shall be replaced as warranted to provide a uniform pavement texture.
 - e. An integral pickup and conveying device to immediately remove milled material from the roadway and discharge the millings into a truck, all in one operation.
 - f. All necessary safety devices such as reflectors, headlights, taillights, flashing lights and back up signals so as to operate safely in both day and night.
 - g. A means of effectively limiting the amount of dust escaping from the milling and removal operation in accordance with local, State, and Federal air pollution control laws and regulations.
2. The micromilling machine shall be equipped with a drum specifically designed to provide the surface specified below.
 - a. Control Strip
 1. The Design-Builder shall micromill a control strip. The control strip shall be 500 feet minimum in length with a uniformly textured surface and cross slope, as approved by the MBTA.
 2. The micromilled surface of the control strip shall provide a satisfactory riding surface with a uniform textured appearance. The micromilled surface shall be free from gouges, excessive longitudinal grooves and ridges, oil film, and other imperfections that are a result of defective equipment, non-uniform milling teeth, improper use of equipment, or otherwise poor workmanship. Any unsatisfactory surfaces produced in the control strip shall be corrected by additional micromilling at the Design-Builder's expense and to the satisfaction of the MBTA.
 3. The micromilled pavement surface shall have a transverse pattern of 0.2 – 0.3 inch center to center of each strike area. The Design-Builder shall perform surface texture measurements with a 10 foot (3 meter) straightedge in the transverse direction across the milled surface. The milled surface shall have a texture such that the variation from the edge of the straightedge to the top of ridges between any two ridge contact points shall not exceed 1/8 inch (3 mm). The difference in height from the top of any ridge to the bottom of the groove adjacent to that ridge shall not exceed 1/16" (1.6 mm). Any point in the surface not meeting these

requirements shall be corrected as directed by the MBTA at the Design-Builder's expense.

3. Sweeper Equipment Requirements

- a. The Design-Builder shall provide a sufficient number of mechanical sweepers to ensure that the milled surface is free of millings and debris at the end of each day's milling operations. Each sweeper shall be equipped with a water tank, spray assembly to control dust, a pick-up broom, a dual gutter broom, and a dirt hopper. The sweepers shall be capable of removing millings and loose debris from the textured pavement.

B. Operation

1. The milling operations shall be scheduled to minimize the duration and placement of traffic on the milled surface. The milling operations shall not proceed more than 3 miles ahead of the paving operations. Under no circumstances shall the milled surface be left exposed to traffic for a period exceeding seven days. The Engineer may allow the Design-Builder to adjust the above limitations on milling production when necessary.
2. The Design-Builder shall coordinate milling and paving operations to minimize the exposure of milled surfaces to traffic. The Design-Builder shall ensure that milled surfaces are overlaid in a timely manner to avoid damage to the pavement structure. Any damage to the pavement structure resulting from extended exposure of the milled surface to traffic shall be repaired as directed by the MBTA at the Design-Builder's expense.
3. The existing pavement shall be removed to the average depth shown on the plans, in a manner that will restore the pavement surface to a uniform cross-section and longitudinal profile. The longitudinal profile of the milled surface shall be established using a 30 foot (10 meter) mobile ski, mobile string line, or stationary string line. The cross-slope of the milled surface shall be established by a second sensing device or by an automatic cross-slope control mechanism. The Design-Builder will be responsible for providing all grades necessary to remove the material to the proper line, grade, cross section, superelevation, and transitions shown on the plans or as directed by the MBTA. The requirement for automatic grade or slope controls may be waived by the MBTA in locations warranted by the situation, including intersections and closely confined areas.
4. The Engineer may adjust the average milling depth specified on the plans by $\pm 3/4"$ ($\pm 20\text{mm}$) during each milling pass at no additional payment to minimize delamination of the underlying pavement course or to otherwise provide a more stable surface. If delamination or exposure of concrete occurs when milling a HMA pavement course from an underlying Portland Cement Concrete (PCC) pavement, the Design-Builder shall cease milling operations and consult the MBTA to determine whether to reduce the milling depth or make other adjustments to the operation.

C. Protection of Utilities

1. Throughout the milling operation, protection shall be provided around existing catch basin inlets, manholes, utility valve boxes, and any similar structures. Any damage to such structures as a result of the milling operation is the Design-Builder's responsibility and shall be repaired at the Design-Builder's expense. To prevent the infiltration of milled material into the storm sewer system the Design-Builder shall take special care to prevent the milled material from falling into the inlet openings or inlet grates. Any milled material that falls into inlet openings or inlet grates shall be removed at the Design-Builder's expense.

D. Vertical Faces

1. All permanent limits of the milled area shall be sawcut or otherwise neatly cut by mechanical means to provide a clean and sound vertical face. No vertical faces, transverse or longitudinal, shall be left exposed to traffic. If any vertical face is formed in an area exposed to traffic a temporary paved transition with a maximum 12:1 slope shall be established. If the milling machine is used to temporarily transition the milled pavement surface to the existing pavement surface, the temporary transition shall be constructed at a maximum 12:1 slope.

E. Opening to Traffic

1. Prior to opening a milled area to traffic, the milled surface shall be thoroughly swept with a mechanical sweeper to remove all remaining millings and dust. This operation shall be conducted in a manner so as to minimize the potential for creation of a traffic hazard and to comply with local, State, and Federal air pollution control laws and regulations. Any damage to vehicular traffic as a result of milled material becoming airborne is the responsibility of the Design-Builder and shall be repaired at the Design-Builder's expense. Temporary pavement markings shall be placed in accordance with the provisions of Section 02052 as shown on the plans or directed by the MBTA.

F. Inspection

1. The milled surface shall provide a satisfactory riding surface with a uniform textured appearance. The milled surface shall be free from gouges, excessive longitudinal grooves and ridges, oil film, and other imperfections that are a result of defective equipment, non-uniform milling teeth, improper use of equipment, or otherwise poor workmanship. Any unsatisfactory surfaces produced shall be corrected by remilling at the Design-Builder's expense and to the satisfaction of the MBTA.
2. The Design-Builder shall perform Quality Control inspection of all work items addressed as specified in the table below. Inspection activities during milling of HMA pavement may be performed by qualified Production personnel (e.g. Skilled Laborers, Foremen, Superintendents). However, the Design-Builder's QC personnel shall have overall responsibility for QC inspection. The Design-Builder shall not rely on the results of Department Acceptance inspection for Quality Control purposes. The Engineer shall be provided the opportunity to monitor and witness all QC inspection.
3. The milled surface of each travel lane shall be divided into longitudinal Sublots of 500 feet (150 meters). The Design-Builder shall perform a minimum of one random QC measurement within each Sublot with a 10 foot (3 meter) straightedge in the transverse direction across the milled surface. Additional selective QC measurements within each Sublot will be performed as deemed necessary by the QC personnel. All QC inspection results shall be recorded on NETTCP Inspection Report Forms. The Engineer will also randomly inspect a minimum of 25% of the Sublots. The Design-Builder shall perform surface texture measurements with a 10 foot (3 meter) straightedge in the transverse direction across the milled surface. The milled surface shall have a texture such that the variation from the edge of the straightedge to the top of ridges between any two ridge contact points shall not exceed 1/8 inch (3 mm). The difference in height from the top of any ridge to the bottom of the groove adjacent to that ridge shall not exceed 1/16" (1.6 mm). Any point in the surface not meeting these requirements shall be corrected as directed by the MBTA at the Design-Builder's expense.

4. In isolated areas where surface delamination between existing HMA layers or a surface delamination of HMA on Portland Cement Concrete causes a non-uniform texture to occur, the straightedge surface measurement requirements stated in the preceding paragraph may be waived, subject to the approval of the Owner.
5. Minimum QC Inspection of Milling Operations

Inspection Component	Items Inspected	Minimum Inspection Frequency	Point of Inspection	Inspection Method
Equipment	As specified in QC Plan	Per QC Plan	Per QC Plan	Per QC Plan
Environmental Conditions	Protection of Inlets & Utilities	Per QC Plan	Existing Surface	Visual Check
	Removal of Millings & Dust	Per QC Plan	Milled Surface	Visual Check
Workmanship	Milling Depth	Per QC Plan	Milled Surface	Check Measurement
	Cross-Slope & Profile	Per QC Plan	Milled Surface	Check Measurement
	Milled Surface Texture	Per QC Plan	Milled Surface	Visual Check
	Milled Surface Roughness	Once per 600 feet (150 meters) per milled lane	Milled Surface per MassDOT Specification 410.67	10 foot (3 meter) standard straightedge
	Sawcut Limit Vertical Face	Per QC Plan	Sawcut Limits	Visual Check

3.17 RAISING AND ADJUSTING CASTINGS

- A. In areas of permanent top course paving, existing municipally-owned catch basin and manhole castings and valve boxes shall be raised to the proper grade required by the MBTA.
- B. Castings owned by private utilities shall be raised by their own forces. The Design-Builder shall be responsible for coordinating this work.

3.18 PAVEMENT MARKINGS

- A. The Design-Builder shall replace all pavement markings removed or covered-over in carrying out the work, and as required by the MBTA, no sooner than 48 hours after completion of the permanent pavement.

3.19 OPENING TO TRAFFIC

- A. No vehicular traffic or loads shall be permitted on the newly completed pavement until adequate stability has been attained, and the material has cooled sufficiently to prevent distortion or loss of fines, and the pavement has achieved a maximum temperature of 140 degrees F.
- B. If the climatic or other conditions warrant it, the period of time before opening to traffic may be extended at the discretion of the MBTA.
- C. All work under SUPERPAVE HMA Pavement items shall conform to the relevant provisions of Section 450 and 455 (00717 Superpave requirements).

PART 4 - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. Separate measurement and payment will not be made for the work of this section, but all costs in connection with the work are included in the contract price as identified in Volume 1 DB Contract Terms and Conditions Section 14 "Payment".

Percentages shown in table above for aggregate sizes are stated as proportional percentages of total aggregate for the mix. Unless authorized by the Owner, no Job-Mix Formula will be approved which specifies:

- a. Less than 6% binder for HMA Surface Course – Standard Top.

Less than 5.5% binder for HMA Surface Course – Dense Binder and HMA Surface Course – Modified Top for mixes containing RAP.

TABLE 02513-D

ACTION LIMITS FOR AGGREGATE GRADATIONS AND BINDER CONTENT

SIEVE DESIGNATION/BINDER CONTENT	ACTION LIMIT
Passing No.4 Sieve and Larger Sieve Sizes	JMF Target +/- 7%
Passing No. 8 Sieves	JMF Target +/- 4%
Passing No. 16 to No. 50 Sieves (Inclusive)	JMF Target +/- 4%
Passing No. 100 Sieve	JMF Target +/- 4%
Passing No. 200 Sieve	JMF Target +/- 2%
Binder	JMF Target +/-0.4%

Deviations from the final approved mix design for bitumen content and gradation of aggregates shall be within the action limits for individual measurements as specified in Table 02513-D. The limits still will apply if they fall outside the master grading band in Table 02513-C except as noted on the specific state approved Job Mix Formula or Laboratory Trial Mix Formula.

SECTION 450 AND 455 (00717 SUPERPAVE REQUIREMENTS)

SUPERPAVE REQUIREMENTS

SECTION 450
HOT MIX ASPHALT PAVEMENT

Section 450 - Hot Mix Asphalt Pavement entirely replaces the following Sections and Subsections of the Standard Specifications for Highways and Bridges:

- **Section 420 - Class I Bituminous Concrete Base Course Type I-1**
- **Section 460 - Class I Bituminous Concrete Pavement Type I-1**
- **Subsection M3.01.0 - Asphalt Cement**
- **Subsection M3.11.06 - Bituminous Materials**
- **Subsection M3.11.08 - Inspection**
- **Subsection M3.11.09 - Composition and Compaction Acceptance Tests**

The Design-Builder shall adhere to all of the requirements herein of Section 450, Hot Mix Asphalt Pavement. All QC Inspection Report Forms and Test Report Forms must be submitted to the Department by the Design-Builder at the completion of each Lot. Material produced and placed must conform to the Quality Limits specified in Subsection 450.77. Design-Builder QC data and Department Acceptance data for each Lot falling under HMA Lot Category A (Large Lot) or Category B (Small Lot) will be evaluated using Quality Level Analysis and must meet the minimum Percent Within Limits specified in Subsection 450.77.

NOTE: The Pay Adjustment provisions included in Subsection 450.92 will be applied to items under this contract.

**SECTION 450
HOT MIX ASPHALT PAVEMENT**

DESCRIPTION

450.20 General.

This work shall consist of producing and placing Hot Mix Asphalt (HMA) pavement. HMA mixtures shall be composed of the following: Mineral aggregate, mineral filler (if required), Performance Graded Asphalt Binder (PGAB), and as permitted, reclaimed materials (limited to Reclaimed Asphalt Pavement (RAP), Manufactured Asphalt Shingles (MAS), and Processed Glass Aggregate (PGA)). The HMA pavement shall be constructed as shown on the plans and as directed on the prepared or existing base in accordance with these specifications and in close conformity with the lines, grades, compacted thickness and typical cross section as shown on the plans. Unless specified otherwise, each HMA pavement course placed shall be comprised of one of the mixture types listed in Table 450.1.

Table 450.1 - HMA Pavement Courses & Mixture Types

Pavement Course	Mixture Type	Mixture Designation
Friction Course	<ul style="list-style-type: none"> • Open-Graded Friction Course - Polymer Modified 	OGFC-P
Surface Course	<ul style="list-style-type: none"> • SUPERPAVE Surface Course - 4.75 • SUPERPAVE Surface Course - 9.5 • SUPERPAVE Surface Course - 12.5 • SUPERPAVE Surface Course - 19.0 	SSC - 4.75 SSC - 9.5 SSC - 12.5 SSC - 19.0
Intermediate Course	<ul style="list-style-type: none"> • SUPERPAVE Intermediate Course - 12.5 • SUPERPAVE Intermediate Course - 19.0 	SIC - 12.5 SIC - 19.0
Base Course	<ul style="list-style-type: none"> • SUPERPAVE Base Course - 25.0 • SUPERPAVE Base Course - 37.5 	SBC - 25.0 SBC - 37.5
Leveling Course	<ul style="list-style-type: none"> • SUPERPAVE Leveling Course - 4.75 • SUPERPAVE Leveling Course - 9.5 • SUPERPAVE Leveling Course - 12.5 	SLC - 4.75 SLC - 9.5 SLC - 12.5
Bridge Surface Course	<ul style="list-style-type: none"> • SUPERPAVE Bridge Surface Course - 9.5 • SUPERPAVE Bridge Surface Course - 12.5 	SSC-B - 9.5 SSC-B - 12.5
Bridge Protective Course	<ul style="list-style-type: none"> • SUPERPAVE Bridge Protective Course - 9.5 • SUPERPAVE Bridge Protective Course - 12.5 	SPC-B - 9.5 SPC-B - 12.5

450.30 Quality Assurance.

A. Quality Assurance Responsibilities.

This is a Quality Assurance Specification wherein the Design-Builder is responsible for controlling the quality of materials and workmanship and the Department is responsible for accepting the completed work based on the measured quality. Quality Assurance is simply defined as “making sure the Quality of a product is what it should be”.

The core elements of Quality Assurance include: Design-Builder Quality Control (QC), Department Acceptance, Department Independent Assurance (IA), Dispute Resolution, Qualified Laboratories, and Qualified Personnel. Although Quality Assurance utilizes test results to control production and determine acceptance of the HMA, inspection remains as an important element in controlling the process and accepting the product.

The Design-Builder is responsible for providing an appropriate Quality Control system to ensure that all materials and workmanship meet the required quality levels for each specified Quality Characteristic. The Design-Builder will perform all required Quality Control inspection, sampling, and testing in accordance with these specifications and the Design-Builder’s Quality Control Plan.

The Department will monitor the adequacy of the Design-Builder’s QC activities and will perform Acceptance inspection, sampling, and testing. The Department’s Acceptance information will be utilized in the acceptance determination for each Lot of material produced and placed.

Independent Assurance is the responsibility of the Department’s Central Materials Laboratory. The function of IA testing is to periodically provide an unbiased and independent evaluation of the sampling and testing procedures used in the acceptance decision. Design-Builder QC and Department Acceptance testing procedures and equipment will be evaluated by IA personnel using one or more of the following: observation, calibration checks, split sample comparison, or proficiency samples (homogeneous samples distributed and tested by two or more laboratories). QC and Acceptance testing personnel are evaluated by observation and split samples or proficiency samples.

B. Hot Mix Asphalt Lots & Sublots.

The quality of each HMA pavement course of the same mixture type produced and placed will be inspected, tested, and evaluated on the basis of Lots and Sublots. A Lot is defined as “an isolated quantity of material from a single source which is assumed to be produced or placed by the same controlled process”.

The Lot size and corresponding unit of measure is a function of the individual Quality Characteristic evaluated. Lot sizes for Quality Characteristics subject to Department Acceptance are as shown in Table 450.2.

Changes in the target values, material sources, or JMF for an HMA mixture type will constitute a change in Lot, requiring the establishment of a new Lot. All Lots will be properly identified for accurate evaluation and reporting of HMA quality.

Table 450.2 - HMA Lot Sizes

Quality Characteristic	Lot Size & Unit of Measure
PG Asphalt Binder Grading	Total Tons of HMA from all JMFs using the same PGAB Grade (from same PGAB Supplier), produced by a single plant and placed within same construction season.
PG Asphalt Binder Content	Total quantity of an HMA mixture type with same JMF for same individual pavement course, produced by a single plant using the same source of materials and placed at a uniform plan thickness within the same construction season, not to exceed 18,000 tons. (See Table 450.3).
Volumetrics - Air Voids	
In-place Density	
Thickness	
Ride Quality (IRI)	Total length (miles) of individual wheel paths (in all travel lanes and ramps) of in-place HMA with same JMF for same individual pavement course, produced by a single plant and placed within same construction season, and which is located within the same posted speed limit range as defined in Table 450.19
Wheel Path Deviations	

C. HMA Quality Assurance Requirements.

These Specifications establish three categories under which Hot Mix Asphalt Lots will be produced, placed, evaluated and accepted. Table 450.3 below defines each of the Lot categories and outlines the required Quality Assurance activities of the Design-Builder and the Department. The division of the Lot categories is based on the total estimated contract quantity of each individual HMA mixture type per each project location. For contracts containing multiple Hot Mix Asphalt items, it is possible to have work performed under more than one HMA Lot category.

(1) Determination of Lot Size and Lot Category

When the total contract quantity of an HMA mixture type is < 2,100 tons (1,925 Mg), it shall be classified as a Minor Lot (Category C Lot).

When the total contract quantity of an HMA mixture type is ≥ 2,100 tons (1,925 Mg), but < 7,500 tons (6,875 Mg), it shall be classified as a Small Lot (Category B Lot).

When the total contract quantity of an HMA mixture type is ≥ 7,500 tons (6,875 Mg), but ≤ 15,000 tons (13,750 Mg), it shall be classified as a Large Lot (Category A Lot).

When the total contract quantity of an HMA mixture type is > 15,000 tons (13,750 Mg), each 15,000 tons (13,750 Mg) will represent a Category A Lot. If the quantity remaining after all 15,000 ton (13,750 Mg) Category A Lots is ≤ 3,000 tons (2,750 Mg), it shall be added to the final Lot providing a final Lot quantity not to exceed 18,000 tons (16,500 Mg). If the quantity remaining after all 15,000 ton (13,750 Mg) Category A Lots is > 3,000 tons (2,750 Mg), it shall constitute a separate Category A Lot.

(2) Determination of Sublot Size

Each HMA Lot will be divided into Sublots of uniform size. The size of each HMA Sublot shall be as listed in Table 450.10 and Table 450.17. If the HMA quantity at the end of a Lot is equal to or greater than one half of a full Sublot, then such quantity shall be identified and evaluated as a separate Sublot. If the HMA quantity at the end of a Lot is less than one half of a full Sublot, then such quantity shall be combined with the previous full Sublot quantity and shall be identified and evaluated as the final Sublot.

Table 450.3 - HMA Lot Categories & Quality Assurance Requirements

Quality Assurance Requirements	Category A (Large Lot)	Category B (Small Lot)	Category C (Minor Lot)
Total Quantity for individual Lot of HMA:	$\geq 7,500$ tons (6,875 Mg), but $\leq 15,000$ tons (13,750 Mg) (See Note 1)	$\geq 2,100$ tons (1,925 Mg), but $< 7,500$ tons (6,875 Mg)	< 2100 tons (1,925 Mg)
QC Plan Required:	YES	YES	(See Note 2)
Design-Builder QC Inspection Required:	YES (Subsection 450.64)	YES (Subsection 450.64)	YES (Subsection 450.64)
Design-Builder QC Testing Required:	YES (Subsection 450.65)	YES (Subsection 450.65)	YES (Subsection 450.65)
(a) Control Strip Required:	YES	NO	NO
Control Charts Required:	YES	NO	NO
Quality Level Analysis Required:	YES	YES	NO
MassDOT Acceptance Inspection & Testing Performed:	Minimum 25% of Sublots (Subsection 450.74)	Minimum 50% of Sublots), But Minimum 3 Sublots (Subsection 450.74)	100% of Sublots (Subsection 450.74)
QC Test Results included in MassDOT Acceptance Determination:	YES (If Validated)	YES (If Validated)	NO
Pay Adjustment Applied:	YES (Subsection 450.92)	YES (Subsection 450.92)	NO

Note 1: Category A Lots shall not exceed 18,000 tons (16,500 Mg) as specified in Subsection 450.30C(1)

Note 2: If all HMA Lots fall under Category C then a QC Plan is not required. However, if any Lots on the project fall under Category A or Category B, then any Category C Lots must be addressed in the QC Plan.

MATERIALS

450.40 General.

Materials shall meet the requirements in the following Subsections of Division III, Materials and as otherwise specified herein:

Asphalt Emulsion	M3.03.0
Hot Poured Joint Sealer	M3.05.0
Asphalt Anti-Stripping Additive	M3.10.0
Job-Mix Formula	M3.11.03
Mineral Aggregate	M3.11.04
Mineral Filler	M3.11.05
Plant Requirements	M3.11.07

450.42 Hot Mix Asphalt Mix Design.

The Design-Builder shall be responsible for development of all HMA Laboratory Trial Mix Formulas (LTMF). The aggregate gradation structure and target PG Asphalt Binder content of each LTMF for HMA base courses, HMA intermediate courses, and HMA surface courses shall conform to the Control Points in Section 455. The aggregate gradation structure and target PG Asphalt Binder content for Open-Graded Friction Course (OGFC-P) shall conform to the master ranges in M3.11.03 – Table B.

All LTMFs for HMA pavement courses shall be supported by volumetric mix designs. Volumetric mix designs are not required for OGFC-P.

All HMA LTMF's will be submitted to the Owner with adequate samples of individual ingredients for verification of each proposed mixture. Upon the Owner's laboratory verification of the LTMF for Category A Lots, a Control Strip will be necessary. Once each LTMF for Category B Lots or Category C Lots is laboratory verified and accepted by the Owner, the LTMF will become the approved job mix formula (JMF).

Two or more job-mix formulas per HMA mixture type may be approved for a particular plant, however, only HMA conforming to one job-mix formula is permitted to be produced and placed on any given day.

450.44 Reclaimed Asphalt Pavement (RAP).

Reclaimed Asphalt Pavement (RAP) shall consist of the material obtained from the highways or streets by crushing or milling existing HMA pavements. This material shall be transported to the HMA production facility yard and processed through an appropriate crusher so that the resulting material will contain no particles larger than the maximum aggregate size of the HMA mixture in which it will be used. The material shall be stockpiled on a free draining base, covered and kept separate from the virgin aggregates. The material contained in the RAP stockpiles shall have a reasonably uniform gradation from fine to coarse and shall be protected from accumulation of excessive moisture and shall not be contaminated by foreign materials.

The use of RAP will be permitted at the option of the Design-Builder provided that the end product is in conformance with the approved job-mix formula. The proportion of RAP to virgin aggregate for base course mixtures and intermediate course mixtures shall be limited to a maximum of 40% for drum mix plants and 20% for modified batch plants. The maximum amount of RAP for all surface course mixtures listed in Table 450.1 shall be 15%. No RAP will be allowed in OGFC-P mixtures.

450.46 Manufactured Asphalt Shingles (MAS)

Manufactured Asphalt Shingles (MAS), as defined in M3.11.04, may be used in HMA leveling courses, HMA base courses, and HMA intermediate courses at a maximum rate of 5% by weight only when RAP is not included in the job mix formula. When MAS is used in HMA mixtures containing RAP or other reclaimed materials, the MAS will be considered as part of the overall allowable mass of reclaimed materials in the mixture, as defined in M3.11.06. HMA mixtures containing MAS shall be designed, produced, and placed in accordance with the requirements contained in Section M3.

450.48 Performance Graded Asphalt Binder.

A. Standard Asphalt Binder Grade.

The Asphalt Binder shall be a Performance Graded Asphalt Binder (PGAB) which meets the specification requirements of AASHTO Standard M320. PGAB shall be provided by an Approved Supplier (AS) in accordance with the Approved Supplier Certification (ASC) system outlined in AASHTO R26, "Standard Practice for Certifying Suppliers of Performance Graded Asphalt Binders".

The standard PGAB grade for Massachusetts has been determined based upon the expected minimum and maximum pavement in-service temperature using the *LTPPBind software* with a High Reliability (96-98%). Unless indicated otherwise on the Plans or in the Special Provisions, the standard PGAB Grade of PG64-28 shall be used.

B. Asphalt Binder Modifiers for Reclaimed Materials.

For any HMA containing reclaimed materials, an asphalt binder modifier shall be added to the mixture to restore the asphalt binder properties of the reclaimed materials to a level that is consistent with the specified virgin PGAB. If greater than 25% RAP is used in an HMA mixture, the PGAB modifier grade used shall be in accordance with Table 450.4. The type and amount of asphalt binder modifier to be used shall be included as part of the LTMF. Only Performance Graded Asphalt Binders will be used as modifiers and shall meet the requirements of AASHTO M 320. However, the resulting final PGAB grade shall be in accordance with Table 450.4 (or the specified PGAB grade per the contract).

For HMA Category A Lots and Category B Lots incorporating greater than 25% RAP in the LTMF, the Design-Builder shall perform, as part of the mix design, full binder testing per AASHTO M 320 on samples of asphalt binder recovered from the RAP (by Abson recovery) blended in the appropriate proportion with samples of the virgin PGAB.

For HMA Category A Lots containing greater than 25% RAP, the Design-Builder shall also perform full binder testing (on asphalt binder recovered from the RAP blended with the virgin PGAB) for the Control Strip and for Quality Control during HMA production and placement as specified in Subsection 450.65.

Table 450.4 - PGAB Grades for HMA Mixtures Containing RAP

Amount of RAP in Mixture	PGAB Modifier Grade	Resulting PGAB Grade
\leq 25% RAP by Weight of Mixture	None	64-28
> 25% to 40% RAP by Weight of Mixture	52-34	64-28 \pm 2°C

CONSTRUCTION PROCEDURES

450.50 General.

Prior to the start of any work activity addressed in Subsections 450.53 thru 450.59 below, a Construction Quality Meeting shall be held to review the Design-Builder's Quality Control system. The Design-Builder shall present and discuss with the Owner in sufficient detail the specific Quality Control information and activities contained in each section of their QC Plan as outlined in Subsection 450.61 below. The meeting is intended to ensure that the Design-Builder has an adequate Quality Control system in place and that the Design-Builder's personnel are fully knowledgeable of the roles and activities for which they are responsible to achieve the specified level of quality. Design-Builder personnel required to attend the Construction Quality Meeting include; the Project QC Manager, all other QC personnel (production facility and field operations), all Superintendents, and the Foremen for field operations. The Design-Builder shall provide a copy of the approved QC Plan for each Design-Builder and Department attendee of the meeting.

450.51 Control of Grade and Cross-Section.

The Design-Builder will provide a longitudinal and transverse reference system, with a maximum spacing of 100 ft (30 meters), for the purpose of locating and documenting sampling and testing locations and related uses. It is the Design-Builder's responsibility to clearly mark this reference system in the field. Work related to this reference system is incidental and will be included as part of the Design-Builder's Quality Control system. The Department shall provide information tying in the Design-Builder's reference system to the State Mile Marker System.

The Design-Builder shall furnish, set and maintain all line and grade stakes necessary to guide the automated grade control equipment. Where required these control stakes shall be maintained by the Design-Builder and used throughout the operations, from the grading of the subbase material up to and including the final course of the pavement.

Under normal conditions, where more than one course of HMA is to be constructed, the use of the string line for grade control may be eliminated or discontinued after the construction of the initial course of HMA. For resurfacing projects, where only one course of HMA is to be constructed, the use of the string line for grade control may be eliminated. The use of approved automation may then be substituted for the string line where lines and grades are found to be satisfactory by the Owner.

450.52 Weather Limitations.

HMA shall only be placed on dry, unfrozen surfaces and only when the temperature requirements contained in Table 450.5 below are met.

The Design-Builder may continue HMA placement when overtaken by sudden rain, but only with material which is in transit from the HMA production facility at the time, and then only when the temperature of the HMA mixture is within the temperature limits specified and when the existing surface on the roadway is free of standing moisture.

The construction of HMA pavement shall terminate November 15 and shall not be resumed prior to April 1 except as determined and directed in writing by the Owner depending upon the necessity and emergency of attendant conditions, weather conditions, and location of the project. Only in extreme cases will the placement of surface courses be permitted between November 15 and April 1. Regardless of any temperature requirements, OGFC-P mixtures shall not be placed after October 31 or before May 1 without the written permission of the Owner.

Table 450.5 - Temperature Limitations for HMA Placement

HMA Pavement Course	Lift Thickness Inches (mm)	Minimum Air Temperature °F (°C)	Minimum Surface Temperature °F (°C)
Friction Course	1 (25)	50 (10)	55 (13)
Surface Course	< 1¾ (45)	45 (7)	50 (10)
Surface Course	≥ 1¾ (45)	40 (4)*	45 (7)
Intermediate Course	All	40 (4)*	45 (7)
Base Course	All	40 (4)*	45 (7)
Leveling Course	As Specified	45 (7)	50 (10)

*When the air temperature falls below 50° F (10° C), extra precautions shall be taken in drying the aggregates, controlling the temperatures of the materials, and in placing and compacting the mixtures.

The Design-Builder shall supply the Owner with an approved dial type thermometer with a temperature range of -50° to 500° F (10° to 260° C) and an infrared pistol thermometer for each paving machine in operation on the project. The infrared pistol thermometer shall be Fahrenheit or Celsius selectable and conform to the following requirements:

- Portable and battery operated
- LCD Display to nearest 1° F (1° C)
- Temperature operating range of 0° to 750° F (-18° to 400° C)
- Accuracy of ± 2%
- Repeatability of +/- 5° F (± 3° C)
- Emissivity preset at 0.95

The thermometers will remain the property of the Design-Builder upon completion of the project.

450.53 Preparation of Underlying Surface.

HMA mixtures shall be placed only upon properly prepared surfaces that are clean from foreign materials. The underlying surface shall be prepared in accordance with the requirements below, prior to the placement of HMA pavement courses.

A. Subbase or Reclaimed Base.

Prior to the placement of HMA base course mixtures, the Design-Builder shall inspect the prepared subbase or reclaimed base material to ensure that it is in conformance with the required grade, cross-section, and in-place density. Subbase or reclaimed base material that is not in accordance with the plans or specifications shall be re-worked or replaced to meet the applicable requirements of Sections 401, 402, or 403 before the start of HMA placement. The subbase or reclaimed base shall not be frozen or have standing water when placing HMA.

B. Milling Existing HMA Pavement.

When specified on the plans, existing HMA pavement courses shall be milled and removed from the project by the Design-Builder. Milling shall be performed in conformity with the limits, line, grade, and typical cross-section shown on the plans and in accordance with Section 130, Milling Existing HMA Pavement. All Quality Control activities for milling shall be addressed in the Design-Builder's HMA QC Plan.

C. Patching Existing Pavement Courses.

Areas of existing HMA pavement courses that are significantly distressed or unsound shall be removed and replaced with patches using new Hot Mix Asphalt. The location and limits of patching will be as identified in the plans or as directed by the Owner.

Each existing pavement course determined to be unsound shall be removed to the full depth of the pavement course within a rectangular area. For each patch location equal to or greater than 50 square feet (4.6 square meters) in area (and having a minimum dimension of 4 feet (1.2 meters)) where the existing pavement courses are removed down to subbase, the subbase shall be compacted by mechanical means to not less than 95% of the maximum dry density of the subbase material as determined by AASHTO T 99 method C at optimum moisture content. Each edge of the patch area shall be sawcut or otherwise neatly cut by mechanical means to provide a clean and sound vertical face. The vertical face of each edge shall be thoroughly coated with a hot poured rubberized asphalt sealant meeting the requirements of ASTM D3405 immediately prior to placing the HMA patching mixture.

Delaminated areas of existing pavement courses resulting from pavement milling shall be cut back neatly by mechanical means to the limits of any unsound material. After removing all unsound material, the underlying pavement surface within the patch limits shall receive a thorough tack coat at a rate of application of 1/10 gal/s.y. (0.40 liters/square meter) immediately prior to placing the HMA patching mixture.

HMA patching mixture shall be the same mixture type as the existing pavement course being patched or as specified on the plans or as directed by the Owner. The lift thickness of the patching mixture shall not exceed four times the nominal maximum aggregate size of the mixture. The patching mixture will be placed by hand or by mechanical means and shall match the thickness, grade, and cross-slope of the surrounding pavement. The HMA patching mixture shall be compacted using a steel wheel roller. For patch areas not large enough to permit use of a roller, compaction shall be accomplished using a mechanical tamper capable of achieving the required in-place density. The Design-Builder shall test the in-place density of each patched area using a calibrated density gauge and record the test data for each patched area on NETTCP Test Report Forms. The in-place density of the HMA patching mixture shall be not less than 92% of the maximum theoretical density of the mixture as determined by AASHTO T 209.

D. Leveling Courses.

HMA Leveling Courses shall only be used when specified in the Plans or Special Provisions. The HMA mixture used for a Leveling Course shall be as specified in the Plans or Special Provisions and shall conform to the relevant Materials requirements of Section 450.

E. Preparation of Curbs, Edging, and Utilities.

All curbs or edging shall be installed or reset to the line and grade established on the plans. The surface elevation of all catch basin frames and grates, manholes, utility valve boxes, or other utility structures located in the pavement shall uniformly match the grade and cross-slope of the final pavement riding surface. Adjustment of all curbs, edging, and utilities shall be completed prior to the placement of the HMA surface course. When OGFC-P is specified to be placed over the HMA surface course, all curbs, edging, and utilities shall be adjusted prior to

placement of the surface course mixture. Hand placement of HMA along curbs and edging or around utilities after placement and compaction of the surface course shall not be permitted.

F. Sweeping Underlying Surface.

The Design-Builder shall provide a mechanical sweeper equipped with a water tank, spray assembly to control dust, a pick-up broom, a dual gutter broom, and a dirt hopper. The sweeper shall be capable of removing millings and loose debris from the underlying surface.

All milled pavement surfaces shall be thoroughly swept in accordance with Section 130, prior to opening a milled area to traffic, to remove all remaining millings and dust. All other existing pavement surfaces shall be swept immediately prior to application of the tack coat. Any new HMA pavement course that has been open to traffic, or that was placed 30 days prior to placement of the subsequent pavement course, shall also be swept immediately prior to application of the tack coat.

G. Tack Coat.

A tack coat of asphalt emulsion, grade RS-1 shall be uniformly applied to existing or new pavement surfaces prior to placing pavement courses as specified below. The existing surface shall be swept clean of all foreign matter and loose material using a mechanical sweeper and shall be dry before the tack coat is applied.

(1) Tack Distributor System.

A pressure distributor shall be used to apply the tack coat. The tack distributor system shall be equipped with the following to control and monitor the application:

- (b) System for heating the asphalt emulsion uniformly to specified temperature.
- (c) Thermometer for measuring the asphalt emulsion temperature.
- (d) Adjustable full circulation spray bar.
- (e) Positive controls including tachometer, pressure gauge, and volume measuring device.

(2) Tack Application Requirements.

The tack coat material shall be applied by a pressure distributor. All nozzles on the distributor shall be open and functioning. All nozzles shall be turned at the same angle to the spray bar. Proper nozzle angle shall be as determined by the manufacturer of the distributor spray bar. The spray bar shall be adjusted so that it is at the proper height above the pavement surface to provide a double overlap spray for a uniform coverage of the pavement surface. A double lap application requires that the nozzle spray patterns overlap one another such that every portion of the pavement receives spray from exactly two nozzles.

When an HMA pavement course is placed on an existing tight smooth pavement surface, a tack coat shall be applied at the rate of 1/20 gal/s.y. (0.20 liters/square meter). All existing surfaces subjected to milling shall receive a tack coat at the rate of 1/15 gal/s.y. (0.28 liters/square meter). Tack coat shall be applied to cover approximately 90% of the pavement surface.

Any new HMA pavement course that has been open to traffic, or that was placed 30 days prior to placement of the subsequent pavement course, shall receive a tack coat at an application rate of 1/20 gal/s.y. (0.20 liters/square meter).

When the surface of a new HMA pavement course is in a condition which in the Owner's judgment is unsatisfactory for the direct placement of the subsequent pavement course, a tack coat shall be applied at the applicable rate specified above for the particular pavement surface condition.

In addition to the requirements above, all vertical surfaces of curbs, edging, utilities, and drainage structures shall receive a thorough tack coat application immediately prior to placing each HMA pavement course.

(3) Tack Inspection.

The asphalt emulsion temperature and application rate shall be periodically measured and properly recorded by the Design-Builder on NETTCP Inspection Report Forms. If the temperature or application rate is determined to not be in conformance with the specification requirements above, the Design-Builder shall make appropriate adjustments to the tack application operations.

450.54 Hot Mix Asphalt Transportation and Delivery.

A. Haul Unit Equipment.

The trucks used to transport HMA to the field placement site shall have tight, clean, smooth metal beds. When necessary to maintain the required HMA temperature, trucks shall be equipped with insulated beds. The truck beds shall be evenly and lightly coated with an approved release agent to prevent HMA mixture adherence. Release agents may consist of soapy water or commercial oil emulsions (also known as soluble oils) in the proportions recommended by the manufacturer. Truck beds shall be kept free of kerosene, gasoline, fuel oil, solvents, or other materials that could adversely affect the HMA mixture. Excess lubricant shall not be allowed to accumulate in low spots in the body. The Design-Builder shall employ sufficient procedures and QC inspection to ensure that all truck beds are free of contaminants, residual HMA, or excess release agent.

B. HMA Protection During Transport.

The HMA shall be transported from the plant to the field placement site in trucks previously cleaned of all foreign materials. During transportation of the HMA from the plant to the placement equipment at the site, each load shall be fully covered at all times, without exception, with canvas or other suitable material of sufficient size and thickness, which is tightly secured to furnish complete protection. The HMA shall not be transported such a distance that segregation of the mixture takes place or that a crust is formed on the surface, bottom or sides of the HMA.

C. Coordination and Inspection of HMA Delivery.

The dispatching of trucks from the plant shall be continuously coordinated to ensure that all HMA mixture planned to be delivered to the field placement site may be placed and compacted before the end of the scheduled work day. During paving operations, the Design-Builder shall provide for ongoing two-way radio or cellular phone communication between the field placement site and the HMA plant.

The target temperature and allowable range of the HMA when delivered at the field placement site will be established in the Design-Builder's Quality Control Plan. The Design-Builder shall measure the temperature of the HMA, either from the trucks prior to discharge or from the paver hopper, using a metal stemmed dial type thermometer at the minimum frequency indicated in the approved QC Plan. All QC temperature measurement results of the delivered HMA mixture shall be recorded on NETTCP Inspection Report Forms. The Design-Builder shall also visually inspect the delivered HMA for crusting or material (physical) segregation. The Design-Builder shall reject any loads of HMA with material which is crusted, segregated, or which is not within the delivery temperature range established in the Design-Builder's Quality Control Plan.

450.55 Hot Mix Asphalt Placement.

A. Material Transfer Vehicles

For projects on all controlled access highways with HMA Category A Lots, a Material Transfer Vehicle (MTV) will be required. The MTV shall be used to place each pavement

course, with the exception of leveling courses, on the mainline of the traveled way including all travel lanes, auxiliary lanes, and collector/distributor (C/D) lanes.

(1) MTV Equipment Requirements.

The MTV shall be self-propelled and capable of remixing and transferring the HMA mixture to the paver so that the HMA mat behind the paver has a uniform homogeneous temperature and appearance. The MTV shall be equipped with the following:

- (a) A truck unloading system, capable of 600 tons per hour (550 Mg per hour), which shall receive HMA from the trucks and independently deliver the mixture from the trucks to the paver.
- (b) A paver hopper insert with a minimum capacity of 14 tons (12.7 Mg) shall be installed in the hopper of conventional paving equipment. The paver hopper insert shall be marked to identify the point at which the insert is 50% full.
- (c) An internal storage bin with a minimum capacity of 25 tons (22.7 Mg) of mixture and a remixing system in the bottom of the storage bin to continuously blend the mixture as it discharges to a conveyor system; or a dual pugmill system located in the paver hopper insert with two full length longitudinally mounted counter-rotating screw augers to continuously blend and feed the mixture through the paver to the screed.

(2) MTV Operations.

The Design-Builder shall ensure that the MTV is loaded continuously to keep the paver moving. The volume of HMA in the paver hopper insert shall remain above the 25% capacity mark during all paving operations. In the event the MTV malfunctions during HMA placement operations, the Design-Builder shall continue placement of material until such time there is sufficient HMA placed to maintain traffic in a safe manner. The Design-Builder may continue placement of HMA until any additional mixture in transit has been placed. Paving Operations may resume only after the MTV has been repaired and is fully operational.

(3) Bridge Loading Restrictions.

The MTV shall be subject to all bridge load restrictions. The Design-Builder shall verify the sufficiency of the current bridge ratings with the Owner. In the event that the MTV exceeds the maximum allowable bridge load, the MTV shall be empty when crossing the bridge and shall be moved across without any other Design-Builder vehicles or equipment being on the bridge. The MTV shall be moved across the bridge in a travel lane and shall not be moved across the bridge on the shoulder. The MTV shall be moved at a speed no greater than five miles per hour (8 kph) without any acceleration or deceleration.

B. Pavers.

Each HMA pavement course shall be placed with one or more pavers at the specified grade, cross-slope, and lift thicknesses.

(1) Paver Equipment Requirements.

Each paver shall be a self-contained, power propelled unit and shall produce a finished surface of smooth and uniform texture without segregating, tearing, shoving or gouging the HMA. The pavers shall be equipped with the following:

- (a) A receiving hopper having sufficient capacity to ensure a uniform and continuous placement operation.
- (b) Automatic feed controls, which are properly adjusted to maintain a uniform depth of material ahead of the screed.
- (c) Automatic screed controls with sensors capable of sensing the transverse slope of the screed, and providing the automatic signals that operate the screed to maintain grade and transverse slope.

- (d) An adjustable vibratory screed with full-width screw augers and heated for the full width of the screed.
- (e) Capable of spreading and finishing HMA pavement courses in widths at least 12 inches (300mm) more than the width of one travel lane.
- (f) Capable of being operated at forward speeds to satisfactorily place the HMA.

(2) Paver Operations.

The Design-Builder shall ensure that the paver is loaded continuously to keep the placement operation moving. The volume of HMA in the paver receiving hopper shall remain above the paver tunnel during all paving operations. Proper practices shall be utilized to ensure that HMA is not dumped or spilled onto the prepared underlying surface in front of the paver by trucks unloading into the receiving hopper.

C. HMA Placement Inspection.

The HMA shall be free of identifiable material (physical) segregation or temperature related segregation. The HMA placed shall be a homogeneous mixture that is of uniform temperature. The Design-Builder shall inspect the HMA in the paver receiving hopper for material (physical) segregation. The Design-Builder will also inspect the uncompacted HMA mat behind the paver for longitudinal streaks, end-of-load segregation or other irregularities.

The Design-Builder shall also measure the temperature differential in the uncompacted mat behind the paver. Each HMA pavement course behind the paver shall be divided into longitudinal Sublots of 500 feet (150 meters). The mat temperature differential of the uncompacted HMA shall be measured at a minimum of one location in each Sublot along a straight transverse line behind the paver at a minimum frequency of once per Sublot. The transverse line for mat temperature measurement shall be established at a distance within 10 feet (3 meters) behind the paver screed. Temperature measurements shall be obtained by the Design-Builder using an infrared pistol thermometer at two (2) foot intervals along the transverse line across the width of the mat and recorded on NETTCP Inspection Report Forms. The difference between the highest and lowest temperature measurement shall not exceed 20°F (10°C).

If the maximum mat temperature differential is exceeded, or if material segregation or irregularities in the HMA mat behind the paver are noted, the Design-Builder shall review the production, transportation, and placement operations and take corrective action. The Design-Builder shall make every effort to prevent or correct any irregularities in the HMA, such as changing pavers or using different and additional equipment. The Design-Builder's Quality Control Plan shall fully outline procedures for inspecting the HMA mat during placement, identifying and troubleshooting material segregation or temperature related segregation, and implementing corrective action.

450.56 Hot Mix Asphalt Compaction.

A. Compaction Equipment Requirements.

The Design-Builder shall employ compaction equipment as outlined in the approved Quality Control Plan. Equipment used for compaction of HMA Base Courses, Intermediate Courses and Surface Courses may include steel wheeled rollers, vibratory rollers, oscillation rollers, or pneumatic-tired (rubber tired) rollers as determined appropriate by the Design-Builder for the particular mixture type being placed. The number and type of rollers used for breakdown, intermediate, and finish rolling shall be sufficient to achieve the target in-place density and specified course thickness.

B. Compaction Operations.

The rollers shall not crush the aggregate in the HMA mixture and shall be capable of reversing without shoving or tearing the mixture. The Design-Builder shall outline in the Quality Control Plan the proposed rolling sequence for each HMA pavement course to be placed. For HMA Category A Lots, the initial rolling pattern for each pavement course will be confirmed or adjusted during placement of the Control Strip in accordance with the requirements of Subsection 450.66B. As Lot placement progresses during the construction season, the rolling pattern shall be adjusted as necessary to achieve the specified HMA in-place density.

C. Compaction of Open-Graded Friction Course.

Vibratory rollers, oscillation rollers, or rubber tire rollers will not be permitted on Open Graded Friction Course (OGFC-P) mixtures. Initial rolling of OGFC-P should be accomplished with the breakdown roller within a short distance of the paver. Any subsequent rolling shall be accomplished without over-rolling the mixture. Breakdown and Intermediate Rolling of OGFC-P shall be completed before the material has cooled to 195°F (90°C).

D. Inspection & Testing of Compacted HMA.

The compacted HMA pavement course shall be free of material (physical) segregation and shall meet the requirements for in-place density, thickness, and ride quality specified in Subsection 450.65F. The Design-Builder shall inspect each Sublot of HMA throughout the compaction operation and shall further inspect the in-place HMA after Sublot completion and identify any areas of visible material (physical) segregation. The Design-Builder shall reject any in-place Sublot of HMA which is determined to be segregated through procedures established in the Quality Control Plan. The Design-Builder will also test each Sublot for in-place density, thickness, and ride quality as specified in Subsection 450.65F.

450.57 Hot Mix Asphalt Joints.

The Design-Builder shall plan the sequence of HMA placement to minimize transverse and longitudinal joints in each pavement course. Paving operations should employ long pulls or tandem pavers, whenever practicable, to reduce the number and length of joints.

A. Transverse Joints.

Where the start or end of a new HMA pavement course meets existing HMA pavement, the existing pavement shall be sawcut to form a transverse butt joint for the full depth of all new pavement courses. The sawcut shall follow a straight line and provide a clean and sound vertical face. Material at any intermediate transverse joint resulting from suspension of placement of a new HMA pavement course shall also be sawcut and removed to provide a clean vertical face before continuing placement of the pavement course.

When traffic is to be carried over any transverse joint before completion of an HMA pavement course, the Design-Builder shall provide a temporary tapered joint with a maximum 12:1 slope. The HMA mixture forming the taper shall be placed on heavy wrapping paper or other suitable material to serve as a bond breaker. The temporary tapered joint shall be sawcut to reveal the full depth of the pavement course and form a transverse butt joint with a clean vertical face. The temporary tapered joint material shall be completely removed before resuming placement of the HMA pavement course.

Prior to the start of HMA placement at each transverse joint, the vertical joint face shall be thoroughly coated with a hot poured rubberized asphalt sealant meeting the requirements of ASTM D3405, with a minimum of 15% ground reclaimed tire rubber. The asphalt sealant temperature and application rate for each pavement course shall be established in the

Design-Builder's Quality Control Plan. No reheating of the joint face shall be permitted. Equipment used to apply the hot poured rubberized asphalt sealant shall be capable of maintaining the sealant at the established temperature and application rate sufficient to uniformly coat the vertical joint face without runoff or accumulation of the asphalt sealant.

B. Longitudinal Joints.

All longitudinal joints in HMA surface courses shall be located on the roadway centerline or on a lane line or edge line of the traveled way. The longitudinal joints in each pavement course below the surface course shall be successively offset from the joint in the surface course by no more than 12 inches (300 mm) and no less than six inches (150 mm).

(1) Vertical Joints.

When an HMA pavement course is placed using single paver pulls, the Design-Builder shall employ suitable equipment to confine the longitudinal edge of the HMA mixture to establish an edge that is near vertical. For all HMA surface course mixtures placed, when the Design-Builder's placement operations do not provide a confined and near vertical edge, the longitudinal edge of the surface course shall be sawcut full depth and removed to provide a clean vertical face before placement of the adjacent course of HMA.

All longitudinal joint edges of HMA surface courses, regardless of whether the joint edge is required to be sawcut, shall be treated prior to placing the adjacent pull of HMA. The vertical joint shall be coated with a hot poured rubberized asphalt sealant meeting the requirements of ASTM D3405, with a minimum of 15% ground reclaimed tire rubber. The asphalt sealant shall be applied at a sufficient temperature and application rate sufficient to uniformly coat the vertical joint face without runoff or accumulation of the sealant. The asphalt sealant temperature and application rate shall be established in the Design-Builder's Quality Control Plan. No reheating of the joint shall be permitted.

When placing an HMA surface course with pavers in tandem, the use of the hot poured rubberized asphalt sealant will be omitted, provided the temperature of the mixture at the longitudinal joint does not fall below 200°F (95°C) prior to the placement of the adjacent mat.

When the longitudinal edge of any HMA pavement course is placed against an adjoining edge such as existing pavement, curb, gutter, drainage or utility structure, or any metal surface, a tack coat shall be uniformly applied to the entire vertical joint surface in accordance with Subsection 450.53 prior to placement of the HMA.

(2) Wedge Joints.

The Design-Builder may use a longitudinal wedge joint when placing HMA pavement courses at a thickness of 1.75 inches (45 mm) or greater.

When a wedge joint is proposed for use, the joint detail shall be included in the Design-Builder's QC Plan. The wedge joint shall include a notched vertical edge with a minimum depth of 0.5 inches (12.5 mm). The sloped surface of the wedge joint shall not exceed a 6:1 slope. The Design-Builder shall use a commercially manufactured wedge joint attachment to the paver, or other attachment approved by the Owner, to form the wedge joint.

Hot poured rubberized asphalt sealant shall not be applied to wedge joints. A tack coat shall be applied to the entire surface of the wedge joint in accordance with Subsection 450.53 prior to placement of the adjacent pull of HMA.

C. Inspection & Testing of HMA Joints.

The hot poured rubberized asphalt sealant temperature and application rate shall be measured and properly recorded by the Design-Builder on NETTCP Inspection Report Forms a minimum of once per transverse joint and once per 1,000 feet (300 meters) of longitudinal joint. If the temperature or application rate is determined to not be in conformance with the

requirements established in the Design-Builder's Quality Control Plan, the Design-Builder shall make appropriate adjustments to the asphalt sealant application operations.

The placement and compaction of HMA at each transverse joint or longitudinal joint shall provide a tight bond between the existing pavement and the new pavement course. The Design-Builder shall visually inspect each transverse joint and longitudinal joint throughout the placement and compaction operations and shall further inspect the joints after Sublot completion and identify any bumps, depressions, openings, or other visible defects. The Design-Builder shall reject any in-place Sublot of HMA which is determined to have defective joints through procedures established in the Quality Control Plan.

Finished joint surfaces shall be smooth and true to the required grade and cross-slope without deviations exceeding 0.25 inches (6 mm), both transversely and parallel to the joint, when measured with a 10 foot (3 meter) standard straightedge. The in-place density of the completed HMA pavement course, within 1 foot (300 mm) of either side of the finished joint, shall be not less than 90% of the maximum theoretical density of the mixture as determined by AASHTO T 209. The Design-Builder will measure the surface smoothness and test the in-place density of each transverse joint and longitudinal joint of each Sublot of HMA as specified in Subsection 450.65F. All joint inspection and testing data shall be recorded on NETTCP Inspection Report Forms and Test Report Forms.

450.58 HMA Pavement on Bridges.

A. Bridge Course Mixture Requirements.

HMA pavement courses for bridge decks shall consist of a bridge protective course, placed first, followed by a bridge surface course. Unless specified otherwise on the plans, the bridge protective course mixture shall consist of Dense Binder treated with an approved anti-stripping compound as specified under M3.10.0.

The bridge protective course and bridge surface course shall be placed only after all curbing and edging, when included in the work, are in place. The bridge protective course shall be placed within 24 hours after the membrane waterproofing has been placed, unless an exception is granted by the Owner. No vehicular traffic shall be permitted over any bare membrane waterproofing except as provided for under Subsection 965.62. Equipment used for placement and compaction of the bridge protective course and bridge surface course shall be sufficient to place the HMA mixture at the required grade, cross-slope, thickness, and in-place density without damaging the underlying membrane waterproofing.

B. Inspection & Testing of Bridge Course Mixtures.

The Design-Builder shall inspect and test each Sublot of bridge protective course HMA mixture and bridge surface course HMA mixture in accordance with the requirements for mixture temperature, mat temperature, segregation, and joint quality as specified in Subsections 450.54 through 450.57. QC sampling and testing of each Sublot shall be performed for all HMA loose mix Quality Characteristics specified in Subsection 450.65F. The in-place density of the bridge protective course and bridge surface course shall be randomly tested using a calibrated density gauge and the test data recorded on NETTCP Test Report Forms. The in-place density of the bridge protective course and bridge surface course shall be not less than 90% of the maximum theoretical density of the mixture as determined by AASHTO T 209 and tested per AASHTO TP-68 or ASTM D2950. Cores shall only be allowed for Dispute Resolution. When the HMA bridge surface course is placed in conjunction with mainline pavement, QC testing for ride quality shall be performed as specified in Subsection 450.65F(11).

450.59 Opening to Traffic.

No vehicular traffic or loads shall be permitted on the newly completed HMA pavement until adequate stability has been attained and the material has cooled sufficiently to a temperature of 140° F (60° C) or less as indicated by a surface type thermometer. The Design-Builder shall clearly outline, in the Quality Control Plan, the specific criteria related to opening new pavement to traffic.

HMA cores shall be obtained by the Design-Builder for all Sublots placed each day in accordance with the approved Quality Control Plan prior to opening to traffic. At the discretion of the Owner, based on climactic or other conditions, obtaining of cores may be delayed for a period up to, but not to exceed, 48 hours. In the event of force majeure resulting from direction by Traffic Police or the Owner, the Design-Builder shall document the event and may submit a claim in accordance with current Department procedures. In such event, the affected Sublots will be isolated from the relevant HMA Lot and the HMA quality will be evaluated as a separate Lot.

DESIGN-BUILDER QUALITY CONTROL

450.60 General.

The Design-Builder shall provide a Quality Control (QC) system, as outlined in their Quality Control Plan, adequate to ensure that all materials and workmanship meet the required quality levels for each specified Quality Characteristic. The Design-Builder shall provide qualified QC personnel and QC laboratory facilities and perform Quality Control inspection, sampling, testing, data analysis, corrective action (when necessary), and documentation as outlined further below.

450.61 Design-Builder Quality Control Plan.

For projects with HMA Category A Lots (Large Lot) or Category B Lots (Small Lot), the Design-Builder shall provide and maintain a detailed Quality Control Plan, hereinafter referred to as the "QC Plan". If all HMA Lots fall under Lot Category C (Minor Lot) then a QC Plan is not required. However, if any Lots on the project fall under Lot Category A or Category B, then any Category C Lots must be addressed in the QC Plan. The QC Plan should sufficiently document the QC processes of all Design-Builder parties (i.e. Prime Design-Builder, SubDesign-Builders, Producers) performing work required under Section 450. The QC Plan is not intended to be a generic document, but rather must be project specific.

A. QC Plan Submittal Requirements.

At the pre-construction conference, the Design-Builder shall be prepared to discuss the Quality Control Plan. Information to be discussed shall include the proposed QC Plan submittal date, QC organization, and sources of materials. The Design-Builder shall submit one (1) hard copy and one (1) electronic copy of the QC Plan to the Owner for approval not less than forty-five (45) days prior to the start of any work activities related to HMA pavement construction (including preparation of underlying surface) addressed in Subsections 450.53 thru 450.59. The Design-Builder shall not start work on the subject work items without an approved QC Plan.

B. QC Plan Format and Contents.

The QC Plan shall be structured to follow the format and section headings outlined below, and as outlined in further detail in the New England Transportation Technician Certification Program (NETTCP) "Model QC Plan" for HMA. In the event of discrepancies between the section headings below and the NETTCP Model QC Plan, the current version of the Model QC Plan shall take precedence. The pages of the QC Plan shall be sequentially numbered. The QC Plan shall address, in sufficient detail, the specific information requested under each section and subsection contained in the NETTCP Model QC Plan.

C. QC Plan Approval and Modifications.

Approval of the QC Plan will be based on the inclusion of the required information. Revisions to the QC Plan may be required prior to approval for any part of the QC Plan that is determined by the Department to be insufficient. Approval of the QC Plan does not imply any warranty by the Owner that the QC Plan will result in completed work that complies with the specifications. It remains the responsibility of the Design-Builder to demonstrate such compliance. The Design-Builder may modify the QC Plan as work progresses when circumstances necessitate changes in Quality Control personnel, laboratories, or procedures. In such case, the Design-Builder shall submit an amended QC Plan to the Department for approval a minimum of three calendar days prior to the proposed changes being implemented.

Quality Control Plan Outline

7.1 Preliminary Schedule of Field Operations

7.2 Placement Equipment and Procedures

7.3 Placement QC Activities

7.4 Placement Control Charts

7.5 Evaluation of QC Data (from the placement operations)

7.7 Placement QC Inspection Reporting

450.62 Quality Control Personnel Requirements.

The Design-Builder's Quality Control organization shall, at a minimum, consist of the personnel outlined below that meet the described minimum qualifications. Every effort should be made to maintain consistency in the Quality Control organization, however substitution of qualified personnel shall be allowed. When circumstances necessitate substitution of QC personnel not originally listed in the approved QC Plan, the Design-Builder shall submit an amended QC Plan for approval in accordance with Subsection 450.61C.

A. Quality Control Manager.

The Design-Builder's Quality Control system and QC Plan shall be administered by a qualified project assigned Quality Control Manager (QC Manager). The QC Manager must be a full-time employee of the Design-Builder or a Quality Control consultant engaged by the Design-Builder. The QC Manager shall have full authority to institute any and all actions necessary for the successful implementation of the QC Plan. The QC Manager (or their assistant in the QC Manager's absence) shall be available to communicate with the Owner at all times.

Principal responsibilities of the QC Manager shall include preparation and submittal of the Design-Builder's QC Plan, managing the activities of all QC personnel, communicating on quality issues within the Design-Builder's organization, and ensuring that all requirements outlined in the approved QC Plan are met.

For all projects with HMA Category A Lots (Large Lot), the QC Manager shall be certified by the NETTCP as a Quality Assurance Technologist. For projects having only HMA Category B Lots or Category C Lots, the Design-Builder may submit alternate qualifications for the QC Manager acceptable to the Department.

B. Production Facility Quality Control Technician(s).

All Design-Builder Quality control sampling, testing, and inspection conducted at the HMA production facility shall be performed by qualified Production Facility Quality Control Technicians (Plant QCTs). The Design-Builder shall provide a sufficient number of Plant QCTs to adequately implement the minimum Quality Control requirements contained in Section 450 and as outlined in the approved QC Plan. A minimum of one (1) qualified Plant QCT shall be present at each production facility location. HMA will not be accepted by the Department unless the Plant QCT is physically present at the plant during production and correctly performs the required Quality Control inspection, testing and documentation.

All Plant QCTs shall be certified as a HMA Plant Technician by the NETTCP.

C. Laboratory Quality Control Technician(s).

Any QC testing that is performed at off site laboratories (i.e. other than at the production facility or field site) shall be performed by qualified Laboratory Quality Control Technicians (Laboratory QCTs). The Design-Builder shall provide a sufficient number of Laboratory QCTs to adequately implement the minimum Quality Control requirements contained in Section 450 and as outlined in the approved QC Plan.

All Laboratory QCTs shall be certified as a HMA Plant Technician by the NETTCP.

D. Field Quality Control Technician(s).

All Design-Builder Quality Control sampling, testing, and inspection conducted at the HMA field placement site shall be performed by qualified Field Quality Control Technicians (Field QCTs). The Design-Builder shall provide a sufficient number of Field QCTs to adequately implement the minimum Quality Control requirements contained in Section 450 and as outlined in the approved QC Plan. A minimum of one (1) qualified Field QCT will be present at each field placement site. HMA will not be accepted by the Department unless the Field QCTs is physically

present at the site during pre-placement and placement operations and correctly performs the required Quality Control inspection, testing and documentation.

All Field QCTs shall be certified as a HMA Paving Inspector as certified by the NETTCP.

450.63 Quality Control Laboratory Facility Requirements.

All Design-Builder Quality Control testing shall be performed in laboratories qualified through the NETTCP Laboratory Certification Program (LCP) or accredited through the AASHTO Accreditation Program (AAP). Laboratory facilities shall be kept clean and all equipment shall be maintained in proper working condition. The QC Manager shall have overall responsibility for ensuring that all laboratories utilized for Quality Control are in compliance with the requirements of the NETTCP LCP. This includes providing required AASHTO, ASTM, and NETTCP reference documents and ensuring that all required equipment and tools are properly functioning and calibrated.

The Engineer shall be permitted unrestricted access to inspect and review the Design-Builder's laboratory facility. The Engineer will advise the Design-Builder in writing of any noted deficiencies concerning the laboratory facility, equipment, supplies, or testing personnel and procedures. Deficiencies shall be grounds for the Owner to order an immediate stop to incorporating materials into the work until deficiencies are corrected. The Engineer shall be provided with laboratory space and the availability of laboratory testing equipment to conduct Acceptance testing at the HMA plant.

450.64 Quality Control Inspection.

The Design-Builder shall perform Quality Control inspection of all work items addressed under Section 450. Inspection activities during HMA production and placement may be performed by qualified Production personnel (e.g. Skilled Laborers, Foremen, and Superintendents). However, the Design-Builder's QC personnel shall have overall responsibility for QC inspection. The Design-Builder shall not rely on the results of Department Acceptance inspection for Quality Control purposes. The Engineer shall be provided the opportunity to monitor and witness all QC inspection.

Quality Control inspection activities must address the following four primary components:

- Equipment
- Materials
- Environmental Conditions
- Workmanship

The minimum frequency of Quality Control inspection activity shall be in accordance with the requirements below and as outlined in the approved QC Plan. The results and findings of QC inspection shall be documented on NETTCP Inspection Report Forms (IRFs).

A. QC Inspection for Preparation of Underlying Surface.

The Design-Builder’s personnel will perform Quality Control inspection during preparation of the underlying surface in accordance with the requirements of Subsection 450.53. The minimum items to be inspected shall be as outlined in Table 450.6 and Table 450.7. The Design-Builder shall identify in the QC Plan the specific inspection activities necessary to ensure the quality of the work, including any additional inspection activities not specifically listed in Table 450.6 and Table 450.7.

Table 450.6 - Minimum QC Inspection of HMA Patching Operations

Inspection Component	Items Inspected	Minimum Inspection Frequency	Point of Inspection	Inspection Method
Equipment	As specified in QC Plan	Per QC Plan	Per QC Plan	Per QC Plan
Materials	Aggregates & PG Binder (Correct Type)	Per QC Plan	HMA Production Facility	Visual Check + Manufacturer COC
	Rubberized Asphalt Sealant (Correct Type)	Per QC Plan	Per QC Plan	Check Manufacturer COC
	Temperature of HMA Mix	4 per Day ⁽¹⁾	From Haul Vehicle at Patching Site	Check Measurement
Environmental Conditions	Underlying Surface Soundness & Moisture	Per QC Plan	Underlying Surface	Visual Check
	Temperature of Air & Underlying Surface	1 per Day ⁽²⁾	At Patching Site	Check Measurement
Workmanship	Sawcut Limit Vertical Face	Per QC Plan	Sawcut Limits	Visual Check
	Rubberized Asphalt Sealant Application Rate	Per QC Plan	Sawcut Limits	Check Measurement
	HMA Lift Thickness	Per QC Plan	HMA Lift	Check Measurement
	Cross-Slope & Profile	Per QC Plan	Compacted HMA	Check Measurement

- (1) The initial temperature measurements will be taken from haul vehicles on the first or second load.
- (2) As a minimum, the temperature measurements of the air and underlying surface shall be obtained prior to starting the HMA patching placement.

Table 450.7 - Minimum QC Inspection of Tack Coat Operations

Inspection Component	Items Inspected	Minimum Inspection Frequency	Point of Inspection	Inspection Method
Equipment	As specified in QC Plan	Per QC Plan	Per QC Plan	Per QC Plan
Materials	Asphalt Emulsion (Correct Type)	Per QC Plan	Per QC Plan	Check Manufacturer COC
	Asphalt Emulsion Temperature	(See Note 1)	From Tack Distributor System	Check Measurement
Environmental Conditions	Underlying Surface Cleanliness & Moisture	Per QC Plan	Underlying Surface	Visual Check
	Temperature of Air & Underlying Surface	1 per Day ⁽²⁾	At Paving Site	Check Measurement
Workmanship	Asphalt Emulsion Application Rate	(See Note 1)	From Tack Distributor System	Check Measurement

- (1) The Asphalt Emulsion Temperature and Application Rate shall be checked as follows:
- After application of the first 1,000 lane-feet (300 lane-meters) per HMA pavement course.
 - After application of the next 1,500 lane-feet (450 lane-meters) per HMA pavement course.
 - After application of the next 2,500 lane-feet (750 lane-meters) per HMA pavement course.
 - Thereafter, a minimum of once per 5,000 lane-feet (1500 lane-meters) each day.
- (2) As a minimum, the temperature measurements of the air and underlying surface shall be obtained prior to starting the tack coat placement.

B. QC Inspection for Production & Placement of HMA Lots.

The Design-Builder’s QC personnel will perform Quality Control inspection at both the HMA production facility and at the site of HMA field placement to ensure that the production and placement processes are providing work conforming to the contract requirements. The minimum items to be inspected for each HMA Lot shall be in accordance with the requirements of Subsection 450.54 thru Subsection 450.59 and as outlined in Table 450.8a and Table 450.8b. The Design-Builder shall identify in the QC Plan the specific inspection activities necessary to ensure the quality of the work, including any additional inspection activities not specifically listed in Table 450.8a and Table 450.8b.

(1) Wheel Path Deviations.

A wheel path is defined as 3 feet (1 meter) from and parallel to each longitudinal edge of a travel lane. Each wheel path for all HMA pavement course Lots shall be inspected for Wheel Path Deviations (high points or low points). Inspection shall be performed using a 10-foot (3 meter) standard straightedge in the longitudinal direction on each wheel path. The Sublot size and minimum frequency of QC inspection for Wheel Path Deviations shall be as specified in Table 450.8b, and in the approved Design-Builder Quality Control Plan. Each random inspection location shall be established by determining a randomly selected distance along the wheel path in accordance with ASTM D3665. Additional selective QC inspection for Wheel Path Deviations within each Sublot of compacted HMA pavement courses shall be as determined necessary by the Field QCT and as specified in the Design-Builder’s approved QC Plan.

The variation from the edge of the 10-foot (3 meter) straightedge to the top of the wheel path surface between any two contact points in the wheel path shall not exceed 0.25 inches (6 mm). The Design-Builder shall correct any location in a pavement course wheel path not meeting

this requirement. The corrective method(s) proposed by the Design-Builder shall be subject to the approval of the Department and shall be performed at the Design-Builder's expense. The Design-Builder shall re-inspect any Sublots where corrections are made and provide the Department with a copy of the inspection data for the corrected Sublots.

Table 450.8a - Minimum QC Inspection at HMA Production Facility

	Sawcut Joint Vertical Face	Per QC Plan	Joint Vertical Face	Visual Check
	Rubberized Asphalt Sealant Application Rate	Once per 1,000 ft (300 meters) per joint	Joint Vertical Face	Check Measurement
	Temperature Differential in HMA Mat	Once per 500 feet (150 meters) per pavement course	HMA Mat Behind Paver	Per Subsection 450.55C
	Physical Segregation	Per QC Plan	HMA Mat Behind Paver & Compacted HMA	Visual Check
	HMA Lift Thickness	Per QC Plan	HMA Lift	Check Measurement
	Cross-Slope	Per QC Plan	Compacted HMA	Check Measurement
	Joint Tightness	Per QC Plan	Compacted HMA	Visual Check
	Joint Surface Deviations	Once per 500 feet (150 meters) per joint	At Finished Joint	10 foot (3 meter) standard straightedge
	Wheel Path Deviations	Once per 2,000 ft (600 meters) per Wheel Path	Wheel Path	10 foot (3 meter) standard straightedge

(1) The initial temperature measurements will be taken from the first or second load.

(2) As a minimum, the temperature measurements of the air and underlying surface shall be obtained prior to starting the HMA placement.

450.65 Quality Control Sampling and Testing Requirements.

The Design-Builder's QC personnel will perform Quality Control sampling and testing at both the HMA production facility and at the site of HMA field placement to ensure that the production and placement processes are providing work conforming to the contract requirements. The Engineer will not sample or test for Quality Control or assist in controlling the Design-Builder's operations. All QC sampling and testing shall be in accordance with the AASHTO, ASTM, NETTCP, or Department procedures specified in Table 450.9 and Table 450.10. The Design-Builder shall furnish approved containers for all material samples. The Engineer shall be provided the opportunity to monitor and witness all QC sampling and testing.

A. Random Sampling.

The Design-Builder's Quality Control system shall utilize stratified random sampling of each Lot produced and placed to assure that all material within the Lot has an equal probability of being selected for testing.. The Design-Builder's qualified QC personnel shall obtain random QC samples at the minimum frequencies specified in Table 450.9 and Table 450.10. In all cases, application of the specified QC sampling frequencies shall result in a minimum one random sample per Sublot.

Random sample locations shall be determined using the random number tables and procedures contained in ASTM D 3665 or an electronic random number generator, as presented by the NETTCP. The determination of all random sample locations shall be documented on NETTCP Standard Test Report Form D3665. The Design-Builder will provide the Owner with the random QC sampling locations selected and documented for each Sublot prior to production and placement of the relevant Sublots.

B. Selective Sampling.

The Design-Builder's Quality Control system will also utilize selective sampling (i.e. non-random samples) as needed to provide supplemental information to assist in maintaining all production and placement processes in control. The Design-Builder's qualified QC personnel shall obtain selective QC samples from any Sublot as determined necessary and in accordance with the guidelines established in the approved QC Plan.

C. QC Sample Identification System.

The Design-Builder shall establish a reliable system for the identification of all QC samples obtained. All PG Asphalt Binder samples, HMA loose mixture samples, and core samples shall be correctly labeled with the following minimum information:

- (a) Contract No.
- (b) Date of Sample.
- (c) Mixture Type.
- (d) Lot & Sublot No.
- (e) Sample No.
- (f) Sample Type (i.e. Random or Selective).
- (g) Sample Location (e.g. Station & Offset).

All QC sampling data for Ride Quality and Wheel Path Deviations will be identified by the Design-Builder as directed by the Owner. The Design-Builder's system and procedures for identification of QC samples shall be outlined in the approved QC Plan.

D. Retention of Split Samples.

The Design-Builder’s qualified QC personnel shall obtain all material samples (PGAB samples, HMA loose mix samples, and cores) for QC testing. The Design-Builder will retain split samples from each PGAB sample and HMA loose mix sample and provide a split sample to the Owner if requested. The Design-Builder shall retain the original core samples after testing to serve as “split samples” and protect them from damage. All split samples shall be properly labeled and stored for a period of (30) days, or until tested. These split samples (PGAB samples, HMA loose mix samples, and cores) will be utilized if necessary, in the Dispute Resolution process. If mutually agreed upon by the Design-Builder and the Department, the retained split samples may be discarded prior to the required thirty (30) days.

E. Quality Control Testing of Prepared Underlying Surface.

The Design-Builder’s QC personnel will perform Quality Control testing during preparation of the underlying surface. All QC testing shall be in accordance with the AASHTO, ASTM, NETTCP, or Department procedures specified in Table 450.9. The Engineer shall be provided the opportunity to monitor and witness all QC testing.

Table 450.9 - Minimum QC Sampling & Testing of Prepared Underlying Surface

Quality Characteristic	Test Method(s)	Sublot Size	Minimum Test Frequency	Point of Sampling	Sampling Method
HMA Patching Mixture: PG Asphalt Binder Content	AASHTO T164 or AASHTO T308	150 tons (140 Mg)	1 per Sublot	From Haul Vehicle at Plant	Random AASHTO T168
HMA Patching Mixture: Combined Agg. Gradation	AASHTO T30	150 tons (140 Mg)	1 per Sublot	From Haul Vehicle at Plant	Random AASHTO T168
HMA Patching Mixture: Maximum Theo. Specific Gravity	AASHTO T209	150 tons (140 Mg)	1 per Sublot	From Haul Vehicle at Plant	Random AASHTO T168
HMA Patching Mixture: In-place Density	ASTM D2950 or AASHTO TP68	100 sq. feet. (10 sq. meter) per each Patch Area	1 per Sublot	From Compacted HMA Patch	Random ASTM D2950, AASHTO TP68

F. Quality Control Testing of HMA Lots.

The Design-Builder’s QC personnel will perform Quality Control testing at both the HMA production facility and at the site of HMA field placement to ensure that the production and placement processes are providing work conforming to the contract requirements. The Engineer shall be provided the opportunity to monitor and witness all QC testing of HMA. All QC testing of HMA Lots shall be in accordance with the AASHTO, ASTM, NETTCP, or Department test methods specified in Table 450.10 and the procedures outlined below.

Table 450.10 - Minimum Quality Control Sampling & Testing of HMA Lots

Quality Characteristic	Test Method(s)	Sublot Size	Minimum Test Frequency	Point of Sampling	Sampling Method
PG Asphalt Binder Grading	AASHTO M320	Per Supplier QC Plan or 24,000 tons (22,000 Mg) of HMA per Subsection 450.65F(1)	See Subsection 450.65F(1)	See Subsection 450.65F(1)	Random AASHTO T40
Aggregate Gradation	AASHTO T27	Per QC Plan	Per QC Plan	At HMA Plant Per QC Plan	Random AASHTO T2
PG Asphalt Binder Content	AASHTO T164 or AASHTO T308	600 tons (550 Mg)	1 per Sublot ⁽¹⁾	From Haul Vehicle at Plant	Random AASHTO T168
Combined Aggregate Gradation	AASHTO T30	600 tons (550 Mg)	1 per Sublot ⁽¹⁾	From Haul Vehicle at Plant	Random AASHTO T168
Maximum Theo. Specific Gravity	AASHTO T209	600 tons (550 Mg)	1 per Sublot ⁽¹⁾	From Haul Vehicle at Plant	Random AASHTO T168
Bulk Specific Gravity	AASHTO T166 (SSD Method)	600 tons (550 Mg)	1 per Sublot ⁽¹⁾	From Haul Vehicle at Plant	Random AASHTO T168
Volumetrics: Air Voids, VMA, VFA	AASHTO T245	600 tons (550 Mg)	1 per Sublot ⁽¹⁾	From Haul Vehicle at Plant	Random AASHTO T168
In-place HMA Mat Density (Density Gauge)	ASTM D2950 or AASHTO TP68	150 tons (140 Mg)	1 per Sublot ⁽¹⁾	From Compacted HMA Course	Selective & Random ASTM D2950, AASHTO TP68
In-place HMA Mat Density (Cores)	AASHTO T230 AASHTO T166 AASHTO T269	600 tons (550 Mg)	1 per Sublot ⁽¹⁾	From Compacted HMA Course	Random AASHTO T269
Thickness	AASHTO T269	600 tons (550 Mg)	1 per Sublot ⁽¹⁾	From Compacted HMA	Random AASHTO T269
Transverse Joint Density	ASTM D2950 or AASHTO TP68	Each Joint	1 per Sublot ⁽¹⁾	At Finished Joint	Random ASTM D2950, AASHTO TP68
Longitudinal Joint Density	ASTM D2950 or AASHTO TP68	500 feet (150 meters) per Joint	1 per Sublot ⁽¹⁾	At Finished Joint	Random ASTM D2950, AASHTO TP68
Ride Quality (IRI)	AASHTO PP52 Per Subsection 450.65F(11)	0.1 miles (160 meters) per each Wheel Path	3 Runs per Sublot	Each Pavement Course Per Subsection 450.65F(11)	Random Per Subsection 450.65F(11)
Wheel Path Deviations	10 foot (3 meter) standard straightedge	500 feet (150 meters) per each Wheel Path	1 per Sublot ⁽¹⁾	Each Pavement Course Per Subsection 450.65F(12)	Random Per QC Plan

(1) In the event that the total daily HMA production is less than one Sublot, a minimum of one random QC sample shall be obtained for the day's production.

(1) PG Asphalt Binder Grading.

QC testing of PG Asphalt Binder shall be performed by the PGAB Supplier in accordance with AASHTO R26 and the Supplier's approved PGAB Quality Control Plan. The Design-Builder shall submit to the Owner a Supplier's Certificate of Compliance (COC) along with copies of the certified AASHTO M320 test results for each Supplier Lot of PGAB from which the HMA Producer's PGAB was obtained.

If the Design-Builder modifies the PGAB at the HMA production facility through blending or introduction of an asphalt binder modifier, the Design-Builder (i.e. HMA Producer) shall assume responsibility as the PGAB Supplier per AASHTO R26. In such case, the Design-Builder shall obtain and test a minimum of one random sample of the modified PGAB for each 24,000 ton (22,000 Mg) HMA Sublot, as defined in Table 450.10, to determine conformance with AASHTO M320. A minimum of two 1-quart (1 Liter) containers of PGAB shall be obtained for each PGAB sample in accordance with AASHTO T40. All QC samples shall be split prior to testing and the un-tested portion of the sample shall be retained for a minimum of 30 days.

For HMA Category A Lots incorporating greater than 25% RAP or greater in the job-mix formula, the Design-Builder shall perform full asphalt binder grade testing on a minimum of one random sample from the Control Strip and from each Sublot as specified in Table 450.10 during HMA Lot production. The QC testing shall be performed on samples of asphalt binder recovered from the RAP (by Abson recovery) blended in the appropriate proportion with samples of the virgin PGAB to determine conformance with AASHTO M320. The PG Asphalt Binder Grade testing results shall be within $\pm 2^{\circ}\text{C}$ of the specified PGAB grade for the HMA pavement course mixture.

(2) Aggregate Gradation.

The virgin aggregates utilized in each HMA Lot shall be tested for Gradation in accordance with AASHTO T27. The Sublot size and minimum frequency of QC testing for Aggregate Gradation shall be as specified in the Design-Builder's approved QC Plan. Aggregate samples shall be obtained at the HMA plant from aggregate bins or stockpiles in accordance with AASHTO T2.

(3) PG Asphalt Binder Content.

Each HMA Lot produced and placed shall be tested for PG Asphalt Binder Content in accordance with either AASHTO T164 or T308. When AASHTO T164 is used, the test results shall be reported prior to ash correction. The Sublot size and minimum frequency of QC testing for PG Asphalt Binder Content shall be as specified in Table 450.10. Each material sample for PG Asphalt Binder Content shall be obtained at the HMA plant from a randomly selected quadrant from the haul vehicle in accordance with ASTM D3665 and AASHTO T168.

(4) Combined Aggregate Gradation.

Each HMA Lot produced and placed shall be tested for Combined Aggregate Gradation in accordance with AASHTO T30. The Sublot size and minimum frequency of QC testing for Combined Aggregate Gradation shall be as specified in Table 450.10. Each material sample for Combined Aggregate Gradation shall be obtained at the HMA plant from a randomly selected quadrant from the haul vehicle in accordance with ASTM D3665 and AASHTO T168.

The QC test results of Combined Aggregate Gradation must be plotted on Control Charts with Action Limits. Recommended Action Limits are provided in Table 450.11, however, the Action Limits to be used for each HMA Lot shall be as specified in the Design-Builder's approved QC Plan. If the QC test results for an individual Sublot fall outside of the established Action Limits, the Design-Builder shall evaluate the HMA production process and determine any adjustments necessary to bring the Combined Aggregate Gradation back within the Action Limits. If the subsequent Sublot test result falls outside of the Action Limits, the Design-Builder shall suspend Lot production until it can be demonstrated that the HMA mixture can be produced within the Action Limits. The Design-Builder's QC personnel shall document all action(s) taken to bring the HMA production process into control.

Table 450.11 - Recommended Action limits for Combined Aggregate Gradation

Sieve Size	Action Limit
Passing No. 4 Sieve (4.75mm) and larger sieve sizes	JMF Target +/-6 percent
Passing No. 8 sieves (2.36mm)	JMF Target +/-5 percent
Passing No. 16 (1.18mm) to No. 50 (300µm) sieves (inclusive)	JMF Target +/-3 percent
Passing No. 100(150µm) sieve	JMF Target +/-2 percent
Passing No. 200(75µm) sieve	JMF Target +/-1 percent

(5) Maximum Theoretical Specific Gravity.

Each HMA Lot produced and placed shall be tested for Maximum Theoretical Specific Gravity in accordance with AASHTO T209. The Sublot size and minimum frequency of QC testing for Maximum Theoretical Specific Gravity shall be as specified in Table 450.10. Each material sample for Maximum Theoretical Specific Gravity shall be obtained at the HMA plant from a randomly selected quadrant from the haul vehicle in accordance with ASTM D3665 and AASHTO T168.

(6) Bulk Specific Gravity.

Each HMA Lot produced and placed shall be tested for Bulk Specific Gravity in accordance with AASHTO T166 (SSD Method). The Sublot size and minimum frequency of QC testing for Bulk Specific Gravity shall be as specified in Table 450.10. Each material sample for Bulk Specific Gravity shall be obtained at the HMA plant from a randomly selected quadrant from the haul vehicle in accordance with ASTM D3665 and AASHTO T168.

(7) Volumetrics (Air Voids, VMA, VFA).

Each HMA Lot produced and placed shall be tested for Volumetrics (Air Voids, VMA, VFA) in accordance with AASHTO T245. The requirement for Volumetric testing of laboratory compacted specimens applies to HMA mixtures for all pavement courses, with the exception of Open Graded Friction Courses and Base Courses. The Sublot size and minimum frequency of QC testing for Volumetrics shall be as specified in Table 450.10. Each material sample for Volumetrics shall be obtained at the HMA plant from a randomly selected quadrant from the haul vehicle in accordance with ASTM D3665 and AASHTO T168.

(8) In-place HMA Mat Density.

Each HMA Lot produced and placed shall be tested for In-place Density using a density gauge or cores as specified below. The requirement for In-Place Density testing applies to all pavement courses, with the exception of Open Graded Friction Courses and Leveling Courses. The Sublot size and minimum frequency of random QC testing for In-place Density by either density gauge or core shall be as specified in Table 450.10.

(a) Testing In-Place Density by Density Gauge. Initial QC testing of In-Place Density during compaction of HMA pavement courses shall be performed selectively (or randomly when determined appropriate by QC personnel) using a density gauge in accordance with ASTM D2950 or AASHTO TP 68. QC testing of In-Place Density for all HMA bridge protective courses and bridge surface courses shall be performed randomly using a density gauge. Each random sampling and testing location for HMA bridge courses shall be established by determining a randomly selected tonnage and corresponding approximate longitudinal distance within the Sublot, along with a randomly selected offset distance in accordance with ASTM D3665. Additional selective QC sampling and testing within each Sublot of compacted HMA bridge protective courses or bridge surface courses shall be as determined necessary by the Design-Builder's QC personnel and as specified in the Design-Builder's approved QC Plan.

(b) Testing In-Place Density by Cores. Final QC testing of In-Place Density of all applicable HMA pavement courses shall be performed using 6-inch (150 mm) diameter cores in accordance with AASHTO T230, T166, and T269. Cores shall not be obtained from bridge protective surface courses. In-Place Density shall be de-

terminated from each core by comparing the Bulk Specific Gravity of the core to the average Maximum Theoretical Specific Gravity for all HMA mixture Sublots produced for the pavement course on the same day's production. Each core location shall be established by determining a randomly selected tonnage and corresponding approximate longitudinal distance within the Sublot, along with a randomly selected offset distance in accordance with ASTM D3665. If the randomly determined sampling location coincides with one of the following conditions, the sampling location shall be relocated immediately beyond the boundary distance as indicated below for the specific condition:

1. Within 1 foot (300mm) from an edge of pavement course to be left unconfined upon project completion
2. Within 1 foot (300mm) of any longitudinal joint or transverse joint.
3. Within 3 feet (1 meter) of any drainage structure.

Core samples shall be obtained in accordance with AASHTO T230 prior to opening the pavement course to traffic. At the discretion of the Owner, based on climactic or other conditions, obtaining of cores may be delayed for a period up to, but not to exceed, 48 hours. All cores shall be protected against damage and tested within 24 hours after they have been obtained. The Design-Builder shall fill all core holes, whether from QC sampling or Department Acceptance sampling, with fresh HMA mixture from the same Lot. The filled core holes shall be thoroughly compacted as outlined in the Design-Builder's approved QC Plan.

(9) Thickness.

Each HMA pavement course specified to be placed at a compacted thickness of 1 inch (25mm) or greater shall be tested for Thickness using cores, with the exception of the following courses:

1. Open Graded Friction Course.
2. Bridge Surface Course.
3. Bridge Protective Course.
4. Leveling Course.
5. In the absence of a Leveling Course, the first pavement course placed over existing pavement.

The aforementioned pavement courses are exempt only from determination of Thickness using cores and the corresponding statistical evaluation of Lot quality. The Design-Builder is still responsible for ensuring the minimum required thickness of these pavement courses using an appropriate sampling and testing protocol as outlined in the Design-Builder's approved QC Plan.

All sampling and testing for Thickness of the applicable pavement courses using cores shall be in accordance with AASHTO T269. The Sublot size and minimum frequency of random QC testing for Thickness shall be as specified in Table 450.10.

(10) Joint Density.

Each transverse joint and longitudinal joint formed during placement of a pavement course shall be tested for Joint Density using a density gauge in accordance with ASTM D2950. The requirement for Joint Density testing applies to all pavement courses, with the exception of Open Graded Friction Courses and Leveling Courses. The Sublot size and minimum frequency of random QC testing for Joint Density shall be as specified in Table 450.10.

Each random sampling and testing location shall be established by determining a randomly selected distance along the joint, along with a randomly selected offset distance within 1 foot (300 mm) of either side of the finished joint, in accordance with ASTM D3665. Additional selective QC sampling and testing of Joint Density within each Sublot of compacted HMA pavement courses or bridge protective surface courses shall be as determined necessary by the Field QCT and as specified in the Design-Builder's approved QC Plan.

(11) Ride Quality.

The finished surface of the pavement shall be uniform in appearance, free from irregularities in contour and texture and shall present a smooth riding surface. Ride Quality testing shall be performed for Quality Control on a periodic basis during construction of the HMA pavement courses specified below. QC testing shall be performed for HMA Category A Lots, at a minimum, within 24 hours after each 8 lane-miles (13 lane-kilometers) of an individual pavement course have been placed. QC testing of HMA Category B Lots shall be performed, at a minimum, every other paving day. In addition, the Design-Builder shall perform QC testing of the entire final pavement course placed upon completion.

(a) Pavement Courses Subject to Ride Quality Testing. For projects having a posted speed equal to or greater than 40 mph with HMA Lots falling under Lot Category A (Large Lots) or Category B (Small Lots), QC testing shall be performed with an inertial profiler to determine the Ride Quality of the following pavement courses:

- Friction Course (OGFC-P)
- Surface Course
- Intermediate Course (lift immediately beneath Surface Course only)
- Leveling Course (when placed immediately beneath Surface Course)
- Bridge Surface Course (when asphaltic bridge joints are used and when placed on the same contract with the mainline Surface Course)

At a minimum, the finished surface of these pavement courses will be tested for all mainline travel lanes, auxiliary lanes, ramps, and side road travel lanes. The Design-Builder may also elect to perform Ride Quality testing of the pavement courses beneath the courses indicated above in order to provide adequate Quality Control.

(b) Pavement Courses Excluded from Ride Quality Testing

The following pavement courses and surfaces are specifically excluded from Ride Quality testing:

1. All exposed concrete bridge decks and any Bridge Surface Course without asphaltic bridge joints (including 15 feet (5 meters) before the approach joint and 15 feet (5 meters) after the departure joint).
2. Mainline pavement courses less than one half mile (800 meters) in total length (excluding bridge lengths).
3. Side road pavement courses less than one Sublot (0.1 mile (160 meters)) in total length.
4. Single resurfacing pavement courses placed in one lift at a total plan (compacted) thickness less than 1.50 inches (40 millimeters).
5. Pavement courses on horizontal curves having a centerline radius of curvature of 500 feet (150 meters) or less, including the length of pavement within the super-elevation transition of such curves.
6. Pavement courses for shoulders.
7. Pavement segments with manholes or catch basins in the travel lane (the Ride Quality testing data for such pavement segments shall be excluded, including 15 feet (5 meters) before and after these manholes or catch basins).

(c) Inertial Profiler Equipment Requirements. All inertial profilers used for Design-Builder QC testing shall conform to the equipment specifications contained in AASHTO PP50 and ASTM E950. The inertial profiler shall be equipped with a system of transducers (height sensor, accelerometer, distance sensor) to measure the longitudinal pavement profile. An automated triggering system shall be provided that detects a reference mark to start, stop, and event mark the data collection process. The profiler equipment shall include an onboard computer system capable of storing all profile measurement data, calculating the real time International Roughness Index (IRI) per ASTM E1926 (independent of speed), and displaying profile plots.

(d) Certification and Correlation of Inertial Profilers. All inertial profilers used for Design-Builder QC testing must be certified for precision and accuracy in accordance with the requirements of AASHTO PP51. In addition, all Design-Builder QC profilers must be correlated against the Department's reference profiling device in accordance with the Department's correlation procedures. The certification and correlation of all profilers shall be conducted at the Profiler Correlation Center in New Bedford, MA established by the University of Massachusetts at Dartmouth. The certification and initial correlation of the Design-Builder's inertial profiler shall be completed prior to the start of Ride Quality testing on the project. After the initial correlation is successfully completed, the same inertial profiler can be used on any Department project without re-correlation for the remainder of the construction season. Equipment that does not pass the Department's correlation procedure shall not be used. The Design-Builder's use of inertial profiler equipment that has not been successfully correlated is sufficient grounds for withholding payment for QC testing of Ride Quality. The Design-Builder's inertial profiler equipment may be required to undergo re-correlation at any time during the construction season if significant variations are found within the Design-Builder's QC test data or between the QC test data and the Department's Acceptance test data.

(e) Ride Quality Testing Procedures. Ride Quality testing shall be performed in accordance with the procedures outlined in AASHTO PP52, as clarified or amended herein.

The Ride Quality will be measured for each wheel path [a wheel path is defined as 3 feet (1 meter) from and parallel to each longitudinal edge of the lane to be measured]. Each wheel path will be divided into 0.1 mile (160 meters) Sublots starting at the project limits in the direction of traffic. Partial Sublots may result at either end of the project or as a result of interruptions of the continuous pavement surface (i.e. bridge approaches, railroad crossing, cessation of daily paving operations, etc.).

Just prior to testing, the Design-Builder shall sweep the pavement and remove all foreign objects or materials on the pavement course surface. Testing will begin 15 feet (5 meters) after the transverse approach joint and end 15 feet (5 meters) before the transverse departure joint. A minimum of three and up to a maximum of five test runs will be performed on each wheel path. The final test result for each Sublot will be the average of the three best test runs.

(f) Data Format and Reporting Requirements. All Ride Quality QC testing data shall be collected and saved in electronic format in an ASCII data file. A copy of the raw data file shall be provided to the Owner on site immediately following testing of completed Sublots. A longitudinal profile shall be determined for all Sublots tested and an average IRI value shall be determined and reported for each Sublot (i.e. each 0.1 mile (160 meters) segment of each wheel path). The Design-Builder shall summarize the results for all Sublots, by corresponding Ride Quality Lot, in an electronic spreadsheet file (MS Excel) consistent with the format of the Department’s QA Spreadsheets. The summary spreadsheet of QC testing data shall be submitted to the Department, electronically and in hardcopy, within two days after the testing is completed.

(g) Ride Quality Monitoring & Corrective Action. The Design-Builder shall evaluate and monitor the test data for each pavement course requiring Ride Quality testing for conformance with the applicable Quality Limits specified in Table 450.19. If the running Quality Level for all Sublots placed and tested falls below the Suspension Quality Level (70 PWL), the Design-Builder shall suspend further placement of the corresponding pavement course and evaluate the Sublots placed for appropriate corrective action. If the running Mean IRI of all Sublots placed and tested for the pavement course immediately below the final course is greater than the Action Limits specified in Table 450.12, corrective action will be required prior to placement of the final pavement course.

When Ride Quality correction is required, the Design-Builder shall use one or more of the following corrective methods:

1. Removal and replacement of the entire pavement course.
2. Partial depth removal of the pavement course by milling and placement of new pavement course(s) of the same mixture type.
3. Overlaying (not patching) with the specified pavement course.
4. Diamond grinding or use of other surface profiling devices.

The corrective method(s) chosen by the Design-Builder shall be subject to the approval of the Department and shall be performed at the Design-Builder's expense. The Design-Builder shall retest any Sublots where corrections are made and provide the Department with a copy of the raw data file, the profile plot, and the IRI summary spreadsheet data for the corrected Sublots.

Table 450.12 - Action Limits for Pavement Course Below Final Pavement Course

Posted Speed Limit⁽¹⁾	Target IRI	Maximum Mean IRI of All Sublots Tested
Greater than or equal to 55 mph (90 km/hr)	60 in/mile (0.95 m/km)	≤ 85 in/mile (1.34 m/km)
40 mph (65 km/hr) to 55 mph (90 km/hr)	80 in/mile (1.26 m/km)	≤ 105 in/mile (1.66 m/km)
Less than 40 mph (65km/hr)	Not subject to Ride Quality testing	N/A

- (1) Note that projects with posted speed limits that fall into more than one of the Posted Speed Limit ranges above will be divided into multiple Lots and evaluated separately.

450.66 HMA Mix Design Verification and Control Strip Requirements.

For all pavement courses with HMA Lots falling under Lot Category A (Large Lots), the HMA mix design Verification and Control Strip procedures outlined below shall apply.

A. Laboratory Verification of HMA Mix Design.

The Design-Builder shall develop and submit a Laboratory Trial Mix Formula (LTMF) for each HMA mixture type, which is to be proposed as a Job Mix Formula, a minimum of forty-five (45) days prior to the start of HMA production. The Design-Builder shall not proceed to HMA production for the Control Strip as outlined below until the LTMF is verified by the Department.

B. HMA Control Strip.

The Design-Builder shall produce and place a Control Strip Lot for all HMA pavement courses, with the exception of Leveling Courses, on the first day of HMA production. The Control Strip will be used to verify that the HMA can be produced per the LTMF, to establish compaction patterns, and to verify that the equipment and processes for lay-down and compaction are capable of providing the HMA pavement course in conformance with these specifications. The Control Strip Lot shall consist of a minimum of 600 tons (550 Mg) of HMA, but not more than 1,800 tons (1,650 Mg). Each Control Strip will be divided into three (3) equal Sublots. The Design-Builder and the Department will both perform inspection, sampling, and testing on the Control Strip and evaluate the corresponding data as outlined below.

(1) Control Strip Inspection.

The Design-Builder's QC personnel shall perform inspection of each Control Strip Sublot at both the HMA production facility and at the site of HMA field placement. The specific items to be inspected for the Control Strip shall include the four primary inspection components (Equipment, Materials, Environmental Conditions, Workmanship) in accordance with the requirements of Table 450.8a, Table 450.8b and as specified in the Design-Builder's approved QC Plan. The Department will also inspect each Control Strip Sublot for the inspection components of Materials and Workmanship.

(2) Control Strip Sampling and Testing.

The Design-Builder and the Department shall independently sample and test the Control Strip Lot for the Quality Characteristics identified in Table 450.13. The Design-Builder and the Department shall each sample and test each Sublot produced and placed. Each Design-Builder QC sample and each Agency Acceptance sample shall be randomly obtained from each Sublot in accordance with ASTM D3665 and the prescribed sampling protocols for each Quality Characteristic as outlined in Subsection 450.65F. Split samples shall be retained for each Sublot by both the Design-Builder and the Department in accordance with Subsection 450.65D.

(3) Evaluation of Control Strip Inspection Data.

The Design-Builder and the Department shall each evaluate their respective Control Strip inspection data against the requirements for Materials and Workmanship specified in Subsection 450.53 thru Subsection 450.58.

(4) Evaluation of Control Strip Sampling and Testing Data.

The Design-Builder and the Department shall each evaluate their respective individual Sublot test results against the Control Strip Quality Limits in Table 450.13. The Design-Builder and the Department shall also evaluate the Control Strip Lot Quality Level (PWL) using the Specification Limits in Table 450.13 for those Quality Characteristics subject to Quality Level Analysis. The Design-Builder's QC test data shall be combined with the Agency's Acceptance test data to determine the Lot Quality Level, provided that the QC data is Validated against the Acceptance data in accordance with Subsection 450.77. The Control Strip Lot Quality Level must be 70 PWL or greater.

Table 450.13 - Control Strip Quality Limits

Quality Characteristic	Target	Specification Limits		Engineering Limits		Acceptance Limit
		LSL	USL	LEL	UEL	
PG Asphalt Binder Grading	Per Binder Grade specified	N/A	N/A	Per AASHTO M320	Per AASHTO M320	N/A
PG Asphalt Binder Content	Per LTMF	Target - 0.3 %	Target + 0.3 %	Target - 0.4 %	Target + 0.4 %	≥ 70 PWL
Volumetrics: Air Voids	4 %	2.7 %	5.3 %	2 %	6 %	≥ 70 PWL
Combined Gradation: Passing #4 (4.75mm) and Larger Sieves	Per LTMF	N/A	N/A	Target - 7%	Target + 7%	N/A
Combined Gradation: Passing #8 (2.36mm) Sieve	Per LTMF	N/A	N/A	Target - 5%	Target + 5%	N/A
Combined Gradation: Passing #16 (1.18mm) to #50 (300um) Sieve	Per LTMF	N/A	N/A	Target - 4%	Target + 4%	N/A
Combined Gradation: Passing #100 (150um) Sieve	Per LTMF	N/A	N/A	Target - 3%	Target + 3%	N/A
Combined Gradation: Passing #200 (75um) Sieve	Per LTMF	N/A	N/A	Target - 1.5%	Target + 1.5%	N/A
In-Place HMA Mat Density (Cores)	95 % of G _{mm}	92.5 % of G _{mm}	97.5 % of G _{mm}	92 % of G _{mm}	98 % of G _{mm}	≥ 70 PWL
Thickness*: (All Courses 1 inch (25mm) or greater)	Per Plans	- 20 % of Target Thickness	+ 20 % of Target Thickness	- 30 % of Target Thickness	+ 30 % of Target Thickness	≥ 70 PWL
Ride Quality*: Greater than or equal to 55 mph (90 km/hr)	50 in/mile (0.79 m/km)	N/A	70 in/mile (1.10 m/km)	N/A	80 in/mile (1.26 m/km)	≥ 70 PWL
Ride Quality*: 40mph (65 km/hr) to 55 mph (90 km/hr)	70 in/mile (1.10 m/km)	N/A	100 in/mile (1.58 m/km)	N/A	110 in/mile (1.74 m/km)	>70 PWL

*To be evaluated for applicable pavement courses subject to testing per Subsection 450.65F. The Quality Limits for Ride in Table 450.13 shall only apply to Control Strips for the final pavement course (HMA Surface Course or Friction Course). For pavement courses below the final pavement course that are subject to Ride Quality testing, the Mean IRI for the Control Strip Sublots shall be less than or equal to the Maximum Mean IRI values in Table 450.12.

(5) Verification of Control Strip Lot and LTMF.

In order for a Control Strip Lot and corresponding LTMF to be Verified, the following criteria must be met:

- a) All Attributes inspected for each Sublot must meet the specification requirements in Table 450.16.
- b) All individual Sublot test results for the Quality Characteristics tested on the Control Strip must be within the Ownering Limits in Table 450.13.
- c) If the evaluation of all inspection data and testing data for the Control Strip indicates that the individual Sublots are in conformance with the requirements outlined in Subsection 450.66 B paragraphs (3) and (4) above and the Lot Quality for each applicable Quality Characteristic in Table 450.13 is ≥ 70 PWL, the Control Strip Lot and LTMF shall be declared "Verified". In such event, the LTMF shall become the Job Mix Formula (JMF) for the Lot and the Design-Builder may proceed with production and placement of the first HMA Lot.
- d) If the Control Strip is not Verified, the Design-Builder shall reassess the LTMF, the production process, and the placement process to determine the apparent cause(s) of nonconformance. The Design-Builder must submit proposed adjustment(s) to the LTMF and/or the production process and/or placement process. If adjustments to the LTMF are "major" (as defined in Table 1 of AASHTO R 42), the Design-Builder will be required to submit a new LTMF for laboratory verification by the Owner per the requirements of Section 450.66A. If proposed adjustment(s) are accepted by the Owner, the Design-Builder may proceed with a subsequent Control Strip.
- e) If a 2nd or any subsequent Control Strip does not pass all of the inspection and testing requirements, the Design-Builder must submit proposed adjustment(s) to the LTMF and/or the production process and/or placement process,
- f) If the computed PWL for any Quality Characteristic, with the exception of thickness, is < 60 PWL, the Control Strip Lot will be determined rejected and shall be removed. If the mean thickness of the Lot is determined to be greater than the target, it may remain in place, but payment will be based upon the HMA tonnage calculated at the target thickness.
- g) For any Control Strip that is not Verified, the Design-Builder shall prepare a Corrective Action Plan for the nonconforming Control Strip Lot. The corrective method(s) proposed by the Design-Builder shall be subject to the approval of the Department and shall be performed at the Design-Builder's expense.

(6) Acceptance and Payment of Control Strips

(a) 1st and 2nd Control Strip

For each Control Strip Lot that has been Verified, payment shall be determined for each individual Quality Characteristic in accordance with the pay adjustment provisions of Subsection 450.92. If the Lot Quality Level for an individual Quality Characteristic is 90 PWL, payment for the Quality Characteristic shall be 100% of the Design-Builder's bid price for the pay item quantity placed on the Control Strip. If the Lot Quality Level for an individual Quality Characteristic is > 90 PWL, payment for the Quality Characteristic shall be an incentive amount determined in accordance with Subsection 450.92. If the Lot Quality Level for an individual Quality Characteristic is ≥ 60 PWL, but < 90 PWL, payment for the Quality Characteristic shall be a disincentive amount determined in accordance with Subsection 450.92. If the computed Quality Level for an individual Quality Characteristic is < 60 PWL, the Control Strip Lot will be determined rejected and removed in accordance with Subsection 450.66B(5) and shall receive no payment.

(b) 3rd Control Strip

If a 3rd Control Strip Lot is placed and is Verified, payment shall be limited to a maximum of 85% of the Design-Builder's bid price for the entire pay item quantity placed on the Control Strip, regardless of the actual calculated Quality Level for the Lot. If a 3rd Control Strip Lot is placed and is not Verified, payment shall be limited to a maximum of 80% of the Design-Builder's bid price for the entire pay item quantity placed on the Control Strip, regardless of the actual calculated Quality Level for the Lot. If the computed Quality Level for an individual Quality Characteristic is < 60 PWL, the Control Strip Lot will be determined rejected and removed in accordance with Subsection 450.66B(5) and shall receive no payment.

(c) 4th or Subsequent Control Strip

If a 4th or subsequent Control Strip Lot is placed and is Verified, payment shall be limited to a maximum of 75% of the Design-Builder's bid price for the entire pay item quantity placed on the Control Strip, regardless of the actual calculated Quality Level for the Lot. If a 4th or subsequent Control Strip Lot is placed and is not Verified, payment shall be limited to a maximum of 70% of the Design-Builder's bid price for the entire pay item quantity placed on the Control Strip, regardless of the actual calculated Quality Level for the Lot. If the computed Quality Level for an individual Quality Characteristic is < 60 PWL, the Control Strip Lot will be determined rejected and removed in accordance with Subsection 450.66B(5) and shall receive no payment.

450.67 Quality Control Documentation and Data Evaluation.

A. QC Inspection Documentation & Evaluation.

The Design-Builder shall document all QC inspection activity for each HMA Lot Category (Category A, B, or C) produced and placed. All inspection results shall be recorded within 24 hours of inspection on current NETTCP standard Inspection Report Forms (IRFs). The QC Manager shall evaluate inspection results in a timely manner to confirm that production and placement processes are in control. The Design-Builder shall submit hard copies of all IRFs to the Owner at the completion of each Lot.

B. QC Sampling and Testing Documentation & Data Analysis.

The Design-Builder shall document all QC sampling and testing data for each HMA Lot Category (Category A, B, or C) produced and placed. All sampling and testing data shall be recorded within 24 hours of sampling and testing on current NETTCP standard Test Report Forms (TRFs). The QC Manager shall evaluate sampling and testing results in a timely manner, as further outlined below, to confirm that production and placement processes are in control. All QC testing data shall be entered into the Department's MS-Excel QA Data Spreadsheets via the internet (mhdqa.com) within two (2) days after completion of testing. The Design-Builder shall submit hard copies of all TRFs to the Owner at the completion of each Lot.

(1) Control Charts.

For each HMA Category A Lot produced and placed, the Design-Builder shall use Control Charts as part of the QC system to assist in identifying assignable causes affecting the HMA production and placement processes. Control Charts shall be prepared for the Quality Characteristics subject to QC sampling and testing listed in Table 450.10. As a minimum, the Design-Builder shall plot all QC test results of each Lot on Control Charts for individual Sublot measurements or test values (Run Charts). It is also recommended practice for the Design-Builder to use Control Charts that plot Subgroups of data (e.g. X-Bar Charts, R Charts). The Design-Builder shall submit examples of the Control Charts to be used in the QC Plan. As a minimum, the Control Charts shall identify the Contract number, the Payment Item number, the Lot number, the Quality Characteristic, the Control Chart Target, the Upper and Lower Control Chart Limits, and Sublot or Subgroup numbers.

All Control Charts should be updated within 24 hours after the corresponding testing is completed and documented. Quality Control personnel should use the Control Chart data to monitor and adjust the production and placement processes or suspend operations as determined necessary. Control Charts for Quality Characteristics related to HMA production should be maintained at the HMA production facility. Control Charts for Quality Characteristics related to HMA field placement should be maintained at the project field site. Current Control Charts shall be posted in an accessible location. The Engineer shall be provided access to all Control Charts as part of the Department's monitoring of Design-Builder QC activity.

(2) Evaluation of Individual Sublot QC Test Results.

The Design-Builder shall evaluate the individual QC test results for each HMA Lot Category (Category A, B, or C) produced and placed. Each random QC test result shall be evaluated against the applicable Quality Limits within 24 hours of testing. For HMA Category A Lots and Category B Lots, each Sublot test value shall be within the Owning Limits specified in Table 450.19. For HMA Category C Lots, each Sublot test value shall be within the Specifications Limits indicated in Table 450.19.

If the evaluation of the QC testing data indicates that an individual Sublot is not in conformance with the applicable Quality Limits for the particular HMA Lot Category, the Design-Builder shall isolate the Sublot and perform selective sampling followed by additional random sampling of the Sublot to quantify the actual quality of the Sublot.

(3) Evaluation of Lot Quality Level.

For HMA Category A Lots and Category B Lots, the Design-Builder shall use all random QC test results to continuously evaluate the running quality level and determine the percent within limits (PWL) for each Lot during production and placement. The PWL shall be determined through Quality Level Analysis (QLA) for each of the applicable Quality Characteristics listed in Table 450.19 using the corresponding Specification Limits therein. The Design-Builder shall perform a running QLA using random QC data only at a minimum after each 5 Sublots have been tested and shall plot the cumulative PWL after each 5 Sublot interval. The Engineer shall be provided access to all records documenting the running QLA for each Lot as part of the Department's monitoring of Design-Builder QC activity.

If the running QLA shows the PWL falling below the Acceptable Quality Level (AQL) of 90 PWL, the Design-Builder shall initiate appropriate adjustments to the production or placement process or initiate corrective action in accordance with procedures outlined in the approved QC Plan. If the PWL falls below the Suspension Quality Level (SQL) of 70 PWL, the Design-Builder shall suspend production and placement of the Lot. The Design-Builder shall prepare a plan of corrective action for any nonconforming Lot, as further outlined below. If significant adjustment to the JMF or the production or placement process is required, a new Lot will be established. After resuming production and placement, the PWL for the Lot must be back at or above the AQL of 90 PWL.

450.68 Corrective Action.
